The NI PEIS identifies (in Chapter 3 of Volume 1) endangered species that live on or near all of the candidate sites, as well as aquatic and wetlands areas that may be impacted by operations at candidate locations. According to an International Atomic Energy Agency (IAEA) publication (IAEA Technical Report Series No. 332, Effects of Ionizing Radiation on Plants and Animals at Levels Implied by Current Radiation Protection Standards), a dose rate of 100 millirem per year to the most exposed human will lead to dose rates to plants and animals of less than 0.1 rad per day. The IAEA concluded that a dose rate of 0.1 rad per day or less for animals and 1 rad per day or less for plants would not affect these populations. The largest individual dose for any of the nuclear infrastructures alternatives under normal operations would be less than 0.1 millirem, which is three orders of magnitude less than the IAEA threshold for adverse effects. Therefore, implementation of any of the range of reasonable nuclear infrastructure alternatives analyzed would not be expected to result in an adverse impacts on plants and animals living in potentially affected areas around the candidate sites.

Commentor No. 1894: Misty East

Response to Commentor No. 1894

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

I oppose the restart of the FFTF at Hanford Nuclear reactor.
 I feel that having this company open has destroyed many lives, people govt. And they have lost their chance of being a lawyer or going into the ARMY.
 I also feel that destroying our animals our plant our water, makes my fellow friends scared of what is going to happen, or not doing the right thing, like not giving their children the right nutrients they need.
 I feel that before you make any decisions about re-opening the reactor think of our futures.

1894-1

1894-2

1894-3

1894-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

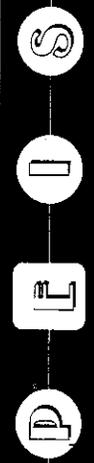

1894-2: DOE notes the commentor's opposition to the use of FFTF for the enhancement of its nuclear facility infrastructure. The environmental impacts associated with operation of the FFTF and support facilities at Hanford during normal operations and from postulated accidents are presented and discussed in Section 4.3 of Volume 1 of the NI PEIS. All impacts to human health and to ecological resources would be small in the immediate area of the Hanford Site and negligible at all distant locations.

All environmental parameters (e.g., air, soil, surface water, groundwater, vegetation, animals, etc.) in and around the Hanford Site are monitored on a set frequency. The information is available to the public in annual monitoring reports. No food or water restrictions are currently in place outside the Hanford Reservation as a result of Hanford activities.

1894-3: DOE notes the concern expressed in the comment on the potential impacts associated with FFTF restart described in the NI PEIS. The environmental impacts associated with operation of the FFTF and support facilities at Hanford during normal operations and from postulated accidents are presented and discussed in Section 4.3. All impacts to human health and to ecological resources would be small in the immediate area of the Hanford site and negligible at all distant locations.

Commentor No. 1895: Jesse Hayres

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

I oppose strongly
 the reopening of Hanford nuclear
 reactor. General Electric has
 poisoned our northwest enough.
 You've ruin familys killed people
 and covered it up the whole
 time. I cant believe it is even
 a option to reopen it.

Response to Commentor No. 1895

1895-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1895-2: General Electric is not involved with any part of the DOE missions addressed in the NI PEIS. There have been no serious safety-related accidents or accidental releases of hazardous or radioactive materials causing injury or harm to workers, or posing any threat or harm to the offsite public at FFTF or the proposed Hanford support facilities during their respective lifetimes.

The environmental impacts associated with operation of the FFTF and support facilities at Hanford during normal operations and from postulated accidents are presented and discussed in Section 4.3 of Volume 1 of the NI PEIS. All impacts to human health and to ecological resources would be small in the immediate area of the Hanford Site and negligible at all distant locations.

Commentor No. 1896: Melinda Arnone

Response to Commentor No. 1896

Draft PEIS Comment Form

I oppose the restart of the FTF at Hanford nuclear reactor. I don't believe that there could ever be a good enough reason to restart the FTF. There are too many problems that would happen. People would die, become sterile, have deformed children, and get long-term sickness that would conclude in death. I would also like our rivers to get cleaner, not more radio-active.

1896-1

1896-1: DOE notes the commentor's opposition to Alternative 1, Restart FTF.

1896-2

1896-2: DOE notes the commentor's views. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs:

1896-3

1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;

1896-4

2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and

3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

1896-3: This PEIS has provided an estimate of the incremental potential human health impacts associated with a range of reasonable alternatives (one of which includes the restart of FTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of these alternatives, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with each alternative and with restarting FTF would be small. As stated in Appendix H of the EIS, other human health impacts (non-fatal cancers and genetic mutations) occur with a lower frequency for the same level of exposure to low levels of radiation. Since the most likely impact on the population from all of the alternatives

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Commentor No. 1896: Melinda Arnone (Cont'd)

Response to Commentor No. 1896

is no additional fatalities, it follows that the expected result for these other health impacts is no additional impact.

- 1896-4:** FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Further, the waste generated from the candidate facilities at Hanford would be managed in a safe and environmentally protective manner and in compliance with all applicable Federal and State laws and regulations and DOE Orders. The Hanford Site also has a comprehensive waste minimization and pollution prevention program in place as summarized in Section 3.4.11.8 that would govern any proposed site activities.

Commentor No. 1897: Mary Conway

Response to Commentor No. 1897

Draft PEIS Comment Form

I oppose the restart of the FFTF at Hanford nuclear reactor because I would like the rivers to get better not worse. The nuclear reactor is killing fish and people. So why restart it?

7/12/00

1897-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1897-2: FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. Section 3.4.4 of Volume 1 of the NI PEIS describes the current condition of water resources potentially affected by the Hanford Site, with specific discussions of surface water and groundwater resources in the Hanford 400 Area, where FFTF is located, provided in Sections 3.4.4.1.2 and 3.4.4.2.2, respectively. This information indicates that the only impact that 400 Area operations have had on water resources to date is contamination of the unconfined aquifer system with nitrate from sanitary sewage disposal. The source of this contamination has since been removed resulting in nitrate levels diminishing over time. The effects of maintaining FFTF in its current standby mode for 35 years are described in Section 4.2.1.2.4 of Volume 1 and this analysis indicates that the impact on water resources would be negligible. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

FFTF standby operations have no impact on fish or other aquatic life. There has never been an accidental release or discharge from FFTF that has killed fish in the Columbia River. As described in Section 3.4.4.1.2 of the NI PEIS, the only liquid effluent discharged from FFTF during current standby operations consists of process wastewater from the facility's cooling towers. This wastewater is discharged to the 400 Area Pond that allows the effluent to percolate to the subsurface. The pond is normally dry. These discharges are regulated under State Waste Discharge Permit No. ST-4501. The effluent is continuously monitored before discharge with periodic sampling and analysis to determine compliance with effluent limitations. Aside from cooling water treatment chemicals added to control corrosion and algae growth, the only chemical and radiological constituents in the discharge are those that occur in the groundwater used for cooling tower makeup. As discussed in the previously cited sections of Chapter 4, restart of FFTF would increase the volume of process wastewater discharged to the pond system but would not measurably affect the quality of the effluent.

Commentor No. 1897: Mary Conway (Cont'd)

Response to Commentor No. 1897

1897-3: The commentor's position regarding the restart of FFTF is noted. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, which includes restart of FFTF, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

Commentor No. 1898: Daniel Anthony Herrera

Response to Commentor No. 1898

Draft PEIS Comment Form

I Daniel Anthony Herrera of the Parkrose Community oppose the restart of FFTF Nuclear at Hanford. How could you want to start up something that causes so much devastation and tragedy to so many innocent peoples lives. Do you really think our lives are expendable so you can go make your stupid plutonium or what ever you make. I will do whatever I can in my power to try and stop your irresponsibility.

1898-1

1898-2

1898-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1898-2: This PEIS has provided an estimate of the incremental potential human health impacts associated with each of a range of reasonable alternatives (including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated each alternative analyzed and with restarting FFTF would be small. As stated in Appendix H of the EIS, other human health impacts (non-fatal cancers and genetic mutations) occur with a lower frequency for the same level of exposure to low levels of radiation. Since the most likely impact on the population from all of the alternatives is no additional fatalities, it follows that the expected result for these other health impacts is no additional impact.

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Commentor No. 1899: Jeanine

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

I oppose the restart of the FFTF nuclear reactor at Hanford. I think it's a very serious health problem. I don't want to have health problems down the line. I don't think it's right for people to put other people's life in jeopardy. I don't want to wake-up one day and have one of my friends dead because of the FFTF. Not only will you be risking the health of people, but you're risking the health of unborn babies. So to keep our health good, don't restart the FFTF.

Commentor No. 1901: Stephanie Rankin

Draft PEIS Comment Form

I oppose the restart of the FFTF nuclear reactor at Hanford. Peoples lives, farm land, cattle, our water supply, and all living things are more important than your nuclear reactor. Your nuclear reactor will affect too many living things in not the right way. You need to also think more about the health and safety of your employees. You have already killed and affected more than too many people.

1901-1

1901-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1901-2

1901-2: This PEIS has provided an estimate of the incremental potential human health impacts associated with each of a range of reasonable alternatives (including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

1901-3

The NI PEIS identifies (in Chapter 3 of Volume 1) endangered species that live on or near all of the candidate sites, as well as aquatic and wetlands areas that may be impacted by operations at candidate locations. According to an International Atomic Energy Agency (IAEA) publication (IAEA Technical Report Series No. 332, Effects of Ionizing Radiation on Plants and Animals at Levels Implied by Current Radiation Protection Standards), a dose rate of 100 millirem per year to the most exposed human will lead to dose rates to plants and animals of less than 0.1 rad per day. The IAEA concluded that a dose rate of 0.1 rad per day or less for animals and 1 rad per day or less for plants would not affect these populations. The largest individual dose for any of the nuclear infrastructure alternatives under normal operations would be less than 0.1 millirem, which is three orders of magnitude less than the IAEA threshold for adverse effects. Therefore, implementation of any of the range of reasonable nuclear infrastructure alternatives analyzed would not be expected to result in adverse impacts on plants and animals living in potentially affected areas around the candidate sites.

Worker safety (radiological protection) is a key element of DOE's Radiological Health and Safety Policy (DOE P 441.1, April 26, 1996). This policy states in part that DOE facilities must "conduct radiological operations in a manner that controls the spread of radioactive materials and reduces exposure to the workforce and the general public and that utilizes a process

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Commentor No. 1901: Stephanie Rankin (Cont'd)

Response to Commentor No. 1901

that seeks exposure levels as low as reasonably achievable.” Each DOE site, including Hanford, is required to implement a radiological control program with the intent to meet this policy goal. Based on the assessment of worker health impacts for all of the alternatives and options that make use of Hanford facilities, the most likely impact of the use of these facilities is no increase in cancer fatalities among the facility workers. For example in Alternative 1 option 3, all of the activities target irradiation and processing) occur at Hanford facilities. As shown in Section 4.3.3.1.9, the expected consequences are less than one additional fatal cancer among the workforce; that is, no additional fatal cancers are expected.

1901-3: No food or water restrictions are in place outside the Hanford Reservation as a result of Hanford activities.

DOE worker and public health and safety are of paramount and primary importance to the Department. There have been no serious safety related accidents causing significant injury or harm to workers, or posing any threat or harm to the offsite public at FFTF during its lifetime. The environmental impacts associated with operation of the FFTF are addressed in detail in Section 4.3 of Volume 1 of the NI PEIS. The impacts are shown to be small. These impacts specifically include the risks to human health during normal operations and associated with postulated accidents. Over the 35-year operational period no fatalities would be expected among workers or in the general public in the vicinity of Hanford or at distant locations.

Commentor No. 1902: Anonymous

Draft PEIS Comment Form

I oppose the restart of the FFTF Nuclear reactor at Hanford. Because it's not right and our guys know it's not right, so why do people want to make people life all messed up and stuff it's going to make the environment dirty and it's going to kill most of our animals and fish and all the things that provide food for the community and all the good stuff like that, but most of all what make my family and I proud is that the people that's trying to open it back up there are the selfish people on the world, they doing it all because they need more money they're not thinking about all the people they are putting out work of doing or something.

1902-1

1902-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1902-2

1902-2: DOE notes the concern expressed in the comment on the potential health and environmental impacts of FFTF startup. All air emissions and wastewater discharges would be in accordance with applicable permit and regulatory requirements. The releases of air pollutants and contaminated liquid are addressed in Section 4.3 of the NI PEIS. The release of air pollutants would result in concentrations well below Federal and state air standards (Table 4-13). The release of radioactivity and hazardous chemicals into the atmosphere would have a negligible effect on human health (Tables 4-17 and 4-19, respectively). There would be no discernible impacts to groundwater or surface water quality (Section 4.3.1.1.4). All impacts on ecological resources, including animals and fish, associated with operation of the FFTF would be small (Section 4.3.1.1.6).

1902-3

It is concluded that operation of the FFTF would have small adverse effects on the environment.

1902-4

1902-3: DOE notes the commentor's views. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs:

- 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;
- 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and
- 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

- attending public meetings and giving your comments directly to DOE officials
- returning this comment form to the registration desk at the meeting or to the address below
- calling toll-free and leaving your comments: 1-877-562-4593
- faxing your comments toll-free to: 1-877-562-4592

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Response to Commentor No. 1902

Commentor No. 1902: Anonymous (Cont'd)

Response to Commentor No. 1902

1902-4: This PEIS has provided an estimate of the incremental potential human health impacts associated with a range of reasonable alternatives including the restart of FFTF for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small. As stated in Appendix H of the PEIS, other human health impacts (non-fatal cancers and genetic mutations) occur with a lower frequency for the same level of exposure to low levels of radiation. Since the most likely impact on the population from all of the alternatives is no additional fatalities, it follows that the expected result for these other health impacts is no additional impact.

Commentor No. 1903: Carl Guinn, Jr.

Draft PEIS Comment Form

My name is Carl Guinn JR and I oppose the restart of the FFTF nuclear reactor at Hanford. I plan on having kids some day and I don't want them to have problems and besides why do you want to open something that can hurt the Earth. The only thing this does is make peoples lifetime shorter

1903-1

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Response to Commentor No. 1903

1903-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1903-2: This PEIS has provided an estimate of the incremental potential human health impacts associated with a range of reasonable alternatives including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small. As stated in Appendix H of the PEIS, other human health impacts (non fatal cancers and genetic mutations) occur with a lower frequency for the same level of exposure to low levels of radiation. Since the most likely impact on the population from all of the alternatives is no additional fatalities, it follows that the expected result for these other health impacts is no additional impact.

The PEIS identifies (in Chapter 3 of Volume 1) endangered species that live on or near all of the proposed sites, as well as aquatic and wetlands areas that may be impacted by operations at all of the proposed locations. According to an International Atomic Energy Agency (IAEA) publication (IAEA 1992), a dose rate of 100 millirem per year to the most exposed human will lead to dose rates to plants and animals of less than 0.1 rad per day. The IAEA concluded that a dose rate of 0.1 rad per day or less for animals and 1 rad per day or less for plants would not affect these populations. The largest individual dose for any of the alternatives evaluated is below 0.1 millirem, three orders of magnitude less than the IAEA identified threshold level. This is well below the IAEA benchmark. Therefore, all of the range of reasonable alternatives analyzed would have no effect on the plants and animals around the proposed sites.

Commentor No. 1904: Ian Albers

Response to Commentor No. 1904

Draft PEIS Comment Form

I oppose the restart of the FFTF nuclear reactor at Hanford. The fact that you have even thought of re-opening the reactor is just crazy! I watched movies on this sorta thing and it's so horrible the kinds things that happen to people affected by the reactor. I want you to think about how you would feel if your baby dies because your neighborhood reactor that you were assured was safe contaminated your land you can't go home and you can't survive.

1904-1

1904-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1904-2

1904-2: This PEIS has provided an estimate of the incremental potential human health impacts associated with a range of reasonable alternatives including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small. As stated in Appendix H of the EIS, other human health impacts (non fatal cancers and genetic mutations) occur with a lower frequency for the same level of exposure to low levels of radiation. Since the most likely impact on the population from all of the alternatives is no additional fatalities, it follows that the expected result for these other health impacts is no additional impact.

The PEIS identifies (in Chapter 3 of Volume 1) endangered species that live on or near all of the proposed sites, as well as aquatic and wetlands areas that may be impacted by operations at all of the proposed locations. According to an International Atomic Energy Agency (IAEA) publication (IAEA 1992), a dose rate of 100 millirem per year to the most exposed human will lead to dose rates to plants and animals of less than 0.1 rad per day. The IAEA concluded that a dose rate of 0.1 rad per day or less for animals and 1 rad per day or less for plants would not affect these populations. The largest individual dose for any of the alternatives evaluated is below 0.1 millirem, three orders of magnitude less than the IAEA identified threshold level. This is well below the IAEA benchmark. All impacts to human health and to the ecological resources would be small in the immediate area of Hanford and negligible at all distant sites.

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Commentor No. 1905: Raeleen Rambeau

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

To who it may concern,
 I oppose the restart of the FFTF nuclear reactor. I really don't want to die at a young age, and I don't want to live in pain. I don't want to see little kids all deformed running around. I don't want to see everyone around me dropping dead. So for me, and for you please don't restart the FFTF.

Sincerely,
 Raeleen Rambeau

Chapter 2—Written Comments and DOE Responses

Commentor No. 1907: Joel R. Morsette

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

I oppose the restart of the FFTF nuclear reactor I think it's messed up that you people care more about money than other peoples lives. Whoever raised gas guys must not have had any values. You guys need to check your heads and get your values straight. How would you guys feel if your family members or friends had cancer or diseases from this power plant? I bet that you would think twice about it then.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

7/12/00

Response to Commentor No. 1907

1907-1

1907-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1907-2

1907-2: DOE notes the commentor's viewpoint. DOE is very concerned about the health and safety of the public and its workers. The NI PEIS provides an estimate of the incremental potential human health impacts associated with each of the alternatives proposed for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. The radiological risk has been determined to be low. In all cases, the analysis shows that the most likely impacts from the proposed actions are no additional cancer fatalities among the population surrounding the irradiation and processing facilities. See Chapter 4 and summary tables in Chapter 2 for the analysis results.

1907-3

1907-3: This PEIS has provided an estimate of the incremental potential human health impacts associated with a range of reasonable alternatives including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

Commentor No. 1908: Shelly

Response to Commentor No. 1908

Draft PEIS Comment Form

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

I oppose the restart of FFTF nuclear reactor. Because we don't need the radiation hurting all the people and the animals.

1908-1

7/12/00

1908-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1908-2: DOE notes the commentor's opposition to the restart of FFTF. This NI PEIS provides an estimate of the incremental potential human health impacts associated with each of the alternatives proposed (including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Over the 35-year operational period no fatalities would be expected among workers or in the general public in the vicinity of Hanford or at distant locations. [See for example Tables 4-17, 4-30, 4-41 etc. in chapter 4 and the summary Tables in Volume 1, Chapter 2 of the NI PEIS.]

The NI PEIS identifies (in Volume 1, Chapter 3) endangered species that live on or near all of the candidate sites, as well as aquatic and wetlands areas that may be impacted by operations at candidate locations. According to an International Atomic Energy Agency (IAEA) publication (IAEA Technical Report Series No. 332, Effects of Ionizing Radiation on Plants and Animals at Levels Implied by Current Radiation Protection Standards), a dose rate of 100 millirem per year to the most exposed human will lead to dose rates to plants and animals of less than 0.1 rad per day. The IAEA concluded that a dose rate of 0.1 rad per day or less for animals and 1 rad per day or less for plants would not affect these populations. The largest individual dose for any of the nuclear infrastructures alternatives under normal operations would be less than 0.1 millirem, which is three orders of magnitude less than the IAEA threshold for adverse effects. Therefore, implementation of the nuclear infrastructure alternatives would not be expected to result in adverse impacts on plants and animals living in potentially affected areas around the candidate sites.

Worker safety (radiological protection) is a key element of the DOE's Radiological Health and Safety Policy (DOE P 441.1, April 26, 1996). This policy states in part that DOE facilities must "conduct radiological operations in a manner that controls the spread of radioactive materials and reduces

Chapter 2—Written Comments and DOE Responses

Commentor No. 1908: Shelly (Cont'd)

Response to Commentor No. 1908

exposure to the workforce and the general public and that utilizes a process that seeks exposure levels as low as reasonably achievable.” Each DOE site, including Hanford, is required to implement a radiological control program with the intent to meet this policy goal. Based on the assessment of worker health impacts for all of the alternatives and options that make use of Hanford facilities, the most likely impact of the use of these facilities is no increase in cancer fatalities among the facility workers. For example in Alternative 1 option 3, all of the activities target irradiation and processing) occur at Hanford facilities. As shown in Table 4-42, the expected consequences are less than one additional fatal cancer among the workforce; that is, no additional fatal cancers are expected.

Commentor No. 1909: Chairish Thomas

Response to Commentor No. 1909

Draft PEIS Comment Form

To whom it may concern:
 I oppose to restart of the FFTF nuclear reactor at Hanford, because it is killing everyone and everything that breathes air.

It would be extremely stupid to restart this. So think of how many animals we have extinct now. Think of the number of animals and people you could kill. So don't be stupid. I think of the danger.

Sincerely

Chairish Thomas

Response to Commentor No. 1910

1910-1

1910-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1910-2

1910-2: The commentor's position regarding restart of FFTF is noted. This PEIS has provided an estimate of the incremental potential human health impacts associated with a range of reasonable alternatives, including the restart of FFTF, for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small. As stated in Appendix H of the EIS, other human health impacts (non-fatal cancers and genetic mutations) occur with a lower frequency for the same level of exposure to low levels of radiation. Since the most likely impact on the population from all of the alternatives is no additional fatalities, it follows that the expected result for these other health impacts is no additional impact.

1910-1

Commentor No. 1911: Kayla Grow

Response to Commentor No. 1911

Draft PEIS Comment Form

91400

To whom it may concern

There are too many reasons why you should NOT restart the FFTF to even consider putting thousands of people in such great danger is immoral. Also please think of the kids you'll be infecting. It's not a good idea.

Sincerely

Kayla Grow

1911-1

1911-1: This PEIS has provided an estimate of the incremental potential human health impacts associated with a range of reasonable alternatives including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks (including the risks to children) associated with restarting FFTF would be small. As stated in Appendix H of the EIS, other human health impacts (non-fatal cancers and genetic mutations) occur with a lower frequency for the same level of exposure to low levels of radiation. Since the most likely impact on the population from all of the alternatives is no additional fatalities, it follows that the expected result for these other health impacts is no additional impact.

1911-2

1911-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Commentor No. 1912: Ann Sanders/Lewis W. Cornwell

sept 14 2000

U.S. Dept of Energy
19901 Germantown Rd
Germantown, MD 20874

Dear Mr. Brown:

We urge you to shut down the FFTF reactor. We don't want any more radioactive fuel brought into our state, nor do we want more radioactive waste produced. We certainly don't want any more accidents. The D.O.E.'s lack of disclosure to our public regarding the Plutonium emissions into the air during the recent brushfire is one more piece of evidence to add the already weighty body of evidence that no one (public or private) is capable of regulating these toxic elements safely continuously or with integrity.

Sincerely,
Ann Sanders
Lewis W. Cornwell

1912-1

1912-2

1912-3

1912-4

1912-5

Response to Commentor No. 1912

- 1912-1:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 1912-2:** DOE notes the commentor's concerns about bringing radioactive fuel into the state. Use of the FFTF to support the proposed action would require, after onsite fuel was spent (approximately 6 years of operation), domestic highly enriched uranium fuel or foreign mixed-oxide fuel to be transported to Hanford. However, the radioactivity of this incoming fuel is relatively low. The potential impacts associated with transportation activities to support the proposed action are addressed in Chapter 4, Volume 1 and Appendix J, Volume 2 of the NI PEIS.
- 1912-3:** DOE notes the commentor's concern regarding wastes. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.
- 1912-4:** FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.
- 1912-5:** No radioactive materials were "released" in the Hanford Wildfires of 2000. Wildfires did resuspend some materials already in the environment. The resuspended materials were low, slightly above natural background levels. The low levels required several days of analysis to quantify. Very low, environmental levels are not detectable with real-time measurement techniques. Monitoring results were reported to the public as they became available.

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

The Fast Flux Test Facility at Hanford should not be restarted. It should be shut down and decommissioned permanently. The FFTF is not needed for the production of medical isotopes, for NASA, or any other reason. It is an environmental accident waiting to happen. Adding more nuclear waste will only increase the risk and make more difficult the problems of nuclear waste disposal. Both President Carter and President Reagan ordered the cancellation of the breeder program. With that program gone, there is no rational purpose for the FFTF. The FFTF should not be restarted. It should be shut down.

Response to Commentor No. 1914

- 1914-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.
- 1914-2:** See response to comment 1914-1.
- 1914-3:** DOE notes the commentor's opposition to restarting FFTF for expanding its existing nuclear facility infrastructure. DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Although research to identify other potential fuel sources to support these space exploration missions has been conducted, no viable

Commentor No. 1914: J. M. Fritzman (Cont'd)
Lewis and Clark College

Response to Commentor No. 1914

alternative to using plutonium-238 has been established. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

In January 1997, President Clinton tasked his Committee of Advisors on Science and Technology (PCAST) to evaluate the current national energy research and development portfolio and to provide a strategy that ensures the United States has a program to address the Nation's energy and environmental needs for the next century. In its November 1997 report responding to this request, the PCAST Energy Research and Development Panel determined that restoring a viable nuclear energy option to help meet our future energy needs is important and that a properly focused research and development effort to address the potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) was appropriate. The PCAST panel further recommended that DOE reinvigorate its nuclear energy research and development activities to address these potential barriers. Section 1.2.3 provides information on the nuclear energy research and development mission.

The Fast Flux Test Facility was not designed to be a breeder reactor. It was originally intended to support production of nuclear fuel for use in breeder reactors; however, it will not be used for this purpose, if restarted. There is no breeder reactor program in the United States at this time.

- 1914-4:** The environmental impacts associated with operation of the FFTF and support facilities at Hanford during normal operations and from postulated accidents are presented and discussed in Section 4.3 of the NI PEIS. All impacts to human health and to ecological resources would be small in the immediate area of the Hanford site and negligible at all distant locations.
- 1914-5:** DOE notes the commentor's concern regarding wastes. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the

Commentor No. 1914: J. M. Fritzman (Cont'd)
Lewis and Clark College

Response to Commentor No. 1914

proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

re: Hanford nuclear facilities

Dear Ms. Brown:

I am writing to express my fears of renewed production activities at the highly contaminated Hanford plant and my opposition to such renewal.

The Fast Flux Test Facility should simply be shut down—for the safety of the people of the immediate area, for the safety of the people of Washington, for the present and long-term safety of the earth.

We on the earth are all one people. No nation has the right to endanger all the planet, as nuclear waste does. There can be no arguments, in my opinion, that outweigh our communal responsibilities to preserve the earth for other human beings. Our forays into nuclear bombs and power have already created huge amounts of waste, whose half-lives are far longer than written human history.

Therefore, please simply shut down the Fast Flux Test Facility and continue with the clean-up there.

Yours sincerely,

Susan Kay Donaldson

|| 1916-1
|| 1916-2

|| 1916-3

|| 1916-1 || 1916-4

Response to Commentor No. 1916

1916-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

1916-2: This PEIS has provided an estimate of the incremental potential human health impacts associated with a range of reasonable alternatives including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small. As stated in Appendix H of the EIS, other human health impacts (non fatal cancers and genetic mutations) occur with a lower frequency for the same level of exposure to low levels of radiation. Since the most likely impact on the population from all of the alternatives is no additional fatalities, it follows that the expected result for these other health impacts is no additional impact.

The PEIS identifies (in Chapter 3 of Volume 1) endangered species that live on or near all of the proposed sites, as well as aquatic and wetlands areas that may be impacted by operations at all of the proposed locations. According to an International Atomic Energy Agency (IAEA) publication (IAEA 1992), a dose rate of 100 millirem per year to the most exposed human will lead to dose rates to plants and animals of less than 0.1 rad per day. The IAEA concluded that a dose rate of 0.1 rad per day or less for animals and 1 rad per day or less for plants would not affect these populations. The largest individual dose for any of the alternatives evaluated is below 0.1 millirem, three orders of magnitude less than the IAEA identified threshold level. This is well below the IAEA benchmark. Therefore, all of the range of reasonable alternatives analyzed would have no effect on the plants and animals around the proposed sites.

Chapter 4 of Volume 1 of the PEIS provides a comprehensive assessment of the environmental consequences of each of the proposed alternatives. (The results of these assessments are also summarized in Chapter 2.) These analyses include assessments of the impacts on land resources,

Commentor No. 1916: Susan Kay Donaldson (Cont'd)

Response to Commentor No. 1916

water resources, air quality, geology and soils (in addition to the human health impacts discussed in the preceding paragraph). For the alternatives that consider the use of facilities at Hanford, the environmental impact on all of these resources is negligible.

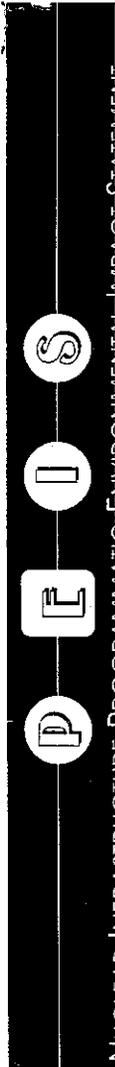

1916-3: The commentor's positions on nuclear waste are noted. The missions described in Section 1.2 of Volume 1 are unrelated to the national defense and none are concerned with the production of nuclear weapons. Chapter 4 of Volume 1 (e.g. 4.3.1.1.13, 4.3.2.1.13, 4.3.3.1.13) describes the generation and disposition of nuclear waste that would occur under implementation of the alternatives described in Section 2.5 of Volume 1.

1916-4: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

Commentor No. 1917: E. Benoth

Response to Commentor No. 1917

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

The FFTF reactor
should not be restarted.
It should be shut down.
Cleanup and safety
should be #1 priorities.
Thank you.
I am speaking for
my children and the
next generations.

1917-1
1917-2
1917-3

1917-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.

1917-2: See response to comment 1917-1.

1917-3: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

DOE worker and public health and safety are of paramount and primary importance to the Department.

The environmental impacts associated with operation of the FFTF and support facilities at Hanford during normal operations and from postulated accidents are presented and discussed in Section 4.3 of Volume 1 of the NI PEIS. All impacts to human health and to ecological resources would be small in the immediate area of the Hanford Site and negligible at all distant locations.

September 12, 2000

Dear Ms. Brown,

I are writing to request that NASA be required to develop alternative (solar) power sources for space missions. The technology is workable and has been developed in Europe.

I strongly feel the current path of increased Plutonium production is not justified by the health risks to workers or the safety risks to the public at large. Nor is the astronomical costs of plu-238 which drains the economy for decades to come.

Please push forward a space program that our country can be proud of and will not increase possibilities for massive environmental pollution of our earth.

Sincerely,

Barbara Scott

1918-1

1918-2

1918-3

1918-1

Response to Commentor No. 1918

- 1918-1:** DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions, although issues such as NASA research priorities are beyond the scope of this PEIS. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch.
- 1918-2:** Worker safety (radiological protection) is a key element of the DOE's Radiological Health and Safety Policy (DOE P 441.1, April 26 1996) This policy states in part that DOE facilities must "conduct radiological operations in a manner that controls the spread of radioactive materials and reduces exposure to the workforce and the general public and that utilizes a process that seeks exposure levels as low as reasonably achievable." Each DOE site, including Hanford, is required to implement a radiological control

Commentor No. 1918: Barbara A. Scott (Cont'd)

Response to Commentor No. 1918

program with the intent to meet this policy goal. Based on the assessment of worker health impacts for the range of reasonable alternatives and options that make use of Hanford facilities, the most likely impact of the use of these facilities is no increase in cancer fatalities among the facility workers. For example in Alternative 1 option 3, all of the activities (target irradiation and processing) occur at Hanford facilities. As shown in Section 4.3.3.1.9 the expected consequences are less than one additional fatal cancer among the workforce; that is, no additional fatal cancers are expected.

This PEIS has provided an estimate of the incremental potential human health impacts associated with each of the alternatives proposed including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

1918-3: DOE notes the commentor's concern regarding the cost of expanded plutonium-238 production. However, the costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS.

Draft PEIS Comment Form

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

**I REMEMBER THESE COMMENTS ARE LATE, FOR WHICH I APOLOGIZE.*
 PLEASE, LET ME SAY THAT I CONSIDER MYSELF A STRONG ENVIRONMENTALIST. THAT BEING SAID, I STRONGLY BELIEVE THAT THE FFTF SHOULD BE RESTARTED FOR THE FOLLOWING REASONS: 1) THERE IS AN URGENT NEED FOR THE THERAPEUTIC ISOTOPES THAT ONLY THE FFTF CAN PRODUCE IN MEMORABLE QUANTITIES, 2) Pu-238 IS NEEDED FOR STELLING CYCLE GENERATORS FOR NASA'S DEEP-SPACE EXPLORATION VEHICLES, A MOST IMPORTANT PROGRAM, 3) THE UNITED STATES NEEDS TO CONDUCT FAR MORE RESEARCH ACTIVITIES RELATED TO NUCLEAR POWER THAN WE DO CURRENTLY, WE SEVERELY LAG MANY OTHER COUNTRIES IN THIS FIELD.*

I WOULD ALSO LIKE TO SAY THAT THE ANTI-NUCLEAR ANTI-FFTF GROUPS, AS EXEMPLIFIED BY HEART OF AMERICA NORTHWEST, MAKE ME SICK WITH THEIR LIES AND RESTRICTIONS (AND HALF-TRUTHS!) USDOE SHOULD CUT OFF THEIR FUNDING; IT'S A GREAT WASTE OF MY TAX DOLLARS! FINALLY, I THOUGHT USDOE, ESPECIALLY MS. COLETTE BROWN, CONDUCTED ITSELF VERY PROFESSIONALLY AT THE SEATTLE MEETING, SHOWING GREAT RESPECT FOR THE VIEWS OF THE PUBLIC (AND GREAT RESTRAINT WITH THE LIES OF GERALD PILLETT!).

Sincerely

David B. Robbins

Subject: Draft Programmatic Environmental Impact Statement (PEIS) for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the United States, Including the Role of the Fast Flux Test Facility (FFTF) [DOE/EIS-0310D, July 2000]

Dear Ms. Brown:

I will refer to the subject document in the remainder of this letter as the Nuclear Infrastructure (NI) PEIS. I received the Cost Report for Alternatives Presented in the NI PEIS on September 1 and the NI Nonproliferation Impact Assessment (DOE/NE-D119) on September 12. Even though the time frame was short, I have considered the material in them in preparing these comments:

1. The requirement for this action is fuzzy at best, a stronger case should be made. It now sounds like an excuse to restart FFTF. In addition, future isotope demand should be bounded by a low and a high estimate. Existing facilities at INEEL and ORNL are NOT considered for the Medical and Industrial Isotopes Production and Nuclear Research and Development Mission. See Table 2-1 (page 2-3) or Table S-1 (page S12). This is, in my opinion, the worst flaw in this document. **Please correct this in the Final PEIS!**
2. **Alternative 5 and the No Action Alternative must be rejected as unresponsive to the needs of the nation as well as for reason of nonproliferation concerns.** As a NASA retiree, I recognize the importance of Pu-238 for future space exploration. An assured, domestic supply is preferable. Medical needs are discussed below.
3. **Alternative 1 must be rejected for reasons of cost and equity.** From the scoping meetings, it seems that most folks in the Northwest do NOT want the FFTF restarted. Promises were made about the future use of this area; therefore, these wishes should be honored. Additionally, the surrounding area is now a National Monument (Hanford Reach). Since folks in Idaho and Tennessee are generally supportive of the production of Pu-238 for future space missions and of the production of medical isotopes, it is also unnecessary to select this alternative.
4. **Alternative 3 should be rejected for reasons of cost and unsuitability for many isotopes.**
5. **Alternative 4 should be considered only as a long-term solution.**
6. **The best solution is to expand the scope of Alternative 2 and select it for the near term.** The expansion of alternative 2, upgrading existing facilities, namely HFIR in Oak Ridge and ATR at INEEL, is the most cost-effective option. ATR can be modified to produce short-lived medical isotopes by addition of a rabbit system. HFIR can be upgraded to its full design power of 100 megawatts easily and quickly.
- INEEL, in partnership with I4, and ORNL are currently producing medical isotopes, as noted in pages 2-19 thru 2-23. ORNL also has potential for commercial/government partnership for such production. This has cost saving potential. An additional advantage for isotope production at ORNL is location, with a nearby transportation hub (UPS in Nashville) as well as the proximity of a high percentage of isotope users (East Coast population centers).
7. The REDC is the only Pu-238 Target Fabrication and Processing Facility that is currently operational (Table 7-1, page 7-1 in the NI Nonproliferation Impact Assessment). Use of CLWR requires additional cost to produce stainless steel-clad targets. Therefore Options 7 and 1 of Alternative 2 should be preferred.

Additional comments are attached. Please include me in your distribution of the Final PEIS and ROD.
Sincerely,

Barbara A. Walton

Barbara A. Walton
bwalton@kornet.org

Response to Commentor No. 1920

1920-1

1920-1: DOE notes the commentor's views. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs:

1920-2

1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;

1920-3

2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and

3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

While some existing reactors, such as ATR at INEEL and HFIR at ORNL, may possess the potential capability or capacity to support medical and industrial isotope production and/or nuclear research and development missions, it is unlikely that reliable, increased support of these missions to the extent needed to fulfill projected needs could be accomplished without disturbing the existing missions of these facilities.

Commentor No. 1920: Barbara A. Walton (Cont'd)

Page 2 Barbara A. Walton

Additional comments:

a. The addition of Commercial Light Water Reactor (CLWR) to Alternative 2 since the Pu-238 Production Scoping Meetings is noted; this is a good change.

b. Table 4-155 on page 4-307 is misleading. Several of these decisions have already been made so some of the X's should be removed. For example, line 1 SRS was chosen so delete X from INEEL and Hanford. Likewise line 4, INEEL & SRS were chosen for SNF -- delete X for ORR and Hanford.

c. For Section 4.8, Cumulative Impacts, an estimate of the impacts for Alternatives 3 & 4 for the three sites concerned in this action would be helpful while recognizing that a future EIS would still be needed. This is because the bounding case for ORR (option 7, Alternative 2) and INEEL (option 2, Alternative 2) do NOT include isotope production.

d. The ORNL facilities under consideration were designed to produce medical isotopes. In fact, the origination of isotope production and distribution was at ORNL. It has continued involvement; however, the volume diminished when competition with the private sector became contrary to DOE policy.

e. You may remember the related 1996 EIS for the production of Molybdenum-99. The ROD selected the Annular Core Research Reactor (ACRR) and Hot Cell Facility at Sandia National Laboratory in Los Alamos and the Chemistry and Metallurgy Research facility at Los Alamos National Laboratory. Facilities in Oak Ridge and Idaho were not seriously considered. The ACRR is shown in Table 2-4 as fully dedicated to existing missions. Guess what! In response to questions at the 8/28 meeting, I found out that they never produced any Mo-99 but have been producing I-131. This is, in part, my reason for stating in item 1 on the previous page that this action appears to be an excuse to restart FFTF -- your track record appears to be highly influenced by politics.

1920-4

1920-5

Response to Commentor No. 1920

1920-2: DOE notes the commentor's support for Alternative 2, Use Only Existing Operational Facilities with the upgrade of HFIR and ATR, for the near term and Alternative 4, Construct New Research Reactor, for the long term and her opposition to all other alternatives, including the No Action Alternative.

1920-3: See response to comment 1920-2.

1920-4: The table is being changed to reflect the commentor's observations.

The commentor's concern regarding the cumulative impacts at ORR and INEEL is noted. However, as stated in Section 4.8.5 and 4.8.6 of the NI PEIS, site specific cumulative analyses would be prepared for Alternative 3 (New Accelerator(s) and Support Facility) or Alternative 4 (New Reactor and Support Facility) only if either of these alternatives were selected for implementation. Prior to those analyses, however, siting studies would be prepared to identify the preferable locations for the various facilities. The specific locations so identified would affect the magnitude of impacts associated with their operations. Only then could assessments be performed that would be of comparable accuracy to those presented in the PEIS for the existing facilities at Oak Ridge and INEEL.

In addition to the above, the cumulative impacts presented in Section 4.8 are based on the impacts that have been evaluated earlier in Chapter 4, to which are added existing site impacts and impacts from reasonably foreseeable actions. However, for Oak Ridge and INEEL, impacts associated with the production of medical and industrial isotopes and with research and development activities have not been evaluated in the earlier Chapter 4 sections because the action alternatives assessed (Alternatives 1 through 4) call only for plutonium-238 production at those sites.

1920-5: DOE notes the commentor's views. As discussed in Volume 1, Section 1.7 of the NI PEIS, the "Final Environmental Impact Statement, Medical Isotopes Production Project: Molybdenum-99 and Related Isotopes" analyzed the proposed establishment of a domestic capability to produce molybdenum-99 and related medical isotopes such as iodine-131, xenon-133, and iodine-125. At the time this review was conducted, the U.S. supply of molybdenum-99 depended on the production capacity of one aging reactor in Canada, so DOE proposed this action to ensure a

Commentor No. 1920: Barbara A. Walton (Cont'd)

Response to Commentor No. 1920

reliable domestic source for this vital isotope. The range of reasonable alternatives evaluated in this EIS included facilities at SNL, LANL, ORNL, and INEEL. In the subsequent Record of Decision, DOE selected the ACRR and the Hot Cell Facility at SNL for the production of molybdenum-99 and the related isotopes, with target fabrication to be conducted at LANL. However, since that time, the diversity and reliability of world supply of molybdenum-99 have increased. DOE has determined that, because the vulnerability in supplies of molybdenum-99 has sufficiently diminished, the selected SNL facilities should be further developed for molybdenum-99 production using private funds. Negotiations toward that end are ongoing. Until an agreement is reached, the reactor and hot cell facilities are available for emergency molybdenum-99 production should the need arise. The reactor is also being used for the production of other isotopes, for example iodine-125, and has been made available on a services basis to serve defense missions. As such, the ACRR is currently configured to support DOE Office of Defense Programs pulse testing missions. This configuration is compatible with reactor operations for the production of some isotopes.

Germantown, MD 20874

Re: Hanford FFTF Restart

Ms. Brown:

I can not find strong enough adjectives to express how much I oppose the restart of the Fast Flux Test Facility located at the Hanford Nuclear Reservation in the State of Washington! Your reasons for needing to restart this facility are not credible as the materials it would produce can be either produced else where or purchased on the international market. Our lives have been negatively impacted enough from the idiotic past practices at this site. We are sick and tired of the slick side shows and half truths! We're real people here -- quit treating us like we're not! Enough is enough!!

It's time your Department makes a complete change in it's policies and goals. Get on with trying to clean up this ridiculous mess we have been left with as Hanford is one of the most contaminated sites on this planet. The Draft EIS for the restart of the FFTF is inadequate. It fails to properly address the waste issue if it was to go into production. The last thing we need is to generate more low and high level nuclear waste!

If you need more to do spend your time and resources developing and encouraging the development of alternative energy sources other than fossil fuels and nuclear power. Much of it is already available it just needs commitment on the part of the federal government.

I am not normally this antagonistic towards government agencies and am not one of those anti government extremist or even close. But I and many others have a complete lack of trust with your agency. We have been deceived too many times. Please restore your credibility and do the right thing. Listen to common sense and the majority of the public who care about this planet. Choose alternative 5 and permanently deactivate FFTF.

Sincerely,

Gary Bickett
15105 Twin Fir Road
Lake Oswego, OR 97035

Response to Commentor No. 1921

1921-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.

1921-2: The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily Molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. Further, supplies of many research isotopes are not readily available from existing foreign or domestic sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed. As such, reliance on these other sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions

1921-3: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

The environmental impacts associated with operation of the FFTF are addressed in Section 4.3 of Volume 1 of the NI PEIS. The impacts are shown to be small. These impacts specifically include the risks to human health during normal operations and associated with postulated accidents. Over the 35-year operational period no fatalities would be expected

1921-1

1921-2

1921-3

1921-4

1921-5

1921-6

1921-7

Commentor No. 1921: Gary Bickett (Cont'd)

Response to Commentor No. 1921

among workers or in the general public in the vicinity of Hanford or at distant locations.

Steady and consistent progress in restoring the Hanford Site is documented in annual reports. These are available at www.hanford.gov.

- 1921-4:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. High-level radioactive waste would not be generated from merely operating FFTF. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

- 1921-5:** DOE notes the commentor's interest in alternative energy sources. It is the current United States policy that clean, safe, reliable nuclear power continue as a viable component of the United States' energy portfolio. In recognition of this need, the government has initiated nuclear energy

Commentor No. 1921: Gary Bickett (Cont'd)

Response to Commentor No. 1921

research and development programs to address potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) and to ensure that current nuclear power plants can continue to deliver adequate and affordable energy supplies. An enhanced DOE nuclear facility infrastructure is required to support such nuclear energy research and development for civilian applications.

1921-6: DOE notes the commentor's concern.

1921-7: See response to comment 1921-1.

**Commentor No. 1922: Former Members of Congress;
Honorable Sid Morrison/Honorable Mike McCormack**

September 5, 2000

Ms. Colette Brown
DOE Office of Space and
Defense Power Systems NE-50
19901 Germantown Road
Germantown, Maryland 20874-1290

Dear Ms. Brown:

We urge the DOE to restart the Fast Flux Test Facility (FFTF) to produce radio isotopes for much needed special pharmaceuticals.

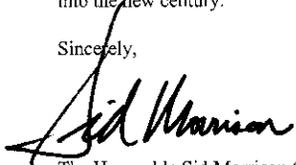

As members of the Congressional Committee that oversaw and authorized funding for the construction and operation of the FFTF, we are especially aware of its unique and valuable ability to produce a variety of isotopes as they are needed.

We believe that abandoning the FFTF would constitute a mindless waste of a significant national resource. We must not let the fears associated with inaction on the handling of nuclear waste blind us to this opportunity to take advantage of an investment we have already made.

We wish to emphasize that producing medical isotopes at the FFTF would in no way impede the clean up of the military waste at Hanford. Nor would FFTF operations contribute to waste management challenges.

This exceptional reactor was built with emphasis on safety and flexibility. While the mission has changed, so have the medical needs of our nation. FFTF is uniquely capable of producing a promising array of isotopes for cancer research and therapy, both now and well into the new century.

Sincerely,

The Honorable Sid Morrison (R-Wash-4)
Member of Congress 1981-1993

The Honorable Mike McCormack (D-Wash-4)
Member of Congress 1971-1981

1922-1

RE: *Support for the Fast Flux Test Facility*

Dear Ms. Colette:

The Fast Flux Test Facility (FFTF) located in Richland/Hanford, Washington, is a significant national asset as the most advanced and newest reactor that has established unmatched international records for performance, safety and efficiency. Because of its design and the large number of neutrons it can produce, FFTF provides the only full sized test facility for specialized leading edge research in international programs, fusion and medicine.

There are no military or weapons production programs planned for the FFTF. The programs proposed in the EIS include medical and industrial isotope production, production of isotopes for NASA space mission electrical power supplies, nuclear energy research, and development of programs for civilian applications.

The FFTF has the capability to produce a wide variety of isotopes for medical and industrial uses which are not available in adequate quantities anywhere. More than twenty urgently needed scarce radioisotopes of unusually high quality can be produced by FFTF for medical research, treatment, and diagnosis. The United States currently imports 90% of its medical isotopes, virtually all of which could be produced at the FFTF.

The FFTF had an outstanding performance record and was built to strict NRC safety standards. The reactor is inherently safe and has no significant environmental releases. Operation of the reactor will not result in the generation of any additional quantities of high-level waste and only very small amounts of low level, easily treated waste materials.

We support the restart and the continued utilization of the Fast Flux Test Facility. The FFTF is clearly the preferred alternative for the programs considered based on availability, capacity for multi product missions, demonstrated technology, cost effectiveness, safety and minimal environmental impact.

Sincerely,

A handwritten signature in cursive script that reads "Robert G. Graves".

Dear Ms. Brown:

Please accept the following comments regarding the PEIS draft on FFTF restart on behalf of Columbia Riverkeeper, a public interest group located in the Columbia River Basin. As a member of the international Water Keeper Alliance we hold the support of tens of thousands of citizens across this nation. Please weigh these comments as representing those interests and more directly the interests of the approximately 2200 members and supporters in the Northwest.

- Your **compilations of prior public comment are seriously lacking** and show your failure to listen to the public. You fail to give any numerical breakdown for the 7000 comments received. You only say “**Many** of the commentors who attended the meetings in Seattle, Portland and Hood River were strongly opposed to the restart of FFTF.” Then you go on to say “**Most** of the comments received at the Richland meeting were in support of restart.” You need to state the numbers on these comments so Sec. Richardson is clear on where the people of the Northwest stand. You put the numbers in when it is to your advantage and leave them out when they are opposed. You need to note that every person at the Hood River hearings was opposed except the people who came to lecture us from the TriCities. You also failed to mention the 5 City Council Resolutions opposing FFTF restart which means you have representatives of entire cities opposing it and their numbers should be included. You must also note the opposition of an entire state as Governor Kitzhaber has taken a position opposing restart.

- You’ve **failed to demonstrate a compelling need** for the production of 1) plutonium for space, 2) medical or research isotopes or 3) nuclear energy research. Neither is there adequate justification for the **need to produce all of them at one site**. Neither is there justification for the **need to produce them domestically** (other than reference to some DOE policy) which makes no sense when we would continue to buy foreign nuclear fuel to run FFTF.

- You must include the recommendations of your own blue ribbon panel (**Subcommittee**

Response to Commentor No. 1924

1924-1: In preparing the Final NI PEIS, DOE has carefully considered and responded to all comments received from the public during the comment period, regardless of how or where they were received. All pertinent information and public input will be provided to the Secretary so that he may make an informed and unbiased decision with respect to the alternatives presented in this NI PEIS.

1924-2: Opportunities for public involvement in the NEPA process occur during the scoping process and the Draft PEIS public comment period in accordance with requirements and guidelines of CEQ and DOE regulations. As stated in Section N.1, one of six major purposes of the scoping process includes “... obtaining input from the public and other concerned entities on significant issues that should be evaluated” in the PEIS. Towards this end, all comments received were compiled and grouped in the NI PEIS comment tracking system to determine the major issues and public concerns to be addressed in the NI PEIS. Section 1.4 identifies the issues raised during the scoping process. Any numerical compilation of comments was done only for the purpose of determining the significant issues, whether expressed by individuals, organizations or public officials.

Comments received during the Draft NI PEIS public comment period were carefully reviewed and served as a basis for revisions to the Draft NI PEIS which appear in the Final NI PEIS and identified therein with a vertical bar in the right hand margin of the page. Volume 3 of the Final NI PEIS, referred to as the comment response document, contains a verbatim compilation of all comments received on the Draft NI PEIS along with DOE’s response to each comment which will be used along with other factors by the Secretary of Energy as input to the Record of Decision.

As a result of the scoping and the Draft NI PEIS public hearing processes, the Final NI PEIS adequately and accurately addresses the public’s concerns on the proposed actions.

DOE’s responses to Oregon Governor Kitzhaber’s letter are contained under Commentor No. 1648 in this volume.

1924-3: DOE notes the commentor's opposition to restarting FFTF for enhancing its existing nuclear facility infrastructure. Consistent with its mandates

**Commentor No. 1924: Cyndy deBruler
Columbia Riverkeeper (Cont'd)**

for Isotope Research and Production Planning) that advised **against** the use of FFTF for medical isotope production. Furthermore, EIS Isotope demand projections are outdated and inadequate. They also fail to take into account possible cancer cures like gene therapy that could make medical isotopes unnecessary. In addition, medical isotopes can be adequately produced at other DOE sites if they are a high priority as implied. Current isotope production levels for DOE reactors are misstated in the EIS at near capacity when most are only at around 50%.

- You must include the current demand estimates from NASA for Plutonium 238 which are considerably lower than your need projections and could easily be met under the current contract with Russia. A discussion of alternatives to plutonium fuel must be included. A renegotiated contract with Russia (at double the current cost) could meet future NASA needs at 1/3 the cost of FFTF restart.

- It is improper to release the draft EIS for public comment without the critical information requested by the public in the scoping meetings including:
 - cost analysis of restart and all alternatives with reasonable review time (FFTF will be much more expensive than reasonable alternatives by at least \$2 Billion.)
 - studies on treatment of wastes at all proposed sites and
 - nonproliferation impacts from FFTF and the importation of its necessary radioactive fuel from Europe. (**Violation of the Nonproliferation Agreement by use of Highly Enriched Uranium fuel alone is reason enough to stop restart of FFTF!**)

- You have failed to adequately characterize environmental impacts from FFTF restart. An example is the statement, "Environmental impacts associated with the existing inventory of spent fuel at Hanford site are minimal." To imply that the existing spent nuclear fuel inventory poses no problems is massively incorrect. More than 2100 tons of corroding spent fuel sites in aging water-filled basins near the Columbia River posing one of the largest problems for cleanup and an expected cost of more than \$1.6 billion. You must address all impacts on waste management and the environment at Hanford not dismiss them with erroneous statements.

- You must include the cost of FFTF and all companion facilities decontamination and decommissioning in the restart not just every other alternative. All facilities used in all other alternatives must show the cost of decontamination and decommissioning as well.

- You have failed to assess all existing contaminant sources at Hanford and all other sites before adding additional waste. You must assess current waste inventories and then assess the addition of any new waste to existing waste sources.

1924-4
(Cont'd)

1924-5

1924-6

1924-7

1924-8

1924-6

1924-9

1924-10

1924-11

1924-12

Response to Commentor No. 1924

under the Atomic Energy Act, DOE is proposing this expansion for the purposes of addressing three primary needs:

1) to support the increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;

2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and

3) to support civilian nuclear research and development in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio.

There is no requirement to conduct all of these missions at one site. In the Record of Decision process, DOE could choose any one of the alternatives or choose to combine components of several alternatives in selecting the most appropriate strategy. For example, DOE could select a low-energy accelerator to produce certain medical, research, and industrial isotopes, and an existing operating reactor to produce plutonium-238 and conduct nuclear research and development. Should FFTF be selected for restart in support of these missions, DOE expects it could utilize a 15-year supply of mixed-oxide fuel that would be available from Germany under favorable economic terms (i.e., no charge for the fuel).

1924-4: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for

Commentor No. 1924: Cyndy deBruer Columbia Riverkeeper (Cont'd)

- You fail to adequately consider use of the Advanced Test Reactor (ATR) in Idaho and the High Flux Isotope Reactor (HFIR) in Oakridge for medical isotopes while acquiring Plutonium 238 from another source. You also fail to analyze lower cost alternatives such as subsidizing university reactors or buying time from private accelerators or reactors.
- The No Action Alternative must include the shutdown of FFTF not maintaining it on stand-by based on prior commitments of Secretaries O'Leary and Watkins and TPA milestones.
- You failed to address the conflict of interest of using PNNL's evaluations when they are a proponent of restart and stands to gain financially.
- You fail to access the legality of introducing new programs and wastes into the highly contaminated 306 e or 325 buildings at Hanford that would be used with FFTF.
- You must admit that the real reasons to restart FFTF are in a hidden agenda that includes preserving jobs and starting new weapons research or other classified missions.
- The draft EIS must state the preferred alternative for adequate public review.
- You must include the impact on demand for medical and research isotopes of the new facility being built at Los Alamos. Why is this not even mentioned??

USDOE should choose Alternative 5- SHUT DOWN FFTF, or Alternative 2- Produce at existing sites with shutdown of FFTF.

Thank you for this opportunity to comment. We hope you will begin to listen to the people of the Northwest and request that these comments be forwarded to the Secretary of Energy who has unfortunately been kept in the dark about the massive opposition to the restart of this reactor in the Northwest.

Sincerely,

Cyndy deBruer
Director

1924-13

Response to Commentor No. 1924

evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

DOE has taken the Expert Panel and NERAC report recommendations under consideration in developing the range of alternatives evaluated in the NI PEIS. These reports were made available to the public at the NI PEIS public information centers and on the Internet at www.nuclear.gov.

Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability

*Commentor No. 1924: Cyndy deBruler
Columbia Riverkeeper (Cont'd)*

Response to Commentor No. 1924

supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term (less than 5 years).

1924-5: As discussed in Section 1.2.2, through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. The selection of power systems for space missions is the responsibility of NASA. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Under the No Action Alternative, DOE would continue to purchase plutonium-238 to meet the space mission needs for the 35-year evaluation period considered in the NI PEIS. However, DOE recognizes that any purchase beyond what is currently available to the United States through the existing contract would likely require negotiation of a new contract and may require additional NEPA review.

The May 22, 2000, correspondence from NASA to DOE identifies that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, SRTG development efforts were stopped in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires one-third less

***Commentor No. 1924: Cyndy deBruler
Columbia Riverkeeper (Cont'd)***

Response to Commentor No. 1924

plutonium-238 as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000, letter to DOE that large RTGs be maintained as backup. Section 1.2.2 of Volume 1 was revised to clarify plutonium-238 mission needs.

- 1924-6:** The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS. DOE made every effort to obtain, analyze, and disclose all required information to make a decision on expanding nuclear infrastructure. The costs and nuclear nonproliferation impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report and Nuclear Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such ancillary documents need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed these documents to more than 730 interested parties on August 24 and September 8, 2000, respectively. Both reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided summaries of the Cost Report and Nuclear Nonproliferation Impact Assessment in Appendixes P and Q, respectively, in the Final NI PEIS.
- 1924-7:** DOE notes the commentor's opinion. See response to Comment 1924-6.
- 1924-8:** This NI PEIS addressed the environmental impacts due to the treatment, storage and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.
- 1924-9:** In the event that a decision is made to restart FFTF, the first six years of operation would use existing onsite mixed oxide fuel. DOE expects that an additional 15-year supply of mixed oxide fuel in Europe, owned by Germany, would be available for FFTF. The Nuclear Infrastructure Nonproliferation Impact Assessment for the NI PEIS alternatives,

*Commentor No. 1924: Cyndy deBruler
Columbia Riverkeeper (Cont'd)*

Response to Commentor No. 1924

published in September, 2000, indicated that using the two different sources of existing mixed oxide (MOX) fuel for FFTF (existing FFTF fuel and German MOX fuel) would result in significant mitigating factors, indicating that substantial nonproliferation benefits could be gained by disposing of this inventory as spent fuel. During the period of MOX fuel use, in support of U.S. nonproliferation policy directives, DOE's Office of Nonproliferation and National Security would undertake a study under the Reduced Enrichment Research and Test Reactor (RERTR) program to consider the technical feasibility of using low enriched uranium to fuel the FFTF. Under this nonproliferation protocol, if use of low enriched uranium fuel is found infeasible in FFTF for meeting assigned missions, policy would allow DOE to subsequently procure highly enriched uranium fuel for use in FFTF. Again, this approach is consistent with U.S. nonproliferation policy.

1924-10: DOE notes the concern expressed in the comment on the potential health and environmental impacts of FFTF startup. All air emissions and wastewater discharges would be in accordance with applicable permit and regulatory requirements. The releases of air pollutants and contaminated liquid are addressed in Section 4.3 of Volume 1. The release of air pollutants would result in concentrations well below Federal and state air standards (Table 4-13). The release of radioactivity and hazardous chemicals into the atmosphere would have a negligible effect on human health (Tables 4-17 and 4-19, respectively). There would be no discernible impacts to groundwater or surface water quality (Section 4.3.1.1.4). All impacts on ecological resources, including animals and fish, associated with operation of FFTF would be small (Section 4.3.1.1.6).

It is concluded that operation of FFTF would have small adverse effects on the environment.

The discussion in the Summary and Section 4.8.3.5 of Volume 1 on the cumulative impacts for spent nuclear fuel management at Hanford was revised to clarify that the management of the existing spent nuclear fuel at Hanford results in a dose of less than 0.1 millirem per year of the maximally exposed member of the public. This dose is well within the DOE limits given in DOE Order 5400.5. As discussed in that Order, the dose limit from airborne emissions is 10 millirem per year, as required by the Clean Air Act; drinking water is 4 millirem per year, as required by the Safe Drinking Water Act; and the dose limit from all pathways

***Commentor No. 1924: Cyndy deBruler
Columbia Riverkeeper (Cont'd)***

Response to Commentor No. 1924

combined is 100 millirem per year. DOE has committed to remove the spent nuclear fuel at Hanford for ultimate disposition in a geologic repository.

1924-11: Decommissioning FFTF, including associated costs and cleanup, is not within the scope of the NI PEIS. Before decommission activities were undertaken, DOE would prepare the appropriate environmental documentation to address the associated environmental impacts. Cost assessments would also be prepared.

1924-12: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The current inventory of wastes managed at the Hanford Site are identified in Section 3.4.11.1 of Volume 1. In addition, the generation rates of wastes associated with the NI PEIS options that use Hanford facilities are compared with the current waste generation rates at the site in Section 4.3 of Volume 1. As stated in Sections 4.3.1.1.13, 4.3.3.1.13, and 4.4.3.1.13, the generation rates of wastes at Hanford associated with the options that utilize either FFTF, FMEF and/or RPL 306-E would be much smaller than the current waste generation rates at the site. These volumes would also be small in comparison to the existing inventory at the site (Section 3.4.11.1). These comparisons were also made for the other options which involved INEEL and ORR facilities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

1924-13: Under the No Action Alternative, ATR and HFIR would continue to produce medical isotopes and plutonium-238 could be purchased from Russia. ATR and HFIR would continue to produce medical isotopes under the remaining alternatives. The addition of a CLWR option under Alternative 2, Use Only Existing Operational Facilities, for plutonium-238

*Commentor No. 1924: Cyndy deBruler
Columbia Riverkeeper (Cont'd)*

Response to Commentor No. 1924

production would permit the medical isotope mission at existing reactors to grow. However, this growth was not analyzed in the PEIS because it is not a new mission.

With regard to the commentor's second concern, DOE did consider the use of irradiation facilities other than those addressed under Alternatives 1 through 4. However, their use was dismissed for a variety of reasons as discussed in Section 2.6.1.

The No Action alternative is required under Council on Environmental Quality regulations (40 CFR 1502.14(d)). It provides a point of comparison for the action alternatives. The No Action Alternative generally represents the status quo; that is, it includes those actions that would normally take place without the proposed action. Since the status quo involves maintaining FFTF in standby and not its deactivation, it is not appropriate to include its deactivation as part of the No Action Alternative. Deactivation of FFTF is included as Alternative 5, Permanently Deactivate FFTF, and as part of Alternative 2, Use Only Existing Operational Facilities, Alternative 3, Construct New Accelerator(s), and Alternative 4, Construct New Research Reactor.

1924-14: The 300 Area Revitalization Plan (DOE 1999) provides for continued multi-program R&D operations in the 300 Area, including operation of various laboratories, office facilities, and services. It also provides for consolidation (but not complete elimination) of radiological operations, with support for Hanford Site facility transition and environmental restoration efforts. The plan does not require closure of the 325 and 306 E buildings as long as they are needed for active research projects. Operation of these facilities would not violate any existing agreements between DOE and stakeholders or other legal obligations, nor would it affect ongoing or planned environmental restoration and facility transition activities.

As discussed in Section 1.2 of Volume 1, plutonium-238 would be produced to support NASA's deep space missions. Plutonium-238 is not used to produce nuclear weapons. All missions considered in the NI PEIS are for civilian purposes.

PNNL is not preparing this PEIS, although it has offered technical comments on it. These comments have been evaluated by DOE and the contractor preparing the PEIS. PNNL has also previously provided

***Commentor No. 1924: Cyndy deBruler
Columbia Riverkeeper (Cont'd)***

Response to Commentor No. 1924

technical and cost analyses on matters related to the FFTF, which have undergone independent scrutiny, and have helped confirm the need for the environmental review now being independently developed. PNNL's work does not present a conflict of interest. Ultimately, DOE has full control over the contents of the PEIS.

1924-15: At the time the Draft NI PEIS was completed and published, DOE did not have a preferred alternative. DOE used the environmental evaluation in the Draft NI PEIS, and also other reports on cost and nonproliferation impacts, as well as input from the public to develop its preferred alternative. Council on Environmental Quality regulations (40 CFR 1502.14(e)) do not require the inclusion of a preferred alternative in a draft EIS if one has not been identified at that time. However, the regulations do require identification of a preferred alternative in the final document. DOE has identified a preferred alternative in Section 2.8 of the Final NI PEIS.

1924-16: The Isotope Production Facility (IPF) at Los Alamos National Laboratory produces radioisotopes using the Los Alamos Neutron Science Center's LANSCE) half-mile accelerator that delivers medium-energy protons. Among other isotopes, the IPF's three major products include germanium-68, strontium-82, and sodium-22. As a result of changing DOE missions, the production of radioisotopes at target area "A" of the LANSCE has been rendered inoperable. In order to replace the level of production lost due to this change, DOE is completing a new and more efficient IPF that would allow DOE to continue to produce most of these same isotopes in an effort to meet existing demand. As addressed in Section 2.6.1 of the NI PEIS, IPF at LANSCE was considered but dismissed from further evaluation because, although it can be used in tandem with the Brookhaven Linac Isotope Producer (BLIP) located at the Brookhaven National Laboratory to supply near-term isotope requirements, it is unlikely that these facilities could accomplish reliable, increased isotope production at the level needed to support projected needs.

In 1998, an Expert Panel convened to forecast future demand for medical isotopes estimated that the expected growth rate of medical isotope use during the next 20 years will range between 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These growth projections were adopted by DOE as a planning tool for evaluating the potential capability of the existing

*Commentor No. 1924: Cyndy deBruler
Columbia Riverkeeper (Cont'd)*

Response to Commentor No. 1924

nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. As addressed in Section 2.6.1 of the NI PEIS, IPF at LANSCE was considered but dismissed from further evaluation because, although it can be used in tandem with the Brookhaven Linac Isotope Producer (BLIP) located at the Brookhaven National Laboratory to supply near-term isotope requirements, it is unlikely that these facilities could accomplish reliable, increased isotope production at the level needed to support projected needs.

1924-17: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, or Alternative 2, Use Only Existing Operational Facilities.

Commentor No. 1925: Stanley Hobson, INEEL Citizens Advisory Board

Citizens Advisory Board

Idaho National Engineering and Environmental Laboratory

00-CAB-065

August 31, 2000

William B. Richardson
Secretary of Energy
U.S. Department of Energy, Headquarters
1000 Independence Avenue, S.W., MS 7E-079
Washington, DC 20585

Dear Secretary Richardson:

Chair:

Stanley Hobson

Vice Chair:

Jan M. Edelstein

Members:

Wynona Boyer
James Bondurant
Karen Corrigan

Teri Tyler

I am a member of DOE's Environmental Management Site Specific Advisory Board for the Idaho National Engineering and Environmental Laboratory (INEEL). Within our charter under the Department of Energy, we develop all of our recommendations through consensus-building processes involving the full membership of the Citizens Advisory Board (CAB) in a public setting. The INEEL CAB meets every other month for two full days. This schedule sometimes makes it difficult for us to provide our consensus recommendations within the established public comment periods. When we believe a particular issue for which DOE is seeking citizen input is of considerable importance to the INEEL, we request an extension for the public comment period. We find ourselves in that position once again, with regard to the Draft Programmatic Environmental Impact Statement for Accomplishing Expanded Civilian Nuclear Research and Development and Isotope Production Missions in the United States, Including the Role of the Fast Flux Test Facility (NI PEIS).

