

Modeling and Simulation of Human Behavior in Buildings

2015 Building Technologies Office Peer Review

Energy-related occupant behavior in buildings, e.g.:

- Open/close windows
- Switch/dim lights
- Adjust thermostat
- Move around
- Turn on/off HVAC
- Operate shades

2008 NBI Study of LEED NC certified buildings

Project Summary

Timeline:

Start date: 1/1/2013

Planned end date: 12/31/2015

Key Milestones

1. Behavior framework; 12/2013
2. IEA EBC Annex 66; 11/2013, 11/2014
3. Behavior workshops; 8/2014, 3/2015
4. Behavior modeling tool; 2/2015
5. Behavior XML schema; 3/2015

Budget:

Total DOE \$ to date: **\$380k (FY13+FY14)**

Total future DOE \$: **\$100k (FY15)**

Target Market/Audience:

- Commercial and multi-family residences
- New construction and existing buildings
- Energy modelers

Key Partners:

U.S. Partners	China Partners
Bentley Systems	Tsinghua University
	Center of Building Standards
	Center EEB

Project Goal:

1. Improve data and assumptions of occupant behavior for building energy modeling
2. Develop tools
 - An XML schema to describe occupant behavior
 - A modeling tool for simulating behavior
3. Integrate the tools with EnergyPlus to improve simulation of behavior impacts on building energy use and technology performance

Purpose and Objectives

Problem Statement:

- Occupant behavior in buildings is not well understood and oversimplified!
- Occupants play an essential role in building design and operation.
- Strong need of behavior data, modeling tools and case studies.

Target Market and Audience:

- Commercial & residential buildings; New construction & existing buildings;
- Size of Market: 24 Quads Total (2.2 Quads U.S. homes)
- Energy modelers

Impact of Project:

- The developed occupant behavior tools will enable more accurate consideration of behavior in building performance simulation
- Case studies and workshops demonstrated the use of these behavior tools to improve building design and operations
- Contribution to ASHRAE Handbook Fundamental 2017
- Contribution to IEA EBC Annex 66

Complexity of Human Behavior

- Inherent uncertainty
- Multi-disciplinary
- Various driving factors:
 - ❖ Individual: culture, lifestyle, habit, environmental awareness
 - ❖ Temporal: time of the day, day of the week, season
 - ❖ Spatial: office, home, ...
 - ❖ Indoor and outdoor environmental conditions
- Very limited data to help us understand

How Do Occupants Adjust to Thermal Comfort Issues?

IFMA 2009 HVAC Survey of IFMA members in US and Canada with 452 responses from 3357 samples

Diverse ways to turn on air-conditioning (China Survey Results):

- always turn on**
- turn on when entering**
- turn on when feeling hot**
- turn on before sleep**
- never turn on**
- randomly turn on**

Limitations of occupant related input in current BEM programs

- Deterministic or fixed settings and rules
- Homogeneous profiles or schedules
- Implicit assumptions
 - ❖ Behavior input defined at physical (e.g. Windows , Shades) objects rather than People objects. EnergyPlus as an example.
- Use of custom features needs advanced skills; custom features are not robust.
 - ❖ EnergyPlus EMS (Energy Management System)
 - ❖ DOE-2 User Function

K.P. Lam et al. An EnergyPlus whole building energy model calibration method for office buildings using occupant behavior data mining and empirical data. 2014
ASHRAE/IBPSA-USA Building Energy Modeling Conference.

Approach

Data Driven	Identify, understand and describe energy-related occupant behavior by data analytics
Standard	Develop a DNAs (Drivers, Needs, Actions, Systems) framework to standardize the representation of occupant behavior in buildings
Robust Modeling	Develop and integrate behavior modeling tool into whole building performance simulation (EnergyPlus)
Provide Insights	Evaluate the impact of behavior on building energy use and performance of building technologies using case studies

