## 61 CAUTIONARY NOTE

62 This publication is not intended for regulatory use. It is not intended to replace or subsume other  
63 cybersecurity-related activities, programs, processes, or approaches that energy sector organizations  
64 have implemented or intend to implement, including any cybersecurity activities associated with  
65 legislation, regulations, policies, programmatic initiatives, or mission and business requirements.  
66 Additionally, this publication uses the words "adopt", "use", and "implement" interchangeably. These  
67 words are not intended to imply compliance or mandatory requirements.

68

## 69 ACKNOWLEDGMENT

70 The Department of Energy (DOE) acknowledges the dedication and technical expertise of all the  
71 organizations and individuals who participated in the development of the Energy Sector Framework  
72 Implementation Guidance. This document is based on inputs from members of framework guidance  
73 development workgroups under the Electricity Subsector Coordinating Council (ESCC) and Oil & Natural  
74 Gas Subsector Coordinating Council (ONG SCC). The DOE also acknowledges inputs provided by  
75 members of the government partners working group, representing different public sector organizations,  
76 as well as comments provided by other public and private stakeholders during the public comment  
77 period.

# 78 1. INTRODUCTION

---

79 The National Institute of Standards and Technology (NIST) released the voluntary [Cybersecurity](#)  
80 [Framework](#) (Framework) in February 2014 to provide a common language organizations can use to  
81 assess and manage cybersecurity risk. Developed in response to Executive Order (EO) 13636 “Improving  
82 Critical Infrastructure Cybersecurity” of February 2013, the Framework recommends risk management  
83 processes that enable organizations to inform and prioritize decisions regarding cybersecurity based on  
84 business needs, without additional regulatory requirements. It enables organizations—regardless of  
85 sector, size, degree of cybersecurity risk, or cybersecurity sophistication—to apply the principles and  
86 best practices of risk management to improve the security and resilience of critical infrastructure. Each  
87 sector and individual organization can use the Framework in a tailored manner to address its  
88 cybersecurity objectives.

89 Energy sector organizations have a strong track record of working together to develop cybersecurity  
90 standards, tools, and processes that ensure uninterrupted service. The U.S. Department of Energy  
91 (DOE), as the Energy Sector-Specific Agency (SSA), worked with the Energy Sector Coordinating Councils  
92 and other SSAs to develop this Framework Implementation Guidance specifically for energy sector  
93 owners and operators. It is tailored to the energy sector’s risk environment and existing cybersecurity  
94 and risk management tools and processes that organizations can use to implement the Framework. This  
95 Framework Implementation Guidance is designed to assist energy sector organizations to:

- 96 • Characterize their current and target cybersecurity posture.
- 97 • Identify gaps in their existing cybersecurity risk management programs, using the Framework as  
98 a guide, and identify areas where current practices may exceed the Framework.
- 99 • Recognize that existing sector tools, standards, and guidelines may support Framework  
100 implementation.
- 101 • Effectively demonstrate and communicate their risk management approach and use of the  
102 Framework to both internal and external stakeholders.

103 Section 2 provides key Framework terminology and concepts for its application, and Section 3 identifies  
104 example resources that may support Framework use. Section 4 outlines a general approach to  
105 Framework implementation, followed in Section 5 by an example of a tool-specific approach to  
106 implementing the Framework. The tool selected for this example is the DOE- and industry-developed  
107 Cybersecurity Capability Maturity Model (C2M2; DOE 2014a).

108 Energy sector organizations, particularly those that are using the Framework to establish a new security  
109 risk management program are invited to contact DOE via email at [cyber.framework@hq.doe.gov](mailto:cyber.framework@hq.doe.gov) with  
110 any questions or requests for direct assistance.

111

## 112 2. PREPARING FOR FRAMEWORK 113 IMPLEMENTATION

---

114 This section helps in preparation for [Cybersecurity Framework](#) implementation by presenting key  
115 Framework terminology, concepts, and benefits.

### 116 2.1 FRAMEWORK GUIDANCE TERMINOLOGY

117 The three main elements of the [Cybersecurity Framework](#) (NIST 2014) are the **Core**, the Framework  
118 **Implementation Tiers (Tiers)**, and the **Profile**. These terms are frequently used in this Framework  
119 guidance document and defined below.

120 The **Core** is a set of “cybersecurity activities, desired outcomes, and applicable informative references  
121 that are common across critical infrastructure sectors,” which are organized under five Functions:  
122 Identify, Protect, Detect, Respond, and Recover. Each **Function** is divided into Categories, Subcategories,  
123 and informative references. The **Categories** are cybersecurity outcomes that are closely tied to  
124 programmatic needs and particular activities. The **Subcategories** are specific outcomes of technical  
125 and/or management activities that support achievement of each Category. Informative references are  
126 specific cross-sector standards, guidelines, and best practices that illustrate a method to achieve the  
127 outcomes associated with each Subcategory.

128 **Tiers** describe an organization’s approach to “cybersecurity risk and the processes in place to manage  
129 that risk,” ranging from Tier 1 (Partial) to Tier 4 (Adaptive). Each Tier demonstrates an increasing degree  
130 of rigor and sophistication of cybersecurity risk management and integration with overall organizational  
131 needs. Progression to higher Tiers is encouraged when such a change would reduce cybersecurity risk  
132 and be cost effective. Tiers are associated with the overall robustness of an organization’s risk  
133 management process and are *not* tied to Functions, Categories, or Subcategories. An organization may  
134 align its application of the Tiers with its desired scope for using the Framework (e.g., if an organization is  
135 using the Framework for a specific business function only, the Tiers could be used to describe the overall  
136 robustness of risk management processes at that business function level).

137 **Profiles** align the Framework core elements with business requirements, risk tolerance, and  
138 organizational resources. The Profile can be used to identify opportunities for improving cybersecurity  
139 posture by comparing a Current Profile to a Target Profile. Profiles provide a roadmap to reduce  
140 cybersecurity risk consistent with business practices.

141 This document also frequently refers to the term **organization**, which describes a functional entity of  
142 any size that uses the same cybersecurity risk management program within its different components  
143 and may individually use the Framework. This may describe one corporation, or one business unit within  
144 a multi-unit corporation. As each company may develop and implement its risk management programs  
145 at different levels, this guidance is designed for any organization, be it the enterprise or a business unit  
146 within the enterprise.

## 147 2.2 FRAMEWORK GUIDANCE CONCEPTS

148 This document provides guidance to organizations at all different levels of maturity in their  
149 cybersecurity and risk management programs.

150 **For organizations that do not have a cybersecurity risk management program**, this implementation  
151 guidance will assist organizations in directly implementing the Framework or selecting an alternative  
152 approach (such as a widely used set of standards or security and risk management tools) that effectively  
153 implements the Framework by its use.

154 **For organizations that have an existing cybersecurity risk management program**, this document will  
155 assist them in reviewing their existing program, identifying any cybersecurity and risk management gaps,  
156 and aligning their existing program to the key Framework elements. Aligning current approaches to the  
157 Framework can help demonstrate implementation and support the organization in communicating its  
158 cybersecurity risk profile and management approach with internal organizations and external  
159 stakeholders.

160 **To use the Framework**, an organization does not have to directly match every element in their  
161 organization's cybersecurity program with the Framework elements. However, organizations who wish  
162 to demonstrate their alignment with the Framework are recommended to review and document the  
163 alignment of their program and practices with the objectives of the Framework's Core Functions, Tiers,  
164 and Profiles.

165 The Framework includes considerations to address **privacy and civil liberties issues** during  
166 implementation. In certain sectors and organizations, these issues might be directly applicable to the  
167 reliable delivery of critical services. In other sectors and organizations, these issues may not be relevant  
168 because of the nature of the information the organizations handle and the degree to which it is  
169 aggregated. This Framework guidance document does not directly address privacy and civil liberties  
170 issues. However, organizations are encouraged to review and consider using the Framework's privacy  
171 and civil liberties guidance (NIST 2014, p. 15) in alignment with other privacy guidelines and state and  
172 federal laws.

## 173 2.3 FRAMEWORK IMPLEMENTATION PROCESS AND BENEFITS

174 The Framework and this guidance are designed to be flexible enough to be used both by energy sector  
175 organizations with mature cybersecurity and risk management programs and by those with less-  
176 developed programs. Each organization will choose if, how, and where it will use the Framework based  
177 on its own operating environment. Choosing to implement the Framework does not imply that an  
178 existing cybersecurity and risk management approach is ineffective or needs to be replaced. Rather, it  
179 means that the organization wishes to take advantage of the benefits that the Framework offers.

180 Implementing the Framework provides the mechanism for an organization to:

- 181 1. Describe their current cybersecurity posture in terms of **Functions, Category** and **Subcategory**  
182 **Outcomes**, and **Implementation Tiers** for appropriate stakeholders.
- 183 2. Describe the **Current and Target Profiles** for their cybersecurity programs.
- 184 3. Assess progress toward the desired **Target Profiles**.

- 185 4. **Identify and prioritize opportunities for improvement** within the context of a continuous and  
186 repeatable process.  
187 5. **Communicate the Current and Target Profiles** and other risk management information to  
188 internal and external cybersecurity risk stakeholders.

189 Organizations with less-developed cybersecurity risk management programs can use the framework to  
190 define and establish a program that successfully addresses cybersecurity risk commensurate with the  
191 organization's business and critical infrastructure security objectives.

192 A key benefit of Framework implementation is to strengthen an organization's risk management  
193 approach and communicate its use of particular cybersecurity practices to internal and external  
194 stakeholders. The implementation approach detailed in Section 4 guides organizations to map their  
195 existing cybersecurity and risk management approaches (e.g., standards, tools, methods, and guidelines)  
196 to the Framework's Core and Implementation Tiers. The mapping may:

- 197 • **Identify gaps between the outcomes achieved by the organization's approach and the**  
198 **outcomes defined in the Framework Core and the organization's desired Implementation Tier.**  
199 The organization may take steps to address these gaps, or may ultimately determine that these  
200 differences are not significant or material to managing its cybersecurity risks. However, the  
201 organization may need to describe and document these differences to facilitate  
202 communications about the organization's use of the Framework.  
203 • **Identify areas where the organization's approach is more comprehensive than the Framework**  
204 **Core and desired Implementation Tier.** Due to specific organizational or critical infrastructure  
205 risks, an organization may deploy cybersecurity approaches that achieve outcomes that go  
206 above and beyond the outcomes described by the Framework's Core Categories and  
207 Subcategories or Implementation Tiers. Those organizations may also need to identify and  
208 document those differences to facilitate risk communication with internal and external  
209 stakeholders. When appropriate, energy sector organizations should consider sharing their risk  
210 management approach with DOE and NIST to help strengthen and expand the Framework.

