

# H<sub>2</sub> Grid Integration: Tools and Analyses

## Hydrogen Energy Storage Workshop

**Josh Eichman, PhD**

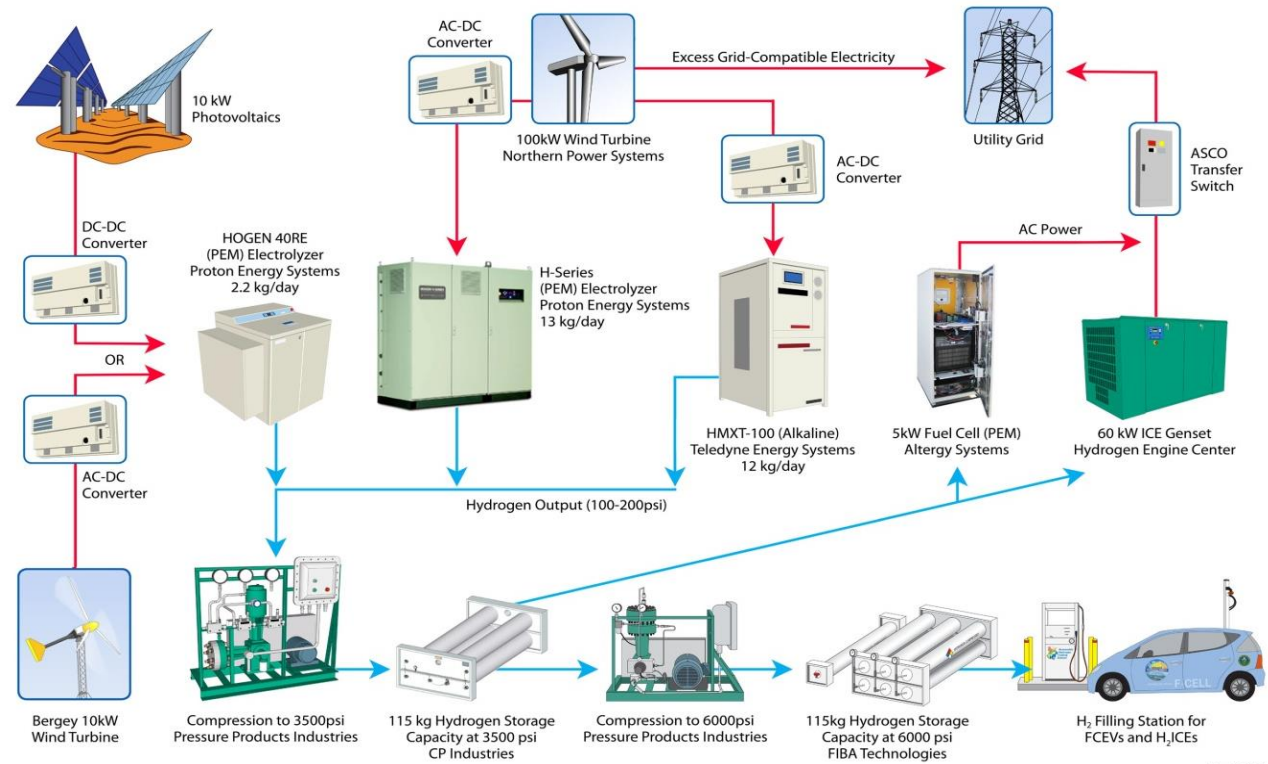

**5/14/2014**

# Wind to Hydrogen Project

- Xcel Energy, DOE and NREL collaboration
- Can explore the role of H<sub>2</sub> for...

## Xcel Energy and NREL's Integrated Renewable Hydrogen System

- Renewable Integration
- Responsive loads (demand response)
- Energy Storage
- Multiple outputs streams
  - Electricity
  - Transportation fuel
  - Industrial gas

# Electricity market requirements

---

- **Important operational characteristics**

- Power capacity

How much can you provide in response?

- Energy capacity

For how long can you respond (duration)?

- Response time

How quickly can you begin responding?

- Ramp-rate

How fast can you change your response?

- Min. turndown

What is your lowest operating point?

- Startup time

How long does it take to start up?

