New High Power $\text{Li}_2\text{MTi}_6\text{O}_{14}$ Anode Material

D. Dambournet, I. Belharouak, and K. Amine

Argonne National Laboratory

May 19th, 2009

U.S. Department
of Energy

THE UNIVERSITY OF
CHICAGO

A U.S. Department of Energy laboratory
managed by The University of Chicago

Project ID : esp_21_amine

Overview

Timeline

- Start - October 1st, 2008.
- Finish - September 30, 2009.
- 40%

Budget

- Total project funding
 - DOE share : 200K

Barriers

- Barriers addressed
 - Safety of the battery.
 - power density of the battery.
 - Cycle & calendar life span of the battery.

Partners

- Interactions/ collaborations:
D. Dambournet, I. Belharouak
- Project lead: Khalil Amine

Objectives

- Develop new anode materials that provide very high power capability and outstanding safety.
 - Investigate the applicability of $\text{Li}_2\text{MTi}_6\text{O}_{14}$ (M= Sr, Ba) as anode for high power Li-ion batteries.
 - Explore ways for preparing pure and nanosized $\text{Li}_2\text{MTi}_6\text{O}_{14}$ with full capacity and very high power.
 - Investigate the cycle, calendar life and safety of the cell based on this new anode

Milestones

Month/Year	Milestone or Go/No-Go Decision
May-09	<ul style="list-style-type: none">- Develop of a new synthetic method to prepare pure and nano-sized $\text{Li}_2\text{MTi}_6\text{O}_{14}$ anode materials.- Conduct structural and electrochemical characterizations.- Evaluate of this anode with advanced cathode materials.
Sept-09	<ul style="list-style-type: none">- Improve the capacity and rate performance through carbon coating and/or high energy ball milling.- Investigate of new phases in the Li_2O-MO-TiO_2 ternary diagram.
Sept-2010	<ul style="list-style-type: none">- Explore a process to get a suitable morphology with micron size secondary particles and dense nano-sized primary particles to obtain full capacity of $\text{Li}_2\text{MTi}_6\text{O}_{14}$ and good rate capability.

Approach

- Develop a synthesis route to prepare nano-sized $\text{Li}_2\text{MTi}_6\text{O}_{14}$ anode materials to improve rate capability.
- Investigate the effect of high oxidation state dopant to increase the conductivity and enable the power capability of the material.
- Explore a new synthesis process to get a suitable morphology with micron size secondary particles and dense nano-sized primary particles to obtain full capacity of $\text{Li}_2\text{MTi}_6\text{O}_{14}$ and good rate capability.
- Investigate the effect of coating $\text{Li}_2\text{MTi}_6\text{O}_{14}$ with carbon conductive agent to increase overall material conductivity and improve the rate capability.

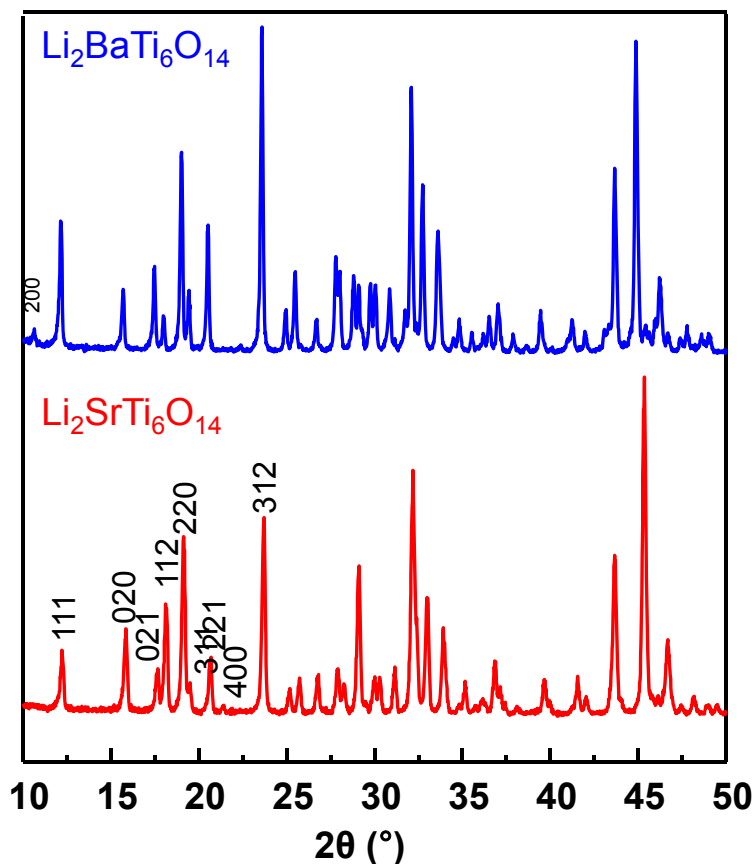

Advantage of $\text{Li}_2\text{MTi}_6\text{O}_{14}$ as Anode for Safe and High Power Battery for HEV Applications