The comment period for the NI PEIS is scheduled to end on September 18, 2000; our next CAB meeting is scheduled for September 19 and 20, 2000. We have requested for an extension of the comment period so that we can develop an informed, consensus recommendation on this proposed action(s) with significant potential impact on the INEEL. We have not yet received a written response to that request. I have been very cordially advised by telephone (via calls from Mr. Dan Funk and Ms. Collette Brown) that DOE has received our request for an extension. Both further explained that an extension of the comment period would not be granted due to internally determined schedule constraints for this PEIS. Both Mr. Funk and Ms. Brown encouraged the submission of our consensus recommendation, although the comment period will be closed before we will be able to complete our processes.

The INEEL CAB uses topical committees (from within its membership) to review documents and prepare draft recommendations for consideration by the full board at its next meeting. (We define consensus as "all members understand and support the content and intent" of the recommendation.) The NI PEIS is currently being reviewed by one of our issue committees. Discussions within the committee indicate several major areas of concern. These concerns can only be forwarded to the Department after reaching consensus within the entire INEEL CAB. The value of further review by the relevant committee and of full Board deliberations striving toward consensus is, at best, a problem in light of the September 18, 2000 deadline.

Jason Associates Corporation • 477 Shoup Avenue, Suite 201 • Idaho Falls, Idaho 83402
Phone • (208) 522-1662 Fax • (208) 522-2531
<http://www.ida.net/users/cab>

Response to Commentor No. 1925

1925-1

1925-1: DOE values the input of the INEEL CAB to the NEPA process and that of all of its advisory boards. The effort inherent with the development of the CAB's consensus recommendations and its value to informed decision making is also appreciated. DOE stated in the Notice of Availability (65 FR 46443 et seq.) that it would consider comments submitted after the close of the comment period on September 18, 2000 to the extent practicable. Responses to the INEEL CAB comments are shown under Comment Number 2050 of this comment response document (Volume 3 of the NI PEIS).

***Commentor No. 1925: Stanley Hobson (Cont'd)
Citizens Advisory Board***

We find ourselves in a dilemma, Mr. Secretary. On the one hand, we believe that DOE's efforts to address our concerns would considerably strengthen the EIS. On the other hand, as volunteers, we want the expenditure of our time to be productive. The alternatives and options being considered in this EIS portend significant federal outlays. This environmental documentation and the decision-making process it supports are important to DOE, important to the citizenry of the country, and perhaps just a little more important to the potentially impacted sites and their surrounding communities. We would hope that developing a thorough and legally-defensible EIS—one that has been provided to the public consistent with provisions for public participation under the National Environmental Policy Act—is more important than meeting a self-imposed deadline.

In my several years of service on the INEEL CAB, I have come to genuinely believe our jointly-derived, consensus recommendations are vastly superior to any I could develop on my own. I offer my thoughts on the EIS and my concerns about the associated public participation efforts as a private citizen who has invested a number of hours of my own time in reviewing the EIS. I have made this investment of my time in preparation for listening to my esteemed colleagues and then participating in collaborative work to forge a consensus recommendation that is worthy of transmittal to the Department. The Board has not met, nor deliberated on the contents of this letter; the thoughts I am expressing have not been approved by my peers.

I very much appreciate the recent efforts by Ms. Brown and Mr. Funk to keep me, as Chair of the INEEL CAB, informed.

Sincerely,

Stanley Hobson

September 14, 2000

Colette Brown,
US Department of Energy
Office of Space and Defense Power Systems (NE-50)
19901 Germantown Road
Germantown MD 20874-1290

Dear Ms Brown

Document NEPA Review: Draft Programmatic Impact Statement for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the United States, Including the Role of the Fast Flux Test Facility (Nuclear Infrastructure Programmatic Environmental Impact Statement [NI PEIS]) (DOE/EIS-0310D)

The Tennessee Department of Environment and Conservation, DOE oversight Division (TDEC/DOE-O) has reviewed the subject document in accordance with the requirements of the National Environmental Policy Act (NEPA) and associated regulations of 40 CFR 1500-1508 and 10 CFR 1021 as implemented.

General Comments

The listed options that incorporate use of existing facilities demonstrate that no increased impacts would be associated with operations on the Oak Ridge Reservation (ORR). Since the options that incorporate the building of new facilities do not specifically state where the new facilities would be located on the ORR, there is no means to properly evaluate impacts associated with this new construction. If one of these options is chosen, then further evaluation will become necessary.

Specific Comments

1. Volume 1, Page 1-5, Table 1-1 and Related Text

DOE will soon be supplying medical isotopes derived from uranium-233 (U-233) for the *Phase II Leukemia Research Trials* to be conducted during the fall of 2000. The isotopes of interest for these studies (and for the ultimate treatment of leukemia) are actinium-225 (Ac-225) and bismuth-213 (Bi-213). Ac-225 and Bi-213 are not listed in Table 1-1 of the NI PEIS. Please list Ac-225 and Bi-213 in Table 1-1 and also address those isotopes, as well as U-233, in the text of the NI PEIS.

1926-1

1926-2

Response to Commentor No. 1926

- 1926-1:** DOE notes the commentor's observations. DOE used the generic site approach for Alternatives 3 and 4 in the absence of specific siting alternatives. This level of analysis is appropriate for a PEIS. Projected construction and operational data on nonradiological air emissions, water use, radiological and chemical releases, and waste generation are provided at a level of detail commensurate with that provided for the existing facilities under consideration. Should one of these alternatives ultimately be selected on the basis of its technical merit for accomplishing the stated missions and the assessment of environmental impacts, subsequent NEPA reviews would be conducted to include an analysis of siting alternatives and associated site-specific impacts.
- 1926-2:** The commentor identifies several isotopes that are not discussed in the Draft NI PEIS. DOE is supplying small amounts of isotopes actinium-225 and bismuth-213 for medical clinical trials. The small quantity needed for these clinical trials was produced by chemically processing uranium-233. If clinical trials are successful, large quantities might require the use of a reactor or accelerator to meet this possible future demand. In response to comments on the Draft NI PEIS, a discussion of isotopes that can be extracted from existing supplies of long-lived isotopes, including progeny of uranium-233, has been added to Section 2.7.3 of Volume 1.

**Commentor No. 1926: Earl C. Leming, State of Tennessee,
Department of Environment and Conservation (Cont'd)**

2. Volume I, Page 1-13, Section 1.6, Related NEPA Reviews

DOE has stated in correspondence with the Division that it plans to initiate a specific "U-233 Storage and Disposition Programmatic Environmental Impact Statement (PEIS)" in 2002. This PEIS should be listed and discussed in Section 1.6 of the NI PEIS.

**3. New Accelerator(s) Alternative (Alternative 3, Page 2-61, Section 2.2.4) and
New Reactor Alternative (Alternative 4, Page 2-63, Section 2.5.5)**

These sections in the NI PEIS mention that if either the new accelerator(s) or new reactor alternatives are chosen, the facility "...would be constructed at an existing DOE site." The possible locations of the new accelerator(s) and reactor should be listed and discussed in the NI PEIS. Without this information, an adequate evaluation of the alternatives cannot be conducted.

The above sections in the NI PEIS state that "Targets for medical and industrial isotope production would be fabricated in a new support facility located at the same site as the new low energy accelerator (or reactor)" if alternative 3 or 4 is chosen. It is the Division's position that an existing facility should be utilized as a support facility if practical.

If you have any questions concerning these comments, please contact me at (865) 481-0995.

Sincerely

Earl C. Leming
Director

xc: Dodd Galbreath - TDEC
Eddie Nanny - TDEC
Rodney Nelson - DOE

Ecl540.99

Response to Commentor No. 1926

1926-3

1926-3: DOE is no longer planning to initiate a U-233 storage and disposition PEIS in 2002. Rather, DOE is changing its plans for the use of uranium-233 at Oak Ridge. An appropriate NEPA review would be performed for the proposed action to determine the level of NEPA documentation.

1926-1

1926-4

1926-4: As noted in Sections 2.5.4. and 2.5.5 of Volume 1, because Alternative 3, Construct New Accelerator(s), and Alternative 4, Construct New Research Reactor, are evaluated at a generic DOE site(s), no credit was taken for any support infrastructure existing at the site and it was postulated that a new support facility would be required. However, it is highly unlikely that DOE would consider locating either a new accelerator(s) or reactor on a DOE site(s) that does not have existing infrastructure capable of supporting all or most of the infrastructure requirements.

 Office of Nuclear Energy, Science & Technology
 US Dept of Energy
 19901 Germantown Rd
 Germantown MD 20874

Dear Ms. Brown:

Thank you for the opportunity to comment on the draft programmatic environmental impact statement for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the United States, Including the Role of the Fast Flux Test Facility (NI PEIS) [#DOE/EIS-0310D]. We have reviewed the draft EIS and have the following comments.

General Comments:

- (1) The description in Section 3.4 of the Hanford environment impacted by the use of the Fast Flux Test Facility (FFTF) is relatively thorough, especially compared to other Department of Energy programmatic environmental impact statements (PEIS), such as the Waste Management PEIS.
- (2) The cost information in the document is incomplete. It appears the real tradeoff is between use of the FFTF and cutting or prioritizing certain research activities at currently operating facilities. The PEIS fails to make a specific case why creating new capacity is necessary. Please expand the document to include this information.
- (3) The "Purpose and Need" section (1.2) is very qualitative, based on summary assertions from advisory committees. To some degree, the sources cited that are available via the Internet do not provide a quantitative basis to assess the need for additional capacity. Consequently, "Comparison of Mission Effectiveness Among Alternatives" (Section 2.7.1.2.3) is very brief and inconclusive. As there is no cost analysis included in the draft NI PEIS, it is impossible to evaluate the tradeoffs between the options in terms of meeting specific needs based on relative costs. Please expand the NI PEIS to include this discussion.
- (4) The list of "Related NEPA Reviews" in Section 1.6 is illuminating and helpful. However, the text does not help the reader clearly understand how these reviews relate to the decisions to be made under this PEIS. Perhaps a graphic or table showing links would be helpful.

1927-1

1927-2

1927-3

1927-4

1927-2

1927-5

Response to Commentor No. 1927

- 1927-1:** DOE notes the commentor's view that Volume 1, Section 3.4 of the NI PEIS presents a relatively thorough description of the affected environment at Hanford.
- 1927-2:** CEQ (40 CFR 1500 et seq.) and DOE (10 CFR Part 1021) implementation regulations do not require inclusion of cost studies in an environmental impact statement. The basic purpose of the NI PEIS is to describe the alternatives under consideration for implementation (Section 2.5 of Volume 1) and the environmental impacts that would occur if these alternatives were implemented (Chapter 4 of Volume 1). Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. The associated cost report was made available to the public on August 24, 2000. DOE mailed this document to approximately 730 interested parties, and the report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in public reading rooms.
- 1927-3:** DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing

Commentor No. 1927: Rebecca J. Inman, State of Washington, Department of Ecology (Cont'd)

September 13, 2000
Page 2

- (5) The PEIS does not address decommissioning, closure, and long-term stewardship requirements for facilities. In particular, what would be the long-term added requirements and costs were FMEF to be used and contaminated? Please include a discussion on these issues.
- (6) The information (calculations, etc.) to establish the basis for the amount of waste generated by restart of FFTF is not included. Please clarify this issue in the final document.

Specific Comments

Page S-8 The second sentence of the next to last paragraph states "However, in Richland, Washington, the meeting was attended by several stakeholder and environmental groups who voiced considerable opposition...", while on page S-9 the fourth sentence of the fourth paragraph says "Most of the comments received at the Richland, Washington, meeting supported restarting FFTF." Please clarify this discrepancy in the final document.

Page S-29 The third sentence of the next to last paragraph says "200 degrees C (44 degrees F)". Centigrade temperatures are converted to Fahrenheit by multiplying by 9/5 and adding 32; (200x9/5) plus 32 = 392 degrees F. Please correct the error in the final NI PEIS.

Page S-63 The third sentence under Spent Fuel Management states "The environmental impacts associated with the existing inventory of spent fuel at Hanford site are minimal. Please expand this section to include the justification for the statement.

Section 4.3.1.1.13 The statement made here and elsewhere in the document that "transuranic waste would be... eventually shipped to a suitable geologic repository for disposal" lacks candor. There is no disposal path for transuranic wastes generated in this program. Indefinite storage on-site appears highly likely. Please clarify the disposal pathway for this material.

The same section states that low-level and mixed low-level wastes were analyzed in and will be handled under the Waste Management PEIS Records of Decision. It would be helpful to see exactly where these wastes were covered in the Waste Management PEIS. Furthermore, if they are not disposed of commercially (the "preference" expressed in this draft PEIS), they would likely be disposed of on-site. To assert that would have no impact at Hanford is premature, based on the Waste Management PEIS. The Hanford Radioactive and Hazardous Solid Waste draft EIS has yet to be released for public review. Please include this discussion in the final NI PEIS.

1927-6

1927-7

1927-8

1927-9

1927-10

1927-11

Response to Commentor No. 1927

research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

DOE has taken the Expert Panel and NERAC report recommendations under consideration in developing the range of alternatives evaluated in the NI PEIS. These reports were made available to the public at the NI PEIS public information centers and on the Internet at www.nuclear.gov.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Under the No Action Alternative, DOE would continue to purchase plutonium-238 to meet the space mission needs for the 35-year evaluation period considered in the NI PEIS. However, DOE recognizes that any purchase beyond what is currently available to the United States through the existing contract would likely require negotiation of a new contract and may require additional NEPA review.

Commentor No. 1927: Rebecca J. Inman, State of Washington, Department of Ecology (Cont'd)

September 13, 2000
Page 3

Chapter 5: The list of potentially applicable laws and regulations (Chapter 5) is quite exhaustive. However, the text does not indicate specifically which state laws and regulations (Section 5.1.4) the Department of Energy actually commits to comply with. Please expand this section to clarify the regulations that will be complied with.

1927-12

Section 5.1.4: Delete the word 'potentially' from the third line in the paragraph above Table 5-2. The sentence should read "A list of applicable state laws, regulations and agreements is provided in Table 5-2."

1927-13

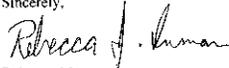

Section 5.1.4, Table 5-2: Replace the word "Potential" from the third column of Table 5-2 with the word "Regulatory." The heading should read 'Regulatory Requirements.'

1927-14

The tenth item identified in this table is the "Hanford Federal Facility Agreement and Consent Order (Tri-Party Agreement)." The description in the third column under "Potential Requirements" is not complete. The Tri-Party Agreement does not establish the applicability of state and federal laws but determines the steps necessary to bring Hanford into compliance with state and federal regulations. Replace the information in this column with the following wording: 'The Tri-Party Agreement is an enforceable agreement which details work necessary to comply with State and Federal hazardous waste management requirements.'

Thank you again for the opportunity to comment on the NI PEIS. If you have any questions, please call Mr. Max Power with our Nuclear Waste Program at (360) 407-7118.

Sincerely,

Rebecca J Inman

Response to Commentor No. 1927 (Cont'd)

The May 22, 2000, correspondence from NASA to DOE identifies that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, SRTG development efforts were stopped in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires one-third less plutonium-238 as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000, letter to DOE that large RTGs be maintained as backup. Section 1.2.2 of Volume 1 was revised to clarify plutonium-238 mission needs.

The major mission of FFTF would not be the production of plutonium-238. Rather, all three missions are of equal importance; no one mission is given priority in the NI PEIS.

1927-4: Volume 1, Section 2.7.1.2.3 of the Draft NI PEIS presents a comparison of mission effectiveness among alternatives. This section has been revised in the Final NI PEIS (see Section 2.7.1.8, "Comparison of Mission Effectiveness Among Alternatives") to provide the reader a better understanding of the medical isotopes that can be produced using accelerator technology (Alternative 3) and reactor technology alternatives (Alternatives 1 and 4).

1927-5: DOE notes the commentor's view. Discussions addressing related NEPA reviews, originally presented in Section 1.6 of the Draft NI PEIS, are now presented in Section 1.7 of the Final NI PEIS. The relevance of each of these NEPA reviews to the NI PEIS analyses is provided at the end of each individual discussion.

1927-6: Decommissioning of existing facilities, including FMEF, and their closure and long-term stewardship requirements are not within the scope of the NI PEIS. Before these activities were undertaken, DOE would prepare the appropriate environmental documentation to address the associated environmental impacts. Cost assessments would also be prepared.

1927-7: The NI PEIS provides references for the sources of waste generation in each of the alternatives and alternative options. The waste generation estimates for FFTF were obtained from the May 2000 draft of the

Commentor No. 1927: Rebecca J. Inman, State of Washington, Department of Ecology (Cont'd)

Response to Commentor No. 1927 (Cont'd)

“Waste Minimization and Management Plan for FFTF.” The estimates used in the draft plan were based on information from past operations of the FFTF. Waste generation and disposition are detailed in Chapter 4 of the NI PEIS for each of the alternatives.

- 1927-8:** Page S-8 of the Draft NI PEIS summarizes comments DOE received at the Plutonium-238 Production EIS scoping meetings that were held in November 1998. The comments summarized on page S-9 of the Draft NI PEIS are comments DOE received at the NI PEIS scoping meetings held in October 1999. Appendix N of the NI PEIS summarizes the comments received during both public scoping periods.
- 1927-9:** The commentor is correct. The value of 392 degrees F is the correct conversion of 200 degrees Centigrade to Fahrenheit temperature. However, since 200 degrees Centigrade is identified as approximate, the value of 400 degrees F has been inserted in the parentheses on page S-29 of the final PEIS instead of the incorrect value of 44 degrees F. This error has no effect on the results presented in the EIS.
- 1927-10:** The discussion in the Summary and Section 4.8.3.5 of the NI PEIS on the cumulative impacts for spent nuclear fuel management at the Hanford Site was revised to clarify that the management of the existing spent nuclear fuel at Hanford results in a dose of less than 0.1 millirem per year to the maximally exposed member of the public. This dose is well within the DOE limits given in DOE Order 5400.5. As discussed in that Order, the dose limit from airborne emissions is 10 millirem per year, as required by the Clean Air Act; drinking water is 4 millirem per year, as required by the Safe Drinking Water Act; and the dose limit from all pathways combined is 100 millirem per year. DOE has committed to remove the spent nuclear fuel at Hanford for ultimate disposition in a geologic repository.
- 1927-11:** Sections 4.3.1.1.13, 4.3.2.1.13, 4.3.3.1.13, and 4.4.3.1.13 were revised to address comments received during the public comment period. These sections now state that “DOE is considering whether the waste from processing of irradiated neptunium-237 targets should be classified as high-level radioactive waste and not transuranic waste. Irrespective of how the waste is classified (i.e., transuranic or high-level radioactive waste), the composition and characteristics are the same and the waste management activities (i.e., treatment and onsite storage) as described in this NI PEIS would be the same. In addition, either waste type would

Commentor No. 1927: Rebecca J. Inman, State of Washington, Department of Ecology (Cont'd)

Response to Commentor No. 1927 (Cont'd)

require disposal in a suitable repository. If it is transuranic waste, it would be nondefense waste and could not be disposed of at WIPP under current law. Because nondefense transuranic waste has no current disposal path, DOE Headquarters' approval would be necessary before a decision is made to generate such waste, as required by DOE Order 435.1. If the waste is classified as high-level radioactive waste, it is assumed for the purposes of this analysis that Yucca Mountain, Nevada, if approved, would be the final disposal site for DOE's high-level radioactive waste."

Section 4.3.1.1.13 states that "In accordance with the Records of Decision for the 'Waste Management PEIS', wastes could be treated and disposed of on site at Hanford or at other DOE sites or commercial facilities." The paragraph continues on to provide summaries of the various Records of Decision for each of the waste types. This section does not state that the wastes that would be generated from the proposed alternative or alternative options were included in the Waste Management PEIS.

Section 4.8 of the NI PEIS provides information on the cumulative impacts. The waste management information has been revised from the draft to include capacities for the treatment, storage and disposal facilities. For this assessment the total maximum waste volume that would be generated for each site were added to the total site baseline for the 35 year nuclear infrastructure operation and can be compared to the site's storage, treatment and disposal capacities.

1927-12: Section 5.1.1 provides information on the Federal environmental, safety, and health laws and regulations including the applicability to the alternatives. In the Final NI PEIS, Section 5.1.4 provides information on environmental requirements, which were previously addressed in Section 5.1.1, that have been delegated to state authorities or for which the state has established their own programs. DOE is committed to comply with state laws and regulations, as they are determined applicable to the proposed action.

1927-13: Section 5.1.4 has been revised in the Final NI PEIS to reflect the commentor's request.

1927-14: Table 5-2 in the Final NI PEIS has been revised to reflect the commentor's request.

Ms. Colette Brown
DOE, Office of Space and Defense Power Systems

Dear Ms. Brown,

Your Department's recent proposal to expand the civilian nuclear infrastructure, as outlined in the Draft Programmatic Environmental Impact Statement, for accomplishing expanded civilian nuclear energy research and development and the isotope production mission in the United States, including the role of the Fast Flux Test Facility, raises significant nuclear weapons proliferation issues, as well as environmental issues and human health concerns.

As a concerned taxpaying and voting citizen living downwind of the INEEL, I have become aware of the serious nuclear waste and contamination problems at this facility, as well as the irresponsible attempts to cover up or downplay these problems. INEEL is one of the most contaminated areas in America. The Department's recent estimate on cleaning up this site is \$22 billion and is expected to take 50 years__longer than any other DOE facility. In addition, we have over 360 individual superfund sites within the 890 sq. mile area that comprises INEEL. With this known, the last thing we need is a plan to generate more nuclear waste at a site that can't handle the waste it already has. INEEL needs more waste like the DOE needs more security security scandals. Out of concern for Idaho's environment, I strongly urge you not to pursue the plutonium_238 production mission as outlined in your PEIS.

2014-1

Response to Commentor No. 2014

- 2014-1:** The commentor's position regarding waste generation and selection of INEEL's Fluorinel Dissolution Processing Facility for plutonium-238 production is noted. Waste management at INEEL is discussed in Volume 1, Section 3.3.11. Waste generation and disposition that would result from selection of the Fluorinel Dissolution Processing Facility to support plutonium-238 production is described in Section 4.3.2.1.13. Use of facilities considered in the NI PEIS would not impact the cleanup missions at their respective sites.
- 2014-2:** The use of proposed alternative facilities associated with processing of neptunium-237 targets would have no impact on schedules or available funding for high-level radioactive waste programs at either Hanford or INEEL. At INEEL, the tanks would not be used although certain facilities at the Idaho Nuclear Technology Engineering Center (INTEC) would be used to treat the wastes resulting from processing the irradiated targets. These are reliable systems that would process a maximum of 1,050 cubic meters of low-level radioactive waste over the 35-year nuclear infrastructure operational period. The higher activity waste would be treated as a solid form via a stand-alone vitrification system, separate from any tank waste treatment system. At Hanford, the existing high-level radioactive waste facilities would not be used, and as analyzed in the PEIS, no existing or planned high-level radioactive waste facilities would be used to treat the wastes resulting from processing the irradiated targets.
- 2014-3:** Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost.

Commentor No. 2014: Sally Yocum (Cont'd)

One of the most daunting problems confronting cleanup at major DOE facilities such as Hanford and INEEL, is the solidification of liquid high_level nuclear waste. Your current plan for plutonium_238 production entails the generation of approximately 288,000 additional gallons of this waste over the project's 35 year span. While this is a small portion of Hanford's high level waste, it is approximately one fifth of what is remaining in Idaho, which makes it a very significant amount. Previous leakage of this waste at INEEL and Hanford threatens our already contaminated water supplies. What we certainly don't need is any more of this most highly problematic of waste forms.

Given the certain risks inherent in production of plutonium, the justified need for this material would have to be tremendous, and the PEIS does a poor job of providing ample justification. Beyond the risks involved in production, and the aforementioned resulting waste problem, there is also the issue of an accident occurring upon lift_off or reentry of a space probe carrying this material. The Cassini probe, launched in 1997, carried 72 pounds of Pu_238. The potential for an explosion during lift_off or upon an inadvertent re_entry during the fly_by phase, gave many in the scientific community pause, including top scientists within NASA. According to NASA's own conservative estimate, a burn up upon reentry of the Cassini probe could have caused 2,300 cancer fatalities; independent analyses ranged much higher. This potential for a catastrophic release of this extremely toxic material will imminent, as long as the US government remains committed to the use of plutonium_238. If DOE is to have a role in developing power systems for NASA's instrumentation, it should focus on promising solar technology, an alternative that has been promoted in the European scientific community, or at best research other alternative power methods

There are also proliferation concerns as it pertains to this plan. A return to production of this isotope, however poorly justified, means a return to the use of aqueous reprocessing at DOE facilities where

2014-2

2014-3

2014-4

2014-5

Response to Commentor No. 2014

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concerns for nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed production of plutonium-238 are relatively low and are discussed in detail in Chapter 4 of Volume 1, and Appendixes H, I, and J of Volume 2 in the Final NI PEIS.

2014-4: DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions, although issues such as NASA research priorities are beyond the scope of this NI PEIS. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch.

2014-5: It is not true that resumption of plutonium-238 production constitutes a return to reprocessing. The aqueous technique that would be used to separate plutonium consisting of over 80 percent plutonium-238 and neptunium from the irradiated target is similar to the technology that was used in portions of the complex process to extract plutonium-239. However, as discussed in PEIS Sections S.3, 2.2.3 and A.1.4, this technology would be used to chemically separate plutonium-238 and neptunium from irradiated targets and not from irradiated or spent nuclear fuel, whereas reprocessing separates weapons grade plutonium-239 from irradiated nuclear fuel. Plutonium-238 extraction is not reprocessing. Unlike plutonium-239, plutonium-238 is not used in nuclear weapons, but rather it would be used as a power and heat source for NASA space missions.

Commentor No. 2014: Sally Yocum (Cont'd)

this dirty and ancient technology has been used to extract bomb material for the weapons program. From President Carter to presidents Bush and Clinton, US policy has been to halt reprocessing in this country in order to set a global precedent to curtail the spread of nuclear weapons material_a noble effort in serious need of bolstering through aggressive action.

Indeed, an otherwise lukewarm Nuclear Infrastructure Nonproliferation Impact Assessment conducted by your Office of Arms Control and Nonproliferation questions whether our commitment to nonproliferation isn't weakened by the use of the Fluorinel Dissolution Process Facility within Building 666 at INEEL. INEEL's reprocessing facility is next door to a wet storage unit for Navy spent fuel, which contains a greater than average amount of highly enriched uranium. It was reprocessed from 1953 to 1989 at INEEL for the weapons program. Use of this facility to carry out plutonium_238 extraction, especially considering the dubious need for this isotope, at the very least raises the concern that DOE is not fully committed to ending reprocessing. How can the international community be expected to trust DOE's civilian_mission claim when this agency is obviously devoutly committed to development of weapons by using nuclear weapons technology at a weapons facility?

The silent issue of transportation of these high_level radioactive materials has not been mentioned. As we well know, the inherent risks of transportation are of a huge concern, and not to include this in the PEIS is irresponsible and makes for an incomplete study.

Considering all these factors that could adversely affect our environment and commitment to nonproliferation, I strongly urge you to select alternative 5 in the current PEIS. This alternative would allow the Advanced Test Reactor at INEEL to continue producing medical and industrial isotopes for the commercial sector and would not lead to the production of anymore highly radioactive liquid waste at Hanford or INEEL. The main mission at these two facilities has been and should continue to be cleanup of the mess

2014-5
(Cont'd)

2014-6

2014-7

Response to Commentor No. 2014

The Nuclear Infrastructure Nonproliferation Impact Assessment, published in September 2000, confirms that extracting plutonium-238 from irradiated targets would not undermine nonproliferation goals. In this report, DOE recognizes that proliferation concerns might be raised related to one of the technical assessment factors, "reduction in attractiveness of material forms," due to the fact that, in the extraction of plutonium-238, the remaining unconverted neptunium, a weapons-useable fissile material used as target material for conversion into plutonium-238, must also be recovered (not produced), purified, and recycled. This is unavoidable (unless the United States elects to neither produce or purchase plutonium-238), and it impacts all PEIS alternatives and options, including the No Action Alternative and Alternative 5: permanently deactivate FFTF with no new missions at U.S. facilities. However, while the fact that concerns might be raised is a valuable input to the record of decision process, it does not constitute an inconsistency with or departure from nonproliferation policy, and plutonium-238 is needed to fulfill our missions. Further, in the event that plutonium-238 production is resumed in the United States, the total separated stocks of neptunium would be reduced over time in an irreversible manner since there is a moratorium on U.S. spent fuel reprocessing. This overall reduction in a weapons-useable material would mitigate the potential concerns related to material attractiveness, and offer an additional method to pursue U.S. nonproliferation goals. DOE's proposed approach in this mission, and its rigorous nonproliferation impact assessment, demonstrate its commitment to nonproliferation policy, domestically and in the international community.

The juxtaposition of Fluorinel Dissolution Process Facility (FDPF) in INEEL Building 666 to wet storage of highly enriched uranium Navy spent nuclear fuel, and its previous mission of reprocessing spent nuclear fuel, were rigorously and objectively evaluated in the Nuclear Infrastructure Nonproliferation Impact Assessment published in September 2000. In no uncertain terms, this report discusses the proliferation concerns raised in the areas of facilitating cost-effective international monitoring and supporting negotiation of a verifiable FMCT, and outlines what is needed to mitigate these concerns. This is a valuable input to the record of decision process.

Commentor No. 2014: Sally Yocum (Cont'd)

left over from previous nuclear weapons work. Additional waste production would interfere with this already difficult and expensive work. Alternative 5 also calls for the decommissioning of the FFTF reactor at Hanford. FFTF is an aging breeder reactor whose use would be inconsistent with United States policy to discourage use of this technology due to the capability this class of reactors has to produce more plutonium than is consumed.

Thank you for the opportunity to comment on this plan.

Sincerely,

Sally Yocum
P.O. Box 514
Wilson, Wy. 83014
307_733_6807

**2014-7
(Cont'd)**

Response to Commentor No. 2014

Most of the concerns and uncertainties surrounding the use of FDPF are associated with its history as a defense programs facility and the resulting lack of transparency that could be afforded in the event that international monitoring becomes desirable under an FMCT. This is a different set of concerns than those expressed in the comment. The fact is, that since it is well known that FDPF has a long history of Navy defense missions, and since the described mission (plutonium-238 extraction) in the PEIS does not involve the production of special fissile material, sufficient transparency could possibly be provided by a managed access regime that would meet the requirements of FMCT verification. If this could be done, the aforementioned concerns would be mitigated.

2014-6: Appendix J contains a comprehensive risk analysis of all materials transported under the alternatives defined in the NI PEIS. Table J-3 lists the number of shipments and the mass of all materials shipped. The results of the risk analysis is shown in detail in Table J-7 and J-8, and summarized in Chapters 2 and 4 of Volume 1 and the Summary Volume for this PEIS. These results indicate the transportation risks would be small. The waste generated from processing of irradiated neptunium-237 targets would be vitrified and stored, onsite pending availability of a suitable repository for permanent disposal.

The DOE Manual 435.1. Radioactive Waste Management defines high level radioactive waste as the highly radioactive waste material resulting from the reprocessing of spent nuclear fuel, including liquid waste produced directly in reprocessing and any solid material derived from such liquid waste that contains fission products in sufficient concentrations; and other highly radioactive material that is determined, consistent with existing law, to require permanent isolation. DOE has prepared an implementation guide to DOE M 435.1 to assist in implementing the requirements contained in that manual. For this particular requirement, the definition of high-level radioactive waste, the guide is intended to facilitate the classification of indefinite waste as to whether or not they are high-level radioactive waste. It is recognized that the definition of high-level radioactive waste is not precise and is essentially a source-based definition that also alludes to concentrations of a given waste stream. Page II-8 of this guide notes that for the purpose of managing high-level waste under DOE M 435.1-1 [sic], spent nuclear fuel includes spent driver elements and/or irradiated target elements that contain transuranium elements. This statement was

Commentor No. 2014: Sally Yocum (Cont'd)

Response to Commentor No. 2014

included in the guide because the concentrations of long-lived isotopes are likely to be somewhat high during reprocessing and it also meets the source-based definition.

As a result of reviewing this guide and to address the comments raised, DOE is considering whether the waste from processing of irradiated neptunium-237 targets should be classified as high-level radioactive waste and not transuranic waste. As a result, the Waste Management sections (i.e., Sections 4.3.1.1.13; 4.3.2.1.13; 4.3.3.1.13; and 4.4.3.1.13) of this NI PEIS have been revised to reflect this different classification from what was assumed in the draft NI PEIS. As discussed in these revised sections, irrespective of how the waste is classified (i.e., transuranic or high-level radioactive waste), the composition and characteristics are the same and the waste management (i.e., treatment and onsite storage) for this NI PEIS would be the same. In addition, even if the waste is managed as high-level radioactive waste it would have no impact on the existing high-level radioactive waste management infrastructure (e.g., high-level waste storage tanks), since the high activity waste from processing of the targets would be initially stored and vitrified within the processing facility (i.e., FMEF, REDC, or FDPF).

2014-7: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF. It should be noted that medical isotopes would continue to be produced at ATR regardless of which alternative is selected in the Record of Decision. The FFTF would produce spent nuclear fuel and low-level radioactive waste, and as discussed throughout Section 4.3 of Volume 1, none of the proposed alternatives would add waste to the high-level waste tanks at Hanford or INEEL. Also, it should be pointed out that while FFTF supported the breeder reactor program, it is not itself a breeder reactor, but rather a fast flux research reactor.

Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of

Commentor No. 2014: Sally Yocum (Cont'd)

Response to Commentor No. 2014

low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

With respect to cleanup of wastes at Hanford or INEEL, the proposed action and the existing cleanup missions are independent programs and actions related to one will not impact the other. While the cleanup activities at both Hanford and INEEL are high priority to DOE, it should be noted that the cleanup of legacy wastes is beyond the scope of the NI PEIS.

Commentor No. 2015: Norris Palmer

NI PEIS_Toll Free Telephone

9/20/00

Norris Palmer
Bingen, WA
817_481_9022

Yes, my name is Norris Palmer. I've got a house in Bingen, Washington at 2222 Laurie Circle. My phone number is, you can reach me at 817_481_9022. I want to leave my comments on the Environmental Impact Statement. They're definitely, we're totally against it. Everybody in that area is against it. Let's not open this Hanford back up again. We can't even clean it up the way it is. It's leaking currently. If you open it back up, we need to just take it out of there. So, please do not even think of opening that place up. Put it somewhere else away from a major river, like in the middle of Texas somewhere. We'd be happy to have it there. So, please do not think of opening this thing back up. Let's spend our money cleaning it up. Thank you.

2015-1

2015-2

2015-1

2015-2

Response to Commentor No. 2015

2015-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF. FFTF is located approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to the groundwater. The environmental impacts associated with operation of the FFTF during normal operations and from postulated accidents are presented and discussed in Section 4.3 of the NI PEIS. All impacts to human health and to environmental media including air, water, and land are shown to be small.

Specific sites for the new accelerator(s), Alternative 3, and new research reactor, Alternative 4, have not been selected. If Alternatives 3 or 4 are selected for implementation, site specific NEPA documentation will be prepared prior to site selection.

2015-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Hanford cleanup is funded by DOE's Office of the Assistant Secretary for Environmental Management (EM). FFTF funding is provided through the Office of Nuclear Energy, Science & Technology (NE). Further, two different congressional subcommittees oversee the appropriations for these activities. No monies have been or will be taken from any EM projects at Hanford to support the FFTF. Restart of FFTF would not impact current cleanup schedules. If the decision is made to shutdown the FFTF, then cleanup dollars will be needed to deactivate the facility, which will impact the Hanford cleanup budget.

2018-1**Response to Commentor No. 2018**

2018-1: As part of its charter under the Atomic Energy Act, DOE and its predecessor agencies have been developing and supplying radioisotope power systems to NASA for space exploration for more than 30 years. It should be noted that NASA and not DOE determines the need for space power systems. When such a power system is required, NASA utilizes the NEPA process to evaluate all reasonable alternatives. Plutonium-238 sources are used when it is the only mission enabling technology or enhances mission capabilities. As stated in Section 1.2.2 of Volume 1, research has been conducted to identify other potential fuel sources to support these space exploration missions, but no viable alternative to using plutonium-238 has been established.

A report to the U.S. Department of Energy
from the Oregon Office of Energy
September 2000

Many people played a role in helping the Oregon Office of Energy test a new way to gather public opinion on Hanford issues. We thank them all. In particular, we would like to recognize the invaluable efforts of DOE/FFTF project staff member Al Farabee and participants Steve Binney, Adam Bless, Barbara Clark, Janet Franco, and Greg DeBruler.

To view this report on-line, please visit <http://www.energy.state.or.us/nucsafe/nucsafe.htm>. For more information about the report, please contact Mary Lou Blazek by telephone at (503) 378-5544, by e-mail at mary.l.blazek@state.or.us, or in writing at Oregon Office of Energy, 625 Marion St. N.E., Suite 1, Salem, Oregon, 97301-3742.

This report was prepared with funding from the U.S. Department of Energy. Any opinions, findings, conclusions or recommendations expressed herein are those of the authors and do not necessarily reflect the views of the U.S. Department of Energy.

Ms. Collette Brown
Office of Nuclear Energy,
Science and Technology (NE-50)
US Department of Energy
19901 Germantown Road
Germantown, MD 20874

Dear Ms. Brown:

Enclosed is our report "*The Oregon Approach: Involving the Public in DOE's Nuclear Infrastructure Proposals Including Use of Fast Flux Test Facility.*" This report summarizes the results of an extensive public involvement effort to include Oregonians in evaluating the adequacy of the draft Programmatic Environmental Impact Statement (Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the U.S., Including the Role of the Fast Flux Test Facility). Our report includes public input on whether to restart the Fast Flux Test Facility. This information was collected from 20 focus groups in six Oregon communities. The public input provided in this report should be considered public comment on the Draft PEIS.

The report also provides a description of our process which involved a good number of Oregonians who had not previously commented on Hanford issues. I think you'll agree that the project and report provide you with meaningful public comment that DOE would not have otherwise received.

Sincerely,

Mary Lou Blazek, Administrator
Nuclear Safety Division

FOCUS GROUP ROUND ONE QUESTIONS

Key to Focus Group Abbreviations

OHSU = Oregon Health Sciences University
 CCS1 = Community Cross Section Group 1 (Portland)
 CCS2 = Community Cross Section Group 2 (Portland)
 MD = Market Decisions (Multnomah, Clackamas, Washington, Yamhill, Columbia Co.)
 HW = Hanford Watch
 OOE = Oregon Office of Energy (non-nuclear staff)
 C/A = Umatilla and Morrow County community leaders and agricultural interests
 E = Engineers
 OR = State of Oregon

Focus Group	Questions/Issues/Concerns/Interests to Address	Comments/Notes
1. OHSU	Does FFTF produce electricity?	No.
2. OHSU	Where did the tritium mission from FFTF's earlier proposals go?	To commercial reactors at Tennessee Valley Authority.
3. HW	Will PNNL be involved in the restart decisions? Will PNNL benefit from restart? Is there a conflict of interest?	The decision will be made by DOE headquarters. PNNL evaluated FFTF for restart and may be part of the operating group. The conflict of interest question is unclear.
4. HW	What is Gov. Kitzhaber's position on the restart of FFTF?	Currently, there is no official position on the restart of FFTF. In the past, the Governor opposed restart of FFTF to produce tritium. That mission is no longer proposed. The Governor will use the results of these Oregon focus groups along with staff's technical evaluation to guide his decision on this EIS.
5. HW	Will OOE demand a cumulative impacts analysis?	OOE will encourage USDOE to conduct a cumulative impacts analysis.
6. HW	Will OOE declare the EIS "illegal?"	No. The Attorney General makes legal decisions for the state.
7. HW	Will OOE articulate the public's opposition and Portland City Council's resolution against restart?	OOE will convey all the messages we've heard concerning restart of FFTF including these focus groups, the Portland City Council resolution, and others.
8. C/A	Does FFTF generate waste in standby mode?	Yes. Contaminated low level wastes are generated. Some radioactivity remains from past operations. Spent fuel from reactor is currently being processed for dry cask storage. This process generates caustic soda as a mixed waste.
9. CCS1	Can we process existing waste to get Pu238?	No, not from the waste at Hanford.
10. HW	What is Yttrium-90 that Hanford sells used for?	According to the Nuclear Medicine Research Council web site (http://www.cbvsp.com/nmrc/mia.html), Y-90 is used for "Internal radiation therapy of liver cancer, monoclonal antibodies, Hodgkin's disease, and hepatoma. Cellular dosimetry, treating rheumatoid arthritis, treating breast cancer, treatment of gastrointestinal adenocarcinomas."

Oregon Office of Energy

Response to Commentor No. 2019

Appendix D

Item #	Topic Group	Policy Issue or Intentional Question	Commentor's Answer
1.	OOE	If these missions go elsewhere, will that have an impact on (reduce) Hanford's budget?	There is the possibility that building of new DOE facilities such as a reactor or an accelerator might impact cleanup budgets complex wide.
2.	OCS2	Does use of FFTF focus attention and funding on Hanford and thereby help cleanup?	While it certainly may focus attention on Hanford it won't likely help the cleanup budget.
3.	OHSU, OOE, CCS1, CCS2, C/A	Is there a way to keep cleanup funds from being diverted to FFTF?	DOE's current plan for this is to fund FFTF from a separate part of DOE – Nuclear Energy vs. Environmental Management.
4.	OOE	If FFTF is re-started, could DOE then change its position and use the reactor for tritium production after all?	Not without going through the NEPA process to change the Record of Decision that sent this mission to TVA. However, it is possible that classified missions could be performed at FFTF without public input once it is re-started. (Post-meeting clarification: FFTF could not restart for defense missions without another EIS.)
5.	OCS1	If FFTF was built for the breeder reactor program which ended, if they restart could they use it for a breeder program again?	Yes, it would be possible to use the reactor to conduct research into breeder reactor materials, etc. However, it is highly unlikely this would occur since there is no breeder reactor program in progress in the US and it is very unlikely that there ever will be again. Note that FFTF is NOT a breeder reactor itself.
6.	OOE, C/A	Why has there been such a push to re-start the reactor? Is proposal for restart driven by politics, economics, or a business plan?	Part of DOE's official mission is to ensure an adequate supply of medical isotopes and an adequate nuclear research infrastructure in the US. The reason for the push to restart FFTF is many people feel that it is the best facility to accomplish these purposes in the US.
7.	OCS2	What is the larger public purpose of government facilities? Sometimes a federal vision/subsidy addresses things not commercially feasible or things the private sector cannot/will not undertake.	See the answer for the above question.
8.	C/A	What are we doing (differently) now to avoid the cleanup problems generated in the past?	FFTF is developing a Waste Minimization and Management Plan to help minimize the impact of FFTF's wastes on existing wastes. Currently, regulations on waste are much more stringent than they used to be and the public is much more aware of the dangers of these materials. However – wastes will be generated, and there will be an impact on current waste levels. The significance of this is controversial.
9.	C/A	Is the proposed FFTF mission(s) the only mission at Hanford other than cleanup?	In addition to cleanup there are various research missions going on. There is a commercial low-level radioactive waste dump in operation at Hanford, and there is a commercial nuclear power plant on Hanford site generating electricity for the region's power grid that are not DOE facilities.
10.	OCS2	Is Pu-238 a defense related mission for which the DOD should pay some of the cleanup costs?	This argument could be made if these generators are used in military satellites.

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Appendix D

1.	OHSU, C/A, OOE	What will happen to wastes from FFTF operations?	According to the latest version of FFTF's plan: Spent Nuclear Fuel would be stored on-site in dry storage casks, the disposition of the Transuranic Waste from target processing is unclear, low level waste will be disposed of at a commercial facility.
2.	OHSU	What kinds of "international research" are being considered for the new FFTF mission?	These research missions generally involve materials research. In other words, people want to know how a certain metal will behave when bombarded by radiation. This type of research is generally aimed at improving the strength of materials used in nuclear reactors.
3.	OHSU, HW, CCS2, C/A	What isotopes are proposed for FFTF; where are those isotopes currently produced; what are long range plans for each of those production facilities?	See table 1-1 in the EIS. Some examples are: Actinium-227, Iodine-131, Iridium-192, Krypton-81m, Rhenium-186, Thorium-228. Some of these are currently available commercially such as Iodine-131 and Iridium-192. These are generally produced in a Canadian reactor or by buying space in a research or DOE reactor. For example - OGSU has produced some medical isotopes in its research reactor.
4.	OOE, HW, CCS2	What is the need for medical isotope production?	This is controversial - some studies indicate there is a need, others indicate there isn't. Currently we buy many of our isotopes from Canada.
5.	OOE, HW, CCS2	What isotopes are currently being used for medical research and treatment?	Currently three radioisotopes dominate therapeutic applications: Iodine-131, Yttrium-90, and Phosphorus-32. Others in use are Strontium-89, Samarium-153 and Rhenium-186. These are currently in commercial production.
6.	HW, CCS1, C/A	What wastes and how much of each would be produced? Will liquid wastes be produced?	The following wastes would be produced: Spent Nuclear Fuel - 16 metric tons of heavy metal, Transuranic Waste from target processing, (numbers unavailable), Low-Level Radioactive Waste - from both target processing and operation of FFTF (about 23 cubic meters total for FFTF - numbers not available for processing facilities) Liquid wastes will be produced by both FFTF and the processing facilities. FFTF's liquid waste will be stabilized by drying and then it will be handled as dry waste. The processing liquid wastes have an unclear path.
7.	C/A	Is FFTF ready for proposed missions or would it have to be retrofitted?	It could physically perform the missions as it is without much retrofitting. However, there are plans to upgrade the control and protection systems since they are older technology and modify the reactor to allow on line insertion and retrieval of targets.
8.	C/A	How much waste would be generated from creating targets vs. processing targets?	More waste would be generated in the processing of targets than in the creation of them. Actual numbers are not provided in the EIS.
9.	HW	What type of fuel will be used? Can the fuel also be used for bomb production?	There are actually two plans for fuel. Both begin with using the current stocks on hand (about 6 years worth). This is Mixed Oxide (MOX) fuel - a mixture of plutonium and uranium. Once this fuel is exhausted there are two options - import MOX fuel from Germany or use domestically produced Highly Enriched Uranium (HEU) fuel. Both types of fuel contain weapons type materials. The fuel itself could not be used for bombs without significant re-processing.
10.	CCS1	Where will the fuel come from?	See above.
11.	HW	What alternate uses are being considered for FFTF?	Other than the missions discussed in this EIS, no alternate uses are being considered at this time.

Response to Commentor No. 2019

- 2019-1:** Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.
- 2019-2:** Researchers from many foreign countries use DOE's high-flux research reactors for materials testing and experimentation. These facilities have the capability to maintain a high density of neutrons in a given test volume for materials testing; shorten the time needed for such testing; tailor the neutron flux to simulate the different reactor types and conditions; and instrument the core for close monitoring of the test conditions. Although the NI PEIS analyzes the expansion of U.S. civilian nuclear research and development, it is anticipated that FFTF would play a role in the continuing international research conducted in the United States. As described in Section 1.2.3 of the NI PEIS, some specific areas of research identified are advanced reactor development including materials and nuclear fuel research for advanced terrestrial or space reactors and for the Accelerator Transmutation of Waste system.
- 2019-3:** For purposes of analysis in the NI PEIS, a representative set of isotopes was selected on the basis of recommendations of a thirteen member Expert Panel convened by DOE in 1998 to forecast future demand for medical isotopes, medical market forecasts, reviews of medical literature, and more than 100 types of ongoing clinical trials that use radioisotopes for the treatment of cancer and other diseases. These 37 representative isotopes are listed in Table 1-1 of the NI PEIS, along with a brief description of their medical and, in some cases, industrial applications. Some examples of isotopes included in the table

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Appendix D

Comment ID	Commenter	Comment	Response
12.	HW	Are some of the alternatives more easily adapted to future weapons related missions?	It would be easiest to conduct classified missions in FFTF, or another DOE controlled facility due to DOE's control and self-regulation status.
13.	HW	Is the FFTF reactor safe to operate?	The FFTF reactor is about 25 years old and its protection and control technology is of this vintage. There are commercial reactors operating safely with this technology.
14.	HW	Are the costs of making FFTF safe for particular missions included in the proposals?	We don't know -- we haven't seen the cost data yet. The latest word is that the cost study would be released September 5.
15.	HW	What other nuclear sites in the U.S. may be used for the proposed missions. What other facilities at the Hanford Site?	The sites with existing reactor facilities analyzed in this EIS are Hanford, Idaho National Engineering and Environmental Laboratory, the Oak Ridge Reservation in Tennessee, and a generic commercial light water reactor site. Processing facilities analyzed are at Hanford, Idaho, and Oak Ridge. The EIS discusses a generic DOE site for the possible construction of a new research reactor or accelerators.
16.	HW	Can the isotopes be produced elsewhere in the same amounts?	The EIS makes the statement that current facilities are unable to meet the demand for isotopes. The demand is currently being met mainly by purchase of isotopes from Canada. There are no commercial facilities in the U.S. now dedicated to the production of medical isotopes.
17.	HW	Can they use the large volume of waste at Hanford to process at FFTF and make something useful and profitable?	In general, no. Some things have been extracted from the waste in the past -- Cs and Sr, but it wasn't profitable.
18.	HW	How much Pu-238 will be produced; is there any foreign opposition?	The current EIS envisions 175 kilograms of Pu-238 being produced over a 35 year period. No foreign opposition that we are aware of.
19.	MD	Where else can Pu-238 be produced?	Pu-238 could be produced in another research type reactor, in a commercial light water reactor or in an accelerator.
20.	CCS1	Are there other materials besides Pu-238 that could be used for the space mission?	From a radioisotope standpoint, in theory -- any material that generates heat as it decays could be used. Practically, Pu-238 is probably the best material as other materials don't have as high a heat generating capacity and so would require bigger, bulkier batteries. Solar panels have, until recently (about 1995), been too inefficient.
21.	MD, OOE, CCS1, CCS2, OR, C/A	What will these proposals for FFTF cost (including startup, operation, shut-down, decommissioning)?	We haven't seen the cost data. The latest information we have is that this data will be released September 5.
22.	C/A	Will the government recoup its costs for this project?	It is the intention of the project to recoup its operating costs, but we are skeptical this can be done. The 35-45 million dollars per year spent thus far on keeping it in standby is not included in this.

Response to Commentor No. 2019

are Actinium-227, Iodine-131, Iridium-192, Krypton-81m, Rhenium-186, and Thorium-228. Currently, the medical applications for the representative isotopes primarily involve the diagnosis and treatment of three major classes of disease - cancer, vascular disease, and arthritis. Although these isotopes are a representative sample of possible isotopes that could be produced, DOE expects that the actual isotopes that would be produced at FFTF would vary from year to year in response to the focus of clinical research and the specific market needs occurring at that time.

The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. Although other manufacturers produce medical radioisotopes, DOE remains the key provider for a large number of radioisotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large-enough quantities to make their production financially attractive to private industry.

Supplies of many research isotopes are not readily available from existing domestic or foreign sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed. Under the NI PEIS proposed action and consistent with its mandates under the Atomic Energy Act, DOE would enhance its existing nuclear facility infrastructure to, among other things, more effectively support production of radioisotopes for medical applications and research. DOE's intent is to complement commercial sector capabilities to ensure that a reliable supply of isotopes is available in the United States to meet future demand, and to encourage the commercial sector to privatize the production of isotopes that have established applications to a level that would support commercial ventures.

A forecast for future demand for medical isotopes and the expected growth rate of medical isotope use during the next 20 years is provided in Section 1.2 of the NI PEIS. The growth projections were adopted by DOE as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual rate of growth of medical isotope use is consistent with the Expert Panel findings.

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Appendix D

#	Focus Group	Questions/Comments to be Addressed in EIS	Comments/Notes
23.	C/A	What does it cost to operate FFTF in standby mode?	About 35 to 45 million dollars a year.
24.	OR, C/A	Can we be sure operation of FFTF will not compromise Hanford cleanup funding, schedule or resources?	No.
25.	CCS2	Does EIS address suitability of FFTF for medical isotope production	In a general way. It does not do a detailed analysis of the suitability. In particular, there is no discussion of whether the advantages of fast neutrons are significant enough to warrant using this reactor, there is no discussion of the economics of using a reactor of this size for these missions. This material may be discussed in the economic information due out Sept 5.
26.	CCS1	Will the EIS assume all proposed missions are viable?	Yes. The EIS makes the assumption that these missions will be done and then analyzes their viability at various possible sites.
27.	OR	Does FFTF represent the best choice for any mission from economic, technical, public health & safety, and environmental standpoints.	This question is still under consideration. The Oregon Office of Energy is reviewing each mission to determine what we think is the most suitable facility rather than try to fit all the missions in at one facility. For example, using this criteria, a commercial light water reactor might be the best place for the Pu-238 mission.
28.	OR	Does the EIS include a broad selection of options including other DOE and private sites and modification of existing reactors and accelerators to meet the stated needs?	Yes – the EIS analyzes essentially about 21 different combinations of irradiation and processing facility options.
29.	CCS1, OR, E	Is there a compelling need for these missions?	For the medical isotopes there are conflicting reports, but due to the possibility that these materials could save lives, we will concede this point. For the other missions, there are alternatives such as purchase of materials from Russia. We will study this issue further before we make our recommendation to the Governor.
30.	OR	Has there been a detailed examination of DOE's projections for irradiation needs?	No, the EIS proceeds from the assumption that the needs are real and that these missions will be accomplished.
31.	OR	Has there been a thorough examination of all potential impacts of FFTF operations on all current and projected Hanford cleanup operations?	No. In particular, cost data and financing plans are still unavailable. The Waste Minimization and Management Plan is still in draft form and does not consider processing wastes in any detail.

Response to Commentor No. 2019

- 2019-4:** The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste volumes (both liquid and solids) are provided in Chapter 4 of the NI PEIS for each of the alternatives and alternative options under the Waste Management Sections. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.
- 2019-5:** FFTF can physically perform the missions in its current state without much retrofitting. However, there are plans to upgrade the control and protection systems since they are older technology, and modify the reactor to allow online insertion and retrieval of targets. These modifications are discussed in Section 2.3.1.1.2 of the NI PEIS.
- 2019-6:** The NI PEIS provides a total waste volume (by waste types) generated by the target processing and fabricating activities. However, these numbers are not broken out by these two activities since one would not be done without the other.
- 2019-7:** If a decision is made to restart FFTF, the first six years of operation would use existing onsite mixed oxide fuel. DOE expects that an additional 15-year supply of mixed oxide fuel in Europe, owned by Germany, would be available for FFTF. MOX fuel does not use highly enriched uranium. Further, use of the Hanford MOX fuel would dispose of a significant U.S. stockpile of highly attractive fresh plutonium fuel by conversion to spent fuel through irradiation in FFTF. This represents a safe, low-cost, high benefit opportunity to reduce U.S. civilian plutonium without chemical or bulk processing. Use of the German MOX represents a similar advantage with respect to the German stockpile of separated civilian plutonium. During the period of MOX fuel use, in support of U.S. nonproliferation policy directives, DOE's Office of Nonproliferation and National Security would undertake a study under Reduced Enrichment for Research and Test Reactors (RERTR) to consider the technical feasibility of using low enriched uranium to fuel the FFTF. Under this nonproliferation protocol, if use of low enriched uranium fuel is found infeasible in

Oregon Office of Energy

Appendix D

Item	Focus Group	Questions/Comments	Comments/Notes
32.	CCS2	Is the need to have trained people for any given mission at FFTF an argument for the missions?	No. This argument is not used in the EIS.
33.	C/A	How many people are employed by FFTF in standby mode? How many would be employed in operational mode?	Currently estimate about 120 workers at FFTF in standby. Operation would probably increase that number to about 250 to 300.
34.	C/A	Who pays for socio-economic impacts on Oregon local and county governments?	Other than possibly increased payments in lieu of taxes to Washington counties, there is no payment for socio-economic impacts. The EIS states that these impacts would be very small and absorbed within the normal population fluctuations for the area.
35.	C/A	Will FFTF operation mean more radioactive waste shipments on Oregon highways?	Yes. This increased transportation would at least involve shipment of FFTF's products to end-users. Additional transportation of radioactive materials would occur if the targets are fabricated and/or processed at a location other than Hanford itself. Also, much of FFTF's wastes are slated to go to a commercial repository. This could possibly involve transport of this waste to the repository through Oregon.

2019-24

2019-25

2019-26

Response to Commentor No. 2019

FFTF for meeting assigned missions, policy would allow DOE to subsequently procure highly enriched uranium fuel for use in FFTF. Again, this approach is consistent with U.S. nonproliferation policy.

The use of mixed oxide or highly enriched uranium to fuel the FFTF has been rigorously evaluated in the Nuclear Infrastructure Nonproliferation Impact Assessment which was published in September, 2000. This report confirms that the manner in which these fuels would be used, as described in the PEIS, is consistent with nonproliferation policy

2019-8: Other than the missions discussed in the NI PEIS, no alternate uses for FFTF are being considered at this time. None of the alternatives in the NI PEIS include defense missions nor would any contribute to future weapons production. All missions considered in the NI PEIS are for civilian purposes.

2019-9: To address the question of whether it is safe to restart the FFTF, the risks associated with the restart of the FFTF have been analyzed in the NI PEIS. These risks include the impacts from normal operations, accidents, and the transportation of material (new and spent fuel, medical isotopes) to and from the facility. Information on each of these impacts is presented in Chapter 2, Chapter 4, and Appendixes H, I, and J of the PEIS. These risks have been presented in terms of the risk of additional fatalities (in most cases additional cancer fatalities) should the reactor be restarted. In all alternatives that include the restart of the FFTF, the most likely result of implementation of the alternative is that there will be no additional fatalities.

The FFTF can be operated safely to accomplish the mission as described in the NI PEIS. The analyses presented in this NI PEIS reflect the proposed changes to the reactor core (including fuel and irradiation targets) to perform the stated missions. In the event that FFTF restart is selected in the Record of Decision, a new Safety Analysis Report, including a Probabilistic Risk Assessment (PRA), will be prepared and it will address any changes in plant configuration, operating conditions and procedures. The revised safety analyses will be subjected to a thorough independent review process.

2019-10: The costs of FFTF restart presented in the Cost Report include facility and safety modifications as well as revision of the Safety Analysis Report.

FOCUS GROUP ROUND TWO ORAL COMMENTS

CITIZEN QUESTIONS AND COMMENTS TO BE ADDRESSED

Questions/comments on EIS purpose, assumptions and structure

- Until I read the EIS, I really did assume this was about the missions. It was only when I read it that I understood: No, it begins with the assumption that the purpose is to "enhance our domestic infrastructure capability." Once I got that in my head, I realized this is just a setup. Once that's established as the goal, it's just a matter of assembling the right information and numbers. Again, I'm reacting pretty strongly to the basic logic of the EIS. I disagree with this fundamental assumption.
- I want to react to a comment that really bothered me about the EIS's examination of validity. Until I read the EIS I was prepared to believe that. But it is, in my estimation, a very bad sales document, larded with all kinds of things about the need to maintain U.S. technology leadership in biomedical research and justification for reinvigorating the nuclear power industry. I found it offensive as a promotional document rather than an EIS. I'm reacting to the comment that it doesn't examine the validity of the proposed mission. In fact, it tries to sell us on those and I think it failed badly.
- I disagree with the assumption that enhancing sole U.S. technical capacity is a correct beginning assumption when so much of where we're going is the opposite direction in terms of both medical needs and something like space exploration with international cooperation, for example. It just seems obvious. The notion that somehow we need to capture the technology for doing medical isotope work in the U.S. and keep it from other people given the health needs of the world is just wrong-headed. Why aren't we exploring how we can do these things internationally in a way for cost reasons, for humanitarian reasons, for international relations reasons, for all kinds of reasons? The notion that we don't want to rely on Canada or we don't want to share this stuff is just flat-out wrong-headed.
- The EIS was not a 'programmatic' EIS. It did not address the overall program. This is just a political document that biased the ability of an EIS to look at the situation. When you get to this issue about reviewing the mission, it seems to me that we have not dealt with the program issues in the EIS the way an EIS ought to deal with them.
- They didn't really broaden the list of options. They just sliced and diced the same proposals more finely. If they really set out to accomplish the expansion of options, you wouldn't end up with this EIS.
- The draft EIS appears to be a justification for the restart of FFTF hidden in an invented need to improve the U.S. nuclear infrastructure. That makes us uncomfortable.
- EIS's are not always objective. You cannot assume that a given EIS is objective.
- Some of the technologies we've discussed are not considered in the EIS – like more, smaller production facilities instead of one or two large scale facilities.

Response to Commentor No. 2019

- 2019-11:** Sites with existing reactor facilities analyzed in this EIS are Hanford, INEEL, and ORR, and a generic CLWR. Processing facilities analyzed are at Hanford INEEL, and ORR. The NI PEIS discusses a generic DOE site for possible construction of a new research reactor or accelerator(s). DOE also analyzed a number of other sites and facilities within the DOE complex; however, these were dismissed for a variety of reasons as stated in Section 2.6.
- 2019-12:** For nearly 50 years, DOE's use of its unique technologies and capabilities to develop isotopes for civilian purposes has enabled the widespread application of medical isotopes seen today. While its market share is a small fraction of total world radioisotope production, DOE remains the key provider for a large number of radioisotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large-enough quantities to make their production financially attractive to private industry.
- The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, supplies of many research isotopes are not readily available from existing domestic or foreign sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed. Under the NI PEIS proposed action and consistent with its mandates under the Atomic Energy Act, DOE would enhance its existing nuclear facility infrastructure to, among other things, more effectively support production of radioisotopes for medical applications and research.
- It appears from the flow of the commentor's comments that the question can be rephrased as "Can the isotopes produced by FFTF be produced elsewhere in the same amounts?" Operational facilities in the United States jointly do not have the available production capacity to match the variety and quantity of isotopes that could be produced at FFTF.
- 2019-13:** DOE notes the commentor's interest in processing nuclear wastes into useful products. In general, issues of waste processing are beyond the scope of this Nuclear Infrastructure PEIS. Normally pure target materials are selected for irradiation for the production of isotopes to assure that relatively pure materials are produced. Transmutation of nuclear wastes research and development experiments could be supported by FFTF.

2019-31

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Appendix E

- Is there legal ground on which we can call this PEIS inadequate given that the cost study is late and non-proliferation is not available?
- How can DOE do an EIS that only evaluates effects for 35 years?
- Is there anything in the PEIS that allows the missions to be separated?
- Does (the EIS) assess questions like the fact that there is no permanent waste storage for this stuff here or anywhere else that is satisfactory? Do they talk about the impacts of waste that is not properly stored?

Questions/comments on the cost and non-proliferation studies and on general costs

- It is unacceptable for the public to be presented with an EIS lacking the cost and proliferation studies. The public has a right to see the costs involved before DOE makes a decision. The current process or policy of separating these facets out is part of the duping of the American public. Trust in our government is a thing of the past because of the way the DOE does business.
- If cost figures are not available for the DOE public meetings, it's a big waste of time.
- It is a waste of money to just let FFTF sit in standby. We need to spend the money to either run it or permanently shut it down.
- Of what value is the EIS without the cost study?
- There is not enough information to comment on the questionnaire on the economic viability of the alternatives because no economic information is included in the PEIS.
- The cost figures on the internet are shocking.
- Why did DOE fail to give us the cost and non-proliferation documents? How could DOE not provide this key information after the public asked for it as part of scoping?
- We need cost estimates on the use of the canister storage building to accommodate this new waste. It will be huge. It will also be hard to track costs because of the way DOE funding is decentralized.
- Some believe (restarting FFTF) would have a positive socio-economic impact.
- I am appalled at the amount of money this nation is spending (I wish they would put those costs in the EIS) on standby equipment for nuclear facilities, not just at Hanford. It's this great idea that if we keep all this on standby, our industry will eventually be able to make the leap and move forward.
- What is the likelihood that budget projections made today will hold true over a 35-year project?
- Is the agreement to pay for dismantlement of FFTF from the Nuclear Energy, Science and Technology

Response to Commentor No. 2019

2019-14: The NI PEIS projects that approximately 175 kilograms of plutonium-238 would be produced over a 35-year period. At this time, DOE is not aware of any foreign opposition to this mission.

Plutonium-238 can be produced in FFTF, another research reactor, a commercial light water reactor, or in an accelerator. Although research to identify other potential fuel sources to support these space exploration missions has been conducted, no viable alternative to using plutonium-238 has been established. DOE could purchase plutonium-238 from Russia to satisfy its responsibility to supply NASA with the necessary fuel to support future space exploration missions. Under the current contract set to expire in 2002, the United States is authorized to purchase up to 40 kilograms of plutonium-238, with the total available for purchase in any one year limited to 10 kilograms. However, DOE does not stockpile large quantities of Russian plutonium-238 long in advance of needs due to budget constraints and the additional processing required to remove decay products that occur following extended storage of the material. To date, DOE has purchased approximately 9 kilograms of plutonium-238 under this contract. Future purchases under the current contract with Russia are negotiable through calendar year 2003. DOE recognizes that this is a viable option and has analyzed this option under the No Action Alternative.

2019-15: The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. The cost report contains costs for FFTF standby mode, startup, operation, and deactivation. Since all of the missions are not generate revenue, DOE will not recoup its costs for the project. DOE has provided a summary of the Cost Report in Volume 2, Appendix P.

2019-16: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford

Appendix E

budget enforceable and permanent?

2019-42
(Cont'd)

Questions/comments on selecting an alternative

- Now that the suboptions for each alternative are identified, has a rational decision making process been used, i.e., the Kepner/Traigo methodology, to make a decision?
- The U.S. Department of Energy needs to adequately address all of the unknowns prior to choosing any option.
- The 'no action' alternative should refer action back to prior decisions. 'No action' should mean that FFTF is shut down now. They must not continue to spend these huge sums of money to keep FFTF on standby.
- I'm concerned that the EIS is written to point to alternative one as the de facto preferred alternative. The EIS is difficult for a lay person to read.
- Do they address the suitability of any sites other than FFTF?
- Why are there so many options under each alternative?