- Shutdown time

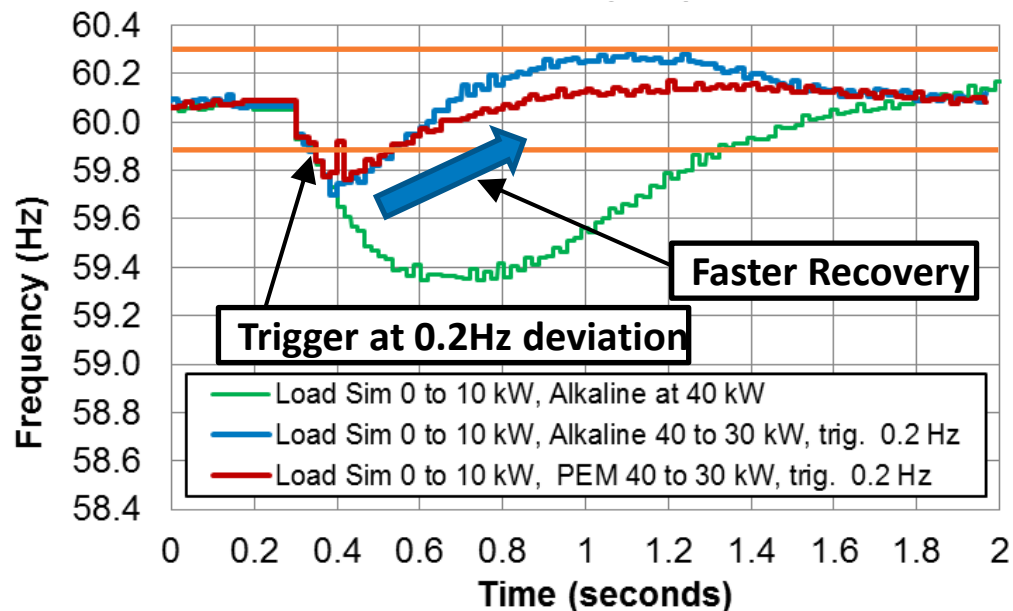

How long does it take to shutdown?

# Electrolyzer Regulation Tests

- Tested PJM regulation A and D signals
- Tested frequency response using a microgrid

