

# Native Village of Eyak Wind Energy Feasibility Study

---

Prepared by Heath Kocan & Casey Pape

Presented by Casey Pape  
Alternative Energy Coordinator

# Native Village of Eyak

- Federally Recognized Tribe in Cordova, AK
- Governed by a five-member tribal council
- Provides health and social services, economic development, job training and environmental and resource management
- 525 Tribal members

# Location of Project

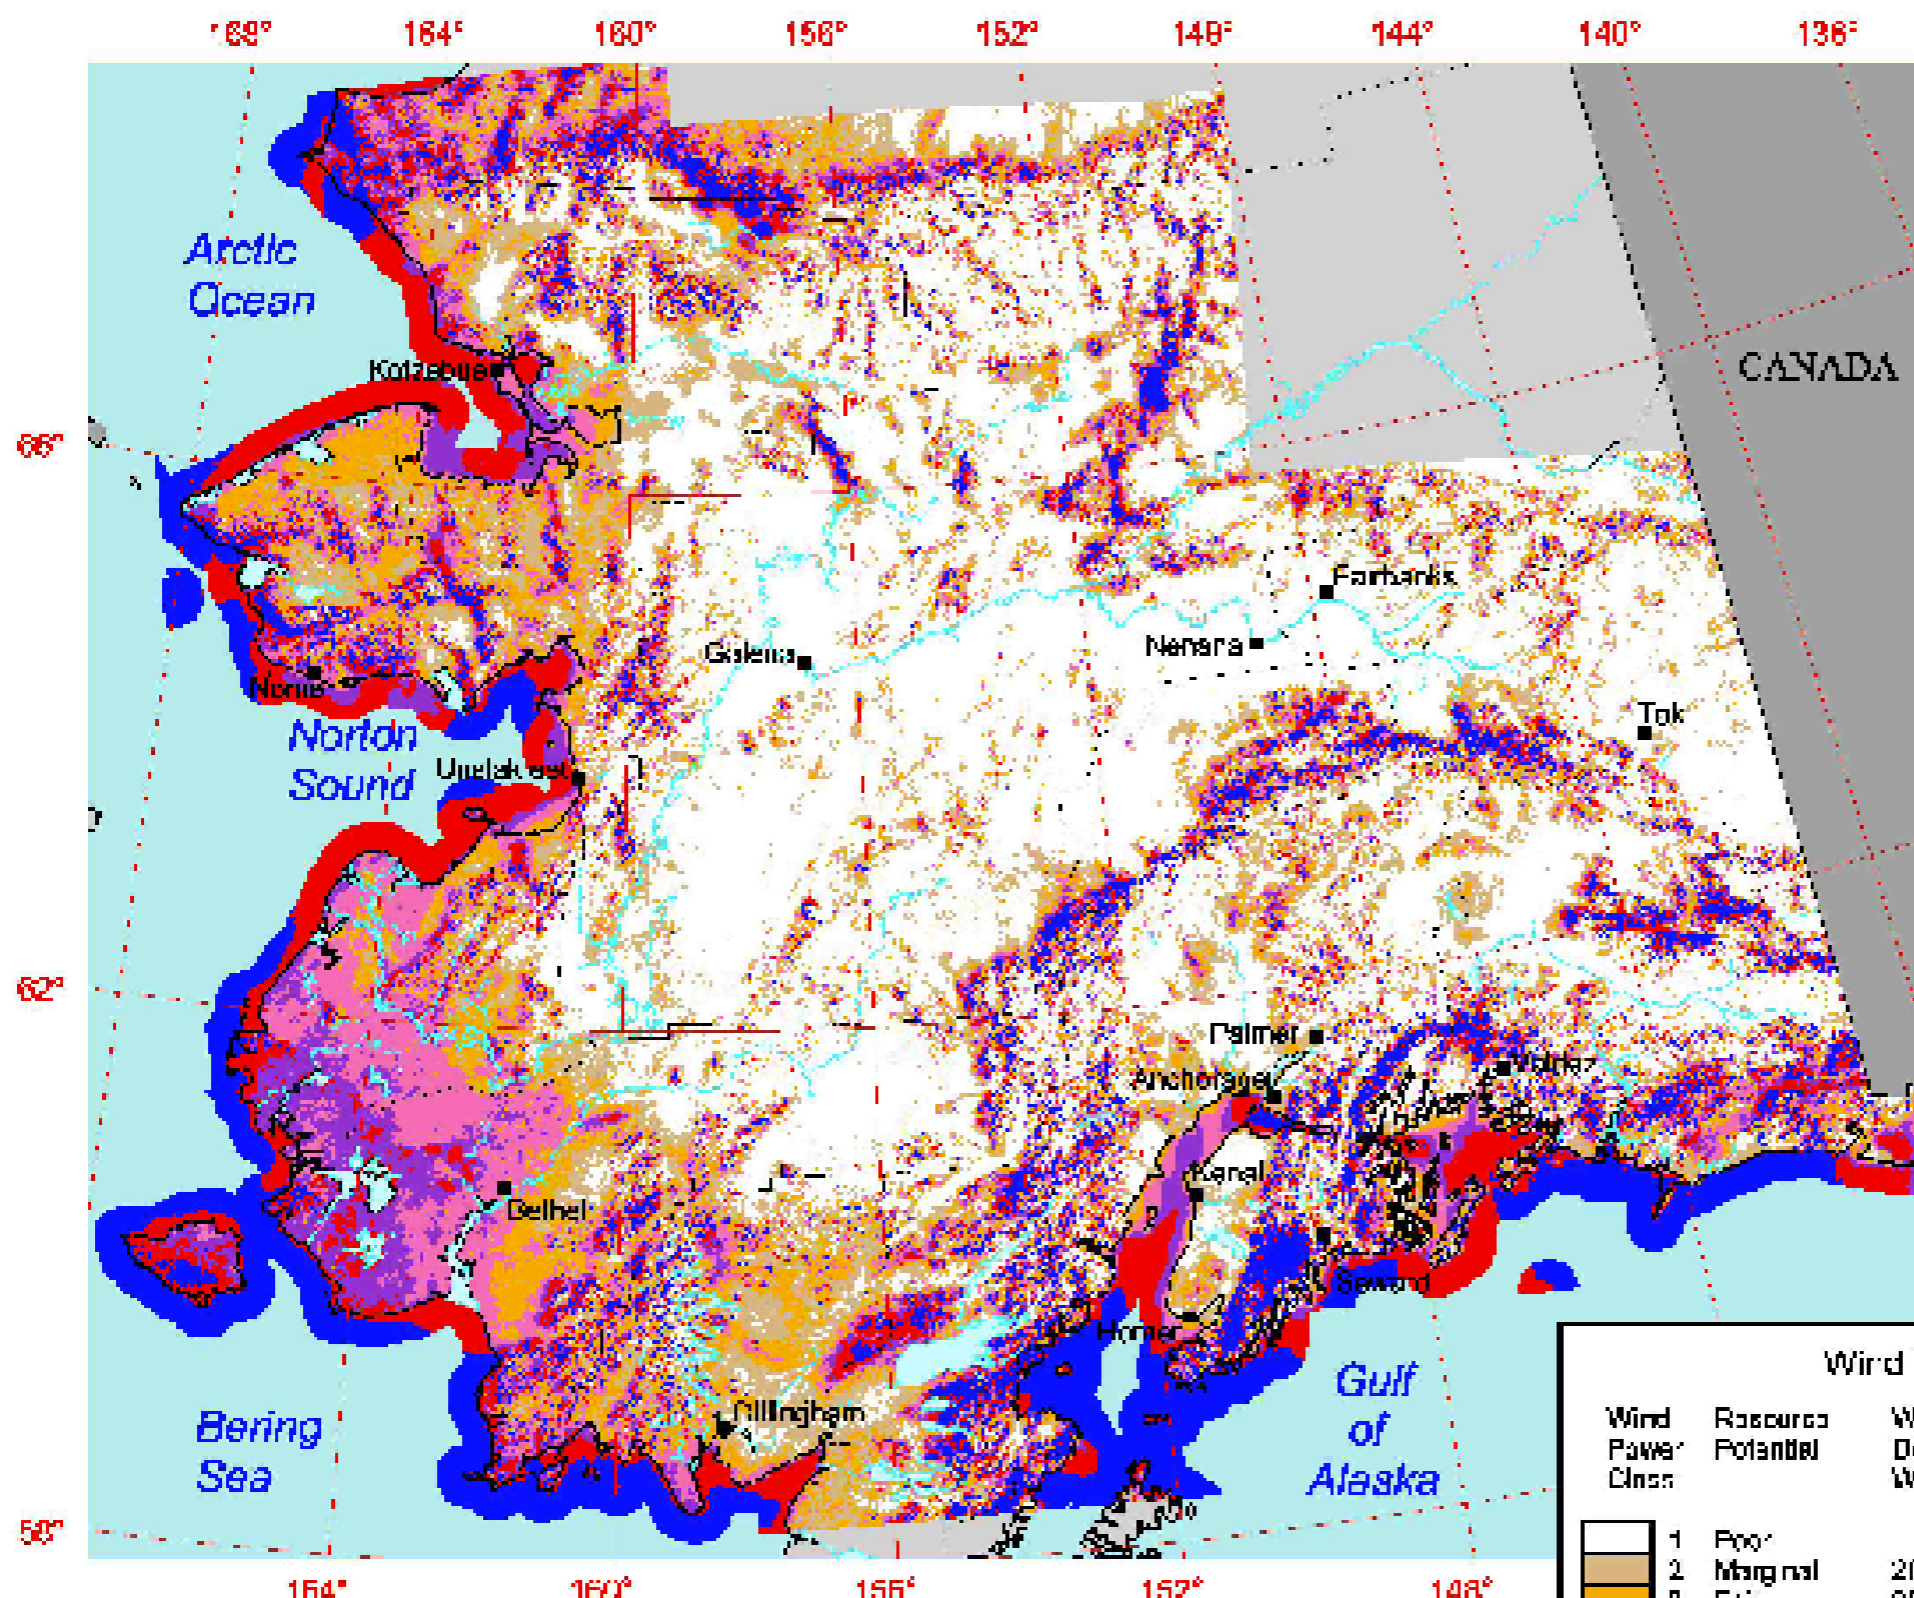

# Why Wind Power?

- Reduces petroleum use
