2015 Project Peer Review

Improved Advanced Biomass Logistics Utilizing Woody Feedstocks in the Northeast and Pacific Northwest

SUNY-ESF

Timothy A. Volk

March 27, 2015

Technology Area Review

Goal Statement

- Principal goal is to lower the delivered cost of short rotation woody crops by optimizing a commercial-scale supply system:
 - \$80 Dry Ton total cost to throat of conversion reactor
 - \$50 Dry Ton for all cumulative logistic costs (excluding grower payments)
- Fits with terrestrial feedstock goals:
 - (1) reducing the delivered cost of sustainably produced feedstock
 - (2) preserving and improving the quality of harvested feedstock to meet the needs of biorefineries and other biomass users

Quad Chart Overview

Timeline

- Start: Anticipated Summer 2015
- End: Summer 2018

Budget

	Total Planned Funding (FY 15-Project End Date)
DOE Funded	~\$3.0 million
Project Cost Share (Comp.)*	~\$936,000

*If there are multiple cost-share partners, separate rows should be used.

Barriers Addressed

- Ft-A. Feedstock Availability and Cost
- Ft-D. Sustainable Harvesting
- Ft-G. Feedstock Quality and Monitoring:
- Ft-H. Biomass Storage Systems:
- Ft-L. Biomass Material Handling and Transportation
- Ft-M. Overall Integration and Scale-Up

Partners

- SUNY ESF
- Case New Holland
- Greenwood Resources
- ORNL – WVU – INL (modeling)
- Applied Biorefinery Sciences
- Celtic Energy – ZeaChem – ReEnergy

1 - Project Overview

- **Previous project (August 2010 to August 2014)**
 - Primary focus was on harvester development for SRWC
- **Previous Achievements**
 - Increased harvester performance
 - Decreased costs by approximately one third
 - Achieved consistent quality from harvester (particularly chip sizes)
 - Improved methodology for tracking harvester performance
 - Better understanding of harvester performance
 - Identified logistics optimization factors including capacity & number of collection vehicles, haul distance, and harvest pattern
- **Unsolved Issues**
 - Harvesting system has not been optimized
 - Changes in feedstock quality through supply system
 - Relate specific crop and site conditions to harvester performance
 - Difficult to make specific recommendations for improving system
 - Can only evaluate inefficiencies in a general way