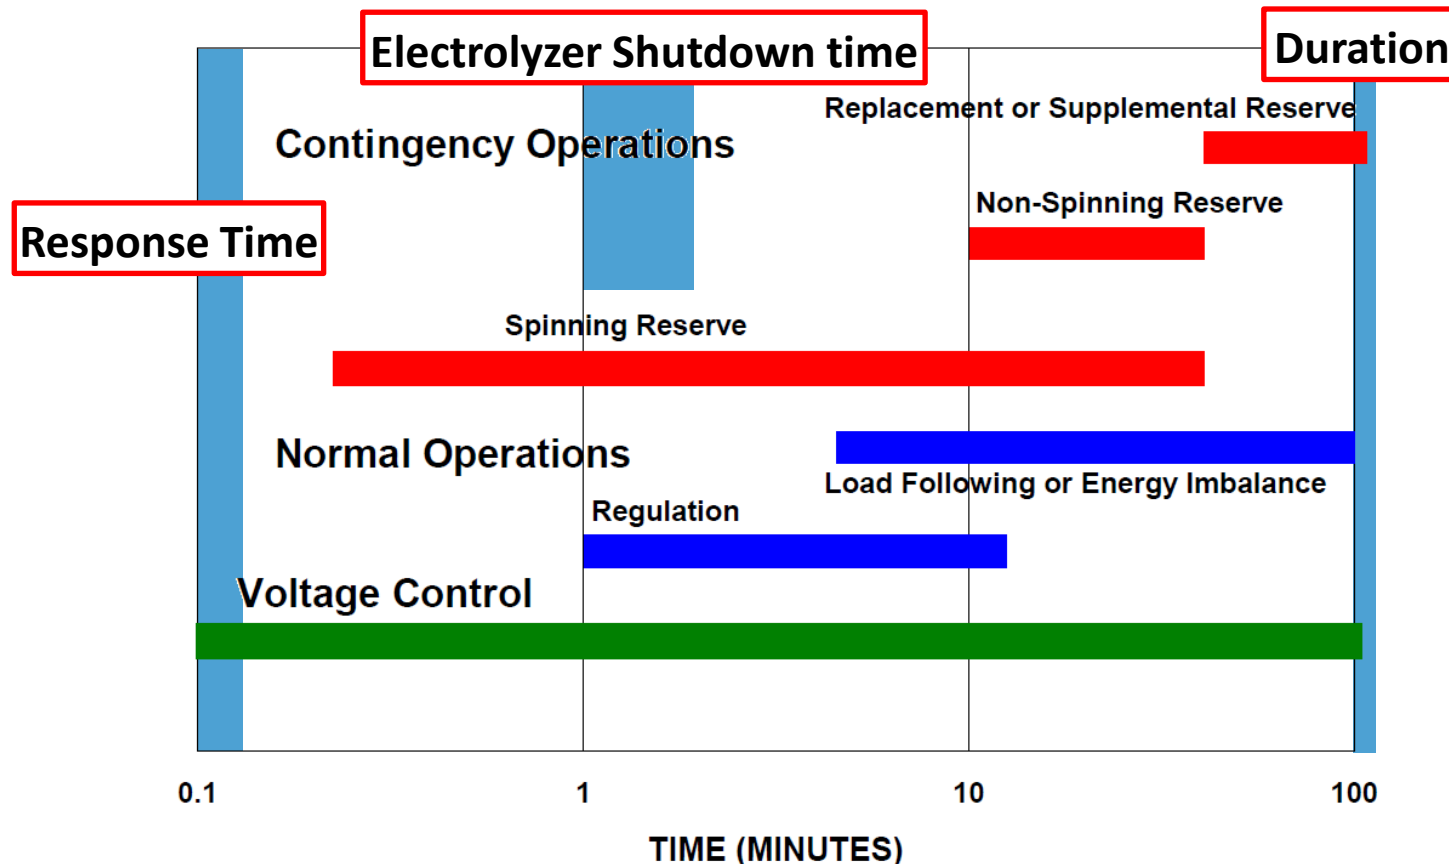

Source: Harrison K., Mann M., Terlip D., and Peters M., NREL/FS-5600-54658

Electrolyzers can respond to rapidly varying input signal

# Electrolyzer Testing Results vs. Requirements

- Ancillary Service Requirements

Source: Kirby, B.J. 2006. Demand Response for Power Systems Reliability: FAQ. ORNL

Source: Eichman, J.D.; Harrison, K.; Peters, M. (Forthcoming). Novel Electrolyzer Applications. NREL/TP-5400-61758

**Electrolyzers can respond fast enough and for sufficient duration to “technically” participate in electricity markets**

# Capacity req. for grid services is falling

- **Minimum capacity requirements to bid into market**
  - 50 MW for E.ON as of 2006 [2]
  - 30 MW for EnBW, RWE, and VET for minute reserve power in Germany as of 2006 [2]
  - 10 MW for ISO-NE and the primary and secondary control markets in Germany [2, 4]
  - 1 MW for NYISO, PJM and CAISO [3, 4]
  - 100 kW load reduction in the case of NYISO curtailment program [1]
- **Capacity can often be aggregated**

4. Cutter, E., L. Alagappan and S. Price (2009). Impacts of Market Rules on Energy Storage Economics, Energy and Environmental Economics, [http://www.usaee.org/usaee2009/submissions/OnlineProceedings/8025-Energy%20Storage\\_Paper%20E3.pdf](http://www.usaee.org/usaee2009/submissions/OnlineProceedings/8025-Energy%20Storage_Paper%20E3.pdf)

**Grid capacity requirements are approaching  
manufacturer scale-up targets**

# Modeling Approach

Can perform time-resolved  
co-optimization of energy and  
ancillary service products very quickly

## Historical or Modelled

- Energy Prices
- Reserve Prices
- H<sub>2</sub> Prices
- Operational parameters

Price-Taker

Profit based on operation  
(arbitrage, AS, H<sub>2</sub> sale, etc.)

## Assumes

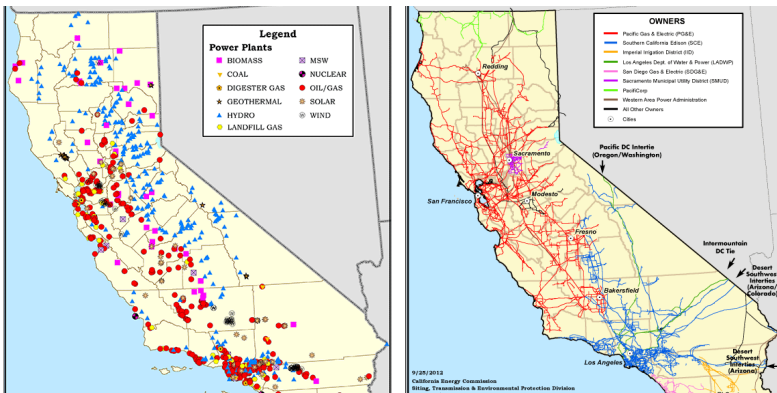

- 1.) Sufficient capacity is available in all markets
- 2.) Objects don't impact market outcome (i.e., small compared to market size)

# Modeling Approach

- Transmission Network (electric and gas)
- Generator properties (coal, gas, nuclear, renewable, etc.)
- Load requirements
- Reliability requirements
- Other System Constraints

