

# WHY WE VENTILATE: Recent Advances

Max Sherman

*BA Stakeholders meeting*

# ASHRAE BIO

- ❖ Distinguished Lecturer
- ❖ Exceptional Service Award
- ❖ Board of Directors; TechC
- ❖ Chair of committees:
  - ❖ 62.2; Standards Committee
  - ❖ TC 4.3; TC 2.5
- ❖ Holladay Distinguished Fellow

# OVERVIEW QUESTIONS

- ❖ What is Ventilation? What is IAQ?
- ❖ What functions does it provide?
- ❖ How much do we need? Why?
- ❖ How should ventilations standards be made?

LBL has working on these problems

# Who Are You?

- ❖ Engineers (ASHRAE Members & not);
- ❖ architects,
- ❖ contractors,
- ❖ reps,
- ❖ builders,
- ❖ vendors,
- ❖ code officials

# WHAT IS VENTILATION

- ❖ Medicine: To Exchange Air In the Lungs
- ❖ Latin: *Ventilare*, “to expose to the wind”
- ❖ Today: To Bring In Outdoor Air And Replace Indoor Air Of The Occupied Space

# VENTILATION: Do We Like it?

## Sustainable

- ❖ Improves Comfort
- ❖ Reduces Exposure to Contaminants
- ❖ Saves Energy
- ❖ Control Moisture
- ❖ Improved Durability

## Not Sustainable

- ❖ Reduces Comfort
- ❖ Increase Exposure to Contaminants
- ❖ Costs Energy
- ❖ Causes Moisture Problems
- ❖ Reduces Durability

# VENTILATION FOR COMFORT

## ❖ Thermal Comfort

- ❖ Prevents overheating by venting excess heat
- ❖ Air movement makes us feel cooler

## ❖ Odor Control

- ❖ Not all odors are bad
- ❖ Occupants are best “sensors” –can take actions
- ❖ Most odors not controlled by constant ventilation

# Key Odor: US!

- ❖ People Emit “Human Bioeffluents”
  - ❖ CO<sub>2</sub> is only surrogate
- ❖ Daily Hygiene of Western World
  - ❖ 5 cfm adapted (occupants)
  - ❖ 15 cfm unadapted (visitors)
- ❖ Dominates In High-Density Spaces
- ❖ Sets Floor Otherwise