- $\text{Li}_2\text{MTi}_6\text{O}_{14}$ material has available space and can accommodate lithium atoms within its 3D-structure.
- $\text{Li}_2\text{MTi}_6\text{O}_{14}$ is a high voltage anode material (1~1.5V):
 - *Doesn't require SEI (good for safety and long life)*
 - *No significant volume and structural change (good for stable cycling).*
 - *High ionic conductors materials (good for rate capability)*
- $\text{Li}_2\text{MTi}_6\text{O}_{14}$ enables very long cycle and calendar life and significantly improves the safety of the battery.
- $\text{Li}_2\text{MTi}_6\text{O}_{14}$ provides lower resistance at the micron scale particle than the established $\text{Li}_4\text{Ti}_5\text{O}_{12}$ used by the industry as anode for HEV's.
- $\text{Li}_2\text{MTi}_6\text{O}_{14}$ provides higher capacity (180mAh/g) than the established $\text{Li}_4\text{Ti}_5\text{O}_{12}$ (150mAh/g)

Conventional Materials Preparation

- $\text{Li}_2\text{MTi}_6\text{O}_{14}$ (M=Ba, Sr) can be prepared by solid state reaction:
$$\text{Li}_2\text{CO}_3 + \text{MCO}_3 + 6 \text{TiO}_2 \rightarrow \text{MLi}_2\text{Ti}_6\text{O}_{14} + 2 \text{CO}_2^\uparrow \quad (T=1000^\circ\text{C})$$

X-ray diffraction patterns

Symmetry: orthorhombic

Space group: Cmca

Unit cell parameters:

$\text{Li}_2\text{BaTi}_6\text{O}_{14}$	$\text{Li}_2\text{SrTi}_6\text{O}_{14}$
$a=16.570 \text{ \AA}$	$a=16.566 \text{ \AA}$
$b=11.150 \text{ \AA}$	$b=11.148 \text{ \AA}$
$c=11.458 \text{ \AA}$	$c=11.468 \text{ \AA}$

$\text{Li}_2\text{BaTi}_6\text{O}_{14}$ and $\text{Li}_2\text{SrTi}_6\text{O}_{14}$
are isostructural