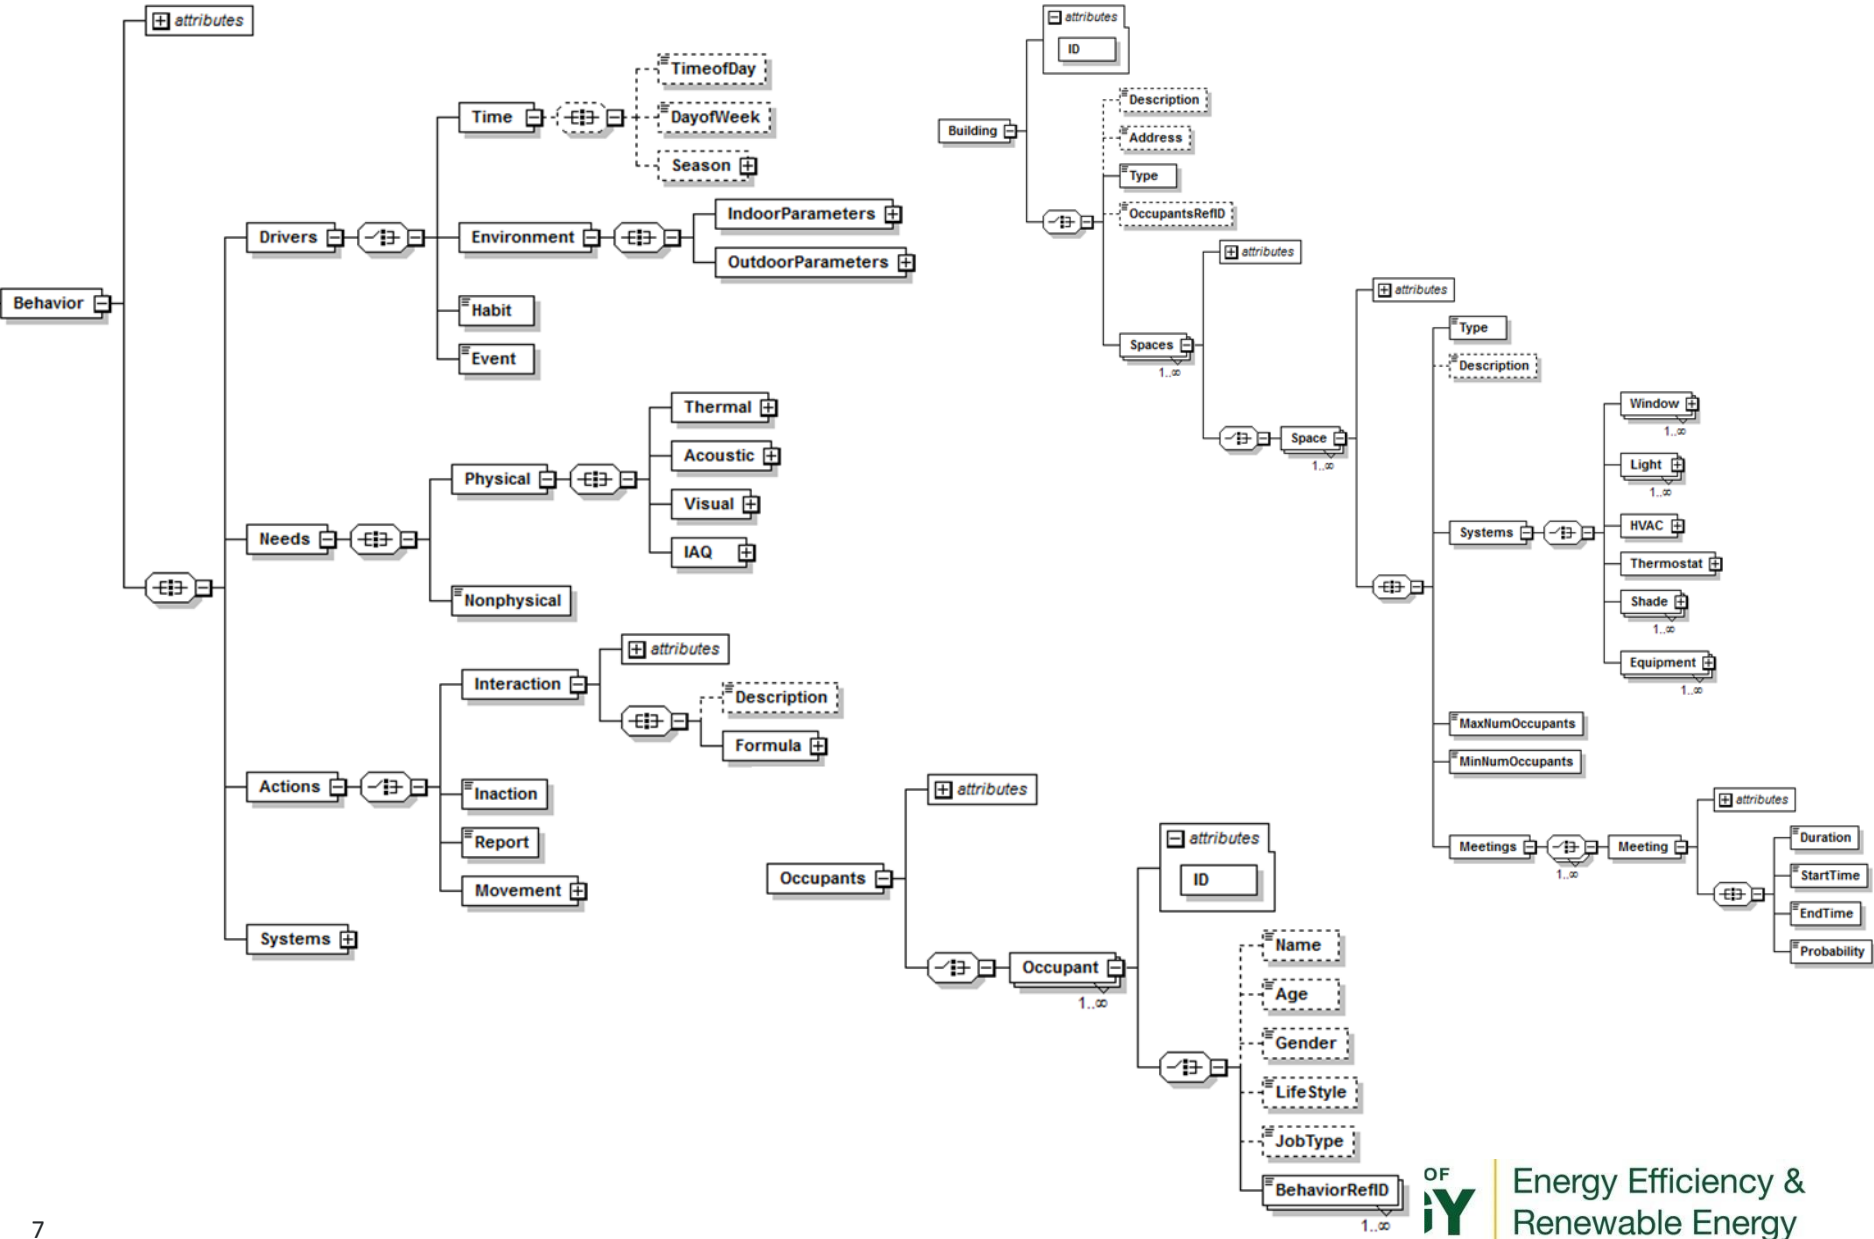

Distinctive Characteristics:

- Advanced data mining methods to discover behavior patterns
- A framework and XML schema to describe occupant behavior
- A behavior modeling tool to enable co-simulation
- Integration with EnergyPlus to simulate behavior impact

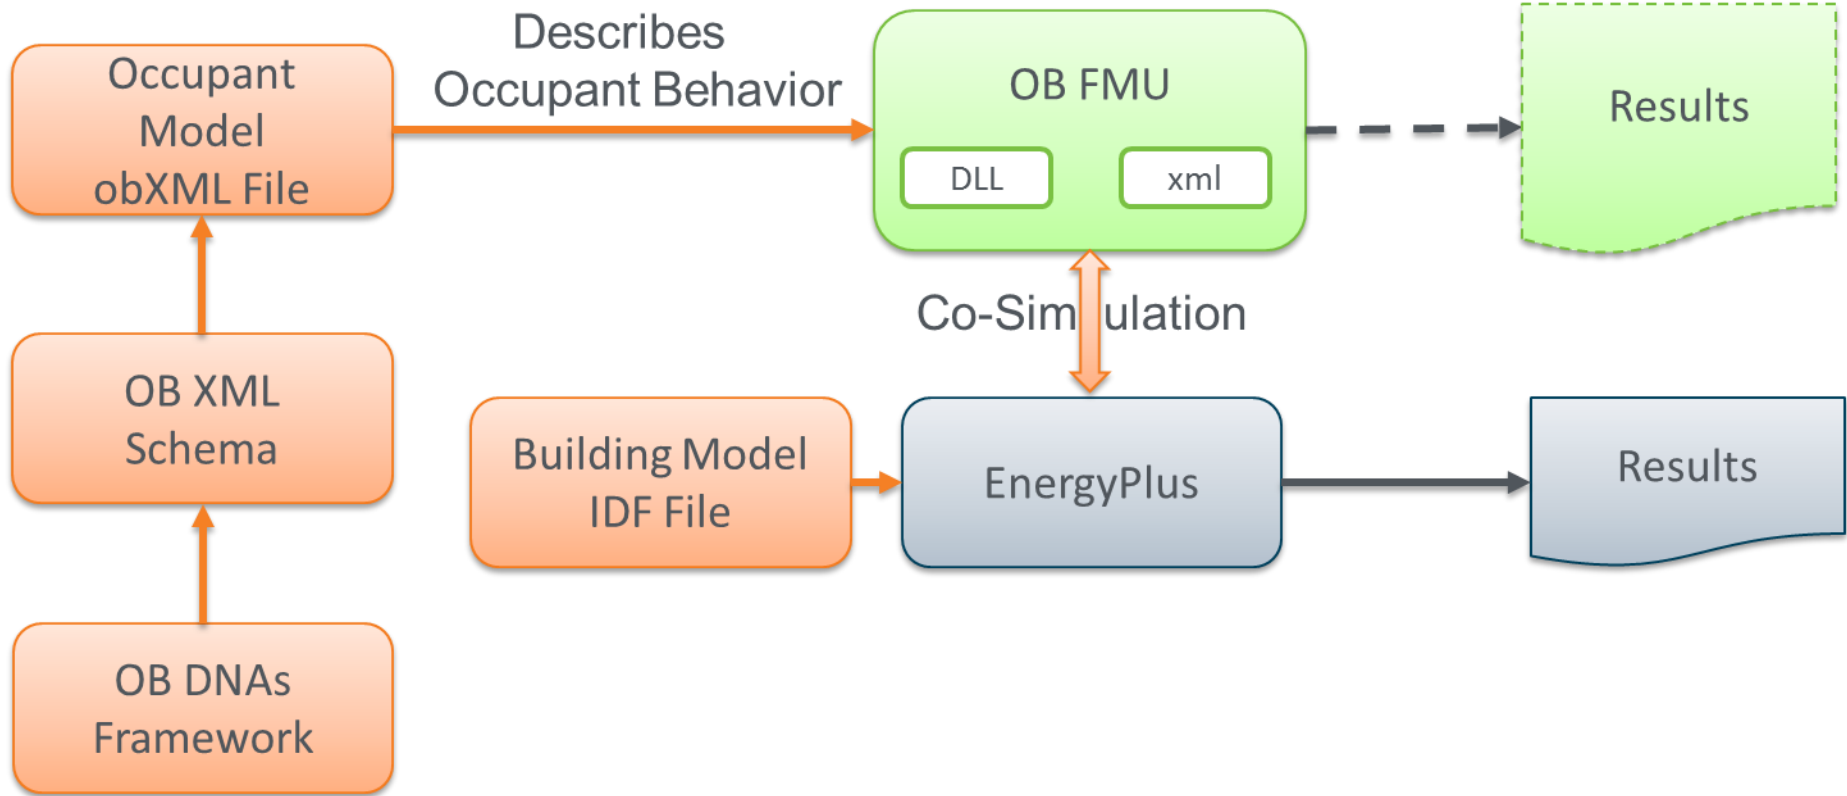

Key Issues:

- Complexity and multi-disciplinary of occupant behavior
- Behavior data: hard to get, privacy concerns

The XML Schema (obXML) representing Occupant Behavior

Architecture of the Occupant Behavior Modeling Tool

A new and unique behavior modeling tool enabling co-simulation

Example: Models of Air-Conditioning On/off

No.	Turn on pattern description	Model
1	Never turn on AC	$P = 0$
2	Turn on AC when occupied and feeling hot	$P = \begin{cases} 1 - e^{-\left(\frac{T-u}{L}\right)^k \Delta\tau} & , T \geq u \text{ , when occupied} \\ 0 & , T < u \end{cases}$
3	Turn on AC when entering the room and feeling hot	$P = \begin{cases} 1 - e^{-c\left(\frac{T-u}{L}\right)^k} & , T \geq u \text{ , when entering} \\ 0 & , T < u \end{cases}$
4	Turn on AC when entering the room	$P = P_{enter}$
5	Turn on AC when working time begins	$P = P_{on_time}$

$$P = \begin{cases} 1 - e^{-\left(\frac{x-u}{L}\right)^k \Delta\tau} & , x \geq u \\ 0 & , x < u \end{cases}$$