211 Ideally, the Framework would be incorporated as part of an ongoing cybersecurity and risk management  
212 process improvement program.

## 213 3. SECTOR FRAMEWORK GUIDANCE RESOURCES

214 This section presents an overview of some of the existing cybersecurity tools and processes currently in  
215 use by the energy sector that may support Framework implementation.

### 216 3.1 SAMPLE ENERGY SECTOR SECURITY AND RISK MANAGEMENT 217 APPROACHES

218 Several cybersecurity risk management tools, processes, standards, and guidelines already widely used  
219 by energy sector organizations may align well with Framework security and risk management  
220 approaches and help demonstrate how an organization is already applying Framework concepts. While  
221 this Framework guidance document only supplies a mapping of one tool—the Cybersecurity Capability  
222 Maturity Model (C2M2)—to the Framework, other in-use approaches will likely support an organization  
223 in mapping its program to the Framework. An example set of readily available tools and processes used  
224 across the energy sector is described in Table 1. Other tools and processes are in active use, or in  
225 development, which may provide similar cybersecurity risk management capabilities.

226 **Table 1: Example Cybersecurity Tools and Processes**

Name	Summary	Additional Information
<b>Cybersecurity Capability Maturity Model (C2M2), both electricity and oil and natural gas sector-specific versions</b>	Used to assess an organization's cybersecurity capabilities and prioritize their actions and investments to improve cybersecurity.	<a href="http://energy.gov/oe/cybersecurity-capability-maturity-model-c2m2">http://energy.gov/oe/cybersecurity-capability-maturity-model-c2m2</a>
<b>Cyber Resilience Review (CRR)</b>	Evaluates an organization's operational resilience and cybersecurity practices across ten domains.	<a href="https://www.us-cert.gov/ccubedvp/self-service-crr">https://www.us-cert.gov/ccubedvp/self-service-crr</a>
<b>Cyber Security Evaluation Tool (CSET)</b>	Guides users through a step-by-step process to assess their control system and information technology network security practices against recognized industry standards.	<a href="http://ics-cert.us-cert.gov/Assessments">http://ics-cert.us-cert.gov/Assessments</a>
<b>Electricity Subsector Cybersecurity Risk Management Process (RMP) Guideline</b>	Enables organizations to apply effective and efficient risk management processes and tailor them to meet their organizational requirements.	<a href="http://energy.gov/oe/downloads/cybersecurity-risk-management-process-rmp-guideline-final-may-2012">http://energy.gov/oe/downloads/cybersecurity-risk-management-process-rmp-guideline-final-may-2012</a>

227

228

## 229 3.2 SAMPLE SUBSECTOR-SPECIFIC SECURITY AND RISK MANAGEMENT

### 230 APPROACHES

231 The electricity and oil and natural gas subsectors each have tailored standards or cybersecurity  
 232 approaches that many organizations may use voluntarily or by requirement, in addition to the cross-  
 233 sector informative references identified in the Framework Core. Some of these, like the C2M2 (included  
 234 in Table 1), have customized versions for different subsectors. This section presents examples of tools  
 235 and processes that are applicable only to specific subsectors.

236 **Table 2. Examples of Electricity Subsector Tool and Processes**

Name	Summary	Additional Information
<b>Critical Infrastructure Protection (CIP) Standards</b>	The North American Electric Reliability Corporation (NERC) CIP Standards provide a set of regulatory cybersecurity requirements to assist in securing the energy system assets that operate and maintain the bulk electric grid.	<a href="http://www.nerc.com/pa/Stand/Pages/CIPStandards.aspx">http://www.nerc.com/pa/Stand/Pages/CIPStandards.aspx</a>
<b>Interagency Report (IR) 7628, Guidelines for Smart Grid Cyber Security</b>	These National Institute of Standards and Technology (NIST) guidelines present an analytical framework to develop effective cybersecurity strategies tailored to their particular smart grid-related characteristics, risks, and vulnerabilities.	<a href="http://csrc.nist.gov/publications/PubsNISTIRs.html#NIST-IR-7628">http://csrc.nist.gov/publications/PubsNISTIRs.html#NIST-IR-7628</a>

237

Name	Summary	Additional Information
<b>Control Systems Cyber Security Guidelines for the Natural Gas Pipeline Industry</b>	This Interstate Natural Gas Association of America (INGAA) guideline assists operators of natural gas pipelines in managing their control systems cyber security requirements. It sets forth and details the unique risk and impact-based differences between the natural gas pipeline industry and the hazardous liquid pipeline and liquefied natural gas operators.	<a href="http://www.ingaa.org/">http://www.ingaa.org/</a>
<b>API OS0001 – Security Guidance</b>	This American Petroleum Institute (API) document provides guidance on security for	<a href="http://www.api.org/publications-standards-and-">http://www.api.org/publications-standards-and-</a>

Name	Summary	Additional Information
<b>for the Petroleum Industry, Second Edition</b>	worldwide offshore oil and natural gas operations.	<a href="#">statistics</a>
<b>Chemical Facilities Anti-Terrorism Standards</b>	These risk-based performance standards (RBPS) from the Department of Homeland Security (DHS) provide guidance on physical and cybersecurity for organizations handling chemicals of interest. RBPS 8 specifically requires facilities regulated by CFATS to address cybersecurity in their facility security plan.	<a href="http://www.dhs.gov/chemical-facility-anti-terrorism-standards">http://www.dhs.gov/chemical-facility-anti-terrorism-standards</a>

### 239 3.3 MAPPING TO THE FRAMEWORK

240 Section 5 details a Framework implementation approach using the C2M2, and a mapping of the C2M2 to  
 241 the Framework is provided in Appendix A. Vendors and standards developers may also have separately  
 242 developed mappings of other tools and processes to the Framework. Organizations may use any such  
 243 mappings along with this guidance to support use of the Framework. For more information on available  
 244 mappings, please contact the developer of the practice, tool, or standard, or the appropriate Subsector  
 245 Coordinating Council.

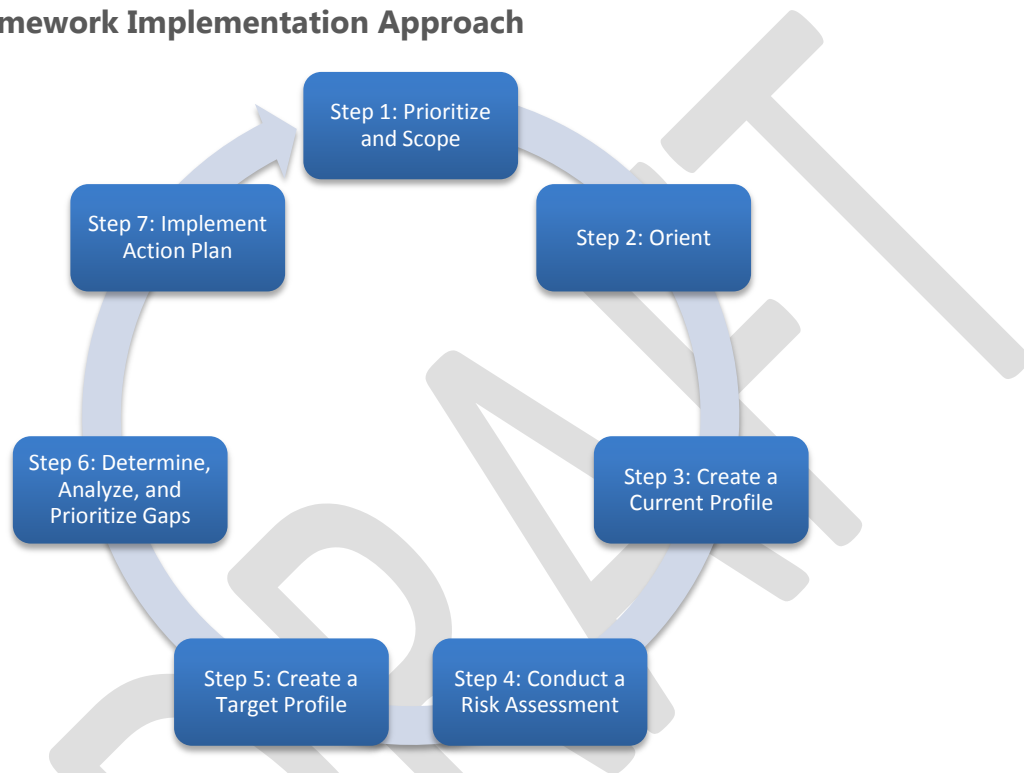

246 Organizations can map their current cybersecurity approach to the Framework elements, using tool-  
 247 specific mappings as a guide where possible. Mapping not only supports an organization's ability to  
 248 identify potential gaps that may need to be addressed, but it can also highlight where the Framework  
 249 does not adequately describe the organization's cybersecurity approach. A clear mapping provides a  
 250 translation between the organization's current practices and the Framework taxonomy, supporting  
 251 communication to external stakeholders. See "Step 3: Create a Current Profile" in Section 4 for guidance  
 252 about using mappings with the Framework.

## 253 4. APPROACH TO FRAMEWORK 254 IMPLEMENTATION

---

255 This section presents a standard approach for using the Framework (Figure 1) that is aligned with the  
256 seven-step process outlined in the [Framework document](#) (NIST 2014; section 3.2). This approach can be  
257 used along with any cybersecurity standard, energy-sector-specific tool, or commercial tool for  
258 managing cybersecurity risk—such as those described in Section 3 of this document—to facilitate  
259 Framework implementation. (As an example, Section 5 of this guidance document explains how  
260 Cybersecurity Capability Maturity Model [C2M2] implementation fits within this approach.)

261 **Figure 1: Framework Implementation Approach**

262

263

264 Each step is introduced by a table describing the step’s inputs, activities, and outputs. Additional  
265 explanation is provided below each table. A summary table of the inputs, activities, and outputs for  
266 each step is included in Appendix B.

267 Many energy sector organizations already have comprehensive risk management programs that allow  
268 for framing risk (i.e., establish the context for risk-based decisions), assessing risk, addressing identified  
269 risk, and monitoring risk on an ongoing basis. Many also use effective communications and an iterative  
270 feedback loop for continuous improvement (see the *Electricity Subsector Cybersecurity Risk  
271 Management Process Guideline* [RMP; DOE 2012b] for a possible risk management approach). For these  
272 organizations, the activities described in these seven steps are most likely already performed, and

273 implementing the Framework is largely a matter of describing and aligning or “translating” elements of  
 274 their current approach to the Framework Core and Implementation Tiers.