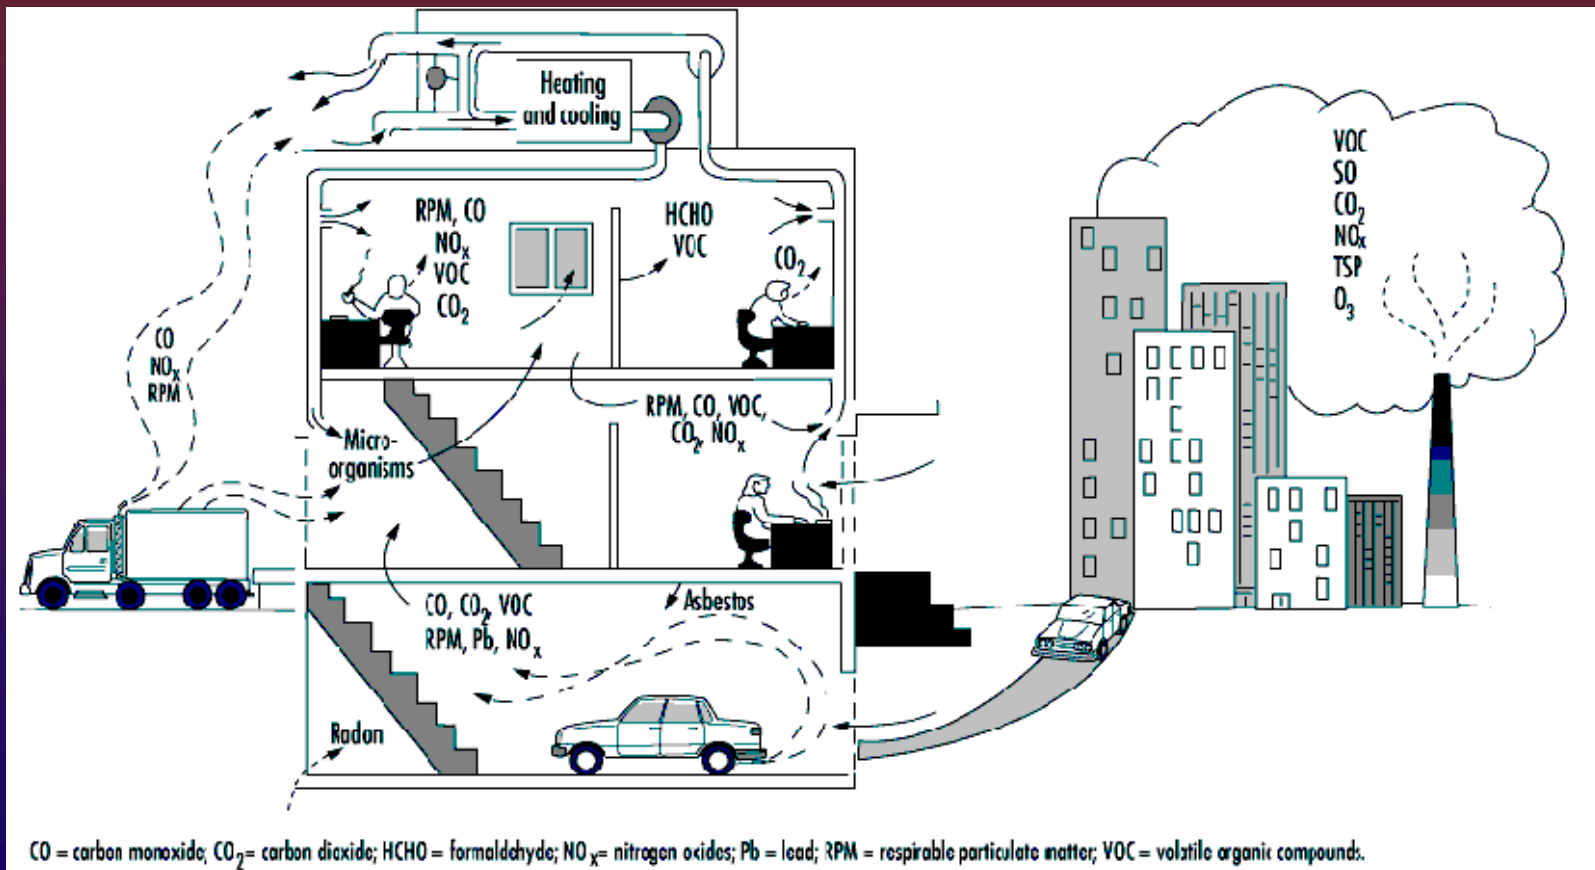

# VENTILATION FOR HEALTH

- ❖ Occupants not usually good sensors
  - ❖ So, we must design healthy buildings
- ❖ Key Questions:
  - ❖ What are the important contaminants?
  - ❖ How do we measure harm from them?
  - ❖ How do we mitigate that harm?
- ❖ Contagion not typically a justification

# CONTAMINANT SOURCES

# OZONE

- ❖ Usually Lower Indoors
- ❖ Highly Reactive
  - ❖ Reacts w/ almost anything
- ❖ Can Be Mitigated by
  - ❖ Envelope Performance
  - ❖ Closed Windows
  - ❖ Pressure Management
  - ❖ Activated Carbon

# COMBUSTION

- ❖ Lots of Pollutants
  - ❖  $\text{NO}_x$ ,  $\text{SO}_x$ ,  $\text{CO}_x$
  - ❖  $\text{H}_2\text{O}$
  - ❖ Ash & Soot
  - ❖ Other Stuff
- ❖ Outdoors
- ❖ Indoors worse if not vented

# NAAQS: CRITERIA POLLUTANTS

- ❖ Lead: A Lesser Airborne Contaminant Of Concern
  - ❖ Still some local issues
- ❖ SO<sub>2</sub>: From High-Sulfur Coal In Power Plants
  - ❖ Acid Rain is a local phenomena
- ❖ CO, NO<sub>2</sub>: Mostly From Combustion
- ❖ Ozone: Photochemically Produced From (Auto) Combustion By-Products
- ❖ Particulates: PM<sub>2.5</sub> (*mass below 2.5μ*)

# BIOLOGICAL

- ❖ Dust Mite, Pets
- ❖ Mold, Fungi
- ❖ Allergies
- ❖ Asthma

Mostly moisture control

# Toxic Air Contaminants

- ❖ Activities
  - ❖ Cleaning
  - ❖ Painting
  - ❖ Pesticides
  - ❖ Hobbies
  - ❖ Office
- ❖ Residues Linger
- ❖ Entrainment

# BUILDING EMISSIONS

- ❖ Volatile Organic Compound (VOC)
  - ❖ Formaldehyde
- ❖ Radon
  - ❖ Soil Gas
- ❖ Particles
- ❖ Others

# HISTORY OF STANDARDS

- ❖ These contaminants require ventilation
  - ❖ From cave-man to euro-man
- ❖ Rates and design based on expert judgments
  - ❖ From cave-man to euro-man
- ❖ Science is latecomer
  - ❖ Need to find what we are ventilating for

# Early Codes and Standards

- ❖ 1631 King Charles & Windows
- ❖ 4 cfm/p 1836 Tredgold “Parliament Stinks”
  - ❖ Steady rise as research continues
- ❖ 30 “ 1895 ASVE Contagion-based
- ❖ 30 “ 1925 22 US State Codes
- ❖ 1927 UBC Requires 1/8 Windows

# ASHRAE Standards History

- ❖ ASHRAE 62-73 Was 5 cfm/person
  - ❖ 15-20 cfm/p recommendation
- ❖ ASHRAE 62-81 Was 5 cfm/person
  - ❖ But 7.5 l/s/p, *if smoking allowed*
- ❖ ASHRAE 62-89
  - ❖ 15 cfm/p assumed moderate smoking
  - ❖ 0.35 ACH for houses
- ❖ Separate Residential in '97 (62.2-2003)