2019-43

2019-44

2019-45

2019-46

Questions/comments on medical isotopes

- I'm concerned about the physician experts who don't have breadth of vision. They are very narrowly focused and don't think of the broader societal issues. We are at crisis in medical technology. They need to say there are certain procedures we will not do. It is difficult to see a medical need for this isotope phenomena.
- Adding to the stream of nuclear waste so that older men can have erections doesn't seem right" (in reference to a statement that most isotopes are being used for prostate cancer therapy).
- What we need to do is ask whether there are other means to accomplish the research without the nuclear materials. The damage to the populace in the present may not be worth the potential future benefit from the nuclear materials.
- DOE needs to look into the reliability for predicting isotopic needs for future uses in research and medicine as it appears impossible to project an accurate need out more than three years.
- One consideration might be that medical isotope production is less hazardous to workers and the environment as opposed to plutonium production. Biologic and radiation hazards are greater.
- It doesn't make sense to not have any data on the need for industrial isotopes.
- FFTF could make research isotopes, but it would be overkill. Like digging a post hole with a backhoe.

2019-47

2019-48

2019-49

Response to Commentor No. 2019

Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2019-17: As discussed in Chapter 2 of the NI PEIS, FFTF has demonstrated its capability to function as a nuclear science and irradiation services user facility. Its large core size, flux spectrum, demonstrated testing capability, and rated power levels provide a multipurpose facility suitable for medical and industrial isotope production, plutonium-238 production, and nuclear research and development related to a broad range of materials, advanced reactors, advanced fuels, and waste transmutation. Although FFTF was used primarily to evaluate reactor fuels and different fuel assembly materials during its 10 years of operation, the reactor facility has also supported large and varied test programs for industry, nuclear energy (domestic and international), medical isotope applications and research, space nuclear power, and fusion research programs. A more detailed description of FFTF and its capabilities is included in Appendix D of the NI PEIS.

2019-18: All the alternatives evaluated for meeting requirements of the missions identified in the PEIS are reasonable.

2019-19: A preferred alternative is the alternative an agency believes best accomplishes the proposed actions, given consideration to environmental, technical, economic, and other information available at

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Appendix E

- You can have both (the isotope and plutonium 238) missions by using two different reactors.
- We should use existing research reactors to make medical and research isotopes.
- Did National Institutes of Health say we need more isotopes? NERAC says we need them, but they are hired by DOE.
- Medical isotopes are 'a chicken and egg' situation. The medical community doesn't know there's a shortage because many of the isotopes are so new doctors are not aware of their existence. A lot of doctors don't realize the isotopes are out there. There is a need for medical isotopes, but it is veiled. It is very hard to quantify the need.
- One of the strongest arguments for restarting FFTF is that the nation will be avoiding many millions of dollars in invasive surgeries through early detection, treatment of disease and lives saved through use of radioactive isotopes. These are 'real medical savings' of health costs and for the national health budget. The few millions that are spent on medical isotopes should be ramped up to get the public behind DOE instead of batting it around so much.
- The focus should be on the making of the isotopes and not the means for processing.
- What is the true need for medical isotope production?
- Are Russia, Canada, Belgium and other foreign countries currently producing medical isotopes, willing to produce medical isotopes to support the demand?
- Are other countries searching for other alternatives to cancer treatment rather than using medical radioisotopes?
- What are the risks associated with transporting medical radioisotopes?
- What percentage of medical radioisotopes is the U.S. is currently importing from foreign countries?
- If the Canadian reactors are shut down, we'd be in a tough situation for acquiring needed isotopes.
- The isotopes used for diagnostic purposes are different from those used for therapeutic purposes. Most nuclear medicine is diagnostic. Only a small fraction of nuclear medicine is therapeutic.
- It is hard to comment on proposals without knowing the economics of isotope supply and demand. Radiopharmacists should be consulted on economics of supply of medical isotopes.
- Currently there is a backlog of requests for some radioactive seeds that causes waits of as long as three months for some procedures such as iodine 125.
- There is a need to consider the human dimension of backlogs. Without the isotopes, the tumors grow.

2019-50

2019-51

2019-52

2019-53

2019-54

Response to Commentor No. 2019

the time. In accordance with CEQ implementing regulations (40 CFR 1502.14(e)), DOE has identified its preferred alternative for accomplishing the stated missions in Section 2.8 of Volume 1 of this Final NI PEIS and includes a discussion of DOE's reasons for selecting it.

2019-20: DOE analyzed a range of reasonable alternatives and options. In fact, including the No Action Alternative, 23 different combinations of irradiation and processing facility options were examined. This was done in order to determine the range of environmental impacts that may be encountered. Since combinations of sites and facilities other than those set forth in the PEIS may be selected (see Section 1.3 of Volume 1), the broad range of reasonable alternatives analyzed also bounds these other possible options.

2019-21: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual rate of growth of medical isotope use is consistent with the Expert Panel findings. Section 1.2.1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for

Commentor No. 2019: Mary Lou Blazek (Cont'd) Oregon Office of Energy

Appendix E

- Who made the decision that we can't use foreign isotopes, that we need our own domestic supply? **2019-54 (Cont'd)**
- If we want medical isotopes, do we have to accept one or more of these options? If we give up on domestic supply, then we would not need to restart or build anything. Would we need accelerators? If we build these new accelerators (and not restart FFTF) would that cut down net production of nuclear waste? **2019-55**
- How can we know if there really is a shortage of isotopes? **2019-56**
- Tri-Cities wants to be a regional medical hub. They want to move the patient to the isotope. **2019-57**
- Can the spallation neutron source at Oak Ridge be used for isotope production? **2019-58**
- It sounds like it's difficult to project need for isotopes. **2019-58**
- The Oregon Office of Energy said at the last FFTF hearing that DOE had to prove a need for specific isotopes. But the EIS does not do this. **2019-58**
- Can't we make medical isotopes at commercial power reactors? **2019-58**

Questions/comments on environmental impact and Hanford cleanup

- DOE's poor track record in managing Hanford cleanup gives me no confidence in their ability to handle any new mission on site. **2019-59**
- I refuse to consider the FFTF, given as much time as I've spent on cleanup activities. But I've reached the point that I just don't have any faith whatsoever in DOE at this point in time to continue a stabilization and cleanup program on that site. The last thing I want to do is have them start a new production. It seems to me that the only leverage we have is to say: "if you want new production, don't turn it over to DOE at this point in time." I have become a real skeptic. **2019-59**
- It's not a valid argument that adding a small percentage to the existing amount of waste has a minimal impact. The proposed amount to be added from FFTF operation (one percent of Hanford's total waste) is one percent of a huge amount, given the total size of the waste at Hanford. **2019-60**
- Portland is more and more concerned about contamination in the Columbia River because Portland is using more and more of the Blue Lake aquifer for drinking water. There is a lot of concern about contamination in the Columbia River. **2019-60**
- Has anyone tested the soils in the river for radioactive contaminants? You cannot even think about adding more to the waste stream! **2019-61**
- At what point would they shut the river down? **2019-61**
- Why aren't the plumes characterized? Why don't we know what will be entering the river? **2019-61**

Response to Commentor No. 2019

maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Under the No Action Alternative, DOE would continue to purchase plutonium-238 to meet the space mission needs for the 35-year evaluation period considered in the NI PEIS. However, DOE recognizes that any purchase beyond what is currently available to the United States through the existing contract would likely require negotiation of a new contract and may require additional NEPA review.

2019-22: Section 1.2.1 of Volume 1 discusses the need for isotopes based on the Expert Panel and NERAC subcommittee recommendations. As discussed in the previous response and presented in Section 1.5 of Volume 1, the recommendations of these independent review groups were taken into consideration in developing the range of reasonable alternatives evaluated in the NI PEIS. NERAC is an independent Federal advisory committee appointed by the Secretary of Energy to advise DOE on civilian nuclear energy research program as noted in Section 1.2 of Volume 1.

The need for plutonium-238 to support NASA's mission is discussed in the previous response and further in Section 1.2.2 of Volume 1.

2019-23: As discussed throughout Section 4.3 of Volume 1, none of the proposed alternatives would add waste to the high-level waste tanks at Hanford.

Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or

**Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy**

Appendix E

- DOE works on one issue at a time. They don't want to look at cumulative impacts and don't want to find out that the problems are even bigger than we know now. As long as DOE convinces Congress that the waste is captured, no one in Washington will even say we have a problem at Hanford. The polluter always minimizes the harm and the impacts.
- It's the cleanup issue that makes us anxious. I'm concerned that DOE brings up FFTF to create a thought turmoil. It's a diversion. We don't want them to start up FFTF and take away from cleanup. Let's get to that discussion.
- Three years ago we said no FFTF for tritium and space. Now it's back again. It won't die.
- There is no mention of catastrophic events. What about earthquakes, fires, etc.?
- Under the environmental management of waste stream piece, they cite baseline and mention what waste might be produced in addition. There is a huge data gap for looking at the addition of new waste to existing waste (at Hanford, Oak Ridge, all sites.) The statement that 'we have considered it' isn't adequate reassurance. First of all the baseline data do not exist at any of the sites. It's incomplete. We know that from the Columbia River Comprehensive Impact Assessment.
- Nothing has been studied about the risk of transport of fuels, etc. This is a frightening prospect.
- Stack releases are not in the EIS.
- How many curies of tritium? Reactors put out a lot.
- What are the off gases?
- On-site vs. off-site production of targets. Wouldn't these missions add to already unsolved waste problems? The EIS makes the waste issue sound like no big thing. I disagree. It is not a small issue!
- The DOE assumes that cleanup is not a problem to be solved. Why is that not addressed in this EIS?
- There isn't any mention of how DOE will clean up wastes from operations of FFTF.
- The EIS says mixed low-level waste will be handled on site at a facility that is not yet constructed.
- We need to compare the waste from manufacturing plutonium 238 vs. decay during long-term storage. Will DOE process plutonium 238 on demand to avoid storage?
- Estimating health effects on humans seemed to be based on those people in the 50-mile radius over a 35-year period. A larger effect would be on workers. Literature shows employees in similar facilities have an increased incidence of cancers.
- I'm disappointed in the DOE. We fight to get money and they haven't used it well to clean up. This must be their number one mission, not new efforts. Keep FFTF at the ready for isotopes. I don't care about

Response to Commentor No. 2019

- other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4 3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.
- 2019-24:** The maintenance of certain technical capabilities represented in the employees at FFTF is not part of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development. However, DOE acknowledges that FFTF could provide a platform for training the next generation of nuclear scientists in the United States.
- 2019-25:** 33. Approximately 242 people are employed in maintaining FFTF in the standby mode. If FFTF is restarted, 410 people will be needed to operate it.
34. There is no direct payment for the socioeconomic impacts on local governments. As work expands within a region, the money spent on accomplishing this work flows into the local economy. It is spent on additional jobs, goods, and services within the region. The increased taxes realized by local governments, from income taxes, sales taxes, etc., are expected to cover the cost of any socioeconomic impact.
- 2019-26:** Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

Appendix E

plutonium or nuclear research and development.

- Is there clear evidence of cleanup money being diverted to FFTF?
- The draft PEIS suggests there is no environmental impact.
- Can DOE clarify how the restart of FFTF would have an impact on Hanford cleanup funds? Whether FFTF is restarted or shutdown, it shouldn't have an impact on Hanford cleanup funding.
- How would restarting FFTF have an impact on the current waste problem at Hanford in terms of amount and handling?
- How does this affect Hanford cleanup? That has to be first! It's too expensive to keep FFTF in standby. That's money we need for cleanup.
- Spent fuel is an environmental impact. The EIS dismisses this! We can argue that proliferation creates an environmental hazard and therefore should be in the EIS.
- Where will the waste go? Yucca Mountain is already overbooked. That's the same lack of vision and blatant disregard that got us into the mess we're in now.
- The nuclear industry in this country has drained our pockets dry and left us with a legacy of waste that we have no way to deal with.
- Does this EIS address new earthquake standards?
- Could the sodium reactor blow up and damage the whole facility? Is this type of reactor more dangerous to operate than other types?
- Does the draft EIS actually talk about the environmental impacts? Does it include an analysis of impacts from waste that is not properly stored?
- If they restart FFTF, will they continue to do cleanup at Hanford?
- Would FFTF generate significant amounts of waste?
- Does DOE think the additional waste won't be significant?
- (The EIS) basically says, "Yes, there will be waste produced. But, just as (the government) claimed when we built these and produced waste during the war, we promise we'll find a place to put it. So don't worry about that." It's basically 50 years later, making the same claim: "don't worry."
- Is Hanford cleanup on schedule? How far behind are they? Is it all because of budget? How much does politics play in it? What are some examples of where the politics come in?

Response to Commentor No. 2019

If an exemption is approved to use commercial facilities, these facilities have not been identified at this time, therefore, it is premature at this time to determine whether or not wastes resulting from the operation of FFTF would be shipped across Oregon highways.

The NI PEIS addressed the environmental impacts due to the treatment storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

2019-27: DOE notes the commentor's concerns. The purpose of the NI PEIS is not to "enhance our domestic infrastructure capability." Rather, the purpose of the NI PEIS is to evaluate the potential environmental impacts associated with the proposed expansion of DOE's nuclear infrastructure which would enable DOE to fulfill three missions: ensuring the availability of isotopes for medical, industrial, and research applications; meeting the nuclear material needs of other Federal agencies (i.e., NASA); and undertaking research and development activities related to development of nuclear power for civilian use.

DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual rate of growth of medical isotope use is consistent with the Expert Panel findings. Section 1.2.1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Appendix E

- Isn't a large part of the cleanup problem DOE's failure to oversee its contractors?
- How does DOE prioritize FFTF restart in relation to cleanup?
- Won't income flow to the Tri-Cities be just as big for cleanup as it would be if they restarted FFTF?
- Have they begun moving any of FFTF's fuel into dry cask storage yet? Who is doing this? What success have they had?
- There needs to be an endowment to ensure cleanup and make sure that Hanford cleanup is not affected.

2019-78

Questions/comments on FFTF's effect on agricultural communities

- There are no added negative impacts to the agricultural community with the restart of FFTF. We are confident with the existing emergency planning efforts.
- I came to these focus groups with a bias of supporting the shut down of FFTF. Nothing from the focus groups or the EIS has persuaded me that there is a viable mission for FFTF. It appears that DOE is still looking for a way or a credible case to restart FFTF. I am hesitant to support restart of FFTF when Morrow and Umatilla counties won't benefit financially from it but will likely experience some of the negative impacts.
- What is the potential drain of restarting FFTF to an already limited pool of skilled labor in the surrounding area?

2019-79

2019-80

Questions/comments on groundwater issues

- Groundwater issues are complex, and the EIS needs to give more information about them.
- "When you get into the cones of depression and the tugging and pulling that occurs with groundwater, that should have been analyzed in the EIS. I don't know where the wells are and the depths in relations to the carbon tetrachloride plume and some of the other plumes. Any water that perks back into the ground will also affect the vadose zone before it affects groundwater."

2019-81

Questions/comments on public/state influence on DOE decision

- It doesn't matter whether DOE listens (to public input). You need to comment to preserve your dignity.
- I don't trust that the public process makes any difference. But we have to make our position known. It's a political decision. But I can only hope this is the last stop before the law suit and the withdrawal of funding from DOE.

2019-82

Response to Commentor No. 2019

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Under the No Action Alternative, DOE would continue to purchase plutonium-238 to meet the space mission needs for the 35-year evaluation period considered in the NI PEIS. However, DOE recognizes that any purchase beyond what is currently available to the United States through the existing contract would likely require negotiation of a new contract and may require additional NEPA review.

The United States is and will continue to cooperate with foreign countries in medical research, space exploration, and nuclear energy research. For example, researchers from many foreign countries use DOE's high-flux research reactors for materials testing and experimentation. These facilities have the capability to maintain a high density of neutrons in a given test volume for materials testing; shorten the time needed for such testing; tailor the neutron flux to simulate the different reactor types and conditions; and instrument the core for close monitoring of the test conditions. Although the NI PEIS analyzes the expansion of U.S. civilian nuclear research and development, it is anticipated that DOE facilities would play a role in the continuing international research conducted in the United States.

2019-28: This NI PEIS presents a range of reasonable alternatives for consideration with respect to the decisions to be made for expansion of civilian nuclear energy research and development and isotope production missions in the United States. These actions are appropriately considered within the context of a programmatic EIS. While neither NEPA nor the CEQ implementing regulations provides a specific definition for what constitutes a "programmatic" EIS, CEQ's definition of a Major Federal Action (see 40 CFR 1508.18(b)(3))

Commentor No. 2019: Mary Lou Blazek (Cont'd) Oregon Office of Energy

Appendix E

- Has Secretary Richardson taken a position? Is this whole thing a pointless exercise?
- How will these focus group comments influence the final decision on whether to restart FFTF?
- When this relationship started with us and the Oregon Office of Energy, the office wanted our values, not our scientific input. This (level of scientific detail) has no redeeming value.

2019-82
(Cont'd)

Questions/comments on the plutonium 238 mission

- Do we want to depend on Russia as a source of supply?
- It's stupid to not buy it from Russia when they've got the supply.
- There's also the importance of skill and expertise in making plutonium. We will lose that intellectual capital if we stop making it. It's another factor.
- In absence of a compelling defense necessity, it's stupid for us to make it at a risk to our people when someone else will sell it to us.
- We need to weigh one against the other because the reactors don't have the capacity to produce all needed of both" (regarding weighing the production of plutonium 238 vs. medical isotopes).
- It makes sense for the U.S. Department of Energy to continue to purchase plutonium from Russia. This way DOE can focus on the production of isotopes for medical and industrial uses domestically.
- Assuming we can continue to purchase plutonium from Russia or elsewhere without problems, the U.S. Department of Energy should shut down FFTF. The \$40 million a year used to keep the facility in standby should be put into an account, and the money should be offered to private industry to subsidize medical isotope production.
- NASA says they don't need plutonium 238.
- I'm intrigued about purchasing plutonium from Russia. Can we be sure they know what they are doing in terms of safe processing, safe operation, etc.? It may not be as simple as just making the purchase. How do we know they aren't using children and putting workers in unsafe situations to make our plutonium?
- There are other sources of plutonium if we choose to use them. Materials are there for purchase. NASA may not even need them. So we're back to the cognitive dissonance DOE creates to keep us off base. They just want to keep a mission at Hanford. As far as I'm concerned, they must shut down FFTF. It's simple.
- Currently 50 percent of isotope production is being used. This statement assumes a resurgence of need for nuclear power. I don't believe it. We must scrap the Atomic Energy Act of 1954.

2019-83

2019-84

2019-85

2019-86

Response to Commentor No. 2019

indicates, in part, that a group of actions undertaken to "implement a specific policy or plan" constitutes a program. Also, CEQ's guidelines for tiering EISs clearly state that broader EIS analyses are appropriate for "national program or policy statements" from which subsequent, more site-specific analyses may have to be prepared (40 CFR 1502.20 and 40 CFR 1508.28(a)). This NI PEIS has a broad, national-level scope associated with the selection of facilities and site locations for accomplishing multiple missions. However, the selection of facilities and site locations for accomplishing expanded civilian nuclear energy research and development and isotope production missions is not a political decision and is not biased. DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow for a fair comparison among the various alternatives.

2019-29: DOE notes the commentor's concerns regarding what is evaluated in the NI PEIS. Consistent with its mandates under the Atomic Energy Act, DOE is proposing the nuclear infrastructure expansion for the purposes of addressing three primary needs:

- 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;
- 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and for which the United States has no long-term, assured supply; and
- 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. The NI PEIS evaluates the environmental impacts of a range of reasonable alternatives for accomplishing this mission. In addition to restarting the FFTF, the NI PEIS also evaluates alternatives that would either employ the use of existing facilities or rely on the construction of new facilities.

2019-30: DOE has made every effort to make this NI PEIS objective. This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021),

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Appendix E

(To use FFTF) we must import mixed oxide fuel from Germany. That statement doesn't make sense given DOE's expressed concern about domestic supply.	2019-87
Is the only place we're currently purchasing plutonium 238 from Russia?	2019-88
Has the import of plutonium 238 from Russia been dismissed because of the transportation risk?	2019-89
Could a commercial reactor produce plutonium 238?	
Can plutonium 238 be used for anything else, like weapons?	
Was the validity of plutonium 238 for space missions discussed in the EIS or is it just a given that plutonium 238 supply will be needed for a 35-year period?	2019-90
The space mission need for plutonium 238 is not subject to the same kind of public scrutiny and public comment as this EIS. This is the same as our discussion of the tritium mission for FFTF. We couldn't question the need, only the impact. This is the same situation.	
Will NASA have the budget to do the missions for which they say they need plutonium 238?	2019-91
Does the no-action alternative address isotopes?	2019-92
Was there discussion about splitting the missions – plutonium 238 in one place and isotopes in another?	2019-93
Does the EIS say commercial light water reactors can't do the plutonium 238?	2019-94
I don't like the statement that solar panels are too inefficient. Germans are using them. They've been tested. There is pressure on NASA to go with plutonium 238 instead of photovoltaics. It's just too dangerous to have radioactive power sources in space. I'm concerned about accidental or purposeful distribution of plutonium in atmosphere upon reentry. That would result in total atmospheric dispersion of plutonium.	2019-95
How does the price compare between purchasing plutonium 238 as opposed to producing it?	2019-96
What is the current U.S. plutonium 238 stockpile and where is it located?	
It seems like an agreement to get hamburger from Jack-in-the-Box (in reference to buying plutonium 238 from Russia).	2019-97
We've heard about a letter saying NASA doesn't need the plutonium 238. Is that true?	
Is DOE saying there is enough plutonium from Russia if we carry through on the existing agreement?	
The way to go (on plutonium 238) is to buy the stuff from Russia.	
This idea of domestic supply is DOE's own fabrication and is not valid. DOE should adopt alternative five	2019-98

Response to Commentor No. 2019

respectively. DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives. This was accomplished through review and evaluation of site-specific information on the environmental conditions prevailing at ORR, INEEL, and Hanford to include a comprehensive analysis of the associated environmental and health risks of each alternative.

2019-31: A number of facilities, including smaller facilities, other than those selected for detailed analysis in the NI PEIS, were considered, but were dismissed from further consideration (see Section 2.6 of Volume 1). Among the reasons that some were dismissed was the fact that they lacked sufficient neutron production capacity, were fully dedicated to existing missions, were not capable of steady-state neutron production, had insufficient power to sustain adequate steady-state neutron production, were unable to produce a constant, reliable source of neutrons due to dependency on operating schedules of their primary missions, are under construction with capacity fully dedicated to other planned mission, or have been permanently shut down.

2019-32: The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS. DOE made every effort to obtain, analyze, and disclose all required information to make a decision on expanding nuclear infrastructure. The costs and nuclear nonproliferation impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such ancillary documents need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed these documents to more than 730 interested parties on August 24 and September 8, 2000, respectively. Both reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided summaries of the Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment in Appendixes P and Q, respectively, in the Final NI PEIS.

Commentor No. 2019: Mary Lou Blazek (Cont'd) Oregon Office of Energy

Appendix E

and proceed immediately with cleanup.

- If we buy from Russia, that stops the proliferation of the stuff.
- It's deceptive to not let us know the material is available from Russia.
- Did the NERAC study look only at U.S. needs, or did they also look at possibly getting isotopes from Canada?
- Does DOE sell plutonium 238 to NASA? Are there other opportunities to sell it for a profit and help pay for cleanup?
- Do we know anything about the plutonium 238 we're buying from Russia? Is it already produced, or would they have to make it?
- What does it cost to purchase the plutonium from Russia?
- Is it cheaper to have commercial power reactors produce plutonium 238, as opposed to building a new reactor or re-starting FFTF?

Questions/comments on FFTF effect on Oregon State University

- Is there any way to quantify the effect of FFTF on OSU's program in terms of graduates employed and funding for research?
- The fate of FFTF has a pretty large impact on OSU. If it is restarted, there will be a demand for graduates of OSU's nuclear engineering and health physics programs as well as for the programs for training. OSU is the only educational research program in the West capable of supporting FFTF. Prior to shutdown, two-to-three graduates per year from OSU's program went to work at Hanford. About one quarter of the approximately 600 graduates of OSU's program work at Hanford. There is also funding for research that ended when FFTF was placed on standby. In this regard, FFTF restart has a very positive effect on OSU and the State of Oregon.

Miscellaneous questions/comments

- FFTF is fatally flawed and totally foolish.
- I have not seen, heard, nor read anything to this point that shows me there is a viable mission or credible case for restarting FFTF.
- Alternative 5 is pretty interesting. Can FFTF burn plutonium?
- Is there a hidden agenda for weapons research and use of FFTF for classified future missions?

32 THE OREGON APPROACH

Response to Commentor No. 2019

2019-33: For analysis purposes, the NI PEIS evaluates impacts from facility construction, modification, startup, and 35 years of operation, followed by decommissioning when applicable. The 35-year operating period is based upon the estimated length of time existing DOE irradiation facilities would continue operating if used for accomplishing the missions described in the NI PEIS. This timeframe also accommodates current projections that indicate the demand for radioisotopes and nuclear research and development requiring these expansion will extend for at least the next 20 years.

2019-34: The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste treatment, storage, and disposal facilities for the wastes expected to be generated are identified in Chapter 4 under the Waste Management sections of the NI PEIS. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. Mismanagement of wastes and its associated impacts are not discussed in the NI PEIS.

The NI PEIS assumes, for the purposes of analysis, that Yucca Mountain, Nevada, would be the final disposal site for DOE's high level radioactive waste and spent nuclear fuel. As directed by the U.S. Congress through the Nuclear Waste Policy Act, as amended, Yucca Mountain is the only candidate site currently being characterized as a potential geologic repository for high-level radioactive waste and spent nuclear fuel. DOE has prepared a separate EIS, "Draft Environmental Impact Statement for a Geologic Repository for the Disposal of Spent Nuclear Fuel and High-Level Radioactive Waste at Yucca Mountain, Nye County, Nevada" (DOE/EIS-0250D, July 1999), which analyzes the environmental impacts from construction, operation and monitoring related transportation, and eventual closure of a potential geological repository.

2019-35: The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS. DOE made every effort to obtain, analyze, and disclose all

Appendix E

- FFTF would be available for any number of secret missions once it's restarted.
- The tourism slogan "Things look different here" shouldn't mean we glow! An accident or the fear of an accident can hurt tourism.
- When will FFTF be considered to be too old to operate?
- Was Argonne West at INEEL evaluated for the research missions?
- Has ATR been in cold standby?
- INEEL is also looking for a mission for its facilities.
- The conflict of interest/PNNL issue is not unclear. It's quite clear.
- Is NERAC appointed by DOE? Who are they? I'm immediately skeptical of a DOE-endorsed group.
- I read the National Research Council report on long-term management capabilities. It's chilling to read the degree to which they identify the institutional incapacity to deal with some of these issues. And then you read this (NERAC) which says: "Well, let's just keep kind of creating them." And meanwhile there is no mention at all of the institutional issues identified by NRC, which is at least independent, for dealing with this massive waste stream and the fruits of the technology. I find it very hard to put them in the same scale.
- "The only way, in my view, that this industry will make any leap to move forward is to start over again and build some credibility and build smaller. I see the stresses we have with nuclear power generation. I'm not in a good mood to be positive for this focus group and I apologize."
- "Is there any civilian nuclear energy research underway? There's been a 24-35 percent increase in the price of natural gas."
- "Is it technically feasible to build a 50 megawatt Triga type reactor?"
- "What is driving the numbers on the Latent Cancer Fatalities Table at S-46? Does one mission in particular drive the numbers? If not, why not? If the information that went into the table is available separately, why isn't it also presented separately in the Draft PEIS? The table should break out radiological impact by mission so that a cost-benefit analysis can be done. The table indicates that a new research reactor would not contribute any radiological risk."
- "Is there any analysis of cancer risk for deactivation?"
- "The Draft PEIS has a lot of analysis on non-traditional environmental (non-environmental) impacts."
- "Cost escalation in natural gas and other energy sources is making nuclear energy more cost-competitive. Is the underlying catalyst of the nuclear research the many relicensings of nuclear plants that are soon going to occur? 80-90 percent of current operating reactors will need relicensing. There's a big consolidation in the

commercial nuclear energy industry occurring. In a deregulated energy market, nuclear operators are doing quite well because their costs per watt are so low.”

- “The fact that the plant has remained operationally ready over 25 years says a lot about the operational capabilities of management.”
- “If a 50 megawatt TRIGA is not feasible, can they use multiple, smaller reactors?”
- “Where does DOE want to locate the new reactors?”
- “In the combinations of options being considered, it looks like Hanford can’t have a new accelerator unless FFTF is restarted.”
- “Restarting FFTF is completely antithetical to our values.”
- “Who is the expert panel? The NERAC committee should have been named in the EIS.”
- “What about the bills, the MOU, the Oregon Legislature position to not make more waste, the City of Portland opposition. What else must we do to say we are unalterably and adamantly opposed to restart of FFTF?”
- “Hanford and Tri-Cities see financial gain in restarting FFTF.”
- “We want the Oregon Office of Energy to pass this message on to DOE: ‘We are unanimously opposed to the restart of FFTF.’”
- “What is this need for research and development? Is it being driven by the nuclear industry? This is the wrong direction to go. This is a violation of our values.”
- “Are there defense research missions that can lead to new bomb production? If there are defense projects that can be pursued with FFTF, how could they not do an EIS?”
- “Could they sneak in a tritium mission and keep it classified?”
- “I’ve heard concerns that some of the FFTF waste would go into Hanford’s underground tanks.”
- “I think some of the missions should not be done anywhere.”
- “Not in my backyard. Over my dead body!”
- “We’ve shown up in huge numbers and told them what we want, and it hasn’t made any difference.”
- “This is a snow job!”
- “I’m concerned about operation safety. If FFTF goes another 35 years it will be 55+ years old. No

Response to Commentor No. 2019

used as part of the proposed action and alternatives considered including activities under Alternative 1, Restart FFTF. Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13).

- 2019-39:** Restarting FFTF could have a positive socioeconomic impact on the Hanford area. Socioeconomic impacts associated with Alternative 1, Restarting FFTF, are discussed in Section 4.3 of the NI PEIS.
- 2019-40:** DOE notes the commentor’s concern over the costs of maintaining DOE facilities in standby. Cost concerns related to this, as well as to all the alternatives in the PEIS will be considered in reaching a decision on managing the DOE nuclear infrastructure. DOE prepared a separate Cost Report and Nuclear Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such ancillary documents need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed these documents to more than 730 interested parties on August 24 and September 8, 2000, respectively. Both reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided summaries of the Cost Report and Nuclear Nonproliferation Impact Assessment in Appendixes P and Q, respectively, in the Final NI PEIS.
- Reaching a decision will help DOE make best use of its nuclear facilities, and minimize the time any must remain in a standby condition. Even after a decision is made, however, DOE’s budget requests to use its facilities must be approved by the Congress.
- 2019-41:** The uncertainty of cost projections is well understood and is included in a separate Cost Report analyzing each of the PEIS alternatives. Future adjustments in project scope or schedule, or future policy changes, may change such projections beyond any uncertainties. Even so, the analyses in the Cost Report allow a comparative evaluation by the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS.

Even after a decision is made, however, DOE’s budget requests must be approved each year by the Congress, which

reactor in history has operated safely for that length of time.”

- “I don’t trust that FFTF can operate another 35 years. Do previous safety analyses support another 35 years?”
- “What do the people in the Tri-Cities feel about this?”
- “Why are these missions being proposed? Is this a mandate from Congress?”
- “Are other linear accelerators in the United States being shut down?”
- “Would you outline the decision process which DOE will be following?”
- “Wasn’t NERAC’s final report very negative on the use of FFTF?”
- “I don’t understand what you’re talking about. It’s way too technical. I want to get to my concerns. What about the cleanup agreement? What about the Columbia? What about the groundwater?”

Questions/comments about Oregon Office of Energy input on FFTF issues

- “Is it possible for the Oregon Office of Energy to take a position on whether to restart the Fast Flux Test Facility at this time without a cost analysis document and incomplete information on many of the proposed alternatives?”
- “There is a perception that the Oregon Office of Energy is anti-nuclear, even though it may not actually be so predisposed... There is a perception that staff are told what to think about the issues.”

Questions/comments on the Oregon Office of Energy/DOE public input process

- “Focus groups would be a lot more informative if the summary had been available for the first meeting and everyone had read it.”
- “I want to compliment the Oregon Office of Energy on its written and mailed info. It was very well put together.”
- “The Oregon Office of Energy did a great job on the last EIS. I expect this will be a great job as well.”
- “I would like a description of how this information will be used. I’m concerned about the format of any report of the process. Process is good for developing policy positions for the agency and governor. I don’t like it when DOE uses head counts and votes: They tend to pick and choose the parts they want.”
- “This is a good public process. I commend (the Oregon Office of Energy) for going through this exercise.”

Response to Commentor No. 2019

determines how funds are allocated. DOE spends monies consistent with Congressional direction.

- 2019-42: The Final PEIS does not address the dismantlement of the FFTF. If the Secretary of Energy decides in the Record of Decision to deactivate FFTF, DOE would request funding to implement this decision. In this budget request, DOE would indicate under which office FFTF deactivation would be funded and managed. Congress would determine where the funding would be appropriated and managed, either approving, denying or modifying DOE’s request. The budget decisions are thereby made binding.
- 2019-43: DOE notes the commentor’s view.
- 2019-44: The No Action Alternative, which is required by Council on Environmental Quality regulations (40 CFR 1502.14 (d)), requires DOE to consider the continuation of its present course of action, which includes maintaining FFTF in standby. The No Action Alternative provides an alternative to which the action alternatives may be compared. It should be noted that permanent deactivation of FFTF is a part of all other alternatives analyzed in the NI PEIS, except Alternative 1, Restart FFTF.
- 2019-45: This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives. No final decisions have been made with regard to the facilities and locations evaluated to fulfill the requirements of the stated missions, which include the production of medical and industrial isotopes, the production of plutonium-238 for NASA space missions, and nuclear research and development. However, in accordance with Council on Environmental Quality regulations (40 CFR 1502.14(e)), DOE has identified its preferred alternative in Volume 1, Section 2.8 of the Final NI PEIS and includes a discussion of DOE’s reasons for selecting it. DOE’s Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

Commentor No. 2019: Mary Lou Blazek (Cont'd) Oregon Office of Energy

FOCUS GROUP WRITTEN COMMENTS

Focus Group Written Comments From Opinion Forms

- "No opinion on the issue." 2019-142
- "I lean toward the last alternative." 2019-143
- "PEIS needs to deal with issues at already contaminated groundwater under Hanford and how that might limit uses for FFTF operation or be affected by FFTF operation." 2019-144
- "There was an assumption that the missions were valid. Those assumptions were not justified, and seem to not be solid. Costs are important, but were not provided. Other seeming important issues were not well covered or not covered at all such as: processing waste disposal, groundwater impact, transportation safety accommodation, etc." 2019-145
- "I believe the other two facilities, at least together, can accomplish what can be accomplished at Hanford. The above questions do not provide an opportunity to do this." 2019-146
- "Assuming the needs are valid, and the need to do it in the USA is correct, then restarting FFTF is the best alternative. It is important to keep FFTF separate from cleanup or military activities." 2019-147
- "I have no faith in DOE's capability in stabilizing and clean up of legacy wastes. Until better progress is made for these wastes I cannot support any further production at Hanford." 2019-148
- "More info should be provided in the EIS to answer many questions we/I have. The FFTF could be shut down if other facilities can produce the Pu-238 and isotopes. Need costs if DOE can't get what is needed FFTF could restarted, but processes to develop fuel, extract Pu-238, etc need to be described accurately and adequately." 2019-149
- "The Department of Defense and other Federal Agencies have used Hanford facilities without paying for waste management and cleanup. Until Congress guarantees a budget that includes decommissioning and cleanup costs, I cannot support a restart option of FFTF." 2019-150
- "Shutdown now – costs will only continue to rise. I believe that other facilities can meet the proposed mission. Put the operating costs and/or maintenance costs into a fund to underwrite the production or purchase of product as needed." 2019-151
- "I suggest you provide a summary table of the costs, risks, options, and "others" factors for each mission. The state position should be tied to your original position or what the PEIS and the decision should cover. Most notably, diversion costs from clean up and production of new waste." 2019-152
- "Purchase Pu-238 from Russia. Restart FFTF for medical isotopes/industrial. Otherwise, decommission" 2019-152

Response to Commentor No. 2019

CEQ regulations for implementing NEPA require that EISs be written in plain language so that they can be more easily understood and that the EIS be accompanied by a summary of the EIS's content (40 CFR 1502.8 and 1502.12, respectively). DOE strives to produce NEPA documentation and related materials that are easily understood by the public by avoiding the use of jargon, defining technical terms and concepts through the use of common comparisons, avoiding the use of acronyms to the extent possible, and provision of a summary that is clear and concise, among other means. In order to improve the public's comprehension and understanding of the PEIS, this Final NI PEIS reflects revisions that have been made to eliminate some redundant and extraneous information while some sections have been reorganized to improve readability. For example, the summary of environmental impacts (Volume 1, Section 2.7) has been reorganized by environmental resource area so that impacts in each area (e.g., waste management) can be quickly gauged across all alternatives.

2019-46: See response to comments 2019-11 and 2019-20.

2019-47: DOE notes the commentor's concerns about the need for radioactive isotopes in medical procedures and the wastes produced in their production. Radioisotopes are used for both therapy and diagnosis. In ongoing clinical testing, therapeutic isotopes have proven effective in treating cancer and other illnesses by cell-directed localized radiation therapy (i.e., deploying antibodies or carriers of radioisotopes to seek and destroy invasive cancer cells). This directed therapy can minimize adverse side effects (e.g., healthy tissue damage, nausea, hair loss), making it an effective, attractive alternative to traditional chemotherapy or radiation treatments. In addition to therapy for cancer and other illnesses, radioisotopes are also used for diagnostic purposes, such as imaging internal organs. Unlike conventional radiology, imaging with radioisotopes reveals organ function and structure, which provides additional data for a more accurate diagnosis, and assists in the early detection of abnormalities. The generation of wastes from the production of medical isotopes, which are small in comparison to the candidate sites' current generation rates, are discussed for each alternative in Chapter 4 of the NI PEIS. The additional waste generated would only have a small impact on the management of wastes at the candidate sites.

DOE notes the difficulty in reliably predicting isotopic needs for future uses in research and medicine. DOE has sought independent analysis of

Commentor No. 2019: Mary Lou Blazek (Cont'd) Oregon Office of Energy

Appendix F

FFTF.”

- “Comment on Question 5 – But what’s the cost of not having the medical isotopes available or not enough or too expensive due to lack of availability?”
- “Shutdown FFTF and put the \$40 million/yr savings from holding it in standby into a fund that incent [sic] the development of needed medical/industrial isotopes. NIH could do regular projections of need, RFPs could be issued and whoever can produce what’s needed would get up to \$40 million/yr. The Pu-238 can come from Russian (our space partner) and help their economy while meeting all our needs.”
- “This process does not seem effective. This is complex stuff which requires a greater level of knowledge to contribute effectively. We should read the summary (75 pages) prior to the first meeting. I’m not sure what you were trying to accomplish.”
- “EIS needs to address disposition of transuranic waste from target processing. This could have a significant environmental impact. Need cost study to determine if FFTF is the best alternative.”
- “EIS should demonstrate need for the proposed mission. DOE should either restart or permanently shutdown, but should not continue spending 35 –45 million indefinitely for hot standby. DOE should clearly state the decision criteria uses to make a final decision. FFTF was originally designed as a research reactor – the EIS should include detail on what kind a [sic] research would be done. A good summary should be widely distributed well in advance of the comment period. Two days with a 4-page summary is not enough.”
- “I am confident that an environmental and economic comparison of using as exiting facility (which otherwise requires \$35M/yr to maintain with no output) with building new facilities will definitely prove highly more favorable and wise for restarting FFTF.”
- “I feel other alternatives need to be considered i.e. can and should availability of material from outside the U.S. be used? What is the downside to doing this? I am still concerned about clean up at Hanford and the impact of restarting FFTF in practical and political terms.”
- “I ultimately believe that the good outweighs the bad.”
- “I would not be opposed to restarting the FFTF provided cleanup (current and future) is not endangered. The need for medical isotopes appears clear to me. I believe the U.S. should not be dependent on foreign countries for deep space missions. I very much appreciate this opportunity for input and information.”
- “The idea of using existing nuclear facilities for an expanded mission is a very good idea. Analysis of the PEIS is needed to establish if FFTF is the best place to do this. Some issues are problematic, such as generating nuclear waste at FFTF v. buying the materials elsewhere with no U.S. waste.”
- “I believe we need assurances to the public that there will be a strong and well funded Columbia River water monitoring program for the 35 year period. We need assurances that management turnovers at FFTF are in the best interests of the public and the environment. A well thought out cost-benefit analysis is needed

42 THE OREGON APPROACH

Response to Commentor No. 2019

trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual rate of growth of medical isotope use is consistent with the Expert Panel findings. Section 1.2.1 was revised to incorporate this information and to clarify DOE’s role in fulfilling the U.S. research and commercial isotope production needs.

2019-48: DOE radiological control requirements (for both workers and the public) are designed with the intent to meet the legal requirements for the safe operation of DOE facilities contained within 10 CFR 835. In order to meet these requirements, DOE has established the DOE Radiological Health and Safety Policy (DOE P 441.1, April 26 1996) and developed a DOE Standard: Radiological Control (DOE-STD-1098-99, July 1999). Worker safety (radiological protection) is a key element of the both the Policy and the Standard. The policy states in part that Department of Energy facilities must “conduct radiological operations in a manner that controls the spread of radioactive materials and reduces exposure to the workforce and the general public and that utilizes a process that seeks exposure levels as low as reasonably achievable.” Each DOE site, including Hanford, is required to implement a radiological control program with the intent to meet this policy goal, using as guidance the radiological control standard. The health and safety impacts on workers associated with both medical isotope production and plutonium production are presented in Appendix H of the NI PEIS. The worker dose associated with the irradiation of target materials is independent of the type of target material being irradiated. The worker dose is a function of the type of reactor, operating procedures and radiological control measures in use at the facility. The average worker dose associated with processing of the irradiated targets

Commentor No. 2019: Mary Lou Blazek (Cont'd) Oregon Office of Energy

Appendix F

in terms which could be easily understood by typical people on the street. The medical needs present a unique human benefit perspective which bears enhancement and support in the political and academic communities."

- "I think the main use should be production of medical and research isotopes rather the "space battery" production. I feel there is strong need at present for these items."
- "I didn't get the summary of the PEIS prior to this meeting to review. I think the missions (especially medical isotope production) should be evaluated as separate entities. I don't want the facility kept on line, supposedly to produce medical isotopes, then have it used primarily as a research facility by a foreign country."
- "Without having seen the cost analysis, it appears that the cost of using FFTF for Pu-238 and medical missions will be significantly more expensive. However, it comes down to being prepared for future difficulties with supply and being able to respond."
- "(Comments) Will be submitted directly to USDOE."
- "I feel that the first two questions on this questionnaire are significantly biased toward the negative [disagree, strongly disagree]."
- "#3 Don't know what exploring they've already done. These questions obviously try to slant my response (#1-5)"
- "These questions are severely biased and lead to inconsequential results and answers."
- "Buying Pu-238 would not prevent any negative environmental impacts from occurring in the world."
- "Since we need it, it would be better for us to have the control of the process."
- "I have a serious concern that the numbers will be tallied and USDOE will not understand the overwhelming opposition to the restart of FFTF. There also needs to be mentioned the prior commitment made to shutting down FFTF by Admiral Watkins and Sec. O'Leary and that it was USDOE who placed FFTF in the TPA for the final termination!"
- "The emphasis at Hanford should focus on clean-up and not future production. Without the cost studies to demonstrate cost effectiveness the PEIS is ludicrous."
- "1) Any fuels purchased from foreign countries should be dependent on their adequate systems of disposal in accordance with U.S. standards. 2) NASA's needs should be reviewed on the basis of the percentage of missions funded by the Congress in the past. 3) Risk of transportation of radioactive materials should be ascertained using mathematical models and worse case scenarios. 4) DOE should research alternative forms of energy with the same vigor as they have pursued nuclear fuel research and development."
- "It's obvious the USDOE doesn't want public input on this scheduling the public comments the last week of

Response to Commentor No. 2019

are very similar for both medical isotopes and the irradiated neptunium targets. Based on the assessment of worker health impacts for the range of reasonable alternatives and options that make use of Hanford facilities, the most likely impact of the use of these facilities is no increase in cancer fatalities among the facility workers. For example in Alternative 1 option 3, all of the activities (target irradiation and processing) occur at Hanford facilities. As shown in Section 4.3.3.1.9, the expected consequences are less than one additional fatal cancer among the workforce; that is, no additional fatal cancers are expected.

The estimates of the potential human health impacts associated with the range of reasonable alternatives proposed for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems also shows that the impacts from the production of medical isotopes and from the production of radionuclide heat sources are very similar. Sections 4.3 through 4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from implementation of each of the alternatives including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with each alternative would be small.

2019-49: DOE has sought independent analysis of trends in the use of medical radioisotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert committees. In 1998, an Expert Panel convened to forecast future demand for medical isotopes estimated that the expected growth rate of medical isotope use during the next 20 years will range between 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by DOE's Nuclear Energy Research Advisory Committee (NERAC), established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. The growth projections were also adopted by DOE as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings.

Commentor No. 2019: Mary Lou Blazek (Cont'd) Oregon Office of Energy

Appendix F

summer vacation and by not providing the public with necessary information in advance, i.e. cost study, nonproliferation study, and preferred alternative when it is obvious they have one already.”

2019-178
(Cont'd)

• “I would like to thank the Oregon Office of Energy for their effort to conduct these focus group meetings. They have help to further educate me as well as comment on the FFTF issue.”

• “I believe that main focus of DOE at Hanford should be CLEAN UP to original state before nuclear missions were started at Hanford Site. I also would highly recommend that no further production missions are pursued and rather than production a new push toward radiation neutralization research should be pursued and funding through Congress be found. This way the biggest reason - self-perpetuation of DOE and saving jobs will be funded and secured.”

2019-179

• “The missions stated do not support restarting the FFTF. What other missions are being considered? What proposals have DOD made in relation to the FFTF restart?”

2019-180

• “This is the latest smoke and mirror show from the DOE. The FFTF should be shut down ASAP - you told us you would shut it down - there is overwhelming public support of shutting it down and should live up to your word - shut it down.”

2019-181

• “Shut down the FFTF. Concentrate solely on clean up. Do not import any more radioactive materials to this site.”

2019-182

• “There doesn't seem to be any question that the condition of Hanford Facility will not improve (environmentally) by re-starting the FFTF. Knowing that, and speaking simply as a concerned Oregonian, I believe that the only right thing to do is to shut down FFTF and continue clean up.”

2019-183

• “You have not addressed the effect that non-cleanup would have to the environment. You must consider the river and do long term effects of this nuclear waste. Hardly any emphasis has been given to this topic. Other facilities with the U.S. can be adjusted to “cover” any needs of the FFTF. You can buy plutonium from Canada/Russia, etc.”

2019-184

2019-185

• “It appears that the PEIS report has ignorantly and disapprovingly ignored options such as purchasing [Pu]238 from Russian and using commercial reactors to make the plutonium and/or isotopes. Also, by dismissing the nuclear waste's threat as minimal they are ignoring a huge known fact and insulting many people's intelligence. This is disappointing considering that a several hundred page scientific report could ignore such blaring facts.”

2019-186

2019-187

• “PEIS[sic] cannot be credible unless it deals straight up with permanent waste disposal. Likewise unless it is willing to look at option involving international sources. More comments to follow.”

2019-188

• “The over 25 individuals that I have daily contact with from varying social-economic backgrounds have basically voiced the same opinion about this site. Why would you even have to ask if there is a choice, clean it up, close it down.”

2019-189

Response to Commentor No. 2019

DOE notes the commentor's concern that producing research isotopes at FFTF would be “overkill.” It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: “In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production.” In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without disturbing the existing missions of these facilities.

The Final Report issued in April 2000 by the NERAC Subcommittee for Isotope Research and Production Planning identifies the need for expanded production of both medical and industrial isotopes. The proposed action similarly includes expanded production of industrial isotopes, as discussed in Section 1.2 of the NI PEIS. Industrial isotopes are needed to support both academic research, and industrial research and development applications. These applications fall into the three broad categories of nucleonic instrumentation, irradiation and radiation processing, and technologies that use radioactive tracers.

The Expert Panel and NERAC reports were each used in developing the NI PEIS, and made available to the public at the NI PEIS public information centers and on the Internet at www.nuclear.gov.

2019-50: As presently structured, the alternatives do not provide for the production of medical/industrial isotopes and plutonium-238 in two different reactors; however, as stated in Section 1.3 of Volume 1, DOE could choose to combine components of several alternatives in selecting the most appropriate strategy. Thus, it is possible that such an alternative could be developed. It should be noted that at the present time existing research reactors do make medical/research isotopes;

Commentor No. 2019: Mary Lou Blazek (Cont'd) Oregon Office of Energy

Appendix F

- “In the overall scheme of things I don’t think running it would make a difference, i.e. it’s going to take “billions of years” however a little helps I guess – so let someone else do it!! How does the cost i.e. buy from Russia, buy from Canada affect our balance of payments?”
- “The information available generally tends to support the interests of those providing it. Seems the biggest concern should be cleanup. I can’t understand this from only one perspective. Couldn’t they build some sort of retaining wall between and under the 177 tanks at Hanford and the Columbia River? (very costly – sure).”
- “Interesting that plutonium 238 is so lucrative – just happens to be the fuel for so many technologically unobtainable (at least to the comprehension of many) “implements.”
- “It’ll be interesting to see how the public opinion “falls out” – considering how one sided and uneducated (to the issues) we as a whole are.”
- “Actually I do need more data on this and study this subject on my own.”
- “Discussion of Hanford tank pool cleanup – irrelevant; disposal of reopened FFTF waste is crucial. Is dry cask storage possible? Successful? – e.g., Trojan.”
- “PEIS is inadequate because 1) it doesn’t include cost issues, which are integral to the analysis 2) it doesn’t include the NN issues - undermining the nonproliferation regime poses and environmental hazard 3) it doesn’t include environmental impact of potential defense-related missions that could be done on FFTF once it’s restarted 4) doesn’t look at all possible catastrophic failures over 35 years of operation (these are also dependent on operational funding levels, staffing, training, and safety budgets over the 35 years period).”
- “Not in my backyard. Over my dead body.”
- “I object to the rip-off of American taxpayers to subsidize the nuclear industry - an effort to create missions to keep this toxic program going. DOE so readily spends millions that create toxic wastes and accepts little responsibility for spending the millions needed to clean up the mess that has been made. We demand the right to speak out - direct the use of our money as we see fit.”
- “(You have them in your computer.) To the US DOE: The whole process for considering the restart of the FFTF over the past several years has been duplicitous to say the least. Budgets have been shuffled to deceive us; the PEIS is full of vague and misleading statements, a skirting around the real issues and deep concerns of the larger public. The explanation of environmental impacts and risks is a sham: you will move ahead without looking far out into the future, merely to create your own empires and pad your pockets. You do not have the best interest of the real public in mind. It is obvious.”
- “We do not wish to repeat the lack of vision, mismanagement, the production of waste, the disregard for the earth and future generations. No more waste production at Hanford that is not directly involved in effective cleanup.”
- “Hanford cleanup should carry primary priority. Many of the missions (question 4) I see no reason for.”

Response to Commentor No. 2019

however, these facilities would be fully used within a 5- to 10-year period if no enhancements to the existing nuclear facility infrastructure are implemented.

- 2019-51:** DOE notes the difficulty in reliably predicting isotopic needs for future uses in research and medicine. Section 1.2.1 of Volume 1 discusses the need for isotopes based on the Expert Panel and NERAC subcommittee recommendations. As further discussed in Section 1.5 of Volume 1, the recommendations of these independent review groups were taken into consideration in developing the range of reasonable alternatives evaluated in the NI PEIS. NERAC is an independent Federal advisory committee appointed by the Secretary of Energy to advise DOE on civilian nuclear energy research program.

DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual rate of growth of medical isotope use is consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE’s role in fulfilling the U.S. research and commercial isotope production needs.

For nearly 50 years, DOE’s use of its unique technologies and capabilities to develop isotopes for civilian purposes has enabled the widespread application of medical isotopes seen today. While its market share is a small fraction of total world radioisotope production, DOE remains the key provider for a large number of radioisotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large-enough quantities to make their production financially attractive to private industry.

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Appendix F

- "The lack of a cost analysis and limiting the scope of the alternative hinders the ability to make a conclusive decision. The social-economic impacts to communities outside the immediate Tri-Cities, WA area are very real but not addressed. Lack of management by the DOE in past issues increases the skepticism as to their ability to follow through. By not addressing fabrication and processing scenarios it can't be determined as to the level of exposure to the general public."
- "Future alternatives should be made for such needs. Alternatives that will not produce future long term hazardous cleanups. A hazardous material should not be produce if clean-up, or proper storage cannot be addressed. The negative impacts of the current hazardous wastes are undetermined and will impact all of us/or my lifetime and others."

|| 2019-205

Response to Commentor No. 2019

The United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. However, supplies of many research isotopes are not readily available from existing domestic or foreign sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed. Under the NI PEIS proposed action and consistent with its mandates under the Atomic Energy Act, DOE would enhance its existing nuclear facility infrastructure to, among other things, more effectively support production of radioisotopes for medical applications and research.

Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short term (less than 5 years). DOE has not received any comments or input from the National Institutes of Health on the NI PEIS.

2019-52: The commentor's interests in foreign medical research and alternative cancer treatments are noted, although these topics are outside of the scope of the NI PEIS. As discussed in Section 1.2.1 of Volume 1, one of the DOE's missions is to insure a reliable supply of medical isotopes for clinical applications and medical research.

2019-53: Risks associated with transporting medical radioisotopes are included in the analysis described in Chapter 4 of Volume 1 and Section J.5.3 of Appendix J. The analysis conservatively assumes that all medical, industrial and research and development isotopes are shipped via air to an east coast distribution facility. The maximum transportation impacts for these isotopes are given in Table J-7. The incident-free risk to the public is 0.0037 latent cancer fatalities and the accident risk is 0.53 latent cancer fatalities. Transportation risks are summarized in Section 2.7.1.6 of Volume 1.

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Appendix F

Other written comments

Response to Commentor No. 2019

2019-54: Diagnostic radioisotopes are used for imaging internal organs. Unlike conventional radiology, imaging with radioisotopes reveals organ function and structure, which provides additional data for a more accurate diagnosis, and assists in the early detection of abnormalities. In ongoing clinical testing, therapeutic isotopes have proven effective in treating cancer and other illnesses by cell-directed localized radiation therapy (i.e., deploying antibodies or carriers of radioisotopes to see and destroy invasive cancer cells). This directed therapy can minimize adverse side effects (e.g., healthy tissue damage, nausea, hair loss), making it an effective, attractive alternative to traditional chemotherapy or radiation treatments.

The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, supplies of many research isotopes are not readily available from existing domestic or foreign sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed. Under the NI PEIS proposed action and consistent with its mandates under the Atomic Energy Act, DOE would enhance its existing nuclear facility infrastructure to, among other things, more effectively support production of radioisotopes for medical applications and research.

For nearly 50 years, DOE's use of its unique technologies and capabilities to develop isotopes for civilian purposes has enabled the widespread application of medical isotopes seen today. While its market share is a small fraction of total world radioisotope production, DOE remains the key provider for a large number of radioisotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large-enough quantities to make their production financially attractive to private industry.

DOE has sought independent analysis of trends in the use of medical radioisotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it has established two expert committees. The first, a thirteen-member Expert Panel convened in 1998 to forecast future demand for medical isotopes, included academicians from leading medical universities and schools of public health, and professional affiliations ranging from the National Cancer Institute to manufacturers of radiopharmaceuticals. The second

Commissioner Charlie Hales' statement on Hanford Cleanup

It is time for Portland citizens to recognize the serious threat to their health and welfare posed by the Hanford nuclear reservation. As the largest city on the Columbia River, we can no longer ignore this significant issue of local concern.

I call upon the federal government to meet its obligation to clean up the highly radioactive soup that now pollutes the Hanford site and threatens groundwater and the Columbia River. A serious commitment on the part of the U.S. Department of Energy to fully characterize and clean up the site to the highest regulatory standards is long overdue.

In addition, any serious consideration of a restart of any of Hanford's reactors should be seen for what it truly is - pure and dangerous folly. There is absolutely no justification for a restart for any purpose without a fully funded and verifiably safe cleanup regime. The DOE's current position on FFTF represents a dangerous abandonment of common sense as well as their obligation to protect the health and safety of citizens of the Pacific Northwest.

1221 S.W. Fourth Ave., Room 210 • Portland, OR 97204-1997

Response to Commentor No. 2019

consists of a subcommittee of DOE's Nuclear Energy Research Advisory Committee (NERAC), established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. The members of this Subcommittee were selected based upon their expertise and experience in the production, processing, distribution, and application of stable and radioactive isotopes in the biological and physical sciences, and in medicine. The members included basic and clinical scientists, administrators, the radiopharmaceutical industry, and users of isotopes from academia and the federal government. The studies that were conducted by these expert committees looked at the economics of medical isotope production. The Expert Panel and NERAC reports were each used in developing the NI PEIS, and made available to the public at the NI PEIS public information centers and on the Internet at www.nuclear.gov

2019-206

2019-207

2019-206

2019-55: Medical isotopes are currently being produced in the United States; however, the United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs. Supplies of many research isotopes are not readily available from existing domestic or foreign sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed. Under the NI PEIS proposed action and consistent with its mandates under the Atomic Energy Act, DOE would enhance its existing nuclear facility infrastructure to, among other things, more effectively support production of radioisotopes for medical applications.

As noted in Table 2-7 of the PEIS, the total volume of radioactive waste produced by use of either the FFTF or a new accelerator would be close to the same, with the accelerator alternative actually producing

Appendix F

Memorandum

To: Oregon Office of Energy
 From: David V. Yaden
 Date: 8/14/00
 Subj: Comments on DEIS for restart of FFTF

The following comments are based on reading of the summary, not the full document. The cost study was not available for review. In addition, the National Research Council report *Long-Term Institutional Management of U.S. Department of Energy Legacy Waste Sites* was reviewed.

- The DEIS is disingenuous in presenting the alternatives as a response to critical DOE "programmatic needs." The document reads more as a justification than an evaluation.
- The missions proposed for FFTF are not compelling. The "needs" it presents are promotional (nuclear energy), problematic (medical isotopes), or not pressing (space exploration).
- The DEIS rests heavily on an underlying ethos of wanting to maintain US technological leadership when the needs themselves suggest at least a much more aggressive look at international solutions. E.g., medical isotopes.
- The use of the DEIS to promote nuclear energy is inappropriate.
- The DEIS presents technology as both the problem and the solution for reinvigorating nuclear energy while ignoring the main obstacle: institutional capacity to deal with the waste stream.
- Even though DOE asserts that there will be a firewall between funding of NE programs and Hanford cleanup, this is not true for Congress and administrations who set overall funding levels for DOE.
- Unfortunately, due to its abysmal record on cleanup, DOE has lost credibility I used to grant it. I now believe DOE should not be allowed any further mission that will promote and prolong its nuclear activities until it demonstrates even a modicum of competence and commitment to cleanup.

2019-208

2019-209

2019-210

2019-211

Response to Commentor No. 2019

slightly more waste. However, it should be noted that a reactor produces spent nuclear fuel, while an accelerator does not.

- 2019-56:** DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual rate of growth of medical isotope use is consistent with the Expert Panel findings. Section 1.2.1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.
- 2019-57:** The Spallation Neutron Source at ORR was considered, but was dismissed since once completed it will be fully dedicated to other planned missions (see Section 2.6.1 of Volume 1).
- 2019-58:** See response to 2019-56.
- 2019-59:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

DOE's also notes the commentor's lack of confidence in DOE.

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

- 2019-60:** The waste generated by each alternative and alternative option were compared to the site's current waste generation. Section 4.8.3 was revised to include waste treatment, storage and disposal facility capacities so that the total maximum waste volume that would be generated for each site in addition to current site activities and reasonably foreseeable activities can be compared to the site's storage, treatment and disposal capacities.
- 2019-61:** All environmental parameters (e.g. air, soil, surface water, groundwater, vegetation, animals, fish, etc.) in and around the Hanford Site are monitored on a set frequency. The information is available to the public in annual environmental monitoring reports. Cumulative impacts as a result of the proposed action are included in Section 4.8 of the PEIS.

DOE notes the commentor's concerns regarding the risk of contamination to the Columbia River. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

funds designated for Hanford cleanup, regardless of the alternative(s) selected.

- 2019-62:** FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The accident analysis included a review of internal events (e.g., equipment failures, human errors), external events (e.g., airplane crashes, nearby explosions, fires), natural phenomena (e.g., floods, tornadoes, earthquakes), common-cause events, and sabotage and terrorist activities. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.
- 2019-63:** The individual site baselines for the 35-year nuclear infrastructure operation were obtained from the best available site information. The sources for this information are cited in the Section 4.8 of the NI PEIS. The cumulative impact tables for waste management have been revised to include the individual site's storage, treatment and disposal capacities for comparison.
- 2019-64:** Alternative 1 does postulate that DOE might decide at some point to import mixed oxide fuel from Europe to fuel FFTF. At this time, however, DOE has not proposed to import this fuel through any specific port. If DOE ultimately decides to import fuel from Europe, it would perform a separate NEPA analysis to select a port. This review would address all relevant potential impacts of overseas and inland water transportation, shipboard fires, package handling, land transportation, as well as safeguards and security associated with the import of SNR-300 mixed oxide fuel through a variety of specific candidate ports on the east and west coasts. It would consider all public comments, including local resolutions, concerning the desirability of bringing mixed oxide fuel into the proposed alternative ports.

In the event that DOE decides to enhance its nuclear infrastructure, it would not expose any population to high, unacceptable risks under any alternative. Any transportation activities that would be conducted by DOE would comply with U.S. Nuclear Regulatory Commission and U.S. Department of Transportation regulations. Associated

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

transatlantic shipment would comply with International Atomic Energy Agency requirements. In Section J.6.2, DOE reviewed the potential maximum impacts from the marine transportation of mixed oxide fuel from Europe to a representative military port, Charleston, South Carolina, and overland transportation to Hanford. Also in that section, a bounding analysis demonstrates that the maximum potential radiological risks to the surrounding public from mixed oxide fuel shipments would be extremely small (e.g., less than 1 chance in a trillion for a latent cancer fatality per shipment from severe accidents at docks and in channels and less than 1 chance in 50 billion for a latent cancer fatality per shipment from overland highway accidents).

- 2019-65:** The off gases released from FFTF, including those released from the facility stack, during normal operation are provided in Appendix H Table H-7 and consist of tritium, argon, and cesium. As discussed in Section 2.3.1.1.3 of Volume 1, if Alternative 1, Restart FFTF, is selected for implementation, then the reactor would operate at a nominal 100 megawatts with periodic excursions to no more than 400 megawatts. Based on operational data from FFTF, the amount of tritium released during normal operations at 400 MW would be expected to be no more than 4 curies per year (See Table H-7, Appendix H). The release of tritium, and other radionuclides, was used to determine the public health impacts from normal operation of the FFTF. The analysis showed that the most likely health impact from these releases was no additional health impact among the population surrounding the Hanford.
- 2019-66:** The NI PEIS addresses the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste treatment, storage, and disposal facilities for the wastes expected to be generated are identified in Chapter 4 under the Waste Management sections of the NI PEIS. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

Hanford, INEEL, and ORR environmental restoration activities are conducted in accordance with the individual DOE site's agreements with their appropriate regulatory agency. These agreements specify milestones and schedules for restoration of the individual DOE sites. These cleanup agreements are discussed in Chapter 3 of the NI PEIS under the waste management sections for each of the DOE sites under consideration.

DOE does not stockpile large quantities of Russian plutonium-238 long in advance of needs due to budget constraints and the additional processing required to remove decay products that occur following extended storage of the material.

- 2019-67:** Worker safety (radiological protection) is a key element of DOE's Radiological Health and Safety Policy (DOE P 441.1, April 26 1996) This policy states in part that Department of Energy facilities must "conduct radiological operations in a manner that controls the spread of radioactive materials and reduces exposure to the workforce and the general public and that utilizes a process that seeks exposure levels as low as reasonably achievable." Each Department of Energy site, including Hanford, is required to implement a radiological control program with the intent to meet this policy goal. The health and safety impacts on workers associated with both medical isotope production and plutonium production are presented in Appendix H of the NI PEIS, see Table H-13. Based on the assessment of worker health impacts for the range of reasonable alternatives and options that make use of Hanford facilities, the most likely impact of the use of these facilities is no increase in cancer fatalities among the facility workers. For example in Alternative 1 option 3, all of the activities target irradiation and processing) occur at Hanford facilities. As shown in Section 4.3.3.1.9, the expected consequences are less than one additional fatal cancer among the workforce; that is, no additional fatal cancers are expected.
- 2019-68:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

- 2019-69:** The environmental impacts associated with all nuclear infrastructure activities are addressed in Chapter 4 of the NI PEIS. The results of the detailed assessments are included for each of the alternative options evaluated. It is not suggested that there are no associated environmental impacts; these are presented in detail in Chapter 4. However, for options that do not require new construction, e.g., all options under the Restart FFTF Alternative, there would be no impacts on certain disciplines such as land use, visual resources, and cultural and paleontological resources; these specific situations are also addressed in the pertinent sections of Chapter 4.
- 2019-70:** See response to 2019-61.
- 2019-71:** The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. The cumulative impact tables for waste management in Section 4.8.3 of the NI PEIS have been revised to include the individual site's storage, treatment and disposal capacities for comparison. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.
- 2019-72:** See response 2019-61.
- 2019-73:** The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

all alternatives and alternative options. Waste treatment, storage, and disposal facilities for the wastes expected to be generated are identified in Chapter 4 under the Waste Management sections of the NI PEIS. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. Spent nuclear fuel disposition is detailed in Chapter 4 of the NI PEIS for each of the alternatives that would involve spent nuclear fuel generation.

The NI PEIS assumes, for the purposes of analysis, that Yucca Mountain, Nevada, would be the final disposal site for DOE's high level radioactive waste and spent nuclear fuel. As directed by the U.S. Congress through the Nuclear Waste Policy Act, as amended, Yucca Mountain is the only candidate site currently being characterized as a potential geologic repository for high-level radioactive waste and spent nuclear fuel. DOE has prepared a separate EIS, "Draft Environmental Impact Statement for a Geologic Repository for the Disposal of Spent Nuclear Fuel and High-Level Radioactive Waste at Yucca Mountain, Nye County, Nevada" (DOE/EIS-0250D, July 1999), which analyzes the environmental impacts from construction, operation and monitoring related transportation, and eventual closure of a potential geological repository.

- 2019-74:** FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The accident analysis included a review of internal events (e.g., sodium spills, equipment failures, human errors), external events (e.g., airplane crashes, nearby explosions, fires), natural phenomena (e.g., floods, tornadoes, earthquakes), common-cause events, and sabotage and terrorist activities. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small. Prior to an FFTF restart, a revised safety analysis report and a probabilistic risk assessment would be prepared which would address any changes in plant configuration,

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

operating conditions and procedures. The revised safety analyses would be based on all applicable orders and standards, including current seismic requirements, and then subjected to a thorough independent review process.