Grid  
Simulation  
Model

- Generator operation (starts, fuel, costs)
- Fuel use and cost
- Emissions
- Transmission operation (flow, congestion)
- Imports & Exports
- Load served
- Energy Prices
- Reserve Prices

California Power Plants and Transmission Lines ([energyalmanac.ca.gov/](http://energyalmanac.ca.gov/))

**Perform temporal and spatial  
co-optimization of energy and  
ancillary service products  
(days or weeks of runtime)**

# Modeling Approach

- Transmission Network (electric and gas)
- Generator properties (coal, gas, nuclear, renewable, etc.)
- Load requirements
- Reliability requirements
- Other System Constraints

Grid  
Simulation  
Model

- Energy Prices
- Reserve Prices
- H<sub>2</sub> Prices
- Operational parameters

- Generator operation (starts, fuel, costs)
- Fuel use and cost
- Emissions
- Transmission operation (flow, congestion)
- Imports & Exports
- Load served

**Models can be integrated (e.g., effect of renewables, changes to gas system, market design)**

Price-Taker

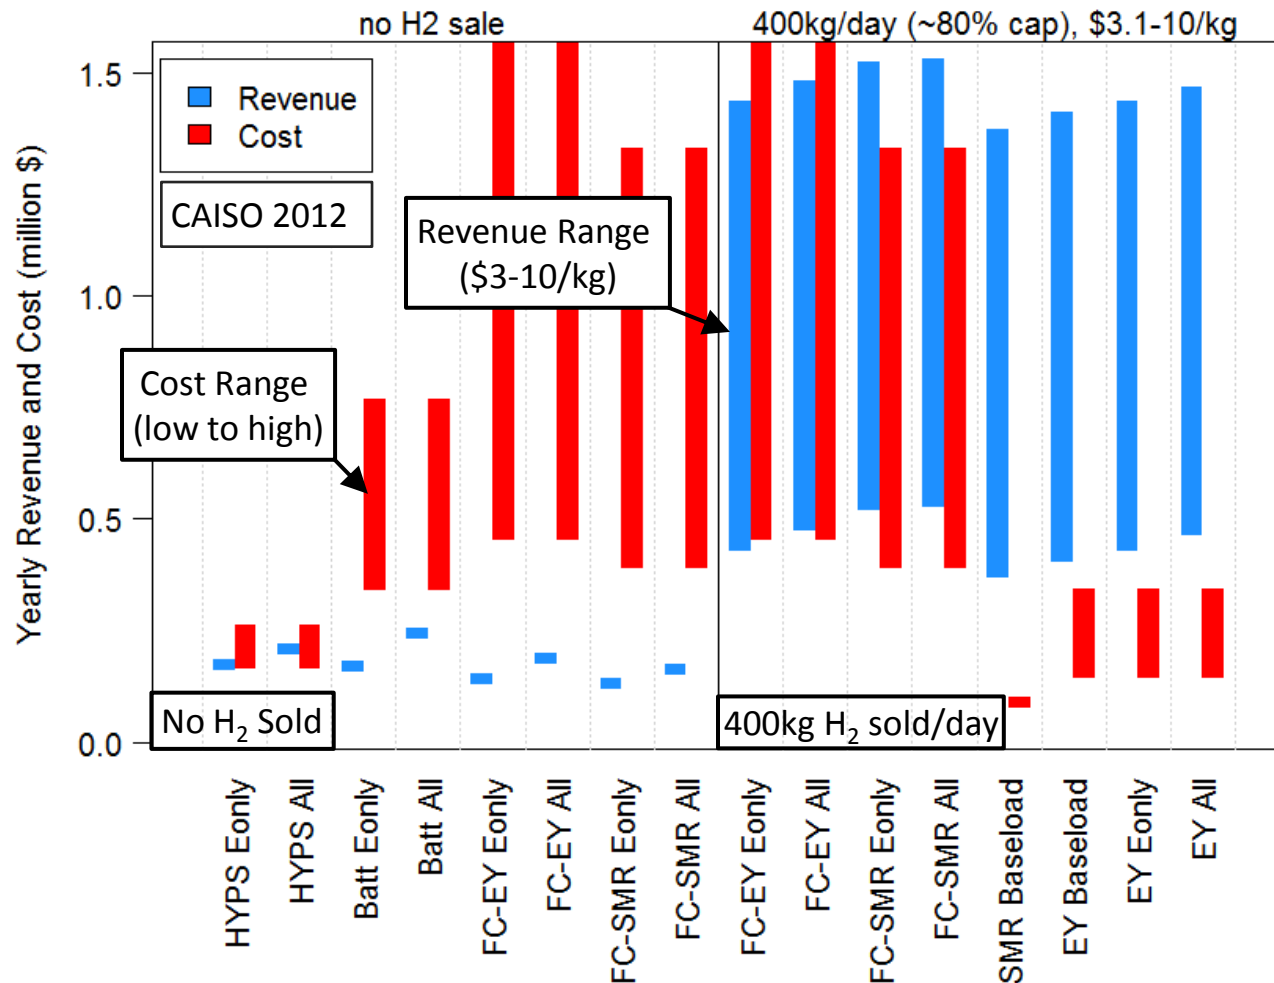