# OUR APPROACH

- ❖ Hazards Analysis
  - ❖ Identify likely contaminants of concern
  - ❖ Compare measured concentrations to standards
- ❖ Harm (Risk) Analysis
  - ❖ What is the harm done from these hazards
  - ❖ What should be the focus of mitigation efforts

# Conduct Hazard Analysis

- ❖ Study includes 77 published studies of measured concentrations indoors; focus on US homes
  - ❖ 67 relevant to long term concentrations
  - ❖ 10 relevant to short term concentrations
- ❖ 267 chemicals were included: criteria pollutants, VOCs, SVOCs, and metals
- ❖ 97 chemicals had relevant health standard or metrics for comparison

# Comparing Concentrations to Health Standards

## ❖ Criteria Pollutants

- ❖ US EPA- NAAQS (1hr, 8hr, 24hr, annual)
- ❖ WHO (1hr, 8hr, 24hr, annual)

## ❖ HAPs/TACs

### ❖ Cancer Health Standards

- ❖ California EPA - Unit Risk Estimates
- ❖ US EPA - Unit Risk Estimates

### ❖ Non-Cancer Health Standards

- ❖ California EPA-Reference Exposure Levels (1hr, 8hr, annual)
- ❖ US EPA – Reference Concentrations (annual)

## Note: ACUTE vs. CHRONIC

- ❖ Acute exposures involve strongly intermittent sources and short-term effects
- ❖ Chronic exposures caused by low level, but continual sources and have long-term effects
- ❖ Ventilation standards control
  - ❖ Acute exposures by source control or local exhaust
  - ❖ Chronic exposures by general ventilation