2019-75: The environmental impacts associated with all nuclear infrastructure activities are addressed in Chapter 4 of the NI PEIS. Specific to waste management, the NI PEIS addresses the environmental impacts due to the treatment, storage, and disposal of all wastes generated by the stated missions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable federal and state laws and regulations and appropriate DOE Orders.

The accidents considered in the NI PEIS are based on a complete spectrum of postulated accidents, ranging from high-probability low consequence events to extremely unlikely and incredible events. The consequences and risks associated with waste storage would be bounded by these accidents. Appendix I of the NI PEIS addresses all accidents in detail.

2019-76: See response 2019-61.

2019-77: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposal) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed.

2019-78: Although beyond the scope of this NIPeIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Spent FFTF fuel is currently stored onsite in 50-year storage containers.

2019-79: DOE notes the commentor's hesitance to support restarting FFTF for expanding its existing nuclear facility infrastructure. Consistent with its mandates under the Atomic Energy Act, DOE is proposing this enhancement for the purposes of addressing three primary needs:

1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;

2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and

3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio.

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

- 2019-80:** The FFTF is currently being maintained in a standby condition by approximately 242 personnel. These make up the a large portion of personnel needed to restart FFTF. The Hanford site estimates only 168 additional workers would be required. It is possible that some of these positions could be filled from other projects at Hanford.
- 2019-81:** DOE notes the commentor's concerns for additional detail on groundwater conditions at Hanford, including effects of withdrawals on contaminant plumes and effects on groundwater quality from percolation sources.

CEQ regulations for implementing NEPA specify that affected environment descriptions and environmental impact analyses in an EIS are to be discussed at a level of detail proportionate to expected level of impact (40 CFR 1502.2 and 40 CFR 1502.15). This NI PEIS meets or exceeds the CEQ requirements. Section 3.4.4.2.1 provides a general description of the Hanford groundwater environment. Discussions of groundwater resources and quality in the Hanford 400 Area are provided in Section 3.4.4.2.2. These sections describe the general extent of groundwater contamination across the Hanford Site. Generalized groundwater contamination maps have been added under Section 3.4.4.2 in the Final NI PEIS as a visual aid to understanding discussions of groundwater contamination at the Hanford Site.

Analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4) indicate that there would be no measurable impact on regional groundwater levels from increased groundwater withdrawals that would result from restarting FFTF. While restart of FFTF could potentially affect groundwater flow direction on a localized basis (i.e., around the well field), it would not be sufficient to measurably affect regional groundwater levels or contaminant plumes within the unconfined aquifer system. Little or no effect would be expected on the 400 Area nitrate plume that originates just to the north of the FFTF complex or on the site-wide tritium and nitrate plumes which originate outside of the 400 Area. There is no indication that the 197 million liters (52 million gallons) of groundwater withdrawn annually in the 400 Area has had any effect on area or regional groundwater flow or on plume configurations. Water-level elevation maps published in annual site groundwater monitoring reports indicate that there was no discernible effect attributable to FFTF on water-table elevation and groundwater

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

flow during the period when FFTF was last fully operational. Therefore, additional discussion of groundwater flow parameters, modeling results, or well completion data is not warranted.

No impacts on groundwater quality would be expected as a result of FFTF restart. As described in Volume 1, Section 3.4.4.1.2 of the NI PEIS, the only liquid effluent discharged from FFTF during current standby operations consists of process wastewater from the facility's cooling towers. This wastewater is discharged to the 400 Area Pond that allows the effluent to percolate to the subsurface. These discharges are regulated under State Waste Discharge Permit No. 4501. The effluent is continuously monitored before discharge with periodic sampling and analysis to determine compliance with effluent limitations. Aside from cooling water treatment chemicals added to control corrosion and algae growth, the only chemical and radiological constituents in the discharge are those that occur in the groundwater used for cooling tower makeup. As discussed in Section 4.3.1.1.4, restart of FFTF would increase the volume of process wastewater discharged to the pond system but would not measurably affect the quality of the effluent. There are no radiological liquid effluent pathways from FFTF.

- 2019-82:** DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and to providing ample opportunity for public comment on those actions. Selection of facilities and site locations for accomplishing expanded civilian nuclear energy research and development and isotope production missions is not a political decision. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.
- 2019-83:** DOE could purchase plutonium-238 from Russia to satisfy its responsibility to supply NASA with the necessary fuel to support future space exploration missions. Under the current contract set to expire in 2002, the United States is authorized to purchase up to 40 kilograms of plutonium-238, with the total available for purchase in any one year limited to 10 kilograms. To date, DOE has purchased approximately 9 kilograms of plutonium-238 under this contract. Under the No Action Alternative, DOE would continue to purchase plutonium-238 to meet the space mission needs for the 35-year evaluation period considered in the NI PEIS. However, any purchase of plutonium-238 from Russia beyond what is currently available to the

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

United States through the existing contract would likely require negotiation of a new contract and may require additional NEPA review.

DOE also notes the commentor's concern that intellectual capital will be lost if the United States stops producing plutonium-238. DOE currently has the technical capability and human resources to carry out the plutonium-238 mission.

The May 22, 2000, correspondence from NASA to DOE identifies that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, SRTG development efforts were stopped in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires one-third less plutonium-238 as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000, letter to DOE that large RTGs be maintained as backup. Section 1.2.2 of Volume 1 was revised to clarify plutonium-238 mission needs.

2019-84: DOE notes the commentor's interest in the safety of the Russian nuclear program. As discussed in Volume 1, section 1.2.2, information is limited concerning nuclear safety and domestic safeguards of foreign plutonium-238 production facilities.

2019-85: As explained in Section 1.2.2 of the final NI PEIS, the current inventory of plutonium-238 will be exhausted by 2005. DOE could purchase more plutonium-238 from Russia, but its preference is to reestablish a domestic production capability, because of the Russian supply uncertainty and nonproliferation concerns. See also response to 2019-83.

DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2019-86: Chapter 1 of Volume 1 of the NI PEIS makes the statement that "currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions..."

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

This statement does not assume a resurgence of need for nuclear power. As stated in the EIS, these primary missions include basic energy sciences, as well as national defense.

- 2019-87:** The use of mixed oxide fuel that was originally fabricated for a German nuclear reactor constitutes use of nuclear fuel which has been fabricated, but no longer required by the Germans. This unused nuclear fuel is a resource which has been in storage and available since the 1980s. The Nuclear Infrastructure Nonproliferation Impacts Assessment report for the NI PEIS alternatives indicated that using the two different sources of existing mixed oxide fuel for FFTF (existing FFTF fuel and German MOX fuel) would result in significant mitigating factors, indicating that substantial nonproliferation benefits could be gained by disposing of this inventory as spent fuel.
- 2019-88:** Currently, DOE only purchases plutonium-238 from Russia. Under the current contract with Russia set to expire in 2002, the United States is authorized to purchase up to 40 kilograms of plutonium-238, with the total available for purchase in any one year limited to 10 kilograms. To date, DOE has purchased approximately 9 kilograms of plutonium-238 under this contract. Future purchases from Russia would require the negotiation of a new contract with Russia. DOE recognizes that this is a viable option and has analyzed this option under the No Action Alternative.
- 2019-89:** The import of plutonium-238 from Russia is part of the No Action Alternative. Transportation risks for importing plutonium-238 from Russia would be 0.0099 latent cancer fatalities to the public from incident free transportation and 4.4×10^{-4} latent cancer fatalities to the public from radiological accidents (See Section 4.2.1.1 of Volume 1). While there are differences in the total shipping distances and risks among the alternatives, the risks from transportation are small for all of the alternatives. Figures and tables in Section 2.7.1.6 summarize transportation risks and provide comparisons of transportation risks among the alternatives. Transportation risk is only one factor in DOE's decision.
- 2019-90:** The NI PEIS states that commercial light water reactors (CLWRs) can produce the necessary plutonium-238 to meet NASA space mission needs. Alternative 2, Options 4, 5, and 6 include CLWRs for the production of plutonium-238.

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

Plutonium-238 should not be confused with weapons-grade plutonium (plutonium-239) used for defense purposes. The plutonium-238 that would be produced as a result of this proposed action would only be used for NASA space missions. The need for NASA space missions, however, is outside the scope of this NI PEIS. NASA must also comply with the National Environmental Policy Act when considering major Federal actions such as space missions. NASA has its own public participation processes to involve interested parties in its decision making processes. The need for DOE production of plutonium-238 to support NASA space missions, is however, discussed in Section 1.2.2 of Volume 1 of the NI PEIS.

- 2019-91:** DOE notes the commentor's interest in NASA's funding, although this issue is beyond the scope of this Nuclear Infrastructure EIS.
- 2019-92:** The No Action Alternative, which is required by Council on Environmental Quality regulations (40 CFE 1502.14 (d)), requires DOE to consider the continuation of its present course of action, which includes production of currently produced isotopes. Thus, the current production of medical isotopes in existing operating reactors and accelerators would continue under No Action (and all other alternative as well). The No Action Alternative provides an alternative to which the action alternatives may be compared.
- 2019-93:** The potential to split missions and consider new combinations of alternatives was considered. As addressed in Section 1.3 of Volume 1, in addition to the range of reasonable alternatives evaluated in the PEIS, DOE could choose to combine components of several alternatives in selecting the most appropriate strategy. For example DOE could select a low-energy accelerator to produce certain medical, research, and industrial isotopes, and an existing operating reactor to produce plutonium-238 and conduct nuclear research and development.
- 2019-94:** The NI PEIS states that commercial light water reactors (CLWRs) can produce the necessary plutonium-238 to meet NASA space mission needs. Alternative 2, Options 4, 5, and 6 include CLWRs for the production of plutonium-238.
- 2019-95:** DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions, although issues such as NASA research priorities are beyond the scope of this PEIS. Through

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch.

2019-96: As presented in the Cost Report, the annual total cost for the purchase of Russian plutonium-238 is \$8.84 million (excluding the \$40 million annual cost for maintaining FFTF in standby mode). Conversely, the annual operating costs for producing plutonium-238 range from \$14.8 million (using FDPF in combination with existing irradiation facilities) to \$77.2 million (using FFTF with FMEF). These estimated production costs exclude the costs for facility modification and startup and target development, testing, and evaluation.

2019-97: There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory (stored at the Los Alamos National Laboratory) available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

The May 22, 2000, correspondence from NASA to DOE identifies that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, SRTG development efforts were stopped in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

system, referred to in the subject correspondence, requires one-third less plutonium-238 as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000, letter to DOE that large RTGs be maintained as backup. Section 1.2.2 of Volume 1 was revised to clarify plutonium-238 mission needs.

- 2019-98:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2019-99:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is committed to honoring this agreement.
- 2019-100:** As stated in PEIS Section 1.2.2 Volume 1, DOE has had a contract with Russia to purchase plutonium-238 since 1992 and is aware of the existence and production capability of plutonium-238 in Russia. However, according to the Nonproliferation Impact Assessment, "the status of Russian domestic safeguards of ANM (alternate nuclear material, neptunium and americium) is largely unknown. Moreover, since there is currently no Russian moratorium on spent fuel reprocessing, and neptunium recovery is part of the Russian reprocessing flowsheet, the Russian inventory of separated weapons usable neptunium could continue to increase, even if smaller quantities of neptunium were destroyed in the production of plutonium-238." The potential nonproliferation impacts of continued purchases from Russia are discussed in Section 8.2 of the Nuclear Infrastructure Nonproliferation Impact Assessment which was published in September, 2000.
- 2019-101:** DOE notes the commentor's view. However, as stated in the NI PEIS, DOE signed a 5-year contract in 1992 to purchase plutonium-238 from Russia. Under the current contract set to expire in 2002, the United States is authorized to purchase up to 40 kilograms of plutonium-238, with the total available for purchase in any one year limited to 10 kilograms. However, DOE does not stockpile large quantities of

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

Russian plutonium-238 long in advance of needs due to budget constraints and the additional processing required to remove decay products that occur following extended storage of the material. To date, DOE has purchased approximately 9 kilograms of plutonium-238 under this contract. DOE recognizes that this is a viable option and has analyzed this option under the No Action Alternative.

- 2019-102:** The NERAC study looked at U.S. isotope research and production planning. It evaluated domestic capabilities to support domestic isotope needs. It should be noted, however, that the United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada.
- 2019-103:** NASA would be the only end user of any plutonium-238 produced as a result of the NI PEIS Record of Decision. While NASA does not provide funds to DOE on an annual basis for the production of plutonium-238, payments to offset expenses are made by NASA to DOE upon delivery of radioisotope power systems.

The supply of plutonium-238 in the Russian inventory is limited. The inventory on hand is not adequate to meet the long-term needs of NASA. Russia would have to fabricate targets, irradiate targets, and startup their reprocessing plants to produce the plutonium-238. The public health and safety and the environmental impacts associated with the plutonium-238 production would be under Russian control.

- 2019-104:** A separate Cost Report was prepared to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. The Cost Report presents the costs associated with purchasing plutonium-238 from Russia under the No Action Alternative as well as the use of Commercial Light Water Reactors to produce plutonium-238 under Alternative 2 (Options 4, 5, and 6). Cost associated with the construction of new accelerator(s) and a new research reactor to meet production requirements under Alternatives 3 and 4, respectively, are also presented. Specifically, the annual total cost for purchasing Russian plutonium-238 is \$8.84 million (excluding the \$40 million annual cost for maintaining FFTF in standby). The annual operating costs for producing plutonium-238 in a CLWR range from \$14.8 million (using FDPF) to \$23.4 million (using FMEF). These estimated production costs exclude the costs for facility modification and startup and target development, testing, and evaluation which range

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

from in total cost from \$342.4 million to \$374 million in combination with the same two processing facilities. Construction of a new research reactor is estimated to cost \$312 million. DOE has provided a summary of the Cost Report in this Final NI PEIS.

2019-105: This is not an area that is evaluated in the NI PEIS. DOE of Energy estimates that restarting FFTF will only require 168 additional personnel, in addition to the staff of approximately 242 which currently maintain FFTF in standby mode. As for funding for research, there are too many uncertainties to quantify any impact on OSU.

2019-106: The commentor's opposition to the use of FFTF, alternative 1 of this EIS, is noted.

2019-107: Consistent with its mandates under the Atomic Energy Act, DOE is proposing this expansion for the purposes of addressing three primary needs:

- 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;
- 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and for which the United States has no long-term, assured supply; and
- 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio.

2019-108: The commentor's interest in Alternative 5 is noted. FFTF is capable of reducing the inventory of plutonium (i.e., burning it) during normal operation.

2019-109: DOE has no hidden agenda for weapons research and use of FFTF for classified missions. The only missions being considered are those analyzed in the NI PEIS, which are the production of isotopes for medical, research, and industrial uses; plutonium-238 production for future NASA space exploration missions; and U.S. nuclear research and development needs for civilian application. Any future uses of FFTF

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

and other facilities evaluated in the NI PEIS that are not addressed in the NI PEIS would require additional NEPA assessment.

- 2019-110:** The environmental impacts associated with operation of the FFTF for the stated missions are addressed in detail in Section 4.3 of the NI PEIS. This section specifically evaluates the incremental radiological impact to the public associated with both normal operation and postulated accident conditions. As discussed, if FFTF were to operate for 35 years, this risk would be small (less than 1 latent cancer fatality). For perspective, the radiation dose the average American receives from natural sources is about 300 mrem each year. Based on the same 35 year time period used above, approximately 2,600 latent cancer fatalities would be expected among the same population as a result of this natural (non-Hanford related) radiation exposure. In that same 35 years, about 19,000 cancer fatalities from all causes (nonradiological causes included) would be expected in the same population.
- 2019-111:** Although the FFTF is 20 years old, it is DOE's newest reactor, it is in excellent condition and evaluations have been performed to show that it has sufficient life remaining to fully support the proposed 35 year mission.
- 2019-112:** Facilities at Argonne National Laboratory-West were considered but dismissed from further consideration (see Section 1.3 of Volume 1). The Neutron Radiographic Reactor lacks sufficient neutron production capacity to support the NI PEIS proposed action without impacting existing missions, and the Transient Reactor Test Facility is not capable of steady-state neutron production. Processing facilities considered but dismissed included the Hot Fuel Examination Facility, Analytical Laboratory, and Fuel Conditioning Facility. These were not considered to be the most suitable facilities at INEEL in terms of capability, capacity, and availability.
- 2019-113:** ATR is an operating reactor (see Volume 1, Section 2.3.1.2).
- 2019-114:** The programmatic alternatives and options analyzed in the NI PEIS focus on the use of irradiation facilities that are currently operating, could be brought on line, or constructed and operated to meet DOE's irradiation needs. The Advanced Test Reactor (ATR) at INEEL is an existing DOE irradiation facility that would meet DOE's irradiation needs and is considered under Alternative 2. The NI PEIS also looks at

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

facilities for fabrication, storage, and postirradiation processing of targets. The Fluorinel Dissolution Process Facility (FDPF) and Building CPP-51 (storage only) would accomplish these activities under Alternatives 1 through 4. The selection of an alternative and option or combination of alternatives and options for meeting the purpose and need described in Section 1.2 would be based on a number of factors including environmental impacts, costs, public input, nonproliferation concerns, program objectives and schedules, technical assurance and national policy considerations.

2019-115: PNNL has not prepared this PEIS. It has been prepared by a contractor under contract to DOE. (See Volume 1, Chapter 6, List of Preparers, and the contractor's disclosure statement in Volume 2, Appendix O, indicating no conflict of interest.) As the responsible Federal agency, DOE has provided guidance, reviewed, evaluated, and approved its contents, including the responses to comments. In exercising these responsibilities, DOE has provided and considered information, analyses, and data from many sources, including PNNL. All such sources are noted in the text of the PEIS and shown in the report References. Consequently, DOE does not believe that its independent consideration of referenced sources, including those of PNNL, represents a conflict of interest. DOE exercises full control over the preparation, and takes full responsibility for the contents of this PEIS.

2019-116: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost-efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

DOE has taken the Expert Panel and NERAC report recommendations under consideration in developing the range of alternatives evaluated in the NI PEIS. These reports were made available to the public at the NI PEIS public information centers and on the Internet at www.nuclear.gov.

2019-117: DOE notes the commentor's concern over the credibility of the nuclear industry, although this issue is beyond the scope of this NI PEIS. The scope of this EIS is limited to analysis of alternatives to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development.

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

Civilian nuclear energy research initiatives are discussed in Volume 1, section 1.2.3. Further information can be found at the Office of Nuclear Energy, Science, and Technology web site, <http://www.nuclear.gov/>.

2019-118: Although the 50 megawatt power level of the new TRIGA research reactor is larger than the largest currently operating TRIGA reactor power of 16 megawatts, the fuel design is almost identical to the current TRIGA 10 megawatt high power design and the system thermal hydraulic performance represents a linear extrapolation of existing designs. The 50 megawatt TRIGA reactor design has been discussed with General Atomics, the TRIGA reactor design corporation. It is technically feasible to build a 50 megawatt TRIGA research reactor.

2019-119: As discussed in the text that accompanies the figure on page S-46 of the draft Summary, radiological accident risks are driven by activities at the fabrication/processing facilities that support the production of radioisotopes. Production of radioisotopes is discussed in Sections 1.2.1 and 1.2.2 of Volume 1. The figure summarizes information that is separately available throughout Chapter 4. Information is not presented by mission because the alternatives (described in Section 2.5 of Volume 1) provide multiple options for accomplishing the missions listed in Section 1.2 of the NI PEIS. A cost-benefit analysis is optional under the Council on Environmental Quality implementation regulations and none was prepared for the NI PEIS. The figure on page S-46 illustrates that the radiological accident risk that would result at a new reactor would be small relative to the risks attributable to accidents at the fabrication/processing facilities.

2019-120: Impacts from the deactivation of FFTF are presented in section 4.4.1.2. of the NI PEIS. Specifically risks associated with normal operations are presented in Section 4.4.1.2.9, accident risks are presented in Section 4.4.1.2.10, and transportation risks are presented in Section 4.4.1.2.11. The environmental analysis showed that radiological and nonradiological risks associated with deactivating FFTF would be small.

2019-121: In Chapter 4 of the NI PEIS, the impact analyses assess all disciplines where the potential exists for effects on the environment. These disciplines are the same as those generally assessed in environmental impact statements prepared by DOE. None of the disciplines is considered to be “non-traditional.”

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

- 2019-122:** Clean, safe, reliable nuclear power has a role today and in the future for our national energy security. In recognition of this need, nuclear energy research and development programs have been initiated to address potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) and to ensure that current nuclear power plants can continue to deliver adequate and affordable energy supplies. Because it is unlikely that existing facilities could fully and effectively support these nuclear energy research and development initiatives without disturbing their existing missions, DOE is proposing to enhance its nuclear facility infrastructure to also support these activities. Further information on the need for nuclear energy research and development is provided in Section 1.2.3 of Volume 1.
- 2019-123:** See the response to Comment 2019-118. No single irradiation facility can meet all the NI PEIS mission needs (see Section 2.7 of Volume 1) (e.g., the current TRIGA reactor design), nor will multiple small reactors completely meet these needs.
- 2019-124:** If a Record of Decision selects Alternative 4, Construct New Research Reactor, it would be located at an existing DOE site. However, the specific site is unknown at this time. If Alternative 4 is selected, site specific NEPA documentation would be completed prior to site selection and the start of detailed design.
- 2019-125:** Alternative 3 involves constructing a new accelerator(s) at an existing, but as yet unidentified DOE site. Alternative 3 as written does include the permanent deactivation of FFTF; however, since a decision can include components of various alternatives, a combination of restarting FFTF and the construction of an accelerator can be selected. The siting of that accelerator would be determined through a separate site-specific NEPA review.
- 2019-126:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 2019-127:** DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. The first, a thirteen member Expert Panel convened in 1998 to forecast future demand for medical isotopes, included academicians from leading medical universities and schools of public health, and professional affiliations

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

ranging from the National Cancer Institute to manufacturers of radiopharmaceuticals. The second consists of a subcommittee of DOE's Nuclear Energy Research Advisory Committee (NERAC), established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. The members of this Subcommittee were selected based upon their expertise and experience in the production, processing, distribution, and application of stable and radioactive isotopes in the biological and physical sciences, and in medicine. The members included basic and clinical scientists, administrators, and users of isotopes from academia, industry, and the federal government.

DOE is aware that there is a considerable difference of public opinion regarding the alternatives evaluated in this NI PEIS to accomplish the DOE missions, including direct support as well as opposition to Alternative 1, Restart FFTF, on the part of members of the public, interest groups, and government bodies. It is further recognized that waste generation and its management is of particular concern. Analyses presented in Chapter 4 of the NI PEIS (e.g., Sections 4.3.1.1.13, 4.3.3.1.13) assess the impact on waste management infrastructure from operation of existing facilities (FFTF, FMEF, and 300 Area facilities) at Hanford in support of the missions. Further, the waste generated from the facilities proposed for use at Hanford will be managed (i.e., treated, stored, and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and DOE orders. The Hanford Site also has a comprehensive waste minimization and pollution prevention program in place as summarized in Volume 1, Section 3.4.11.8 that would govern any proposed site activities. The Record of Decision for the PEIS will be based on a number of factors including environmental impacts, costs, public input, nonproliferation issues, schedules, technical assurance, policy, and program objectives.

2019-128: Socioeconomic impacts associated with Alternative 1, Restarting FFTF, are discussed in Section 4.3 of the NI PEIS.

2019-129: See response to comment 2019-126.

2019-130: In January 1997, President Clinton tasked his Committee of Advisors on Science and Technology (PCAST) to evaluate the current national energy research and development portfolio and to provide a strategy that ensures the United States has a program to address the Nation's

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

energy and environmental needs for the next century. In its November 1997 report responding to this request, the PCAST Energy Research and Development Panel determined that restoring a viable nuclear energy option to help meet our future energy needs is important and that a properly focused research and development effort to address the potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) was appropriate. The PCAST panel further recommended that DOE reinvigorate its nuclear energy research and development activities to address these potential barriers.

It is current U.S. policy that clean, safe, reliable nuclear power has a role today and in the future for our national energy security. Recognizing this need, the U.S. has initiated two new significant nuclear energy research and development programs: the Nuclear Energy Research Initiative and Nuclear Energy Power Optimization. The Nuclear Energy Research Initiative program sponsors new and innovative scientific and engineering research and development to address the potential long-term barriers affecting the future use of nuclear energy identified by the PCAST panel. The Nuclear Energy Power Optimization program, a cost-shared program with industry, sponsors applied research and development to ensure that current nuclear plants can continue to deliver adequate and affordable energy supplies up to and beyond their initial 40-year license period by resolving open issues related to plant aging and by applying new technologies to improve plant reliability, availability, and productivity.

The Nuclear Energy Research Advisory Committee (NERAC) Subcommittee on Long-term Planning for Nuclear Energy Research, an independent expert panel established by DOE, has set forth a recommended 20-year research and development plan to guide DOE's nuclear energy programs in areas of material research, nuclear fuel, and reactor technology development. This plan stresses the need for DOE facilities to sustain the nuclear energy research mission in the years ahead. Such nuclear research and development initiatives requiring an enhanced DOE nuclear facility infrastructure fall into three basic categories: materials research, nuclear fuel research, and advanced reactor development.

2019-131: Other than the missions discussed in the NI PEIS, no alternate uses for FFTF are being considered at this time. None of the alternatives in the

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

NI PEIS include defense missions and would not contribute to future weapons production. Any future uses of FFTF and other facilities evaluated in the NI PEIS that are not addressed in the NI PEIS would require additional NEPA assessment.

2019-132: The additional radioactive waste that would be generated from the restart of FFTF (i.e., low-level radioactive waste) would not be stored in the high-level radioactive waste tanks located at Hanford.

Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

2019-133: DOE notes the commentor's opposition to some of the missions addressed in the NI PEIS.

2019-134: DOE policy encourages effective public participation in its decision making process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

2019-135: This NI PEIS has examined the risks associated with the operation of the FFTF for 35 years for the purpose of producing isotopes for medical use, research and development, and for the production of

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

radioactive heat sources for power supply systems. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. Accident analysis is described in Appendix I and the normal operations risk analysis is described in Appendix H.) The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small. Based upon these analyses, as well as the previous safe operation of the facility, FFTF can be operated safely to accomplish DOE missions. Additionally, in the event that FFTF restart is selected, a new Safety Analysis Report will be prepared and subjected to a thorough independent review process. The facility reanalysis as part of the Safety Analysis Report update process would ensure that the analyses bound the reactor-operating envelope for the duration of FFTF operation, The Safety Analysis Report would be routinely reassessed and updated when required to address any changes in plant configuration or changes in plant operation procedures. This continuing safety analysis updating would include analysis of changes that may occur as a result of facility aging during the 35 years of operation

2019-136: DOE has assumed that the commentor is questioning the general view of the public in the Tri-Cities region of Washington State toward the alternatives, particularly Alternative 1, Restart FFTF, to accomplish the missions alternatives evaluated in this NI PEIS. The transcript from the public hearing and DOE's responses to all comments made or submitted during the hearing are contained in the Comment Response Document of this NI PEIS. At the Richland, Washington public hearing held on August 31, 2000, there were a total of 93 commentors. Of these, 75 or about 81 percent expressed support for Alternative 1 while 16 or about 17 percent were opposed; 2 commentors did not specifically state an alternative preference in their comments.

2019-137: The purpose of the NI PEIS is to evaluate the potential environmental impacts associated with the proposed enhancement of DOE's nuclear infrastructure to fulfill three missions DOE is responsible for under the authority of the Atomic Energy Act: ensuring the availability of isotopes for medical, industrial, and research applications; meeting the nuclear material needs of other Federal agencies (i.e., NASA); and

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

undertaking research and development activities related to development of nuclear power for civilian use.

DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual rate of growth of medical isotope use is consistent with the Expert Panel findings. Section 1.2.1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Under the No Action Alternative, DOE would continue to purchase plutonium-238 to meet the space mission needs for the 35-year evaluation period considered in the NI PEIS. However, DOE recognizes that any purchase beyond what is currently available to the United States through the existing

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

contract would likely require negotiation of a new contract and may require additional NEPA review.

It is current U.S. policy that clean, safe, reliable nuclear power continue as a viable component of the United States' energy portfolio. In recognition of this need, the U.S. has initiated nuclear energy research and development programs to address potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) and to ensure that current nuclear power plants can continue to deliver adequate and affordable energy supplies. An enhanced DOE nuclear facility infrastructure is required to support such nuclear energy research and development for civilian applications.

- 2019-138:** DOE evaluated the capabilities and availability of existing government, university, and commercial accelerators (see Volume 1, section 2.6.1). There were no accelerators identified which could be used to meet the stated mission requirements.
- 2019-139:** DOE's decisionmaking procedures are outlined in 10 CFR 1021.210, which have been adopted in accordance with CEQ regulations (40 CFR 1505.1). DOE will consider the information presented in the NI PEIS as well as public and agency comments, including DOE's responses to those comments. Information contained in the Cost Report and the Nuclear Infrastructure Nonproliferation Impacts Assessment will also be considered. These information sources taken in consideration with the technical merits and timelines required to meet DOE policy and mission objectives will be used by the decisionmaker (The Secretary of Energy) in selection of an alternative, or alternative elements, from the range of alternatives evaluated in the NI PEIS. This decision will be published in a Record of Decision along with the supporting information required by CEQ and DOE regulations (40 CFR 1505.2 and 10 CFR 1021.315, respectively). DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.
- 2019-140:** The conclusions presented in the "NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000" regarding the suitability of the Fast Flux Test Facility (FFTF) to produce research isotopes in a timely and cost-efficient manner were made in the context of the facility producing research isotopes as its sole mission.

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

DOE agrees that the FFTF's large size and configuration are not particularly well suited for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of the FFTF for the production of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates use of the FFTF when coupled with the other proposed missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without disturbing the existing missions of these facilities.

2019-141: See response 2019-61.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

2019-142: See response to comment 2019-98.

2019-143: The reader is referred to the response to Comment No. 2019-81 above.

Analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4) indicate that restart of FFTF under Alternative 1 and subsequent operations would neither be expected to affect nor be affected by existing groundwater contamination. As discussed in Section 3.4.4.2.2, the quality of water supplied via the 400 Area's three wells is closely monitored and, thus, any deterioration in water quality supplied to FFTF would be detected.

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

2019-144: DOE notes the commentor's views that assumptions and bases for the proposed action are not valid. Consistent with its mandates under the Atomic Energy Act, DOE is proposing this enhancement for the purposes of addressing three primary needs:

- 1) to support the increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;
- 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and for which the U.S. has no long-term, assured supply; and
- 3) to support civilian nuclear energy research and development in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio.

A separate Cost Report was prepared to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. The Cost Report was mailed to interested parties on August 24, 2000 and made available on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has provided a summary of the Cost Report in Appendix P of the Final NI PEIS. The NI PEIS adequately address such issues as target processing waste disposal, groundwater impacts, and transportation impacts. Groundwater quality and usage impacts were determined to be negligible to relatively minor for most alternatives and options with the exception of the projected requirement for relatively large quantities of water groundwater or surface water) for operation of the high-energy accelerator and research reactor under Alternatives 3 and 4, respectively. Also, the risks and potential human health risks from roadway and marine (for Alternative 1) transportation of all materials (mixed-oxide fuel under Alternative 1, target materials, and isotopes) are addressed in the applicable sections of Chapter 4. All environmental and human health impacts are assessed, with a revised summary of impacts provided in Volume 1, Section 2.7 of this NI PEIS.

2019-145: The nuclear infrastructure missions as set forth in the NI PEIS can be accomplished without the use of Hanford facilities. For example, a new

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

accelerator(s) or research reactor (and support facility) could be constructed at a DOE site other than Hanford and plutonium-238 target fabrication and processing accomplished at either ORR or INEEL.

- 2019-146:** DOE notes the commentor's support for Alternative 1, Restart FFTF. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected. . Further, none of the stated missions are defense- or weapons-related.
- 2019-147:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.
- 2019-148:** DOE has made every effort to provide the public with adequate information in the NI PEIS. The FFTF could be deactivated if other facilities are selected (in the Record of Decision) to produce plutonium-238 and medical and research isotopes. In fact, permanent deactivation of FFTF is a part of each alternative except the No Action Alternative and Alternative 5, Permanently Deactivate FFTF. The commentor is referenced to Appendixes A through F for technical information related to target fabrication and processing and reactor operations. With respect to costs, DOE has prepared a separate cost report that it has made available to the public.
- 2019-149:** See response 2019-61.
- 2019-150:** See response to comment 2019/98. DOE notes the commentor's concern about the cost of operating FFTF. Cost issues would be among the factors considered in connection with decisions on FFTF implementation. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS.

- 2019-151:** Volume 1, Section 2.7 of this NI PEIS has been revised to include a summary of environmental impacts organized by environmental resource and includes impacts summary tables so that the incremental impacts to each area (e.g., occupational and public health and safety, waste management) can be easily compared across all alternatives and between options. In addition, a summary of cost impacts has also been added to this Final NI PEIS. However, costs associated with waste production and cleanup of existing contamination are beyond the scope of this PEIS. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram funds designated for Hanford cleanup, regardless of the alternative(s) selected.
- 2019-152:** DOE notes the commentor's support for an alternative that combines elements of the No Action Alternative (purchase plutonium-238 from Russia) and Alternative 1, Restart FFTF (for medical/industrial isotopes), or their desire to see FFTF permanently deactivated (Alternative 5) if the suggested alternative is not selected.
- 2019-153:** The estimated costs of the range of reasonable alternatives are presented in the Cost Report, summarized in Appendix P of the Final NI PEIS. However, the Cost Report is not a cost-benefit analysis. While it is reasonable to believe that the benefits of medical isotopes are substantial, the purpose of this NI PEIS is to describe the nuclear infrastructure missions (Section 1.2 of Volume 1), a range of reasonable alternatives for satisfying the mission requirements (Section 2.5 of Volume 1), and the environmental impacts that would result from implementation of the alternatives. According to 40 CFR Section 1502.23, if a cost-benefit analysis exists, it must be reported and summarized in the NI PEIS.

2019-154: See response to comment 2019-150.

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

- 2019-155:** DOE notes the commentor's concern that the NI PEIS and the associated decisions to be made are complex. DOE strives to produce NEPA documentation and related materials that are easily understood by the public by avoiding the use of jargon, defining technical terms and concepts through the use of common comparisons, avoiding the use of acronyms to the extent possible, and provision of a Summary that is clear and concise, among other means. In order to improve the public's comprehension and understanding of the PEIS, this Final NI PEIS reflects revisions that have been made to eliminate some redundant and extraneous information while some sections have been reorganized to improve readability. In accordance with CEQ requirements for implementing NEPA, DOE provided a relatively brief summary document for both the Draft and Final NI PEIS to facilitate the public's understanding of the purpose and need, alternatives being considered for implementation, and associated incremental and cumulative impacts of the proposed actions.
- 2019-156:** Sections 4.3.1.1.13, 4.3.2.1.13, 4.3.3.1.13, and 4.4.3.1.13 were revised to address comments received during the public comment period. This section now states that "DOE is considering whether the waste from processing of irradiated neptunium-237 targets should be classified as high-level radioactive waste and not transuranic waste. Irrespective of how the waste is classified (i.e., transuranic or high-level radioactive waste), the composition and characteristics are the same and the waste management activities (i.e., treatment and onsite storage) as described in this NI PEIS would be the same. In addition, either waste type would require disposal in a suitable repository. If it is transuranic waste, it would be nondefense waste and could not be disposed of at WIPP under current law. Because nondefense transuranic waste has no current disposal path, DOE Headquarters' approval would be necessary before a decision is made to generate such waste, as required by DOE Order 435.1. If the waste is classified as high-level radioactive waste, it is assumed for the purposes of this analysis that Yucca Mountain, Nevada, if approved, would be the final disposal site for DOE's high level radioactive waste."
- 2019-157:** The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS.

2019-158: The purpose of the NI PEIS, as discussed in Section 1.2, is to evaluate the potential environmental impacts associated with the proposed enhancement of DOE's nuclear infrastructure to fulfill three missions DOE is responsible for under the authority of the Atomic Energy Act: ensuring the availability of isotopes for medical, industrial, and research applications; meeting the nuclear material needs of other Federal agencies (i.e., NASA); and undertaking research and development activities related to development of nuclear power for civilian use.

DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual rate of growth of medical isotope use is consistent with the Expert Panel findings. Section 1.2.1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Under the No Action Alternative, DOE would continue to purchase plutonium-238 to meet the space mission needs for the 35-year evaluation period considered in the NI PEIS. However, DOE recognizes that any purchase beyond what is currently available to the United States through the existing contract would likely require negotiation of a new contract and may require additional NEPA review.

It is current U.S. policy that clean, safe, reliable nuclear power continue as a viable component of the United States' energy portfolio. In recognition of this need, the U.S. has initiated nuclear energy research and development programs to address potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) and to ensure that current nuclear power plants can continue to deliver adequate and affordable energy supplies. An expanded DOE nuclear facility infrastructure is required to support such nuclear energy research and development for civilian applications.

2019-159: DOE notes the commentor's opinion that the cost of indefinitely maintaining FFTF in standby mode is unacceptable. As stated in the Notice of Intent (65 FR 50064), one of the purposes of the proposed action is to determine the future role of FFTF in support of the expanded nuclear energy research and development and isotope production missions.

2019-160: A discussion of DOE's decisionmaking procedures is contained in response to comment no. 2019-139. This NI PEIS provides an adequate bounding description of nuclear energy research and development for civilian applications which DOE is responsible for supporting under the Atomic Energy Act. Appendix D of the NI PEIS specifically provides a summary of the nuclear energy research and development which could be accomplished in FFTF in overall support of the DOE missions.

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

DOE provided the Summary concurrent with distribution of the Draft and Final NI PEIS as required by CEQ regulations for implementing NEPA (40 CFR 1502.12). The Summary and Draft NI PEIS were distributed well in advance of the 15 days prior to the public hearings that is specified by CEQ regulations (40 CFR 1506.6). Also, the Summary and Draft were mailed starting one week prior to the start of the public comment period on July 28, 2000.

- 2019-161:** DOE notes the commentor's support for Alternative 1, Restart FFTF.
- 2019-162:** An alternative which involves acquisition of material from foreign sources, such as suggested by the commentor, would fail to meet the goal of the proposed action, which is to accomplish expanded civilian nuclear energy research and development and isotope production missions in the United States. It should be noted that the No Action Alternative does consider the purchase of plutonium-238 from Russia and that the United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada.
- 2019-163:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.
- 2019-164:** DOE notes the commentor's support for Alternative 1, Restart FFTF. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram funds designated for Hanford cleanup, regardless of the alternative(s) selected.
- 2019-165:** All environmental parameters (e.g. air, soil, surface water, groundwater, vegetation, animals, fish, etc.) in and around the Hanford Site are monitored on a set frequency. The information is available to the public in annual environmental monitoring reports.

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

The management of the FFTF Facility has been retained through contractor changeovers, and the qualifications of the FFTF management are excellent.

- 2019-166:** The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS. NEPA does not require that cost-benefit analyses be provided in an EIS, and none have been provided in this Final NI PEIS or in the Cost Report. The Cost Report is not a cost-benefit analysis. While it is reasonable to believe that the benefits of medical isotopes are substantial, the purpose of this NI PEIS is to describe the nuclear infrastructure missions (Section 1.2 of Volume 1), a range of reasonable alternatives for satisfying the mission requirements (Section 2.5 of Volume 1), and the environmental impacts that would result from implementation of the alternatives. According to 40 CFR Section 1502.23, if a cost-benefit analysis exists, it must be reported and summarized in the NI PEIS.
- 2019-167:** DOE notes the commentor's support for medical and research isotope production and opposition to plutonium-238 production for space missions.
- 2019-168:** The NI PEIS was not structured to separately determine the environmental impacts of each DOE mission within each alternative, rather it sought to identify the overall impacts of each alternative or option. In order to do this impacts were identified for each facility regardless of the number of missions that might take place in that facility. Thus, for HFIR or ATR only one mission was analyzed (plutonium-238 production) whereas for FFTF all three mission were addressed.

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

If the facility (it is assumed that the commentor is referring to FFTF) is restarted, it would be used for the production of plutonium-238, medical/research isotopes, and for nuclear energy research and development for civilian application. While FFTF could be utilized to some extent by foreign researchers (as are other DOE research reactors), these would not be its primary users.

- 2019-169:** The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS.
- 2019-170:** DOE notes the commentor's support for producing plutonium-238 in the United States rather than purchasing it from Russia.
- 2019-171:** DOE notes the commentor's views regarding opposition to Alternative 1 options, Restart FFTF. DOE is aware that there is a considerable difference of public opinion regarding the alternatives evaluated in this NI PEIS to accomplish the DOE missions, including direct support as well as opposition to Alternative 1, Restart FFTF. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the environmental impact analysis of DOE's proposed alternatives for meeting the mission requirements, and gave equal consideration to all comments, regardless of how or where they were received. All comments received during the public comment period have been responded to in this NI PEIS. While the number of comments for or against a particular alternative may be recorded, it does not automatically constitute a "vote" for or against the alternative.
- 2019-172:** A previous change to the Tri-Party Agreement (TPA) removed the planned milestone for deactivation of the FFTF until its ultimate fate was assessed. That proposed TPA milestone change was the subject of previous public meetings and approved by the U.S. Environmental Protection Agency and the State of Washington Department of Ecology. DOE is fully committed to honoring this agreement.

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

- 2019-173:** The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS.
- 2019-174:** Any foreign country fuel, after its use in the operation of FFTF would be under the custody of the U.S. Department of Energy, and will be managed and disposed of in accordance with U.S. standards. The spent nuclear fuel management is discussed in Section 4.3.1.1.14 of the NI PEIS.
- 2019-175:** Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. DOE bases its planning for plutonium-238 requirements for space missions on NASA estimations, not on past funding. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Under the No Action Alternative, DOE would continue to purchase plutonium-238 to meet the space mission needs for the 35-year evaluation period considered in the NI PEIS. However, DOE recognizes that any purchase beyond what is currently available to the United States through the existing contract would likely require negotiation of a new contract and may require additional NEPA review.

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

2019-176: The methods for calculating transportation risks are discussed in Appendix J of the NI PEIS. Following is a discussion of the methods and approach used for these calculations.

The RADTRAN 5 (Neuhauser and Kanipe, 2000) computer code was used for incident-free and accident risk assessments to estimate the impacts on population. RADTRAN 5 contains the mathematical models needed to calculate the incident free and accident risk of transporting radioactive materials. For accident analysis, RADTRAN 5 calculates distinct probability-consequence products for multiple exposure pathways for each accident severity category for all route segments. The RADTRAN 5 accident consequence assessment models were used to provide an estimate of the potential impacts posed by the maximum foreseeable (1 X 10⁻⁷ per year or once in 10 million year) transportation accident. As discussed in sections J.4 and J.6.1, RADTRAN 5 also takes into account the risk of accidents with frequencies that are less than 1 X 10⁻⁷ per year and this risk is included in the NI PEIS risk analysis results.

2019-177: DOE notes the commentor's interest in alternative energy sources, although issues of research and development of alternative energy sources are beyond the scope of this Nuclear Infrastructure PEIS. The DOE missions to be addressed in this EIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development, can currently only be met using nuclear reactor or accelerator technologies.

2019-178: The schedule for the public hearings was determined in part by CEQ guidelines for implementing NEPA that require that the hearings be held no sooner than 15 days after release of the Draft NI PEIS. DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and holding public hearings is an essential and required part of the NEPA process. In compliance with NEPA and CEQ regulations, DOE provided opportunity for the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

CEQ (40 CFR 1500 et seq.) and DOE (10 CFR Part 1021) implementation regulations do not require inclusion of cost and nonproliferation studies in an environmental impact statement. The basic purpose of the NI PEIS is to describe the alternatives under consideration for implementation (Section 2.5 of Volume 1) and the environmental impacts that would occur if these alternatives were implemented (Chapter 4 of Volume 1). Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. The associated cost report and nonproliferation report were made available to the public on August 24, 2000 and September 8, 2000, respectively. DOE mailed these documents to approximately 730 interested parties, and these reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in public reading rooms.

DOE has also provided summaries of the Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment in Appendixes P and Q, respectively, in the Final NI PEIS.

As outlined in 40 CFR 1502.14 (e), an agency is not required to specify a preferred alternative or alternatives in the Draft EIS if one does not exist, but must do so in the Final EIS. Accordingly, DOE has identified its preferred alternative in Volume 1, Section 2.8 of the Final NI PEIS.

2019-179: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

DOE also notes the commentor's suggestion concerning radiation research.

2019-180: DOE notes the commentor's concern that the missions described in the NI PEIS do not support restarting the FFTF. Other than the missions discussed in the NI PEIS, no alternate uses for FFTF are being

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

considered at this time. None of the alternatives in the NI PEIS include defense missions and would not contribute to future weapons production. Any other use of FFTF beyond what is described and evaluated in the Final NI PEIS would require additional NEPA assessment.

- 2019-181:** See response to comment 2019/98. With respect to previous commitments to deactivate FFTF, a change to the Tri-Party Agreement (TPA) removed the planned milestone for total deactivation of the FFTF until its ultimate fate was assessed. That proposed TPA milestone change was the subject of previous public meetings.
- 2019-182:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.
- Both government and commercial waste disposal sites are operated within the Hanford Site. These are permitted by the State of Washington.
- 2019-183:** See response to comment 2019/98. DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site.
- 2019-184:** FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

2019-185: In addition to the FFTF, other facilities within the United States (i.e., those that are currently operating, could be brought on line, or that could be constructed and operated) were assessed as reasonable alternatives in the PEIS.

DOE could continue to purchase plutonium-238 from Russia to satisfy its responsibility to supply NASA with the necessary fuel to support future space exploration missions. Under the current contract set to expire in 2002, the United States is authorized to purchase up to 40 kilograms of plutonium-238, with the total available for purchase in any one year limited to 10 kilograms. However, DOE does not stockpile large quantities of Russian plutonium-238 long in advance of needs due to budget constraints and the additional processing required to remove decay products that occur following extended storage of the material. To date, DOE has purchased approximately 9 kilograms of plutonium-238 under this contract. Future purchases from Russia would require the negotiation of a new contract with Russia. DOE recognizes that this is a viable option and has analyzed this option under the No Action Alternative.

2019-186: The purchase of plutonium-238 from Russia is considered in the No Action Alternative. Options 4-6 of Alternative 2, Use Only Existing Operational Facilities, considers the use of existing CLWRs to produce plutonium-238. It is not practical to produce medical or research isotopes in a commercial reactor and at the same time efficiently manage it for power production.

2019-187: The NI PEIS addresses the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste treatment, storage, and disposal facilities for the wastes expected to be generated are identified in Chapter 4 under the Waste Management sections of the NI PEIS. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS assumes, for the purposes of analysis, that Yucca Mountain, Nevada, would be the final disposal site for DOE's high level radioactive waste and spent nuclear fuel. As directed by the U.S. Congress through the Nuclear Waste Policy Act, as amended, Yucca Mountain is the only candidate site currently being characterized as a potential geologic repository for high-level radioactive waste and spent nuclear fuel. DOE has prepared a separate EIS, "Draft Environmental Impact Statement for a Geologic Repository for the Disposal of Spent Nuclear Fuel and High-Level Radioactive Waste at Yucca Mountain, Nye County, Nevada" (DOE/EIS-0250D, July 1999), which analyzes the environmental impacts from construction, operation and monitoring, related transportation, and eventual closure of a potential geological repository.

2019-188: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2019-189: See response to comment 2019-98.

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

2019-190: DOE notes the commentor's views and concern. The United States balance of payments in the world economy is not within the scope of the NI PEIS.

2019-191: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Hanford tank waste issues are not within the scope of this PEIS, as none of the alternatives considered would add to these waste volumes.

2019-192: NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. Plutonium-238 sources are used only when required by the space mission or enhance mission capabilities.

2019-193: DOE notes the commentor's remarks concerning the public involvement effort sponsored by the Oregon Office of Energy and for the outcome of public opinion in the decisions to be made.

2019-194: DOE notes the commentor's concern with FFTF waste. As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

FFTF spent nuclear fuel is currently stored onsite safely in 50 year dry cask storage containers.

2019-195: The NI PEIS is adequate. This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS.

The costs and nuclear nonproliferation impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such ancillary documents need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed these documents to more than 730 interested parties on August 24 and September 8, 2000, respectively. Both reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided summaries of the Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment in Appendixes P and Q, respectively, in the Final NI PEIS.

The purpose of this NI PEIS is to evaluate the environmental impacts of reasonable alternatives to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238 for NASA space missions, and civilian nuclear energy research and development. As evaluated under Alternative 1 in this NI PEIS, FFTF would be restarted to

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

accomplish these nondefense-related missions. All missions considered in the NI PEIS are for civilian purposes.

2019-196: FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The accident analysis included a review of internal events (e.g., equipment failures, human errors), external events (e.g., airplane crashes, nearby explosions, fires), natural phenomena (e.g., floods, tornadoes, earthquakes), common-cause events, and sabotage and terrorist activities. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

2019-197: The purpose of the NI PEIS is not to subsidize the nuclear industry. Rather, DOE is proposing a nuclear infrastructure enhancement for the purposes of addressing three primary needs:

- 1) to support the increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;
- 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and for which the U.S. has no long-term, assured supply; and
- 3) to support civilian nuclear energy research and development in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio.

2019-198: DOE notes the commentor's concern regarding the funding for cleanups. Use of any of these facilities for the stated missions would not impact the schedule or available funding for existing cleanup activities.

2019-199: DOE notes the commentor's concerns. This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively.

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives. DOE policy encourages effective public participation in its decisionmaking process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

2019-200: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

DOE notes the commentor's opposition to new waste generation. As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

2019-201: The purpose of the NI PEIS is to evaluate the potential environmental impacts associated with the enhancement of DOE's nuclear infrastructure to fulfill three missions. Under the authority of the Atomic Energy Act, DOE is responsible for ensuring the availability of

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

isotopes for medical, industrial, and research applications; meeting the nuclear material needs of other Federal agencies (i.e., NASA); and undertaking research and development activities related to development of nuclear power for civilian use.

DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual rate of growth of medical isotope use is consistent with the Expert Panel findings. Section 1.2.1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Under the No Action Alternative, DOE would continue to purchase plutonium-238 to meet the space mission needs for the 35-year evaluation period considered in the NI PEIS. However, DOE recognizes that any purchase beyond

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

what is currently available to the United States through the existing contract would likely require negotiation of a new contract and may require additional NEPA review.

It is current U.S. policy that clean, safe, reliable nuclear power continue as a viable component of the United States' energy portfolio. In recognition of this need, the U.S. has initiated nuclear energy research and development programs to address potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) and to ensure that current nuclear power plants can continue to deliver adequate and affordable energy supplies. An enhanced DOE nuclear facility infrastructure is required to support such nuclear energy research and development for civilian applications.

2019-202: DOE notes the commentor's concerns about the inclusion of cost in the NI PEIS and analysis of alternatives in the decisionmaking process. The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS.

In accordance with NEPA and CEQ regulations, this NI PEIS analyzes a range of reasonable alternatives for accomplishing the DOE missions which include the production of medical and industrial isotopes, the production of plutonium-238 for NASA space missions, and civilian nuclear energy research and development.

2019-203: The PEIS includes a detailed examination the socioeconomic impacts of the Region of Influence, which is the area in which 90 percent of the Hanford workers live, to determine the impacts on population, housing, and public services. For Hanford, the Region of Influence is defined as Benton and Franklin counties. It also includes a broader examination of the Regional Economic Area, defined as those counties that will be

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

economically impacted by actions at the Hanford site. The Regional Economic Area is comprised of Adams, Benton, Chelan, Douglas, Franklin, Grant, Kittitas, Okanogan, and Yakima counties. See Appendix G for an in-depth discussion of the impact assessment method.

2019-204: The fabrication and processing of the target materials were considered in the development of the risks associated with each of the alternatives. Fabrication and processing activities were analyzed for several different facilities, including Fuels and Materials Examination Facility (FMEF), Fluorinel Dissolution Process Facility (FDPF), Radiochemical Engineering Development Center (REDC), Radiochemical Processing Laboratory (RPL), and a generic processing facility. In all cases the processing (versus fabrication) of the irradiated targets is the dominant contributor to both worker and population health impacts. The fabrication of unirradiated targets results in essentially no radiological consequences. The health impacts from processing the irradiated targets are included in the information provided for each alternative where needed. For example Section 4.3.1.1.9 includes information on the health impacts from normal operation for both REDC and RPL; Section 4.3.2.1.9 for FDPF and RPL, Section 4.3.3.1.9 for FMEF, and Section 4.5.1.1.9 for a generic support (processing) facility. Similar information is provided for a processing facility for each of the options in alternatives 2, 3, and 4. (Processing of targets does not occur in Alternatives 1 and 5.)

2019-205: The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. The action to be addressed in this NI PEIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development, can currently only be met using nuclear reactor or accelerator technologies.

***Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy***

Response to Commentor No. 2019

2019-206: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

2019-207: See response to comment 2019-126. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2019-208: Consistent with its mandates under the Atomic Energy Act, DOE is proposing this enhancement for the purposes of addressing three primary needs:

- 1) to support the increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;
- 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and for which the U.S. has no long-term, assured supply; and

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

3) to support civilian nuclear energy research and development in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio.

DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual rate of growth of medical isotope use is consistent with the Expert Panel findings. Section 1.2.1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Under the No Action Alternative, DOE would continue to purchase plutonium-238 to meet the space mission needs for the 35-year evaluation period considered in the NI PEIS. However, DOE recognizes that any purchase beyond what is currently available to the United States through the existing

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

contract would likely require negotiation of a new contract and may require additional NEPA review.

It is current U.S. policy that clean, safe, reliable nuclear power continue as a viable component of the United States' energy portfolio. In recognition of this need, the U.S. has initiated nuclear energy research and development programs to address potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) and to ensure that current nuclear power plants can continue to deliver adequate and affordable energy supplies. An enhanced DOE nuclear facility infrastructure is required to support such nuclear energy research and development for civilian applications.

2019-209: Consistent with its mandates under the Atomic Energy Act, DOE is proposing this enhancement for the purposes of addressing three primary needs:

- 1) to support the increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;
- 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and for which the U.S. has no long-term, assured supply; and
- 3) to support civilian nuclear energy research and development.

It is current U.S. policy that clean, safe, reliable nuclear power continue as a viable component of the United States' energy portfolio. In recognition of this need, the U.S. has initiated nuclear energy research and development programs to address potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) and to ensure that current nuclear power plants can continue to deliver adequate and affordable energy supplies. An enhanced DOE nuclear facility infrastructure is required to support such nuclear energy research and development for civilian applications.

2019-210: The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste treatment, storage, and

Commentor No. 2019: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 2019

disposal facilities for the wastes expected to be generated are identified in Chapter 4 under the Waste Management sections of the NI PEIS. The cumulative impact tables for waste management in Section 4.8 of the NI PEIS have been revised to include the individual site's storage, treatment and disposal capacities for comparison. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS assumes, for the purposes of analysis, that Yucca Mountain, Nevada, would be the final disposal site for DOE's high level radioactive waste and spent nuclear fuel. As directed by the U.S. Congress through the Nuclear Waste Policy Act, as amended, Yucca Mountain is the only candidate site currently being characterized as a potential geologic repository for high-level radioactive waste and spent nuclear fuel. DOE has prepared a separate EIS, "Draft Environmental Impact Statement for a Geologic Repository for the Disposal of Spent Nuclear Fuel and High-Level Radioactive Waste at Yucca Mountain, Nye County, Nevada" (DOE/EIS-0250D, July 1999), which analyzes the environmental impacts from construction, operation and monitoring related transportation, and eventual closure of a potential geological repository.

2019-211: DOE notes the commentor's opinions and concern for funding of the Hanford cleanup. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Commentor No. 2020: Chuck Lennox Seattle Audubon Society

09-20-2000 10:34 AM FHL21 TO 18775624592 P.02

19901 Germantown Road
Germantown, MD 20874

RE: Fast Flux Test Facility

Dear Ms. Brown,

I write on behalf of Seattle Audubon Society and its 5,600 members to express our opposition to the restart of the Fast Flux Test Facility (FFTF) that is proposed in the recent Nuclear Infrastructure Programmatic Environmental Impact Statement (NI-PEIS). Thank you for the opportunity to comment on this important matter.

After reading the NI-PEIS, we were concerned to learn that the U.S. Department of Energy (DOE) appears to be leaning towards Action Alternative 1(AA1), i.e. the "Restart FFTF" alternative over all other alternatives. This choice would pose the highest public health risks according to your NI-PEIS. We base this conclusion on the bar graphs of the NI-PEIS in pages S-48, S-49, S-51 and S-52. The diagrams in S-48 & 49 that summarize "Expected Latent Cancer Fatalities" due to (a) radiological accidents at sites (b) radiological transportation accidents and (c) risks due to incident free transportation, clearly display the high level of risk to public health, involved in proceeding with AA1. From the bar graphs in page S-51 & 52 similar conclusions can be reached regarding collision and emission fatalities from the various transportation parameters.

We urge the DOE to consider Action Alternative 5. Only AA5, that "Permanently deactivates the FFTF with no new missions" seems to provide the safest and cleanest route to travel from a public health standpoint. This decision would help the DOE reorient itself firmly in the direction of its core mission in Hanford, which is one of cleanup of all the nuclear wastes in the site. Moreover, the AA5 would help the DOE recover around \$30 million per annum, which is currently used to keep the FFTF in a "hot standby".

We would like to add further that the primary goals of the DOE: the (1) production of isotopes for medical and industrial uses (2) the production of Plutonium-238 for NASA and (3) other nuclear research for civilian uses are in no way jeopardized in abandoning the "Restart FFTF" alternative.

In April of 2000, the DOE's chosen panel of experts the "Nuclear Energy Research Advisory Committee" or NERAC, recommended that "the FFTF will not be a viable source of research isotopes". These research isotopes can be generated in a cost effective manner in the accelerators of various universities and research institutions. The added benefit would be one of less nuclear waste in the production process. This committee further states that DOE should not be in the business of producing either medical or industrial isotopes (violation of their mandate), that can and are currently

Response to Commentor No. 2020

- 2020-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.
- 2020-2:** No final decisions have been made with regard to the facilities and locations evaluated to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238 for NASA space missions, and civilian nuclear research and development. However, in accordance with Council on Environmental Quality regulations (40 CFR 1502.14(e)), DOE has identified its preferred alternative in Volume 1, Section 2.8 of the Final NI PEIS and included a discussion of DOE's reasons for selecting it. The Record of Decision for the PEIS will be based on a number of factors including environmental impacts, costs, public input, nonproliferation issues schedules, technical assurance, policy, and program objectives.
- 2020-3:** FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Sections 4.2-4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from implementation of the alternatives, including normal operations and a spectrum of accidents that included severe accidents. Although there are minor differences in the risks among alternatives, the environmental analysis showed that radiological and nonradiological risks associated with all of the alternatives would be small.
- 2020-4:** While there are differences in risks among the alternatives and among options within alternatives, risks from incident free transportation and transportation accidents are small for all of the alternatives and options. Figures in Volume 1, Section 2.7.1, show that the risk of an additional fatality as a result of implementing any alternative is low. However, transportation risk is only one factor in DOE's decision. Accordingly, DOE has identified its preferred alternative in Section 2.8 of Volume 1 and included a discussion of DOE's reasons for selecting it. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.
- 2020-5:** See responses to comments 2020-1 and 2020-4.

Commentor No. 2020: Chuck Lennox (Cont'd)
Seattle Audubon Society

09-20-2020 12:34PM FROM 10 18775524592 P. 03

produced by the commercial industry, at great benefit to the US taxpayer. Moreover, the Washington State Medical Association and Physicians for Social Responsibility have stated that medical isotopes are readily available from Canada and other non-DOE sources. How can DOE justify the cost of restarting the FFTF at a cost of over \$423 million, when research isotopes can be produced using accelerators at \$106 million?

The second major reason in proposing "Restart FFTF" in this NI-PEIS is to supply the National Aeronautics and Space Administration (NASA) with Plutonium-238 for power generation in space reactors. Whereas NASA has unequivocally stated on May 22nd of 2000 that, "NASA has no longer an identifiable planned requirement for Small Radioisotope Thermoelectric Generator (STRG) power systems.", the DOE manages to insist to the contrary. Notwithstanding the fact that there is always a significant risk in sending nuclear powered space probes, these stated goals by the DOE make no sense either scientifically or economically.

Seattle Audubon can only conclude that to propose restarting of the FFTF just for civilian nuclear research no longer holds any validity.

Seattle Audubon is also quite concerned about the negative impacts to the environment that would result in the "Restart FFTF" alternative. Hanford, by all independent estimates, has a poor record of confining the nuclear wastes it already possesses. There are credible reports that indicate 68 of the 177 High-Level Nuclear Waste tanks are leaking. These wastes might have already polluted the ground water and may be proceeding towards the Columbia River. The untold damages that could accrue to the recently declared "Hanford Reach National Monument" are staggering. This 195,000 acre shrub-steppe ecosystem is the last free flowing non-tidal stretch of the Columbia river, that is home to the spawning of at least 80% of fall Chinook Salmon. The "Hanford Reach" is one of the keystones to recovery salmonid species in the recently declared Endangered Species Act listing. To add more nuclear waste to the Hanford complex, as the "Restart FFTF" would do, would be clearly counterproductive.

We urge the Department of Energy permanently deactivate the Fast Flux Test Facility. Thank you for your careful consideration of our comments.

Sincerely, 
Chuck Lennox
Conservation Chair
206-523-8243 ext. 13

TOTAL P. 03

Response to Commentor No. 2020

2020-6: The conclusions presented in the "NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000" regarding the suitability of the Fast Flux Test Facility (FFTF) to produce research isotopes in a timely and cost-efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of the FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates use of the FFTF when coupled with the other proposed missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without disturbing the existing missions of these facilities.

DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert committees, the Expert Panel and NERAC. In 1998, an Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years will range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings.

Commentor No. 2020: Chuck Lennox (Cont'd)
Seattle Audubon Society

Response to Commentor No. 2020

Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

The United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. Although other manufacturers produce medical isotopes, DOE remains the key provider for a large number of radioisotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large-enough quantities to make their production financially attractive to private industry. Under the NI PEIS proposed action and consistent with its mandates under the Atomic Energy Act, DOE would enhance its existing nuclear facility infrastructure to, among other things, more effectively support production of radioisotopes for medical applications and research. DOE's intent is to complement commercial sector capabilities to ensure that a reliable supply of isotopes is available in the United States to meet future demands, and encourage the commercial sector to privatize the production of isotopes that have established applications to a level that would support commercial ventures.

Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term (less than 5 years).

2020-7: The commentor is comparing the cost of the low-energy accelerator, a element of Alternative 3, Construct New Accelerator(s), with the FFTF. The low-energy accelerator's only mission is to produce a select set of medical isotopes. The FFTF can produce a diverse set of medical and industrial isotopes, plus meet the requirements of the plutonium-238

Commentor No. 2020: Chuck Lennox (Cont'd)
Seattle Audubon Society

Response to Commentor No. 2020

production mission, and the nuclear energy research and development mission. DOE considers all three missions of equal importance.

2020-8: The May 22, 2000, correspondence from NASA to DOE identifies that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, SRTG development efforts were stopped in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires one-third less plutonium-238 as its fuel source. However, the Stirling technology is developmental, and NASA has requested in a September 22, 2000, letter to DOE that large RTGs be maintained as backup. Section 1.2.2 of Volume 1 was revised to clarify plutonium-238 mission needs.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately only 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Under the No Action Alternative, DOE would continue to purchase plutonium-238 to meet the space mission needs for the 35-year evaluation period considered in the NI PEIS. However, DOE recognizes that any purchase beyond what is currently available to the United States through the existing contract would likely require negotiation of a new contract and may require additional NEPA review.

2020-9: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of

***Commentor No. 2020: Chuck Lennox (Cont'd)
Seattle Audubon Society***

Response to Commentor No. 2020

additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposal) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

2020-10: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Commentor No. 2022: David Leon Johnson

September 16, 2000

Collette Brown
U.S. Department of Energy
19901 Germantown Road
Germantown, MD 20874

Dear Ms. Brown,

Enclosed are my comments on the "Draft Programmatic Environmental Impact Statement for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Missions in the United States, Including the Role of the Fast Flux Test Facility", (Nuclear Infrastructure Programmatic Environmental Impact Statement [NI-PEIS] (DOE/HIS-0310D)

Much has been made about the need for medical radioisotopes as outlined in the scope of the NI-PEIS. While I agree that medical isotopes are a high priority need, there are several serious flaws in the scope of the draft NI-PEIS.

It does not include the requirements for finding a new steady-state neutron source for doing world-class neutron scattering research. Furthermore, it does not include in its scope a facility that could perform such neutron scattering research. Finally, it does not show that a specially designed accelerator based steady-state neutron source facility could satisfy all the research and production needs outlined in the draft NI-PEIS as well as the need for neutron scattering research.

The following background material will explain the deficiencies in the scope of the draft NI-PEIS.

Attachment 1 (Titled Research Reactor of the Future: The Advanced Neutron Source) shows a description of the Advanced Neutron Source (ANS) that was to be built at Oak Ridge National Laboratory (ORNL). Attachment 1 also shows the needs for the facility. This steady-state neutron source facility was designed primarily to bring the U.S. back into world leadership in the field of neutron scattering research as noted in attachment 1. It was also designed to produce radioisotopes for use in medicine and other fields, and also various neutron research activities. It was to be the replacement for the aging High Flux Isotope Reactor (HFIR) at ORNL. The ANS project was funded by congress for about 10 years until about fiscal year 1996. It was terminated largely because its cost had grown to about \$3 Billion.

The requirements for a new steady-state neutron source to do world-class neutron scattering research have not gone away. In fact, they have actually increased! In about December of 1999, the U.S. Department of Energy (USDOE) permanently shut down the High Flux Beam Reactor (HFBR) at Brookhaven National Laboratory for environmental reasons. This reactor was one of the few steady-state neutron sources available in the US for doing world-class neutron scattering research.

Response to Commentor No. 2022

- 2022-1:** DOE notes the commentor's support for the production of medical isotopes and concerns with the scope of the PEIS. The scope of this NI PEIS does not include finding a new steady-state neutron source for conducting neutron scattering research.
- 2022-2:** Neutron scattering research is not a primary area of interest in the proposed nuclear research and development program. The proposed nuclear research and development program is focused in the support of civilian nuclear energy programs.

The NI PEIS evaluated a steady state spallation neutron source, the high energy accelerator as part of Alternative 3, Construct New Accelerators. As stated in Volume 1, Section 2.3.1.5.2, the design of the high-energy accelerator presented in the NI PEIS focused on supporting the plutonium-238 production mission, but the design could be refined and expanded to perform additional missions such as the production of a select set of medical and industrial isotopes. The modified high-energy accelerator and low-energy accelerators could jointly produce a broad spectrum of medical and industrial isotopes.