History - Harvesting Equipment in this Project

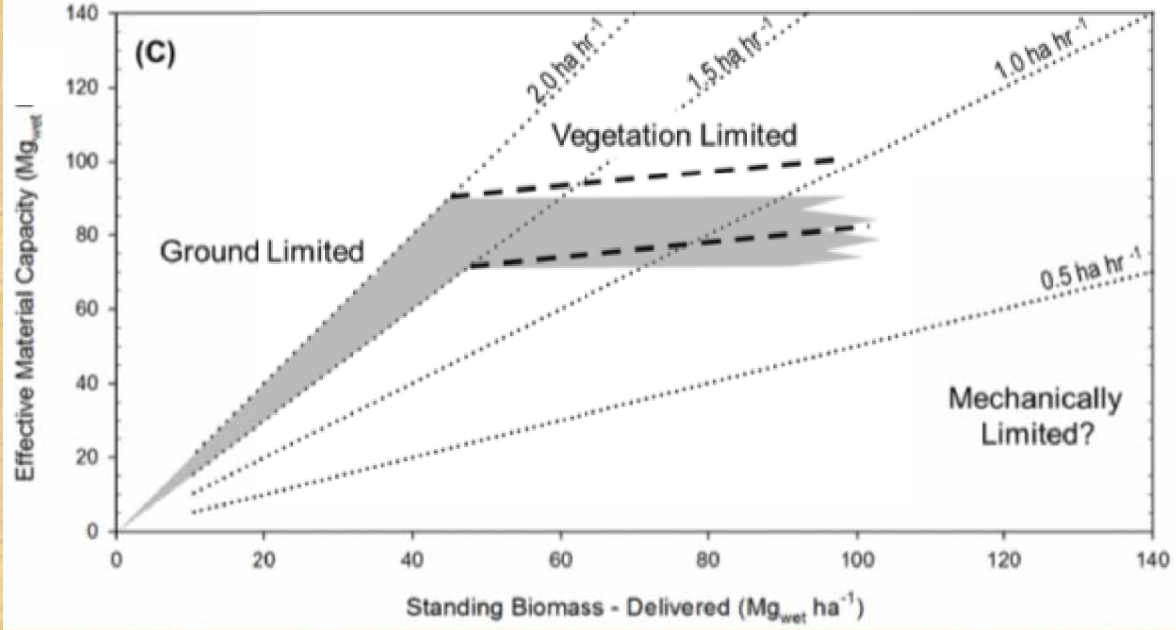

- New Holland FB-130 Coppice Header
- Designed to fit New Holland 9000 and Forage Cruiser series of forage harvesters

History - Harvester Performance

Factors affecting throughput

- (1) Ground Conditions
- (2) Vegetation Characteristics
 - ✓ Shape and form
 - ✓ Planting design
 - ✓ Density of material
- (3) Mechanical limitations
 - ✓ Horsepower
 - ✓ Feed rates
 - ✓ Flow into throat of harvester
- (4) Operator experience

(Eisenbies et al. 2014)

