

BIOENERGY IMPACTS

Bioenergy companies are implementing new technology with less risk

The Bioenergy Technologies Office funds facilities that help companies to identify and address potential challenges before they implement their systems in an industrial setting. The Biomass Feedstock National User Facility (BFNUF) at Idaho National Laboratory assists companies in moving their bioenergy business ventures from laboratory to commercial scale. Companies can test their feedstock preparation technologies onsite at the BFNUF before using them at a commercial scale, saving both time and money.