Profit based on operation (arbitrage, AS, H<sub>2</sub> sale, etc.)

# Price-Taker Results with historical prices

Selling H<sub>2</sub> increases competitiveness

Providing ancillary services > Energy only > Baseload

- Comparison of yearly revenue and cost

Name	Technology
HYPS	Pumped Hydro
Batt	Battery
FC	Fuel Cell
EY	Electrolyzer
SMR	Steam Methane Reformer

Name	Services
All	All Ancillary Services
Eonly	Energy Arbitrage only
Baseload	"Flat" operation

# Comparison to H2A

Integration with the grid can lower feedstock costs and increase revenue

## • H2A Current Central Hydrogen Production Scenarios

Name	Technology
FC	Fuel Cell
EY	Electrolyzer
SMR	Steam Methane Reformer

Name	Services
All	All Ancillary Services
Eonly	Energy Arbitrage only
Baseload	"Flat" operation

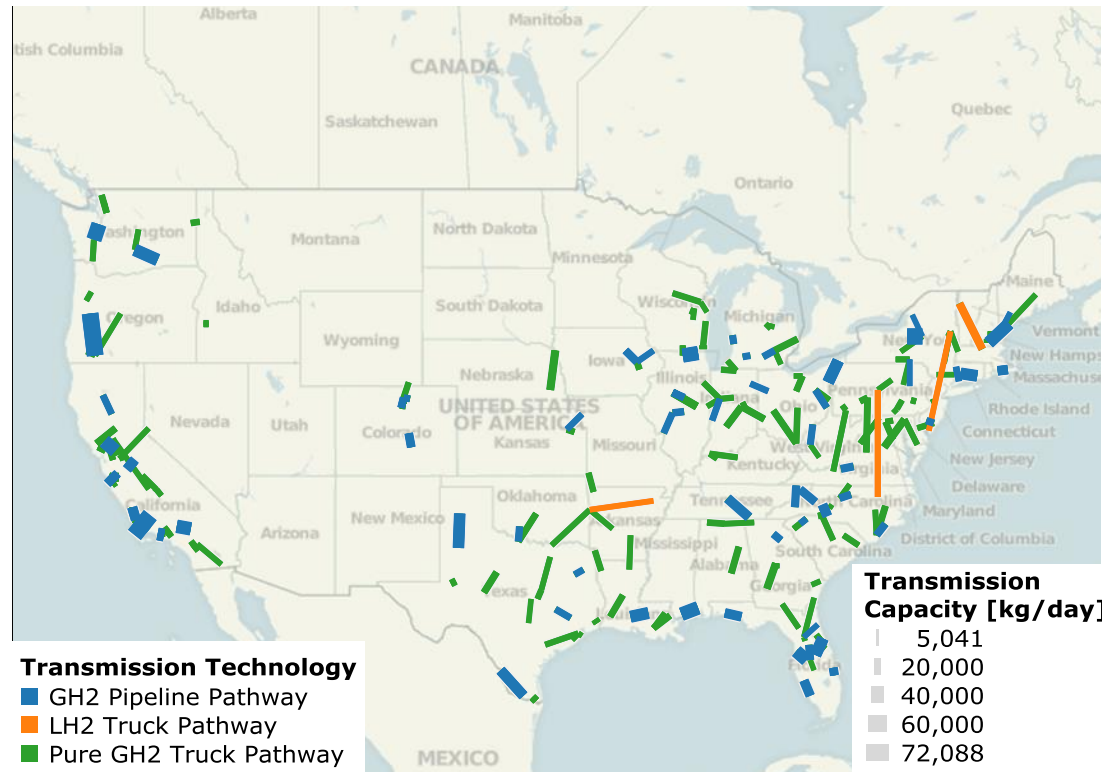

# Transportation infrastructure modeling

- **Scenario Evaluation, Regionalization and Analysis (SERA) Model**

- Integrates various models and datasets

- H2A
- HDSAM
- ADOPT
- MA3T
- VISION
- IRS data
- Census data
- Polk data
- Vehicle data