History – Collection System Performance

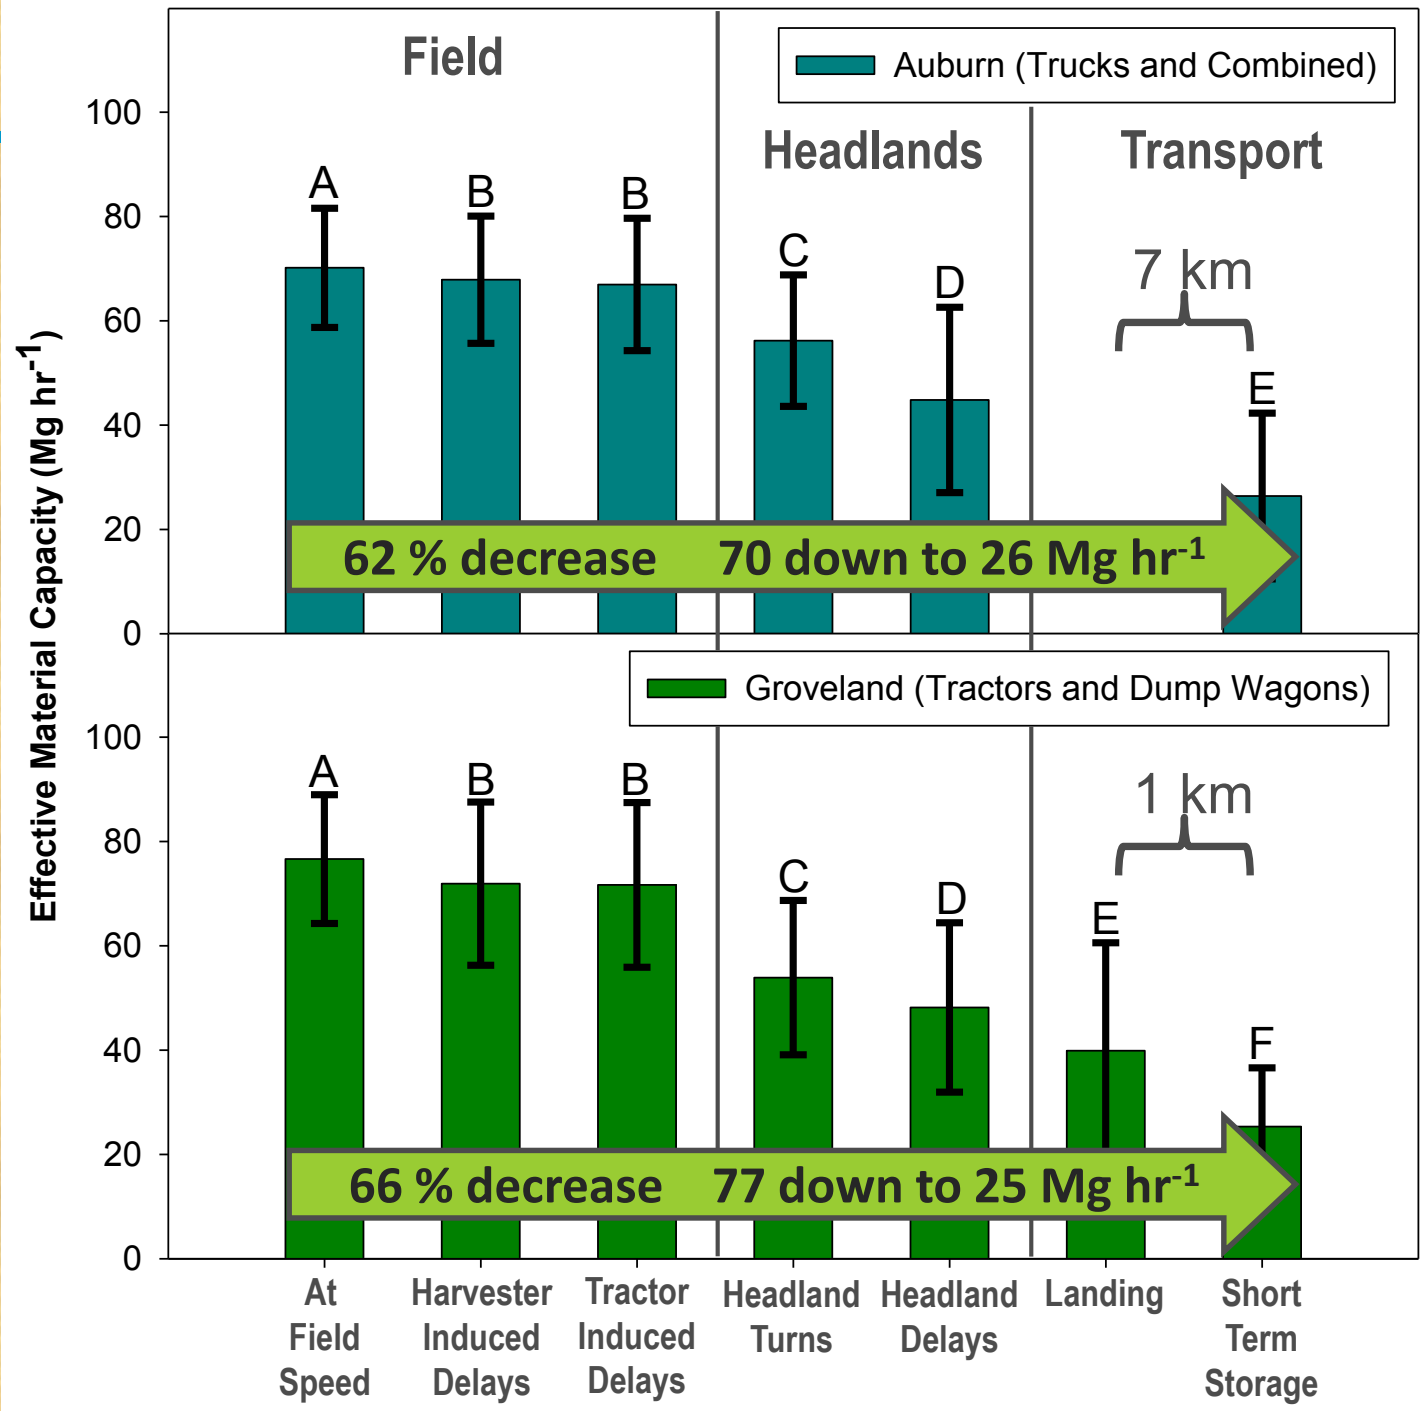

- A variety of collection vehicles were tried during previous harvesting operations

History

Collection System Performance

“Out the Spout”
to
Storage

62-66% loss of efficiency overall

2 – Approach (Technical) **Five Task Areas**

1. **Harvesting Logistics of SRWC Systems**

- Expanding the harvesting window (Engineering methods to remove leaves and snow)
- Iterative process of modeling simulation and field trials to decrease costs
- Improve data collection to integrate plot-level data with machine performance