275 **Step 1: Prioritize and Scope**

Inputs	Activities	Outputs
1. Risk management strategy 2. Organizational objectives and priorities 3. Threat information	1. Organization determines where it wants to apply the Framework to evaluate and potentially guide the improvement of the organization’s cybersecurity capabilities	1. Framework usage scope

276 A risk management process typically includes a strategy addressing how to frame, assess, respond to,  
 277 and monitor risk. This strategy may be developed at the company/entity level for all of the company’s  
 278 organizations, or individual strategies may be developed at the organizational level. Regardless, the  
 279 applicable strategy explicitly and transparently describes the identified organizational risks that the  
 280 organization routinely uses to inform investment and operational decisions. This strategy should  
 281 recognize each organization’s contribution to the national security of critical energy infrastructure, and  
 282 includes both organization-specific and sector-wide objectives and priorities for risk management (see  
 283 the *Electricity Subsector Cybersecurity Risk Management Process Guideline* [RMP; DOE 2012b] for a  
 284 possible approach).

285 In this step, the organization decides how and where it wants to use the Framework (its Framework  
 286 usage scope)—whether in a subset of its operations, in multiple subsets of its operations, or for the  
 287 entire organization. This decision should be based on the organization’s risk management strategy,  
 288 organizational and critical infrastructure objectives and priorities, availability of resources, its current  
 289 risk environment, and other internal and external factors. Current threat information (e.g., information  
 290 from important vendors, communications from the Electricity and Oil and Natural Gas Information  
 291 Sharing and Analysis Centers [ISACs], or other threat advisories) may also help inform scoping decisions.

292 It is recommended that organizations using the Framework for the first time identify a small subset of  
 293 operations for initial Framework application to gain familiarity and experience with the Framework.  
 294 After this pilot activity, the organization can consider applying the Framework to a broader subset of  
 295 operations or to additional parts of the organization as appropriate.

296 **Step 2: Orient**

<b>Inputs</b>	<b>Activities</b>	<b>Outputs</b>
<ol style="list-style-type: none"> <li>1. Framework usage scope</li> <li>2. Risk management strategy</li> </ol>	<ol style="list-style-type: none"> <li>1. Organization identifies in-scope systems and assets (e.g., people, information, technology, and facilities) and the appropriate regulatory and informative references (e.g., cybersecurity and risk management standards, tools, methods, and guidelines)</li> </ol>	<ol style="list-style-type: none"> <li>1. In-scope systems and assets</li> <li>2. In-scope requirements (i.e., regulatory, company, organizational)</li> <li>3. In-scope cybersecurity and risk management standards, tools, methods, and guidelines</li> <li>4. Evaluation approach</li> </ol>

297 The organization identifies the systems, assets, requirements, and cybersecurity and risk management  
 298 approaches that are in scope. This includes standards and practices the organization already uses, and  
 299 could include additional standards and practices that the organization believes would help achieve its  
 300 critical infrastructure and business objectives for cybersecurity risk management. The organization's risk  
 301 management program will often already have identified and documented much of this information or  
 302 the program can help identify individual outputs. A good general rule is to initially focus on critical  
 303 systems and assets and then expand the focus to less critical systems and assets as resources permit.

304 The organization should also determine the evaluation approach it will use to identify its current  
 305 cybersecurity and risk management states. Organizations can use any of a number of evaluation  
 306 methods to identify their current cybersecurity approach and create a Current Profile. For example,  
 307 these include self-evaluations, where an organization may leverage its own resources and expertise, or  
 308 facilitated approaches, where the evaluation is performed by a third party.

309 **Step 3: Create a Current Profile**

<b>Inputs</b>	<b>Activities</b>	<b>Outputs</b>
<ol style="list-style-type: none"> <li>1. Evaluation approach</li> <li>2. In-scope systems and assets</li> <li>3. In-scope regulatory requirements</li> <li>4. In-scope cybersecurity and risk management standards, tools, methods, and guidelines</li> </ol>	<ol style="list-style-type: none"> <li>1. Organization identifies its current cybersecurity and risk management state</li> </ol>	<ol style="list-style-type: none"> <li>1. Current Profile</li> <li>2. Current Implementation Tier</li> </ol>

310 The organization creates a Current Profile and identifies its current Implementation Tier by mapping its  
 311 existing cybersecurity and risk management practices to specific descriptions in the [Framework](#)  
 312 [document](#) (NIST 2014). It is important to understand that the purpose of identifying a Current Profile is  
 313 not simply to create a map between organizational practices and Category and Subcategory outcomes,  
 314 but also to understand the degree to which those practices *achieve the outcomes* outlined by the  
 315 Framework.

316 To identify the Current Profile, the organization uses the evaluation approach identified in Step 2 to map  
 317 its existing cybersecurity approach and outcomes to the Category and Subcategory outcomes in  
 318 Appendix A of the Framework document (called the Framework Core). Organizations may already  
 319 perform these evaluations as part of risk assessment or have defined processes that can be leveraged to  
 320 identify their current state. For example, many organizations perform regular evaluations of their  
 321 cybersecurity programs through internal audits or similar activities. The outputs of those activities may  
 322 describe which practices are performed for in-scope systems and assets and can be used for this step.

323 The current Implementation Tier describes the degree of rigor and sophistication of the in-scope  
 324 cybersecurity risk management program. To identify the Implementation Tier, the organization maps its  
 325 current approach to the Implementation Tier descriptions in the Framework document (NIST 2014).  
 326 Implementation Tiers do not apply to the individual Functions and Categories and Subcategories  
 327 outcomes in the Framework Core; the organization identifies an Implementation Tier for the in-scope  
 328 cybersecurity and risk management program as a whole. Organizations may already be using tools and  
 329 processes or complying with industry standards that closely align with the Framework. Some industry  
 330 and standards organizations have begun to publish their own guidance to map existing standards and  
 331 tools to the Framework elements to facilitate implementation. (Section 5 of this guidance, for example,  
 332 maps the C2M2 to the Framework).

333 Table 4 provides an example of how a mapping can be used to create a Current Profile for a specific  
 334 Subcategory outcome (see Section PR.AC-3 of the [Framework document](#) [NIST 2014]) for three  
 335 organizations using three different approaches. A similar table could be built for Implementation Tiers,  
 336 keeping in mind that Tiers are focused at broader program level risk management. Note that the  
 337 examples in these tables are intended to be illustrative of the mapping concept and are unlikely to  
 338 address any specific organization’s particular approach. The level of specificity and granularity required  
 339 for a Profile to be useful will be unique to each organization.

340 **Table 4: Connecting Organizational Approach to Framework**

<b>Organization 1</b>			
<b>Internal Controls Approach</b>			
Function	Category	Subcategory	Profiles
			Current
<b>PROTECT (PR)</b>	<b>Access Control (PR.AC)</b>	<b>PR.AC-3:</b> Remote access is managed	<ul style="list-style-type: none"> <li>Dial-in access for vendor maintenance is enabled as required and disabled when maintenance window completes</li> <li>Remote access only authorized via encrypted VPN service</li> <li>Remote access activity logged and monitored</li> <li>Access to VPN service restricted to organization approved devices</li> <li>All unauthorized connection attempts to VPN are logged</li> </ul>

			<ul style="list-style-type: none"> <li>• Immediate disabling of VPN account upon employee termination</li> </ul>
--	--	--	--

**Organization 2**

**Standards Based Approach**

Function	Category	Subcategory	Profiles
			Current
<b>PROTECT (PR)</b>	<b>Access Control (PR.AC)</b>	<b>PR.AC-3:</b> Remote access is managed	<ul style="list-style-type: none"> <li>• NIST SP 800-53 Rev 4 AC-17</li> <li>• NIST SP 800-53 Rev 4 AC-17 (1)</li> <li>• NIST SP 800-53 Rev 4 AC-17 (2)</li> <li>• NIST SP 800-53 Rev 4 AC-19</li> <li>• NIST SP 800-53 Rev 4 AC-20</li> <li>• NIST SP 800-53 Rev 4 AC-20 (1)</li> </ul>

**Organization 3**

**Exception Approach**

Function	Category	Subcategory	Profiles
			Current
<b>PROTECT (PR)</b>	<b>Access Control (PR.AC)</b>	<b>PR.AC-3:</b> Remote access is managed	<ul style="list-style-type: none"> <li>• Not Applicable - No remote access available for in-scope assets and systems</li> </ul>

341 While the Framework provides broad coverage of the cybersecurity and risk management domains, it is  
 342 not all-inclusive, and the organization may have deployed standards, tools, methods, and guidelines that  
 343 achieve outcomes not defined by or referenced in the Framework. The Current Profile should identify  
 344 these practices as well. When appropriate, organizations should consider sharing these practices with  
 345 NIST to help strengthen and expand the Framework.

346 **Step 4: Conduct a Risk Assessment**

Inputs	Activities	Outputs
1. Framework usage scope 2. Risk management strategy 3. Organization-defined risk assessment approach 4. In-scope regulatory requirements 5. In-scope cybersecurity and risk management standards, tools, methods, and guidelines	1. Perform risk assessment for in-scope portion of the organization	1. Risk assessment reports

347 Organizations perform cybersecurity risk assessments to identify and evaluate cybersecurity risks and  
 348 determine which are outside of current tolerances. The outputs of cybersecurity risk assessment  
 349 activities assist the organization in developing its Target Profile and identifying a Target Implementation  
 350 Tier, which occurs in Step 5. (See the *Electricity Subsector Cybersecurity Risk Management Process*  
 351 *Guideline* [DOE 2012b] and *Integrating Electricity Subsector Failure Scenarios into a Risk Assessment*

352 *Methodology* [DOE 2013] for possible guidance on performing a cybersecurity risk assessment.) For  
 353 organizations that have a risk management program in place, this activity will be part of regular business  
 354 practice, and necessary records and information to make this determination may already exist.