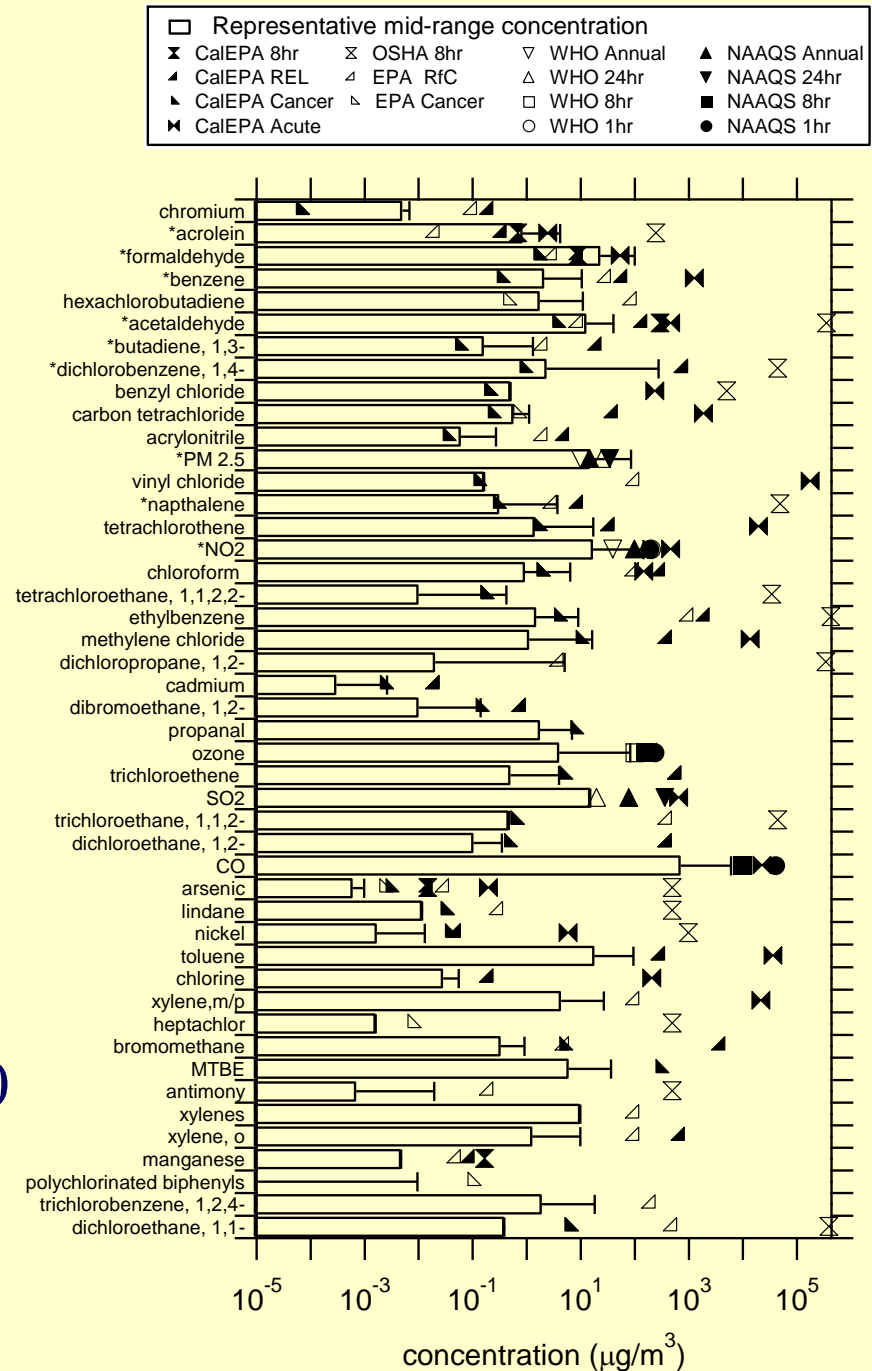

# Identifying Chronic Health Hazards

## ❖ Non-Cancer

❖ Direct comparison to published values

## ❖ Cancer

❖ Cancer “REL” set to a cancer risk that correspond to a lifetime incremental risk of 1 in  $10^5$  assuming 70 years of continuous exposure

# Top 10 Chronic IAQ Hazards

## Priority Hazards

- ❖ acetaldehyde,
- ❖ acrolein,
- ❖ benzene,
- ❖ 1,3-butadiene,
- ❖ 1,4-dichlorobenzene,
- ❖ formaldehyde,
- ❖ naphthalene,
- ❖ NO<sub>2</sub>,
- ❖ PM<sub>2.5</sub>.