Structural Description of $\text{Li}_2\text{MTi}_6\text{O}_{14}$

M
Site

Lithium
Site

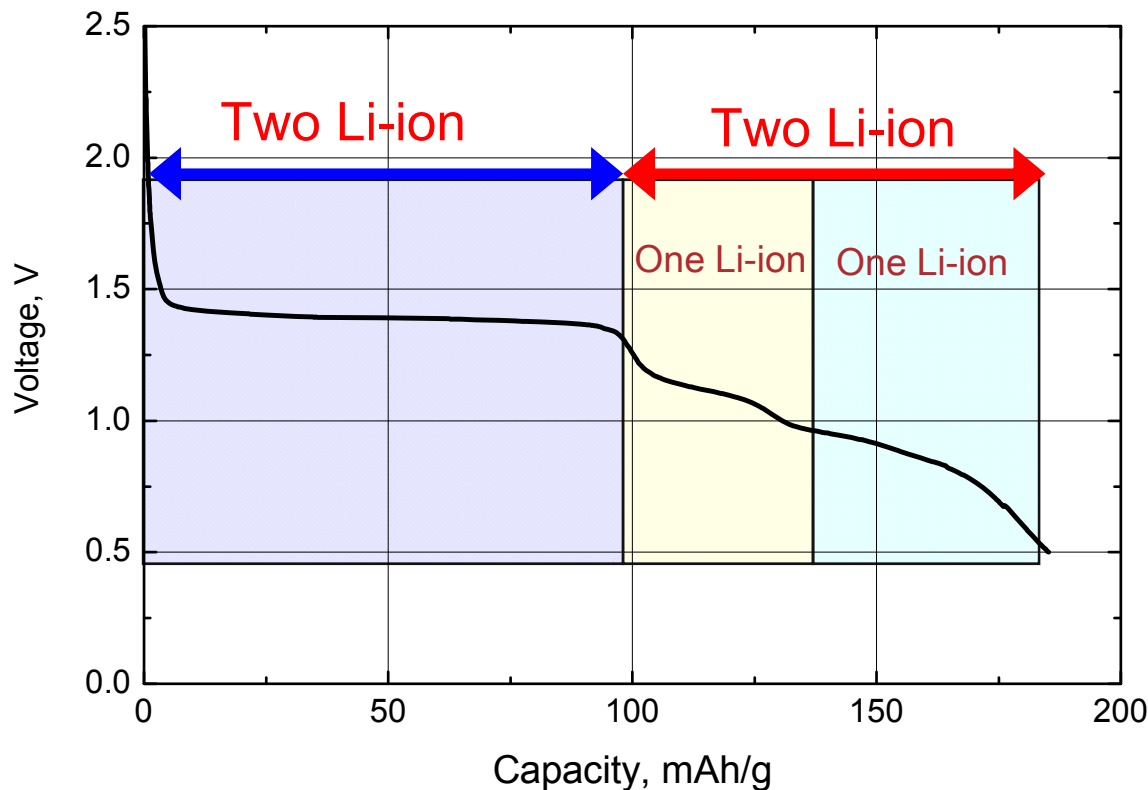

Titanium
Site

- Open-type structure with empty channels suitable for lithium insertion

Electrochemical Properties

- Theoretically, $\text{Li}_2\text{MTi}_6\text{O}_{14}$ can provide around 250 mAh/g (based on $\text{Ti}^{4+}/\text{Ti}^{3+}$)
- Experimentally, $\text{Li}_2\text{MTi}_6\text{O}_{14}$ can provide around 180 mAh/g based on:
$$\text{MLi}_2\text{Ti}_6\text{O}_{14} + 4 \text{Li}^+ + 4 \bar{e} \rightleftharpoons \text{Li}_6\text{MTi}_6\text{O}_{14} \quad (\sim 180 \text{mAh/g})$$

- The material offers a lower operating voltage profile compared to $\text{Li}_4\text{Ti}_5\text{O}_{12}$

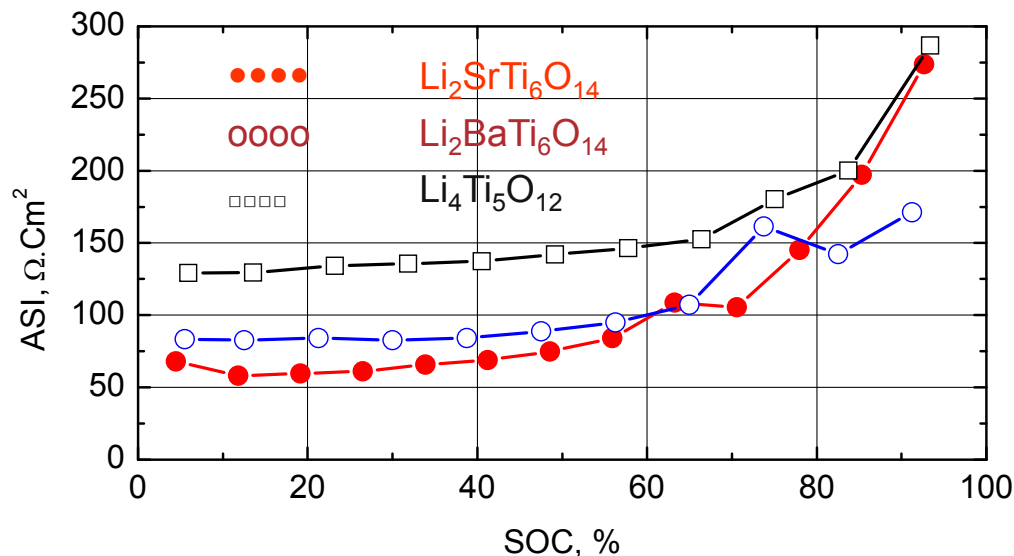

Stability Upon Lithium Insertion

■ $\text{Li}_2\text{MTi}_6\text{O}_{14}$ shows outstanding structural stability upon discharge

Stability Upon Lithium Insertion

Area specific impedance

Cycling of $\text{Li}_2\text{SrTi}_6\text{O}_{14}$ at C/7

- $\text{Li}_2\text{MTi}_6\text{O}_{14}$ shows lower area specific impedances compared to $\text{Li}_4\text{Ti}_5\text{O}_{12}$, provides 160 mAh/g, and cycles fairly well.