355 **Step 5: Create a Target Profile**

Inputs	Activities	Outputs
1. Current Profile 2. Current Tier 3. Organizational objectives 4. Risk management strategy 5. Risk assessment reports	1. Organization identifies goals that will mitigate risk commensurate with the risk to organizational and critical infrastructure objectives	1. Target Profile 2. Target Tier

356 In creating a Target Profile, the organization should consider:

- 357 • Current risk management practices
- 358 • Current threat environment
- 359 • Legal and regulatory requirements
- 360 • Business and mission objectives
- 361 • Organizational constraints

362 The Target Profile identifies the desired Category and Subcategory outcomes and associated  
 363 cybersecurity and risk management standards, tools, methods, and guidelines that will mitigate  
 364 cybersecurity risks, commensurate with the risk to organizational and critical infrastructure security  
 365 objectives. As noted in Step 3, the Framework provides broad coverage of the cybersecurity and risk  
 366 management domains, but is not all-inclusive. The organization may need to deploy standards, tools,  
 367 methods, and guidelines that achieve outcomes not defined by the Framework. The Target Profile  
 368 should also identify these practices.

369 Table 5 provides an example of a Target Profile for a specific Subcategory outcome (PR.AC-3) for three  
 370 organizations using three different approaches. The ***bold and italicized*** text in the Target Profile  
 371 highlights where the organization has identified additional practices it desires to use to successfully  
 372 achieve an outcome based on its current risk environment and business and critical infrastructure  
 373 objectives. Organization 1 has determined that its current practices for managing remote access are not  
 374 adequate for addressing its unique risk environment, and identifies additional practices that are  
 375 required. Organization 2 comes to the same conclusion and identifies additional standards that it wants  
 376 to roll out across the in-scope organization. Organization 3 shows an organization whose Current Profile  
 377 is the same as the Target Profile for this Subcategory outcome. This will be the case when the standards,  
 378 tools, methods, and guidelines currently deployed by the organization meet its cybersecurity and risk  
 379 management requirements. While not included in an example, an organization may determine that a  
 380 current practice is no longer necessary or is inadequate and it might be omitted from the Target Profile.

381 In developing a Target Profile, organizations may take a broad approach—considering more effective  
382 and efficient risk management approaches across the entire in-scope organizations—rather than  
383 examining individual Categories and Subcategories.

384 In addition to the Target Profile, the organization selects a Target Implementation Tier that applies to  
385 the in-scope risk management process. The organization examines each Tier and selects its target (the  
386 “desired” state), using the same list of considerations above for the Target Profile. Once a Target  
387 Implementation Tier is selected, the organization identifies the cybersecurity practices and risk  
388 management activities necessary to achieve that target—considering their ability to meet organizational  
389 goals, feasibility to implement, and their ability to reduce cybersecurity risks to acceptable levels for  
390 critical assets and resources (i.e., those most important to achieving the organization’s business and  
391 critical infrastructure objectives).

392 Using its collection of cybersecurity and risk management standards, tools, methods, and guidelines, the  
393 organization documents these desired outcomes in the Target Profile and Target Implementation Tier.

394

DRAFT

395 **Table 5: Creating a Target Profile**

<b>Organization 1</b>					
<b>Internal Controls Approach</b>					
Function	Category	Subcategory	Profiles		
			Current		Target
PROTECT (PR)	Access Control (PR.AC)	PR.AC-3: Remote access is managed	<ul style="list-style-type: none"> <li>Dial-in access for vendor maintenance is enabled as required and disabled when maintenance window completes</li> <li>Remote access only authorized via encrypted VPN service</li> <li>Remote access activity logged and monitored</li> <li>Access to VPN service restricted to organization approved devices</li> <li>All unauthorized connection attempts to VPN are logged</li> <li>Immediate disabling of VPN account upon employee termination</li> </ul>		<ul style="list-style-type: none"> <li>Dial-in access for vendor maintenance is enabled as required and disabled when maintenance window completes</li> <li>Remote access only authorized via encrypted VPN service</li> <li>Remote access activity logged and monitored</li> <li>Access to VPN service restricted to organization approved devices</li> <li>All unauthorized connection attempts to VPN are logged</li> <li>Immediate disabling of VPN account upon employee termination</li> <li><b>Supervisor signature required before VPN account issued</b></li> <li><b>Bi-annual review of authorized VPN account list</b></li> </ul>

PROTECT (PR)	Access Control (PR.AC)	PR.AC-3: Remote access is managed	<ul style="list-style-type: none"> <li>NIST SP 800-53 Rev 4 AC-17</li> <li>NIST SP 800-53 Rev 4 AC-17 (1)</li> <li>NIST SP 800-53 Rev 4 AC-17 (2)</li> <li>NIST SP 800-53 Rev 4 AC-19</li> <li>NIST SP 800-53 Rev 4 AC-20</li> <li>NIST SP 800-53 Rev 4 AC-20 (1)</li> </ul>		<ul style="list-style-type: none"> <li>NIST SP 800-53 Rev 4 AC-17</li> <li>NIST SP 800-53 Rev 4 AC-17 (1)</li> <li>NIST SP 800-53 Rev 4 AC-17 (2)</li> <li><b>NIST SP 800-53 Rev 4 AC-17 (3)</b></li> <li><b>NIST SP 800-53 Rev 4 AC-17 (4)</b></li> <li>NIST SP 800-53 Rev 4 AC-19</li> <li><b>NIST SP 800-53 Rev 4 AC-19 (5)</b></li> <li>NIST SP 800-53 Rev 4 AC-20</li> <li>NIST SP 800-53 Rev 4 AC-20 (1)</li> <li><b>NIST SP 800-53 Rev 4 AC-20 (2)</b></li> </ul>
<b>Organization 3</b>					
<b>Exception Approach</b>					
Function	Category	Subcategory	Profiles		
			Current		Target
PROTECT (PR)	Access Control	PR.AC-3: Remote	<ul style="list-style-type: none"> <li>Not Applicable - No remote access available for in-scope assets and systems</li> </ul>		<ul style="list-style-type: none"> <li>Not Applicable - No remote access available to in-scope assets and systems</li> </ul>

	<b>(PR.AC)</b>	access is managed	
--	----------------	-------------------	--

396 *Bold and italicized text highlights the differences between the current and target approaches.*

397 **Step 6: Determine, Analyze, and Prioritize Gaps**

Inputs	Activities	Outputs
<ol style="list-style-type: none"> <li>1. Current Profile</li> <li>2. Current Tier</li> <li>3. Target Profile</li> <li>4. Target Tier</li> <li>5. Organizational objectives</li> <li>6. Impact to critical infrastructure</li> <li>7. Gaps and potential consequences</li> <li>8. Organizational constraints</li> <li>9. Risk management strategy</li> <li>10. Risk assessment reports</li> </ol>	<ol style="list-style-type: none"> <li>1. Analyze gaps between current state and Target Profile in organization’s context</li> <li>2. Evaluate potential consequences from gaps</li> <li>3. Determine which gaps need attention</li> <li>4. Identify actions to address gaps</li> <li>5. Perform cost-benefit analysis (CBA) on actions</li> <li>6. Prioritize actions (CBA and consequences)</li> <li>7. Plan to implement prioritized actions</li> </ol>	<ol style="list-style-type: none"> <li>1. Prioritized gaps and potential consequences</li> <li>2. Prioritized implementation plan</li> </ol>

398 The organization evaluates its Current Profile and Implementation Tier against its Target Profile and  
 399 Target Implementation Tier and identifies any gaps. It is important to include inputs from all appropriate  
 400 organizational stakeholders to ensure that business and critical infrastructure objectives are considered  
 401 in the prioritization process.

402 A gap exists when there is a desired Category or Subcategory outcome in the Target Profile or program  
 403 characteristic in the Target Implementation Tier that is not currently achieved by the organization’s  
 404 existing cybersecurity and risk management approach, as well as when current practices do not achieve  
 405 the outcome to the degree of satisfaction required by the organization’s risk management strategy. The  
 406 ***bold and italicized*** text in Table 6 provides some very simple examples where organizations may identify  
 407 additional practices or standards to achieve outcomes to the degree required by the organization’s risk  
 408 tolerances.

409 As noted, the identified Framework Category and Subcategory outcomes may not address all of the  
 410 organization’s cybersecurity risks. However, the Target Profile should include all applicable cybersecurity  
 411 practices, tools, standards, and guidelines that will be used by the organization to address cybersecurity  
 412 risk commensurate with the risk to organizational and critical infrastructure objectives, even if those go  
 413 beyond the outcomes identified in the Framework.

414 **Table 6: Identifying Implementation Gaps**

**Organization 1  
Internal Controls Approach**

**Organization 2  
Standards Based Approach**

Function	Category	Subcategory	Profiles		
			Current	Target	Gaps
PROTECT (PR)	Access Control (PR.AC)	PR.AC-3: Remote access is managed	<ul style="list-style-type: none"> <li>NIST SP 800-53 Rev 4 AC-17</li> <li>NIST SP 800-53 Rev 4 AC-17 (1)</li> <li>NIST SP 800-53 Rev 4 AC-17 (2)</li> <li>NIST SP 800-53 Rev 4 AC-19</li> <li>NIST SP 800-53 Rev 4 AC-20</li> <li>NIST SP 800-53 Rev 4 AC-20 (1)</li> </ul>	<ul style="list-style-type: none"> <li>NIST SP 800-53 Rev 4 AC-17</li> <li>NIST SP 800-53 Rev 4 AC-17 (1)</li> <li>NIST SP 800-53 Rev 4 AC-17 (2)</li> <li>NIST SP 800-53 Rev 4 AC-17 (3)</li> <li>NIST SP 800-53 Rev 4 AC-17 (4)</li> <li>NIST SP 800-53 Rev 4 AC-19</li> <li>NIST SP 800-53 Rev 4 AC-19 (5)</li> <li>NIST SP 800-53 Rev 4 AC-20</li> <li>NIST SP 800-53 Rev 4 AC-20 (1)</li> <li>NIST SP 800-53 Rev 4 AC-20 (2)</li> </ul>	<ul style="list-style-type: none"> <li><b>NIST SP 800-53 Rev 4 AC-17 (3)</b></li> <li><b>NIST SP 800-53 Rev 4 AC-17 (4)</b></li> <li><b>NIST SP 800-53 Rev 4 AC-19 (5)</b></li> <li><b>NIST SP 800-53 Rev 4 AC-20 (2)</b></li> </ul>

**Organization 3  
Exception Approach**

Function	Category	Subcategory	Profiles		
			Current	Target	Gaps
<b>PROTECT (PR)</b>	<b>Access Control (PR.AC)</b>	<b>PR.AC-3:</b> Remote access is managed	<ul style="list-style-type: none"> <li>• Not Applicable - No remote access available for in-scope assets and systems</li> </ul>	<ul style="list-style-type: none"> <li>• Not Applicable - No remote access available for in-scope assets and systems</li> </ul>	<ul style="list-style-type: none"> <li>• <b><i>None</i></b></li> </ul>

415 *Bold and italicized text indicates gaps between the Current and Target Profiles.*

416

417 After identifying both types of gaps (Profile and Tier), the organization determines the potential  
 418 consequences of failing to address those gaps. A mitigation priority should then be assigned to all  
 419 identified gaps. Prioritization should consider current risk management practices, the current threat  
 420 environment, legal and regulatory requirements, business and mission objectives, and any  
 421 organizational constraints deemed relevant.