No.	Turn off pattern description	Model
1	Turn off AC when feeling cold enough	$P = \begin{cases} 1 - e^{-\left(\frac{u-T}{L}\right)^k \Delta\tau} & , T \leq u \text{ , when occupied} \\ 0 & , T > u \end{cases}$
2	Turn off AC when leaving the room	$P = 1 - e^{-\left(\frac{t_{leave}}{L}\right)^k}$
3	Turn off AC when working time ends	$P = P_{off_time}$
4	Never turn off AC	$P = 0$

Example: AC Results

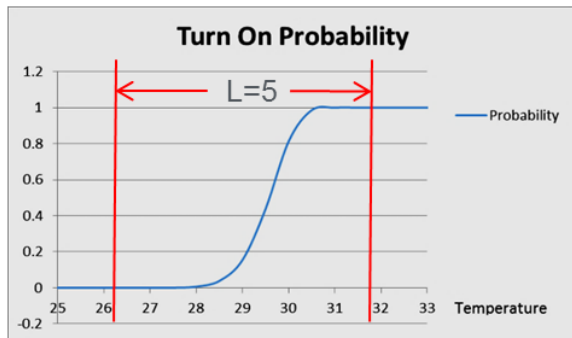

• AC On model

- ✓ Turn on when entering the room
- ✓ Turn on when feeling hot

Turn on AC when feeling hot

$\Delta t = 10$ min
 $u = 26$, $l = 5$, $k = 8$

$T = 30 \rightarrow P = 0.81$

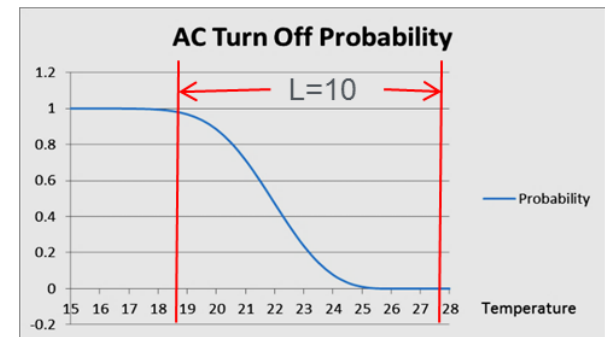

• AC Off model

- ✓ Turn off when leaving the room
- ✓ Turn off when feeling cold

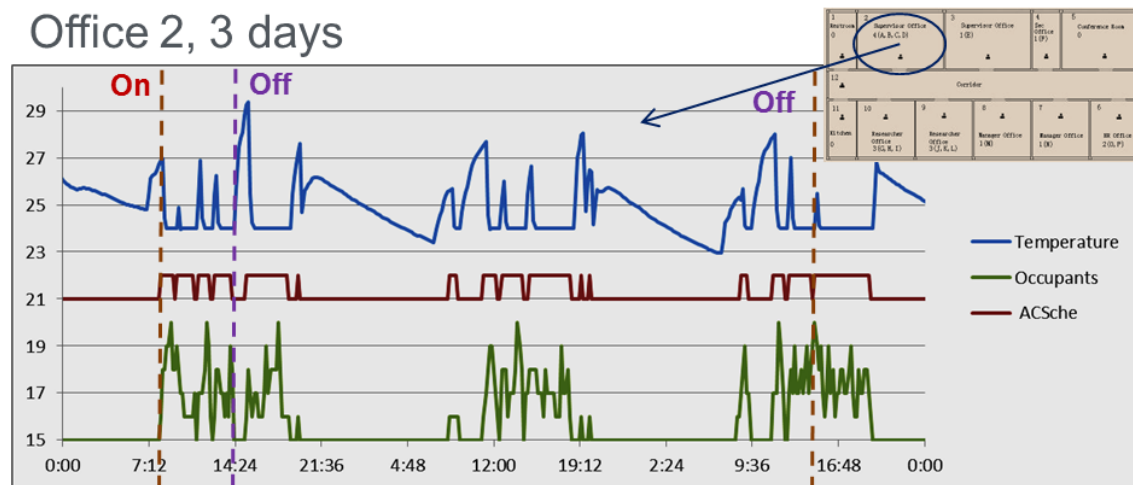

Turn off AC when feeling cold

$\Delta t = 10$ min
 $u = 26$, $l = 10$, $k = 3$

$T = 24 \rightarrow P = 0.08$

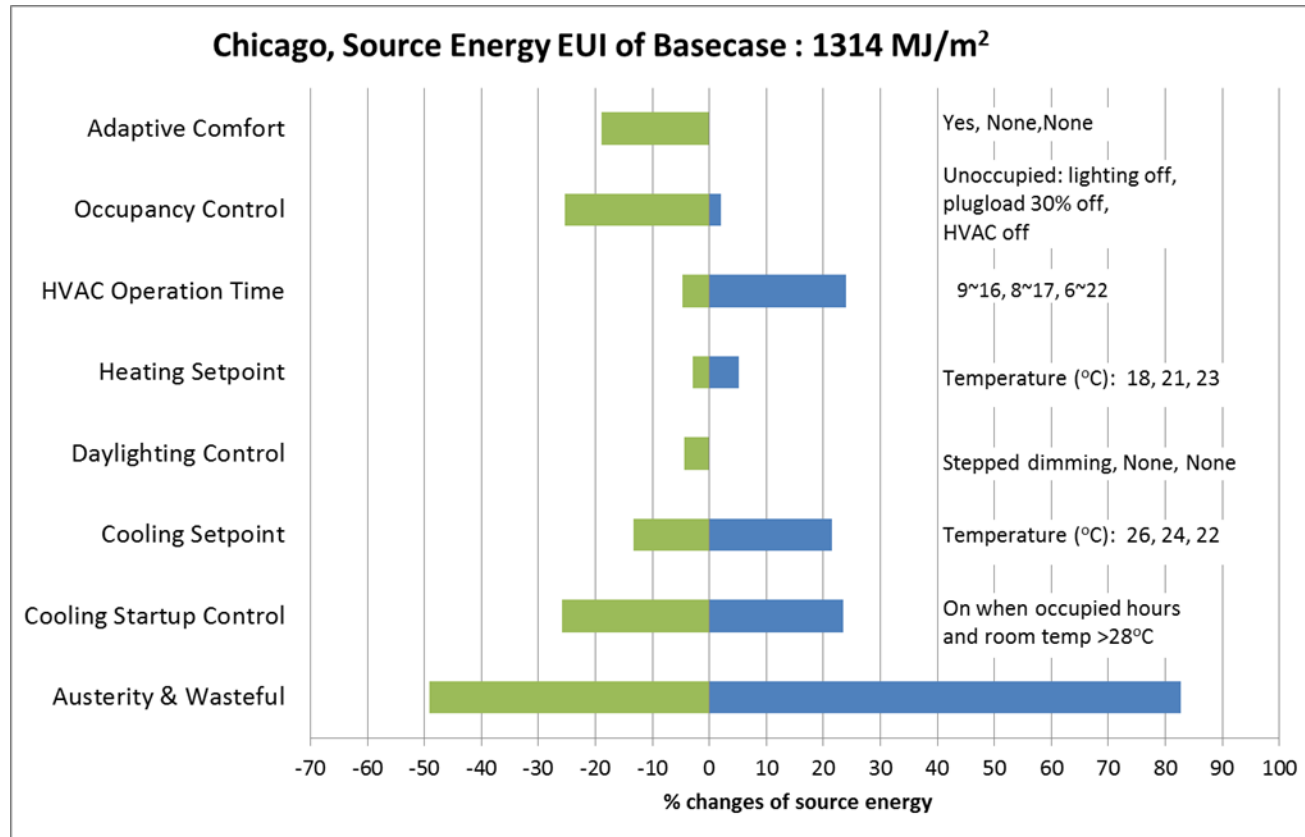

Office 2, 3 days

Occupant Behaviors in Private Offices

Behavior	Austerity Lifestyle	Standard Lifestyle	Wasteful Lifestyle
Cooling Setpoint (°C)	26	24	22
Heating Setpoint (°C)	18	21	23
HVAC Operation Time (Cooling and Heating)	9:00am - 4:00pm	8:00am - 5:00pm	6:00am - 10:00pm
Occupancy Control	If unoccupied <ul style="list-style-type: none"> • Lighting: off • Plug-load: 30% off • HVAC: off 	Scheduled	If unoccupied <ul style="list-style-type: none"> • Lighting: on • Plug-load: on • HVAC: on