- Locates least cost geographic infrastructure options

**Important to explore interactions between electric, gas and transportation sectors**

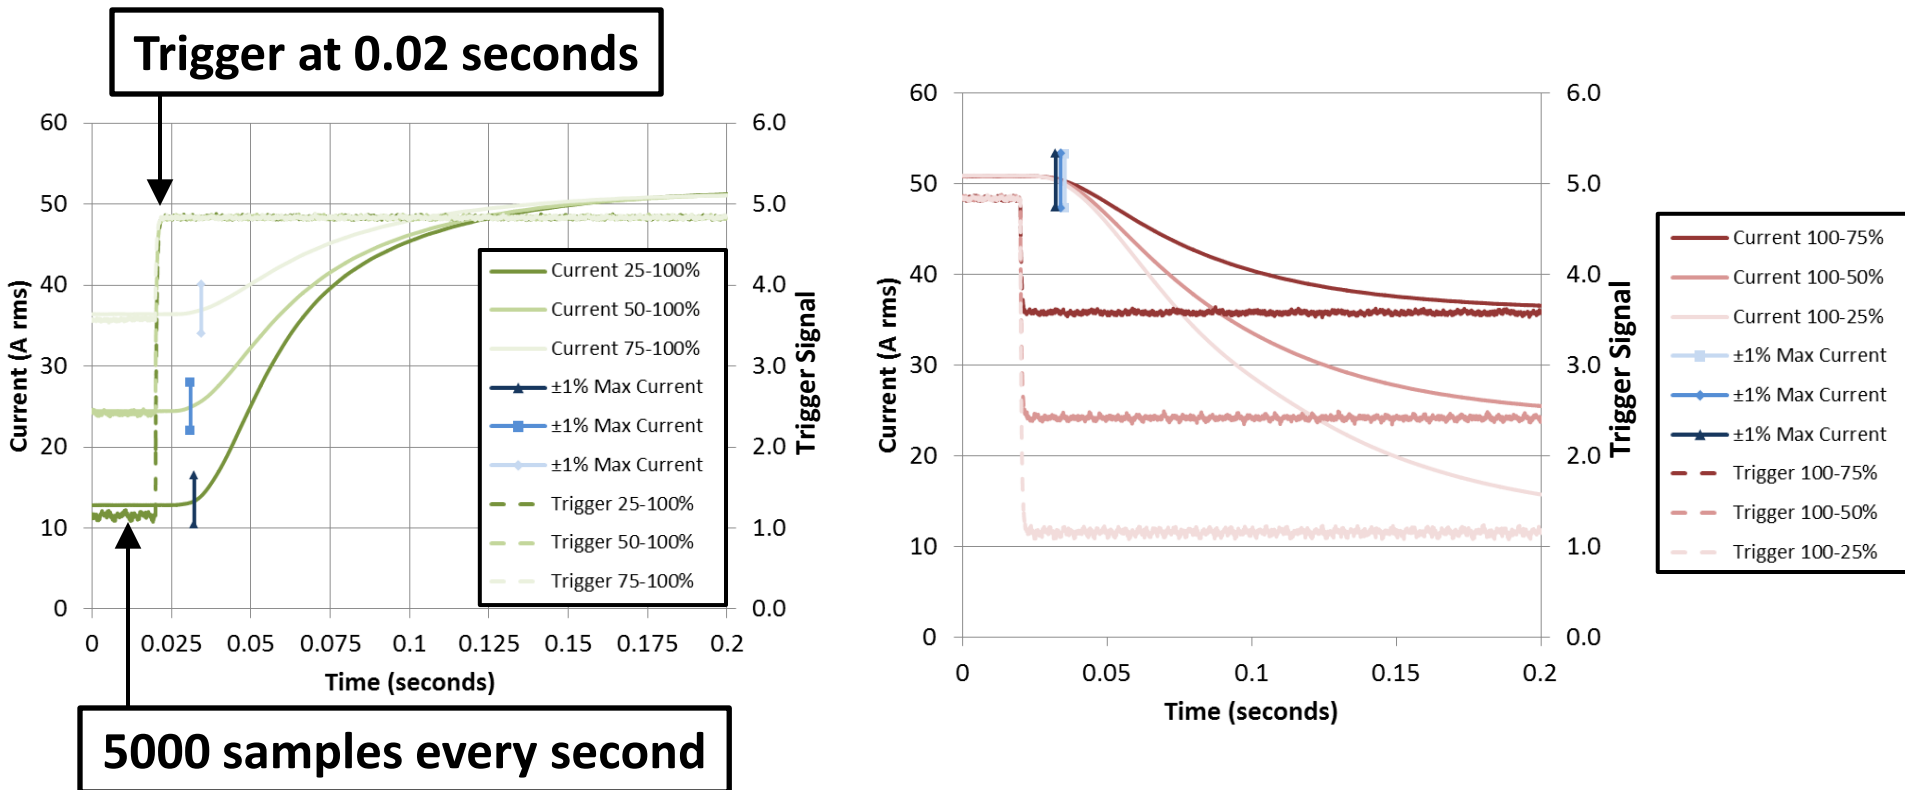

**Questions?**

# Backup Slides

# Electrolyzer Response Time

- **Power set-point was changed (PEM unit shown below)**
  - Ramp Up: 25%, 50%, and 75% → 100%
  - Ramp Down: 100% → 75%, 50% and 25%

**Electrolyzers can rapidly change their load point  
in response to grid needs**

# Approach – Assumptions

Properties	Pumped Hydro	Pb Acid Battery	Stationary Fuel Cell	Electrolyzer	Steam Methane Reformer
Rated Power Capacity (MW)	1.0	1.0	1.0	1.0	500 kg/day
Energy Capacity (hours)	8	4	8	8	8
Capital Cost (\$/kW <b>Low to High</b> )	1500 <sup>1</sup> - 2347 <sup>2</sup>	2000 <sup>1</sup> - 4600 <sup>1</sup>	1500 <sup>3</sup> - 5918 <sup>2</sup>	430 <sup>3</sup> - 2121 <sup>6</sup>	427 – 569 \$/kg/day <sup>4</sup>
Fixed O&M (\$/kW-year <b>Low to High</b> )	8 <sup>1</sup> - 14.27 <sup>2</sup>	25 <sup>1</sup> - 50 <sup>1</sup>	350 <sup>2</sup>	42 <sup>4</sup>	4.07 – 4.50 % of Capital <sup>4</sup>
H <sub>2</sub> Storage Cost (\$/kg)	-	-	623 <sup>5</sup>	623 <sup>5</sup>	623 <sup>5</sup>
Installation cost multiplier	1.2 <sup>4</sup>	1.2 <sup>4</sup>	1.2 <sup>4</sup>	1.2 <sup>4</sup>	1.92 <sup>4</sup>
Lifetime (years)	30	12 <sup>1</sup> (4400hrs)	20	20 <sup>4</sup>	20 <sup>4</sup>
Interest rate on debt	7%	7%	7%	7%	7%
Efficiency	80% AC/AC <sup>1</sup>	90% AC/AC <sup>1</sup>	40% LHV	70% LHV	0.156 MMBTU/kg <sup>4</sup> 0.6 kWh/kg <sup>4</sup>
Minimum Part-load	30% <sup>7</sup>	1%	10%	10%	100%

# Results

More storage is not necessarily more competitive in current energy and AS markets