DOE is aware of longer-term concepts that would apply high-energy accelerators to produce "tunable" neutrons in a subcritical assembly. Such a facility could be used to address some of the missions more familiar to reactor facilities and may hold considerable promise for future science and technology research. A facility of this nature could provide unique capabilities in areas such as the testing of many different nuclear system coolant, fuel, and materials interactions.

Commentor No. 2022: David Leon Johnson (Cont'd)

The USDOE is currently designing a new pulsed neutron source for doing neutron scattering research. It is called the Spallation Neutron Source (SNS) and is to be built at ORNL. However, there is a critical need for **both** a steady-state and a pulsed neutron source for doing neutron scattering research.

Attachment 2 (Titled: A History of the ANS: Going Back to the Source) shows a history of the ANS concept. In this document, there is a description of the need for **both** a steady-state and a pulsed neutron source for doing neutron scattering research. This document is quoted below.

In 1991, the Basic Energy Sciences Advisory Committee (BESAC) of DOE's Office of Energy Research (OER) was asked by OER Director Will Happer to form a panel to revisit the question of whether a reactor or spallation source would make the best neutron source. The panel was headed by Walter Kohn of the University of California at Santa Barbara, who had been a member of the Seitz-Eastman committee.

In June 1992, the Kohn committee issued its report. According to the report, the BESAC panel concluded that "the nation has a critical need for a complementary pair of sources: a new reactor, the Advanced Neutron Source (ANS), which will be the world's leading neutron source, and a pulsed spallation source. . . . The ANS is the Panel's highest priority for rapid construction. In the Panel's view, any plan that does not include a new, full-performance high-flux reactor is unsatisfactory because of a number of essential functions that can best or only be performed by such a reactor."

Again, it is pointed out that the needs for a steady-state neutron source to enable world-class neutron scattering research have not gone away, they have increased.

It is noted here that an accelerator based steady-state neutron source facility could supply all the needs outlined in the scope of the draft NI-PEIS and, in addition, could provide for doing world-class neutron scattering research. A proposal for such a facility was outlined in a document that I co-authored 15 years ago. Attachment 3 (Titled: An Accelerator Based Steady State Neutron Source) is a copy of that proposal. This was to be an accelerator facility that used the spallation principal, just like that employed for the SNS. However, the beam energy was to be much less, hence the capital cost would be less. Furthermore, it was to be steady-state so as to provide a steady-state source of neutrons, just as in a reactor.

Technical details are outlined in attachment 3. One point that should be made is that such a facility would be capable of producing all the same radioisotopes that could be made in the FFTF and in the same or greater quantities. However, they would be made without any of the same nuclear wastes that would be produced by the FFTF. There would be NO production of hard-to-deal-with fission products or transuranic isotopes such as Plutonium. Furthermore, the safety is dramatically improved compared to the FFTF. For example, accelerators do not generally require containment vessels as reactors do. Moreover, there are no criticality issues as in a reactor. When the accelerator beam goes away, the neutrons go away.

2022-2
(Cont'd)

Response to Commentor No. 2022

Commentor No. 2022: David Leon Johnson (Cont'd)

The proposal in attachment 3 was made at the initial conference in 1985 to select what eventually became the ANS. It was rejected, in my opinion, because the people reviewing the proposals had reactor proposals that were in competition for the funding to proceed. In other words, they were biased in favor of getting funds for their own reactor proposals. However, the reactor proposal that eventually emerged became too expensive to build.

Since 1985, when the original accelerator proposal was made, there have been significant advances in accelerator technology. These advances, particularly at Los Alamos National Laboratory (LANL), have demonstrated beyond any doubt the ability to provide the very high steady-state beam currents that are needed for the proposed accelerator source. Furthermore, there have been advances that allow significant reduction in accelerator costs. These reductions are both for construction costs and for operating costs. The cost to build such an accelerator facility should be considerably less than the \$3 Billion required to build the cancelled ANS.

In summary, I propose that the final NI-PEIS be modified to incorporate the following items.

- 1) Include neutron scattering research as proposed for the ANS facility as the primary mission.
- 2) Include analysis of a variant of the accelerator based steady-state neutron source similar to what was proposed in attachment 3 to do all the missions in the current draft NI-PEIS and also world-class neutron scattering research
- 3) Do a better job of providing a design for an accelerator based steady-state neutron source that is cost competitive with restarting the FFTF. The cost estimate of over \$1 Billion for a spallation accelerator for making only the isotope Pu-238 in the draft NI-PEIS seems obviously too high. The spallation accelerator at LANL called the Los Alamos Meson Physics Facility (LAMPF) was built about 30 years ago and has the same beam energy and a beam current similar to what was proposed for the draft NI-PEIS. That design could be used without outrageous cost contingency factors.
- 4) Do not include the \$281 Million cost that was estimated for dismantling the FFTF as part of the cost to build an accelerator facility. The cost for dismantling the FFTF should be tacked onto its cost for restart since it will eventually be shut down and should come out of the same budget.

Sincerely,

**2022-2
(Cont'd)**

2022-3

2022-3: Deactivation of FFTF is not part of implementing Alternative 1, Restart FFTF. Deactivation of FFTF is part of Implementing Alternative 2, 3, 4, and 5 and including the cost of deactivation in the implementation costs for these alternatives is appropriate.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Commentor No. 2023: Lynn Sims

Subject: NO TO PLUTONIUM USED AS FUEL!!!

Dear President Clinton

The use of plutonium in nuclear reactors is an insane program. It is tremendously expensive and risky. Moreover it promotes more handling and transport of plutonium, increases risk of accident and complicates spent fuel "disposition."
Instead, immobilize plutonium and turn towards more sustainable energy sources.

Lynn Sims

Response to Commentor No. 2023

- 2023-1:** The commentor's position on the use of plutonium in nuclear reactors is noted. Human health effects that would result from any of the range of reasonable nuclear infrastructure alternatives analyzed (described in Section 2.5 of Volume 1) are described in Chapter 4. Plutonium is one of the radioisotopes included in the analysis of health and safety impacts. Both radiological and chemical impacts were addressed. (See Appendix H) Plutonium was identified as a primary contributor to the health impacts that would result from processing irradiated neptunium targets at candidate processing facilities. Sections 4.3 through 4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from implementation any of the range of reasonable alternatives (Alternative 1 includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with each analyzed alternative and with restarting FFTF would be small.
- 2023-2:** While there are differences in risks among the alternatives, the risk from transportation accidents is small for all the alternatives. Figures and tables in Section 2.7.1 of Volume 1 summarize transportation risks and provide a comparison of transportation risks among alternatives and among options within alternatives. Transportation risk is only one factor in DOE's decision. Accordingly, DOE has identified its preferred alternative in Section 2.8 of Volume 1. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.
- 2023-3:** The NI PEIS assumes that FFTF would initially be fueled by a mixed oxide (MOX) fuel, essentially the same as that used successfully during the previous ten years of safe operation. While there are differences associated with the use of MOX fuel versus uranium fuel, these differences are not expected to significantly affect the safety of the FFTF. Differences between MOX fuel and uranium fuel are well characterized and can be accommodated through fuel and core design.
- 2023-4:** As stated in section 4.3.1.1.4 of the NI PEIS, "the spent [FFTF] nuclear fuel would be packaged in acceptable containers and shipped to a geologic repository for ultimate disposal." The NI PEIS assumes, for the purposes of analysis, that Yucca Mountain, Nevada, would be the final

Commentor No. 2023: Lynn Sims (Cont'd)

Response to Commentor No. 2023

disposal site for DOE's high-level radioactive waste and spent nuclear fuel. As directed by the U.S. Congress through the Nuclear Waste Policy Act, as amended, Yucca Mountain is designated, and is currently being characterized, as the candidate site for constructing a geologic repository for disposal of high-level radioactive waste and spent nuclear fuel. DOE has prepared a separate EIS, "Draft Environmental Impact Statement for a Geologic Repository for the Disposal of Spent Nuclear Fuel and High-Level Radioactive Waste at Yucca Mountain, Nye County Nevada" (DOE/EIS-0250D, July 1999), which analyzes the environmental impacts from construction, operation and monitoring, related transportation, and eventual closure of a potential geological repository. Based on the categorization of DOE fuel types provided in Appendix A of the EIS, the spent mixed oxide fuel from FFTF is expected to be disposable in its current form and does not need to be immobilized.

2023-5: DOE notes the commentor's interest in alternative energy sources, although issues of research and development of alternative energy sources are beyond the scope of this Nuclear Infrastructure PEIS. The DOE missions to be addressed in this EIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development, can currently only be met using nuclear reactor or accelerator technologies. Immobilization of weapons-grade plutonium is discussed in the Surplus Plutonium Disposition Final Environmental Impact Statement, DOE/EIS-0283, published in November 1999. Plutonium-238 is not used to manufacture nuclear weapons.

Attention: NI PEIS

Dear Ms. Brown:

Thank you for the opportunity to respond to the FFTF DEIS, formally known as "Draft Programmatic Environmental Impact Statement for Accomplishing Expanded Civilian Nuclear Energy Research and development and Isotope Production Missions in the United States, Including the Role of the Fast Flux Test Facility." I am a former nuclear and aerospace engineer and have direct experience working the computer controls of a nuclear power plant, with over 25 years of professional computer systems and network systems experience.

I am submitting testimony that can only bring one to the conclusion that the FFTF facility needs to be decommissioned ASAP. And I support NI PEIS alternative 5, which states "Permanently deactivate FFTF (with no new mission)".

The over all stated mission is misguided in many ways. The production of isotopes for medical purposes can be accomplished in other safer manners, and existing international supplies now and in the future will out strip the needs.

Current manual override controls are not being reviewed. Past problems with these controls caused over 1 million dollars of damage to the FFTF facility. Future abuse of such controls by FFTF staff could cause a catastrophic failure of the facility and a possible meltdown. Such a scenario has not been analyzed or commented upon in this document.

The reality of this issue is that the FFTF facility is designed and planed for use to produce Tritium for the production of Nuclear Warheads. This hidden agenda is spelled out clearly in two documents. U.S. Senator Slade Gorton (R-WA) press release dated January 15, 1997 he states: "I will be working side by side with my Washington state colleagues to see that FFTF becomes an integral part of the nation's tritium mission, ultimately phasing into the production of medical isotopes.". Additionally, in an article written by Bob Ferguson (who was director of the Fast Flux Test Facility from 1973 to 1980) that appeared in the Tri-City Herald (© 1997), he states: "Evaluations by DOE and by the JASON Group, an independent panel of nationally recognized scientists, has determined FFTF can supply most of the tritium needed to meet the presidentially determined national stockpile requirement. ...In this sense, FFTF should be considered as the most flexible way to reliably produce tritium now while efforts to reduce the need for tritium are pursued." This proves that this DEIS is complexly inadequate because it ignores the real processing issues that are going to be secretly pursued. Until this DEIS includes the

2024-1

2024-2

2024-3

2024-4

Response to Commentor No. 2024

- 2024-1:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2024-2:** DOE acknowledges that other manufacturers can produce certain isotopes that are economically attractive. In fact, the United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.
- 2024-3:** Although it is not practical to analyze every conceivable accident scenario a representative spectrum of bounding accidents was evaluated in the NI PEIS. The accident analysis included a review of internal events, external events, natural phenomena, common-cause events, and sabotage and terrorist activities. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected from implementation of Alternative 1. The environmental analysis showed that radiological and nonradiological risks associated with restarting the FFTF would be small.
- 2024-4:** DOE notes the commentor's views. The NI PEIS evaluates a range of reasonable alternatives for expanding DOE's existing nuclear facility infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. However, no component of the proposed action is for the purpose of producing tritium or supporting any defense or weapons-related mission. Tritium for national security needs will be produced in commercial light water reactors (65 FR 26259). Section 1.2

Commentor No. 2024: Andrew Eisman (Cont'd)

NI- PEIS Comment from Andrew Eisman Page 2

9/18/2000

risk analysis of Tritium production and the associated impact to the Worldwide efforts to reduce the Nuclear arms threat, it will remain inadequate and incomplete.

There are issues in the DEIS that are poorly researched. For example, experimental research has a much higher risk of catastrophic failure than standard operation. Such research is included in the scope of this DEIS. With out exact specifics on the scientific methodologies and technologies that will be studied and the exact experiment that will be conducted, it is impossible to calculate the risk factors to the public and working population. It is also impossible to calculate the actual cost benefit analysis.

The future NASA missions may not happen. Any analysis conducted on the need for plutonium-238 is speculative at best and cannot be included in an DEIS. Additionally, the former Soviet Union has dangerous supplies that should be purchased before they are sold on the open market. This could prevent the spread of nuclear materials to those who should not have them. Russia has a large black market that must already be attempting to gain access to these materials.

I have reviewed the DEIS and can go on for hundreds of pages about its' inadequacies. It is unfortunate that the DEIS comment period is so limited. It requires a team of over a hundred people at least 6 months to fully understand the entire scope of this proposal/analysis. As a result, I have limited my analysis to several narrow areas, pointing out the inaccuracies of analysis as examples of this document. There is a lack of mandate and scientific justification for the restart of the FFTF facility.

2024-4
(Cont'd)

2024-5

2024-6

2024-7

2024-8

2024-9

Response to Commentor No. 2024

of Volume 1 was revised to clarify the purpose and need of the proposed action.

2024-5: The NI PEIS accident analysis evaluated a representative spectrum of accidents, including severe accidents which involved damage to the entire FFTF core. In contrast, accidents involving experiments in a research reactor usually result in damage to the experiment itself and relatively limited damage to the reactor. Hence, the accidents reported in the NI PEIS are considered to bound the consequences of typical experiments.

The NI PEIS stated in Section 1.2.3 that “reactor physics and criticality safety data for benchmarking computational codes and analytical methods used in fuel design and performance analysis would also be required.” Such data are readily obtained by the use of well designed, safe experiments that do not involve the risk of an inadvertent criticality and are able to provide useful data for validating computer codes and other computational methods. It is neither necessary nor desirable to “push the safety limits of the material being tested past the limits of safety” in order to obtain this data.

2024-6: DOE agrees with the commentor that the benefits of experimental research are difficult to quantify. The estimated costs of the range of reasonable alternatives are presented in the Cost Report, summarized in Appendix P of the Final NI PEIS. However, the Cost Report is not a cost-benefit analysis. The purpose of this NI PEIS is to describe the nuclear infrastructure missions (Section 1.2 of Volume 1), a range of reasonable alternatives for satisfying the mission requirements (Section 2.5 of Volume 1), and the environmental impacts that would result from implementation of the alternatives. According to 40 CFR Section 1502.23 if a cost-benefit analysis exists, it must be reported and summarized in the NI PEIS.

2024-7: DOE notes the commentor’s opposition to production of plutonium-238 for use in future NASA space exploration missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE’s charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to

Commentor No. 2024: Andrew Eisman (Cont'd)

NI- PEIS Comment from: Andrew Eisman Page 3

9/18/2000

ISSUE 1

In Vol. 1 of the Draft EIS, Page 1-2 States "For analysis purposes, this NI PEIS evaluates impacts from facility construction, modification, startup, and 35 years of operation, followed by decommissioning when applicable."

This statement indicates that eventual decommissioning is required. In the cost analysis of operation, this needs to be calculated in the overall financial equation. Increased costs of decommissioning in the future due to shortage of appropriate waste sites and inflation need to be considered. Additionally, a 35 year life expediency is absurd and has not scientific data to support it with in the body of the EIS. This would, with the already 15 years of life (10 active years which saw several significant accidents (not reported in this report)that effected safety for its' workers and the general population)), far out last any other nuclear power plant and raises serious safety questions. The facilities designed life cycle is much less. Thus, all calculations based on this unrealistic life expectancy are thus inaccurate and misleading.

ISSUE 2

Page 3-7 of the Cost report for Alternatives Presented in the Draft Programmatic Environmental Impact Statement for Accomplishing Expanded Civilian Nuclear Energy Research and development and Isotope Production Missions in the United States, including the Role of the Fast Flux Test Facility. Paragraph 1 states "Current DOE plans, therefore, are to focus initially on the production of medical isotopes that exhibit the most significant medical potential, given an adequate supply, and to look to other promising areas of production when that potential is realized and sustained by supplies from private resources."

This statement has several problems. One would be the lack of specifics on the " other promising areas of production...". What are the risks associated with his on specified research? What are the costs and benefits? Where is the analysis of this information in the DEIS? It sounds like the DOE will be in direct competition with the private sector- I believe this would be counter to the mission of the DOE.

ISSUE 3

Volume 1, Chapter 1 Section 1.2.2 of the *Draft Programmatic Environmental Impact Statement for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the United States*, states "Because it is not in the best interest of the United States to continue relying on foreign sources to provide an assured, uninterrupted supply of plutonium-238 to satisfy future NASA space exploration mission requirements, DOE proposes to re-establish a domestic capability for producing and processing this material. Since the SRS facilities previously used for plutonium-238 production are no longer available, DOE needs to evaluate other DOE irradiation and chemical processing facilities, as well as potential commercial light water reactors (CLWR), for this mission."

2024-10

2024-11

2024-12

Response to Commentor No. 2024

provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

2024-8: As stated in EIS Volume 1, Section 1.2.2, DOE has had a contract with Russia to purchase plutonium-238 since 1992 and is aware of the existence and production capability of plutonium-238 in Russia. However the political and economic climate in Russia creates uncertainties that could affect the reliability of plutonium-238 supply from this source. This is the reason for evaluating alternatives to plutonium-238 purchase from Russia in this EIS. The potential nonproliferation impacts of continued purchases from Russia are discussed in Section 8.2 of the Nuclear Infrastructure Nonproliferation Impact Assessment which was published in September, 2000.

2024-9: The original comment period on the Draft NI PEIS was set at 45 days according to the Council on Environmental Quality's (CEQ) "Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act" (40 CFR 1506.10(c)). As stated in the Notice of Availability (65 FR 46443 et seq.), the public comment period extended from July 28, 2000 to September 18, 2000. In preparing the Final PEIS, DOE has assessed and considered both oral and written comments received on the Draft PEIS during the public comment period and has responded to these comments in the Final PEIS. Volume 3 of the NI PEIS contains public comments received on the NI PEIS and DOE responses to those comments. Moreover, late comments were considered to the extent practicable.

Commentor No. 2024: Andrew Eisman (Cont'd)

NI- PEIS Comment from Andrew Eisman Page 4

9/18/2000

This is subjective speculation not support by any information. I would argue it is in the best interest of the United States to complete purchase down all of the Russian supply of plutonium 238. It would be a safer would if we did! Additionally, there is the assumption that the production would not be interrupted because of the mixed missions of the FFTF facility, nor the high potential for accident (given the DOE's history and the age of the FFTF facility- its' recent past history of operation and the lack of experienced operators.

ISSUE 4

Volume 1, Chapter 1 Section 1.2.4 under the paragraph "Materials Research" of the *Draft Programmatic Environmental Impact Statement for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the United States*. states "The high radiation fields, high temperatures, and corrosive environments in nuclear reactors (terrestrial or space) and other complex nuclear systems (e.g., accelerator transmutation of waste [ATW] systems) can accelerate the degradation of pressure vessels and structural material, component materials, material interfaces, and joints between materials (e.g., welds). Radiation effects in materials can cause a loss of mechanical integrity (fracture toughness and ductility) by embrittlement, dimensional changes (creep and swelling), and fatigue and cracking (irradiation-assisted stress corrosion cracking). Acquiring a fundamental understanding of radiation effects in current and future reactor materials (engineered steel alloys, ceramics, composites, and refractory metals), as well as the experimental validation of analytical models and computational methods, would require material irradiation testing over a range of neutron energies (thermal and fast flux) and doses. Material testing under simulated reactor conditions would be required to ensure the compatibility of advanced materials with the various moderators/coolants of future reactor concepts. In addition, the thermophysical properties and behaviors of liquid metal coolants being considered for advanced reactor (terrestrial or space) and ATW systems would require further irradiation testing. One key area of materials research that is important to plant safety and the license renewal of existing nuclear power plants is the accelerated aging of materials to simulate radiation effects over a plant lifetime."

This statement indicates the pure absurdity of starting up the FFTF. The statement can be summarized as "The DOE wants to start the FFTF so we can find out exactly how dangerous the FFTF is under operation!" This is unscientific! We need more information on exactly what the experiments will be as well as independent scientific peer-review before this have thought out idea is pursued. This section goes on to talk about "criticality safety" data that would be acquired. In order to obtain this data, one needs to push the safety limits of the material being tested past the limits of safety to study its effects. This in it self is a huge risk to the general population. The DOE has already had significant failures in safety and safety reporting over its involvement in the Nuclear research history. This type of experiment safety can not be fully assessed by its very nature. And thus should not be performed at such an aging facility over such a long period of time. The nature of this research will stress all safety measures, equipment, structures of the FFTF facility and is not properly analyzed in the body of the documents.

2024-7

2024-13

2024-14

2024-5

Response to Commentor No. 2024

2024-10: While the Cost Report evaluates the cost of permanently deactivating FFTF as described in the NI PEIS, it does not consider the costs of ultimate decontamination and decommissioning of the facilities evaluated for the proposed actions. There are several reasons for this but, foremost among them, is the fact that decontamination and decommissioning technologies are ever evolving. Due to the great uncertainty associated with what the costs would be in 35 years (the end of the mission campaign) given the state of technological development at that time, it was deemed impractical to estimate decontamination and decommissioning costs with any degree of certainty or contingency.

2024-11: FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. The technical issues that need to be addressed to assure safe operation for an extended lifetime are well understood. The U.S. Nuclear Regulatory Commission has extended the operating license for a commercial power plant an additional 20 years over and above its current 40 year licensing period and is anticipating several more extensions in the near future.

2024-12: The estimated costs of the range of reasonable alternatives presented in the Cost Report, are summarized in Volume 2, Appendix P of the Final NI PEIS. However, the Cost Report is not a cost-benefit analysis. While it is reasonable to believe that the benefits of medical isotopes are substantial, the purpose of this NI PEIS is to describe the nuclear infrastructure missions (Section 1.2 of Volume 1), a range of reasonable alternatives for satisfying the mission requirements (Section 2.5 of Volume 1), and the environmental impacts that would result from implementation of the alternatives. According to 40 CFR Section 1502.23 if a cost-benefit analysis exists, it must be reported and summarized in the NI PEIS.

DOE acknowledges that private commercial vendors could produce a select set of isotopes that are economically attractive. It is not DOE's intent to enter into competition with the commercial sector in the production of isotopes. Rather, DOE's intent is to complement commercial sector capabilities to ensure that a reliable supply of isotopes is available in the United States to meet future demand, and to encourage the commercial sector to privatize the production of isotopes that have established applications to a level that would support commercial ventures.

Commentor No. 2024: Andrew Eisman (Cont'd)

NI- PEIS Comment from Andrew Eisman Page 5

9/18/2000

Issue 5

Chapter 2, Section 2.3.1.1.2 of the *Draft Programmatic Environmental Impact Statement for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the United States*, states, (numbers for modifications supplied by this author to allow reference), "The following is a brief list of the planned modifications if FFTF would be restarted (PNNL 1999).

- 1: Upgrade of plant protection system (scram breakers, power supplies, and signal conditioners)
- 2: Replacement of zero-time-outage motor generator sets with solid-state electronic units
- 3: Upgrades of plant data systems computers
- 4: Upgrade of conductivity metering system on three cooling towers and replacement of electronic sensors and controls
- 5: Installation of two new electrical distribution transformers to replace the polychlorinated biphenyl-filled units that were removed during standby operations
- 6: Establishment of a program to assess and replace elastomer seals during the startup period to take advantage of advancements in seal technology
- 7: Upgrades of the plant simulator (A program to upgrade the existing simulator to reach commercial simulator standards was in progress, but was discontinued when FFTF was placed in standby.)"

These upgrades are not carefully and individually analyzed for their associated impacts to safety. While there planned impacts are positive, huge risks are associated in retrofitting this live facility. Data concerning the online testing of the plant data system computers is not provided. This upgrade will have to be tested in place and thus can lead to catastrophic consequences. Like IFBBF in Idaho Falls, the DOE is relying on third party private contractors that have not been provided with complete information. DOE employees must reply on documentation for final implementation and the complete testing of this package has never and can never be accomplished except on a live reactor- a risk factor not analyzed in this DEIS.

The current state of the elastomer seals is not known. As a result, even maintaining the FFTF facility in its' current standby state is dangerous. A full analysis of impacts of replacements and possible spills of dangerous eradiated materials during the replacement of the elastomer has not been included in this DEIS.

ISSUE 6

In section 2.3.1.1.5 **FFTF Deactivation** it states "This would require placement of FFTF in a radiologically and industrially safe shutdown condition that is suitable for a long-term surveillance and maintenance phase prior to final decontamination and decommissioning. An *Environmental Assessment - Shutdown of the Fast Flux Test Facility, Hanford Site, Richland, Washington*, issued by DOE in 1995, addressed the environmental impacts associated with permanently deactivating FFTF (DOE 1995a)."

2024-15

Response to Commentor No. 2024

2024-13: FFTF is capable of producing the maximum estimated amount of plutonium-238 for NASA (5 kilograms per year), as well as supporting the other nuclear infrastructure mission described in Section 1.2 of Volume 1. The most likely accident that could disable the facility for an extended period would be a design basis primary sodium spill. This accident, evaluated in the NI PEIS, has an estimated probability of occurrence of one in 10,000 years (1×10^{-4}) per year, and is therefore unlikely to impact plutonium-238 production. Smaller sodium spills, while more likely, would not shut down the facility for an extended period.

2024-14: Clean, safe, reliable nuclear power has a role today and in the future for our national energy security. In recognition of this need, nuclear energy research and development programs have been initiated to address potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) and to ensure that current nuclear power plants can continue to deliver adequate and affordable energy supplies. Because it is unlikely that existing facilities could fully and effectively support these nuclear energy research and development initiatives without disturbing their existing missions, DOE is proposing to enhance its nuclear facility infrastructure to also support these activities. Further information on the need for nuclear energy research and development is provided in Section 1.2.3 of Volume 1.

Scientists from around the world participate in DOE research and development programs. All experiments undergo thorough review before acceptance and safety is an integral consideration of all DOE experimental work.

2024-15: As noted in the NI PEIS, these upgrades would have small environmental consequences. They would, individually and collectively, have a beneficial and positive impact on safety and reliability. Since these modifications can be made while the facility is defueled, there would be almost no radiological risk during modification. It is premature to provide data on testing of the plant data systems computers at this time except that they would most certainly be fully tested prior to plant restart. Also, the plant data system computers are not a part of the plant safety systems.

Maintaining the FFTF in its current standby state is not dangerous. Section 4.2.1.2.10 provides the results of the evaluation of potential health

Commentor No. 2024: Andrew Eisman (Cont'd)

NI- PEIS Comment from Andrew Eisman Page 6

9/18/2000

The full benefits of deactivation need to be included in this section. Impacts to reduced nuclear world war, the nuclear arms race and international relations and economic fall out must be analyzed.

This previous environmental assessment needs to be a part of this DEIS. The full life cycle of the FFTF needs to be considered in the DEIS if reactivation is considered. The total cost of restarting and maintenance needs to be included. If after 15 years the proposed changes are being made, what are the regular maintenance over the proposed 30 year operations period? In 15 more years (or less) will we see similar proposed modifications? The complete costs assessment needs to be included for this DEIS to be complete.

Sincerely,

Andrew Eisman
939 SE 17th Ave
Portland OR 97214

2024-16

2024-17

Response to Commentor No. 2024

impacts that are expected from maintaining FFTF in its current standby condition. The environmental analysis showed that radiological and nonradiological risks are negligible. Prior to an FFTF restart, a revised safety analysis report and probabilistic risk assessment would be prepared which would address any changes in plant configuration, operating conditions, and procedures. The revised safety analyses would be subjected to a thorough independent review.

2024-16: Environmental impacts, including social and economic impacts, that would result from deactivation of FFTF are addressed in Section 4.4.1.2 of Volume 1. The nuclear infrastructure missions described in Section 1.2 are unrelated to the national defense, and nuclear weaponry would not be produced under any of the alternatives described in Section 2.5. Activation or deactivation of FFTF would be unrelated to the nuclear arms race. Potential impacts on the nation's nonproliferation policies that would result from activation of FFTF are discussed in Section 2.3.1.1.3 and a separate report prepared by DOE in September 2000 titled "Nuclear Infrastructure Nonproliferation Impact Assessment" (DOE/NE-0119).

2024-17: As specified in 40 CFR 1502.21 of the CEQ regulations for implementing NEPA, DOE has incorporated by reference the Environmental Assessment, Shutdown of FFTF, Hanford Site, Richland, Washington (DOE/EA-0993) to reduce the relative bulk of the NI PEIS, with a summary of the relevant information for the EA provided in Section 4.4.1.2 of Volume 1. While the PEIS evaluates the impact of permanently deactivating FFTF as further detailed in the Environmental Assessment, it does assess the impacts of permanent deactivation and decommissioning including dismantlement and disposal) which would be the subject of subsequent NEPA review.

CEQ (40 CFR 1500 et seq.) and DOE (10 CFR Part 1021) implementation regulations do not require inclusion of cost studies in an environmental impact statement. The basic purpose of the NI PEIS is to describe the alternatives under consideration for implementation (Section 2.5 of Volume 1) and the environmental impacts that would occur if these alternatives were implemented (Chapter 4 of Volume 1). Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. The associated cost report was made available to the public on August 24, 2000. DOE mailed the cost report to approximately 730 interested parties, and the reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in public reading rooms.

Draft PEIS Comment Form

Ms Brown: Please adjust Alternative 5, "Permanently Deactivate FTF, (With No New Missions.)"

1. At best, nothing in this project remotely justifies even the slightest chance of either adding a curies of radioactive waste to the Hanford environment or subtracting a dollar from the Hanford cleanup budget. 2. The supposed need for isotopes was unconvincing the first time that it was proposed as a rationale for FTF restart. The context of the NERAC report and the DOE's own LANL project belie Energy's current assertion of need. 3. The budget analysis is particularly weak. While there may be legitimate debate about which amounts go where, there is no way that restart could possibly not impact a budget which has no allowance for decommissioning. It is beyond belief that the managing organization which has produced so much more in reports, studies and schemes like the current one and so little in tangible results should accomplish the marketing miracle of increasing demand for isotopes to the degree projected. 4. This project will have a totally negative effect on non-proliferation efforts, effectively "nuking" any pretense of U.S. credibility. Conversely, if plutonium were purchased from Russia, we would at least know the disposition of the quantity delivered. 5. The entire

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

7/12/00

Response to Commentor No. 2025

- 2025-1:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FTF.
- 2025-2:** DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1 2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FTF when coupled with the other stated missions. While some

Commentor No. 2025: Anonymous (Cont'd)

Ford, Draft PEIS Comments, Page 2

project seems like a make-work pork barrel for the Tri-Cities, DOE, PNL, and the commercial nuclear industry. U.S. citizens of the Pacific Northwest have no intention of suffering further cleanup delays or additional waste for any such purpose. Thank you.

2025-5

Response to Commentor No. 2025

existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

The Isotope Production Facility (IPF) at Los Alamos National Laboratory produces radioisotopes using the Los Alamos Neutron Science Center's LANSCE) half-mile accelerator that delivers medium-energy protons. Among other isotopes, the IPF's three major products include germanium 68, strontium-82, and sodium-22. As a result of changing DOE missions, the production of radioisotopes at target area "A" of the LANSCE has been rendered inoperable. In order to replace the level of production lost due to this change, DOE is completing a new and more efficient IPF that would allow DOE to continue to produce most of these same isotopes in an effort to meet existing demand. As addressed in Section 2.6.1 of the NI PEIS, IPF at LANSCE was considered but dismissed from further evaluation because, although it can be used in tandem with the Brookhaven Linac Isotope Producer (BLIP) located at the Brookhaven National Laboratory to supply near-term isotope requirements, it is unlikely that these facilities could accomplish reliable, increased isotope production at the level needed to support projected needs.

The use of any of the proposed facilities would not impact the schedule, available funding, or progress of the cleanup missions at any of the candidate sites. Chapter 4 of Volume 1 addresses wastes produced for each alternative, as well as cumulative impacts related to waste production. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

2025-3: While the Cost Report evaluates the cost of permanently deactivating FFTF as described in the NI PEIS, it does not consider the costs of ultimate decontamination and decommissioning of the facilities evaluated for the proposed actions. There are several reasons for this. Foremost

Commentor No. 2025: Anonymous (Cont'd)

Response to Commentor No. 2025

among them is the fact that decontamination and decommissioning technologies are evolving. Due to the uncertainty associated with what the costs would be in 35 years (the end of the mission campaign) given the state of technological development at that time, it was deemed impractical to estimate decontamination and decommissioning costs with any degree of certainty or contingency.

2025-4: DOE developed a separate nuclear infrastructure nonproliferation impacts assessment report which was completed and distributed in September, 2000. This report concluded that, "There are currently no U.S. nonproliferation policies, laws, regulations, or international agreements that preclude the use of any facilities in the manner described in the draft NI PEIS". As stated in EIS Volume 1, Section 1.2.2, DOE has had a contract with Russia to purchase plutonium-238 since 1992 and is aware of the existence and production capability of plutonium-238 in Russia. However, the political and economic climate in Russia creates uncertainties that could affect the reliability of plutonium-238 supply from this source. This is the reason for evaluating alternatives to plutonium-238 purchase from Russia in this EIS. This assessment also evaluated the nonproliferation risks of continued purchase of plutonium-238 from Russia. Since this plutonium contains a minimum of 80 percent plutonium-238, the report concluded that, "...is not considered a nuclear proliferation threat by the international safeguards community." Therefore, purchase of this material from Russia does not reduce the Russian weapons useable plutonium inventory because plutonium-238 is not used in nuclear weapons.

2025-5: DOE notes the commentor's opinions on the purpose and need for the proposed action and concerns regarding the existing cleanup mission at Hanford and new waste generation.

DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

Commentor No. 2025: Anonymous (Cont'd)

Response to Commentor No. 2025

Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposal) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

 Kennewick WA 99337

Gentlemen

The United States needs
 to restart the F.F.T.F. it can
 create necessary isotopes to
 support new cancer treatment
 I understand we are now
 purchasing isotopes from Canada

Ris Yavoh
 Chas Morbeck

2026-1

Response to Commentor No. 2026

2026-1: DOE notes the commentor's support for Alternative 1, Restart FFTF. With respect to medical isotopes, the United States purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, supplies of many research isotopes are not readily available from foreign (or existing domestic) sources, causing a number of medical research programs to be terminated deferred, or seriously delayed. Under the NI PEIS proposed action, DOE would enhance its existing nuclear facility infrastructure to more effectively support production of radioisotopes for medical applications and research.

RE: Draft Nuclear Infrastructure PEIS.

Dear Ms. Brown:

During my oral comments at the Department's Hearing of August 29, 2000 in Portland, Oregon, the Moderator notified me that I had reached the five minute time limit for public comments. I showed the Moderator my written notes and stated that I was at my final paragraph, to which he nodded his head and stated "Okay," but then ordered the sound technician to cut the power to the microphone when I began my final paragraph by describing how to explain something to an incorrigible teenager.

I want to be sure that my comments are fully recorded in the official record, so I'll repeat what the Department's Moderator, who was at that time acting under your personal supervision, did not want the public to hear during the hearing. Just to ensure that there is no "inadvertent" censorship, I'll increase the size of the font so the Department's scanners can easily digest it before the electronic analysis program discards it.

Also, because your attention was lacking during the hearing (you may recall that several speakers had to ask someone to get your attention when they were talking to you), please be sure to do what the sound technician stated you would do: Listen to the tapes of the entire session at Portland to learn what we were trying to say to you when you were supposed to have been listening to us.

Response to Commentor No. 2027

Commentor No. 2027: W. P. Mead (Cont'd)
Public Safety Resources Agency

"We have a clear message for the Department, and we'll state it as we would to an incorrigible teenager:

WE support you financially:

WE pay your bills, and
WE buy you your toys.

YOU acted inappropriately:

YOU lied to us when we asked you to tell us the truth, and

YOU didn't keep your promises when you said that you would clean up Hanford.

You have betrayed our trust.
 And for that,

YOU ARE GROUNDED!

(And you can't go out and play with the reactor until AFTER you have cleaned up your mess!)

2027-1

Response to Commentor No. 2027

2027-1: DOE notes the commentor's opposition to FFTF restart.

Commentor No. 2027: W. P. Mead (Cont'd)
Public Safety Resources Agency

Specific Comments Regarding the Draft PEIS:

1. Failure to include studies by NGOs in the Draft PEIS if they contradicted a "pro" FTFF-restart position:

It should be noted that during the public hearings that were held in Portland in 1999, again under your personal direction, that you allowed representatives of public health and safety NGOs ten minutes to present their testimony. This was changed to five minutes this year.

Although the reason that was cited for this change was to allow everyone to speak, we believe it was because we didn't support the Department's plan to restart the FTFF at the expense of cleaning up Hanford's environmental, health and safety hazards from the past half century of weapons production activities.

I state this because we were restricted in our attempts to enter information into the record at the public hearings where other persons could interact and expand on our information, and also because the documentation that we presented during the previous rounds of hearings was not included in the Draft PEIS.

Studies by pro-nuclear industry organizations who agreed with the Department's alleged "need" to restart FTFF were included, but reports that countered the industry's pro-restart position were not even mentioned. The public should have been allowed to see our information so it could be further studied by independent analysts in time for this round of the process.

A better option would have been to schedule two nights of public hearings in major cities. The Draft PEIS stated that Portland and Hood River, Oregon each had more than 300 persons attend last year's hearings - more than at any other location, including the Tri-Cities and Seattle, Washington - but you did not allow sufficient time for the public to be heard. Better planning could have provided that opportunity and increase the public's respect for the integrity of the process.

2. Flawed Methodology - Citing supporting documents that were previously acknowledged to be inaccurate:

FTFF's adjunct facilities were listed in the Draft PEIS as if they were virtually ready to be used in a supporting role if the FTFF was restarted. This assumption was based on a 1988 inspection report that, in a 1989 review, was found to be defective; yet the Department's Draft PEIS indicates that its decision would be based on the (flawed) 1988 report. 

2027-2

2027-3

Response to Commentor No. 2027

2027-2: DOE policy encourages effective public participation in its decision making process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

The public hearing format was designed to be fair and unbiased. The public hearing format used was based on stakeholder input and was presented in the Notice of Availability (65 FR 46443 et seq.) for the Draft NI PEIS. This format was intended to encourage public participation, regardless of the motivation for attending the hearing. It provided an opportunity for the participants to meet one another, exchange information, and share concerns with DOE personnel available throughout the course of each hearing to answer questions. The meetings were facilitated by an independent moderator to ensure that all persons wishing to speak had an opportunity to do so. Persons wishing to comment were selected at random from the audiences rather than according to the order in which they registered. This was accomplished by a random number drawing. In addition to the comment recorder stationed at the main hearing, a second recorder was available in an adjacent room to receive comments without the need to await selection at the main proceeding. The hearing format used promoted open and equal representation by all individuals and groups.

2027-3: One of the adjunct facilities for FTFF under Alternative 1, Restart FTFF, is the Fuel and Materials Examination Facility, FMEF, which was built during the late 1970s and early 1980s for the breeder reactor technology development program on the Hanford Site. Although FMEF has never been used, it has been maintained in a condition suitable for a future mission. Use of FMEF would require the construction of a new 76-meter (250-foot) emissions stack (See Section 4.3.3). The earliest that FMEF would be used under any of the alternatives described in this PEIS is FY 2005. This is adequate time for any modifications or upgrades to the facility to be made to ensure that it can be operated in a safe and environmentally sound manner.

Commentor No. 2027: W. P. Mead (Cont'd)
Public Safety Resources Agency

This entire area of the Draft PEIS should be reviewed and any decision about restarting FFTF in any role should be re-analyzed only after a new inspection audit of the adjunct facilities has been completed and reviewed by the public, including a new round of hearings, as was done for the possibility of restarting FFTF when the Department used the flawed 1988 inspection report to support that alternative.

3. Financial Analysis - Inaccurate assumptions and misleading FFTF decommissioning costs in non-FFTF alternatives:

The entire aspect of the Department's timing and presentation of its Financial Analysis is suspect. The Draft PEIS was released without any responsible cost analysis for the Alternatives, however the public was expected to make a responsible decision.

No one of sound mind would agree to a major expenditure without knowing the ultimate cost of the purchase, but apparently the Department now has a new definition of a "non-disclosure agreement" with the public. The public and NGOs should have been able to analyze the relative costs of the Alternatives as a part of the original document.

Releasing the cost analysis as an "after market" add-on (I received it after I had completed my testimony at the hearing in Portland, Oregon) can only lead to increased confusion among the participants. If the financial information was not available at the time the Draft PEIS was to be printed, then the document should have been postponed until the entire record had been assembled in a single package.

FFTF's decommissioning costs should be restricted to only those alternatives that postulate restarting FFTF (Alternative 1) or decommissioning FFTF (Alternative 5). FFTF's decommissioning costs should not be included in the financial impact statements of the other proposed alternatives.

These are entirely separate issues and should be treated as such. Instead, the Department under-estimated the actual cost of FFTF's restart in Alternative 1, while completely ignoring any costs for decommissioning FFTF after it completed its role.

This provided a false impression that Alternative 1 would be financially attractive. This variation of the "bait-and-switch" scheme was compounded by including FFTF's decommissioning costs in the other Alternatives. One may logically question why any of those Alternatives, which should be analyzed independently, were blessed with FFTF's decommissioning costs, when Alternative 1 completely ignored that input.

2027-3
(Cont'd)

2027-4

2027-5

Response to Commentor No. 2027

2027-4: NEPA does not require the cost of alternatives to be included in an EIS, although cost will be a factor in the decision-making process. A separate Cost Report was prepared to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. The Cost Report was mailed to interested parties on August 24, 2000 and made available on the NE website (<http://www.nuclear.gov>) and in the public reading rooms. For information purposes, about 730 people were mailed the Cost Report. DOE has provided a summary of the Cost Report in Appendix P in this Final NI PEIS.

To provide interested parties with additional time to comment on the Draft NI PEIS, the deadline for transmittal of comments was extended from September 11, 2000, to September 18, 2000 (65 FR 46444). As stated in the Notice of Availability (65 FR 46443 et seq.), DOE considered comments submitted after the close of the comment period to the extent practicable.

2027-5: Decommissioning FFTF, including associated costs and cleanup, is not within the scope of the NI PEIS. Before decommission activities were undertaken, DOE would prepare the appropriate environmental documentation to address the associated environmental impacts. Cost assessments would also be prepared.

DOE remains committed to cleaning up the Hanford Site independent of ultimate decision on FFTF. The amounts of wastes associated with decommissioning FFTF would be small. The schedule for cleaning up these other wastes would not be affected if FFTF were restarted.

Commentor No. 2027: W. P. Mead (Cont'd)
Public Safety Resources Agency

The logical questions arise: Is the Department's analysis so incompetent that it forgot that Alternative 1 will eventually require FFTF to be decommissioned, or are we to believe that they wrote the analysis with the assumption that the only way slant the analysis was to add FFTF's decommissioning costs to the base price of the other Alternatives in order to adversely influence the selection process against those alternatives, and in favor of restarting FFTF, per Alternative 1.

The cost analysis for the construction and operation of new accelerators to produce isotopes if FFTF is not selected for that mission should stand on their own merits. FFTF's decommissioning costs should not be included in those alternatives, but should instead be limited to Alternatives 1 and 5.

FFTF's decommissioning costs were not fully addressed in the cost analysis for restarting FFTF (Alternative 1). FFTF will require decommissioning costs regardless of when it completes its role within the nuclear infrastructure.

At best, the sooner that we decommission FFTF, the less it will cost. If Alternative 1 is selected, we can be assured that the decommissioning costs will increase exponentially by the time that its postulated mission is completed after another 35 years of service.

In 1998 I examined several "decommissioned" reactor sites that were much smaller and had produced much less contamination than FFTF has to date. In each of those cases, the utility that owned and operated the reactor had experienced much-higher costs than had been projected for decommissioning the reactor, with several subsequent expenditures for environmental remediation years after the facilities had closed. Those expenditures then had to be paid for from the utilities operating budgets for other projects.

In FFTF's case, based on the Department's historic emphasis on "production" missions, and its inability to even comply with its current binding cleanup and environmental remediation agreements, we would be highly skeptical of any assurances the Department gives in this matter. I am sure that others will include this discussion in their comments.

4. Failure to adequately advise the public on the environmental benefits of using accelerators instead of reactors to produce isotopes:

DOE's push to use a liquid-sodium-cooled reactor in an urban area is unconscionable. FFTF's predecessors have shown that such reactors can experience nuclear excursions even under the most rigid monitoring conditions and with safety standards in place. 

2027-5
(Cont'd)

2027-6

Response to Commentor No. 2027

2027-6: FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small. Prior to an FFTF restart, a revised safety analysis report and a probabilistic risk assessment would be prepared which would address any changes in plant configuration, operating conditions, and procedures. The revised safety analyses would be subjected to a thorough independent review process.

Commentor No. 2027: W. P. Mead (Cont'd)
Public Safety Resources Agency

In my testimony of February 12, 1998, at Hood River, Oregon, I cited a history of nuclear accidents in FFTF's predecessor reactors. The cited accidents were nuclear in origin, and in several cases destroyed the reactor's core and resulted in the permanent closure of those reactors.

I also cited scientific studies that stated that beyond the issue of a nuclear excursion within the reactor's core, that an even greater possibility existed for an explosion of a much greater magnitude if the liquid sodium came in contact with air or water: EBR-2's design was postulated for a maximum release equivalent to 300 pounds of TNT for the nuclear excursion; but the same design postulated that the chemical reaction of a sodium-air explosion could reach an explosive force equal to 10,000 pounds of TNT!

FFTF was built in the 1970s and has many of the design flaws of its predecessors. The litany of sodium-cooled reactors that have been catastrophically destroyed in the United States is legend: EBR-1 had an accidental core meltdown; EBR-2 was shut down in mid-cycle because it became unstable and the remainder of its tests could not be safely conducted.

In addition to EBR-1 and EBR-2, the SRE liquid-sodium-cooled reactor and the Fermi-1 reactor both experienced catastrophic core destruction that caused both facilities to be permanently shut down.

Fermi-1 was less than half the size of FFTF, yet its accident threatened the public to such an extent that for nearly an entire month the Atomic Energy Commission seriously considered evacuating 1.5 million persons who lived near it. FFTF is much larger than Fermi-1 and much closer to a major metropolitan area that could not be evacuated in time to protect a significant portion of that public.

Sodium-cooled reactors are inherently unstable and are much more prone to accidents than LWRs of the Three Mile Island and Trojan variety. The liquid sodium is highly corrosive and these reactors experience a much greater neutron flux, operate at very high temperatures, and experience embrittlement even beyond what is commonly found in commercial LWRs of similar age.

Experience has shown that this type of reactor is an accident just waiting to happen. FFTF is a fast-neutron **experimental** breeder reactor that should be retired now instead of trying to retrofit it to run another 35 years of production missions that it was not designed for. FFTF cannot safely produce the quantities of nuclear products that the Draft PEIS postulates during the course of its dangerously-extended lifetime.

Response to Commentor No. 2027

Commentor No. 2027: W. P. Mead (Cont'd)
Public Safety Resources Agency

Under Alternative 1, this threat to our safety would continue for another 35 years, after which the Department still has not included any specific plans or funding for decommissioning FFTF. This constitutes an irresponsible abuse of public trust, and is especially blatant in view that the Department has never honored its many promises to clean up the Hanford Reservation.

Alternative 3 would be a much better option to achieve similar production goals with a greatly reduced amount of waste while at the same time providing additional safety to the public.

5. Additional Production Capacity:

The Department has not satisfactorily demonstrated an actual need for additional isotopes for medical, industrial or use in space missions. NASA has recently changed its position on the need for additional Pu-238. This came after a review of the basis for the Department's announcement that NASA even needed to increase its supply of Pu-238. In fact, NASA didn't even know it was listed as a "needy agency" until after that information had been published in the Congressional Record.

Likewise, the Department's figures for the "need" for future medical isotopes are highly suspect. We have already proven that much of the perceived "need" can be obtained from domestic and foreign commercial vendors who can meet current and the projected future needs.

If a real need can be demonstrated for additional production capacity, then the Department should strongly consider building accelerators instead of relying on reactors.

Conclusion:

1. Decommission FFTF:

PSRA recommends that the Department select Alternative 5 with respect to FFTF's future role in the Nuclear Infrastructure. FFTF has exceeded its safety margin and we should decommission it now; before we experience a catastrophic accident with its incumbent harm to the public and the environment, and increased costs to mitigate the accident's damages.

The public cannot afford to rely on the Department's assurances with respect to health and safety issues. The Department has a thoroughly-documented history of placing a higher priority for "production" missions at the expense of operational safety.

Response to Commentor No. 2027

2027-7: DOE notes the commentor's support for Alternative 3, Construct New Accelerator(s) which includes permanent deactivation of FFTF, instead of relying on reactors.

2027-8: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual rate of growth of medical isotope use is consistent with the Expert Panel findings. Section 1.2.1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other missions. While some existing

Commentor No. 2027: W. P. Mead (Cont'd)
Public Safety Resources Agency

This is an institutional mindset, as underscored by the recently-disclosed incidents of repeated violations of safety procedures, and the subsequent attempts to cover-up those violations at the Hanford Reservation.

The Department and its predecessor agencies have *for decades* tried to convince the public that Hanford is a safe place to work, that Hanford is a valuable asset to our region, and that its employees were one of the nation's healthiest workforces.

During the past sixteen years PSRA, other NGOs and non-DOE public agencies have challenged the Department's assumptions, but have been repeatedly told that we should rely on the Department's own analysis of its history, and that *our* extrapolation of those results was flawed. When pressed for answers to specific questions, the Department often responded that the specific information we needed was classified, but that if we had been able to review that information, that we would have reached the same conclusions as the Department.

We now know that the Department has concealed an entire body of information regarding the health and safety of its workforce. PSRA finds it ironic that many of the Department's employees, who for decades were saying that Hanford was a healthy and safe place to work, are now filing claims subsequent to the Department's admission that working in their production areas have adversely impacted the health of their workforce: The very people who were publicly saying that public health professionals were wrong, are now lining up for financial compensation now that the government has offered to pay for damages.

To date, this "retroactive cognition" has only impacted a few thousand persons (not counting the financial impact on the taxpayers who are expected to pay for the damages now that the Department has decided to admit that for several decades it could not accurately quantify its own data), but that could rapidly change if FFTF were restarted.

A decision to restart FFTF would be another example of the Department making a series of other erroneous assumptions, but with a much greater potential for widespread danger to the general public, instead of being limited to a relatively small segment of the regional workforce.

We cannot justify passively agreeing with the position that "The Department knows best..." The Department's production operations have been so mis-managed that if they were forced to run under the regulatory authority of the NRC, most DOE facilities would have been closed and others probably might not even have been allowed to be built or operated after their first inspection. 

2027-10
(Cont'd)

2027-11

2027-10

Response to Commentor No. 2027

reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

DOE has taken the Expert Panel and NERAC report recommendations under consideration in developing the range of alternatives evaluated in the NI PEIS. These reports were made available to the public at the NI PEIS public information centers and on the Internet at www.nuclear.gov.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Under the No Action Alternative, DOE would continue to purchase plutonium-238 to meet the space mission needs for the 35-year evaluation period considered in the NI PEIS. However, DOE recognizes that any purchase beyond what is currently available to the United States through the existing contract would likely require negotiation of a new contract and may require additional NEPA review.

The May 22, 2000, correspondence from NASA to DOE identifies that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, SRTG development efforts were stopped in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires one-third less plutonium-238 as its fuel source. However, the Stirling technology is

Commentor No. 2027: W. P. Mead (Cont'd)
Public Safety Resources Agency

The Department as an agency is in a chronic state of denial when it comes to the dangers of its operations. At Hanford, its history is one of a "cowboy mentality" about production methods when what is really needed is a more measured, analytical approach when dealing with the scientific principles that govern technical achievements: Working with nuclear processes that have a narrow safety margin of error require more of the type of approach taken by neurosurgeons, instead of playing the part of a rodeo clown.

For years the people of the Northwestern United States have heard Hanford's managers tell us how well they were doing in their efforts to clean up Hanford's environmental wastelands, yet we know that the Environmental Protection Agency has identified more than 1,000 potential "Superfund" chemical and/or radiologic sites within Hanford's boundaries, and that each of those sites will cost approximately \$100,000.00 just to characterize. Beyond that, the final remediation cost may reach \$100,000,000,000.00 and take another hundred years to complete, even though some areas of the Hanford Reservation will be closed for eternity.

We can't afford to grant the Department another chance to fail. In the event of a serious accident at FFTF or any of its adjunct facilities, a significant population of the region could be at risk. Data already exists that extrapolates an ever-increasing probability of such an accident happening at the FFTF if the Department restarts it for a 35-year production run.

If the Department is wrong in their safety assumptions, as we believe to be the case, it will be too late for the surrounding population: FFTF is too close to Richland and the surrounding Tri-Cities population centers to evacuate, given that the Department routinely needs several hours just to determine and understand that an accident really has occurred, that there were emergency procedures to be followed and notifications that it should have made.

Once the Department realizes that it has a response role, it then activates its resources to isolate workers from the public and assume a positive "spin-control" of the incident.

[Facetious Note in response to Ms. Brown's acknowledged facetious comment to Gerald Pollet at the Portland, Oregon Hearing: "Yes, that's true. But, on a positive note, those workers will never need to buy another flashlight or batteries during their lifetime."]

We don't need spin control: We need the Department to show more responsibility for its actions. 

2027-12

2027-6

2027-10

Response to Commentor No. 2027

developmental and NASA has requested in a September 22, 2000, letter to DOE that large RTGs be maintained as backup. Section 1.2.2 of Volume 1 was revised to clarify plutonium-238 mission needs.

The major mission of FFTF would not be the production of plutonium-238. Rather, all three missions are of equal importance; no one mission is given priority in the NI PEIS.

2027-9: DOE notes the commentor's support for Alternative 5.

2027-10: DOE notes the commentor's viewpoint. The FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

DOE disagrees with the commentor's assertion of quoted statement made by Colette Brown to Gerald Pollet at the Portland hearing. The Portland hearing transcripts as well as the Portland scoping meeting transcripts were searched and there is no record of such a statement.

2027-11: The commentor's position regarding the restart of FFTF is noted. This NI PEIS provides estimates of the incremental potential human health impacts associated with a range of reasonable alternatives (Alternative 1 includes the restart of FFTF) evaluated for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology provides results based upon our current knowledge of the health impact of low doses of ionizing radiation and hazardous chemicals. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of each of the analyzed alternatives, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with each of the alternatives and with restarting FFTF would be small.

2027-12: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing

Commentor No. 2027: W. P. Mead (Cont'd)
Public Safety Resources Agency

Accidents such as the 1976 Am-241 column explosion at the 242-Z Building that dosed Harold MacClusky; the case of the Z-9 Waste Crib that approached criticality similar to the Soviet Union's criticality explosion of the late-1950s; and the dismaying series of errors of the 1990s all show that the Department has not been able to safely manage projects where known control procedures were in place, but were not followed.

If the Department is wrong in its assessment of FFTF's safety, it will do no good for it to admit that mistake after hundreds or thousands of persons have been exposed, and more land has been contaminated.

We have no faith in the accuracy of the Department's projections because they were created by the Department's analysts who, by the very nature of their positions, have a conflict of interest in that they want FFTF to resume a production mission.

We have seen several recent examples of the fallacy of forcing a potentially-dangerous technical/scientific project to conform to an arbitrary political time-line: NASA's Challenger explosion and its two recent Mars missions are merely the latest well-known examples. The Department has put the FFTF restart on a similar fast-track, but this time the effects of the potential accident would be directly targeted on the Northwest's population.

The appropriate time for "damage control" is right now: The Department should permanently decommission FFTF and end the very real jeopardy to the region's health and safety. Admitting that the Department's analysis was wrong after an accident will do absolutely no good for victims; the appropriate time for action is now, and Alternative 5 is the only responsible course of action that the Department can justifiable pursue.

Instead of bragging about how well the Department will do in a project 35 years from now, we would rather that it demonstrate its ability to follow safety procedures that currently exist, and demonstrate that it has the technical ability and institutional commitment to comply with the remediation schedules that are already in place, and to which it has already agreed.

2. Review the actual "need" for new production capacity:

Accelerators offer several safety and environmental advantages over reactors. If additional isotope production capacity is truly needed, then PSRA recommends that the Department pursue Alternative 3 to the exclusion of restarting FFTF or building new research reactor(s).

2027-10
(Cont'd)

2027-7

Response to Commentor No. 2027

Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

2027-13: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual rate of growth of medical isotope use is consistent with the Expert Panel findings. Section 1.2.1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the

Commentor No. 2027: W. P. Mead (Cont'd)
Public Safety Resources Agency

At the present time, PSRA cannot verify that an actual "need" for additional production capacity truly exists. We have several other domestic and foreign sources for the identified isotopes that can supply the cited quantities at a lower cost than the Department could achieve by either restarting FFTF or even by building two new accelerators per Alternative 3.

As with our comments regarding FFTF, we question the methodology of how the Department reached its conclusions that additional capacity was needed for the production of those isotopes. The studies appear to be flawed - or at the minimum, compromised - because they were produced by many of the organizations that have a vested financial interest in "creating" such a need.

Due to the Department's failure to include responsible studies that contradict its pre-determined position that additional production capacity is needed, the stated conclusion was a given. In reality, however, the Department's refusal to include data by recognized independent NGOs - including public health agencies - casts serious doubt on the validity of its assumptions about future needs in this area.

In this example, the Department should understand that just because it failed to include opposing data in its Draft PEIS does not mean that that body of knowledge will remain hidden. PSRA recommends that the Department revisit this question by reviewing the data that was submitted to it by NGOs that were not under contract to DOE, and then re-evaluate its analysis after including the full body of evidence.

3. Flawed methodology and administrative procedures have invalidated this version of the Draft PEIS:

The Public Hearing on the Draft PEIS was held on Tuesday, August 29, 2000; about ten months after the Department's last hearing in our area. We expected our comments to be included in the Draft, but the more than 700 unique comments that the Department received were dismissed in only four sentences.

The public did not receive the same treatment as was granted to the pro-FFTF restart community, which was allowed to include comments that had previously been proven to be false with respect to medical isotopes. Instead, the Department gave greater weight to information that was known to be false because that data was given in favor of restarting FFTF. ~~to~~

2027-13

2027-14

Response to Commentor No. 2027

suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

DOE has taken the Expert Panel and NERAC report recommendations under consideration in developing the range of alternatives evaluated in the NI PEIS. These reports were made available to the public at the NI PEIS public information centers and on the Internet at www.nuclear.gov.

2027-14: DOE notes the commentor's views and concerns regarding response to public scoping comments and the preparation of the NI PEIS. It is DOE policy to encourage public input on matters of regional, national and international importance as part of its commitment to facilitate a public participation process that is open and unbiased. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

While all comments received during the scoping periods for both the Plutonium-238 Production EIS and the NI PEIS are part of the

Commentor No. 2027: W. P. Mead (Cont'd)
Public Safety Resources Agency

The Department had nearly an entire year to produce this Draft PEIS and could have delayed even more if they needed more time to produce a completed document that included the information that the public needed in order to reach an intelligent decision.

Instead, they produced an incompetent collection of selected data to support their intent to restart FFTF, and guaranteed that the public could not responsibly analyze it because the Department failed to include two important components of the Draft: The cost analysis for the different Alternatives, and the analysis of the Nonproliferation Impact Assessment.

The *Cost Report for Alternatives* was transmitted with a cover letter dated August 24, 2000, but was not mailed to PSRA until August 29, 2000; the date of the hearing in Portland, Oregon.

The *Nuclear Infrastructure Nonproliferation Impact Assessment* was transmitted with a cover letter dated August 30, 2000, but was not mailed to PSRA until September 8, 2000. This meant that the Department did not release that information until after the date of the hearing in Portland, Oregon, and then with-held mailing the Assessment for another nine days.

Given that the Department apparently can't even manage a timeline that it established internally, and then can't even mail its own documents within a week of their release, we do not believe that it has satisfactorily demonstrated its ability to safely operate the FFTF reactor (which is much more technically complex than the DOE's postage meter machine).

We find it interesting to note that the Department has set an arbitrary time limit of when it will stop accepting response comments from the public, but that it failed to provide the data needed by the public to prepare those comments in a timely manner. A much better solution would have been to delay the distribution of the Draft until all data, including the Cost Report and the Impact Assessment and pertinent comments from non-FFTF restart contributors, had been compiled and then submit it as a single document with several included appendices.

The logical progression here would be to expect that the Department will next discard all public comments because they did not consider the Cost Report and/or Impact Assessment: A challenge by the Department on those grounds would be virtually unassailable because of the Department's own actions of delaying the needed information instead of including it in the report as a single package 

2027-14
(Cont'd)

Response to Commentor No. 2027

Administrative Record for the NI PEIS, Section 1.4 of Volume 1 and Appendix N are intended to provide a summary of the issues and associated trends identified during the scoping process rather than a tabulation of comments by specific issue. It should be noted, however, that NEPA and CEQ regulations do not require an agency to include and respond to each scoping comment as is required for public comments on a Draft EIS. In preparing the NI PEIS, DOE carefully considered scoping comments received from the public. Any perceived discrepancy in the grouping of comments raising any one particular issue or set of issues is attributable to the manner in which they were originally categorized and counted. For example, a number of statements, letters, or resolutions signed by multiple persons, such as city council resolutions mentioned by the commentor, were received by DOE (both for and against FFTF restart) in response to the request for scoping comments. Each such comment document was considered and counted as a single comment in the NI PEIS comment tracking system. The Office of Nuclear Energy, Science and Technology works closely with the Office of the Secretary to keep him informed of the progress on the NI PEIS, including stakeholder input.

This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS. Further, DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives. DOE made every effort to obtain, analyze, and disclose all required information to make a decision on expanding nuclear infrastructure.

CEQ (40 CFR 1500 et seq.) and DOE (10 CFR Part 1021) implementation regulations do not require inclusion of cost and nonproliferation studies in an environmental impact statement. The basic purpose of the NI PEIS is to describe the alternatives under consideration for implementation (Section 2.5 of Volume 1) and the environmental impacts that would occur if these alternatives were implemented (Chapter 4 of Volume 1). Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. The

Commentor No. 2027: W. P. Mead (Cont'd)
Public Safety Resources Agency

In short, PSRA believes that the current version of the Draft PEIS is fatally flawed in both its accuracy and methodology, and we request that the process be reviewed and - if necessary - that a new round of public hearing be held to consider the new data.

W. P. Mead
Director, PSRA
Portland, Oregon

2027-14

Response to Commentor No. 2027

associated cost report and nonproliferation report were made available to the public on August 24, 2000 and September 8, 2000, respectively. DOE mailed these documents to approximately 730 interested parties, and these reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in public reading rooms.

The public comment period for the NI PEIS was not arbitrarily set as stated by the commentor. The Council on Environmental Quality's (CEQ) "Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act" (40 CFR 1506.10(c)) require that a minimum of 45 days be allowed for public comment on the Draft NI PEIS. As stated in the Notice of Availability (65 FR 46443 et seq.), the public comment period began on July 28, 2000 and continued to September 18, 2000. In preparing the Final PEIS, DOE has assessed and considered both oral and written comments received on the Draft PEIS during the public comment period and has responded to these comments in the Final PEIS. Volume 3 of the NI PEIS contains public comments received on the NI PEIS and DOE responses to those comments. Moreover, late comments were considered to the extent practicable.

USDOE Draft PEIS Hearing
 (Verbal Comments Specific To FFTF-related Concerns.)

I'll submit our specific comments by mail as I normally do, but for the purposes of this hearing, I really have to congratulate the Department of Energy on the quality of their work in crafting a document to justify the continued existence of the FFTF Reactor, a reactor that has been in search of a mission for the past decade.

The quantity of maps, tables, diagrams and appendices in the Draft PEIS are all skewed in favor of supporting the Department's pre-determined decision to restart the FFTF regardless of that reactor's actual need within the Nuclear Infrastructure.

In fact, this Draft PEIS included so many exhibits that I fully expected to see the "26 8x10 color glossy photographs with circles, arrows, diagrams, and a paragraph on the back" that Arlo Guthrie told us about in Alice's Restaurant.

However, one thing that I failed to see was any competent discussion or citation of the thousands of specific comments that were made by citizens like us at these hearings, or even by tax-exempt professional public health and safety organizations in their written comments to the Department of Energy.

What I did see were citations of studies by nuclear industry organizations that favored FFTF's restart because they had a financial incentive to divert funding from Hanford's cleanup operations, to return to another 35 years of nuclear waste production and its' associated risks to our populations.

The package of documents I reviewed totaled 1,214 pages, weighed 6 pounds, and cost \$10.00 to ship to me via USPS Priority Mail. Hundreds of other persons, libraries, businesses and public service organizations received these, but no one was able to review any of the thousands of comments that had been made by individuals or organizations who opposed the FFTF's restart.

The Department cited "favorable" comments made by pro-nuclear groups in exhaustive detail, but dismissed our concerns even though the Department's own Draft PEIS identified Portland and Hood River as having the two highest levels of attendance of the

Response to Commentor No. 2027

2027-15: While all comments received during the scoping periods for both the Plutonium-238 Production EIS and the NI PEIS are part of the Administrative Record for the NI PEIS, Section 1.4 of Volume 1 and Appendix N are intended to provide a summary of the issues and associated trends identified during the scoping process rather than a tabulation of comments by specific issue. It should be noted, however, that NEPA and CEQ regulations do not require an agency to include and respond to each scoping comment as is required for public comments on a Draft EIS. In preparing the NI PEIS, DOE carefully considered scoping comments received from the public. Any perceived discrepancy in the grouping of comments raising any one particular issue or set of issues is attributable to the manner in which they were originally categorized and counted. For example, a number of statements, letters, or resolutions signed by multiple persons, such as city council resolutions mentioned by the commentor, were received by DOE (both for and against FFTF restart) in response to the request for scoping comments. Each such comment document was considered and counted as a single comment in the NI PEIS comment tracking system. The Office of Nuclear Energy, Science and Technology works closely with the Office of the Secretary to keep him informed of the progress on the NI PEIS, including stakeholder input.

The public hearing format was designed to be fair and unbiased. The public hearing format used was based on stakeholder input and was presented in the Notice of Availability (65 FR 46443 et seq.) for the Draft NI PEIS. This format was intended to encourage public participation, regardless of the motivation for attending the hearing. It provided an opportunity for the participants to meet one another, exchange information, and share concerns with DOE personnel available throughout the course of each hearing to answer questions. The meetings were

Commentor No. 2027: W. P. Mead (Cont'd)
Public Safety Resources Agency

ten Scoping Meetings that were held in the United States in 1998 and 1999 [Vol-2; Table N-1]. The Department acknowledged receiving "more than 700 unique comments" but dismissed them in four sentences of the Draft PEIS.