Cooling Startup Control	Cooling starts when $T_{zone, air} \geq 28^{\circ}\text{C}$ during occupied hours, once started maintains the cooling setpoint; Cooling off during unoccupied hours.	Follow fan schedule & cooling thermostat during 8:00am - 5:00pm	Cooling always on during 6:00am - 10:00pm
Daylighting Control	Stepped Dimming	None	None
Adaptive Comfort	Yes	None	None

Impact of Occupant Behavior on Energy Use in Private Offices

- Assumed three life/work styles: Austerity, Norm, and Wasteful
- Simulation results for a single-person office in Chicago
- Energy impact
 - ❖ Austerity cuts energy use by 50%
 - ❖ Wasteful increases energy use by 80%

Progress and Accomplishments

Lessons Learned: Perceived complexity and usefulness of research; Lack good data

Accomplishments:

Evaluated impact of occupant behavior on energy use in buildings

Developed a software tool of behavior models

Developed a DNAs framework and XML schema for human behavior

Enabled EnergyPlus to co-simulate with the behavior modeling tool

Market Impact:

- Estimated potential of energy savings from behavior efficiency measures:
 - Residential Sector: 10% to 20%¹ (2.2 Quads from US homes)
 - Commercial Sector: 5% to 30%²
- Benefit to the U.S. and China:
 - Improve building simulation with better assumptions of occupant behavior
 - Provide feedback to technology development and building design

Awards/Recognition:

- Co-founding and leading the IEA EBC Annex 66

¹Heck S. and Tai H (McKinsey & Company): *Sizing the potential of behavioral energy-efficiency initiative in the US residential market*, Report, 2014.

²Hong T. and Lin H-W: *Occupant Behavior: Impact on Energy Use of Private Offices*. LBNL Report, LBNL-6128E, 2013.