## Not listed

- ❖ Carbon Tetrachloride
- ❖ Ozone
- ❖ Radon
- ❖ Tobacco Smoke

# Contaminant Standards Questionable

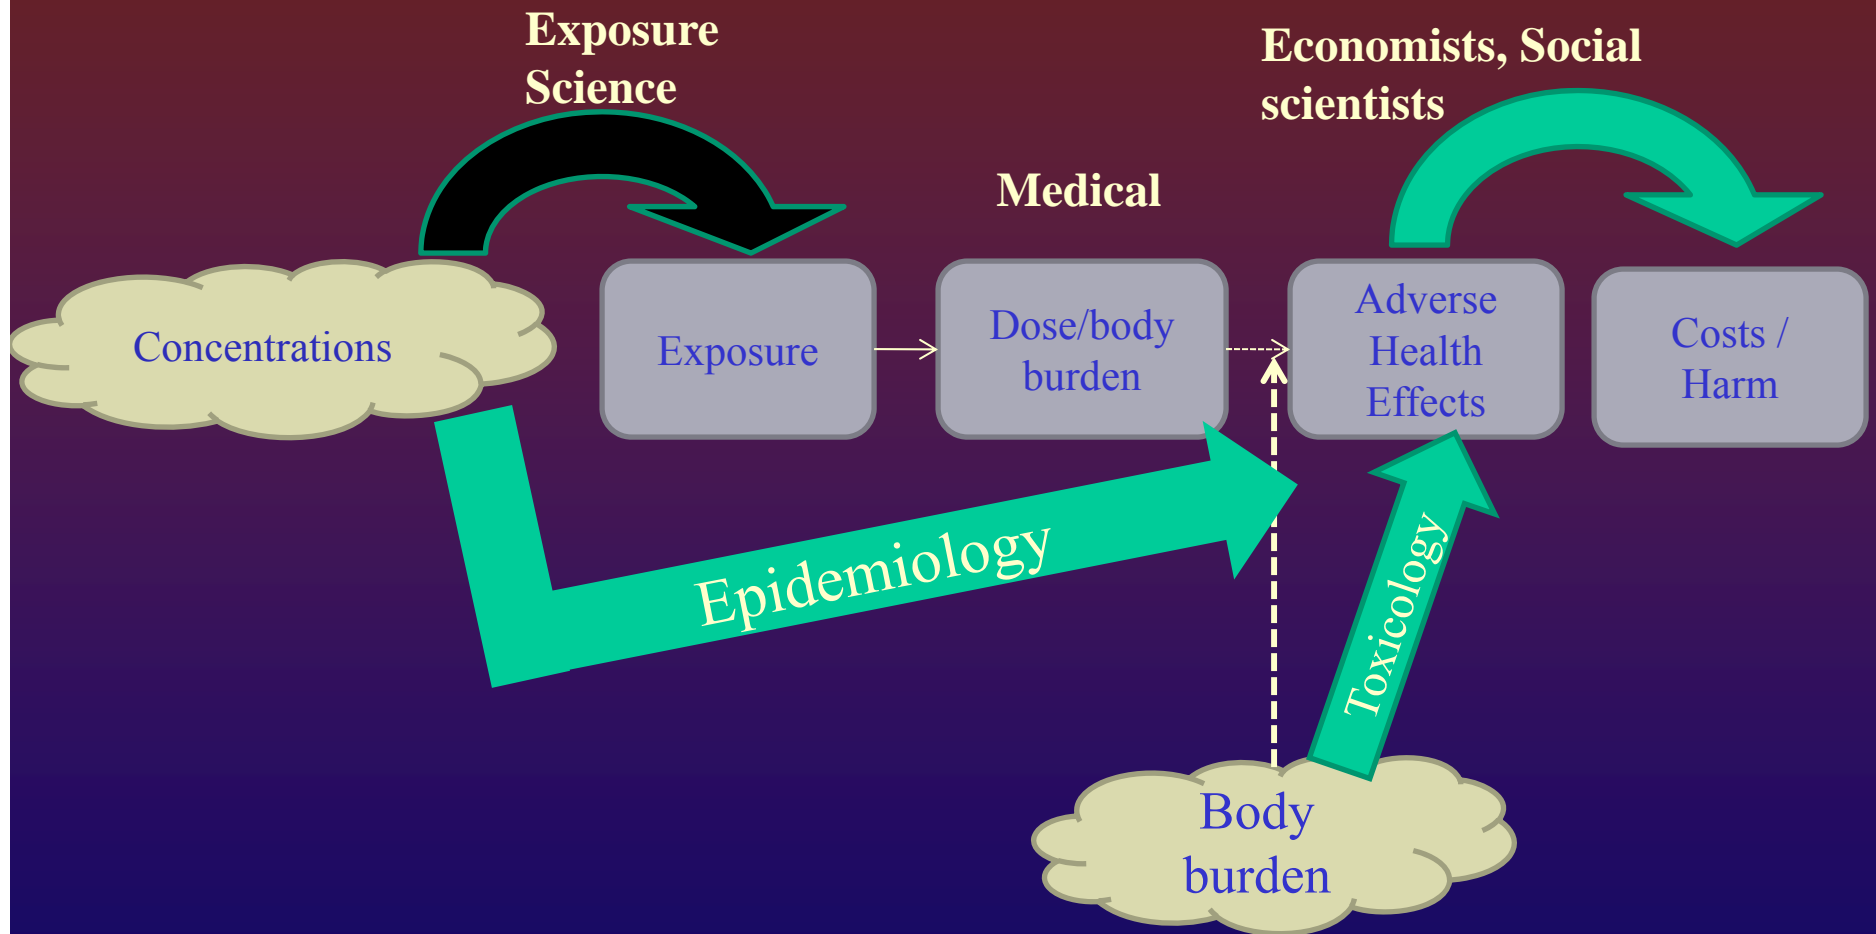

- ❖ Based on expert opinions backed by data
- ❖ But are political decisions
  - ❖ Costs & benefits; practicalities; good as can be
- ❖ Do not use same health impact criteria
  - ❖ So, can't be compared or "traded"
- ❖ Need level playing field
  - ❖ to get total cost/harm from contaminants