2. **Transport and Storage** of SRWC feedstocks

- Devise methods for tracking feedstock quality in a commercially realistic context
- Integrating SRWC with existing forest-based biomass systems

3. **Pre-Processing and Blending** with other forest-based biomass to improve feedstock quality

- Pre-processing methods such as HWE be used to increase feedstock value
- Pre-processing and screening methods be used to stabilize feedstock quality

4. **Feedstock Characterization** throughout the supply chain

- Baseline characterization of Willow and Poplar biomass crops
- Devising high-throughput screening systems for SRWC feedstocks

5. **Logistic and Economic Modeling**

- Develop advanced logistics and process simulation models and optimize planning and management of new and existing systems (Integrating Tasks 1-4)

2 – Approach (Management)

- **Critical Success Factors**
 - Achieve the \$80 and \$50 per dry ton costs to meet BETO goals
 - Improve system efficiency
 - Expand harvesting window
 - Developing and implementing system to affordably monitor quality (e.g. moisture content, ash content) in the field
- **Challenges**
 - Working in fields that did not implement recommended planting designs
 - Coordination of multiple independent players along supply chain
 - Coordinating harvesting trials
 - Tracking feedstock quality through supply chain
 - Engineering leaf and snow handling systems
 - Developing models and sampling protocols for measuring quality in the field
- **Structure**
 - Iterative: Model Simulation/Optimization & Harvest Planning → Harvest Trials
 - Monthly phone calls and quarterly assessment of milestones using PMP
 - Annual meetings organized around harvests
 - Go/No-Go meeting midway through project