Project Integration and Collaboration

Project Integration:

- Actively engage with Bentley Systems during the project
- 7 public workshops and seminars with stakeholders
- Leverage on international effort through Annex 66

[IEA-EBC Annex 66](#)
*Definition and Simulation
of Occupant Behavior in
Buildings*

Partners, Subcontractors, and Collaborators:

- A project under the U.S.-China CERC program
- **U.S. partners:** Bentley Systems
- **China partners:** Tsinghua University, CEEB of MoHURD, CBS

Communications:

- 7 public workshops and seminars: LBNL 7/2013; China 10/2013; IEA 8/2013; LBNL 8/2014; ASHRAE: 6/2014 Seattle, 1/2015 Chicago; LBNL 3/2015.
- Behavior modeling text for ASHRAE Handbook Fundamental 2017
- Presentations at conferences: BECC, ASHRAE, IBPSA, EDRA
- Publications: 12 journal articles, 5 conference papers
- IEA EBC Annex 66 meetings

Next Steps and Future Plans

Next Steps:

- Conduct a simulation-based case study to look at impact of occupant behavior on building performance and energy savings of technology
- Refine and publish the behavior schema and modeling tool
- Continue collaboration with Annex 66
- Outreach to ASHRAE standards (90.1, 189.1, 62.1, 55) committees

Future Plans:

1. Promote the developed behavior tools
2. Synergy with related behavior research and programs: utilities, ASHRAE, ACEEE, code and standards, policy
3. Coordinate with related activities under BTO programs
4. Modeling behavior at-scale: community, district energy systems
5. Integrate occupant behavior XML schema with BIM
6. Study impact of occupant behavior on demand response

Project Budget

Project Budget:

2013: \$160K

2014: \$220K

2015: \$100K

Variances: The budget for 2015 was cut and the scope was adjusted.

Cost to Date: 2014: 100%; 2015: 30%

Additional Funding: NA

Budget History

Jan 2013 – FY2014 (past)		FY2015 (current)		FY2016 – FY2020 (planned CERC 2.0)	
DOE	Cost-share	DOE	Cost-share	DOE	Cost-share
\$380K	\$400K	\$100K	\$100K	tbd	tbd

Project Plan and Schedule

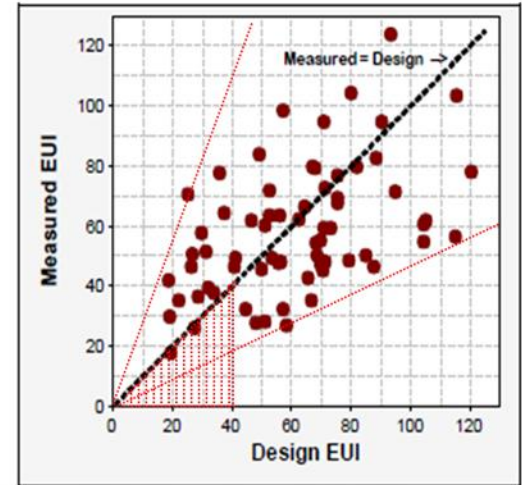

Project plan:

- Start date: 1/1/2013
- Completion date: projected 12/31/2015

Project Start: 1/1/2013	Completed Work											
Projected End: 9/30/2015	Active Task (in progress work)											
	◆ Milestone/Deliverable (Originally Planned) use for missed											
	◆ Milestone/Deliverable (Actual) use when met on time											
	FY2013				FY2014				FY2015			
Task	Q1 (Oct-Dec)	Q2 (Jan-Mar)	Q3 (Apr-Jun)	Q4 (Jul-Sep)	Q1 (Oct-Dec)	Q2 (Jan-Mar)	Q3 (Apr-Jun)	Q4 (Jul-Sep)	Q1 (Oct-Dec)	Q2 (Jan-Mar)	Q3 (Apr-Jun)	Q4 (Jul-Sep)
Past Work												
Q1 Evaluation of enery impact of behavior in private offices	◆											
Q2 Occupancy models and simulation			◆									
Q3 Behavior software model + improvements			◆									
Q4 Public workshops				◆								
Q5 Behavior framework, XML schema						◆						
Current/Future Work												
Improvements to the Behavior software module												◆
Improvements to the XML schema											◆	
Case study of behavior impact												◆

Background

- Technologies alone do not necessarily guarantee low energy use in buildings.
- Human behavior :
 - Not well understood
 - Stochastic and multidisciplinary
 - Usually over-simplified or ignored!
- Behavior changes, usually no or low cost, has demonstrated:
 - 30% energy savings in buildings
 - > 50% in very low energy buildings.