## “Obvious” Approach

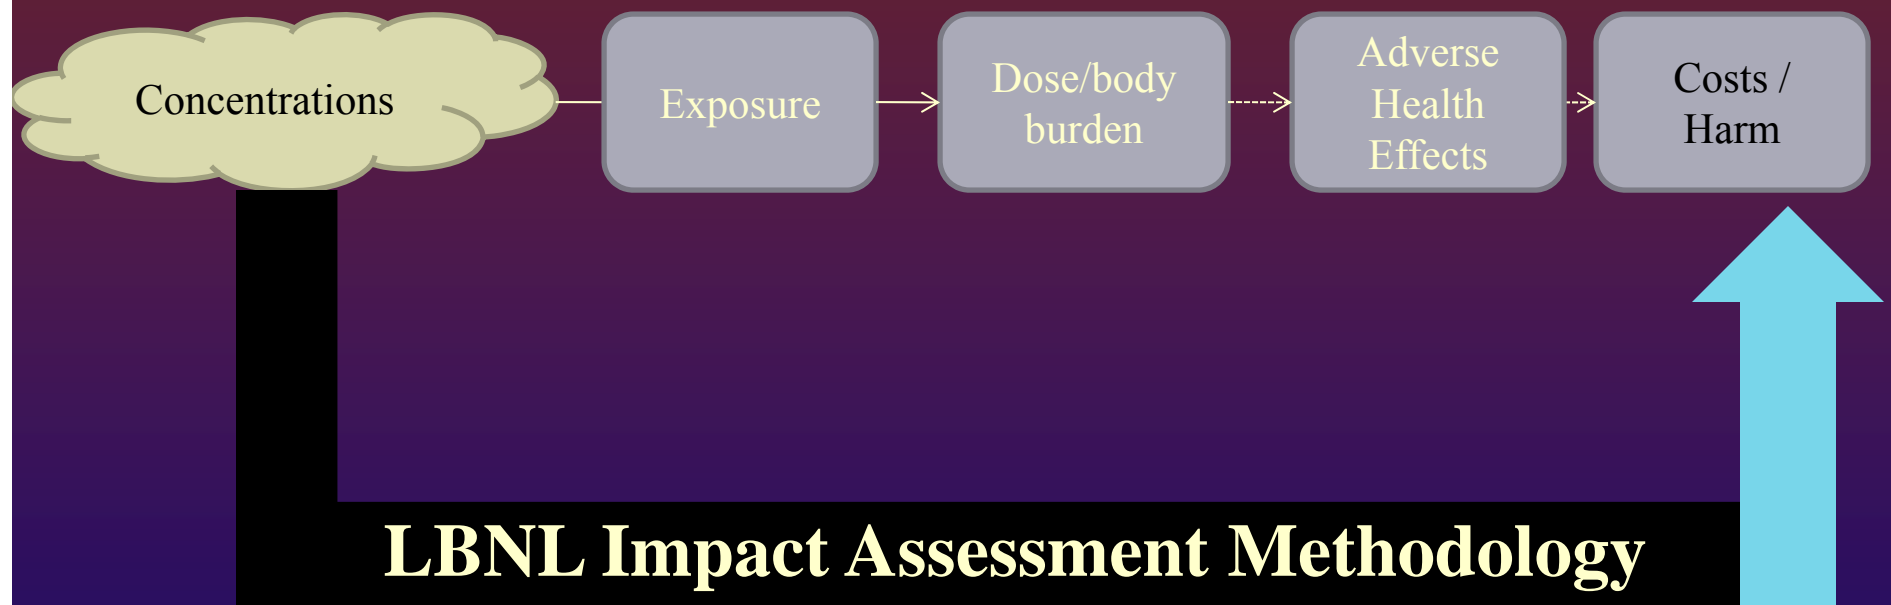

- ❖ Find out what harm (cost) a given exposure has.
  - ❖ Using a common metric
- ❖ Would allow trade-offs, and comparisons
  - ❖ Design optimization
- ❖ But not as easy to do as it is to say
  - ❖ interdisciplinary

# Many Disciplines Involved

# Relating Pollutant Exposure to Health

# Costs of Adverse Health Effects

- ❖ Disability Adjusted Life Years (DALYs)

$$DALY = YLL + YLD$$

- ❖ YLL = Years lost to premature death
- ❖ YLD = Equivalent years lost to disability
- ❖ DALY valued at roughly \$50,000 - \$160,000  
per 100,000/yr:
- ❖ Non-Fatal Stroke: ~9.5–13 DALYs
- ❖ Air Pollution Mortality: ~1.2-10 DALYs

# Indoor Concentrations → DALYs

❖ Annual DALYs lost per person=

❖ Criteria Pollutants

$$\Delta concentration * \frac{\partial Disease\_Incidence}{\partial concentration} * \frac{\partial DALYs}{\partial Disease}$$

❖ Single component gas phase pollutants

(Huijbregts)

$$inhaled\_mass * \frac{\partial DALYs}{\partial inhaled\_mass}$$

# Criteria Pollutant Approach

- ❖ Concentration-Response functions
  - ❖ Relate increased exposure to disease incidence
  - ❖ Derived from epidemiology studies

$$\frac{\partial \text{Disease incidence}}{\partial \text{concentration}} * \Delta \text{concentration} = -[y_0 (\exp(-\beta \Delta C_{\text{exposure}}) - 1)]$$

- ❖ DALYs per incidence of disease (Various)
- ❖ Exposure concentrations (Logue et al. 2011)