- Reduces carbon footprint
- Cost can be competitive with diesel generator production
- When used with storage medium it can greatly reduce diesel generator use and improve grid reliability

# Alaska Mainland Regions 50 m Wind Power

The annual wind power estimates for this map were produced by AWS Truewind using their Mesomap system and historical weather data. It has been validated with available surface data by NREL and wind energy meteorological consultants.

Wind Power Classification				
Wind Power Class	Resource Potential	Wind Power Density at 50 m $Wm^{-2}$	Wind Speed <sup>a</sup> at 50 m m/s	Wind Speed <sup>a</sup> at 50 m mph
1	Poor	0 - 200	0.0 - 5.9	0.0 - 11.3
2	Marginal	200 - 300	5.9 - 6.1	11.9 - 13.7
3	Fair	300 - 400	6.1 - 6.7	13.7 - 15.3
4	Good	400 - 500	6.7 - 7.3	15.0 - 16.4
5	Excellent	500 - 600	7.3 - 7.7	16.4 - 17.2
6	Outstanding	600 - 800	7.7 - 8.5	17.2 - 19.3
7	Superb	> 800	> 8.5	> 19.3

<sup>a</sup> Wind speeds are based on a Weibull  $k$  of 1.9. Weibull  $k$  values in Alaska vary from 1.4 to 2.0.