At other DOE public hearings I've often heard speakers say that the citizens of Portland must understand that nuclear production issues are really a matter of national security, and that we must take the long view of what's good for the country, instead of simply concentrating on what's good for our region. I noticed that many of those speakers were "Three Hour Immigrants" who had been bussed into Portland from the Tri-Cities to pack our hearing and then return to their jobs at Hanford: I saw them get off the bus, they wore their union hats and jackets while they testified, and I watched them get back onto the bus to return to Richland.

Why not take another, untarnished, view of true National Security instead of buying into the company line? True "National Security" is the ability to provide a safe and healthy environment in which to live. We have a horrendous health and safety problem at Hanford. Let's clean that up and then bring the rest of the Department's sites and the rest of the United States up to the standard of living that we have a right to expect in the Northwest.

We all know that the Columbia River flows through Hanford. That's the water that we drink. We use it to irrigate our crops, prepare our food, and wash our clothes and dishes. It's a National Treasure that we can't afford to contaminate, yet we have in the name of "National Security."

The people of Valemount, British Columbia at the northern reach of the Columbia near Jasper National Park could not imagine what we've done to their river. Nor could the people of Canal Flats, 180 miles to the south where the river actually begins after it makes it's U-turn around the Selkirk Mountains to its headwaters in a beautiful area of the Canadian Rockies.

What they could believe, though, is that once again an industry with a vested financial interest has bought the support of a government at the expense of the region's residents.

In the 1880s the people of Montana and Southern British Columbia dug a canal that was less than a mile long to join the Columbia and the Kootenai Rivers. The Canadian Pacific Railroad, a private corporation that had a government-issued transportation monopoly at that time, had the Canadian Government close the canal after only two boats had made the transit.

This is not really much different from what's happening today with Hanford: The nuclear industry wants to protect its jobs at

2027-15

2027-16

Response to Commentor No. 2027

facilitated by an independent moderator to ensure that all persons wishing to speak had an opportunity to do so. Persons wishing to comment were selected at random from the audiences rather than according to the order in which they registered. This was accomplished by a random number drawing. In addition to the comment recorder stationed at the main hearing, a second recorder was available in an adjacent room to receive comments without the need to await selection at the main proceeding. The hearing format used promoted open and equal representation by all individuals and groups.

2027-16: DOE notes the commentor's opinions and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. FFTF restart would not impact the schedule or available funding for existing cleanup activities.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Commentor No. 2027: W. P. Mead (Cont'd)
Public Safety Resources Agency

the taxpayer's expense and the Department of Energy is a willing partner in destroying the slight chance we have of cleaning up their mess.

An example will underscore just how incestuous this relationship is: FFTF is a federally-owned reactor on a federal enclave, but in an internet search on "fftf" you will find the following statement:

"Fast Flux Test Facility (FFTF) - Welcome. This is the official website of the Fast Flux Test Facility (FFTF), the U.S. Department of Energy's 400-megawatt test reactor."

Again, this is a DOE-owned reactor on a federal reservation, but the official URL is "http://www.fftf.org" -- not ".gov."

".Org for "Organization," not ".gov" for "Government" as is standard practice. By this time next year both FFTF and DOE will have a common URL: ".Com" for "Commercial" and the people of the NorthWest will qualify for ".WBH" for "We've Been Had."

FFTF's site has links to five private nuclear medicine sites, and ten links to sites such as the "Nuclear Energy Institute" and "NucNet," but it has no links to any of the public interest organizations here or even to the State of Oregon's Office of Energy.

The Department of Energy is very quick to state that no funding will be diverted from cleanup actions at Hanford, regardless of the decision to restart the FFTF reactor or any of their other facilities.

This is absolutely false.

The Department has diverted more than a hundred million dollars of cleanup funding just to keep the FFTF reactor in Standby status while they fabricate a "need" to restart it.

The truth at Hanford is that the Department of Energy and its contractors have never accomplished a single Environmental Health and Safety remediation project within their announced budget and time frame, not even when the Department's internal "peer review" process underscored the importance of achieving those goals.

The Department's predecessor agencies began creating waste at Hanford in the early 1940s. Forty-five years later I heard a DOE Manager testify that he was very proud of their record of solidifying tank wastes, and he cited an example of the previous year's accomplishments. What he failed to mention, however, was that the entire year's project actually solidified less than a

Commentor No. 2027: W. P. Mead (Cont'd)
Public Safety Resources Agency

single day's production of liquid high-level radioactive wastes from Hanford's operations at the time of his testimony.

The Department should address the real issue of National Security as it relates to Hanford's production operations: That is, it must provide for the security of future generations here on earth instead of inventing a reason to pollute space. NASA didn't even know that the Department had decided it needed more Plutonium-238 for space missions until it was published in the Federal Register on September 15, 1999.

When Ms. Colette Brown, the Department's person who is managing this PEIS process, was questioned about this on October 19, 1999, she never answered the question she had been asked about whether NASA had requested additional Plutonium-238 beyond what was currently available for the three cited missions.

What is really needed is a national commitment to clean up the wastes that we've already created at Hanford, which has been identified as having approximately 1,000 separate areas of radiological and chemical contamination that qualify for the EPA's Superfund cleanup status.

We have a 55-year history of waste production at Hanford and we have not been able to contain, manage or isolate that waste even when using "State-of-the-Art" technology. If we can't clean up the present mess, how can we possibly justify creating even more waste when we will need to contain, manage and isolate that legacy from our descendants for the next 10,000 years?

In 1985, while testifying at another DOE Hearing, I presented a timeline showing the accepted 10-half-lives decay chain of Hanford's radiologic contamination to put this argument into an understandable perspective. At the rate of 1 inch per 100 years, that timeline - which was produced on a roll of paper towels - was 125 feet long and, when un-rolled, stretched down an entire aisle of the Bonneville Power Administration's Auditorium.

Make no mistake about it, the Department's Draft PEIS was written with one objective: to justify the restart of Hanford's FFTF Reactor as the core component of a new generation of nuclear production operations. Much of the materials that would be produced or irradiated at Hanford would require shipments of several thousand miles each way from their initial storage areas to this reactor - which really is not a good candidate for those types of operations - and then back to the east coast for processing before they could be shipped to the end user somewhere else in the United States.

Regardless of how you cook the books, restarting the FFTF Reactor cannot be justified on the basis of economic, social, medical,

2027-19

2027-20

Response to Commentor No. 2027

2027-17: Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Under the No Action Alternative, DOE would continue to purchase plutonium-238 to meet the space mission needs for the 35-year evaluation period considered in the NI PEIS. However, DOE recognizes that any purchase beyond what is currently available to the United States through the existing contract would likely require negotiation of a new contract and may require additional NEPA review.

The May 22, 2000, correspondence from NASA to DOE identifies that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, SRTG development efforts were stopped in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires one-third less plutonium-238 as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000, letter to DOE that large RTGs be maintained as backup. Section 1.2.2 of Volume 1 was revised to clarify plutonium-238 mission needs.

The major mission of FFTF would not be the production of plutonium-238. Rather, all three missions are of equal importance; no one mission is given priority in the NI PEIS.

NASA was informed about the preparation of the NI PEIS and received the Draft NI PEIS for review.

Commentor No. 2027: W. P. Mead (Cont'd)
Public Safety Resources Agency

environmental, transportation, health, safety or national security arguments. It's the wrong type of reactor to use in many of the postulated roles. The only reason FFTF is being considered is because it is already at Hanford and the nuclear industry wants to create jobs at that site.

I'm all in favor of putting those folks back to work, but it's time for the DOE to accept its responsibility for Hanford's waste.

We have a clear message for the Department:

WE support you financially:

WE pay your bills and WE buy you your toys.

YOU broke those toys and acted inappropriately:

YOU lied when we asked you to tell us the truth, and YOU didn't keep your promises when you said that you would clean up Hanford.

You have betrayed our trust and for that,

YOU ARE GROUNDED!

And you can't go out and play with the reactor until AFTER you have cleaned up your mess!

W. P. Mead
 DIRECTOR, PSRA
 PORTLAND, OR.

Response to Commentor No. 2027

2027-18: See response 2027-16.

2027-19: The NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR 1500 through 1508 and 10 CFR 1021, respectively). In the NI PEIS, DOE has analyzed each environmental resource area in a consistent, unbiased manner across all the alternatives to allow for a fair comparison among the various alternatives.

2027-20: While there are differences in the total shipping distances and risks among the alternatives, risks from transportation are small for all of the alternatives. Figures and tables in Section 2.7.1.6 of Volume 1 summarize transportation risks and provide comparisons of transportation risks among alternatives and among options within alternatives. Transportation risk is only one factor in DOE's decision. Accordingly, DOE has identified its preferred alternative in Section 2.8 of Volume 1 and included a discussion of DOE's reasons for selecting it.

September 27, 1996
 It's official: Sandia will produce moly_99 at ACRR

First radiopharmaceutical samples to be generated next year
 By John German, Lab News Staff
http://www.sandia.gov/LabNews/LN09_27_96/acrr.html

Sometime next year, a US hospital likely will use the first batch of medical radioisotopes produced at Sandia to treat or diagnose a patient with cancer.

DOE issued its Record of Decision Sept. 11 to make Sandia the sole US producer of molybdenum-99, one of nuclear medicine's most widely used radioisotopes. The Labs' Annular Core Research Reactor (ACRR) in Area 5, where the moly-99 is to be manufactured, may be called upon to produce other radiopharmaceuticals as well, including iodine-125, iodine-131, and xenon-133.

2029-1

Response to Commentor No. 2029

2029-1: DOE notes the commentor's views. As discussed in Section 1.7 of the NI PEIS, the "Final Environmental Impact Statement, Medical Isotopes Production Project: Molybdenum-99 and Related Isotopes" analyzed the proposed establishment of a domestic capability to produce molybdenum-99 and related medical isotopes such as iodine-131, xenon-133, and iodine-125. At the time this review was conducted, the U.S. supply of molybdenum-99 depended on the production capacity of one aging reactor in Canada, so DOE proposed this action to ensure a reliable domestic source for this vital isotope. The range of reasonable alternatives evaluated in this EIS included facilities at SNL, LANL, ORNL, and INEEL. In the subsequent Record of Decision, DOE selected the ACRR and the Hot Cell Facility at SNL for the production of molybdenum-99 and the related isotopes, with target fabrication to be conducted at LANL. However, since that time, the diversity and reliability of world supply of molybdenum-99 have increased. DOE has determined that, because the vulnerability in supplies of molybdenum-99 has sufficiently diminished, the selected SNL facilities should be further developed for molybdenum-99 production using private funds. Negotiations toward that end are ongoing. Until an agreement is reached, the reactor and hot cell facilities are available for emergency molybdenum-99 production should the need arise. The reactor is also being used for the production of other isotopes, for example iodine-125, and has been made available on a services basis to serve defense missions. As such, the ACRR is currently configured to support DOE Office of Defense Programs pulse testing missions. This configuration is compatible with reactor operations for the production of isotopes.

Commentor No. 2029: Tom Clements (Cont'd)
Nuclear Control Institute

PRODUCTION SITE _ Jeff Wemple of Isotope Project and Compliance Initiatives Dept. 9361 peers toward the "hot cell" of the ACRR where targets are placed for irradiation. To make molybdenum_99, sealed target tubes coated on the inside with uranium_235 are placed in the reactor's hot cell and irradiated for several days. (Photography by Randy Montoya) </italic>

The decision culminates a two_year selection process that began in September 1994 when DOE announced it intended to consider the ACRR as a potential site for medical radioisotope production. At that time, DOE began studying the ACRR and three alternative facilities __ at Oak Ridge National Laboratory, Idaho National Engineering Laboratory, and Los Alamos National Laboratory __ as possible production sites, with the ACRR being its "preferred site."

"I am pleased that this important work will be done at Sandia," said US Sen. Pete Domenici (R_N.M.). "Moly_99 is essential to modern medicine, and the United States was facing a crisis by relying on foreign sources that were becoming increasingly unreliable."

DOE completed its NEPA (National Environmental Policy Act) assessment, including a full Environmental Impact Statement (EIS) of the ACRR, this May to ensure that planned production operations at Sandia would comply with all applicable environmental regulations. The announcement naming the ACRR as the selected facility followed a required post_NEPA_assessment public comment period.

The Record of Decision also names Los Alamos National Laboratory to fabricate the special targets necessary for moly_99 production.

Domestic supply critical

In the US, at least 40,000 diagnostic and therapeutic medical procedures each day, and nearly 100 million laboratory tests each year, require the use of medical radioisotopes such as moly_99.

Response to Commentor No. 2029

Commentor No. 2029: Tom Clements (Cont'd)
Nuclear Control Institute

The radioisotope has not been produced in the US since 1989, partly because of the complex regulatory environment and costs associated with reactor operations.

Currently, the entire US supply of moly_99 comes from a reactor in Canada operated by Canada's Atomic Energy Commission Limited (AECL), which produces about 90 percent of the world's medically important radioisotopes. The 1950s_era reactor may be nearing the end of its productive life, however, and no backup reactor is yet being built. (There are tentative plans to construct a new Canadian reactor for this purpose.)

Because medical radioisotopes decay rapidly (moly_99 has a half_life of 67 hours), their supply must continually be replenished. (See "Radioactive isotopes for medicine" below.) US radiopharmaceutical companies contend that a two_week interruption in production would bring most US nuclear medicine to a standstill. In 1990, Congress requested that DOE develop a reliable domestic source of moly_99.

Sandia's ACRR was selected for several reasons, says Dick Coats (9360), medical radioisotopes program manager, including the Labs' 30 years of experience designing and operating nuclear reactors and its ability to operate the reactor continuously. (See "ACPR to ACRR __ a brief history" below.)

ACRR conversion underway

To make moly_99, the targets __ sealed stainless steel tubes coated on the inside with uranium_235 __ will be placed in the reactor, where each will be irradiated for several days. As many as 37 targets can be placed in the reactor at one time. A few targets will be added and removed each day.

After a cooling period, each target will be loaded into a cask and transported to Sandia's Hot Cell Facility. The target will be opened inside a containment area, gases bled off, and an acid solution

Response to Commentor No. 2029

Commentor No. 2029: Tom Clements (Cont'd)
Nuclear Control Institute

added to dissolve uranium and other fission products. For each target, as much as 800 curies of moly_99 will be precipitated from solution.

After purification, the moly_99 will be shipped by commercial aircraft to medical suppliers. Small quantities of unwanted fission byproducts will be solidified in concrete to prevent leaching. The concrete will be placed in drums for disposal at the Nevada Test Site.

Modifications to the ACRR for radioisotope production will include removal of a tube in the center of the reactor now used for dry irradiation space and addition of a grid for irradiating targets. The first moly_99 samples produced at Sandia are scheduled to be delivered early next year to the Food and Drug Administration (FDA) for testing. The Labs hopes to begin shipping quantities of FDA-approved moly_99 to pharmaceutical companies by late next year.

Radioisotopes produced in the ACRR will be sold by DOE to suppliers at prices comparable to market prices. Initially, revenues received by DOE will only partially offset the cost of production. Later, however, any profits gleaned from improved efficiency or market growth will go directly to the US Treasury. Production eventually could be transferred to private industry.

Radioactive isotopes for medicine

Medical radioisotopes are unstable chemical elements that decay rapidly to relatively stable forms by emitting radiation. Their relatively short lifetimes make them useful for treating and diagnosing patients while minimizing their radiation doses.

The primary medical radioisotope that will be produced at Sandia is molybdenum99. Moly_99 is the precursor, or "parent," of technetium_99m, one of nuclear medicine's most widely used radioisotopes.

Response to Commentor No. 2029

Commentor No. 2029: Tom Clements (Cont'd)
Nuclear Control Institute

Hospitals typically receive quantities of moly_99, which decays in a matter of days to become technetium (moly_99 has a half_life of 67 hours).

Because technetium emits a unique and easily detectable form of radiation, hospitals use specially designed dyes and other technetium_containing substances (injected or ingested into a patient's bloodstream or tissues) to create images of internal organs or other areas of the body. Technetium_99's six_hour half_life means it disappears rapidly from a patient's body.

Radioisotopes also are commonly used for detection and minimally invasive treatment of cancer and other diseases.

ACPR to ACRR __ a brief history

During the remainder of 1996 and into next year, Sandia's Annular Core Research Reactor will be converted to fully support the first large_scale production of molybdenum99 in the US. The program is the latest in a long series of high_profile projects for the reactor.

The ACRR was first constructed at Sandia in 1969 as the Annular Core Pulse Reactor, so named because of its intended role in weapons testing. Different weapons components __ such as arming, fuzing, and firing devices __ were treated with pulses of gamma radiation or neutrons to determine their ability to survive an atmospheric nuclear blast. Every weapon design in the US nuclear stockpile has been certified by the ACRR.

In the late 1970s the program's focus changed, and in 1979 the ACPR became the ACRR after some major modifications associated with changing the reactor fuel to a unique high_performance material and design. The reactor was then used to establish safety standards for nuclear reactors through the Nuclear Regulatory Commission reactor safety research program, as well as to continue to provide Defense Programs support with its enhanced performance capacity.

Response to Commentor No. 2029

Commentor No. 2029: Tom Clements (Cont'd)
Nuclear Control Institute

The 1980s and early '90s saw another change in focus, this time to testing nuclear rocket fuels and reactor-driven laser systems. The conversion to moly-99 production will be the reactor's first foray into radiopharmaceuticals.

Hello. My name is Marjorie Westman. I live at 123 McKinley, in Burleith, Washington, that's 98233. I'm calling the Department of Energy to hope and pray that you will shut down the Fast Flux Facility. This is an abomination that we should not be permitting. It is simply the most unethical thing. We were so blase in the beginning that we assumed that we could dispose of nuclear waste without any problem and look where it is now. The irony of beginning something which by all reports is really not necessary is an act of serious irresponsibility. I do hope that this is something that you will not permit to happen. If you need my number, my phone number is 360_757_1245. Thank you very much.

2032-1

2032-2

2032-3

Response to Commentor No. 2032

- 2032-1:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2032-2:** DOE notes the commentor's concern regarding waste generation and disposition. The restart of FFTF or any of the other proposed alternative facilities would not impact the schedule or available funding for existing cleanup activities at Hanford, INEEL, or ORR. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.
- 2032-3:** Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

2033-1

2033-2

2033-1

Response to Commentor No. 2033

2033-1: DOE notes the commentor's opposition to Alternative 1, Restart FTF.

2033-2: Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists.

A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Response to Commentor No. 2035

2035-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Commentor No. 2036: Marion Olson

Marion Olson
 23904 84th Ave.W.
 Edmonds, Wa 98026

U.S. Dept of Energy

Hanford is supposed to be cleaned
 up, not go into production
 I wish to permanently deactivate FFTF
 with no new missions!

Sincerely,
 Marion Olson

7/12/00

- 2037-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 2037-2:** Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.
- 2037-3:** The concerns expressed in the comment with respect to the potential impacts associated with FFTF restart are noted. The environmental impacts from operation of the Hanford facilities during normal operations and from postulated accidents are presented in Section 4.3 of the draft NI PEIS. The assessments were made using well established and accepted analytical methods, as described in Appendixes G through L. The analytical methodology is conservative by nature; the actual impacts to the environment would be expected to be less than those calculated. All impacts have been shown to be small. No fatalities among workers or the general public would be expected over the full 35-year operational period. The impacts to the biosphere (air, water, and land) are also seen to be small.

Chapter 2—Written Comments and DOE Responses

Commentor No. 2038: Paul Rittmann

Draft PEIS Comment Form

I think the FFTF should be used to make isotopes for diagnostic and therapeutic use at medical facilities

7/12/00

Commentor No. 2040: Kara Mathiason

Draft PEIS Comment Form

Shut down the reactor! Its a major environmental hazard, ridiculously expensive, it must be dismantled. The neutron rich accelerator is more cost effective. The accelerator is a much simpler safer plan. It makes plutonium 238, medical isotopes, can be used for neutron scattering research, as well as other neutron research projects.

7/12/00

Response to Commentor No. 2040

2040-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, as well as Alternative 3, Construct New Accelerator(s). It should be noted that permanent deactivation of FFTF is a part of Alternative 3. DOE also notes the commentor's opinion relative to costs and environmental impacts of restarting FFTF.

As identified in the Cost Report, the listed cost for each alternative is, by itself, not sufficient information to provide a mission decision. Each of the irradiation facility alternatives under consideration can meet various portions of DOE's identified need for expanded isotope production and nuclear research and development. The capability of each irradiation facility to support the proposed expanded mission areas would determine the extent that DOE would be able to meet its stated objectives. The high energy accelerator (Alternative 3) would generate neutrons by spallation, solely for the production of plutonium-238. Alternative 3 would also require the construction of a low-energy accelerator (cyclotron) to produce moderate quantities of medical isotopes through proton-target interactions. Nuclear reactors, such as the FFTF (Alternative 1) could produce a wider range of medical isotopes, as well as plutonium-238, through neutron interactions with appropriate targets. Each facility has its own technical advantages and disadvantages. The relative capabilities of each alternative, the degree to which each alternative satisfies policy and programmatic objectives, as well as the relative cost of alternatives will be factors in the Record of Decision.

2040-2: See response to comment 2040-1.

Commentor No. 2044: Joan Crooks Washington Environmental Council

September 15, 2000

Colette E. Brown
US Department of Energy
M/S NE-50
19901 Germantown Road
Germantown, MD 20874-1290

RE: DOE Plan to Restart FFTF

Dear Ms. Brown,

The Washington Environmental Council (WEC) is a statewide coalition of 90 member groups and thousands of individuals working to protect, restore, and enhance the environment of Washington State. For 33 years we have worked on a wide range of environmental issues, including preventing pollution and protecting public health.

The U.S. Department of Energy is considering a plan to restart the FFTF Nuclear Reactor at Hanford to produce research medical isotopes and plutonium-238.

The Washington Environmental Council strongly opposes this plan for the following reasons:

Restart of the reactor would:

- Put Hanford back into plutonium production, creating more liquid waste for leaking, high-level nuclear waste tanks;
- Likely delay Hanford clean-up further threatening the Columbia River; and
- Increase the danger of accidents and further nuclear contamination in the Pacific Northwest.

The Environmental Impact Statement released by the DOE does not include important information, such as the following:

- Future demands for medical isotopes can be met using other facilities; and
- Future needs for plutonium to power NASA space missions can be met using existing supplies, supplemented by foreign sources if necessary.

2044-1

2044-2

2044-3

2044-4

2044-5

Response to Commentor No. 2044

2044-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2044-2: The use of proposed alternative facilities associated with processing neptunium-237 targets would have no impact on schedules or available funding for high-level radioactive waste programs at either Hanford or the INEEL sites. Higher activity waste would be treated as a solid form via a stand-alone vitrification system, separate from any tank waste treatment system. The existing Hanford high-level radioactive waste facilities would also not be used, and as analyzed in the PEIS, no existing or planned high-level radioactive waste facilities would be used to treat the wastes resulting from processing the irradiated targets.

2044-3: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

2044-4: FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

2044-5: Candidate facilities, including FFTF and other irradiation facilities, for radioisotope production are described in Section 2.3 of Volume 1.

Commentor No. 2044: Joan Crooks (Cont'd)
Washington Environmental Council

Finally, the cost analysis, non-proliferation study and waste management study, all of which are extremely important to measuring the impact of FFTF restart, are separated from the environmental impact study.

|| 2044-6 || 2044-7

We thank you for this opportunity to provide public comment relating to this important issue.

Sincerely,

Joan Crooks
Executive Director

Response to Commentor No. 2044

Candidate irradiation facilities and fabrication/processing facilities dismissed are discussed in Sections 2.6.1 and 2.6.2, respectively. As discussed in Section 1.2.1 of Volume 1, the United States currently purchases approximately 90 percent of its medical isotopes from foreign producers. Consistent with its mandates under the Atomic Energy Act and recommendations of the Expert Panel, DOE would expand its existing nuclear facility infrastructure to, among other things, more effectively support production of isotopes for medical applications and research. Supplies of many research isotopes and radioisotopes that are under development for clinical applications are not readily available from existing domestic or foreign sources, causing some medical research and development programs to be terminated, deferred, or delayed.

As discussed in Sections 1.2.2 and 2.5.1, based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Under the No Action Alternative, DOE would continue to purchase plutonium-238 to meet the space mission needs for the 35-year evaluation period considered in the NI PEIS. However, any purchase of plutonium-238 from Russia beyond what is currently available to the United States through the existing contract would likely require negotiation of a new contract and may require additional NEPA review.

2044-6: As discussed in Chapter 4 of Volume 1, environmental impacts of reasonable alternatives to fulfill the requirements of the DOE missions were disclosed and evaluated in the NI PEIS. DOE made every effort to obtain, analyze, and disclose all required information to make a decision on expanding nuclear infrastructure. The costs and nuclear nonproliferation impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such ancillary documents need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed these documents to more than 730 interested parties on August 24 and September 8, 2000, respectively. Both reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>)

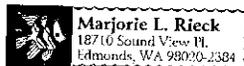

Commentor No. 2044: Joan Crooks (Cont'd)
Washington Environmental Council

Response to Commentor No. 2044

and in the public reading rooms. DOE has also provided summaries of the Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment in Appendixes P and Q, respectively, in the Final NI PEIS.

2044-7: The draft Waste Minimization and Management Plan for the Fast Flux Test Facility (May 2000) was referenced in the NI PEIS and made available prior to the public hearings.

Commentor No. 2045: Marjorie Rieck

9-17-00

Dear Colette Brown,

The only option for the FFTF at Hanford is 5: "permanently deactivate the Fast Flux Test Facility with no new missions".

|| 2045-1

Why add more deadly pollution to the most highly contaminated nuclear site in the western world?

|| 2045-2

Keeping the FFTF on hot standby for four years has cost over \$40 million per year.

|| 2045-1

We need medical isotopes? Your're not serious. The Washington State Medical Association, the WA Academy of Family Physicians and Physicians for Social Responsibility/National have all passed resolutions opposing the restart of the FFTF. Thank you for your attention.

|| 2045-3

|| 2045-4

Yours truly,

Marjorie Rieck

Response to Commentor No. 2045

2045-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.

2045-2: The concerns expressed in this comment with respect to potential environmental and health impacts associated with FFTF restart are noted. The management of all wastes associated with restart and operation of the FFTF is addressed in Section 4.3.1.1.13 of the NI PEIS. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. The management of these wastes would be well within management capacities and would not be expected to adversely affect the environment. Impacts on people and ecological resources would be small.

Hanford is committed to cleaning up its existing wastes in a safe and environmentally acceptable manner. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are of high priority to DOE. The restart of FFTF would not divert or reprogram budgeted funds designated for this effort.

2045-3: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

Commentor No. 2045: Marjorie Rieck (Cont'd)

Response to Commentor No. 2045

The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

2045-4: See response to comment 2045-1.

**Commentor No. 2046: William J. Kinsella
Lewis and Clark College**

William J. Kinsella, PhD
Assistant Professor of Communication
Lewis and Clark College
Portland, OR 97219

18 September 2000

Secretary Bill Richardson
United States Department of Energy
Forrestal Building
1000 Independence Avenue, S.W.
Washington, DC 20585

Dear Secretary Richardson:

I am mailing my comments on the *Draft Programmatic Environmental Impact Statement for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the United States, Including the Role of the Fast Flux Test Facility* (Draft NI PEIS) directly to you, with a copy to Ms. Colette Brown in your Office of Nuclear Energy. I am requesting that these comments be read by a qualified member of your own office staff, as well as by the staff of the Office of Nuclear Energy.

The comments below are in addition to those I read into the record at the public meeting held by the Department of Energy in Portland, Oregon, on 29 August 2000.

After reviewing the draft PEIS, I am in support of a permanent deactivation of FFTF. I also wish to register a strong objection to Alternative 1 in the PEIS, which calls for a restart of FFTF. I am not, at this time, opposed to Alternatives 2, 3, or 4, *if and only if* they are adopted together with a permanent deactivation of FFTF and do not add radioactive or hazardous contamination to the Hanford site (including FMEF).

I am also concerned about a number of process and content issues related to the draft PEIS. The document relies upon a number of *ad hoc* assumptions, and I am requesting that these be examined in more detail in any further stages of the EIS process and in the final decision.

First, it is problematic that the document was prepared entirely by the same program office that is proposing, and will benefit most directly from, an expansion of the nuclear infrastructure. The document presumes, rather than determines, that an expansion of the nuclear infrastructure along the lines proposed is necessary and mandated. In this regard, the PEIS is not a disinterested scientific study. No checks and balances, in the form of outside review or analysis by independent experts, were present in the preparation of the document. While previous studies including those of NERAC were cited in the PEIS, the citations were selected to support the claims of NE and contrary findings in these sources were ignored.

Response to Commentor No. 2046

2046-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF. The commentor's qualified support is noted for Alternative 2, Use Only Existing Operational Facilities, Alternative 3, Construct new Accelerator(s), and Alternative 4, Construct New Research Reactor. Alternative options that include FMEF are not supported due to the generation of additional waste at Hanford. It should be noted that permanent deactivation of FFTF is a part Alternatives 2, 3, and 4.

2046-2: DOE notes the commentors' concerns. This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives.

The NEPA process addresses concerns related to EIS objectivity and accuracy by requiring the Draft EIS be made available for public comment, and that every comment be addressed, and its resolution in the PEIS explained in the comment response section of the Final PEIS. This process provides the opportunity for agencies of the Federal and state government as well as individuals and organizations with special expertise to provide an input to the PEIS and influence the decisions to be made. DOE has received over 4,000 comments on the Draft. DOE has responded to these comments and will take them into account, along with other factors, in formulating the Record of Decision. Additionally, the facilitated discussions which were held during the public comment period between advocates for FFTF deactivation and FFTF restart, will be considered by the Secretary of Energy in making his decision.

2046-1

2046-2

2046-3: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC,

Commentor No. 2046: William J. Kinsella (Cont'd)
Lewis and Clark College

Secretary Bill Richardson

Page 2

For example, the PEIS assumes that future demands for medical isotopes cannot be adequately met using existing, operational domestic facilities and/or foreign sources. In fact, in a letter to Senator Ted Kennedy dated 22 December 1995, Terry Lash, then Director of the Office of Nuclear Energy, stated that "FFTF...is not necessary to DOE's production mission....ATR and HFIR have significant additional capacity to produce isotopes well into the next century if future market needs develop." As recently as April 2000, NERAC recommended that DOE utilize other domestic facilities in place of FFTF for medical isotope production. Foreign sources are also available, but the PEIS appears to have rejected this option without adequate study.

2046-3

Similarly, the PEIS assumes that future needs for Pu-238 cannot be met using existing inventories, supplemented by foreign sources if necessary. In fact, the PEIS makes unwarranted worst-case assumptions about the amount of Pu-238 that might be needed. These assumptions are not supported by an analysis from NASA or from independent experts. If additional uses for Pu-238, beyond those of NASA, are being considered by DOE, then these have environmental impact implications and should be included in the final PEIS.

2046-4

Second, the separation of the cost and nonproliferation studies from the PEIS process, and the lack of availability of the corresponding documents throughout most of the public comment period, has undermined both the public comment process and the credibility and legitimacy of the EIS process. Cost information is directly pertinent to the risk/benefit analysis that you have asked the public to consider and to comment on. Annual budgets for staffing, training, safety audits, and other essentials will affect public safety and environmental impact throughout the proposed 35 years of nuclear operations. These connections need to be included in the analysis, with the participation of independent experts and the public.

2046-5

Non-proliferation considerations, also, cannot be separated from the EIS process. In fact, nuclear proliferation is a public safety and environmental impact issue. Undermining the existing non-proliferation regime, through the use of MOX and HEU fuels at FFTF, increases risks to the public and to the environment. These risks need to be identified, quantified and included in the analysis, with the participation of independent experts and the public. The appearance of the nonproliferation study well after the completion of the PEIS (and near the very end of the public comment period) gives the impression that the NN study was written to fit the needs of NE. Whether this is true or not, this perception has undermined public confidence in the process. Furthermore, vague references to exploring other fueling options, made in the NN study, may be used to justify a restart of FFTF before those options are properly evaluated.

Third, the draft PEIS assumes that existing safety analyses adequately represent the risks of a catastrophic accident involving FFTF. The reactor, its control system, and its safety systems are now more than twenty years old, and the PEIS considers operating them for another 35 years. At the end of that time FFTF would be 55 years old – older than the lifetime of any reactor to date. Its design is far from "inherently safe" – at least two other liquid sodium reactors have suffered partial meltdowns (EBR-1 and Fermi-1) and others have been removed from service as a result of

2046-6

Response to Commentor No. 2046

established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

There currently is little room for growth of medical isotope production at either ATR or HFIR. At ATR the neptunium-237 targets for plutonium-238 production will compete for space in the reactor. There are potential negative impacts to the private company that leases reactor space for the production of radioisotopes due to being assigned less

Commentor No. 2046: William J. Kinsella (Cont'd)
Lewis and Clark College

Secretary Bill Richardson

Page 3

safety risks (Monju) or technical failure (Superphenix). FFTF failure modes may well exist that have not been anticipated or adequately examined. Additional concerns exist regarding the integrity of fuel that has been stored for long time periods, or that is acquired from other suppliers, and that may lack adequate quality control documentation.

Finally, perhaps the most egregious of the assumptions in the PEIS is that the wastes that would be produced by FFTF are acceptable in the context of Hanford. Hanford, its environmental remediation workers, and the Pacific Northwest community bear a truly staggering burden of wastes - the largest burden of any site in the Western world. Restarting FFTF would contaminate buildings and areas that are not yet contaminated, and would directly interfere with the existing cleanup plan for the 300 area. Introducing any new wastes to the site is unacceptable, and would undermine the Department of Energy's own stated mission to clean up Hanford and regain public trust.

Trust, in fact, is at the heart of the matter as we continue with this decision process. FFTF was ordered shutdown by a previous Secretary of Energy in 1993, and despite the creative and costly efforts of those who identify most closely with it, no compelling need for the facility has been shown. It's time to honor the voices of the public and of a wide range of independent technical experts, by shutting FFTF down and moving on toward more productive goals.

Thank you for your attention to these comments, and I look forward to your response.

Sincerely,

William J. Kinsella

✓ copy: Ms. Colette Brown, Office of Nuclear Energy, Science and Technology

Response to Commentor No. 2046

desirable irradiation space. At HFIR, the ability to expand medical isotope targets into additional reactor locations is limited by the potential impacts that the targets have on the primary experiments in the reactor. Medical isotope targets and neptunium-237 targets are not in competition for the same locations at HFIR.

Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term (less than 5 years).

2046-4: Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Under the No Action Alternative, DOE would continue to purchase plutonium-238 to meet the space mission needs for the 35-year evaluation period considered in the NI PEIS. However, DOE recognizes that any purchase beyond what is currently available to the United States through the existing contract would likely require negotiation of a new contract and may require additional NEPA review.

DOE could purchase plutonium-238 from Russia; however, for supply

Commentor No. 2046: William J. Kinsella (Cont'd)
Lewis and Clark College

Response to Commentor No. 2046

reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

NASA will be the end user of any plutonium-238 produced or purchased as a result of the NI PEIS Record of Decision.

- 2046-5:** DOE notes the commentor's views and concerns. The costs and nuclear nonproliferation impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such ancillary documents need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed these documents to more than 730 interested parties on August 24 and September 8, 2000, respectively. Both reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided summaries of the Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment in Appendixes P and Q, respectively, in the Final NI PEIS.
- 2046-6:** FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

The technical issues that need to be addressed to assure safe operation for an extended lifetime are well understood. The U.S. Nuclear Regulatory Commission has extended the operating license for a commercial power plant an additional 20 years over and above its current 40 year licensing period and is anticipating several more extensions in the near future.

Commentor No. 2046: William J. Kinsella (Cont'd)
Lewis and Clark College

Response to Commentor No. 2046

2046-7: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposal) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

All new or existing DOE facilities proposed for missions in the PEIS represent the most suitable alternative sites for carrying out the activities

Commentor No. 2046: William J. Kinsella (Cont'd)
Lewis and Clark College

Response to Commentor No. 2046

described in the document. Use of the 300 area facilities at Hanford for these activities would not violate any existing laws or agreements, and would be consistent with historic and ongoing missions at those facilities. These facilities would meet all DOE, EPA, and Washington State requirements before any new activities were initiated.

The 300 Area Revitalization Plan (DOE 1999) provides for continued multi-program R&D operations in the 300 Area, including operation of various laboratories, office facilities, and services. It also provides for consolidation (but not complete elimination) of radiological operations, with support for Hanford Site facility transition and environmental restoration efforts. The plan does not require closure of the 325 and 306-E buildings as long as they are needed for active research projects. Operation of these facilities would not violate any existing agreements between DOE and stakeholders or other legal obligations, nor would it affect ongoing or planned environmental restoration and facility transition activities.

The 306-E facility is not contaminated and is being proposed as a location to conduct activities that do not involve radioactive materials. While the 325 Building has an inventory of radionuclides associated with ongoing activities at the facility, the building is not contaminated in worker accessible areas.

2046-8: See response to comment 2046-1.

Commentor No. 2047: Phyllis E. Fiege

5319 215th S.E.
Woodinville WA 98072
September 18, 2000

Colette E. Brown, NE-50
U.S. Dept. of Energy
19901 Germantown Rd.
Germantown, MD 20874

Dear Ms. Brown,

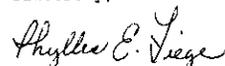

I do not understand why we have not shut down the Fast Flux Test Facility and still keep it on standby. I testified at a hearing in Seattle several years ago supporting the permanent shutdown of the FFTF. At that time most of the people testified against restarting this facility. I heard physicians from the University of Washington Cancer Research state there was no shortage of medical isotopes. I heard the President of the Washington State Medical Association testify against the restart of this facility because of the danger to the health of the workers and the people of this state and region.

The only people testifying in favor of restarting the FFTF were workers from the Hanford-TriCities area. They see startup as an opportunity for jobs. If starting the reactor is a means to provide jobs and to stimulate the economy, it becomes a very expensive program. It gives no benefits to the public as a whole (such as schools, city halls, parks, etc.) and is a danger to the health and safety of the workers and to the citizens while increasing the dangerous toxic pollution of the environment.

The need for jobs and economic stability is real and of concern. We could use the \$40,000,000.00, that we spend each year to keep the FFTF on standby, to increase the number of research and other jobs to clean up Hanford. That would be a better use of our tax dollars.

Please shut down the FFTF--permanently.

Sincerely,

Phyllis E. Fiege

Response to Commentor No. 2047

- 2047-1:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2047-2:** DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information.

2047-1

2047-2

2047-3

2047-4

2047-5

2047-6

2047-1

The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements.

Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a

Commentor No. 2047: Phyllis E. Fiege (Cont'd)

Response to Commentor No. 2047

need for expanded isotope production capacity in the short-term (less than 5 years). Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

2047-3: This NI PEIS provides estimates of the incremental potential human health impacts associated with a range of reasonable alternatives. Alternative 1 includes the restart of FFTF, evaluated for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology provides results based upon our current knowledge of the health impact of low doses of ionizing radiation and hazardous chemicals. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of each of the analyzed alternatives, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with each of the alternatives and with restarting FFTF would be small.

Worker safety (radiological protection) is a key element of DOE's Radiological Health and Safety Policy (DOE P 441.1, April 26 1996). This policy states in part that DOE facilities must "conduct radiological operations in a manner that controls the spread of radioactive materials and reduces exposure to the workforce and the general public and that utilizes a process that seeks exposure levels as low as reasonably achievable." Each DOE site, including Hanford, is required to implement a radiological control program with the intent to meet this policy goal. Based on the assessment of worker health impacts for the range of reasonable alternatives and options that make use of Hanford facilities, use of these facilities would not be expected to increase the number of cancer fatalities among facility workers. For example in Alternative 1 option 3, all of the activities (target irradiation and processing) occur at Hanford facilities. As shown in Section 4.3.3.1.9, the expected consequences are less than one additional fatal cancer among the workforce; that is, no additional fatal cancers are expected.

2047-4: DOE is not considering restarting FFTF for the purpose of creating jobs and stimulating the economy. However, it is possible that restarting FFTF would have a positive socioeconomic impact on the Hanford area. As work expands within a region, the money spent on

Commentor No. 2047: Phyllis E. Fiege (Cont'd)

Response to Commentor No. 2047

accomplishing this work flows into the local economy. It is spent on additional jobs, goods, and services within the region. The increased taxes realized by local governments, from income taxes, sales taxes, etc., are expected to cover the cost of any socioeconomic impact on schools and public services. The socioeconomic impacts associated with Alternative 1, Restarting FFTF, are presented in Section 4.3 of the NI PEIS.

2047-5: This NI PEIS provides estimates of the incremental potential human health impacts associated with a range of reasonable alternatives. Alternative 1 includes the restart of FFTF, evaluated for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology provides results based upon our current knowledge of the health impact of low doses of ionizing radiation and hazardous chemicals. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of each of analyzed alternatives, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with each of the alternatives and with restarting FFTF would be small.

Worker safety (radiological protection) is a key element of DOE's Radiological Health and Safety Policy (DOE P 441.1, April 26 1996). This policy states in part that DOE facilities must "conduct radiological operations in a manner that controls the spread of radioactive materials and reduces exposure to the workforce and the general public and that utilizes a process that seeks exposure levels as low as reasonably achievable." Each DOE site, including Hanford, is required to implement a radiological control program with the intent to meet this policy goal. Based on the assessment of worker health impacts for the range of reasonable alternatives and options that make use of Hanford facilities, use of these facilities would not be expected to increase the number of cancer fatalities among facility workers. For example in Alternative 1 option 3, all of the activities (target irradiation and processing) occur at Hanford facilities. As shown in Section 4.3.3.1.9, the expected consequences are less than one additional fatal cancer among the workforce; that is, no additional fatal cancers are expected.

The NI PEIS identifies (in Chapter 3 of Volume 1) endangered species that live on or near all of the candidate sites, as well as aquatic and

Commentor No. 2047: Phyllis E. Fiege (Cont'd)

Response to Commentor No. 2047

wetlands areas that may be impacted by operations at candidate locations. According to an International Atomic Energy Agency (IAEA) publication (IAEA Technical Report Series No. 332, Effects of Ionizing Radiation on Plants and Animals at Levels Implied by Current Radiation Protection Standards), a dose rate of 100 millirem per year to the most exposed human will lead to dose rates to plants and animals of less than 0.1 rad per day. The IAEA concluded that a dose rate of 0.1 rad per day or less for animals and 1 rad per day or less for plants would not affect these populations. The largest individual dose for any of the nuclear infrastructures alternatives under normal operations would be less than 0.1 millirem, which is three orders of magnitude less than the IAEA threshold for adverse effects. Therefore, any of the range of reasonable nuclear infrastructure alternatives analyzed would not be expected to result in adverse impacts on plants and animals living in potentially affected areas around the candidate sites.

As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed.

2047-6: The commentor's position concerning funding priorities for research and cleanup at the Hanford Site is noted. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the

Commentor No. 2047: Phyllis E. Fiege (Cont'd)

Response to Commentor No. 2047

U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

FFTF restart would not impact the schedule or available funding for ongoing cleanup activities. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Commentor No. 2048: Randy Schwarz

Draft PEIS Comment Form

I Support The restart of FFTF to get the most out of the taxpayers investment in this state of the art facility.

2048-1

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

- attending public meetings and giving your comments directly to DOE officials
- returning this comment form to the registration desk at the meeting or to the address below
- calling toll-free and leaving your comments: 1-877-562-4593
- faxing your comments toll-free to: 1-877-562-4592
- commenting via e-mail: Nuclear.Infrastructure-PEIS@hq.doe.gov

Ms. Colette Brown
DOE, Office of Space and Defense Power Systems

Re: public comment period on the Draft Programmatic
Environmental Impact Statement for accomplishing expanded
civilian nuclear energy research and development and isotope
production mission in the United States, including the role of the
Fast Flux Test Facility

Dear Ms. Brown,

The Pluto_Kuiper Express is the major NASA mission your
department is using to justify the near term need for Pu_238. The
following article at the very least indicates this mission will not
happen on schedule and may not occur at all until 2020. This
mission was to require 16.3 pounds and represents 70% of the
"plutonium requirement" outlined in the PEIS. This is a major blow to
DOE's plan to produce Pu_238. Other canceled missions may follow
due to cost constraints. There are only three outlined in the PEIS
and this one is by far the biggest. Please incorporate the article
posted below into the Snake River Alliance comments on the
above_mentioned draft PEIS.

Sincerely,

Steve Hopkins

Response to Commentor No. 2049

2049-1

2049-1: Section 1.2.2 of Volume 1 has been revised to reflect September 2000 updated mission planning guidance from NASA indicating that implementation of the Pluto/Kuiper Express mission as currently conceived was being deferred. However, the guidance also identified the need to maintain additional backup radioisotope power systems to support the Europa Orbiter mission. As such, while this latest NASA guidance modifies the specific radioisotope power systems and missions for which DOE needs to plan, it does not fundamentally change NASA's overall potential plutonium-238 requirements, or the expectation that the available U.S. inventory of this material would effectively be depleted by approximately 2005.

NASA Stops Work on Mission to Mysterious Pluto
By Deborah Zabarenko

WASHINGTON (Reuters) _ Poor Pluto. NASA (news _ web sites) has stopped work on a robotic mission to this distant, mysterious planet, the only one in the solar system not yet explored by earthly spacecraft.

If work does not resume by the end of this year, planetary astronomers said on Friday they fear the mission will lose its place on NASA's space launch schedule in 2004.

That could delay the craft's expected arrival at Pluto and its moon Charon by seven years, and by that time, the distant little planet's tenuous atmosphere could have started to freeze as Pluto moves into a winter lasting more than 100 years.

The National Aeronautics and Space Administration stressed that the so-called Pluto_Kuiper Express mission being put together by the Jet Propulsion Laboratory in Pasadena, California, was being "rethought and replanned," not scrapped.

"The mission will be deferred until they can replan it for what's affordable," NASA spokesman Don Savage said in a telephone interview.

Originally budgeted at \$350 million a year ago, the mission as currently envisioned would now cost more than \$500 million to complete, Savage said, "and that's just not affordable."

NASA's chief of space science, Ed Weiler, "would like to see some way for them to do the mission by 2020 when the atmosphere will still be there, not frozen out yet," Savage said. Pluto, the most distant planet from the Sun, was only discovered in 1930 and takes 248 years to make one solar orbit, so scientists have never observed its winter and do not know exactly what to expect, said

Ellis Miner, a spokesman for the American Astronomical Society.

Get There Before Atmosphere Freezes

The society's planetary scientists expressed "major concerns" over stopping work on the Pluto mission, and Miner said that any substantial delay might mean astronomers would not be able to observe the planet's atmosphere.

Pluto came closest to the Sun in 1989 and has been moving away ever since. Even at its closest, it is still vastly distant: 30 times Earth's distance from the Sun, or about 2.8 billion miles.

"As Pluto moves out (away from the Sun), the amount of sunlight that it gets is decreasing rapidly," Miner said by telephone. "At some point the temperature will be cold enough that the atmosphere will basically snow out onto the surface and all that will be left is a very tenuous trace atmosphere and it may be difficult to detect."

A planet's atmosphere is often the key to finding out how it formed, and with an eccentric planet like Pluto, this could be important. Astronomers have inspected the atmospheres of every other planet except Pluto.

Pluto has always been a bit of an oddball among planets.

It is small and craggy where the other planets in the outer solar system are big and gassy; it is less than half the size of any other planet; its orbit tilts up from the solar system plane and is the only one to cross the orbit of another planet — Neptune; and its moon, Charon, is larger in proportion to it than any other planet's moon.

There was a move afoot last year to reclassify it as a minor planet, instead of a major one, but it kept its major planet standing.

Citizens Advisory Board
 Idaho National Engineering and Environmental Laboratory
 00_CAB_068, September 25, 2000

Colette E. Brown, Document Manager
 Office of Space and Defense Power Systems (NE_50)
 Office of Nuclear Energy, Science, and Technology
 U.S. Department of Energy
 19901 Germantown Road, Germantown, MD 20874

Dear Ms. Brown:

Note: The Site_Specific Advisory Board (SSAB) for the Idaho National Engineering and Environmental Laboratory (INEEL), also known as the INEEL Citizens Advisory Board (CAB), is a local advisory committee chartered under the Department of Energy's (DOE) Environmental Management (EM) SSAB Federal Advisory Committee Act Charter.

The Department of Energy (DOE) recently issued the Draft Programmatic Environmental Impact Statement for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the United States, Including the Role of the Fast Flux Test Facility (NI PEIS). A public comment period on the document ended on September 18, 2000. The INEEL CAB requested an extension in the public comment period to allow for development of a consensus recommendation in accordance with

Response to Commentor No. 2050

Commentor No. 2050: Stanley Hobson (Cont'd)
Citizens Advisory Board

the CAB's meeting schedule and approved procedures. We have been told that the comment period would not be extended, although we still have received no formal response to our request. Telephone calls from you and from Mr. Dan Funk to me (in my capacity as Chair of the INEEL CAB) offered assurances that the INEEL CAB's comments would be considered to the extent practicable. Because we believe the decision_making process supported by the NI PEIS is of importance, we elected to proceed with development of this recommendation.

It accordance with our charter as an EM SSAB, the attached five_page recommendation, #76, was reached through consensus processes at the INEEL CAB's September 19_20, 2000 meeting. All members in attendance at the meeting understand and agree with the recommendation. It details our concerns and comments regarding the Draft NI PEIS.

In summary, the INEEL CAB believes the NI PEIS should be completely re_written to address the current deficiencies and reissued as a revised draft PEIS for another round of public review and comment. DOE should add missing information, develop a solid approach to evaluating and comparing the alternatives, and enhance its analysis to support comparison among the myriad alternatives. The second draft should 1) substantiate the purpose and need for action, 2) clearly state the Department's objectives, 3) describe multiple, comparable alternatives that would meet those objectives, 4) describe all impacts that would result from the comparable alternatives, and 5) evaluate the alternatives using consistent criteria. The public should be afforded an opportunity to review a revised draft PEIS that is not severely flawed in order to participate in a meaningful manner in DOE's decision_making process, as intended under NEPA.

We await your response to the attached recommendation.
Sincerely,

Response to Commentor No. 2050

Draft Programmatic Environmental Impact Statement
 for Accomplishing Expanded Civilian Nuclear Energy Research
 and Development and Isotope Production Missions in the United
 States, Including the Role of the Fast Flux Test Facility

The Department of Energy (DOE) recently issued the Draft
 Programmatic Environmental Impact Statement for Accomplishing
 Expanded Civilian Nuclear Energy Research and Development and
 Isotope Production Missions in the United States, Including the Role

Response to Commentor No. 2050

**Commentor No. 2050: Stanley Hobson (Cont'd)
Citizens Advisory Board**

of the Fast Flux Test Facility (NI PEIS). A public comment period on the document ended on September 18, 2000. The Idaho National Engineering and Environmental Laboratory Citizens Advisory Board (INEEL CAB) requested an extension in the public comment period to allow for development of a consensus recommendation in support of DOE's decision_making for this significant decision. We are told that the comment period would not be extended although we still have received no formal response to our request. Because we believe this decision is of importance, we elected to proceed with development of this recommendation.

ADEQUACY UNDER THE NATIONAL ENVIRONMENTAL POLICY ACT

The National Environmental Policy Act (NEPA) requires federal agencies contemplating actions that may result in significant environmental impacts to prepare environmental documentation. Environmental documentation written to comply with NEPA should document the purpose and need for federal action, present an array of reasonable alternatives including a "No Action Alternative," and present all environmental impacts that would result from each reasonable alternative. In addition, the federal agency must conduct public participation activities in support of development of its environmental documentation. The INEEL CAB recommends that DOE make every effort to meet the goals of NEPA and prepare an Environmental Impact Statement that can withstand judicial review. To date, the INEEL CAB has submitted comments twice to support preparation of this document. Our consensus Recommendation #51, dated November 18, 1998 submitted comments during scoping for the "Proposed Production of Plutonium_238 for Use in Advanced Radioisotope Power Systems for Future Space Missions Environmental Impact Statement" which was subsequently merged with this PEIS. We also reached consensus on Recommendation #65, which submitted comments during scoping for the NI PEIS. We could not find evidence that some of our earlier comments had been incorporated into the Draft NI PEIS. NEPA requires scoping as a process by which the public participates in the framing of the

2050-1

2050-2

Response to Commentor No. 2050

- 2050-1:** DOE notes the INEEL CAB's recommendation.
- 2050-2:** CEQ regulations for implementing NEPA require that public comment be solicited to assist in defining the scope of a PEIS (40 CFR 1501.7). Section 1.4 of Volume 1, as supplemented by an expanded discussion provided in Appendix N, summarizes the prevailing issues and concerns raised during the scoping process to include identification of relevant issues raised at individual scoping meetings. Statements, letters, and resolutions were received by DOE during the scoping period. Each such comment document was considered and entered into the NI PEIS Administrative Record. In fact, based on the scoping comments received the scope of the NI PEIS was expanded in a number of areas as outlined in Section 1.4 and Appendix N.

In preparing the Final PEIS, DOE has assessed and considered both oral and written comments received on the Draft PEIS during the public comment period and has responded to these comments in the Final PEIS. Volume 3 of the NI PEIS contains public comments received on the NI PEIS and DOE responses to those comments. Moreover, late comments were considered to the extent practicable.

- 2050-3:** DOE's Office of Nuclear Energy, Science and Technology considered the needs of other DOE program offices when it surveyed the surplus capacity of DOE's existing and planned facilities potentially available to support the NI PEIS proposed action. The needs of the other DOE program offices were a primary consideration, as these facilities were considered as potential alternatives for implementation of the proposed action. One of the primary considerations for including a candidate facility as a reasonable alternative was that implementation of the NI PEIS proposed action not impact the capability of the facility from fully meeting the requirements of preexisting DOE mission objectives. The focus of the design for new facilities in the NI PEIS was to support the NI PEIS proposed action. Surplus capacity at these new facilities could be made available to other DOE program offices and/or the private sector on a noninterference cost-reimbursable basis.

Chapter 4 of the NI PEIS addresses cumulative impacts at INEEL and other sites. These impacts include those associated with the proposed action, current, and planned activities at INEEL. The statement concerning "needs beyond DOE's Office of Nuclear Energy, Science,

***Commentor No. 2050: Stanley Hobson (Cont'd)
Citizens Advisory Board***

environmental documentation. If DOE makes no effort to respond to comments during scoping, how can the agency demonstrate that its public participation program is adequate? The INEEL CAB recommends that DOE make every effort to respond to all public comments, ensuring that the public's efforts are not wasted. The document states that it does not address any needs beyond DOE's Office of Nuclear Energy, Science, and Technology. It makes no sense to exclude other Department needs. Further, it was explained to the INEEL CAB that this PEIS is an "incremental EIS" that addresses only additional impacts attributable specifically to the actions described. NEPA requires consideration and public disclosure of the cumulative effects of all related actions during decision making. The INEEL CAB recommends DOE make every effort to consider all impacts of related decisions to ensure full compliance with NEPA and avoid vulnerability to challenges of segmented decision_making.

PURPOSE AND NEED FOR FEDERAL ACTION

There appear to be four separate objectives that form the basis of DOE's assertion that federal action is needed:

1. To expand the civilian nuclear research capacity and infrastructure.
2. To ensure a supply of medical isotopes to support medical needs,
3. To ensure a supply of isotopes to support various research and development (R&D) initiatives, and
4. To ensure an adequate supply of Plutonium_238 to support NASA's needs.

However, the INEEL CAB concludes that the document does not adequately substantiate the purpose and need for taking action within each of those four objectives. Explanations of current and existing capability and capacity leave the reader with the impression that some or all of the objectives could be achieved through continued operation of existing facilities. For example, it appears that: 1) R&D isotope production could be met through continued operation of the Advanced Test Reactor (ATR), High Flux Isotope Reactor (HFIR), and commercial light water reactors, 2) continued

**2050-2
(Cont'd)**

2050-3

2050-4

Response to Commentor No. 2050

and Technology" is referring to the need for the proposed action and not the cumulative impacts. In Chapter 4, the incremental impacts of the proposed action are evaluated. The results of this analysis are factored into the assessment of cumulative impacts.

- 2050-4:** The purpose and need are described in Section 1.2 of Volume 1. It is DOE's intent to provide domestic capability for production of medical and industrial isotopes, production of plutonium-238 for space missions, and nuclear energy research and development for civilian applications. Section 1.5 of Volume 1 was revised to include the recommendations of the Expert Panel and NERAC subcommittee. NERAC is an independent Federal advisory committee appointed by the Secretary of Energy to advise DOE on the civilian nuclear program.
- 2050-5:** Section 2.7.1.2.3 of Volume 1 of the Draft NI PEIS presents a comparison of mission effectiveness among alternatives. This section has been revised in the Final NI PEIS (see Section 2.7.3, Comparison of Mission Effectiveness Among Alternatives) to provide the reader a better understanding of the medical isotopes that can be produced using accelerator technology (Alternative 3) and reactor technology alternatives (Alternatives 1 and 4).
- 2050-6:** The description of the No Action Alternative is presented in Section 2.5.1 of Volume 1, while impacts associated with this alternative are presented in Section 4.2. Under Option 1, neptunium-237, currently stored in solution form at SRS, would be dispositioned according to current SRS stabilization plans. The environmental impacts of this action are addressed in the "Final Environmental Impact Statement, Interim Management of Nuclear Materials" (DOE/EIS-0220, October 1995). Under Options 2 through 4 the neptunium-237 would be transported from SRS to one of three candidate DOE sites (ORNL, INEEL, or Hanford) for up to 35 years for storage.
- 2050-7:** The alternatives are detailed in Chapter 2 of Volume 1. In particular, Section 2.5.1 describes the No Action Alternative and Section 2.5.3 describes Alternative 2, Use Only Existing Operational Facilities. As described in Section 1.3, alternatives evaluated in the NI PEIS, DOE could choose to combine components of several alternatives in selecting the most appropriate strategy.

Commentor No. 2050: Stanley Hobson (Cont'd)
Citizens Advisory Board

purchases of medical isotopes from Canadian sources could fulfill requirements for medical isotopes, and 3) the U.S. could continue to purchase Plutonium_238 from the Russians. In addition, this analysis is critical to assess the No Action Alternative. In order to remedy the current inadequate substantiation of the purpose and need for federal action, the INEEL CAB recommends that the NI EIS:

- * Provide a clear justification for expansion of civilian nuclear research capacity and infrastructure_based on an assessment of deficiencies in current capacity and infrastructure_and demonstrate how that need has been verified.
 - * Include a full explanation of all current and viable sources of each desired material (medical isotopes, R&D isotopes, and Plutonium_238) and the capacity of each of those sources.
 - * Include clear estimates of the projected demand for and projected shortfall of each desired material over a specified timeframe. Clearly stated assumptions should form the basis for all projections.
 - * Demonstrate how each estimate of projected demands, shortfalls, and timeframes has been independently verified.
- A solid explanation of the purpose and need for action is necessary for adequate public review of environmental documentation. Further, sound estimates of need are required to: 1) establish design and operational requirements for facilities, 2) estimate the impacts that would result from construction and operation of facilities, and 3) assess whether existing facilities can be used or new facilities will be required.

ALTERNATIVES CONSIDERED

The document presents a mind_boggling array of alternatives. Unfortunately, it is unclear how these alternatives address DOE's four apparent objectives under its purpose and need for action. It appears that some of the alternatives only address a portion of the four objectives. We understand that the No Action Alternative inadequately addresses the four objectives, but question why other alternatives were considered if they do not meet all four of the objectives. The INEEL CAB recommends that DOE more clearly

**2050-4
(Cont'd)**

2050-5

Response to Commentor No. 2050

2050-8: The specific alternatives and options evaluated in the NI PEIS were not selected for the purpose of "bounding" the impacts. Rather they reflect reasonable potential actions that DOE has selected to meet the irradiation service needs identified in Section 1.2 of Volume 1. While DOE recognizes the possibility that a combination of alternatives/options may be ultimately selected for implementation in the Record of Decision, it did chose the five specific alternatives for this reason.

Although, the alternatives and impacts assessed were not selected for bounding purposes, the impact assessments are based on conservative modeling assumptions (see Appendixes G through J). As described in Section I.1.1, the accident analysis considered a spectrum of accidents including external events (e.g., airplane crashes, nearby explosions, fires), internal events (e.g., equipment failures, human error), natural phenomenon (e.g., floods, tornadoes, earthquakes), and sabotage and terrorist activities. The accidents were screened to determine which accidents would result in the highest consequences (i.e., dose) and the highest risks (i.e., frequency x consequence). In performing these analyses, several conservative and bounding assumptions were made (e.g., worse-case core loading in the irradiated facilities, worse-case target inventories) leading to very conservative consequences.

2050-9: Without identification of the specific "missing details" the commentors question can not be answered. With regard to the specific example, as discussed throughout Appendix E, the coolant for the new research reactor would be water.

2050-10: The DOE Manual 435.1. Radioactive Waste Management defines high level radioactive waste as the highly radioactive waste material resulting from the reprocessing of spent nuclear fuel, including liquid waste produced directly in reprocessing and any solid material derived from such liquid waste that contains fission products in sufficient concentrations; and other highly radioactive material that is determined, consistent with existing law, to require permanent isolation. DOE has prepared an implementation guide to DOE M 435.1 to assist in implementing the requirements contained in that manual. For this particular requirement, the definition of high-level radioactive waste, the guide is intended to facilitate the classification of indefinite waste as to whether or not they are high-level radioactive waste. It is recognized that the definition of high-level radioactive waste is not precise and is

***Commentor No. 2050: Stanley Hobson (Cont'd)
Citizens Advisory Board***

demonstrate how each alternative considered in the NI PEIS would address the four apparent objectives. Alternatively, DOE should explain which of the four apparent objectives would be achieved through implementation of each of the alternatives, and which would not.

We understand that Neptunium_237 would have no use under the No Action Alternative because no domestic Plutonium_238 production capability would be established. The description of that alternative fails to explain how and where the Neptunium would be treated and disposed, however, and no impacts are described that would be attributable to its management. The INEEL CAB recommends that DOE explicitly discuss how Neptunium_237 would be dispositioned under the description of the No Action Alternative and that the NI PEIS include all impacts associated with its disposition.

In addition, it is not clear why the alternatives described were considered and other apparently viable alternatives were not. For example, it seems that one reasonable alternative would be to use HFIR and ATR to produce medical and R&D isotopes and continue current reliance on Russian sources for Plutonium_238. Another possibility would be to use HFIR and ATR to produce Plutonium_238 and R&D isotopes and to rely on Canadian sources for medical isotopes. ATR and HFIR are fully operational; why not use them for production of isotopes? The INEEL CAB recommends that DOE provide clear explanations for why the alternatives analyzed in the NI PEIS were considered and others were not.

Further, the Draft NI PEIS does not offer an adequate explanation of why the alternatives used for the purposes of estimating bounding impacts were chosen (over other alternatives). Neither does it explain how DOE is certain that those alternatives are most appropriate for bounding the possible impacts that would result from the final selected actions. For example, the options under Alternative 2 do not appear to bound an option that would use ATR, HFIR, and a commercial light water reactor for irradiation of targets.

**2050-5
(Cont'd)**

2050-6

2050-7

2050-8

Response to Commentor No. 2050

essentially a source-based definition that also alludes to concentrations of a given waste stream. Page II-8 of this guide notes that for the purpose of managing high-level waste under DOE M 435.1-1 [sic], spent nuclear fuel includes spent driver elements and/or irradiated target elements that contain transuranium elements. This statement was included in the guide because the concentrations of long-lived isotopes are likely to be somewhat high during reprocessing and it also meets the source-based definition. As a result of reviewing this guide and to address the comments raised, DOE is considering whether the waste from processing of irradiated neptunium-237 targets should be classified as high-level radioactive waste and not transuranic waste. As a result, the Waste Management sections (i.e., Sections 4.3.1.1.13; 4.3.2.1.13; 4.3.3.1.13; and 4.4.3.1.13) of this NI PEIS have been revised to reflect this different classification from what was assumed in the draft NI PEIS. As discussed in these revised sections, irrespective of how the waste is classified (i.e., transuranic or high-level radioactive waste), the composition and characteristics are the same and the waste management (i.e., treatment and onsite storage) for this NI PEIS would be the same. In addition, even if the waste is managed as high-level radioactive waste it would have no impact on the existing high-level radioactive waste management infrastructure (e.g., high-level waste storage tanks), since the high activity waste from processing of the targets would be initially stored and vitrified within the processing facility (i.e., FMEF, REDC, or FDPF).

This NI PEIS addressed wastes produced for each alternative, as well as cumulative impacts related to waste production. In particular, information on waste generation by waste types and how this waste would be managed can be found in the Waste Management Sections of Chapter 4 for each of the alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS would be managed (i.e., treated, stored, and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. Spent nuclear fuel is discussed for those alternatives where it would be generated as a result of the proposed activities.

2050-11: Each alternative and option is described separately in Volume 1, Section 2.5, Description of Alternatives, and summarized in Table 2-3. DOE

Commentor No. 2050: Stanley Hobson (Cont'd)
Citizens Advisory Board

It was not possible for us to reconstruct the bounding impacts as described using the information presented in the Draft NI PEIS. NEPA documentation should be written in a manner that can be understood by the public. The INEEL CAB recommends that DOE provide clear explanations for how the alternatives used for the bounding impact analysis in the NI PEIS were selected and how those bounding impacts were calculated.

2050-8
(Cont'd)

Finally, some details regarding the various alternatives appear to be missing from the descriptions of those alternatives. For example, what coolant would be used in a new reactor? The waste stream does not include High_Level Waste (HLW), which is inconsistent with our understanding of the processes that will be involved. If HLW will not be produced, there should be an explanation as to how it will be avoided. The document should also describe how spent nuclear fuel would be handled under each alternative. The options available for disposal of the waste streams are determined by the waste classification, and citizens are keenly concerned about DOE's ability to dispose of any waste generated. The description of each alternative should include an explanation of the quantity of each waste that would be generated along with an explanation of how each will be handled and dispositioned. The INEEL CAB recommends that DOE offer fuller explanations of the alternatives considered in the NI PEIS to ensure that readers can fully understand how each would be implemented and how it would impact the environment.

2050-9

2050-10

2050-11

PREFERRED ALTERNATIVE

In addition to failing to clearly explain the four basic objectives and how each alternative would address each of those objectives, the Draft NI PEIS offers no relative ranking of the four objectives. The members of the INEEL CAB could not discern whether expansion of R&D capacity was more or less important than the production objectives. In addition, it is not clear which of the production missions is most critical. Because of the appearance that some of the alternatives fail to achieve some of the objectives, we are forced

2050-12

Response to Commentor No. 2050

expects that this explanation is adequate to give the reader an understanding of how each alternative would be implemented and how each would impact the environment. It should be further noted that Chapter 4, Environmental Consequences, each alternative and option are also addressed separately in order to facilitate the reader's understanding of environmental impacts.