422 Once each gap is assigned a mitigation priority, the organization identifies potential mitigation activities  
 423 and performs a cost-benefit analysis (CBA) on those potential actions. Where applicable, a CBA should  
 424 consider the cost of possible regulatory fines or sanctions. The organization develops a plan of  
 425 prioritized mitigation actions—based on available resources, business needs, and current risk  
 426 environment—to move from the current state to the target state. If the organization is at its target  
 427 state, it would seek to maintain its security posture as the risk landscape changes.

428 **Step 7: Implement Action Plan**

Inputs	Activities	Outputs
1. Prioritized implementation plan	1. Implement actions by priority 2. Track progress against plan 3. Monitor and evaluate progress against key risks, metrics, and performance indicators 4. Report progress	1. Project tracking data 2. New security measures implemented

429 The organization executes the implementation plan and tracks its progress over time, ensuring that gaps  
 430 are closed and risks are monitored.

431 **4.1 SUMMARY OF SEVEN-STEP APPROACH**

432 This implementation approach can help organizations to use the Framework to establish a strong  
 433 cybersecurity program or to validate the effectiveness of an existing program. It enables organizations to  
 434 map their existing program to the Framework, identify improvements, and communicate results. It can  
 435 incorporate and align with processes and tools the organization is already using or plans to use.

436 This approach, as Figure 1 showed, is intended to be a continuous process, repeated according to  
437 organization-defined criteria (such as a specific period of time or a specific type of event) to address the  
438 evolving risk environment. Implementation of this approach should include a plan to communicate  
439 progress to appropriate stakeholders, such as senior management. Ideally this process would be  
440 integrated into an organization's risk management program.

441

DRAFT

## 442 5. CYBERSECURITY CAPABILITY MATURITY 443 MODEL (C2M2) APPROACH TO 444 FRAMEWORK IMPLEMENTATION

---

445 The Cybersecurity Capability Maturity Model (C2M2) was developed by the Department of Energy (DOE)  
446 and contributors from industry and other government agencies to help critical infrastructure  
447 organizations evaluate and potentially improve their cybersecurity practices. As this section  
448 demonstrates, using the C2M2 also provides a means for any energy sector organization to implement  
449 the Framework.

450 The C2M2 includes a self-evaluation toolkit that guides each organization to identify its cybersecurity  
451 and risk management practices, map them to specific levels of maturity within the model, set target  
452 maturity levels, and identify gaps and potential practices that allow the organization to mature over  
453 time. The C2M2 covers *all* of the practices of the Framework Core and Tiers, and the C2M2 and its  
454 supporting toolkit guide an organization to identify its Current Profile and to establish a Target Profile.

455 This section outlines the benefits of using the tool-specific (vs. general) approach to the Framework,  
456 briefly describes the C2M2 in further detail, and demonstrates how it can support the Framework in  
457 seven steps. A complete, detailed mapping of the C2M2 to the Framework is provided in Appendix A.

### 458 5.1 BENEFITS OF THE C2M2 APPROACH TO FRAMEWORK 459 IMPLEMENTATION

460 In addition to providing an industry-developed, step-by-step process that aligns well with that of the  
461 Framework, the C2M2 offers the following benefits to energy sector owners and operators interested in  
462 demonstrating their implementation of the Framework:

- 463 • **A common goal:** The purpose of both the Framework and the C2M2 is to help critical  
464 infrastructure organizations evaluate and potentially improve their cybersecurity capabilities.
- 465 • **Widespread use:** The C2M2 has already been adopted by many energy sector entities, which  
466 enables organizations to voluntarily share knowledge and best practices using common  
467 terminology.
- 468 • **Supports benchmarking across the sector:** Broad use of the model by each subsector could  
469 support benchmarking of the sector's cybersecurity capabilities.
- 470 • **Tailored sector-specific risk mitigation:** The C2M2 has two variants that have each been  
471 specifically tailored to address concerns of either the Electricity Subsector or the Oil and Natural  
472 Gas Subsector, using sector-specific analysis of cyber risk mitigation, including descriptive  
473 guidance specific to energy sector control systems.
- 474 • **Descriptive guidance for the Framework:** The C2M2 provides descriptive rather than  
475 prescriptive guidance at a high level of abstraction. This helps organizations of all types,

- 476 structures, and sizes to map C2M2 practices to Framework Subcategories. Also, the  
 477 recommended process for using the C2M2 parallels the Framework approach of setting a target,  
 478 identifying gaps, and addressing gaps.
- 479 • **Complete coverage of Framework practices:** The included mapping of C2M2 practices to  
 480 Subcategories and Tiers shows that the C2M2 adequately addresses all the objectives of the  
 481 Framework.
  - 482 • **Progressive maturity levels:** The C2M2 uses maturity indicator levels that can help an  
 483 organization track measurable, incremental progression in the maturity of cybersecurity  
 484 practices.
  - 485 • **Self-evaluation toolkit:** The C2M2 toolkit enables step-by-step self-evaluations using the C2M2,  
 486 with macro-based scoring and reporting of results. These resources help make periodic re-  
 487 evaluation and measuring progress against goals more feasible.

## 488 5.2 C2M2 OVERVIEW

489 The C2M2 is organized around ten *domains* that cover the range of cybersecurity and risk management  
 490 practices used in the energy sector:

491 **Table 7. C2M2 Domains and Abbreviations**

Domain	Abbreviation
Asset, Change, and Configuration Management	ACM
Cybersecurity Program Management	CPM
Supply Chain and External Dependencies Management	EDM
Identity and Access Management	IAM
Event and Incident Response, Continuity of Operations	IR
Information Sharing and Communications	ISC
Risk Management	RM
Situational Awareness	SA
Threat and Vulnerability Management	TVM
Workforce Management	WM

492

493 Using the C2M2 toolkit, organizations self-evaluate their current practices within each domain. Each  
 494 domain is divided into a number of objectives that support the domain. (For example, the Risk  
 495 Management domain comprises three objectives: Establish Cybersecurity Risk Management Strategy,  
 496 Manage Cybersecurity Risk, and Management Activities.) *Objectives* are each made up of one or more

497 *practices* that demonstrate the organization is effectively meeting the objective, commensurate with  
498 their specific level of risk.

499 Each domain has one consistent objective—Management Activities—which describes the activities the  
500 organization performs to *institutionalize* the domain-specific practices throughout the organization.  
501 Institutionalization refers to the extent to which a practice or activity is ingrained into the way an  
502 organization operates.

### 503 **Achieving and Demonstrating Maturity**

504 Each domain in the C2M2 includes four maturity indicator levels (MIL), labeled as MIL0 (Not Performed)  
505 through MIL3 (Managed). Organizations progressively advance in maturity level by improving: 1) the  
506 completeness, thoroughness, or level of development of the practices in a given domain, and 2) how  
507 ingrained or institutionalized the practices are in the organization’s operations and way of conducting  
508 business. Organizations achieve a MIL when they perform both the domain-specific cybersecurity  
509 objectives and practices and the Management Activities of that MIL. Organizations can establish a target  
510 MIL for each domain to guide their cybersecurity improvement.

### 511 **Tiers vs. Maturity Indicator Levels (MILs)**

512 As shown in Table 12 of Appendix A, there is some correspondence between Framework Tier  
513 characteristics and C2M2 practices of various domains and MILs. But Tiers and MILs have a different  
514 structure and purpose. Tiers “describe the degree to which an organization’s cybersecurity risk  
515 management practices... [are] risk and threat aware, repeatable, and adaptive” (NIST 2014, p. 5). Tiers  
516 therefore describe the practices as a whole. C2M2 MILs independently describe the individual maturity  
517 of each domain; each domain has a set of MIL3 practices and a set of MIL2 practices, and most domains  
518 have a set of MIL1 practices. An organization could be at MIL3 in the Identity and Access Management  
519 domain, for example, and at MIL1 in the Situational Awareness domain. Organizations using the C2M2  
520 can use the mapping in Table 12 to identify their Framework Tier and also use the MILs for domain-  
521 specific metrics.

### 522 **Subsector-Specific C2M2 Variants**

523 There are currently three variants of the C2M2. The Electricity Subsector Cybersecurity Capability  
524 Maturity Model (ES-C2M2; DOE 2012a) and Oil and Natural Gas Cybersecurity Capability Maturity Model  
525 (ONG-C2M2; DOE 2014b) contain guidance and examples pertinent to those subsectors. The more  
526 general Cybersecurity Capability Maturity Model (C2M2; DOE 2014a) can be used by organizations  
527 regardless of their sector.

## 528 **5.3 LEVERAGING THE C2M2 TO SUPPORT FRAMEWORK** 529 **IMPLEMENTATION**

530 This section explains how using the C2M2 addresses each of the steps in the Framework implementation  
531 approach described in Section 4. Details specific to the C2M2 are shown in ***bold and italicized***. Several of

532 the steps refer to the *Cybersecurity Capability Maturity Model Facilitator Guide* (DOE 2014c), which can  
533 be downloaded from the DOE website, and elements of the C2M2 toolkit, which is available by request.<sup>1</sup>

534 A C2M2 self-evaluation is an integral activity in using the C2M2 to achieve the goals of the Framework.  
535 *The C2M2 Facilitator Guide* contains detailed instructions for conducting a C2M2 self-evaluation  
536 workshop and for understanding and benefitting from its results. An evaluation survey and scoring and  
537 reporting mechanisms used in the self-evaluation are provided in the C2M2 toolkit.

## 538 Step 1: Prioritize and Scope

Inputs	Activities	Outputs
1. Risk management strategy 2. Organizational objectives and priorities 3. Threat information 4. <b>C2M2</b>	1. Organization determines the scope of operations that will use the <b>C2M2</b> to evaluate and potentially improve the organization's cybersecurity capabilities	1. <b>Function list</b>

539 Organizations begin a C2M2 self-evaluation by determining the scope—the subset of the operations of  
540 the organization that will be evaluated. Section 2.6 of the *C2M2 Facilitator Guide* provides guidance for  
541 scoping.