# Power From The Wind

---

$$P = \frac{1}{2} C_p A_s \rho v^3$$

$C_p$  = Coefficient of Performance

$A_s$  = The swept area of wind turbine blades

# NorthWind 100/21 Wind Turbine Power Curve Standard Density

# So Which is Better

1. A location where the wind blows only 50% of the time at 10m/s but is calm the rest of the time
2. A location where the wind blows all of the time at 5m/s

Both have exactly the same annual mean wind speed

$$P = \frac{1}{2} C_p A_s \rho v^3$$

# Make The Calculation

AEP = Expected Power × Availability × Time

Case 1: 10m/s 50% of the time

$$\begin{aligned} \text{AEP} &= 60\text{kW} \times (8760 \times 0.5) \\ &= \mathbf{262,800} \text{ kWh/year} \end{aligned}$$

Case 2: 5m/s all of the time

$$\begin{aligned} \text{AEP} &= 10 \times (8760 \times 1) \\ &= 87,600 \text{ kWh/year} \end{aligned}$$

# Wind Shear

The type of surface (grass, trees)  
Slope of surface (flat, hilltop)

# Current Energy Generation

---

## Hydro Electric Power

- 2 run of river facilities (5 turbines)
- ~7.5 MW of capacity

## Diesel Generator

- 4 diesel generator units
- 7.1 MW of capacity

# Current Energy Use

---

Peak Load

- 7500 kW

Average Load

- 3500 kW (summer)
- 2000 kW (Oct-Apr)

Minimum Load

- 1400 kW

Diesel Use: ~900,000  
gallons/yr

# NREL Study

---

- DOE Tribal loan program
- 30m tower erected at Point Whitshed
- Data collected for 18 months

Wind Speed and River Flow Rate vs. Time

# Pt Whitshed Statistics

---

- Average wind speed at 29m: 13.1mph (5.9m/s)
- Average power density at 29m: 346W/m<sup>2</sup>
- Estimated resource at 50m: 14mph, 410W/m<sup>2</sup>
- Mean turbulence intensity: 0.18
- Capacity factor: 24%, 42% in winter
- Levelized cost of energy: ~\$0.25/kWh

# Site Analysis

---

- MET Towers Installation
- Data Analysis
- Avian Studies
- Environmental Assessment

# MET Towers

- 1 - 30 meter towers, 18 months of continuous data collection (returned to NREL 2010)
- 2 - 10 meter towers, placed on location at 4 month intervals (NVE owned)
- 1 – 60 meter tower, on loan from NREL to be installed on Copper River delta

# Site Selection

---

- Soil analysis
- Transmission line access
- Road access: Crane, Turbine blades, tower sections
- Turbine model and quantity
- GIS Multi-Criteria Analysis

# Avian Studies

---

- Spring 2011 migration studies of Point Whited and Reservoir were conducted from April 14 to May 24, 2011
- 781 observations were tallied during 42 3-hour surveys – a total of 17,767 individuals
- Of those 781 observations:
  - 203 (26%) – waterfowl
  - 20 (3%) – cranes
  - 94 (12%) – raptors
  - 464 (59%) – various species, primarily gulls (95%)

# Soil Analysis

# Soil Analysis

# Transmission Access

---

- Current best site - No Transmission (submerged cable)
- Mile 14 : 1-2 miles needed

# Road Access

---

- Weight Limits (80 ton crane for larger turbines)
- Current best site has no road
- Temporary road at Point Whitshed

OVERSIZE LOAD

# Lessons Learned

---

- Understand your current energy profile and how wind can play a supporting role
- Conduct regular meetings and obtain community input often
- Use grant money efficiently in the short-term in order to have retain long-term usefulness
- Be realistic with your site selection
- Diversify specialty knowledge and training (factor in personnel turn around)