2050-12: All of the missions described in Section 1.2 of Volume 1 are considered to be of equal importance. Each of the alternatives described in Section 2.5 would contribute to fulfilling some of the stated missions. However, none of the alternatives can completely meet all of the projected nuclear infrastructure needs. Section 2.7.3 contains a discussion of the mission effectiveness for the alternatives. It is possible that a combination of alternatives could be selected in the Record of Decision, e.g., a low power accelerator in combination with the existing reactors to optimize research isotope production, or in combination with FFTF to optimize research and isotope production.

2050-13: The commentor is correct in noting that the No Action Alternative and Alternative 5, Permanently Deactivate FFTF, do not meet the full purpose and need as stated in the NI PEIS. The No Action Alternative does not need to meet mission goals since it is required under NEPA. Alternative 5 was added to the analysis as a result of scoping comments provided by the public. Permanent deactivation of FFTF is a part of all alternatives except the No Action Alternative and Alternative 1, Restart FFTF; thus, any Record of Decision involving Alternatives 2, 3, 4, or 5 could involve the permanent deactivation of FFTF.

2050-14: The United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. However Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 in Volume 1 was revised to incorporate this information.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's

***Commentor No. 2050: Stanley Hobson (Cont'd)
Citizens Advisory Board***

to surmise that DOE does not expect to achieve all four. A clear explanation of the relative importance of the four objectives would greatly enhance the readers' ability to understand how DOE will select its preferred alternative. The absence of such discussion prevents meaningful comment on the part of the public regarding the selection of a preferred alternative. The INEEL CAB recommends that DOE offer a clear explanation of the relative importance of the four objectives in the NI PEIS to support public comment on the preferred alternative. Alternatively, DOE should dismiss all alternatives that fail to meet all four objectives.

For example, Alternative 5, involving permanent deactivation of Fast Flux Test Facility (FFTF), would not allow achievement of the four objectives. As such, it does not appear to be an alternative of equal intent to the others presented. The No Action Alternative similarly would not support achievement of the four objectives; but inclusion of a No Action Alternative is required under NEPA. The INEEL CAB recommends that NEPA environmental documentation for permanent deactivation of the FFTF should follow issuance of the Record of Decision for the NI PEIS if in fact restart of FFTF is not selected as the preferred alternative.

The alternatives discussed in the Draft NI PEIS identify both continued reliance on Canadian sources of medical isotopes and continued reliance on Russian sources of Plutonium_238. Because both options are included in this NEPA document, we assume that DOE considers them "reasonable" alternatives under NEPA. The text implies that DOE is unwilling to rely on Canadian sources of medical isotopes, but we do not understand why continued reliance on Russian sources of Plutonium_238 was not similarly dismissed. The INEEL CAB recommends that DOE clearly explain in the NI PEIS why continued reliance on Russian sources of Plutonium_238 is acceptable, yet similar reliance on Canadian sources of medical isotopes is not.

Another issue that should be considered in the selection of a preferred alternative relates to consistency with current

**2050-12
(Cont'd)**

2050-13

2050-14

2050-15

Response to Commentor No. 2050

preference is to establish a domestic plutonium-238 production capabilities.

2050-15: The use of mixed oxide or highly enriched uranium to fuel the FFTF has been rigorously evaluated in the Nuclear Infrastructure Nonproliferation Impact Assessment. This report confirms that the manner in which these fuels would be used, as described in the PEIS, is consistent with nonproliferation policy. In the event that a decision is made to restart FFTF, the first six years of operation would use existing onsite mixed oxide (MOX) fuel. DOE expects that an additional 15-year supply of mixed oxide fuel in Europe, owned by Germany, could be available for FFTF. MOX fuel does not use highly enriched uranium. Further, use of the Hanford MOX fuel would dispose of a significant U.S. stockpile of highly attractive fresh plutonium fuel by conversion to spent fuel through irradiation in FFTF. This represents a safe, low-cost, high benefit opportunity to reduce U.S. civilian plutonium without chemical or bulk processing. Use of the German MOX represents a similar advantage with respect to the German stockpile of separated civilian plutonium. During the period of MOX fuel use, in support of U.S. nonproliferation policy directives, DOE's Office of Nonproliferation and National Security would undertake a study under the Reduced Enrichment Research and Test Reactor (RERTR) program to consider the technical feasibility of using low enriched uranium to fuel the FFTF. Under this nonproliferation protocol, if use of low enriched uranium fuel is found infeasible in FFTF for meeting assigned missions, policy would allow DOE to subsequently procure highly enriched uranium fuel for use in FFTF. Again, this approach is consistent with U.S. nonproliferation policy. DOE did consider the impacts on nonproliferation policy in the selection of its preferred alternative in this Final NI PEIS.

2050-16: While there are differences in the total shipping distances and risks among the alternatives, risks from transportation are small for all of the alternatives. Figures and tables in Section 2.7.1.6 of Volume 1 summarize transportation risks and provide comparisons of transportation risks among alternatives and among options within alternatives. Transportation risk and associated costs were factored into DOE's selection of the preferred alternative.

Commentor No. 2050: Stanley Hobson (Cont'd)
Citizens Advisory Board

nonproliferation policy. It appears that FFTF is a good option based on capability, productivity, and possibly cost. However, we are concerned that the use of highly enriched uranium as a source may violate non_proliferation policy and agreements with international governments. The INEEL CAB recommends that DOE provide a clear explanation in the NI PEIS of how highly enriched uranium could be used without violation of nonproliferation policy. We further recommend that DOE consider impacts on non_proliferation policy in the selection of its preferred alternative.

2050-15
(Cont'd)

Another issue that should be considered during the selection of the preferred alternative relates to transportation impacts. The INEEL CAB recommends that DOE make every effort to select a preferred alternative that will minimize transportation, if at all possible. For example, if FFTF is selected, all four missions should be performed at Hanford in order to minimize transportation. Similarly, if DOE chooses to select an existing commercial light water reactor, then HFIR should be chosen to support other objectives, thereby minimizing transportation.

2050-16

COST CONSIDERATIONS

The INEEL CAB also reviewed the Cost Analysis Report that was written to support the decision_makers consideration of the Draft NI PEIS. It was released too late to be of much use to the public during the public comment period on the Draft NI PEIS. It was well written and understandable, despite some apparent holes. It provided cost estimates for the various alternatives considered in the Draft NI PEIS. We understood from the Draft NI PEIS that all of the alternatives except Alternative 5 would leave FFTF in standby. However, the cost estimates for all of the alternatives except Alternative 1, the No Action Alternative include \$281 million for deactivation of the FFTF. In comparison, restart of the FFTF would require only \$341 million. We conclude that this apparent oversight makes FFTF restart look more favorable as it is only \$60 million more than deactivation of the facility. The INEEL CAB recommends that DOE frame the alternatives considered in the NI PEIS in a manner that would maintain FFTF in standby mode for all alternatives except Alternative

2050-17

Response to Commentor No. 2050

2050-17: DOE notes the INEEL CAB's opinion that the Cost Report was well written and understandable. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS.

As considered in Volume 1 of the NI PEIS, FFTF would be permanently deactivated should a decision be made to select any alternative other than Alternative 1, Restart FFTF, or the No Action. Under no circumstances would it be maintained in standby except under the No Action Alternative. Under an Alternative 1 decision, since FFTF deactivation would not be implemented, deactivation costs would not be incurred. Therefore, for this NEPA review and record of decision process, the Cost Report correctly assigns FFTF deactivation costs to all alternatives except the No Action Alternative and Alternative 1.

As discussed in Section 2.5.1 of Volume 1, a decision not to establish a domestic plutonium-238 production capability in the future would require DOE to reconsider its stabilization strategy for the neptunium-237 currently stored in solution at Savannah River Site (No Action Alternative Option 1). This may ultimately lead to final disposition of the material. In the near term, stabilization of the neptunium-237 would be conducted in accordance with the Supplemental Record of Decision for the Final Environmental Impact Statement, Interim Management of Nuclear Materials (62 FR 61099). This Record of Decision would be amended or new NEPA analysis performed, if necessary. Therefore, the ultimate disposition of the neptunium-237 is beyond the scope of the NI PEIS and, as a result, the Cost Report includes only the costs of neptunium-237 storage for 35 years under No Action Alternative Options 2-4.

2050-18: The NI PEIS is adequate. This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and

***Commentor No. 2050: Stanley Hobson (Cont'd)
Citizens Advisory Board***

5 to allow consistent comparisons.

We appreciated Figure S_1 on page S_4 of the Cost Analysis Report. It allowed the reader to make meaningful comparisons among the alternatives. The INEEL CAB recommends that DOE add similar tables to the Draft NI PEIS to support public review.

If Neptunium_237 would not be used under the No Action Alternative, the costs associated with its disposition should be included in the cost estimates. The INEEL CAB recommends that the cost estimate for the No Action Alternative be revised to include all costs associated with disposition (including both treatment and disposal) of the Neptunium_237.

CONCLUSION

For all of the reasons stated above, the INEEL CAB finds the Draft NI PEIS to be inadequate. We conclude that DOE's analysis to date fails to provide sufficient analysis to support rational decision_making. The analysis is not presented in a clear, understandable manner. The document is simply too flawed for meaningful public review.

We understand there is a great rush to issue a Record of Decision before the current administration leaves office. While there may be some political, cost, or even technical advantages to this approach and schedule, this decision is too important to proceed without consideration of all relevant facts and alternatives. The goal of NEPA must not be thwarted.

The INEEL CAB recommends that the NI PEIS be completely re_written to address the current deficiencies and reissued as a revised draft PEIS for another round of public review and comment. DOE should add missing information, develop a solid approach to evaluating and comparing the alternatives, and enhance its analysis to support comparison among the myriad alternatives. The second draft should 1) substantiate the purpose and need for action, 2)

2050-19

Response to Commentor No. 2050

the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS. Further, DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives. This was accomplished through review and evaluation of site-specific information on the environmental conditions prevailing at ORR, INEEL, and Hanford to include a comprehensive analysis of the associated environmental and health risks of each alternative. DOE made every effort to obtain, analyze and disclose all required information to make a decision on expanding nuclear infrastructure.

2050-19: See response to Comment 2050-18.

Commentor No. 2050: Stanley Hobson (Cont'd)
Citizens Advisory Board

clearly state the Department's objectives, 3) describe multiple, comparable alternatives that would meet those objectives, 4) describe all impacts that would result from the comparable alternatives, and 5) evaluate the alternatives using consistent criteria. The public should be afforded an opportunity to review a revised draft NI PEIS that is not severely flawed in order to participate in a meaningful manner in DOE's decision_making process, as intended under NEPA.

Auto forwarded by a Rule
Colette Brown, Office of Defense Power Systems (NE_50)
U.S. Dept. of Energy

Dear Ms. Brown:

As a resident of the Columbia River basin, concerned with the vast store of high level nuclear waste now at Hanford, I implore you to halt any plans for restart of the Fast Flux Test Facility. Among the arguments against restarting FFTF:

*The financial cost and potential risk to the public have not been fully disclosed.

*Clean_up was declared by the Federal Government to the highest priority mission at Hanford.

*NASA has stated they have no need to purchase Plutonium_238.

*Washington State Medical Association says there is no need for FFTF as an added source of medical isotopes.

*Shipping weapons_grade plutonium through the region (to fuel FFTF) is an inherently risky (and unnecessary) proposition.

This is only a sampling of the numerous arguments against FFTF. Please cancel any restart plans now. Thanks for your consideration.

Sincerely,
Andrew Butz
411 NE 22nd Ave., #15, Portland, OR 97232

Response to Commentor No. 2052

- 2052-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., DOE's Richland Operations Office, U.S. Environmental Protection Agency, and the State of Washington Department of Ecology). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram funds designated for Hanford cleanup, regardless of the alternative(s) selected.
- 2052-2:** See response to Comment 2052-1.
- 2052-3:** The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS.
- 2052-4:** Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power

Commentor No. 2052: Andrew Butz (Cont'd)

Response to Commentor No. 2052

systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005.

A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium 238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

- 2052-5:** DOE notes the commentor's views. DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

Commentor No. 2052: Andrew Butz (Cont'd)

Response to Commentor No. 2052

The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

2052-6: The commentor appears to express the concern that DOE would expose people in the Columbia River Basin to risks associated with the transport of weapons-grade plutonium. None of the proposed alternatives involved the shipment of any weapons-grade plutonium to any port in the United States. Alternative 1 does postulate that DOE might decide at some point to import mixed oxide fuel from Europe to fuel FFTF. At this time, however, DOE has not proposed to import this fuel through any specific port. If DOE ultimately decides to import fuel from Europe, it would perform a separate NEPA analysis to select a port. This review would address all relevant potential impacts of overseas and inland water transportation, shipboard fires, package handling, land transportation, as well as safeguards and security associated with the import of SNR-300 mixed oxide fuel through a variety of specific candidate ports on the east and west coasts. It would consider all public comments, including local resolutions, concerning the desirability of bringing mixed oxide fuel into the proposed alternative ports.

In the event that DOE decides to enhance its nuclear infrastructure, it would not expose any population to high, unacceptable risks under any alternative. Any transportation activities that would be conducted by DOE would comply with U.S. Nuclear Regulatory Commission and U.S. Department of Transportation regulations. Associated transatlantic shipment would comply with International Atomic Energy Agency requirements. In Section J.6.2, DOE reviewed the potential maximum impacts from the marine transportation of mixed oxide fuel from Europe to a representative military port, Charleston, South Carolina, and overland transportation to Hanford. Also in that section, a bounding analysis demonstrates that the maximum potential radiological risks to

Commentor No. 2052: Andrew Butz (Cont'd)

Response to Commentor No. 2052

the surrounding public from mixed oxide fuel shipments would be extremely small (e.g., less than 1 chance in a trillion for a latent cancer fatality per shipment from severe accidents at docks and in channels and less than 1 chance in 50 billion for a latent cancer fatality per shipment from overland highway accidents).

- 2052-7:** Chapter 4 of Volume 1 and Appendixes H through J discuss the risk to the public from normal operation and from accidents that would be expected to result from implementation of the nuclear infrastructure alternatives. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

Subject: DONT RESTART FFTF

ATT: Colette E. Brown

How can you ethically consider restarting FFTF? In the 1995 Hanford Clean-Up Agreement the Dept. of Energy agreed to deactivate and decommission FFTF. The reasons for doing so are even more compelling today:

1. Plutonium238 would be the major product of FFTF, creating still more nuclear waste for the leaking, High-Level Nuclear Waste Tanks. NASA has written to the Dept.Of Energy stating they don't need more Plutonium 238 so why create it?
2. The secondary product, medical isotopes, still in an experimental stage in cancer treatment, are also unneeded according to the Washington Medical Association. An adequate supply is already available through reactors in Canada and elsewhere.
3. Delaying the Hanford Clean-Up and violating the Clean-Up agreement, further threatens the Columbia River, all life in the Columbia River, and all lands drained by the Columbia River. The epidemic cancer, birth defects etc. which would result create far more risk of cancer than any isotopes made in FFTF could ever cure.
4. Shipments of plutonium needed as fuel in FFTF would have to arrive either via Puget Sound or cross country by truck or railroad. The results of any accident in shipping would be catastrophic to any region involved, for thousands of years and countless generations.
5. The DOE will not release the Environmental Impact Statement until the time for public comment is over!
6. More nuclear waste, high or low level, is not acceptable at Hanford until present <wastes are in a permanently stable form. Adding new wastes would interfere with the primary mission of Hanford to clean it up.
7. Hanford employees, who showed up at the Richland hearing Aug. 31, 2000 in such great numbers, need not worry about job security. The Hanford clean-up required will employ large numbers of people for a very long time, probably at least for the following century. If scientists ever are successful in developing a process to render nuclear wastes permanently stable, there will surely be a great demand for them to enact this process on the nuclear waste of the whole world. Engineers should focus on reeducation in clean-up technology.

Please do not take on your shoulders the responsibility for the potentially catastrophic restart of FFTF.

Please enter my comments in the public record. I would appreciate a response.

Response to Commentor No. 2054

2054-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF. A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Prior public meetings were held on this formal milestone change. FFTF restart would not impact ongoing cleanup missions at Hanford.

2054-2: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. High-level radioactive waste would not be generated from merely operating FFTF. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. No waste would be placed in Hanford's high-level waste tanks.

The use of proposed alternative facilities associated with processing of neptunium-237 targets would have no impact on schedules or available funding for high-level radioactive waste programs at Hanford. The higher activity waste would be treated as a solid form via a stand-alone vitrification system, separate from any tank waste treatment system. Therefore, the existing Hanford high-level radioactive waste facilities would not be used, and as analyzed in the PEIS, no existing or planned high-level radioactive waste facilities would be used to treat the wastes resulting from processing the irradiated targets.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

2054-3: A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean

Commentor No. 2054: Beth Call (Cont'd)

Response to Commentor No. 2054

that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

2054-4: DOE acknowledges that other manufacturers can produce certain isotopes that are economically attractive. In fact, the United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes primarily molybdenum-99, and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements.

Although other manufacturers produce medical radioisotopes, DOE remains the key provider for a large number of radioisotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large-enough quantities to make their production financially attractive to private industry. However, supplies of many research isotopes are not readily available from existing domestic or foreign sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed. Under the NI PEIS proposed action and consistent with its mandates under the Atomic Energy Act, DOE would enhance its existing nuclear facility infrastructure to, among other things, more effectively support production of radioisotopes for medical applications and research. DOE's intent is to complement commercial sector capabilities to ensure that a reliable supply of isotopes is available in the U.S. to meet future

Commentor No. 2054: Beth Call (Cont'd)

Response to Commentor No. 2054

demand, and to encourage the commercial sector to privatize the production of isotopes that have established applications to a level that would support commercial ventures.

Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions basic energy sciences or defense. DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term (less than 5 years).

2054-5: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., DOE's Richland Operations Office, U.S. Environmental Protection Agency, and the State of Washington Department of Ecology). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Commentor No. 2054: Beth Call (Cont'd)

Response to Commentor No. 2054

2054-6: Medical isotope production has been identified as one of the purposes and needs (Section 1.2.1 of Volume 1) for which DOE action is necessary. The NI PEIS addresses the environmental impacts that would result from the production of medical isotopes. Although the 12 million medical procedures a year that use radioisotopes would be expected to result in significant health benefits, the evaluation of impacts resulting from medical procedures is outside the scope of the NI PEIS.

This PEIS has provided an estimate of the potential human health impacts associated with a range of reasonable alternatives as described in Section 2.5 of Volume 1. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, which includes restart of FFTF, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

As stated in Appendix H of the EIS, other human health impacts (non-fatal cancers and genetic mutations) occur with a lower frequency for the same level of exposure. Since latent cancer fatalities would not be expected among the public, it follows that the expected result for other radiological health impacts would also be small.

2054-7: Alternative 1 does postulate that DOE might decide at some point to import mixed oxide fuel from Europe to fuel FFTF. At this time, however, DOE has not proposed to import this fuel through any specific port. If DOE ultimately decides to import fuel from Europe, it would perform a separate NEPA analysis to select a port. This review would address all relevant potential impacts of overseas and inland water transportation, shipboard fires, package handling, land transportation, as well as safeguards and security associated with the import of SNR-300 mixed oxide fuel through a variety of specific candidate ports on the east and west coasts. It would consider all public comments, including local resolutions, concerning the desirability of bringing mixed oxide fuel into the proposed alternative ports.

Commentor No. 2054: Beth Call (Cont'd)

Response to Commentor No. 2054

In the event that DOE decides to enhance its nuclear infrastructure, it would not expose any population to high, unacceptable risks under any alternative. Any transportation activities that would be conducted by DOE would comply with U.S. Nuclear Regulatory Commission and U.S. Department of Transportation regulations. Associated transatlantic shipment would comply with International Atomic Energy Agency requirements. In Section J.6.2, DOE reviewed the potential maximum impacts from the marine transportation of mixed oxide fuel from Europe to a representative military port, Charleston, South Carolina, and overland transportation to Hanford. Also in that section, a bounding analysis demonstrates that the maximum potential radiological risks to the surrounding public from mixed oxide fuel shipments would be extremely small (e.g., less than 1 chance in a trillion for a latent cancer fatality per shipment from severe accidents at docks and in channels and less than 1 chance in 50 billion for a latent cancer fatality per shipment from overland highway accidents).

2054-8: DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and to providing ample opportunity for public comment on those actions. The original comment period on the Draft NI PEIS was set at 45 days according to the Council on Environmental Quality's (CEQ) "Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act" (40 CFR 1506.10(c)). As stated in the Notice of Availability (65 FR 46443 et seq.), the public comment period extended from July 28, 2000 to September 18, 2000. In preparing the Final PEIS, DOE has assessed and considered both oral and written comments received on the Draft PEIS during the public comment period and has responded to these comments in the Final PEIS. Volume 3 of the NI PEIS contains public comments received on the NI PEIS and DOE responses to those comments. Moreover, late comments were considered to the extent practicable.

2054-9: DOE notes the commentor's opinion. Restoration of the Hanford Site and waste management activities are recognized as the primary missions at Hanford. The Department sponsors numerous research efforts to immobilize and destroy hazardous and radioactive wastes. One of the possible missions for the FFTF facility is researching transmutation of radioactive waste.

FINAL Programmatic Environmental Impact Statement
for Accomplishing Expanded Civilian Nuclear Energy
Research and Development and Isotope Production Missions in the
United States, Including the Role of the Fast Flux Test Facility

Volume 3 Book 3—Comment Response Document

Cover photograph and illustration identification, beginning at top center and going clockwise:

- Radioisotope tagged monoclonal antibodies, “smart bullets,” target malignant cells for diagnosis and treatment of diseases
- The Fast Flux Test Facility at the Hanford Site near Richland, Washington
- Illustration of a satellite that could use radioisotope power systems
- The High Flux Isotope Reactor at the Oak Ridge National Laboratory near Oak Ridge, Tennessee
- The Advanced Test Reactor at the Idaho National Engineering and Environmental Laboratory near Idaho Falls, Idaho
- Tip of a remote-handling arm, used for work in developing industrial and medical isotopes

AVAILABILITY OF THE FINAL NI PEIS

General questions regarding this PEIS or for a copy of this PEIS, please contact:

Colette E. Brown, Document Manager
Office of Space and Defense Power Systems (NE-50)
Office of Nuclear Energy, Science and Technology
U.S. Department of Energy
19901 Germantown Road
Germantown, MD 20874
Attention: NI PEIS
Telephone: (877) 562-4593
E-mail: Nuclear.Infrastructure-PEIS@hq.doe.gov

This PEIS is accessible on the Office of Nuclear Energy, Science and Technology web site at www.nuclear.gov.

Printed with soy ink on recycled paper

Reader's Guide

Volume 3, the *Comment Response Document*, is organized into three chapters:

- Chapter 1 - Overview of the Public Comment Process and the Comment Response Document
- Chapter 2 - Written Comments and DOE Responses
- Chapter 3 - Oral Comments Presented at the Public Hearings and DOE Responses

These chapters are divided among the three books of Volume 3 as follows:

- Book 1 - Chapter 1 and Chapter 2 (pages 2-1 through 2-931)
- Book 2 - Chapter 2 (pages 2-932 through 2-1914)
- Book 3 - Chapter 2 (pages 2-1915 through 2-2344) and Chapter 3

Chapter 1, “Overview of the Public Comment Process and the Comment Response Document,” summarizes key issues raised during the comment period on the Draft NI PEIS. It also identifies major changes made to this NI PEIS after publication of the Draft in response to these comments and incorporates new information that was unavailable at the time of the issuance of the Draft NI PEIS.

Chapter 2, “Written Comments and DOE Responses,” provides a side-by-side display of the written comments received (full-text reproductions) and DOE’s responses. Individual comments are numbered in the margins of the comment document, and DOE responses to each numbered comment are provided on the right side of each page.

The comment document numbers in Chapter 2 are in ascending order but are not sequential. Each comment document was assigned a sequential log number as it was received. When the same comment document was submitted by many individuals, it was designated as a campaign. The campaigns were grouped together for the purpose of responding to comments, and do not appear in numerical order.

Chapter 3, “Oral Comments Presented at the Public Hearings and DOE Responses,” provides a side-by-side display of the oral comments presented at the public hearings and DOE’s responses. The speakers’ names appear alphabetically by hearing location. Commentors who submitted their oral presentations in writing will find their submittals and DOE’s responses in Chapter 2.

To Find a Specific Comment Document and DOE Response

Refer to the “List of Commentors” immediately following the Volume 3 Table of Contents. This list is organized alphabetically and contains the corresponding page number(s) to find the comment document. The public officials, organizations, and interest groups appear first, then individuals are listed. City and state government bodies are listed under “City of” or “State of.” Members of Congress are listed alphabetically under “Members of Congress.”

DOE has made a good faith effort to interpret the spelling of names that were either written on comments or were recorded on the telephone comment line.

Table of Contents

Chapter 1

Overview of the Public Comment Process and the Comment Response Document	1-1
1.1 The Public Comment Process	1-1
1.2 Public Hearing Format	1-1
1.3 Comments on the Draft NI PEIS	1-2
1.4 Environmental Protection Agency Rating of the NI PEIS	1-4
1.5 Issues Raised During the Public Comment Period on the Draft NI PEIS	1-4
1.5.1 Purpose and Need for the Proposed Action	1-4
1.5.2 Impact of FFTF Restart on Hanford Cleanup	1-5
1.5.3 Waste Management and Spent Nuclear Fuel	1-5
1.5.4 Cost of the Various Alternatives	1-7
1.5.5 Nuclear Nonproliferation Policy	1-7
1.5.6 Public Involvement	1-8
1.5.7 Environmental Impacts	1-8
1.6 Changes from the Draft NI PEIS	1-9

Chapter 2

Written Comments and DOE Responses	
Individual Commentors	2-1
Form Letter A (<i>Columbia Riverkeeper</i>)	2-2014
Form Letter B (<i>Varsity Construction</i>)	2-2051
Form Letter C (<i>No Nuclear Power for Space Missions</i>)	2-2053
Postcard Campaign A (<i>We support the restart of FFTF Reactor Facility . . .</i>)	2-2055
Postcard Campaign B (<i>TRIDEC</i>)	2-2063

Chapter 3

Oral Comments Presented at the Public Hearings and DOE Responses	
Oak Ridge, Tennessee	3-1
Idaho Falls, Idaho	3-5
Hood River, Oregon	3-13
Portland, Oregon	3-117
Seattle, Washington	3-238
Richland, Washington	3-345
Arlington, Virginia	3-450

Chapter 1

Overview of the Public Comment Process and the Comment Response Document

Chapter 1

Overview of the Public Comment Process and the Comment Response Document

In July 2000, the U.S. Department of Energy (DOE) published the *Draft Programmatic Environmental Impact Statement for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the United States, Including the Role of the Fast Flux Test Facility (Nuclear Infrastructure Programmatic Environmental Impact Statement [NI PEIS])*. In accordance with the Council on Environmental Quality (CEQ) and DOE National Environmental Policy Act (NEPA) regulations, a Federal Register notice (65 FR 46443) announced the availability of the Draft NI PEIS and invited interested parties to provide comments. The Draft NI PEIS or Summary was distributed to approximately 6,000 individuals.

1.1 THE PUBLIC COMMENT PROCESS

NEPA regulations mandate a minimum 45-day comment period after the U.S. Environmental Protection Agency's (EPA) Notice of Availability of a draft EIS to provide an opportunity for the public to comment on the EIS analysis and results. The 45-day comment period on the Draft NI PEIS began on July 28, 2000, and to provide interested parties with additional time to comment, the deadline for transmittal of comments was changed from September 11, 2000 (as stated in the transmittal letter of the Draft NI PEIS and the Summary), to September 18, 2000. While the official comment period ended on September 18, 2000, DOE addressed late comments to the extent practicable and considered all comments received through October 31, 2000, in preparing the final NI PEIS. Comments that were received through September 25, 2000, along with corresponding responses, have been included in Chapter 2 of this volume. Direct responses are not included to comments that were received after September 25, 2000. However, all of these comments were considered and are characterized by other comments received during the comment period (for which a response has been provided).

1.2 PUBLIC HEARING FORMAT

During the 52-day comment period, DOE held seven hearings to discuss the proposed action and to receive oral and written comments on the Draft NI PEIS. The hearings were held near the locations that would be affected by the proposed alternatives, as well as some additional locations in Oregon and Washington in response to stakeholder requests. In addition, a hearing was held in the Washington, D.C. area. The hearing schedule and estimated attendance at each hearing are presented in **Table 1-1**. These attendance estimates are based on the number of registration forms completed and returned to DOE at each hearing, as well as a rough "head count" of the audience, and may not include all those present.

Table 1-1 Hearing Schedule and Attendance

Hearing Location	Date	Estimated Attendance
Oak Ridge, Tennessee	August 22, 2000	15
Idaho Falls, Idaho	August 25, 2000	20
Hood River, Oregon	August 28, 2000	265
Portland, Oregon	August 29, 2000	320
Seattle, Washington	August 30, 2000	250
Richland, Washington	August 31, 2000	330
Arlington, Virginia	September 6, 2000	15
Total		1,215

An independent facilitator was present at each hearing to direct and clarify discussions and comments. A comment recorder also was present at each hearing to record the proceedings. At the hearings in Oregon and Washington, a second comment recorder was available in a separate room to receive comments from attendees who were not able to attend the entire session, or who wanted to give their comments and leave. Transcripts of the hearings are available in DOE public reading rooms and libraries listed in Chapter 7 of Volume 1.

DOE representatives were available to meet with the public for informal discussions prior to and after the hearings. In an effort to encourage interaction between members of the public and DOE representatives, DOE used an interactive format for the hearings. The format included a presentation, question and answer session, and a comment session. Each hearing opened with a welcome from the facilitator, followed by a presentation on the proposed action by a DOE representative. Next, the facilitator opened the question and answer session to give the audience a chance to ask questions about the material presented. This was followed by the comment session, during which attendees were randomly selected to provide their comments. Attendees received a numbered ticket from the staff at the registration table and the facilitator picked the tickets from a container to determine the order of speakers. To ensure that all attendees were given an opportunity to provide comments, each speaker was limited to 5 minutes. Those commentators who needed additional time were invited to speak again after everyone had an initial opportunity to provide their comments. Modifications to the format were made at each of the public hearings to fulfill any special requests of attendees.

1.3 COMMENTS ON THE DRAFT NI PEIS

The public was encouraged to submit comments on the Draft NI PEIS to DOE via U.S. mail, e-mail, telephone, fax, and at the public hearings. DOE received approximately 3,400 submittals containing over 6,200 comments addressing a wide range of issues. A number of written comments submitted during the hearings were also presented orally; those comments were counted once. All comments submitted to DOE during the comment period were given equal consideration in preparation of the Final NI PEIS. Comments determined to be beyond the scope of the NI PEIS were forwarded to the appropriate DOE office for consideration. **Table 1–2** lists the number of comments received by method of submission.

Table 1–2 Comment Submission Method

Method	Number of Submittals
U.S. mail	2,493
E-mail	332
Telephone	107
Fax	92
Comments submitted at hearings	439
Total	3,463

Upon receipt, all written submittals were date-stamped and assigned a sequential log number used in tracking during the comment response process. Oral comments presented at the hearings were similarly identified and assigned a sequential log number. All comments were then processed through the comment analysis and response system for inclusion in this document. Each comment was assigned to a specific category to facilitate response and provide an overview of the type of comments that DOE received. Documents identical in content are presented only once (e.g., a written comment that was presented orally at a hearing). Campaigns (e.g., identical comments submitted by numerous individuals) likewise are presented and responded to only once. However, campaign documents with additional comments are responded to separately. The comment categories are shown in **Table 1–3**.

Table 1–3 Comment Categories

Accelerator Design	Miscellaneous Cost Issues
Air Quality	NEPA Process (extension of comment period, public participation, availability of information, completeness of overall analysis, additional hearings, etc.)
Alternative 1 - Restart FFTF	No Action Alternative
Alternative 2 - Use Only Existing Operational Facilities	Noise
Alternative 3 - Construct New Accelerator(s)	Nonproliferation
Alternative 4 - Construct New Research Reactor	Nuclear Energy Research and Development
Alternative 5 - Permanently Deactivate FFTF (with no new missions)	Oak Ridge Reservation Site Issues
Applicable Laws, Regulations, and Other Requirements	Policy
Cost of Alternatives	Preferred Alternative
Cultural and Paleontological Resources	Processing Facilities
Cumulative Impacts and General Environmental Impacts	Production of Medical and Industrial Isotopes
Ecological Resources	Production of Plutonium-238
Environmental Justice	Public and Occupational Health and Safety - Facility Accidents
Existing Human Health Risks	Public and Occupational Health and Safety - Normal Operations
FFTF Investment	Purpose, Need, and Timing of Missions
General Alternative Issues (alternatives considered but dismissed, new alternatives, etc.)	Reactor Design
General Irradiation Needs	Relationship to Other DOE Programs
General Antinuclear	Scoping
Generic Support Facility Design	Socioeconomics
Geology and Soils	Transportation (incident-free and accidents)
Hanford Site Issues	Visual Resources
Idaho National Engineering and Environmental Laboratory Site Issues	Waste Management (includes spent fuel issues)
Irradiation Facilities	Water Resources
Land Resources	

Chapter 2 contains the comments (submitted in writing and by telephone) and the DOE responses presented in a side-by-side format, with each delineated comment receiving a separate response. Not all responses appear directly next to their corresponding comment due to the varying lengths of each response. However, all comments and responses are numbered with a comment identification number to facilitate matching a comment with its response. Where commentors presented support for, or opposition to, a specific alternative, this was noted. Where commentors provided additional statements supporting their positions, DOE responded in detail to those that needed clarification or were in error.

Chapter 3 contains the comments that were submitted during oral presentations at the public hearings held in August and September 2000. The chapter is organized alphabetically by speaker's name according to the hearing location. The format and response procedures used in Chapter 2 were followed in Chapter 3.

Commentors who submitted their oral presentations in writing will find their submittals and responses in Chapter 2. The full transcripts from each hearing are available at DOE reading rooms and libraries listed in Chapter 7 of Volume 1.

An alphabetical List of Commentors with corresponding page numbers has been provided immediately following the Volume 3 Table of Contents to assist the reader in finding specific comment documents and

DOE responses. Public officials, organizations, and interest groups appear first, then individuals are listed. City and state government bodies are listed under “City of” or “State of.” Members of Congress are listed alphabetically under “Members of Congress.”

1.4 ENVIRONMENTAL PROTECTION AGENCY RATING OF THE NI PEIS

EPA reviewed and rated the Draft NI PEIS as Environmental Concerns - Insufficient Information (EC-2). To a large extent, a lack of information in the Draft NI PEIS was the basis for their environmental concerns. EPA was also concerned that the cost and nonproliferation reports were not made available to the public until well into the comment period on the Draft NI PEIS. A copy of the EPA rating is included among the written comments in Chapter 2 of this volume.

1.5 ISSUES RAISED DURING THE PUBLIC COMMENT PERIOD ON THE DRAFT NI PEIS

During the public comment period on the Draft NI PEIS, DOE received approximately 3,400 submittals containing over 6,200 comments addressing a wide range of issues. DOE considered comments received after the close of the public comment period to the extent practicable (see Section 1.5.6).

The following discusses the major issues raised, and DOE’s responses to these issues. Changes made in response to comments received on the Draft NI PEIS are described in Section 1.6.

Major issues raised addressed purpose and need for the proposed action; impact of FFTF on Hanford cleanup; waste management and spent nuclear fuel; cost of the various alternatives; nuclear nonproliferation policy; public involvement; and environmental impacts. Aside from comments on the proposed action and its environmental impacts, many commentors expressed support for or opposition to FFTF restart, the major point of public controversy associated with the NI PEIS.

1.5.1 Purpose and Need for the Proposed Action

Many commentors expressed the opinion that DOE failed to demonstrate a compelling argument for the projected need for medical isotopes, and that such medical isotopes could be produced or purchased elsewhere, particularly in Canada. In contrast, a large number of commentors expressed support for expanded isotope production by sharing personal stories of how medical isotopes had either saved a relative or friend, or could have saved them had isotopes been available. As presented in Section 1.2.1 of Volume 1, DOE sought independent analysis of trends in the use of medical isotopes, and established two advisory bodies, the Expert Panel and the Nuclear Energy Research Advisory Committee (NERAC). DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. While Canada currently provides a large amount of the medical radioisotopes used in the United States, it only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS.

A number of commentors also questioned the suitability of using FFTF for producing research isotopes in light of findings presented in the NERAC Subcommittee for Isotope Research and Production Planning Report. While it would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if FFTF were operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. In recognition of these

constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF for isotope production when coupled with these other missions.

Commentors also questioned the need for the United States to reestablish domestic production of plutonium-238. In particular, commentors pointed to the availability of plutonium-238 that could be purchased from Russia, and recent guidance from NASA stating that DOE no longer needed to support certain radioisotope power systems. As discussed in Section 1.2.2 of Volume 1, DOE could purchase plutonium-238 from Russia. However, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Current NASA guidance to DOE is also discussed in Section 1.2.2. The May 22, 2000, correspondence from NASA identifies that it no longer has a planned requirement for Small Radioisotope Thermoelectric Generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, SRTG development efforts were stopped in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling radioisotope power systems technology generator. This new radioisotope power system, referred to in the subject correspondence, requires one-third less plutonium as its fuel source. Because the Stirling radioisotope power systems technology is developmental, NASA has requested in a September 22, 2000, letter to DOE that the plutonium-238 needed for a large radioisotope thermoelectric generator be maintained as a backup.

1.5.2 Impact of FFTF Restart on Hanford Cleanup

A number of commentors expressed concern that DOE's primary mission at Hanford needs to be cleanup, including compliance with the Tri-Party Agreement. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford environmental restoration activities are conducted in accordance with the Tri-Party (i.e., DOE's Richland Operations Office, EPA, and the State of Washington Department of Ecology) Agreement. This agreement specifies milestones and schedules for restoration of all parts of Hanford. FFTF milestones in the Tri-Party Agreement were placed in abeyance (suspension) by agreement of the three parties until a decision is made on the future of FFTF. Public meetings were held on this formal milestone change. DOE is fully committed to honoring this agreement.

A number of commentors also expressed concern that funding for Hanford cleanup would be diverted for FFTF restart and hamper the progress of cleanup activities. The U.S. Congress funds Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM). Congress also funds FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded through NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2 of Volume 2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

1.5.3 Waste Management and Spent Nuclear Fuel

A number of commentors expressed concern over the generation and disposition of waste resulting from the proposed action. In particular, commentors pointed to past DOE waste management practices and questioned whether wastes resulting from proposed NI PEIS activities would be properly managed. The NI PEIS addresses wastes produced for each alternative, as well as cumulative impacts related to waste production. Waste minimization programs at each of the alternative sites are also addressed. These programs would be implemented for the alternative selected in the Record of Decision. The waste generated from any of the alternatives considered in the NI PEIS would be managed (i.e., treated, stored, and disposed of) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

A number of commentors expressed specific concern over the generation and disposition of waste resulting from FFTF restart and operation, and how this would impact Hanford's existing waste management infrastructure. Management of wastes that would be generated under implementation of Alternative 1 (Restart FFTF) is discussed in Section 4.3 of Volume 1 (e.g., Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that the Hanford waste management infrastructure is analyzed in this NI PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, *Radioactive Waste Management*, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical, or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Sections 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in the Fuels and Materials Examination Facility (FMEF) and how this waste would be managed at the site.

A number of commentors also raised concern that processing of irradiated targets for production of plutonium-238 would generate high-level radioactive waste. DOE Manual 435.1, *Radioactive Waste Management*, defines high-level radioactive waste as "the highly radioactive waste material resulting from the reprocessing of spent nuclear fuel, including liquid waste produced directly in reprocessing and any solid material derived from such liquid waste that contains fission products in sufficient concentrations; and other highly radioactive material that is determined, consistent with existing law, to require permanent isolation." DOE has prepared an implementation guide to M 435.1 to assist in implementing the requirements contained in that manual. For this particular "requirement," the definition of high-level radioactive waste, the guide is intended to facilitate the classification of indefinite waste as to whether or not they are high-level radioactive waste. It is recognized that the definition of high-level radioactive waste is not precise and is essentially a source-based definition that also alludes to concentrations of a given waste stream. Page II-8 of the guide notes that "For the purpose of managing high-level waste under DOE M 435.1-1 [sic], spent nuclear fuel includes spent driver elements and/or irradiated target elements that contain transuranium elements." This statement was included in the guide because the concentrations of long-lived isotopes are likely to be somewhat high during reprocessing and it also meets the source-based definition. As a result of reviewing this guide and to address the comments raised, DOE is considering whether the waste from processing of irradiated neptunium-237 targets should be classified as high-level radioactive waste and not transuranic waste. As a result, the Waste Management sections (i.e., Sections 4.3.1.1.13, 4.3.2.1.13, 4.3.3.1.13, and 4.4.3.1.13) of this NI PEIS have been revised to reflect this different classification from what was assumed in the Draft NI PEIS. As discussed in these revised sections, irrespective of how the waste is classified (i.e., transuranic or high-level radioactive waste), the composition and characteristics are the same, and the waste management (i.e., treatment and onsite storage) for this NI PEIS would be the same. In addition, even if the waste were managed as high-level radioactive waste, it would have no impact on the existing high-level radioactive waste management infrastructure (e.g., high-level waste storage tanks) because the high-activity waste from processing the targets would be initially stored and vitrified within the processing facility (i.e., FMEF, the Radiochemical Engineering Development Center [REDC], or the Fluorinel Dissolution Process Facility [FDPF]).

Commentors also expressed concern over the potential impacts of spent nuclear fuel generation from FFTF restart and operation, particularly regarding human health risk. This NI PEIS estimates that about 16 metric tons of heavy metal spent nuclear fuel would be generated over 35 years of operation of FFTF. Hanford is currently managing about 2,000 metric tons of heavy metal spent nuclear fuel. As indicated in Table 4-173, the radiation risk to a maximally exposed individual from normal operational activities during management of the current stored nuclear fuel over 35 years is 1.4×10^{-8} latent cancer fatality. The risk to the maximally exposed individual that would be associated with the new nuclear infrastructure operations to restart FFTF and operate FMEF or the Radiochemical Processing Laboratory is 9.5×10^{-8} latent cancer fatality. Furthermore,

only a small fraction of this risk would be attributable to management of the additional spent nuclear fuel at FFTF. The annual dose to the maximally exposed individual from all current and reasonably foreseeable activities is less than 0.2 millirem. This dose is well within the DOE dose limits given in DOE Order 5400.5, *Radiation Protection of the Public and the Environment*. As discussed in that order, the dose limit from airborne emissions is 10 millirem per year, as required by EPA regulations under the Clean Air Act; the dose limit from drinking water is 4 millirem per year, consistent with the EPA drinking water criteria under the Safe Drinking Water Act; and the dose limit from all pathways combined is 100 millirem per year. The risk to the population from all activities at Hanford would be 0.21 latent cancer fatality over 35 years. DOE has committed to remove the spent nuclear fuel at Hanford for ultimate disposition in a geologic repository.

1.5.4 Cost of the Various Alternatives

Commentors expressed opinions about the costs related to the stated missions. Commentors stated that a cost-benefit analysis was necessary to show the value of production of medical isotopes balanced against facility costs, in particular, the restart of FFTF, and noted that perhaps facilities would be able to pay for themselves. There were concerns that FFTF restart would take funds away from the cleanup of Hanford. Commentors noted that the decommissioning costs were not included for the restart FFTF option in the *NI Cost Report*. Several commentors remarked that the expense of plutonium-238 production cannot be justified when DOE needs to clean up existing problems at its sites.

Although the costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS, DOE prepared a separate *NI Cost Report*. This report would provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in this Final NI PEIS. Pursuant to CEQ regulations (40 CFR Section 1505.1(e)), such a document comparing alternatives should be made available to the public prior to any decision being made. DOE mailed this document to more than 730 interested parties on August 24, 2000. This report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided the summary of the *NI Cost Report* in Volume 2, Appendix P, in this Final NI PEIS.

1.5.5 Nuclear Nonproliferation Policy

Commentors expressed opinions about the nuclear nonproliferation implications of the proposed action. Commentors were concerned about keeping plutonium-238 out of the hands of third parties, and it was suggested that the purchase of plutonium-238 from Russia would stop proliferation of the material and the United States would know the disposition of the quantity purchased. Several commentors raised concerns about specific facilities described in the NI PEIS, including FDPF and FFTF. The use of highly enriched uranium fuel in FFTF was questioned related to a possible violation of U.S. nuclear nonproliferation policy. Conversely, the shutdown of FFTF that occurred previously was characterized as being done to discourage proliferation of nuclear weapons worldwide, but had instead weakened the U.S. position as a world leader in nuclear technology. There were comments about the timeliness of release of the *NI Nonproliferation Impact Assessment*, that no nonproliferation information was included in the Draft NI PEIS, and that nuclear nonproliferation policy should be considered by DOE in selection of its preferred alternative.

The plutonium being considered for production in this NI PEIS is plutonium-238, which is not the same isotope of plutonium that is used in nuclear weapons. The production of plutonium-238 does not present a nonproliferation concern. DOE developed the separate *NI Nonproliferation Impact Assessment*, published in September 2000, that analyzed the nonproliferation impacts of the actions considered in this PEIS and found that there are no U.S. nonproliferation policies, laws, regulations, or international agreements that preclude the use of any of the facilities in the manner described in the Draft NI PEIS. Although this policy analysis is not required under NEPA, it is an essential element in the decision-making process for the DOE nuclear

infrastructure. A summary of the *NI Nonproliferation Impact Assessment* is included in Volume 2, Appendix Q, of this Final NI PEIS. It is also available on the DOE NE web site (<http://www.nuclear.gov>).

1.5.6 Public Involvement

Commentors expressed opinions about the length of the comment period on the Draft NI PEIS, and said they wanted additional time to obtain and review relevant documents, including the *NI Cost Report* and *NI Nonproliferation Impact Assessment*. As identified in Section 1.1, the deadline for transmittal of comments was changed from September 11, 2000, to September 18, 2000 (as stated in the transmittal letters of the Draft PEIS and the Summary). While the official comment period ended on September 18, 2000, DOE addressed late comments to the extent practicable and considered all comments received through October 31, 2000, in preparing this Final NI PEIS. Comments that were received through September 30, 2000, along with corresponding responses, have been included in Chapter 2 of this volume. Direct responses are not included to comments that were received after September 30, 2000. However, all these comments were considered and are characterized by other comments received during the comment period (for which a response has been provided).

Many commentors expressed the opinion that public input is intended for “show only,” and that DOE has already made its decisions. Commentors also stated that they had given the same comments over and over again and that DOE representatives were not listening. DOE policy encourages effective public participation in its decision-making process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered all comments received from the public.

Some commentors expressed opinions about the conduct of the hearings, both positive and negative. The public hearing format was designed to be fair. The public hearing format used was based on stakeholder input and was presented in the Notice of Availability (65 FR 46443 et seq.) for the Draft NI PEIS. This format was intended to encourage public participation, regardless of the motivation for attending the hearing. It provided an opportunity for the participants to meet one another, exchange information, and share concerns, with DOE personnel available throughout the course of each hearing to answer questions. The meetings were facilitated by an independent moderator to ensure that all persons wishing to speak had an opportunity to do so. Persons wishing to comment were selected at random from the audience rather than according to the order in which they registered. This was accomplished by a random number drawing. In addition to the comment recorder stationed at the main hearing, a second recorder was available in an adjacent room to receive comments without the need to await selection at the main proceeding. The hearing format promoted open and equal representation by all individuals and groups.

1.5.7 Environmental Impacts

A number of commentors questioned the results of the environmental impact analysis and cumulative impacts, specifically at Hanford. Many of these comments focused on concerns that the proposed action would result in negative impacts to the health of individuals residing in the Hanford region. The NI PEIS analyzes the impacts of the various alternatives, and the environmental impacts associated with all proposed nuclear infrastructure activities are addressed in detail in Chapter 4 of Volume 1. Specifically, the environmental impacts associated with operation of the Hanford facilities during normal operations and from postulated accidents are presented in Section 4.3. These assessments were made using well-established and accepted analytical methods, as described in Appendixes G through L in Volume 2. The analytical methodology is conservative by nature; the actual impacts to the environment would be expected to be less than calculated. All impacts have been shown to be small. No fatalities among workers or the general public would be

expected over the 35-year operational period. The impacts to the biosphere (air, water, and land) were also evaluated and determined to be small.

Some commentors raised specific concern over potential contamination of the Columbia River resulting from the restart of FFTF. However, FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

A number of commentors also expressed concern that DOE would expose individuals in the Pacific Northwest to risks associated with importing of weapons-grade plutonium. None of the proposed alternatives involve the shipment of any weapons-grade plutonium to any port in the United States. Alternative 1 does postulate that DOE might decide at some point to import mixed oxide fuel from Europe to fuel FFTF. At this time, however, DOE has not proposed to import this fuel through any specific port. If DOE ultimately decides to import fuel from Europe, it would perform a separate NEPA analysis to select a port. This review would address all relevant potential impacts of overseas and inland water transportation, shipboard fires, package handling, land transportation, as well as safeguards and security associated with the import of SNR-300 mixed oxide fuel through a variety of specific candidate ports on the west and east coasts. It would take into account all public comments, including local resolutions, concerning the desirability of bringing mixed oxide fuel into the proposed alternative ports.

In the event that DOE decides to enhance its nuclear infrastructure, it would not expose any population to high, unacceptable risks under any alternative. Any transportation activities that would be conducted by DOE would comply with U.S. Nuclear Regulatory Commission (NRC) and U.S. Department of Transportation regulations. Associated transatlantic shipments would comply with International Atomic Energy Agency requirements. In Section J.6.2 of Volume 2, DOE reviewed the potential maximum impacts from the marine transportation of mixed oxide fuel from Europe to a representative military port (Charleston, South Carolina), and overland transportation to Hanford. Also in that section, the results of a bounding analysis show that the maximum potential radiological risks to the surrounding public from mixed oxide fuel shipments would be extremely small (e.g., less than 1 chance in a trillion for a latent cancer fatality per shipment from severe accidents at docks and in channels and less than 1 chance in 50 billion for a latent cancer fatality per shipment from overland highway accidents).

1.6 CHANGES FROM THE DRAFT NI PEIS

In response to comments on the Draft NI PEIS and as a result of information that was unavailable at the time of its issuance, this Final NI PEIS contains revisions and new information. These revisions and new information are indicated by sidebars. A brief discussion of the most important changes included in this Final NI PEIS is provided in the following paragraphs.

Chapter 1

Purpose and Need for Agency Action

As a result of public comments, additional discussion was incorporated to address DOE's production of medical, research, and industrial isotopes relative to global isotope production and availability. In addition, the discussion of the need for plutonium-238 production for space missions was expanded and updated to reflect the most recent planning guidance provided by NASA to DOE.

Issues Raised During the Public Comment Period on the Draft NI PEIS

Section 1.5, Issues Raised During the Public Comment Period on the Draft NI PEIS, was added to this Final NI PEIS.

Related NEPA Reviews

The Final NI PEIS was revised to add descriptions of the *Final Environmental Impact Statement, Management of Spent Nuclear Fuel from the K Basins at the Hanford Site, Richland, Washington* (DOE/EIS-0245F), and the *Environmental Assessment, Management of Hanford Site Non-Defense Production Reactor Spent Nuclear Fuel* (DOE/EA-1185). The impacts of these NEPA actions were factored into the assessment of potential cumulative impacts resulting from the NI PEIS proposed action.

This Final NI PEIS was also revised to reflect recent Records of Decision that have been issued for the *Final Environmental Impact Statement on a Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel* (DOE/EIS-0218F), the *Final Environmental Impact Statement for Treating Transuranic (TRU)/Alpha Low-Level Waste at the Oak Ridge National Laboratory, Oak Ridge, Tennessee* (DOE/EIS-0305), and the *Final Environmental Impact Statement for the Treatment and Management of Sodium-Bonded Spent Nuclear Fuel* (DOE/EIS-0306).

Changes from the Draft NI PEIS

Section 1.8, Changes from the Draft NI PEIS, was added to this Final NI PEIS.

Chapter 2

Transportation Requirements

Additional U.S. ports were named as candidates for receiving mixed oxide fuel from Europe.

Alternatives Considered and Dismissed

Information was provided to explain why the Isotope Production Facility at LANL, the Brookhaven LINAC (Linear Accelerator) Isotope Producer and the Alternating Gradient Synchrotron accelerator complex at Brookhaven National Laboratory, and CLWRs were not considered reasonable alternatives for the production of medical isotopes.

Information was also provided to explain why increasing the power levels at ATR and/or HFIR or installing rapid radioisotope retrieval systems would be insufficient to meet the long-term growth projection needs and therefore were dismissed as reasonable alternatives.

Preferred Alternative

The discussion of DOE's preferred alternative for accomplishing the proposed action, that is, Alternative 2, Use Only Existing Operational Facilities, Option 7, is included in this Final NI PEIS.

Summary of Environmental Impacts

Section 2.7 was revised in response to comments that it was difficult to compare environmental impacts among alternatives. Although estimates of the environmental impacts that would result from implementation of the

alternatives are the same as those in the Draft NI PEIS, the tables and accompanying text were reformatted for ease in comparing environmental impacts among alternatives and among options within alternatives. Section 2.7 was also revised to focus on incremental impacts that would result from implementation of the alternatives. Baseline environmental impacts were removed from the comparisons among alternatives and options. This information is now presented in Chapter 3.

Chapter 3

Affected Environment

Additional information was provided on the environmental baseline at each site, including graphics to more clearly illustrate existing surface water and groundwater conditions. Estimates of existing impacts for current HFIR/REDC operations were added to Sections 3.2.3.2 (Air Quality), 3.2.9.1.2 (Radiation Exposure and Risk), and 3.2.11.1 (Waste Inventories and Activities). Similarly, estimates for current ATR operations were added to Sections 3.3.3.2 (Air Quality), 3.3.9.1.2 (Radiation Exposure and Risk), and 3.3.11.1 (Waste Inventories and Activities). Estimates of existing impacts of maintaining FFTF in standby were added to Section 3.4.3.1 (Air Quality). Information was also provided on the impacts of the range fires affecting Hanford and INEEL during the summer of 2000. In addition, site data were updated to reflect recent measurements and analyses.

In response to public comments on the Draft NI PEIS, additional information on health studies conducted in the Hanford area was also incorporated.

Chapter 4

Air Quality

Stack parameters used for the air quality modeling were added. In response to public comment, estimates of the ambient air quality concentrations from FFTF sources were added to the deactivation section.

Water Resources

New water use and sanitary wastewater generation increments for REDC and FDPF were added to reflect the revised additional workforce required at these facilities and to be consistent with FMEF. Water use and wastewater generation rates for the new accelerator(s) and new research reactor alternatives were also revised. These changes were also incorporated into the waste management analyses.

Ecological and Cultural and Palentological Resources

These sections were updated to reflect that consultations concerning threatened and endangered species and cultural resources were conducted with appropriate Federal and state agencies. Consultations were also conducted with interested Native American tribes. No major issues were raised as a result of these consultations.

Socioeconomics

Section 4.3.1.1.8 was revised to reflect changes in the number of workers associated with FFTF operations and deactivation. The associated impacts on community services were also incorporated. In addition, the number of workers at the Oak Ridge Reservation was revised to reflect the entire site workforce rather than just the number of workers at the Oak Ridge National Laboratory.

Normal Operations

Based on more recent site data on occupational radiation exposure for workers at REDC, all worker health impacts for target processing at REDC, FMEF, and FDPF and for neptunium target storage at REDC, Chemical Processing Plant–651, and FMEF were updated. Also, low-energy accelerator source terms were modified to properly reflect normal operational emissions resulting in modifications to the population health impacts for all options of Alternative 3.

Facility Accidents

The high-energy accelerator analysis was redone to incorporate a more accurate revised source term, and the incremental risks for currently operating reactors were added to the tables. An additional analysis addressing industrial accidents was also performed and incorporated into Chapter 4.

Transportation

The neptunium inventory was revised to use the recently declassified actual inventory. The number of actual shipments from SRS to the processing facilities and the transportation risk estimates were modified accordingly.

Waste Management

The analysis for the Draft NI PEIS assumed that the waste generated from the processing of irradiated neptunium-237 targets is transuranic waste. However, as a result of comments received during the public comment period, DOE is considering whether the waste from processing of irradiated neptunium-237 targets should be classified as high-level radioactive waste and not transuranic waste. The Waste Management sections (i.e., Sections 4.3.1.1.13, 4.3.2.1.13, 4.3.3.1.13, and 4.4.3.1.13) were revised to reflect this different classification from what was assumed in the Draft NI PEIS.

Spent Nuclear Fuel Management

These sections were revised to quantify the generation of spent fuel from 35 years of operation and to state that dry spent nuclear fuel storage at the FFTF site is similar to NRC-approved methods currently being used for interim storage of commercial spent nuclear fuel. In addition, based on public comments, a reference was added about the K Basins spent fuel storage.

Cumulative Impacts

Cumulative impact tables in Section 4.8 were revised to present the contributions from each of the various site actions anticipated during the course of the operational period evaluated in this NI PEIS.

The air quality tables were also revised to incorporate the revised baseline from Chapter 3. In addition, waste management tables were revised to include the sites' treatment, storage, and disposal capacities for easier comparison of the waste generations by waste type to the waste management capacities at the sites.

Chapter 5

In response to public comments, a list of organizations that DOE contacted during the consultation process was added.

Volume 2

Summaries of the *NI Cost Report* and *NI Nonproliferation Impact Assessment* were added as Appendixes P and Q, respectively. NASA mission guidance correspondence was added as Appendix R.

Volume 3

Volume 3 of the NI PEIS was added to present the comments received during the public review period for the Draft NI PEIS and DOE's responses to these comments.

Chapter 2

Written Comments and DOE Responses

Commentor No. 2055: Travis Wells

Response to Commentor No. 2055

Draft PEIS Comment Form

I am strongly opposed to the use of the Hanford plant for FTF. I can understand how you could possibly consider running our environment any worse than it already is. Just take a look at all of the health problems this type of this same causes. I'm not sure if your aware of this but cancer rates were declining at the turn of the century and then started going back up when nuclear testing started. Maybe to you profits are more important than human rights and human life, but what good is all this money gonna do if something goes wrong and we all die. I am a registered voter and I refuse to vote for anyone who agrees with such policies. It's sick that you could ever consider putting the Hanford site back in use. And if you don't care about the health effects on you, take a second to look around all the people you love and see what could die because of this.

2055-1

2055-1: DOE notes the commentor's opposition to Alternative 1, Restart FTF.

2055-2

2055-2: Cancers are believed to be caused by a combination of hereditary and environmental factors, including radiological and chemical agents. Statistics from the National Cancer Institute indicate that the rate of cancer incidence and the rate of cancer mortality has dropped during the 1990's [NCI webpage (as of 10/19/2000) - <http://cancernet.nci.nih.gov/statistics.shtml> article entitled "Cancer Death Rate Declined in the 1990s for the First Time Ever"]. A survey sponsored by the National Cancer Institute and published in the Journal of the American Medical Association in 1991 (JAMA 1991:1403-1408) detected no general increase in the risk of cancer death for people living in 107 counties adjacent to or containing 62 nuclear facilities. The Hanford Site, Idaho National Engineering and Environmental Laboratory, and Oak Ridge Reservation were included in the survey. The study used cancer mortality data from Benton, Franklin, and Grant Counties in the survey for the Hanford Site (See Section 3.4.9.3 of Volume 1).

This PEIS has provided an estimate of the potential human health impacts associated with a range of reasonable alternatives as described in Section 2.5 of Volume 1. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Sections 4.3 through 4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from implementation of each of the alternatives. Alternative 1 includes restart of FTF, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with each alternative and with restarting FTF would be small.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

- attending public meetings and giving your comments directly to DOE officials
- returning this comment form to the registration desk at the meeting or to the address below
- calling toll-free and leaving your comments: 1-877-562-4593
- faxing your comments toll-free to: 1-877-562-4592
- commenting via e-mail (Nuclear.Infrastructure-PEIS@hq.doe.gov)

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Commentor No. 2056: Amy Linstead

Draft PEIS Comment Form

To whom it may concern,

I think re-opening the FFTF is a mistake! The effect the FFTF had was environmentally destructive & unsafe.

The FFTF hasn't even cleaned up the mess they made before now they want to open it again & make another mess.

You have destroyed the Columbia with your pollution & now our river is disgusting & grotesque.

As far as destroying the Columbia goes you've already accomplished that but if you re-open the FFTF you will make the Columbia completely unfixable.

I hope you take this letter into consideration.

7/12/00

Response to Commentor No. 2056

2056-1

2056-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2056-2

2056-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2056-3

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (i.e., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Commentor No. 2056: Amy Linstead (Cont'd)

Response to Commentor No. 2056

In regards to the Columbia River, all environmental parameters (e.g. air, soil, surface water, groundwater, vegetation, animals, etc.) in and around the Hanford Site are monitored on a set frequency. The information is available to the public in annual monitoring reports. No food or water restrictions are currently in place outside the Hanford Reservation as a result of Hanford activities.

2056-3: DOE policy encourages effective public participation in its decision-making process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE considered comments received from the public. No decisions have been made with regard to the facilities and locations evaluated to fulfill the requirements of the DOE missions. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

Commentor No. 2057: Holly Linstead

Response to Commentor No. 2057

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form *Holly Linstead*

To whom it concerns: _____

I strongly suggest not opening the FFTF who ever think this is a good idea. Obviously has not done their research or does not know what cause and effect are.

This is wrong and if they have not cleaned up the mess they have already made then what are you doing making more of a mess or even thinking of making one.

You don't understand the effects of what happened before.

You people really need to take a good a real good look at what happened before.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

- attending public meetings and giving your comments directly to DOE officials
- returning this comment form to the registration desk at the meeting or to the address below
- calling toll-free and leaving your comments: 1-877-562-4593

2057-1

2057-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2057-2

2057-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Commentor No. 2058: Anonymous

Response to Commentor No. 2058

Draft PEIS Comment Form

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

I oppose the restart of the
FFTF at Hanford nuclear reactor
because you kill people and poison
our environment. There is
no reason for all these things
you do. You can build a shed over
the crops to keep the insects
out.

2058-1

2058-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2058-2

2058-2: The environmental impacts associated with operation of the Hanford facilities during normal operations and from postulated accidents are presented in Section 4.3 of the NI PEIS. The assessments were made using well established and accepted analytical methods, as described in Appendixes G through L. The analytical methodology is conservative by nature; the actual impacts to the environment would be expected to be less than calculated. All impacts have been shown to be small. No fatalities among workers or the general public would be expected over the full 35-year operational period. The impacts to the biosphere (air, water, and land) are also shown to be small.

All air emissions and wastewater discharges would be in accordance with applicable permit and regulatory requirements. The releases of air pollutants and contaminated liquid are addressed in Section 4.3 of the NI PEIS. The release of air pollutants would result in concentrations well below Federal and state air standards (Table 4-13). The release of radioactivity and hazardous chemicals into the atmosphere would have a negligible effect on human health (Tables 4-17 and 4-19, respectively). There would be no discernible impacts to groundwater or surface water quality (Section 4.3.1.1.4). All impacts on ecological resources, including animals and fish, associated with operation of the FFTF would be small Section 4.3.1.1.6).

It is concluded that operation of the FFTF would have small adverse effects on the environment.

Draft PEIS Comment Form

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT
 RESTART FFTE NOW?

1500 PEOPLE DIE EACH DAY FROM CANCER.
 THE ADMINISTRATION HAS HAD SEVERAL YEARS
 TO DEVELOP A STRATEGY AND IMPLEMENTING
 POLICY FOR PROVIDING MEDICAL ISOTOPES TO
 REDUCE OUR 90% DEPENDENCY ON IMPORTS.

THE FFTF FACILITY, ALBERT PAID FOR
 BY OUR TAXPAYERS, IS THE ONLY FACILITY
 IN THE WESTERN HEMISPHERE WITH THE CAPABILITY
 OF PRODUCING MEDICAL ISOTOPES IN VARIETY (ABOUT
 60), QUANTITY AND MOST IMPORTANT POINT
 TO MEET MOST OF OUR MEDICAL ISOTOPE NEEDS.
 ACCELERATORS CANNOT EQUAL THE FFTF'S
 CAPABILITIES, BUT ARE ALSO NEEDED TO
 DIVERSIFY THE PRODUCTION OF MEDICAL ISOTOPES
 FOR WHICH THE ACCELERATORS ARE MORE SUITED.

REMEMBER 95% OF THE AMERICAN PEOPLE WOULD
 UNDOUBT OF YOUR HEALING NOR ARE EVEN
 AWARE OF OUR TECHNICAL NATIONAL TREASURE, THE FFTF.
 IF THEY WERE AWARE THEIR VOICES WOULD REVERBERATE
 OVERSHADOW THE DISAPPOINTED VOICES OF THE MINORITY
 VIEWS OF THE ANTI-NUCLEAR AND ENVIRONMENTAL FOES.

Seattle City Council

August 25, 2000

Honorable Bill Richardson,
Secretary of Energy
U.S. Department of Energy
1000 Independence Ave. SW
Washington, D.C. 20585

Dear Secretary Richardson:

We support your initiatives for discussions and use of independently facilitated, negotiations regarding the future of Hanford's FFTF Nuclear Reactor, which you put forward at the Washington State Democratic Convention on June 10th in a meeting with Washington Democrats. These commitments were innovative efforts at ensuring meaningful dialogue on an issue that has created deep opposition. We congratulate you for your willingness to make commitments to improve the EIS and engage in principled negotiations. We are growing increasingly concerned, however, with the apparent bias of the EIS, and the public participation process for the EIS.

Restart of the FFTF Nuclear Reactor and resumption of Plutonium processing at Hanford would have potentially catastrophic impacts on the health of Northwest citizens and our environment. Our constituents are entitled to a fair and impartial process to consider all reasonably foreseeable impacts and reasonable alternatives.

The Department is preventing our constituents and ourselves from reviewing and commenting on the Department's assessment of many of those potential impacts and alternatives by separating them from the Draft Environmental Impact Statement (EIS) and only disclosing them in reports to be made available after the public hearing are over. Apart from the bias of such an approach, this seems to be a clear violation of the National Environmental Policy Act (NEPA). Major public concerns stated in our comments for the scoping of this EIS, including those detailed in the Seattle City Council and Portland City Commission Resolutions opposing FFTF restart (and formally entered into the record at scoping hearings) are ignored in the Draft EIS.

It is not acceptable to have left out of the Draft EIS the following important details:

- what the Department will do with the nuclear and toxic wastes from restarting FFTF and Plutonium operations at Hanford.