2008 NBI Study of LEED NC certified buildings

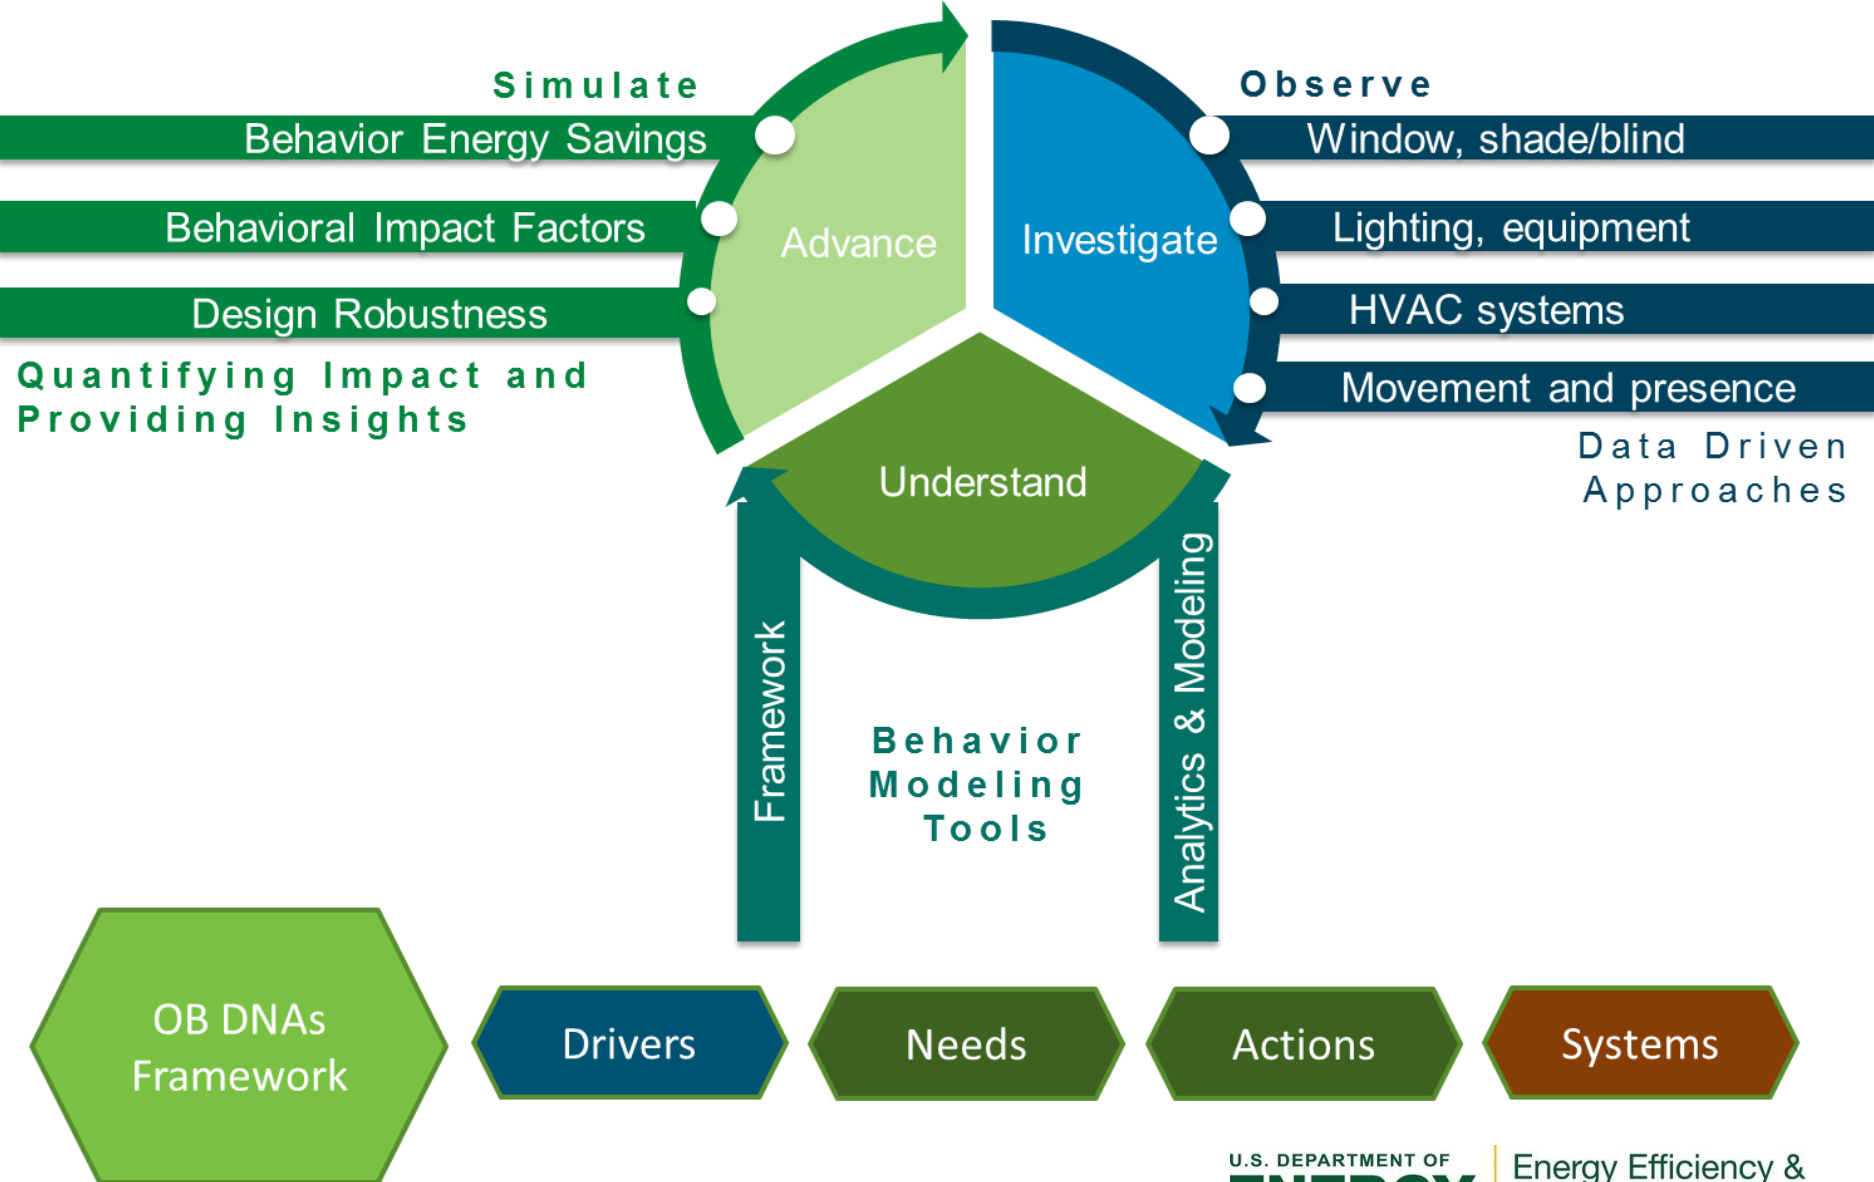

- Low energy buildings under-performed

Courtesy: Danny Parker, FSEC

- Virtually identical homes and efficiencies
- 3x variation in energy use

Technical Approaches

Data Mining and Statistical Methods –

Occupant Behavior of Window Opening/Closing

Phase 1
Statistical Analysis
Logistic regression function

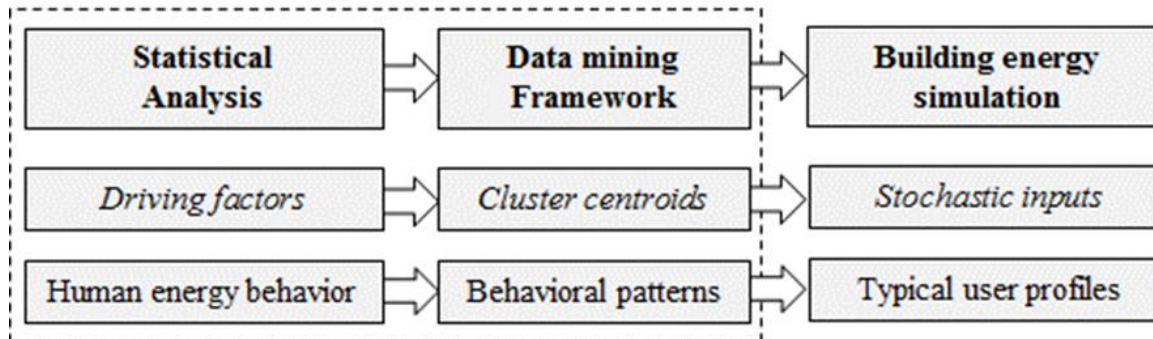

Factors influencing window opening and closing
Variables
Coefficient

Phase 2
Cluster Analysis
k-means algorithm

Behavioral patterns
➤ How long?
window state
h/day windows stay open/close
➤ How often?
window change
n changes/day
➤ How much?
window position
schedules of tilting angle
➤ Why?
window opening/closing drivers
variables and coefficients

Phase 3
Association Rule Mining
FP-growth algorithm

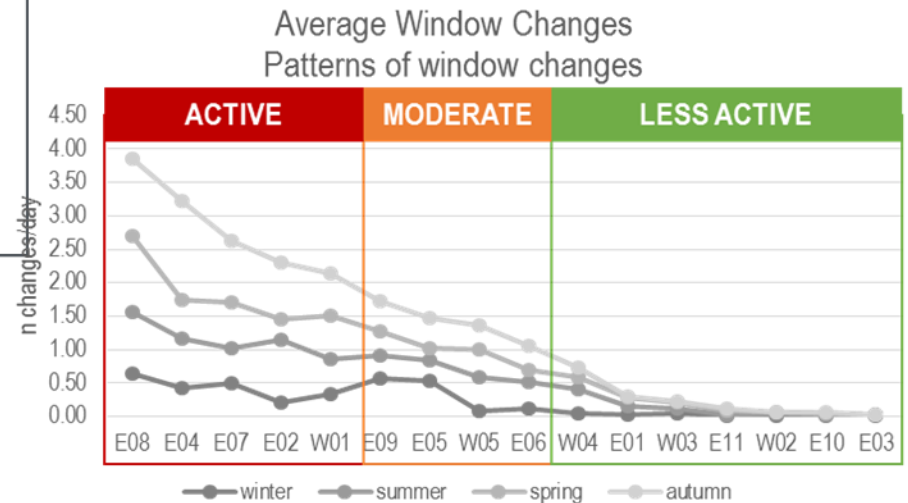

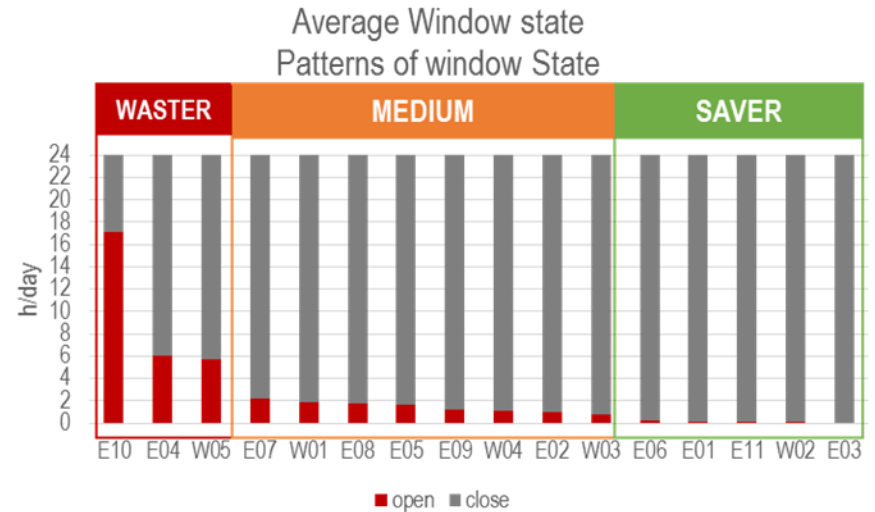

From behavioral patterns to
User profiles

Dataset and Results

- 16 offices of a natural ventilated building
- 5-minute interval data over two complete years
- measured indoor and outdoor physical parameters
- measured behavior and energy use

Outdoor	Indoor	Behavior and Energy Use
Solar radiation [W/m ²]	Room air temperature [°C]	Occupancy [0/1]*
Rain – amount [l/m ²]	Surface temperature [°C]	Window contact [0/1 ; Reed contacts]*
Rain – event [yes/no]	Ceiling slab temperature [°C]	Top light control [0/1 ; Reed contacts]*
Light intensity – horizontal [lx]	CO ₂ concentration [ppm]	Sun protection [% of closure: 0% = open to 100% = closed]
Light intensity - South [lx]		Electricity consumption [kWh]
Light intensity - East [lx]		
Light intensity - North [lx]		
Light intensity - West [lx]		
Outdoor temperature [°C]		
Wind – velocity [m/s]		
Wind – direction [°]		
CO ₂ content in air [ppm]		
Outdoor humidity [%rH]