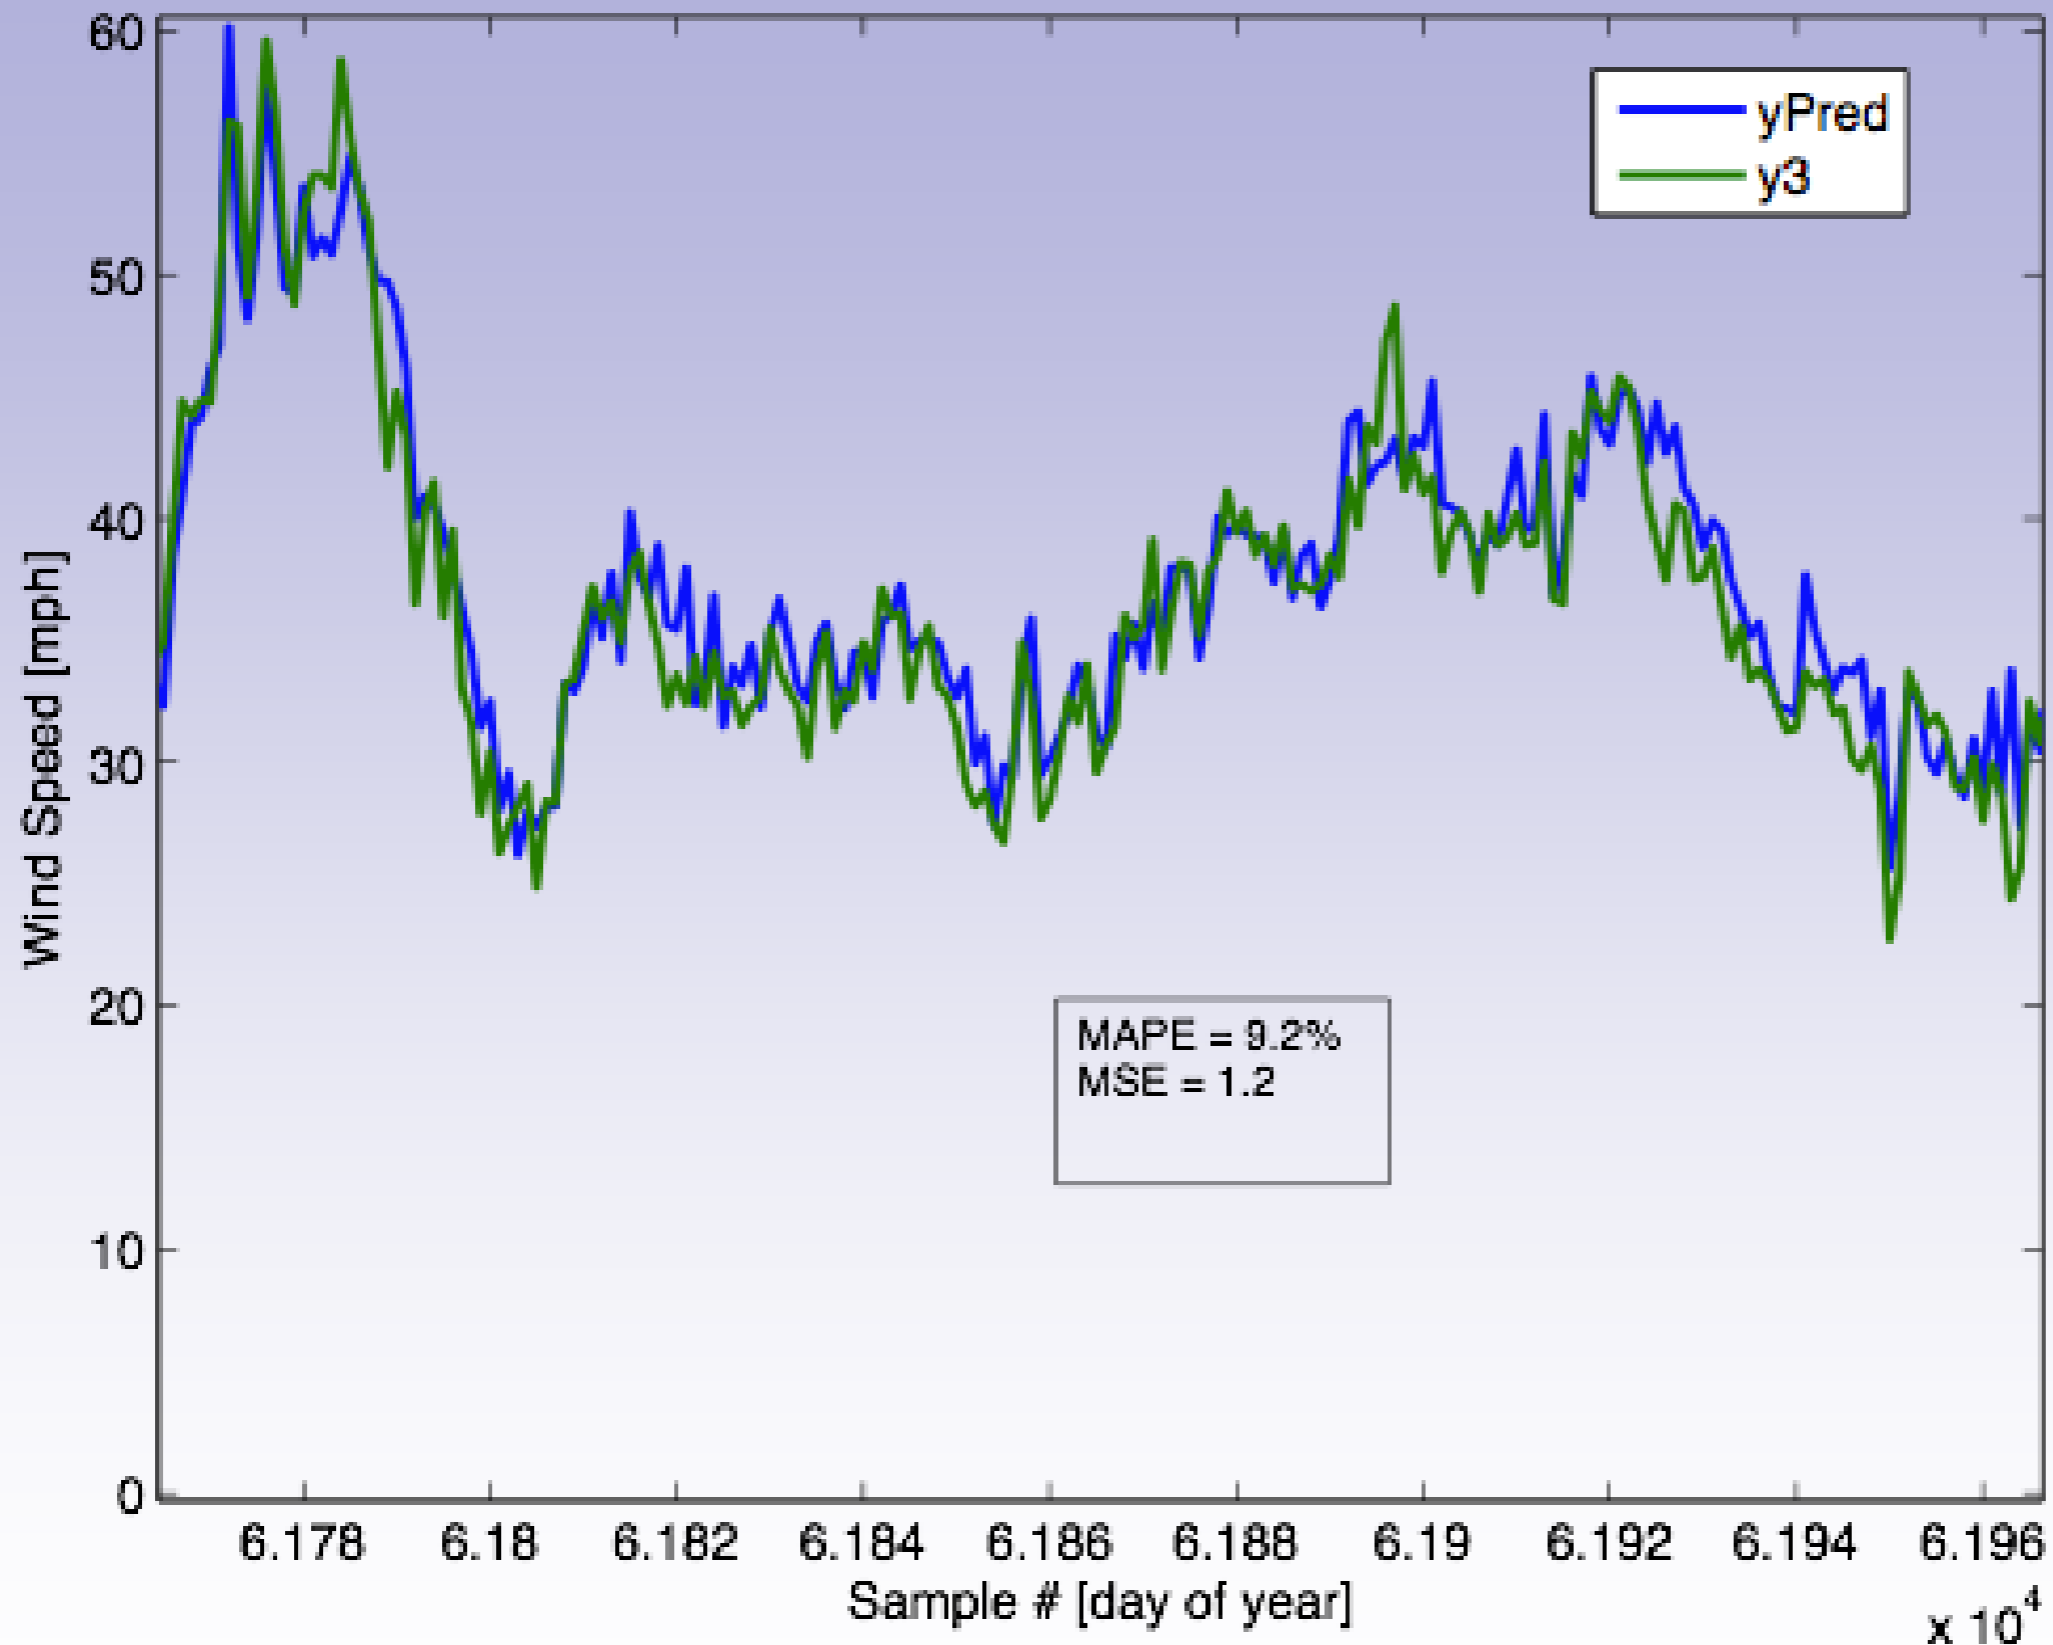

# Thank You

# Monthly Average Electrical Production

GE 1.5 MW Turbine

# Community Wind

---

- Determining community load
- Possible dump loads:  
District heating, battery storage

# Project Funding

---

- Site specific: Eyak corp, City land, USFS
- Tax incentives: CEC, NVE and City are ineligible for most incentives
- Clean Renewable Energy Bonds for Cooperatives
- Possible DOE funding

# Project Status

---

- Site assessments complete, ready for MET tower installation
- Avian studies ready for next years migrations
- Educational outreach
  - Working with High School science club on wind study

# To Be Completed

---