3– Relevance

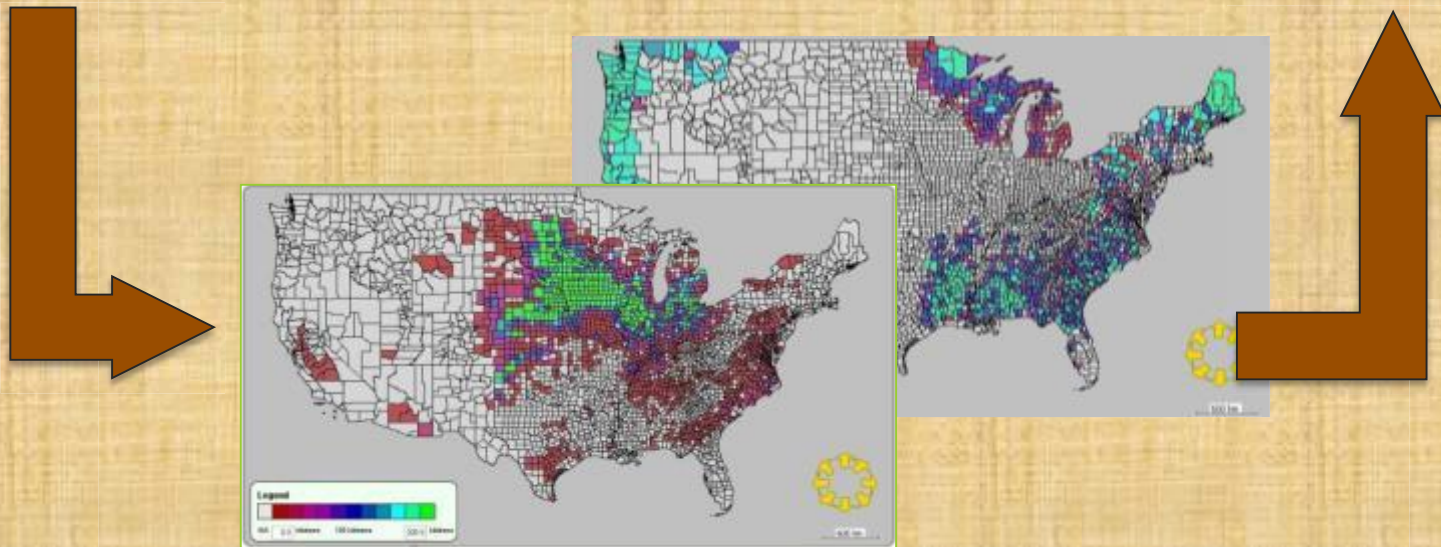

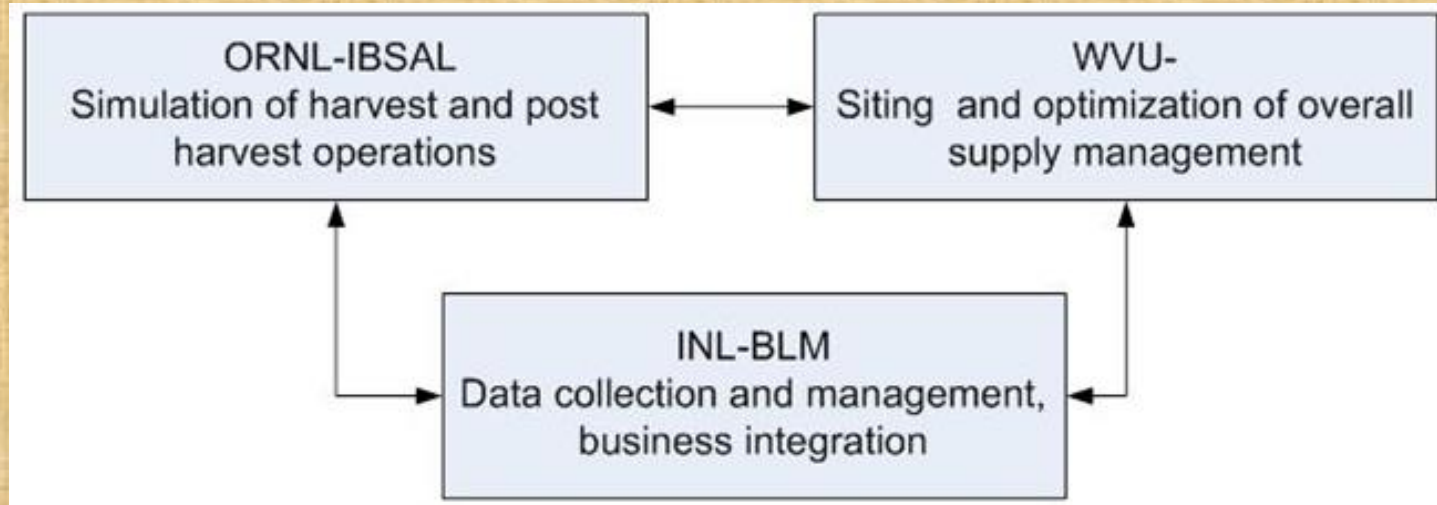

- **BETO Platform Goals and Objectives (MYPP)**
 - Meet the \$80 and \$50 dry ton objectives
 - Addresses important facets of terrestrial feedstock supply and logistics in the MYPP
 - Biomass production, Harvest and collection, Storage, Transport and Handling, Preprocessing, Quality Characterization and Assessment
 - Addresses important facets of conventional logistic systems and moves SRWC in the direction of advanced logistics systems identified in the MYPP
- **Applications for the emerging bioenergy industry**
 - Working with private growers and end users to optimize the system to meet their needs in two regions.
 - 480 ha of shrub willow in NY
 - ~140 ha of hybrid poplar in Oregon
 - Ensure that quality is maintained and/or identify quality challenges throughout supply chain to meet/preserve end user specifications
 - Supply samples and quality data to INL feedstock library
- **Advance the state of technology**
 - Document and develop best practices for harvesting and establishment in conjunction with commercial growers and end users
 - Developing and implementing system to affordably monitor quality (e.g. moisture content, ash content) in the field

Summary - Modeling Effort

IBSAL: Simulation & Harvest Plans → Harvesting Trials

Summary - Modeling Effort

INL Example: Resource Availability for Woody Crops and Corn Stover

Summary - Modeling Effort

Site locating using a multi-objective decision model

- Suitability indices using a fuzzy-logic model
- Optimize feedstock mixes and logistics