542 In the C2M2, each organizational subset that will be evaluated is referred to as a *function*. The ES-C2M2  
543 and ONG-C2M2 each have some predefined subsector-specific functions and scoping guidance.  
544 However, the C2M2 is flexible enough to be used for whatever scope an organization chooses for  
545 Framework implementation, including systems or technology areas that cross organizational  
546 boundaries. A C2M2 *function* could be the same as *organization* as defined in Section 2.1.

---

<sup>1</sup> The C2M2 Toolkit may be obtained by sending a request to [C2M2@doe.gov](mailto:C2M2@doe.gov).

547 **Step 2: Orient**

Inputs	Activities	Outputs
<ol style="list-style-type: none"> <li>1. <b>Function list</b></li> <li>2. Risk management strategy</li> </ol>	<ol style="list-style-type: none"> <li>1. <b>Based on selected functions</b>, the organization identifies the in-scope: <ul style="list-style-type: none"> <li>– assets (e.g., people, information, technology, and facilities)</li> <li>– regulatory and informative references (e.g., cybersecurity and risk management standards, tools, methods, and guidelines)</li> </ul> </li> </ol>	<ol style="list-style-type: none"> <li>1. In-scope systems and assets</li> <li>2. In-scope requirements (i.e., regulatory, company, organizational)</li> <li>3. In-scope cybersecurity and risk management standards, tools, methods, and guidelines</li> <li>4. Evaluation approach: <b>C2M2 self-evaluation</b></li> </ol>

548 Once a scoping decision is made, the organization identifies the information, technology, people, and  
549 facilities covered by the scope, the applicable regulatory requirements, and any cybersecurity and risk  
550 management standards, tools, methods, and guidelines in use.

551 **Step 3: Create a Current Profile**

Inputs	Activities	Outputs
<ol style="list-style-type: none"> <li>1. <b>C2M2 self-evaluation</b></li> <li>2. In-scope systems and assets</li> <li>3. In-scope regulatory requirements</li> <li>4. In-scope cybersecurity and risk management standards, tools, methods, and guidelines</li> </ol>	<ol style="list-style-type: none"> <li>1. <b>Conduct C2M2 self-evaluation workshop with appropriate attendees</b></li> </ol>	<ol style="list-style-type: none"> <li>1. <b>C2M2 Evaluation Scoring Report</b></li> <li>2. Current Implementation Tier</li> </ol>

552 The C2M2 is typically applied through a facilitated, one-day workshop that includes key individuals  
553 representing all in-scope assets and functions. The C2M2 self-evaluation workshop results in a Scoring  
554 Report that can serve as a Current Profile. Through open dialog and consensus, survey workshop  
555 participants answer questions in the evaluation survey about practices in each domain. Responses are  
556 chosen from a four-point scale: Not Implemented, Partially Implemented, Largely Implemented, or Fully  
557 Implemented. Using the toolkit, the C2M2 Evaluation Scoring Report is generated from the survey  
558 results. The report presents results in two views: the Objective view, which shows practice question  
559 responses by each domain and its objectives, and the Domain view, which shows responses by all

560 domains and MILs. Figure 2 gives an example of results for the Risk Management domain in the  
 561 Objective view, and Figure 3 gives an example of results in the Domain view.

562 Red sectors in a doughnut chart show a count of the number of questions that received survey  
 563 responses of “Not Implemented” (dark red) or “Partially Implemented” (light red). The green sectors  
 564 show the number of questions that received responses of “Largely Implemented” (light green) or “Fully  
 565 Implemented” (dark green).

566 **Figure 2: Objective View Example**

567  
 568 In the Objective view, the number in the center of the doughnut indicates the number of questions for  
 569 the objective named below the doughnut chart.

570 **Figure 3: Domain View Example**

571  
 572 In the Domain view, the number in the center of the doughnut indicates the cumulative number of  
 573 questions that must be answered “Largely Implemented” or “Fully Implemented” to achieve that MIL for  
 574 that domain. For the full list of domain names and abbreviations, see Table 7.

575 **Step 4: Conduct a Risk Assessment**

Inputs	Activities	Outputs
<ol style="list-style-type: none"> <li>1. <b>Function list</b></li> <li>2. Risk management strategy</li> <li>3. Organization-defined risk assessment approach</li> <li>4. In-scope regulatory requirements</li> <li>5. In-scope cybersecurity and risk management standards, tools, methods, and guidelines</li> <li>6. <b>C2M2 Evaluation Scoring Report</b></li> </ol>	<ol style="list-style-type: none"> <li>1. Perform risk assessment <b>for each function in the function list</b></li> </ol>	<ol style="list-style-type: none"> <li>1. Risk assessment reports <b>for each of the functions</b></li> </ol>

576 The C2M2 recommends that organizations use the model as part of a continuous enterprise risk  
577 management process that includes risk assessments (C2M2 2014, p. 4). Results of the risk assessment  
578 are used as input in all of the rest of the C2M2 implementation steps. Both the C2M2 and the  
579 Framework identify risk assessment as an important practice. Organizations can also look to the  
580 *Electricity Subsector Cybersecurity Risk Management Process Guideline* for additional guidance for this  
581 activity (DOE 2012b).

582 **Step 5: Create a Target Profile**

Inputs	Activities	Outputs
<ol style="list-style-type: none"> <li>1. <b>C2M2 Evaluation Scoring Report</b></li> <li>2. Current Tier</li> <li>3. Organizational objectives</li> <li>4. Risk management strategy</li> <li>5. Risk assessment reports</li> </ol>	<ol style="list-style-type: none"> <li>1. Organization identifies <b>MIL and practice-specific</b> goals that will mitigate risk commensurate with the risk to organizational and critical infrastructure objectives</li> </ol>	<ol style="list-style-type: none"> <li>1. <b>C2M2</b> Target Profile</li> <li>2. Target Tier</li> </ol>

583 The C2M2 Evaluation Scoring Report highlights potential areas for improvement. For example, within  
584 any domain, practices that represent achievement of MIL1 are prerequisites to practices that allow  
585 achievement of MIL2. All practices must be present to achieve the next MIL. The Evaluation Scoring

586 Report may give some initial insights for the Target Profile by drawing attention to the absence of  
 587 qualifying practices at the lower MILs. The report also includes a “Summary of Identified Gaps” table,  
 588 which lists the survey questions that were answered either “Partially Implemented” or “Not  
 589 Implemented,” and is useful in setting a Target Profile.

590 The risk assessment can be used along with the Evaluation Scoring Report to identify target practices  
 591 and MILs. Some practices may appear to be necessary based on the Domain view to reach the next MIL,  
 592 but may not make sense for the organization based on its risk profile. Each organization determines the  
 593 target MIL and practices that make sense for each domain.

594 With either method, an organization can use the mapping of C2M2 practices to the Framework Core  
 595 Subcategories (in Table 11 in Appendix A) and the mapping of C2M2 practices to the Tier characteristics  
 596 (in Table 12 in Appendix A) to compare its Target Profile to the Framework and possibly make  
 597 adjustments to its Target Profile.

598 For example, Company A has decided to include only MIL1 Threat and Vulnerability Management (TVM)  
 599 practices in its Target Profile. Company A then highlights all its selected practices on Table 11. This  
 600 reveals that no MIL1 C2M2 practices address the Framework Subcategory ID.RA-4, as shown in Table 8.  
 601 Company A decides that based on its current risk management strategy, the ID.RA-4 practice (identifying  
 602 potential business impacts and likelihoods of cybersecurity risks) is a priority, so it adds the MIL2  
 603 practices TVM-1d and TVM-1f to its Target Profile.

604 **Table 8. Example C2M2 Mapping**

Function	Category	Subcategory	C2M2 Practices		
			MIL1	MIL2	MIL3
<b>IDENTIFY (ID)</b>	<b>Risk Assessment (RA):</b> The organization understands the cybersecurity risk to organizational operations (including mission, functions, image, or reputation), organizational assets, and individuals.	<b>ID.RA-4:</b> Potential business impacts and likelihoods are identified		TVM-1d TVM-1f	TVM-1i

605

606 **Mapping of Tier Characteristics to C2M2 Practices**

607 Framework Implementation Tiers are associated with the overall robustness of an organization’s risk  
 608 management process and are not directly tied with individual Functions, Categories, or Subcategories.  
 609 At face value, it may seem difficult to map Framework Tiers to C2M2 domains or practices. However,  
 610 using the C2M2 practices organized by maturity level, and using the C2M2 Risk Management domain in  
 611 particular, organizations can map Tier characteristics to similar C2M2 practices, as shown in Table 12 in  
 612 Appendix A. Table 9 shows one mapping example from Framework Implementation Tier 3:

613 **Table 9. C2M2 Mapping Example from Framework Implementation Tier 3**

Tier Category	Characteristic	C2M2 Domain	C2M2 Practice
Risk Management Process	The organization’s risk management practices are formally approved and expressed as policy.	Risk Management	Risk management activities are guided by documented policies or other organizational directives.

614

615 The C2M2 and the Table 12 mapping thus can help organizations gauge their progress against the  
 616 Framework’s recommended cybersecurity risk management capabilities as described in Implementation  
 617 Tiers.

618 For example, after defining a tentative Target Profile, Company B highlights its C2M2 practices in Table  
 619 12. Company B can then see that it can achieve Implementation Tier 2, “Risk Informed,” by adding two  
 620 C2M2 Risk Management practices to its Target Profile: RM-3a, “Documented practices are followed for  
 621 risk management activities,” and RM-3b, “Stakeholders for risk management activities are identified and  
 622 involved.” Company B decides that, while this goal is worthwhile, its Target Profile achieves the  
 623 objectives of its current risk management strategy, and so it chooses not to add the two practices to the  
 624 Target Profile.