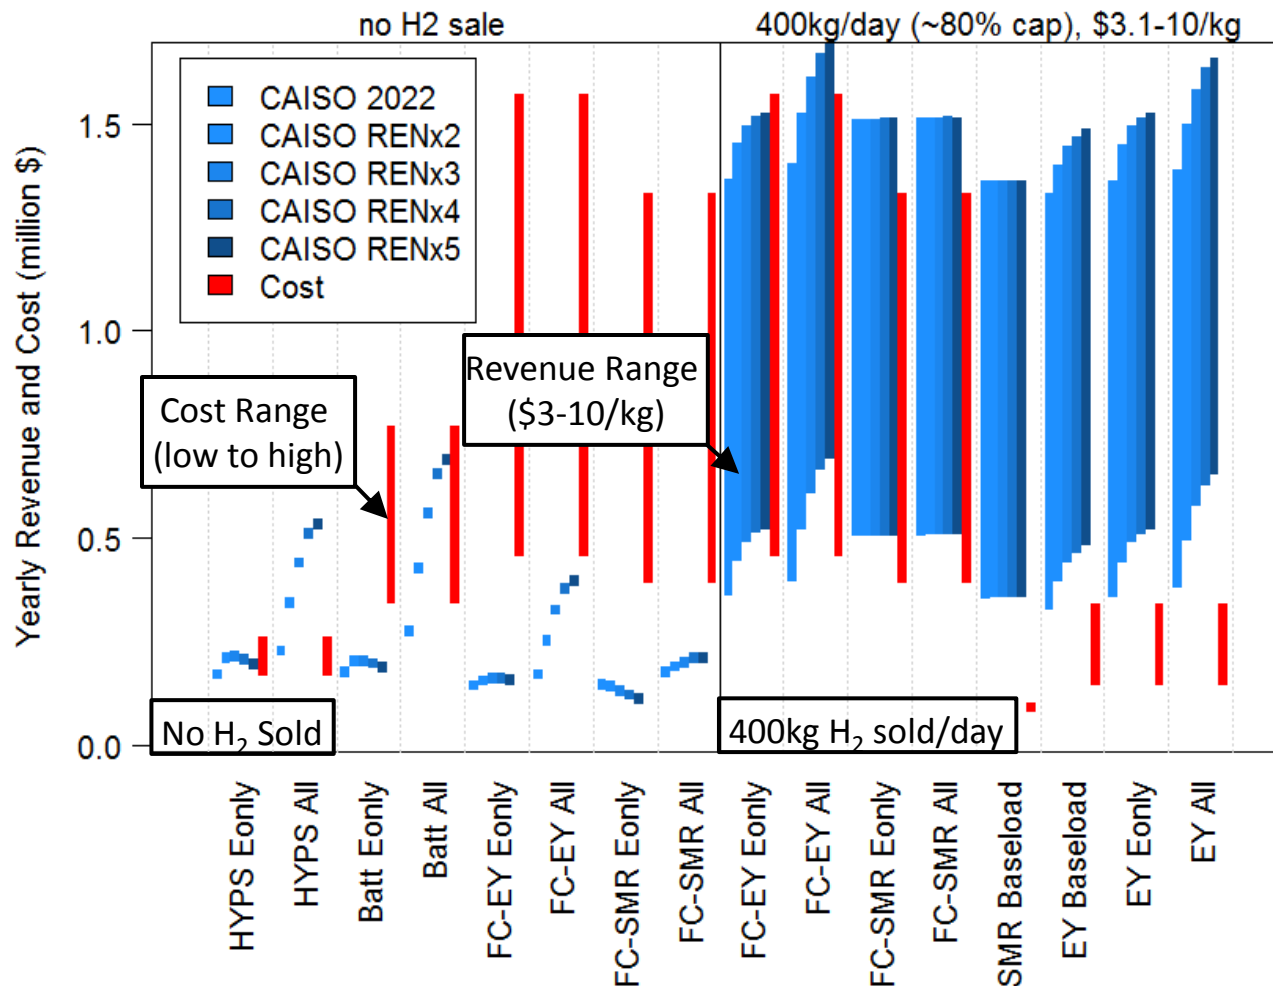

- Capacity Sensitivity
  - FC-EY storage device

# Grid Simulation Model Coupled with Price-Taker

More renewables increases the value for devices participating in ancillary service markets

- Effect of renewables on revenue and cost

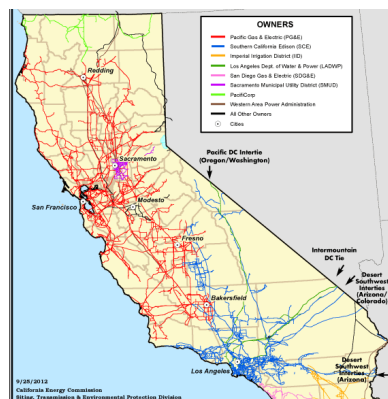

Name	Technology
HYPS	Pumped Hydro
Batt	Battery
FC	Fuel Cell
EY	Electrolyzer
SMR	Steam Methane Reformer

Name	Services
All	All Ancillary Services
Eonly	Energy Arbitrage only
Baseload	"Flat" operation

# Results

- Integrating H<sub>2</sub> devices into a large-scale grid simulation tool shows how the grid will be affected

- Emissions
- Production cost
- Generation mixture
- Prices

California Power Plants and Transmission Lines (energyalmanac.ca.gov/)

# Conclusions

---

- 1. Sell H<sub>2</sub>: FC-EY systems providing strictly storage are less competitive than systems that sell H<sub>2</sub>**
- 2. Revenue w/ ancillary service > energy only > baseload**
- 3. Electrolyzers operating as a “demand response” devices have very favorable prospects**
- 4. More storage is not necessarily more competitive in current energy and ancillary service markets (but may add value in capacity market)**
- 5. More renewables increases the competitiveness for electrical hydrogen equipment (i.e., EY and FC... not SMR)**
- 6. Hydrogen technologies show interesting results when integrated into large-scale grid simulation models**