Sol-Gel Preparation Route for $\text{Li}_2\text{MTi}_6\text{O}_{14}$

- The aim is to prepare nanosized $\text{Li}_2\text{MTi}_6\text{O}_{14}$ to improve the capacity and rate capability

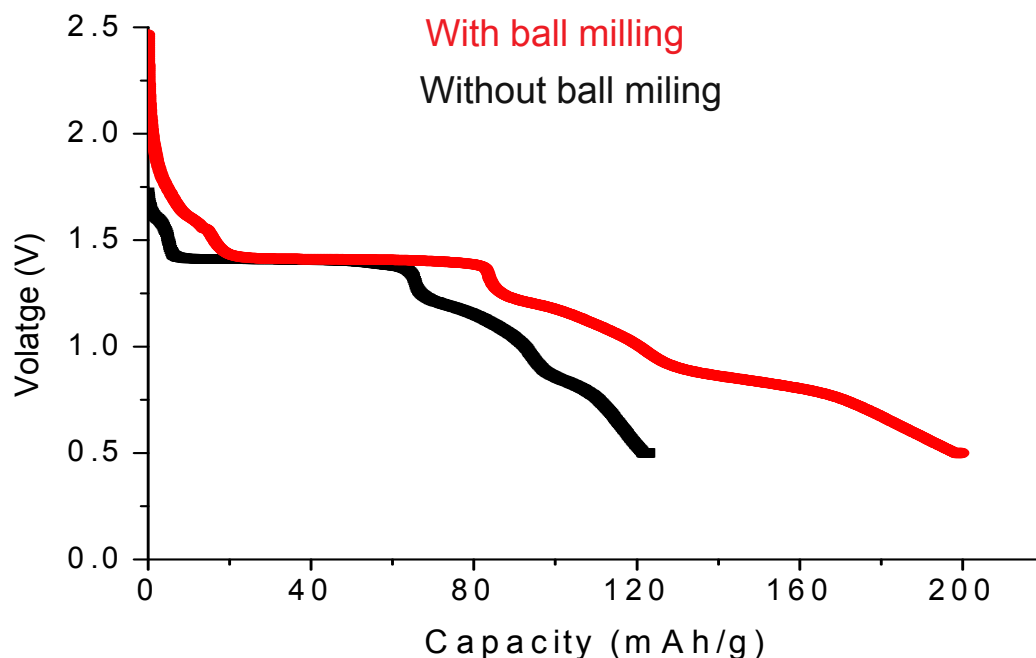

XRD shows pure crystalline phase

Scanning electron microscopy: large agglomerate, secondary particles $\sim 5\mu\text{m}$

Electrochemical Properties of the Material Prepared by Sol-Gel

- Material prepared by sol-gel synthesis shows low capacity due to large agglomerates.
- Ball milling significantly improves the capacity from 120 to 200 mAh/g.
- Average voltage of the material is 1V, can provide 3.2V system with LiMn_2O_4 spinel.

Performance of $\text{Li}_{1.1}(\text{Ni}_{1/3}\text{Co}_{1/3}\text{Mn}_{1/3})_{0.9}\text{O}_2/\text{Li}_2\text{SrTi}_6\text{O}_{14}$ Battery

Voltage Profile

Cycling at C/5

Preliminary cycling data of $\text{Li}_{1.1}(\text{Ni}_{1/3}\text{Co}_{1/3}\text{Mn}_{1/3})_{0.9}\text{O}_2/\text{Li}_2\text{SrTi}_6\text{O}_{14}$ provides an overage voltage of 3V with good preliminary cycling at c/5

Summary

- $\text{Li}_2\text{MTi}_6\text{O}_{14}$ is a promising safe anode that provides a reasonable capacity and a suitable voltage profile for HEVs.
- $\text{Li}_2\text{MTi}_6\text{O}_{14}$ possesses a 3D-dimensional structure where lithium ions can be inserted due to its high ionic conductivity.
- A sol-gel method has been found to provide high purity $\text{Li}_2\text{MTi}_6\text{O}_{14}$ materials using low temperature and duration time.
- $\text{Li}_2\text{MTi}_6\text{O}_{14}$ has lower area specific impedance than $\text{Li}_4\text{Ti}_5\text{O}_{12}$, so high rate capability could be enabled if a nanophased material can be prepared.
- ball-milling $\text{Li}_2\text{MTi}_6\text{O}_{14}$ has shown to improve the capacity of the material.
- $\text{Li}_2\text{SrTi}_6\text{O}_{14}$ provide an average voltage of 1V lower than the 1.5 flat voltage in $\text{Li}_4\text{Ti}_5\text{O}_{12}$ and can lead to high energy density than $\text{Li}_4\text{Ti}_5\text{O}_{12}$

Future works

- Improve the capacity and rate performance through high energy ball milling of the particles.
- Investigate the effect of high oxidation state dopant to increase the conductivity of the material and enable the power capability of the material.
- Explore a new synthesis process to get a suitable morphology with micron size secondary particles and dense nanosized primary particles to obtain full capacity of $\text{Li}_2\text{MTi}_6\text{O}_{14}$ and good rate capability.
- Investigate the effect of coating $\text{Li}_2\text{MTi}_6\text{O}_{14}$ with carbon conductive agent to increase overall material conductivity and improve the rate capability.