625 **Step 6: Determine, Analyze, and Prioritize Gaps**

Inputs	Activities	Outputs
<ol style="list-style-type: none"> <li>1. <b>C2M2 Evaluation Scoring Report</b></li> <li>2. Current Tier</li> <li>3. <b>C2M2</b> Target Profile</li> <li>4. Target Tier</li> <li>5. Organizational objectives</li> <li>6. Impact to critical infrastructure</li> <li>7. Gaps and potential consequences</li> <li>8. Organizational constraints</li> <li>9. Risk management strategy</li> <li>10. Risk assessment reports</li> </ol>	<ol style="list-style-type: none"> <li>1. Analyze gaps between current state and Target Profile in organization’s context</li> <li>2. Evaluate potential consequences from gaps</li> <li>3. Determine which gaps need attention</li> <li>4. Identify actions to address gaps</li> <li>5. Perform cost-benefit analysis (CBA) on actions</li> <li>6. Prioritize actions (CBA and consequences)</li> <li>7. Plan to implement prioritized actions</li> </ol>	<ol style="list-style-type: none"> <li>1. Prioritized gaps and potential consequences</li> <li>2. Prioritized implementation plan</li> </ol>

626 The C2M2 Self-Evaluation Scoring Report enables organizations to identify gaps between the Current  
 627 Profile and the Target Profile. Section 4.3.2 of the *C2M2 Facilitator Guide* [DOE 2014c] provides  
 628 guidance on how to plan and prioritize the actions needed to address gaps and achieve the Target  
 629 Profile. Prioritization should consider how gaps affect organizational objectives and the relative  
 630 criticality of those objectives; the cost of implementing the target practices; and the availability of  
 631 resources to implement the practices.

632 The organization should identify risks that could arise as a result of gaps that are not addressed, and  
 633 decide whether those gaps can be mitigated in other ways. The organization may choose to accept and  
 634 manage such risks over time. The priority of unresolved gaps can also be reconsidered if C2M2 self-  
 635 evaluations are conducted periodically.

636 **Step 7: Implement Action Plan**

Inputs	Activities	Outputs
1. Prioritized implementation plan	1. Implement actions by priority 2. Track progress against plan 3. Re-evaluate periodically or in response to major change	1. Project tracking data

637

638

639

## 6. ALIGNMENT WITH OTHER SECTORS

---

640  
641  
642

DOE and the private sector stakeholders recognize that many organizations operate in multiple critical infrastructure sectors and as a result need alignment between the guidance developed by overlapping Sector-Specific Agencies and associated cybersecurity approaches.

643  
644  
645

DOE is actively engaged with government partners from different sectors to ensure diligence with regard to cross-sector overlaps. As different sectors increase their implementation of the Framework, this guidance may be updated or supplemented to harmonize framework use across different sectors.

646

## 649 APPENDIX A: MAPPING OF C2M2 TO THE 650 FRAMEWORK

---

651 As discussed in Section 5 of this guidance, energy sector organizations using the C2M2 may want to map  
652 their C2M2 practices to the Framework Core and Implementation Tiers to guide their decisions about  
653 Target Profiles or to demonstrate their implementation of the Framework. The following two-part  
654 mapping—with Table 11 for the Framework Core and the C2M2 practices and Table 12 for the  
655 Implementation Tiers and the C2M2 practices—provides extensive detail for organizations to use to map  
656 their practices, or to simply learn more about how the C2M2 practices meet the intent of the  
657 Framework.

658 The mappings in Table 11 and Table 12 collectively present a comprehensive view of how the C2M2  
659 complements the Framework. It is possible that an organization that performs C2M2 practices mapped  
660 to a specific framework outcome may determine that some C2M2 practices do not satisfy the outcome  
661 to a degree required by that organization. Organizations utilizing this mapping should therefore review it  
662 and ensure that it aligns with their needs.

663 C2M2 practices are denoted by the domain abbreviation, a hyphen, the objective number, and the  
664 practice letter. For example, “ACM-1a” denotes practice A in Objective 1 of the Asset, Change, and  
665 Configuration Management domain. The domain abbreviations are listed in Table 10.

666 **Table 10: C2M2 Domains and Abbreviations**

Domain	Abbreviation
Asset, Change, and Configuration Management	ACM
Cybersecurity Program Management	CPM
Supply Chain and External Dependencies Management	EDM
Identity and Access Management	IAM
Event and Incident Response, Continuity of Operations	IR
Information Sharing and Communications	ISC
Risk Management	RM
Situational Awareness	SA
Threat and Vulnerability Management	TVM
Workforce Management	WM

667

			MIL 1	MIL 2	MIL3
		<b>PR.IP-8:</b> Effectiveness of protection technologies is shared with appropriate parties	ISC 1a ISC-1b	ISC-1c ISC-1d ISC-1e ISC-1f ISC-1g ISC-2b	ISC-1h ISC-1i ISC-1j ISC-1k ISC-1l
		<b>PR.IP-9:</b> Response plans (Incident Response and Business Continuity) and recovery plans (Incident Recovery and Disaster Recovery) are in place and managed	IR-4c	IR-3e IR-3f IR-4d IR-4f IR-5a IR-5b IR-5c IR-5d RM-1a RM-1b TVM-1d	IR-3k IR-3m IR-4i IR-4j IR-5e IR-5f IR-5g IR-5h IR-5i RM-1c
		<b>PR.IP-10:</b> Response and recovery plans are tested		IR-3e IR-4f	IR-3k IR-4i IR-4j
		<b>PR.IP-11:</b> Cybersecurity is included in human resources practices (e.g., deprovisioning, personnel screening)	WM-2a WM-2b	WM-2c WM-2d	WM-2e WM-2f WM-2g WM-2h
		<b>PR.IP-12:</b> A vulnerability management plan is developed and implemented		TVM-2d TVM-2e	TVM-3e TVM-3f
		<b>PROTECT (PR)</b>	<b>Maintenance (MA):</b> Maintenance and repairs of industrial control and information system components is performed consistent with policies and	<b>PR.MA-1:</b> Maintenance and repair of organizational assets is performed and logged in a timely manner, with approved and controlled tools	IAM-2a

Energy Sector Cybersecurity Framework Implementation Guidance | Mapping of C2M2 to the Framework

Function	Category	Subcategory	C2M2 Practices		
			MIL 1	MIL 2	MIL3
	procedures.	<b>PR.MA-2:</b> Remote maintenance of organizational assets is approved, logged, and performed in a manner that prevents unauthorized access	SA-1a IR-1c IAM-2a IAM-2b IAM-2c	IAM-2d IAM-2e IAM-2f	IAM-2g IAM-2h IAM-2i
	<b>Protective Technology (PT):</b> Technical security solutions are managed to ensure the security and resilience of systems and assets, consistent with related policies, procedures, and agreements.	<b>PR.PT-1:</b> Audit/log records are determined, documented, implemented, and reviewed in accordance with policy	SA-1a SA-2a	SA-1b SA-1c SA-2e SA-4a	SA-1d SA-1e SA-3d SA-4e
		<b>PR.PT-2:</b> Removable media is protected and its use restricted according to policy	IAM-2a IAM-2b TVM-1c	IAM-2c	IAM-2e IAM-3f TVM-1i
		<b>PR.PT-3:</b> Access to systems and assets is controlled, incorporating the principle of least functionality	IAM-2a IAM-2b IAM-2c	IAM-2d IAM-2e IAM-2f	IAM-2g IAM-2h IAM-2i
		<b>PR.PT-4:</b> Communications and control networks are protected	CPM-3a	CPM-3b CPM-3c	CPM-3d
<b>DETECT (DE)</b>	<b>Anomalies and Events (AE):</b> Anomalous activity is detected in a timely manner and the potential impact of events is understood.	<b>DE.AE-1:</b> A baseline of network operations and expected data flows for users and systems is established and managed	SA-2b	SA-2e	

Function	Category	Subcategory	C2M2 Practices		
			MIL 1	MIL 2	MIL3
		<b>DE.AE-2:</b> Detected events are analyzed to understand attack targets and methods			IR-2i IR-3h
		<b>DE.AE-3:</b> Event data are aggregated and correlated from multiple sources and sensors		IR-1e	IR-1f IR-2i
		<b>DE.AE-4:</b> Impact of events is determined	IR-2b	IR-2d	IR-2g
		<b>DE.AE-5:</b> Incident alert thresholds are established		IR-2d TVM-1d SA-2d	IR-2g RM-2j
		<b>Security Continuous Monitoring (CM):</b> The information system and assets are monitored at discrete intervals to identify cybersecurity events and verify the effectiveness of protective measures.	<b>DE.CM-1:</b> The network is monitored to detect potential cybersecurity events	SA-2a SA-2b	SA-2e SA-2f
	<b>DE.CM-2:</b> The physical environment is monitored to detect potential cybersecurity events	SA-2a SA-2b		SA-2i	
	<b>DE.CM-3:</b> Personnel activity is monitored to detect potential cybersecurity events	SA-2a SA-2b		SA-2i	
	<b>DE.CM-4:</b> Malicious code is detected	SA-2a SA-2b	SA-2e CPM-4a	SA-2i	
	<b>DE.CM-5:</b> Unauthorized mobile code is detected	SA-2a SA-2b	SA-2e	SA-2h SA-2i	
	<b>DE.CM-6:</b> External service provider activity is monitored to detect potential cybersecurity events	EDM-2a SA-2a SA-2b		EDM-2j EDM-2l EDM-2n	

Energy Sector Cybersecurity Framework Implementation Guidance | Mapping of C2M2 to the Framework

Function	Category	Subcategory	C2M2 Practices		
			MIL 1	MIL 2	MIL3
DETECT (DE)		<b>DE.CM-7:</b> Monitoring for unauthorized personnel, connections, devices, and software is performed	SA-2a SA-2b	SA-2e SA-2f	SA-2g  SA-2i
		<b>DE.CM-8:</b> Vulnerability scans are performed		TVM-2e	TVM-2i
	<b>Detection Processes (DP):</b> Detection processes and procedures are maintained and tested to ensure timely and adequate awareness of anomalous events.	<b>DE.DP-1:</b> Roles and responsibilities for detection are well defined to ensure accountability	IR-1a IR-3a WM-1a WM-1b	WM-1d	WM-1f WM-2h
		<b>DE.DP-2:</b> Detection activities comply with all applicable requirements		IR-1d	IR-1g IR-5f RM-1c RM-2j
		<b>DE.DP-3:</b> Detection processes are tested		IR-3e	IR-3j
		<b>DE.DP-4:</b> Event detection information is communicated to appropriate parties	IR-1b IR-3c ISC-1a	ISC-1c ISC-1d	IR-3n ISC-1h
		<b>DE.DP-5:</b> Detection processes are continuously improved		IR-3h	IR-3k
<b>Response Planning (RP):</b> Response processes and procedures are executed and maintained, to ensure timely response to detected cybersecurity events.	<b>RS.RP-1:</b> Response plan is executed during or after an event		IR-3d		
RESPOND (RS)					