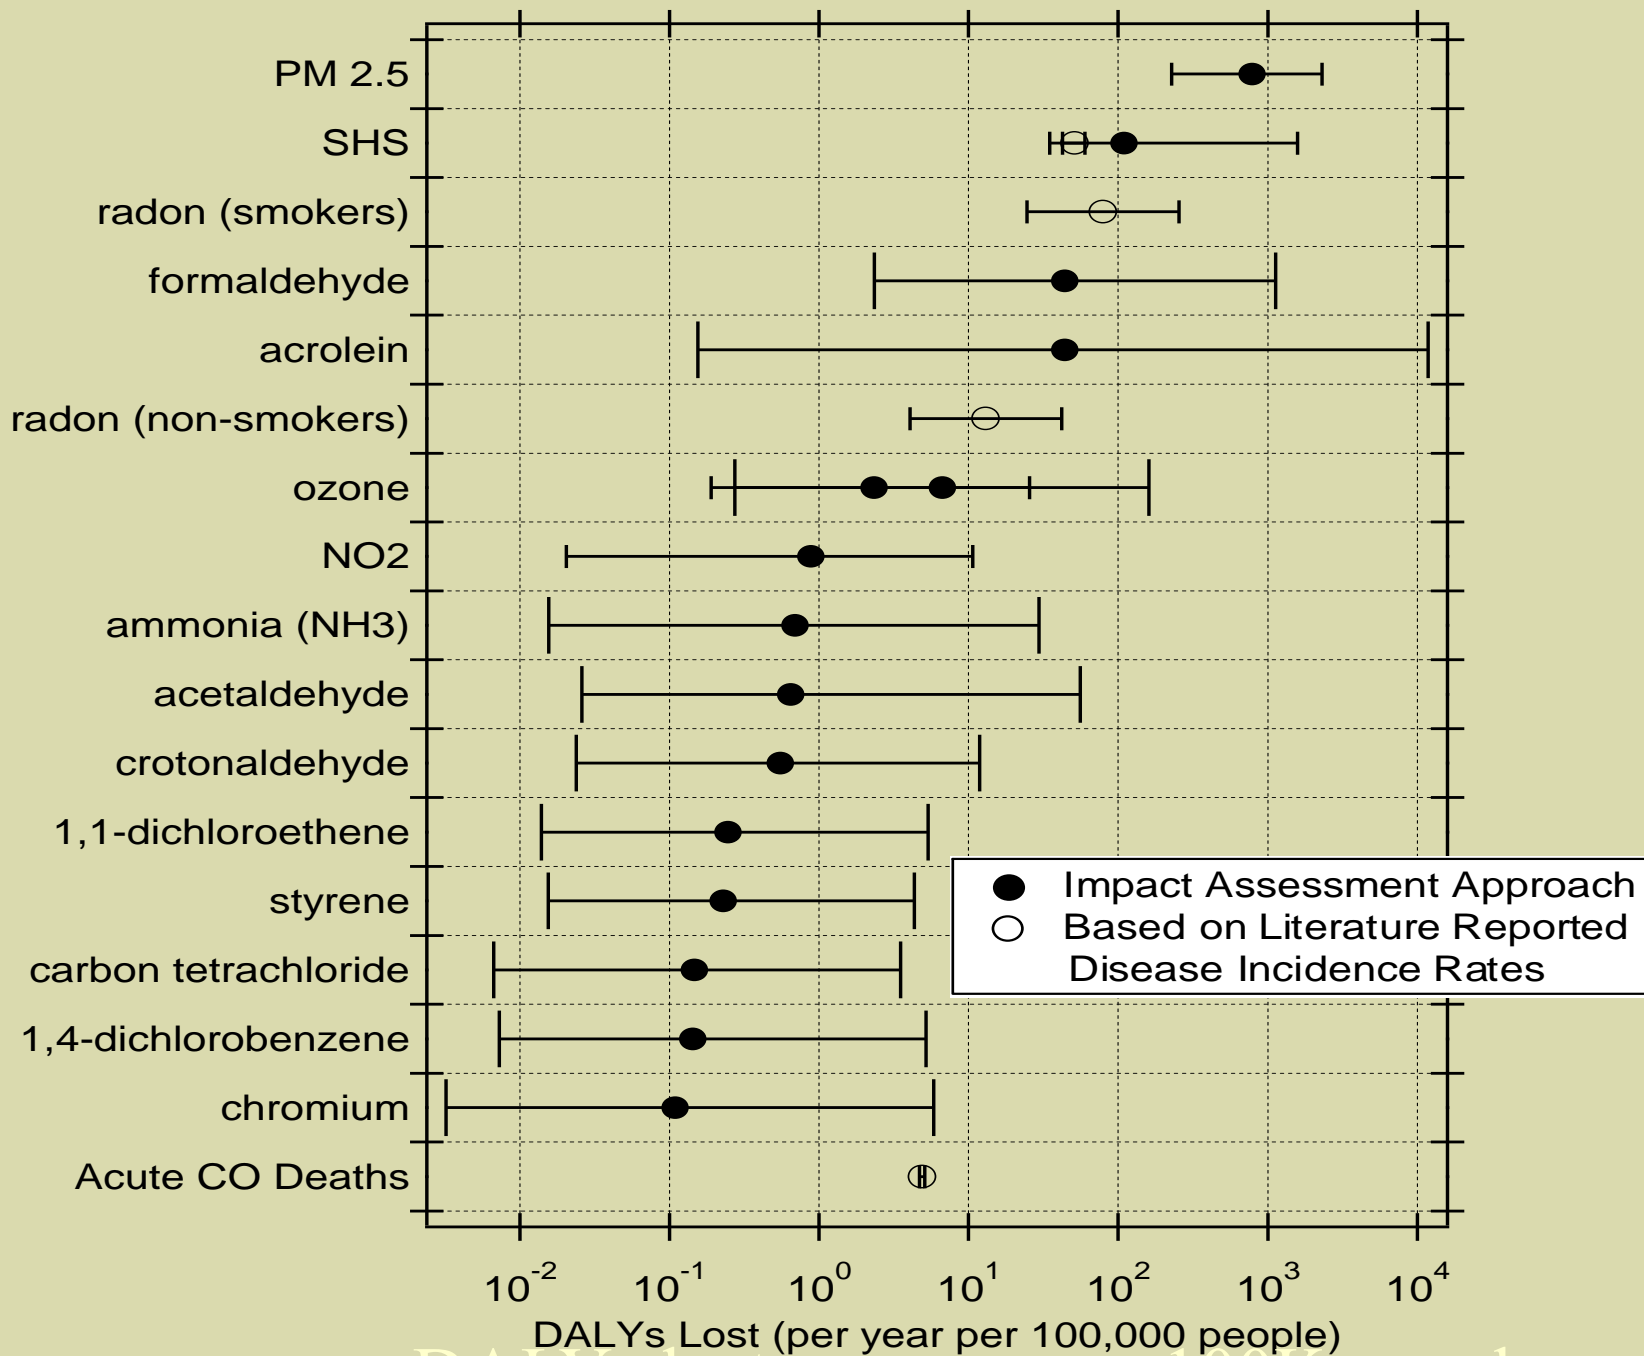

# Checking Methodology: SHS

- ❖ Applied to concentrations of secondhand smoke components
- ❖ Determined damage associated with reported health impact of SHS by EPA
- ❖ Results help assess uncertainty of other indoor pollutant impacts