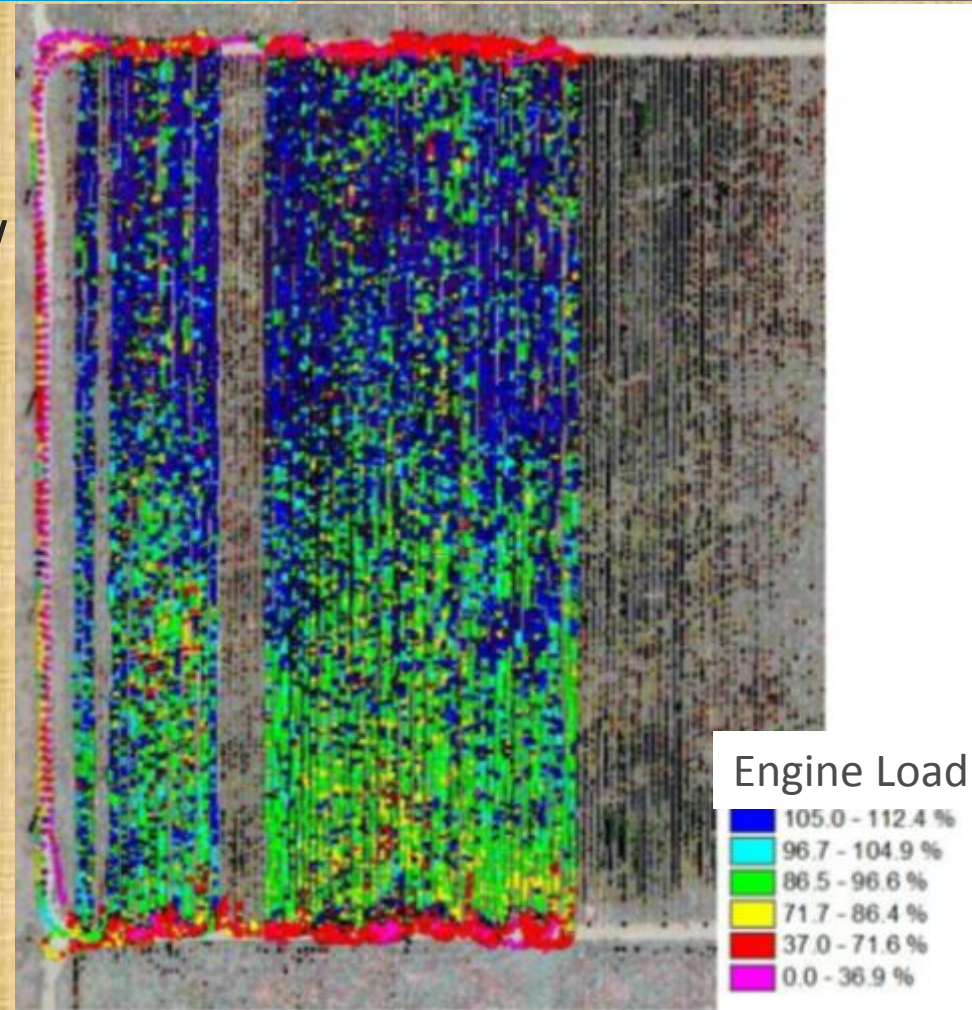

Two-Stage modeling process

- Examine site suitability indices (economic, environmental, infrastructure, societal)
- Evaluate and entail the ranking of potential locations

WVU: Integrating Supply Chains at the Regional Scale

Summary – Couple conditions to performance

- In previous project, machine performance was assessed on a load basis (i.e. row or part of row with 8-12 tons of biomass)
- Now, we plan to evaluate machine performance relative to crop and field conditions at a much finer scale
 - Crop yield
 - Stemform
 - Soil conditions
 - Engine load
 - Fuel consumption

Distribution of engine load for New Holland Harvester in coppice hybrid poplar energy crops

Summary - Expand the harvesting window

Summary - Improve Harvesting Logistics (IBSAL)

An aerial photograph of a farm or field with a blue line tracing a route. Overlaid on the map are two windows from a GIS application. The top window shows a tree view of a project structure. The bottom window shows a data table with columns for Max_HQOP, Min_HQOP, Corn_Type, Row_Type, GPS_Date, GPS_Time, and Update_Status.