Function	Category	Subcategory	C2M2 Practices		
			MIL 1	MIL 2	MIL3
RESPOND (RS)	<b>Communications (CO):</b> Response activities are coordinated with internal and external stakeholders, as appropriate, to include external support from law enforcement agencies.	<b>RS.CO-1:</b> Personnel know their roles and order of operations when a response is needed	IR-3a		IR-5a IR-5b
		<b>RS.CO-2:</b> Events are reported consistent with established criteria	IR-1a IR-1b		
		<b>RS.CO-3:</b> Information is shared consistent with response plans	ISC-1a ISC-1b	IR-3d ISC-1c ISC-1d	
		<b>RS.CO-4:</b> Coordination with stakeholders occurs consistent with response plans		IR-3d IR-5b	
		<b>RS.CO-5:</b> Voluntary information sharing occurs with external stakeholders to achieve broader cybersecurity situational awareness	ISC-1a ISC-1b IR-3c	ISC-1c ISC-1d ISC-1e ISC-1f	ISC-1h ISC-1i ISC-1j ISC-1k ISC-1l
	<b>Analysis (AN):</b> Analysis is conducted to ensure adequate response and support recovery activities.	<b>RS.AN-1:</b> Notifications from detection systems are investigated		IR-1e SA-3a	IR-1f IR-1h
		<b>RS.AN-2:</b> The impact of the incident is understood	IR-2d IR-2g	IR-2d TVM-1d	IR-2g RM-2j
		<b>RS.AN-3:</b> Forensics are performed		IR-3d	IR-3i
		<b>RS.AN-4:</b> Incidents are categorized consistent with response plans	IR-2a	IR-1d IR-1e IR-2d TVM-1d	IR-2g RM-1c
	<b>Mitigation (MI):</b> Activities are performed to prevent expansion of an event, mitigate its	<b>RS.MI-1:</b> Incidents are contained	IR-3b		
		<b>RS.MI-2:</b> Incidents are mitigated	IR-3b

			MIL 1	MIL 2	MIL3
	parties, such as coordinating centers, Internet Service Providers, owners of attacking systems, victims, other CSIRTs, and vendors.	<b>RC.CO-3:</b> Recovery activities are communicated to internal stakeholders and executive and management teams		IR-3d	IR-5e

669

670

671

672 **Table 12. C2M2 Practices Mapped to NIST Framework Tiers**

673 Table 12 maps the Framework Implementation Tiers and the C2M2 practices. This mapping is  
674 cumulative, i.e., the practices mapped to a Tier 1 Category are required for Tier 2 as well. This means an  
675 organization striving for Tier 3 should consider practices listed under Tier 1, 2, and 3 headings in Table  
676 12. Moreover, the framework describes some Tier Categories as the absence and/or ad hoc  
677 performance of a risk management practice. In such cases, the C2M2 practice mapped for ad hoc  
678 performance is marked with an asterisk. By design, the C2M2 recognizes MIL 1 practices as initial  
679 security and risk management activities that organizations may perform in an ad hoc manner.

680 It is possible that an organization that performs C2M2 practices mapped to a specific Framework Tier  
681 may determine that some C2M2 practices do not satisfy the Tier characteristics to a degree required by  
682 that organization. Organizations utilizing this mapping should therefore review it and ensure that it  
683 aligns with their needs.

684

Energy Sector Cybersecurity Framework Implementation Guidance | Mapping of C2M2 to the Framework

Framework Implementation Tier	Tier Category	Characteristics	C2M2 Reference		
			MIL 1	MIL 2	MIL3
<b>Tier 1: Partial</b>	Risk Management Process	Organizational cybersecurity risk management practices are not formalized, and risk is managed in an ad hoc and sometimes reactive manner.	RM-2a* RM-2b*		
		Prioritization of cybersecurity activities may not be directly informed by organizational risk objectives, the threat environment, or business/mission requirements.	RM-2a* RM-2b*		
	Integrated Risk Management Program	There is limited awareness of cybersecurity risk at the organizational level and an organization-wide approach to managing cybersecurity risk has not been established.	RM-2a* RM-2b*		
		The organization implements cybersecurity risk management on an irregular, case-by-case basis due to varied experience or information gained from outside sources.	RM-2a* RM-2b*		
		The organization may not have processes that enable cybersecurity information to be shared within the organization.	RM-2a* RM-2b*		

Energy Sector Cybersecurity Framework Implementation Guidance | Mapping of C2M2 to the Framework

Framework Implementation Tier	Tier Category	Characteristics	C2M2 Reference		
			MIL 1	MIL 2	MIL3
	External Participation	An organization may not have the processes in place to participate in coordination or collaboration with other entities.	RM-2a* RM-2b*		

685 \*As described in the Framework, these Tier characteristics correspond to the specified C2M2 practices  
 686 performed in an ad hoc manner.  
 687

Energy Sector Cybersecurity Framework Implementation Guidance | Mapping of C2M2 to the Framework

Framework Implementation Tier	Tier Category	Characteristics	C2M2 Reference		
			MIL 1	MIL 2	MIL3
<b>Tier 2: Risk Informed</b>	Risk Management Process	Risk management practices are approved by management but may not be established as organizational-wide policy.		RM-3a* RM-3b*	
		Prioritization of cybersecurity activities is directly informed by organizational risk objectives, the threat environment, or business/mission requirements.			RM-1c
	Integrated Risk Management Program	There is an awareness of cybersecurity risk at the organizational level but an organization-wide approach to managing cybersecurity risk has not been established.	RM-2a RM-2b		
		Risk informed, management -approved processes and procedures are defined and implemented, and staff has adequate resources to perform their cybersecurity duties.	CPM-2a CPM-2b	RM-3a RM-3b RM-3c	RM-1c
		Cybersecurity information is shared within the organization on an informational basis.	ISC-1a		
	External Participation	The organization knows its role in the larger ecosystem, but has not formalized its capabilities to interact and share information externally.	EDM-1a EDM-1b	ISC-1c	

## Energy Sector Cybersecurity Framework Implementation Guidance | Mapping of C2M2 to the Framework

688 \*As described in the Framework, these Tier characteristics correspond to the specified C2M2 practices  
689 performed in an ad hoc manner.

694

695 **APPENDIX B: SUMMARY OF FRAMEWORK USE**  
 696 **STEPS**

697 **Table 13. Summary of Framework Use Steps**

<b>Step 1: Prioritize and Scope</b>		
<b>Inputs</b>	<b>Activities</b>	<b>Outputs</b>
1. Risk management strategy 2. Organizational objectives and priorities 3. Threat information	1. Organization determines where it wants to apply the Framework to evaluate and potentially guide the improvement of the organization’s cybersecurity capabilities	1. Framework usage scope
<b>Step 2: Orient</b>		
<b>Inputs</b>	<b>Activities</b>	<b>Outputs</b>
1. Framework usage scope 2. Risk management strategy	1. Organization identifies in-scope systems and assets (e.g., people, information, technology, and facilities) and the appropriate regulatory and informative references (e.g., cybersecurity and risk management standards, tools, methods, and guidelines)	1. In-scope systems and assets 2. In-scope requirements (i.e., regulatory, company, organizational) 3. In-scope cybersecurity and risk management standards, tools, methods, and guidelines 4. Evaluation approach
<b>Step 3: Create a Current Profile</b>		
<b>Inputs</b>	<b>Activities</b>	<b>Outputs</b>
1. Evaluation approach 2. In-scope systems and assets 3. In-scope regulatory requirements 4. In-scope cybersecurity and risk management standards, tools, methods, and guidelines	1. Organization identifies its current cybersecurity and risk management state	1. Current Profile 2. Current Implementation Tier
<b>Step 4: Conduct a Risk Assessment</b>		
<b>Inputs</b>	<b>Activities</b>	<b>Outputs</b>
1. Framework usage scope 2. Risk management strategy	1. Perform risk assessment for in-scope portion of the organization	1. Risk assessment reports

<ol style="list-style-type: none"> <li>3. Organization-defined risk assessment approach</li> <li>4. In-scope regulatory requirements</li> <li>5. In-scope cybersecurity and risk management standards, tools, methods, and guidelines</li> </ol>		
<b>Step 5: Create a Target Profile</b>		
<b>Inputs</b>	<b>Activities</b>	<b>Outputs</b>
<ol style="list-style-type: none"> <li>1. Current Profile</li> <li>2. Current Tier</li> <li>3. Organizational objectives</li> <li>4. Risk management strategy</li> <li>5. Risk assessment reports</li> </ol>	<ol style="list-style-type: none"> <li>1. Organization identifies goals that will mitigate risk commensurate with the risk to organizational and critical infrastructure objectives</li> </ol>	<ol style="list-style-type: none"> <li>1. Target Profile</li> <li>2. Target Tier</li> </ol>
<b>Step 6: Determine, Analyze, and Prioritize Gaps</b>		
<b>Inputs</b>	<b>Activities</b>	<b>Outputs</b>
<ol style="list-style-type: none"> <li>1. Current Profile</li> <li>2. Current Tier</li> <li>3. Target Profile</li> <li>4. Target Tier</li> <li>5. Organizational objectives</li> <li>6. Impact to critical infrastructure</li> <li>7. Gaps and potential consequences</li> <li>8. Organizational constraints</li> <li>9. Risk management strategy</li> <li>10. Risk assessment reports</li> </ol>	<ol style="list-style-type: none"> <li>1. Analyze gaps between current state and Target Profile in organization's context</li> <li>2. Evaluate potential consequences from gaps</li> <li>3. Determine which gaps need attention</li> <li>4. Identify actions to address gaps</li> <li>5. Perform cost-benefit analysis (CBA) on actions</li> <li>6. Prioritize actions (CBA and consequences)</li> <li>7. Plan to implement prioritized actions</li> </ol>	<ol style="list-style-type: none"> <li>1. Prioritized gaps and potential consequences</li> <li>2. Prioritized implementation plan</li> </ol>
<b>Step 7: Implement Action Plan</b>		
<b>Inputs</b>	<b>Activities</b>	<b>Outputs</b>
<ol style="list-style-type: none"> <li>1. Prioritized implementation plan</li> </ol>	<ol style="list-style-type: none"> <li>1. Implement actions by priority</li> <li>2. Track progress against plan</li> <li>3. Monitor and evaluate progress against key risks, metrics, and performance indicators</li> <li>4. Report progress</li> </ol>	<ol style="list-style-type: none"> <li>1. Project tracking data</li> <li>2. New security measures implemented</li> </ol>