DALYs lost per year per 100K people

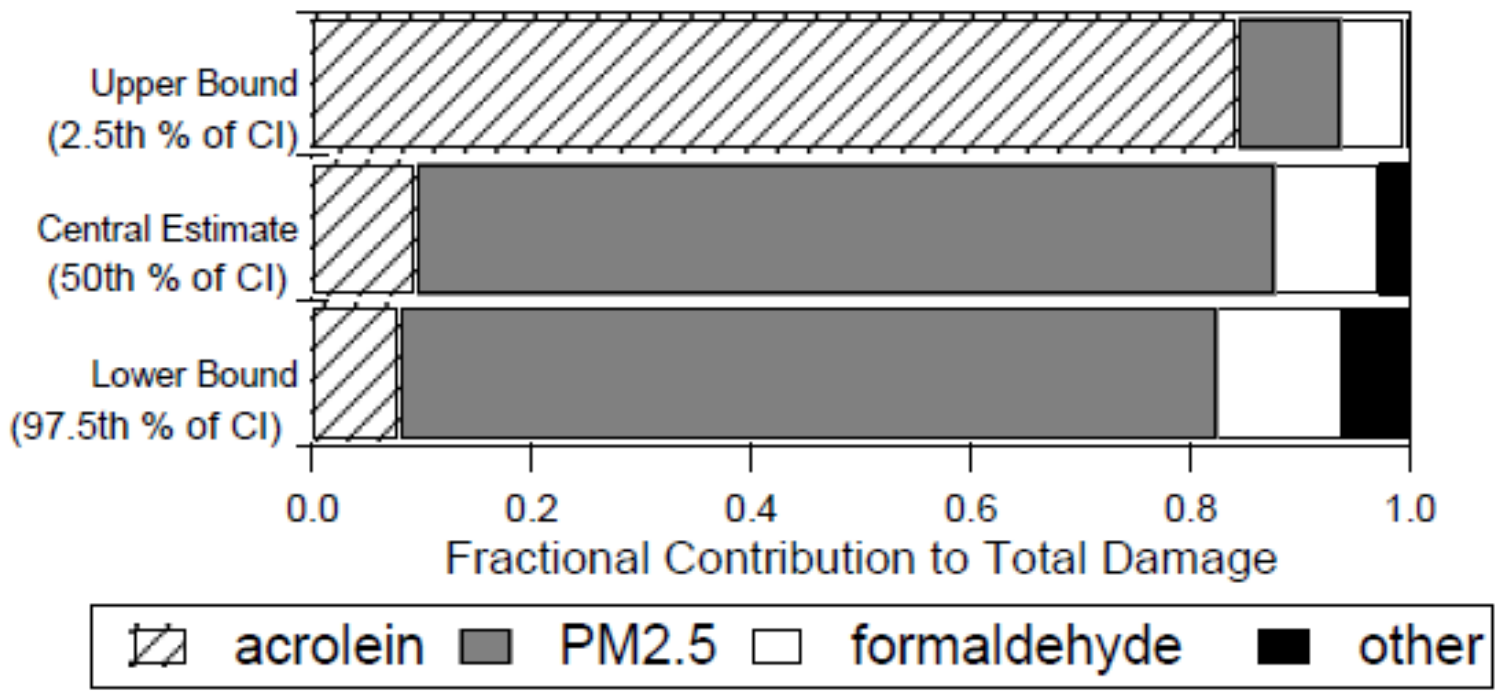

# What is the Damage of Indoor Air?

**DALYs lost per year per 100K people**

# What Pollutants are the main risk drivers? (excludes SHS and radon)

# Study Results

1. PM2.5 is most significant indoor health hazard
    - ❖ Can have significant outdoor source
  2. Product of combustion are 2<sup>nd</sup> most
    - ❖ Acrolein is biggest chronic contributor
    - ❖ Least studied of important compounds
  3. Formaldehyde is 3<sup>rd</sup> most
    - ❖ Even though it meets WHO standards
- ...not counting smoking or Radon or acute*

# Control Approaches

1. Particle filtration (PM<sub>2.5</sub>)
  - ❖ Ventilation may not handle particles well
2. Combustion control (Acrolein et al)
  - ❖ Do not let products of combustion into space
3. Low emitting materials (HCHO mostly)
4. Then dilution ventilation (>human odor needs)
  - ❖ *We don't know what we don't know*

A photograph of a volcanic landscape. In the center, a tall, conical plant with a dense, spiky top and a white, fibrous base stands on a dark, rocky, and gravelly slope. The background features a vast expanse of white, fluffy clouds that appear to be a sea of clouds, stretching across the horizon. The sky above is a clear, bright blue. The overall scene is a high-altitude, volcanic environment.