	Max_HQOP	Min_HQOP	Corn_Type	Row_Type	GPS_Date	GPS_Time	Update_Status
0	6.7		2.3 Prodigence	GeotM 2008-06	20121210	01:21:08am	None

18	6.7		2.3 Prodigence	GeotM 2008-06	20121210	01:21:08am	None

Summary – Rapid Feedstock Assessment

Near Infrared Spectroscopy (NIR)

- Fast (20 seconds)
- Nondestructive
- Small sample requirements

Calibration required to compare lab/field NIR equipment

Most reliable calibrations

- Same species
- Same particle sizes

Quality Attributes

Moisture, Cellulose, HemiC, Lignin, Ash, and possibly “extractives”

Bruker MPA FT-NIR
Lab/Benchtop NIR

ASD QualitySpec Trek
Handheld Portable NIR

Deere and Zeiss
Harvest Lab Sensor
Inline NIR

Summary – Hot Water Extraction

Applied Biorefinery Sciences (ABS) Approach

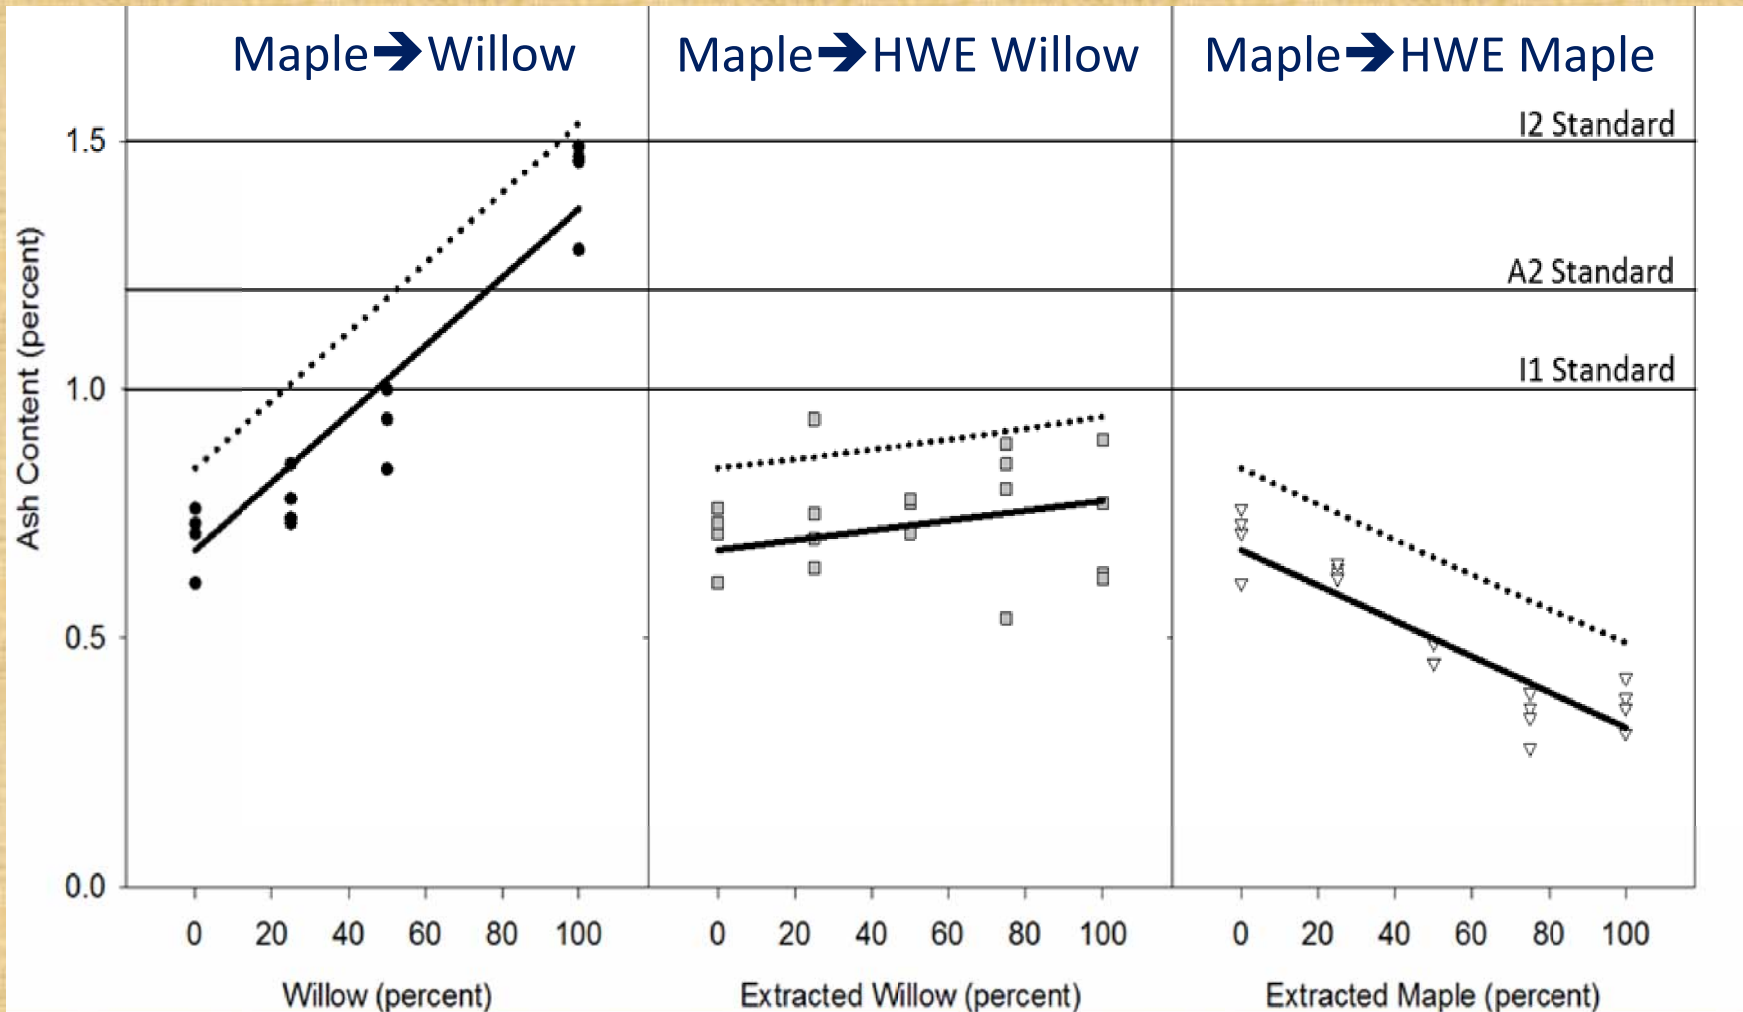

- Hot-water based
- Incremental deconstruction
- Membrane technology
- Fermentation
- Product recovery

A means to improve feedstock
quality while creating
additional revenue streams

Membrane Separation

Summary - Pre-Processing and Blending

Ash content of blended pellets comprised of maple with willow, HWE willow, and HWE maple

Summary - Relevance

- Develop advanced logistics and process simulation models to optimize planning and management of the new and existing systems (Integrating Tasks 1-4)
- Anticipate improved reliability and efficiency of a SRWC that will improve economics and advance these systems in two regions
- ReEnergy Holdings have signed contracts to purchase all the willow biomass from 1,200 acres in northern NY
- US Army has signed 20-yr power purchase agreement with ReEnergy
- ReEnergy is interested in increasing the proportion of willow in their feedstock supply
- Advanced Bioenergy Sciences is developing scale-up plans and pellet producers are interested in residual material
- Hybrid poplar biomass crops are being expanded to supply ZeaChem