- Once funds are available order MET tower components and erect
- Avian studies completed Spring and Fall of 2011 (migratory times)
- System modeling (HOMER, Matlab, Hybrid2)

# Go No Go

---

- More data may be needed based on turbine selection (Taller MET tower data needed at site)
- Is it financially viable?
- Current Outlook: Battery storage needed first due to non-dispatchable power of wind and to allow for higher penetration levels (decreasing diesel consumption)

# Project Participants

---

- Cordova Electric Cooperative
- Eyak Corporation
- Cordova School District
- Alaska Energy Authority

# Small Wind

---

## Small Wind Power 300 W to 10 kW Units

- Installed at individual homes, businesses, schools, etc.
- On the “demand” side of the meter, or off the grid entirely
- High reliability, low maintenance
- 9 mph (4m/s) average wind speed

# Small Wind

---

Generator: direct-drive, permanent magnet alternator (no brushes), variable-speed operation

Controller: electronic device that delivers -DC power for charging batteries -AC power for utility interconnection

Result:

Simple, rugged design

Only 2–4 moving parts

Little regular maintenance required

# Small Wind Incentives

---

- Rebate grant programs:  
USDA
- Net metering
- Reasonable interconnection requirements
- State/City zoning ordinance
- US Treasury tax credit:  
30% of project cost (2016)