Response to Commentor No. 2061

- 2061-1:** DOE notes the commentors' concerns. This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives.
- 2061-2:** DOE policy encourages effective public participation in its decision making process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.
- 2061-3:** The evaluation presented in the NI PEIS considered both normal operations and accidents and indicates that the environmental and human health impacts of these facilities would be low.
- 2061-4:** See responses to Comments 2061-1 and 2061-2.
- 2061-5:** The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS. DOE made every effort to obtain, analyze, and disclose all required information to make a decision on expanding nuclear infrastructure. CEQ (40 CFR 1500 et seq.) and DOE (10 CFR Part 1021) implementation regulations do not require inclusion of cost and nonproliferation studies in an environmental impact statement. The basic purpose of the NI PEIS is to describe the alternatives under consideration for implementation (Section 2.5 of Volume 1) and the environmental impacts that would occur if these alternatives were implemented (Chapter 4 of Volume 1). Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. The associated cost report and nonproliferation report were made available to the public on August 24, 2000 and September 8, 2000, respectively. DOE mailed these documents to approximately 730 interested parties, and these reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in public reading rooms. DOE has also

Commentor No. 2061: Seattle City Council Members (Cont'd)
(N. Licata, P. Steinbrueck, R. Conlin, J. Nicastro)

- the costs of restarting the FFTF reactor and each alternative (especially when the Department has target budgets that are not adequate to comply with the Hanford Clean-Up Agreement)
- the impacts on the nation's nuclear non-proliferation policies from restarting the reactor and use of Plutonium or High Enriched Uranium fuels
- the independent assessment of the need for particular medical isotopes and the suitability of the FFTF reactor to produce them.

For each of these critical areas, the Department has chosen to issue a report separate from the Draft EIS and not to release that report before the public hearings on the Draft EIS.

We are dismayed that the Draft EIS fails to disclose that the Department's own blue ribbon medical advisory committee recommended last April that *"the FFTF not be considered as a viable long-term source of research radioisotopes."* Additionally, neither disclosed or referenced in the Draft EIS are the NERAC Subcommittees for Isotope Research and Production Plannings' findings regarding 1) the suitability of the FFTF reactor for production of research medical isotopes, 2) the claims of the contractors regarding FFTF's costs and projected revenues for producing isotopes, and 3) the "poor" rating of the manufacturing practices at Hanford are.

The Draft EIS should have considered the alternatives recommended by the Subcommittee, and fully disclosed its criticism of the claims made by the FFTF's contractors. Instead, the Draft EIS and DOE documents repeat the cost and isotope need claims that the Subcommittee found to be flawed and overly optimistic. The public deserves to have this fully disclosed in the Draft EIS.

The concerns of the City of Seattle (Resolution 30060 and Resolution 28848) regarding the import of Plutonium on board ships passing through inland waters (such as Puget Sound or the Columbia River to the Port of Portland), and transport of Plutonium through the crowded Puget Sound region, are entirely ignored in this EIS. A shipboard fire involving a shipment of Weapons Grade Plutonium fuel in inland waters poses horrific consequences. Exposure of our constituents to such risk is entirely unacceptable. Other major concerns raised in the Portland and Seattle resolutions, and by Members of Congress, are similarly ignored in the Draft EIS. The Department undermines the public confidence in its consideration of the restart of FFTF when it proposes such actions and ignores the formal input from elected officials and the region's major cities.

As the hearings on the Draft Environmental Impact Statement (EIS) approach, the Department has not provided for adequate notice of the hearings to our constituents, has not changed its plans for conduct of the hearings, and those in charge of the EIS have

2061-11

2061-12

2061-13

2061-14

Response to Commentor No. 2061

provided summaries of the Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment in Appendixes P and Q, respectively, in the Final NI PEIS.

- 2061-6:** DOE has read and considered the public concerns detailed in the Resolutions of the Seattle City Council and the Portland City Commission. Section 1.4 of Volume 1 and the expanded discussion in Appendix N summarize the issues and concerns raised during the scoping process.
- 2061-7:** Management of wastes that would be generated under implementation of Alternative 1 (Restart FFTF) is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.
- 2061-8:** The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). Nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted fund designated for Hanford cleanup, regardless of the alternative(s) selected.
- 2061-9:** DOE notes the commentors' concern that an independent assessment of the need for particular isotopes and the suitability of FFTF is not included in the NI PEIS. Section 1.2.1 of Volume 1 discusses the need

Commentor No. 2061: Seattle City Council Members (Cont'd)

06/25/2006 17:15 2062330054

N. LICATA

PAGE 83

failed to live up to expectations for meaningful discussions regarding the substance of the EIS.

Last year, the conduct of the hearings was itself a major controversy because the Department refused to use a sign in list for determining the order of speakers. Again, the Department appears intent to allow the process to appear biased by allowing the Department's moderator to choose the order of speakers. Last year, this resulted in the spokespeople for the region's major public interest groups not being called on to speak until late in the night at hearing after hearing.

We are also disturbed that the Department has identified public interest groups as "opposition" and "protest" groups, thus requiring them to pay for police in order to hold pre-hearing workshops. We must reiterate that the Cities of Seattle and Portland are also officially opposed to the restart of FFTF.

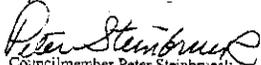

We urge the Department to take immediate steps to do the following:

1. Provide proper notice designed to notify our constituents that these hearings are on an EIS regarding the possible restart of Hanford's FFTF Nuclear Reactor and Plutonium processing.
2. Utilize unbiased procedures for the conduct of the hearings.
3. Discontinue the characterization of groups as "opposition" or "protest" and ensure that there is no intimidation of public comment.

Sincerely,

Councilmember Nick Licata

Councilmember Peter Steinbrueck

Councilmember Richard Conlin

Councilmember Judy Nicastro

2061-14
(Cont'd)

2061-15

2061-16

2061-17

2061-18

Response to Commentor No. 2061

for isotopes based on the Expert Panel and NERAC subcommittee recommendations. As further discussed in the response to Comment 158-13 and presented in Section 1.5 of Volume 1, the recommendations of these independent review groups were taken into consideration in developing the range of reasonable alternatives evaluated in the NI PEIS. NERAC is an independent Federal advisory committee appointed by the Secretary of Energy to advise DOE on civilian nuclear energy research program as noted in Section 1.2 of Volume 1.

2061-10: The draft Waste Minimization and Management Plan for the Fast Flux Test Facility (May 2000) and the NERAC Isotope Subcommittee report (April 2000) were referenced in the NI PEIS and were available prior to the public hearings. The NI PEIS cost and Nonproliferation reports were made available on August 24 and September 8, 2000, respectively; immediately after they were completed, as discussed in response to Comment 2061-5.

2061-11: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel convened to forecast future demand for medical isotopes estimated that the expected growth rate of medical isotope use during the next 20 years will range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and

RESOLUTION 22248

A RESOLUTION stating the City's position that high level nuclear wastes should not be moved through Seattle or the Puget Sound area by water or land transportation.

WHEREAS, in response to a proposal from the Federal Department of Energy in 1986 to ship high-level nuclear waste from Asia through Puget Sound and Seattle to inland destinations, the Mayor and all Councilmembers signed letters to the Secretary of Energy requesting a site-specific EIS before undertaking such shipments; and

WHEREAS, in 1990 the City Council again, this time by resolution, opposed a Department of Energy proposal to ship high-level radioactive wastes from the Hanford Nuclear Reservation to West Germany through the City and Port of Seattle; and

WHEREAS, this proposal was also withdrawn; and

WHEREAS, in 1991, the Department of Energy made another policy proposal for a ten-year program to transport from 100-352 cask-shipments of high-level nuclear waste from research reactors in foreign countries to DOE facilities in South Carolina and Idaho through Puget Sound ports without a complete EIS and again, the Council, through Resolution 28433, opposed such shipment; and

WHEREAS, the Department of Energy on October 21, 1993 began a public comment period on the scope of an EIS for a proposed policy which would permit acceptance through the Port of Seattle of spent nuclear fuel containing enriched uranium of U.S. origin from foreign research reactors; and this EIS will evaluate the impact of such shipments on marina ports of entry, overland transportation routes and storage at its Hanford or the Idaho National Engineering Laboratory (INEL) site, until a means for permanent disposition is available; and

WHEREAS, the DOE press release of October 21, 1993 appears to suggest that it wishes to return up to 700 spent fuel elements from foreign research reactor while the EIS on the acceptance policy is being prepared; and

WHEREAS, the City Council, the Port of Seattle, and the Longshoremen's Union in Seattle continue to oppose these nuclear shipments through Seattle without adequate safeguards, procedures and risk assessments in place, in advance of any such shipments; NOW, THEREFORE,

BE IT RESOLVED BY THE CITY COUNCIL OF THE CITY OF SEATTLE, THE MAYOR CONCURRING, THAT

cost-efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without disturbing the existing missions of these facilities.

DOE has taken the Expert Panel and NERAC report recommendations under consideration in developing the range of alternatives evaluated in the NI PEIS. These reports were made available to the public at the NI PEIS public information centers and on the Internet at www.nuclear.gov.

2061-12: The commentors concern that DOE would expose constituents in the Seattle area to risks associated with the transport of weapons-grade plutonium is noted. None of the purposed alternatives involved the shipment of any weapons-grade plutonium to any port in the United States. Alternative 1 does postulate that DOE might decide at some point to import mixed oxide fuel from Europe to fuel FFTF. At this time, however, DOE has not proposed to import this fuel through any specific port. If DOE ultimately decides to import fuel from Europe, it would perform a separate NEPA review to select a port. This review would address all relevant potential impacts of overseas and inland water transportation, shipboard fires, package handling, land transportation, as well as safeguards and security associated with the import of SNR-300 mixed oxide fuel through a variety of specific candidate ports on the west and east coasts. It would consider all

I. It is the City's position that no shipments of high level nuclear waste, from any source and to any destination requiring transport through the State of Washington, shall be moved through Seattle by land or water transportation without complete site-specific EIS's for each port and each transportation corridor involved, which conclusively establish that shipments will not pose risk to the health or safety of Seattle's residents.

II. It is the City's position that the EIS which is being prepared for the proposed policy should be as thorough and detailed as possible, addressing all potential risks to human health and the environment. The EIS should explore a range of alternatives including leaving the nuclear waste in situ until a strategy for disposal is resolved upon; having DOE take title to the material at the point of its generation, rather than when it arrives at the storage facility; using less-populated locations than the Port of Seattle for transfer from ship to land transport; and using a less congested and dangerous transportation corridor than through Seattle and over the Cascades. It should fully evaluate accidents or events which might result in breakage or leaking from the transport casks, as well as the resulting risks of harm from such leaks and the existence and availability of appropriate emergency equipment and facilities.

III. It is further the city of Seattle's position that if it is not completely satisfied with the EIS, and Seattle is chosen as a Port of Entry, the City will continue, by all means available, to oppose such a plan.

Response to Commentor No. 2061

public comments, including local resolutions, concerning the desirability of bringing mixed oxide fuel into the proposed alternative ports.

In the event that DOE decides to enhance its nuclear infrastructure, it would not expose any population to high, unacceptable risks under any alternative. Any transportation activities that would be conducted by DOE would comply with U.S. Nuclear Regulatory Commission and U.S. Department of Transportation regulations. Associated transatlantic shipment would comply with International Atomic Energy Agency requirements. In Section J.6.2, DOE reviewed the potential maximum impacts from the marine transportation of mixed oxide fuel from Europe to a representative military port, Charleston, South Carolina, and overland transportation to Hanford. Also in that section, a bounding analysis demonstrates that the maximum potential radiological risks to the surrounding public from mixed oxide fuel shipments would be extremely small (e.g., less than 1 chance in a trillion for a latent cancer fatality per shipment from severe accidents at docks and in channels and less than 1 chance in 50 billion for a latent cancer fatality per shipment from overland highway accidents).

2061-13: DOE provided notice of scheduled public hearings in accordance with the requirements of CEQ and DOE regulations (i.e., 40 CFR Parts 1503.1 and 1506.6 and 10 CFR Part 1021.313, respectively). This included announcement of the hearings in the Federal Register as well as in the local media. In addition, copies of the Draft NI PEIS and/or the Summary (including the public hearing schedule) were sent to each individual or group listed to receive it at the address on record. Additional notification to the public concerning meetings on the Draft PEIS were made by the Oregon Office of Energy to members of 20 focus groups in six Oregon communities and other Oregon interest groups.

2061-14: The public hearing format was designed to be fair and unbiased. The public hearing format used was based on stakeholder input and was presented in the Notice of Availability (65 FR 46443 et seq.) for the Draft NI PEIS. This format was intended to encourage public participation, regardless of the motivation for attending the hearing. It provided an opportunity for the participants to meet one another, exchange information, and share concerns with DOE personnel available throughout the course of each hearing to answer questions. The

meetings were facilitated by an independent moderator to ensure that all persons wishing to speak had an opportunity to do so. Persons wishing to comment were selected at random from the audiences rather than according to the order in which they registered. This was accomplished by a random number drawing. In addition to the comment recorder stationed at the main hearing, a second recorder was available in an adjacent room to receive comments without the need to await selection at the main proceeding. The hearing format used promoted open and equal representation by all individuals and groups.

2061-15: DOE does not engage in or condone the actions alleged in the comment. DOE did not and does not label organizations or individuals. Neither does it interfere with workshops held by an organization, nor exert any influence or authority in the matter of fees for security and law enforcement charged by the owners or managers of facilities in which public meetings are held. Such matters are determined by the rules and regulations adopted by or applied to these facilities, consistent with local laws and municipal requirements.

For the record, DOE did not characterize public hearings participants as "opposition" or "protest" groups, and further, did not attempt to recommend or influence any meeting facility fees or security measures applicable to any group or individual.

2061-16: The commentors' concern for proper notice of the public hearing process is addressed in response to Comment 2061-13.

2061-17: The commentors' request to establish procedures for unbiased hearings is addressed in response to Comment 2061-14.

2061-18: The issue of opposition groups is addressed in response to Comment 2068-15.

2064-1

2064-2

2064-3

Response to Commentor No. 2064

- 2064-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 2064-2: FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.
- 2064-3: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

The long-run effects have not been adequately answered. Democratic processes of economic, technical & environmental impacts have been & are being badly abused

Name Brian Barnett
Address 109 SE ALDER #219
City, state Portland OR Zip 97214

Response to Commentor No. 2065

2065-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2065-2: The concerns expressed in this comment with respect to the long-term effects of FFTF operation are noted. The environmental impacts associated with restart and operation of FFTF are presented in Section 4.3 of the NI PEIS. All air emissions and wastewater discharges would be in accordance with applicable permit and regulatory requirements, such that short- and long-term impacts would be small. The release of criteria air pollutants would result in concentrations well below Federal and state air standards (Table 4-13). The release of radioactivity and hazardous chemicals into the atmosphere would have a negligible effect on human health (Tables 4-17 and 4-19). No long term adverse health effects, including cancer and genetic disorders, would be anticipated. There would be no discernible impacts to groundwater or surface water quality Section 4.3.1.1.4). All impacts on ecological resources, including animals and fish, would be small (Section 4.3.1.1.6). The management of all wastes (Section 4.3.1.1.13) would be conducted in accordance with applicable Federal and state laws and regulations and appropriate DOE orders. The generation of spent nuclear fuel from 35 years of FFTF operations would represent less than 1 weight-percent of the total spent nuclear fuel inventory presently stored at Hanford (Section 4.3.1.1.14). DOE is committed to transfer the spent fuel to the national geologic repository for ultimate disposition.

2065-1

It is concluded that nuclear infrastructure activities would have small effects on the environment, both in the long term as well as the short term.

2065-2

2065-3: DOE is committed to discharging its responsibilities in an open and unbiased manner and providing the public with comprehensive environmental reviews of its proposed actions. This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the environmental impact analysis of DOE's proposed alternatives for meeting mission requirements. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

2065-3

2066-1

2066-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2066-2

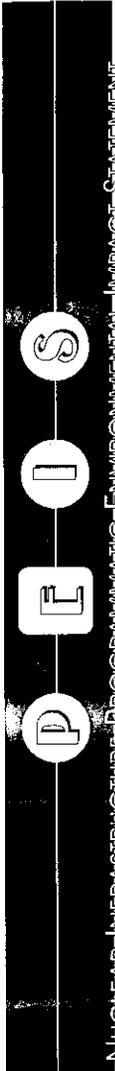

2066-2: This NI PEIS provides estimates of human health impacts associated with a range of reasonable alternatives. The methodology used provides realistic results based upon our current knowledge of the health impact of low doses of radiation. Sections 4.3 through 4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from implementation of each of the alternatives. Alternative 1 includes restart of FFTF, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

Worker safety is a key element of the Department of Energy's Radiological Health and Safety Policy (DOE P 441.1, April 26 1996). This policy states in part that Department of Energy facilities must "conduct radiological operations in a manner that controls the spread of radioactive materials and reduces exposure to the workforce and the general public and that utilizes a process that seeks exposure levels as low as reasonably achievable." Each Department of Energy site, including Hanford, is required to implement a radiological control program with the intent to meet this policy goal. Based on the assessment of worker health impacts for all of the alternatives and options considered that make use of Hanford facilities, no increase in cancer fatalities among the facility workers would be expected. For example in Alternative 1 option 3, all of the activities (target irradiation and processing) occur at Hanford facilities. As shown in Section 4.3.3.1.9, the expected consequences are less than one additional fatal cancer among the workforce; that is, no additional fatal cancers would be expected.

Commentor No. 2067: Curtis A. Kooiker

Response to Commentor No. 2067

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

I support the operations startup of the FFTF to meet the needs of medical isotopes, PU238 and research. The FFTF can meet almost every and any application of all the other options combined. We should not purchase any medical isotopes or PU238 from other countries. We should not purchase PU238 from Russia unless we include the costs to clean up the nuclear waste dumps and Reactors located in Russia.

2067-1

2067-1: DOE notes the commentor's support for Alternative 1, Restart FFTF, and opposition to purchasing medical isotopes or plutonium-238 from other countries. However, the commentor should note that the United States currently purchases limited quantities of plutonium-238 from Russia and approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada.

2067-2

2067-2: The public health and safety, the environmental impacts, and the total cost (including cleanup costs) associated with the plutonium-238 production in Russia are under Russian control. The cost for the purchase of Russian plutonium-238 is determined by the terms and conditions of the negotiated contract between the U.S. and Russia.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

- attending public meetings and giving your comments directly to DOE officials
- returning this comment form to the registration desk at the meeting or to the address below

RE: State of Idaho Comments - *Draft Programmatic Environmental Impact Statement for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the United States, Including the Role of the Fast Flux Test Facility (Draft EIS)*

Dear Ms. Brown:

The State of Idaho has the following comments on the above-referenced Draft EIS:

- INEEL appears to have the most existing capabilities for performing this mission at a single location, thereby minimizing transportation and construction and modification of facilities. The Final EIS should provide a more straightforward comparison of the impacts and capabilities for performing the various aspects of this mission at single locations.
- Summary page S-14 indicates the Advanced Test Reactor (ATR) has insufficient capacity to meet long-term needs for medical isotope production and nuclear research and development. The Final EIS should clarify the ATR's capacity to perform these missions, as ATR representatives have previously indicated to us that ATR does have sufficient capacity. The EIS should also provide more detailed projections for medical isotope needs during the timeframe evaluated.
- The Draft EIS does not clearly indicate how much neptunium-237 would be sent to INEEL for irradiation at the ATR. The final EIS should include the volume of neptunium-237 and number of shipments involved over the 35-year campaign. The Final EIS should also clarify how long Pu-238 produced would be stored prior to shipment to Los Alamos National Laboratory.

Response to Commentor No. 2068

- 2068-1:** The impacts associated with performing all mission activities at a single site would be at Hanford and are presented in Section 4.4.2.1, Alternative 2, Option 2. If either Alternative 3, Construct New Accelerator(s) Section 4.5) or Alternative 4, Construct New Research Reactor (Section 4.6) were selected for implementation, INEEL, ORR, and Hanford would be assessed in subsequent NEPA documents as potential sites for all mission activities. This approach is consistent with the programmatic nature of this nuclear infrastructure EIS.
- 2068-2:** The NI PEIS Volume 1, Summary Section S.4 and Section 2.6.1 were revised to include a discussion on ATR capacity.
- 2068-3:** A forecast for future demand for medical isotopes and the expected growth rate of medical isotope use during the next 20 years is provided in Section 1.2 of the NI PEIS. The growth projections were also adopted by DOE as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use at levels consistent with the Expert Panel findings.
- 2068-4:** The Final NI PEIS has been revised to clearly indicate in Table J-3 that there would be a total of 24 neptunium-237 shipments from SRS to support the domestic production of plutonium-238. These shipments would occur over a 30-month period. This estimate is based on 446 kilograms of neptunium-237 being available at SRS for shipment. This information was classified at the time the Draft PEIS was developed and has since been declassified. The actual number of shipments to a given irradiation facility, such as ATR, would depend on DOE's future allocation of irradiation core volumes to meet plutonium-238 needs. The Final NI PEIS assumes plutonium-238 produced by irradiation of neptunium-237 would be shipped to Los Alamos National Laboratory annually to meet any demand up to 5 kilograms per year. On this basis, plutonium-238 chemically separated in a given facility would be held there no longer than one year.

Commentor No. 2068: Kathleen Trever (Cont'd)
INEEL Oversight, State of Idaho, Governor's Office

Ms. Colette E. Brown

Page 2

September 18, 2000

- The State of Idaho recommends that the Final EIS explain the difference between what constitutes reprocessing prohibited by U.S policy and the reprocessing proposed in this EIS. The Final EIS should incorporate the recommendations contained on page 6-7 of DOE's Office of Arms Control and Nonproliferation's Nonproliferation Impact Assessment for this project (September 2000).
- The position DOE takes in this Draft EIS regarding the classification of waste derived from dissolved neptunium-237 targets is contrary to DOE's direction, articulated in the *Implementation Guide* prepared for DOE Order 435.1. In Volume I, page 4 -70 of the Draft EIS, DOE states, "No high-level radioactive waste would be associated with neptunium-237 target fabrication or processing in the FDPF." And on page 4-72, DOE states, "Although it may be managed as if it were high-level waste, the transuranic waste would not be designated as high-level radioactive waste." In short, in this Draft EIS, it is DOE's position that waste products removed from solutions of dissolved irradiated target material would be classified as transuranic waste.

Confusingly, the EIS also indicates that because INEEL does not currently generate transuranic waste, the waste could be managed as high-level waste. The Final EIS should reconcile the definition of waste products with DOE's waste management order 435.1.

In DOE G 435.1, DOE takes the position that, "For the purposes of managing high-level waste under DOE M. 435.1, spent nuclear fuel includes spent driver elements and/or irradiated target elements that contain transuranium elements."¹ As spent nuclear fuel, the dissolution of such target elements for the purpose of removing Pu-238 would constitute reprocessing. As explained in DOE G 435.1, "...the term reprocessing is not defined statutorily. However, reprocessing is considered by the Department to be those actions necessary to separate fissile elements (U-235, Pu-239, U-233, and Pu-241) and/or transuranium elements (e.g. Np, Pu, Am, Cm, Bk) from other materials (e.g. fission products, activated metals, cladding) contained in spent nuclear fuel for the purposes of recovering desired materials."²

From the above, it should be clear that under the adopted position of the Department as applied to the Draft EIS, irradiated neptunium-237 targets are spent nuclear fuel, since the irradiation process is expressly conducted to produce the transuranic element Pu-238. Using the Facility Dissolution Processing Facility (FDPF) at the Idaho Nuclear

¹ DOE G 435.1, II.A. Definition of High-Level Waste, *Components and Equipment Contaminated with High-Level Waste.*

² DOE G. 435.1, II.A. Definition of High-Level Waste, *Background.*

2068-5

2068-6

Response to Commentor No. 2068

2068-5: The purpose and scope of the NI PEIS is to evaluate the environmental impacts of no action and alternatives. This is the reason why DOE generated a separate Nuclear Infrastructure Nonproliferation Impact Assessment published in September, 2000. DOE will use the separate nonproliferation impact assessment report in its decision making process along with other factors.

DOE has also provided a summary of the Nuclear Infrastructure Nonproliferation Impact Assessment in Appendix Q in the Final NI PEIS, including an explanation of the difference between what constitutes reprocessing prohibited by U. S policy and the processing proposed in this PEIS. DOE will use the recommendations and information in this impact assessment its decision-making process. DOE's decision will be announced in the formal Record of Decision.

2068-6: The point raised in the comment is that the NI PEIS does not follow DOE Order 435.1 regarding management of radioactive wastes. The confusion seems to arise when the commentor indicates that the wording in the NI PEIS is in conflict with the Implementation Guide for the Order.

The Implementation Guide referred to in the comment is a guidance document but does not impose requirements. In this case, the guidance suggests that it is appropriate to manage radioactive waste, such as wastes from irradiated target elements, as high-level radioactive wastes but it does not mandate management of such materials as spent fuel or the processed wastes as high-level radioactive waste. What DOE Order 435.1 does require is that alternative management practices be safe and protective of human health and the environment. The guidance document is just that, a guidance for how to interpret the orders with the idea of giving several methods for safe treatment and disposal without mandating a change from the Order/Manual. Spent nuclear fuel [in the NWSA of 1982, and in the definitions attached to the Manual for DOE Order 435.1] is defined as fuel that has been withdrawn from a nuclear reactor following irradiation, the constituent elements of which have not been separated by reprocessing.

Commentor No. 2068: Kathleen Trever (Cont'd)
INEEL Oversight, State of Idaho, Governor's Office

Ms. Colette E. Brown

Page 3

September 18, 2000

Technology and Engineering Center to dissolve the irradiated targets and recover the transuranic element Pu-238 for future use is clearly reprocessing as intended in the DOE guidance. Therefore, it follows that any waste generated from the reprocessing of the neptunium-237 targets would be high-level waste, as defined in the Nuclear Waste Policy Act.

Historically, DOE has declared only waste from the first cycle of reprocessing to be high-level waste.³ In this regard, the removal of transuranic waste products from the dissolved target solution would constitute the first cycle of reprocessing and would qualify as high-level waste. The liquid waste remaining after the first cycle waste is removed and Pu-238 is recovered, may or may not be high-level waste depending upon its characteristics. As provided in the Nuclear Waste Policy Act, it may be high-level waste if it contains fission products in sufficient concentrations to warrant permanent isolation. DOE M 435.1 indicates that the Department can make this determination.

Finally, since the dissolution of irradiated neptunium-237 targets and the recovery of Pu-238 constitutes reprocessing, DOE will have to carefully determine the status of any objects contaminated with associated high-level waste. DOE G 435.1 provides guidance on making waste incidental to reprocessing determinations for such contaminated wastes and residues. It is by following this procedure that DOE can determine whether such wastes would be more properly managed as transuranic or low-level and therefore reclassified accordingly.

The Draft EIS must discuss DOE's position as adopted in DOE Order 435.1 and elaborated in supporting documentation. In addition, the implications of the waste being classified as high-level and the appropriate treatment options should be explained.

- DOE is currently preparing a *Final High-Level Waste and Facilities Disposition EIS, DOE/EIS-0287D* (HLW & FD EIS) for the management of liquid and calcined waste generated when uranium-235 was recovered from spent nuclear fuel at the Idaho Chemical Processing Plant, now called the Idaho Nuclear Technology and Engineering Center (INTEC). The preparers of this EIS should coordinate with those involved in the HLW & FD EIS, to determine if the high-level waste from reprocessing neptunium-237 can be added to the existing inventory at INTEC and treated in accordance with related decisions. The current plan is to have all the high-level waste at INTEC treated and ready to leave Idaho for interim storage or disposal in a geologic repository by 2035. This schedule would be relatively comparable to that proposed for the Pu-238 campaign.

³ The State of Idaho disagrees with this position, as indicated in the State's Foreword to the Idaho High-Level Waste and Facilities Disposition Draft EIS. (December 1999)

Response to Commentor No. 2068

2068-7: The use of proposed alternative facilities associated with processing of neptunium-237 targets would have no impact on schedules or available funding for high-level radioactive waste programs at the INEEL site. At INEEL the tanks would not be used although certain facilities at the Idaho Nuclear Technology Engineering Center (INTEC) would be used to treat the wastes resulting from processing the irradiated targets. These are reliable systems that would process a maximum of 1,050 cubic meters of low-level radioactive waste over the 35-year nuclear infrastructure operational period. The higher activity waste would be treated as a solid form via a stand-alone vitrification system, separate from any tank waste treatment system. No existing or planned high-level radioactive waste facilities would be used to treat the wastes resulting from processing the irradiated targets.

2068-6

2068-7

Sections 4.3.1.1.13, 4.3.2.1.13, 4.3.3.1.13, and 4.4.3.1.13 were revised to address comments received during the public comment period. This section now states that "DOE is considering whether the waste from processing of irradiated neptunium-237 targets should be classified as high-level radioactive waste and not transuranic waste. Irrespective of how the waste is classified (i.e., transuranic or high-level radioactive waste), the composition and characteristics are the same and the waste management activities (i.e., treatment and on-site storage) as described in this NI PEIS would be the same. In addition, either waste type would require disposal in a suitable repository. If it is transuranic waste, it would be nondefense waste and could not be disposed of at WIPP under current law. Because nondefense transuranic waste has no current disposal path, DOE Headquarters' approval would be necessary before a decision is made to generate such waste, as required by DOE Order 435.1. If the waste is classified as high-level radioactive waste, it is assumed for the purposes of this analysis that Yucca Mountain, Nevada, if approved, would be the final disposal site for DOE's high-level radioactive waste."

Commentor No. 2068: Kathleen Trever (Cont'd)
INEEL Oversight, State of Idaho, Governor's Office

Ms. Colette E. Brown

Page 4

September 18, 2000

- In any event, DOE should determine an appropriate disposal location for waste classified as non-defense transuranic waste prior to its generation.

Colette E. Brown
US Department of Energy
Germantown, MD

Dear Colette.Brown:

More wastes and contamination must not be added at Hanford. Restarting the reactor would cause more liquid waste, delay Hanford clean-up, and threaten the Columbia River.

2069-1

Direct efforts to cleaning up this dangerous area. Do not restart the reactor and add to the uncontrolled, perhaps uncontrollable, mess.

2069-2 2069-3

I am further outraged that, in response to my previous letter as a concerned citizen, you spent \$15.00 of taxpayer money on postage, not to mention the cost of printing, to send me seven pounds (I weighed it!) of technical material. Rather than your techno-justification for this project, use the common sense you were taught in elementary school: don't make another mess until you've cleaned up the one you already made.

2069-4

2069-2

Sincerely,

Gloria Koll

Copy to Washington Senators Murray and Gorton

Response to Commentor No. 2069

2069-1: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (i.e., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

2069-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Commentor No. 2069: Gloria K. Koll (Cont'd)

Response to Commentor No. 2069

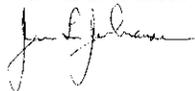

- 2069-3:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 2069-4:** DOE works carefully to strike a balance between keeping the public informed about potential impacts from its proposed actions in a timely manner, as required by NEPA and CEQ regulations, and controlling the cost of the NEPA compliance process. A Summary was prepared for the Draft NI PEIS and this Final NI PEIS as required by CEQ regulations, and the public had the option of receiving the Summary or both the Summary and the NI PEIS in hardcopy or via CD-ROM. Electronic publishing via the Internet is also used extensively by DOE for NEPA analyses and many other types of documents in order to reduce publications costs and material usage. Both the Draft PEIS and this Final NI PEIS have been made available on the NE website (<http://www.nuclear.gov>) and on CD-ROM.

Commentor No. 2070: James L. Johansen

Sept 12 2000

Dear Collette Brown/Secretary Richardson,
Please accept the following as public comments on the Draft Environmental Impact Statement on the Nuclear Infrastructure EIS. As a citizen of the Pacific Northwest, I am deeply concerned about the United States Department of Energy's proposal to restart Hanford's Fast Flux Test Facility Nuclear Reactor. I wish to have my values incorporated into the formal administrative record and taken into consideration when adopting the final record of decision. I also want you to respond to my concerns before you make your record of decision. Considering Hanford's overwhelming problems, including the crisis with tank waste treatment, as well as the damage caused by and radiation released from the Hanford wildfire, restarting FFTF is absolutely unacceptable. We must deal with the waste already at Hanford and focus on the clean-up mission. FFTF maintenance has already gobbled up \$100 million in clean-up money and distracted from desperately needed clean-up. Tank wastes are already seeping towards the Columbia River. More wastes must not be added to those tanks. Clean-up must be the only priority. We must save the Columbia River. Also, I object to the fact that you are asking citizens to comment on an incomplete study. You have not told us how you will deal with non-proliferation issues or additional waste from FFTF. Should FFTF be restarted, that decision will be illegal under Federal law and will be overturned! Do the right thing, shut down FFTF now and save the future of the Columbia River!
Sincerely,

James L. Johansen

Please Save the Columbia River!!

Response to Commentor No. 2070

- 2070-1: DOE notes the commentor's concerns. This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. DOE prepared a separate Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on September 8, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Nuclear Infrastructure Nonproliferation Impact Assessment in Appendix Q in the Final NI PEIS. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.
- 2070-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford and protection of the Columbia River. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., DOE's Richland Operations Office, U.S. Environmental Protection Agency, and the State of Washington Department of Ecology). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected. .

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE).

Commentor No. 2070: James L. Johansen (Cont'd)

Response to Commentor No. 2070

The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Hanford tank waste issues are not within the scope of this PEIS, as none of the alternatives considered would add to these waste volumes.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

In regards to the Hanford wildfire of 2000, the DOE Richland Operations Office, the State of Washington Department of Health, and U.S. Environmental Protection Agency performed environmental monitoring on and around the Site to assess potential radiological impacts. The wildfire did not cause a release of radioactive materials from any Hanford facilities but did result in resuspension of radioactive materials which were already in the environment. The very low levels of radioactive materials that were resuspended were slightly above natural background levels and required several days of analysis to quantify. Information on this event has been made available to the public and can be accessed at <http://www.Hanford.gov/envmon/indes.html>. This site also provides a link to information on the independent offsite air monitoring that was conducted by the U.S. Environmental Protection Agency.

2070-3: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.

2070-4: Management of wastes that would be generated under implementation of Alternative 1 (Restart FFTF) is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify

Commentor No. 2070: James L. Johansen (Cont'd)

Response to Commentor No. 2070

that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site .

2070-5: See response to comment 2070-3. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

 U.S. Department of Energy
 Office of Nuclear Energy,
 Science and Technology
 19901 Germantown Road, Room A-270
 Germantown, Md 20874

Dear Ms. Brown:

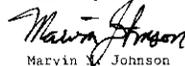

Having attended the DOE presentation in Portland on August 29, reading the literature provided, and considering the testimony, I distilled some relevant facts:

1. Medical isotopes are needed now and in the future.
2. The Hanford fast flux test facility cannot produce them simply by restarting.
3. The FFTF is more accident prone than a newer facility designed for isotope production.
4. The impetus for restarting the FFTF for isotope production is a ruse; the isotopes can be produced safer in a new US production site or purchased more economically from new Canadian facilities.
5. Nuclear energy for NASA exploration and military projects is madness. Have NASA engineers forgotten how to use solar power?

Another space probe like the Cassini mission would risk the destruction of all life and the systems that support life as we know it. The Cassini capsule hurtled over 70 pounds of Plutonium 238 back to Earth, using the Earth's gravitation system to pivot and accelerate the space probe. NASA makes mistakes--remember the Mars missions. (The US must unilaterally ban nuclear energy from space, or risk losing what remaining respect it has from the world's peoples).

The No Action Alternative seems prudent to me as long as it does not impede the Hanford cleanup schedule. This action also would be a clear message to Russia that the US does not favor more cold war adventurism.

Sincerely,

 Marvin M. Johnson

2071-1

2071-2

2071-3

2071-4

2071-5

2071-6

Response to Commentor No. 2071

2071-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for the No Action Alternative.

2071-2: FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

2071-3: The NI PEIS evaluates the environmental impacts of a range of reasonable alternatives to fulfill the requirements of the proposed action, which include the production of medical and industrial isotopes, the production of plutonium-238 for future NASA space exploration missions, and civilian nuclear research and development. In addition to restarting the FFTF, the NI PEIS also evaluates alternatives that would either employ the use of existing facilities or rely on the construction of new facilities.

DOE acknowledges that other manufacturers can produce certain isotopes that are economically attractive. In fact, the United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements.

Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report,

Commentor No. 2071: Marvin M. Johnson (Cont'd)

Response to Commentor No. 2071

as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term (less than 5 years). Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions, although issues such as NASA research priorities are beyond the scope of this NI PEIS. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. Plutonium-238 sources are used only when they enable the mission or enhance mission capabilities. None of the missions stated in the NI PEIS are defense- or weapons-related.

- 2071-4:** DOE notes the commentor's concern for NASA's use of nuclear materials for space missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. The scope of this Nuclear Infrastructure PEIS is limited to analysis of alternatives to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development.
- 2071-5:** See response to comment 2071-1. With respect to cleanup of wastes at Hanford, the proposed action and cleanup of wastes at Hanford are independent programs and actions related to one will not impact the other. However, it should be noted that the cleanup of legacy wastes at Hanford is beyond the scope of the NI PEIS.
- 2071-6:** DOE notes the commentor's viewpoint.

SUBJECT: Nuclear Infrastructure PEIS

Dear Ms. Brown:

I am writing as an advocate for the restart of the Fast Flux Test Facility to produce medical isotopes and to conduct other nuclear services and science missions of importance to the United States.

The need for FFTF as a major supplier of isotopes for the treatment of cancer, cardiovascular disease, and other human health problems is beyond question. At the present time, there are no other reactors in the United States with the capabilities of FFTF for producing medical radioisotopes, and the U.S. must currently rely on foreign suppliers for many of the isotopes used for both the diagnosis and treatment of disease. In addition to its remarkable capabilities for producing isotopes for medicine, industry and research, the FFTF has demonstrated its capability for safe and reliable operations over a ten-year period dating from the early 1980s to 1992.

During the past two decades there have been remarkable advances in the use of targeted radioisotope therapy of cancers that are difficult, and in some cases, impossible to treat by conventional methods such as chemotherapy. The basic limitation to using these new targeted therapeutic methods has been the limited supply of medical isotopes in the United States, and the Department of Energy must respond by making these isotopes available for use in nuclear medicine procedures. There is no other available domestic source with the capability of FFTF for producing these isotopes, most of which have short half-lives and must be produced in the United States to assure both reliable delivery and high quality. In addition, the 50-MW pool reactor proposed as one alternative in the PEIS has a thermal neutron energy spectrum and a relatively low neutron flux, making it unable to match FFTF's capability to produce large quantities of a wide variety of medical isotopes.

My recommendation to DOE, however, goes beyond just the restart of FFTF for producing isotopes to treat cancer and other diseases. There are several diagnostic isotopes in short supply such as iodine-123, which is used for imaging to detect tumors in the brain and other soft tissues, that can only be produced by cyclotrons. My opinion and strong recommendation to DOE is that a hybrid option should be chosen in which FFTF is restarted and, in addition, for a relatively small incremental cost of approximately 15%, a cyclotron with an energy of 50 to 100 MeV and a high beam current should be constructed at a DOE site with an existing radiochemical processing facility. This low-energy cyclotron would be dedicated to the reliable, year-around production of proton-rich medical isotopes. Because the programmatic EIS considers both the FFTF and low-energy cyclotron options, only site-specific environmental documentation would be required for the cyclotron option in order to implement this full course of action. These additional NEPA

2072-1

2072-2

Response to Commentor No. 2072

- 2072-1:** DOE notes the commentor's support for Alternative 1, Restart FFTF, and opposition to Alternative 4, Construct New Research Reactor.
- 2072-2:** As discussed in Section 1.3 of Volume I, in addition to the range of reasonable programmatic alternatives evaluated in the NI PEIS, DOE could choose to combine components of several alternatives in selecting the most appropriate strategy. The combination suggested by the commentor is an example that could be selected in the Record of Decision.

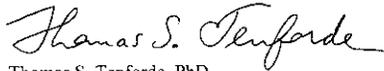

Commentor No. 2072: Thomas S. Tenforde (Cont'd)

Ms. Colette E. brown
September 15, 2000
Page 2

studies could be carried out in parallel with the initial stages of work required to restart FFTF, thereby avoiding any further delays in the reactivation of FFTF.

The combined FFTF and low-energy cyclotron option would provide the capability to produce the full set of radioisotopes needed by nuclear medicine physicians for the diagnosis and treatment of cancer and other diseases, and for medical research. It is, in my opinion, the optimal approach to take for improving the quality of health care for Americans in a cost-effective manner that uses the full range of technology offered by modern nuclear medicine.

Sincerely,

Thomas S. Tenforde, PhD

Commentor No. 2073: Karen Bowman

September 14, 2000

Ms. Colette E. Brown
 NE-50 - Office of Nuclear Science
 Energy & Technology
 U.S. Department of Energy
 19901 Germantown Road
 Germantown, MD 20874

Dear Ms. Brown:

This letter is to express my support for the restart of the Fast Flux Test Facility, and I would like to state some reasons why I do.

- 1) There is no question that used in some ways, nuclear materials can and have been very harmful, and also that clean-up of the Hanford Site contamination is very necessary. **This is a unique opportunity to assign a mission to the FFTF that can serve to compensate for some of the harm that has historically been done by actually doing some very real good.** Since it's known that the FFTF is not part of the clean-up problem, will not contribute to the clean-up problem or create one, nor take money from the clean-up budget, it's the **right thing to do.**
- 2) The FFTF can be likened to a national treasure yet to be unearthed. It is a state-of-the-art facility that's never had a real chance to show what she can do, and **now is her time.** **The mission proposed for the FFTF - producing medical isotopes for diagnostics and treatment and pu-238 for NASA - is a worthy one from every standpoint:**
 - The facility is **capable** of producing large quantities of needed isotopes and pu-238 and is **already built and paid for.** This in itself is a most compelling reason to restart. To shut down this perfectly serviceable reactor and then spend millions and millions building new facilities to do the same thing this reactor is capable of would be just plain stupid, not to mention irresponsible and unaccountable. Startup would cost far less than any other proposed option and would show taxpayers that the government is doing its best to be fiscally responsible, in that it wouldn't just throw away a perfectly good facility to suit political whims.
 - Medical isotopes are sorely needed to battle disease, both to diagnose and to treat. This is the treatment of the future for cancers and many other afflictions, and the future is **now.** Yes, we can buy isotopes from other countries, but why send our dollars elsewhere when we can produce them here? Haven't the lessons been learned about relying on other countries and then falling prey to their changing governments? How many more people must needlessly suffer and die before we provide this product in sufficient quantities to make a difference? **We need first to take care of ourselves**

2073-1

Response to Commentor No. 2073

- 2073-1:** DOE notes the commentor's support for Alternative 1, Restart FFTF, and opposition to building new facilities (i.e., new accelerator(s) or research reactor).
- 2073-2:** DOE notes the commentor's views and observations and concerns regarding misinformation in the public participation process. It is DOE policy to encourage public input on matters of regional, national and international importance as part of its commitment to facilitate a public participation process that is open and unbiased.

Commentor No. 2073: Karen Bowman (Cont'd)

Response to Commentor No. 2073

from within our own country, and only when we cannot, go to another for what we need.

3) You may be aware that the DOE's Hanford complex has long been the staple of Tri-Cities, Washington economy, and that strong efforts are being made to diversify through attracting new, private businesses. It is interesting that in all the hearings I've attended thus far, not once have I heard the vision been spoken of that seems so clear to me: If we produce isotopes here, many of them, because of their short half-lives, will need to stay here and patients - and perhaps researchers - will need to come here to use them. This will open the doors for a more extensive medical community to serve the public, thus serving the public in two ways:

- First and by far most importantly, by providing a **method to improve health and relieve suffering**;
- Second, by **adding to the desired diversity through creating a major regional "medical hub"** where patients know they'll receive the best of treatment, thus **improving the local economy while reducing dependence on Hanford's payroll**.

I have attended several of the PEIS hearings, and continue to be alarmed and concerned at the misinformation being disseminated by Heart of America and others. How this can be allowed to go on, I simply do not understand. Shame on the DOE for not clearly requiring that information must be **accurately** presented from both sides in the interest of **fully and correctly** informing the public. In my mind, every citizen has the right to disagree with a proposed program, but does **not** have the right to try to sway public opinion through half-truths, blatant lying and fear-mongering, and this is what Gerald Pollett and others do best. As a tragic consequence, otherwise rational people have a great fear of what is being proposed for the Fast Flux Test Facility. (Remember the "Raging Grannies" at the Seattle PEIS hearing last month? I had the opportunity to speak [civily] with a couple of them; sadly, one of them actually told me she'd rather that one of her children or grandchildren **died** than use "anything nuclear" to help them, even should that be the only method open to them to diagnose or treat. By the way, that comment elicited quite a surprised expression from the other Granny. Perhaps that will cause her to re-think what she's doing.)

I appreciate the opportunity to express my views to you in this letter, as well as to attend the hearings. I plead with you to ignore the political aspect and heed the simple truth and common sense of this matter: **Restarting the FFTF is the right decision to make.**

Sincerely,

Karen Bowman

RE: FAST FLUX REACTOR AT RICHLAND WASHINGTON

Dear Ms. Brown:

I have been in the practice of cancer medicine for approximately 18 years. During that time, I have actively been involved with the use of radioactive isotopes in the treatment of malignant disease. I use temporary, permanent and infusional radioactive isotopes in my care of cancer patients as deemed appropriate. There is no question that the medical use of radioactive isotopes is well established and quite beneficial for many cancer patients.

I am aware that the Fast Flux Test Facility at the Hanford Nuclear Reservation near Richland, Washington is currently being assessed for restart versus mothballing. I would strongly urge you to consider a restarting of FFTF. I believe that only through active research and clinical trials using radioactive isotopes can we learn how to optimally utilize their value in the treatment of cancer patients. From everything that I have read and heard, the FFTF facility is an optimal facility for producing radioactive isotopes for medical purposes. I would hope that you would strongly consider this possible benefit to the United States and the people of the world when you review this facility's potentials.

If I can be of any assistance to you in discussing the potential value of radioactive isotopes for the treatment of cancer, please contact me.

Sincerely,

Richard J. Giever, M.D., F.A.C.R.O.

Commentor No. 2075: Ruth Yarrow

Response to Commentor No. 2075

Draft PEIS Comment Form

I urge the DOE to choose option 5, shutting down the FFTF permanently, with no new missions. My reasons include the following:

1) Hanford is the most contaminated nuclear site in the western hemisphere. In accordance with its present mission of clean-up, there should be NO new waste streams.

2) In the EIS, medical isotopes are misleadingly portrayed a limited availability of isotopes as hampering research, when top radioisotope users (e.g. at the Univ. of WA) consistently report having no problem finding the isotopes they need. Furthermore, the EIS implies that the FFTF would solve this "problem" when in fact even the NERAC committee recommended against using the FFTF for isotope production for research, and the 1995 National Academy of Sciences Institute of Medicine report recommends NOT restarting reactors such as the FFTF for this purpose.

3) Other very promising approaches to fighting cancer, such as using antibodies specific to cancer, as Dr. Appelbaum is presently doing at the Fred Hutchinson Cancer Research Center, do NOT involve radioactive waste. *

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

- attending public meetings and giving your comments directly to DOE officials
- returning this comment form to the registration desk at the meeting or to the address below
- calling toll-free and leaving your comments: 1-877-562-4593
- faxing your comments toll-free to: 1-877-562-4592
- commenting via e-mail: Nuclear.Infrastructure-PEIS@hq.doe.gov

7/12/00 * 4) Pu-238 production is not needed, since the small amount NASA needs can be purchased from Russia.

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

2075-1

2075-2

2075-3

2075-4

2075-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2075-2: FFTF restart would not impact the schedule or available funding for existing cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram funds designated for Hanford cleanup, regardless of the alternative(s) selected. As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (i.e., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

2075-3: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings.

Commentor No. 2075: Ruth Yarrow (Cont'd)

4417 Cascadia Ave. S.
Seattle, WA 98118
September 14, 2000

To: Colette E. Brown

Public hearings are supposed to be to hear the public. For the public to contribute their wisdom to a decision, key information needs to be available to the public. At the recent hearings on the US Department of Energy's (DOE's) infrastructure, including the Fast Flux Test Facility (FFTF), the opportunity for the public to be informed and to be heard was seriously jeopardized. Here are some of the problems I observed, and suggestions for improvement.

Problem: In Seattle on August 30, you noted that you would present the EIS and the five options for the future of the FFTF but in reality you presented a list of arguments about why the facility should be restarted. **Suggestion:** The public should have an opportunity to hear an alternative view at the start of the meeting.

Problem: The venue (a room in the Convention Center) was cavernous with serious noise distractions from outside, the date was at the height of interested public being away on vacation, and parking was either very expensive or very difficult. **Suggestion:** Please hold the hearing in one of the Northwest Rooms at the Seattle Center in late September.

Problem: Information about the projected costs of the five alternatives was not available to the public before the meeting, an appalling omission. **Suggestion:** Please provide the relevant information or postpone the hearing.

Problem: Central to the entire discussion is the proposed use of the FFTF to produce medical isotopes, and but the specific recommendation of the National Academy of Science's Institute of Medicine report on the nation's radioisotope needs was not included in the EIS. **Suggestion:** Adhere to the openness initiatives launched by the DOE in 1993, and provide the relevant information to the public in a timely manner.

Problem: Non-proliferation is of critical importance to the survival of life on our planet, but was not considered in the materials for this hearing. **Suggestion:** Again, provide the relevant information.

Problem: While DOE acknowledged that the plutonium-238 need for NASA could be met more cheaply by purchasing it from abroad than by restarting the FFTF, the environmental impact study dismisses this option, and omits information from NASA about how little is needed. **Suggestion:** Again, provide the relevant information.

Problem: Any production at FFTF will produce new radioactive waste streams on the most contaminated site in the western world, a fact of overriding importance, not clearly presented in the EIS. **Suggestion:** Once again, please provide the relevant information.

Thank you for your attention to these requests.

Sincerely yours,

Ruth M. Yarrow

Response to Commentor No. 2075

Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

The commentor points out that both the National Academy of Sciences Institute of Medicine 1995 Report and the April 2000 NERAC Subcommittee for Isotope Research and Production Planning Final Report recommend against restarting reactors, such as FFTF, for isotope production. However, the conclusions presented in the more recent NERAC Report were made in the context of the facility producing research isotopes as its sole mission. DOE agrees that the FFTF's large size and configuration are not particularly well suited for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of the FFTF for the production of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production". In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates use of the FFTF when coupled with the other proposed missions.

DOE has taken the Expert Panel and NERAC report recommendations under consideration in developing the range of alternatives evaluated in the NI PEIS. These reports were made available to the public at the NI PEIS public information centers and on the Internet at www.nuclear.gov.

The United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. However Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to

2075-5

2075-6

2075-3

2075-6

2075-7

2075-2

Commentor No. 2075: Ruth Yarrow (Cont'd)

Response to Commentor No. 2075

clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

- 2075-4:** Genetic research and other research will hopefully lead to other effective ways to prevent and fight cancers. However, certain radioisotopes currently offer effective treatment for some cancers. Consistent with its mandates under the Atomic Energy Act, DOE is proposing this enhancement for the purposes of addressing three primary needs: 1) to support the increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and for which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear energy research and development in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio.
- 2075-5:** DOE notes the commentor's views concerning DOE's presentation at the Seattle, Washington public hearing.
- 2075-6:** The costs and nuclear nonproliferation impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such ancillary documents need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed these documents to more than 730 interested parties on August 24 and September 8, 2000, respectively. Both reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided summaries of the Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment in Appendixes P and Q, respectively in the Final NI PEIS.
- 2075-7:** Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In

Commentor No. 2075: Ruth Yarrow (Cont'd)

Response to Commentor No. 2075

addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Dear Ms Brown:

Attached is a paper that I would like to submit for consideration in determining the preferred option for the Programmatic Environmental Impact Statement for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the United States, including the Role of the Fast Flux Test Facility. This paper illustrates the flexibility and effectiveness of the FFTF in producing unique neutronic environments for medical isotope production, basic nuclear research, and development testing. The large available volume and high neutron flux level make the FFTF uniquely suited to simultaneously perform the anticipated civilian nuclear energy research and development and isotope production missions for the United States.

Sincerely,

David Wootan

2076-1

2076-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 2077: John Serop Simonian

9759 El Arco Dr.
Whittier, CA 90603-1303

September 17, 2000

Colette Brown
Department of Energy
Office of Space & Defense Power Systems, NE-50
19901 Germantown Rd.
Germantown, MD 20874

Dear Ms. Brown:

It has come to my attention that the Department of Energy is considering reopening previously closed plutonium-238 production facilities. The stated purpose for this expansion of Pu-238 use is to power future space missions. The production of Pu-238 would resume at Hanford, Washington, Oak Ridge, Tennessee, or Idaho Falls, Idaho.

Any expansion of the use of nuclear power anywhere in the world should concern us as Americans. The branching out of this dangerous energy source into space is even more alarming. Since the discovery and implementation of nuclear fission and fusion in the middle of the twentieth century, scientists have promised us that nuclear power would only benefit the world. The benefits, however, come at enormous cost to human life and freedom. One need look no further than the tens of thousands of civilians incinerated in Japan in 1945, the Polynesian islanders forced to undergo irradiation at the hands of Western powers in the 1950s and 1960s, the thousands around the world who have suffered unspeakable health problems because of meltdowns at nuclear power plants, and the billions of tax dollars wasted by world governments on building huge nuclear arsenals.

Clearly, the Department of Energy's love affair with nuclear power and with the almighty nuclear power industry's lobbyists has caused our government to move away from safer sources of power. It is understandable that NASA would like to travel to Mars more quickly, but the professional curiosity of already over-funded scientists should not override the rights of all Americans and all people to a world habitat free from nuclear power and its unmanageable waste, not to mention the disastrous effects of nuclear accidents. For this reason, I join with millions around the world in calling on you to halt the expansion of plutonium production. Will you please send me a summary copy of the final environmental impact study of the expansion of production of Pu-238?

Sincerely,

John Serop Simonian

2077-1

2077-2

Response to Commentor No. 2077

- 2077-1:** DOE notes the commentor's opposition to the use of nuclear power. The scope of this Nuclear Infrastructure PEIS is limited to analysis of alternatives to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development. The three missions are civilian nuclear energy missions and are not defense-related.
- 2077-2:** The purpose of the NI PEIS is to evaluate the environmental impacts of a range of reasonable alternatives to fulfill the proposed action, one of which is the domestic production of plutonium-238. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions. The commentor has been added to the NI PEIS mailing list and will receive a copy of the Final NI PEIS Summary.

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

It is unsafe. It is already horribly
polluted and we need to use the money for
clean-up. Too much time has been wasted.
The FFTF is actually not a good source for
radioisotopes. We must work for peace, not war.

Name VICTORIA MEIER
Address 4669 EXETER STREET
City, state WEST Linn, OR Zip 97068

Response to Commentor No. 2330

2330-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

While it would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production". In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with supporting the other stated missions.

2330-2: FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

2330-3: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., DOE's Richland Operations Office, U.S. Environmental Protection Agency, and the State of Washington Department of Ecology). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

August 31, 2000

Colette Brown, Document Manager
Office of Nuclear Energy, Science and Technology
U.S. Department of Energy
19901 Germantown Road
Germantown, MD 20874

Dear Ms. Brown:

The Port of Pasco has been a long time supporter of the Fast Flux Test Facility (FFTF) and strongly supports the objectives of the Department of Energy's Energy Program and specifically the implementation of the various uses attributed to the restart of the Fast Flux Test Facility (FFTF) as outlined in the Draft Environmental Impact Statement. We unequivocally support the use of FFTF for production of isotopes for medicine, space missions as well as other commercial isotope research and development projects.

The Draft EIS evaluation of these alternatives clearly shows the capability and superiority of the FFTF over other alternatives being considered.

Residents of Franklin and the surrounding counties were involved in the design construction and operation of FFTF. They are extremely knowledgeable about the facility's track record for safe operation. We would object to our federal tax dollars being spent to build a new facility, or retrofit an existing facility that has less capability than FFTF. We were pleased that the cost analysis done by the Department of Energy, as part of the current Environmental Impact Statement, confirms that FFTF is clearly the preferred alternative for the programs considered based on the availability, capacity for multi product missions, demonstrated technology, cost effectiveness, safety and minimal environmental impact.

We believe that the FFTF has been clearly identified in the EIS studies to be the preferred options for meeting the identified program missions without any significant negative social, environmental, or economic impacts. Operation of the FFTF will provide significant positive economic and social impacts not only to the Pacific Northwest, but also to the nation. Not only through its capability to supply currently unavailable or limited medical isotopes for general use but for its other capabilities attributed with a reactor of this magnitude.

Response to Commentor No. 2332

- 2332-1:** DOE notes the commentor's support for Alternative 1, Restart FFTF.
- 2332-2:** DOE notes the Commissioners' concerns and their support for Alternative 1, Restart FFTF.
- 2332-3:** No decisions have been made with regard to the facilities and locations evaluated to fulfill the requirements of the DOE missions. However, in accordance with Council on Environmental Quality regulations (40 CFR 1502.14(e)), DOE has identified its preferred alternative in Section 2.8 of Volume 1 of the Final NI PEIS. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.
- 2332-4:** The commentor is correct on the separation of DOE program funding sources. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected. Therefore, restart of FFTF would not impact current cleanup schedules.

Decommissioning FFTF, including associated costs and cleanup, is not within the scope of the NI PEIS. Before decommission activities were undertaken, DOE would prepare the appropriate environmental documentation to address the associated environmental impacts. Cost assessments would also be prepared.

DOE remains committed to cleaning up the Hanford Site independent of ultimate decision on FFTF. The amounts of wastes associated with decommissioning FFTF would be small. The schedule for cleaning up these other wastes would not be affected if FFTF were restarted.

2332-1

2332-2

2332-3

Commentor No. 2332: Port of Pasco Commissioners (Cont'd)
(O.E. Boston, Jim Klindworth, Del Lathim)

Furthermore, the startup and operation of the FFTF for the missions evaluated in this EIS will not interfere with or detract from the Hanford cleanup mission. The funding for FFTF programs is provided through Nuclear Energy program appropriated funds, which by law are separately appropriated and segregated from the Environmental Management program. But, if the decision is made to shutdown FFTF and decommission it, then responsibility for the facility would be transferred to the Environmental Management program, which would have a major negative impact on the limited cleanup program funding that is available.

2332-4

It is time for the Department of Energy to develop a new legacy and the Port of Pasco is asking you to make the bold decision to restart the reactor. We request that the assets of the FFTF receive an objective, balanced, and realistic evaluation of the alternatives during the preparation of the Record of Decision on this EIS.

2332-3

Respectfully, Port of Pasco Commissioners,

O.E. "Ernie" Boston
President

Jim Klindworth
Vice-President

Del Lathim

From: Lesley Pomeroy [apigee@hotmail.com]
Sent: Tuesday, August 29, 2000 4:03 PM
To: Secretary, The
Subject: Hanford

Dear Secretary Richardson,

Please do not allow the restarting of the test reactor at Hanford Nuclear Reservation!!! There are so many reasons why this project should be stopped. The fact that we still have the radioactive and chemical wastes up there are polluting the environment should be reason enough not to continue. As the Secretary of Energy, why won't you shut this facility down and invest our tax dollars and future in safe renewable energy sources like solar energy? I doubt you will even read this e-mail, but whoever does, it's your planet too. We can still make a difference. Stop the Fast Flux Test Facility!

**Sincerely,
Lesley Pomeroy**

2618-1

2618-2

2618-3

Response to Commentor No. 2618

- 2618-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 2618-2:** DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "... ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.

- 2618-3:** DOE notes the commentor's interest in alternative energy sources, although issues of research and development of alternative energy sources are beyond the scope of this Nuclear Infrastructure PEIS. The DOE missions to be addressed in this EIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development, can currently only be met using nuclear reactor or accelerator technologies.

 Washington, D.C. 20585

RE: Draft Programmatic Environmental Impact Statement for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the United States, Including the Role of the Fast Flux Test Facility, July 2000; DOE/EIS-0310D

Dear Mr. Magwood:

The Nez Perce Tribe's Environmental Restoration and Waste Management (ERWM) Program's main purpose is the oversight and participation in the clean-up and restoration at the Hanford Nuclear Reservation. The basis for the Tribe's involvement is the Treaty of 1855, in which the Federal Government acknowledged committed to protecting our retained usual and accustomed Columbia River rights. Resource areas in the Hanford Reach and elsewhere are protected by our treaties and provide the basis for the relationship between the U.S. Department of Energy (DOE) and the Nez Perce Tribe.

The Nez Perce Tribal Executive Committee has passed a Resolution (see attachment) opposing the restart of the Fast Flux Test Facility (FFTF) and to permanently deactivate FFTF (with no new missions). FFTF could potentially impede upon access to treaty resource sites. The possible health benefits do not outweigh the creation of new waste when new technologies are still needed to treat waste already in existence. Obligated funding should be redirected to the mission of clean-up and restoration efforts at Hanford. Treatment of wastes are still in need of new technologies.

The Nez Perce Tribe ERWM appreciates the opportunity to provide comments on the Draft NI PEIS, July 2000; DOE/EIS-0310D. If you have any questions please contact Patrick Sobotta at (208) 843-7375 or e-mail at pats@nezperce.org.

Sincerely,

Patrick Sobotta
 ERWM Director

2619-1

2619-2

2619-3

Response to Commentor No. 2619

- 2619-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.
- 2619-2:** DOE values its relationship with the Nez Perce Tribe and remains committed to treaty resource rights and access. Based on your discussion on September 28, 2000, with Mr. Dan Tano of the Department's Richland Operations Office staff, the concern about access to treaty resource sites is premised on your understanding of the waste and funding impact the Fast Flux Test Facility could have on Hanford Nuclear Reservation cleanup and restoration, a program in which the Nez Perce Tribe participates and provides oversight, pursuant to its interests under the Treaty of 1855. Specifically, we understand your position to be that in order to protect Tribal treaty-reserved resources, funding should be used for environmental cleanup at Hanford rather than for the Fast Flux Test Facility.

First, should the Department decide to restart the Fast Flux Test Facility, the waste streams would not impact the Hanford cleanup and would be managed according to a Waste Minimization and Management Plan being developed in consultation with the States of Oregon and Washington. Second, the Secretary is committed to maintaining the Hanford cleanup as a top priority. The management and possible enhancement of DOE's nuclear facility infrastructure based on the Secretary's decision, including the Fast Flux Test Facility if the decision called for its restart, would not divert or reprogram any funding from Hanford cleanup activities. The Hanford Site environmental restoration activities would continue in accordance with the Tri-Party Agreement.

Therefore, should DOE restart the Fast Flux Test Facility, we believe its operation would not impede in any way Nez Perce Tribe access to treaty resource sites. The Fast Flux Test Facility may eventually serve an important role in the Nation's science infrastructure. Given the limited and declining nuclear research infrastructure in the United States, we believe that an exhaustive evaluation of this facility is warranted.

- 2619-3:** The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to

Commentor No. 2619: Patrick Sobotta (Cont'd)
Nez Perce Tribe

NP 00-470

RESOLUTION

WHEREAS, the Nez Perce Tribal Executive Committee has been empowered to act for and in behalf of the Nez Perce Tribe, pursuant to the Revised Constitution and By-Laws, adopted by the General Council of the Nez Perce Tribe on May 6, 1961 and approved by the Acting Commissioner of Indian Affairs on June 27, 1961; and

WHEREAS, the Nez Perce Tribal Executive Committee (NPTEC) is the governing body of the Nez Perce Tribe; and

WHEREAS, the Nez Perce Tribe has been designated an affected Tribe since 1982 under the Nuclear Waste Policy Act (NWPA); and

WHEREAS, the Nez Perce Tribe has interests on the Hanford Nuclear Reservation, that include protecting our sovereignty, resources, culture, health and safety; and

WHEREAS, the Fast Flux Test Facility (FFTF) is an experimental facility consisting of special custom made components with no real mission that has been shown to cost \$60 million per year to keep it in standby mode; and

WHEREAS, the United States Department of Energy is currently drafting an Environmental Impact Statement (EIS) that will consider options for the disposition of the FFTF, including the restart of the facility.

NOW, THEREFORE BE IT RESOLVED, that the NPTEC opposes the spending of dollars on projects such as the FFTF and urges that those dollars be used to clean up and protect those Tribal treaty-reserved resources which have been contaminated or are being threatened by Hanford activities.

BE IT FINALLY RESOLVED, that the Nez Perce Tribe urges the United States Department of Energy to select as the preferred alternative for the FFTF draft EIS the permanent closure and demolition of the FFTF.

Response to Commentor No. 2619

Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

8051 28th NE
Seattle WA 98115
20 September 2000

Secretary Bill Richardson
Department of Energy
1000 Independence Avenue
Washington, D.C. 20585

Dear Mr. Richardson:

I am writing about the Hanford Nuclear Reservation.

I am encouraging you to shut down the FFTF and focus on CLEAN UP. Although Senator Gorton states the FFTF will generate radionuclides for cancer therapy, these can be made more efficiently in newer facilities. And although he states that restarting the FFTF will bring needed jobs to the Richland area, true clean up of existing problems will generate jobs and provide a lasting legacy of environmental restoration.

Yours truly,

Janet Kimball

Response to Commentor No. 2620

- 2620-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2620-2: Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.
- 2620-3: The NI PEIS evaluates the environmental impacts of a range of reasonable alternatives for enhancing DOE's existing nuclear facility infrastructure to support production of isotopes for medical, research, and industrial uses; production of plutonium-238 for use in future NASA space exploration missions; and U.S. nuclear research and development needs for civilian application. In addition to restarting the FFTF, the NI PEIS also evaluates alternatives that would either employ the use of existing facilities or rely on the construction of new facilities specifically designed to support the proposed action.
- 2620-4: The Record of Decision for the PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

Subject: For Medical Isotopes!

Dear Senators,

I write to you today to ask you to support the restart of the Fast Test Flux Facility (FFTF) for the production of medical isotopes. Medical isotopes are changing the face of medical treatments in the area of cancer treatment and arthritis therapy, just to name a few. Some scientists think they may be the long sought after "cure" for cancer. The FFTF is undergoing the preparation of an Environmental Impact Statement (EIS) right now. The Department of Energy (DOE) is expected to issue a record of decision in December of this year on the fate of the FFTF based on this EIS and comments from the public. Thanks for your time and consideration on this matter.

Luis Ojeda

Renton, Wa 98059

Mr. Bill Richardson
1000 Independence Ave. SW
Washington, DC 20585

Dear Secretary Richardson,

I'm writing to let you know of the concern I have about the present and future site conditions at the Hanford reservation.

I understand that the most recent wildfires traveled across two areas of waste storage at Hanford. I also understand that when it was monitored six miles from the site during the fire, levels of radiation detected were 50 clicks of the geiger counter (1000x) above the normal level.

I believe it is time to pay attention to the potential for disaster that exists with the improperly stored containers of radioactive waste. It's time to admit scientists have been unable to find a way to safely hold these wastes for their entire projected radioactive lifespan.

The proximity of Hanford's leaking containers to the Columbia River, which brings water along the southern part of our state and our border with Oregon must be respected. Since the waste can't be seen; the tendency may be to deny it's a problem. We all know that scientists have detected radiation in the groundwater next to the site.

Response to Commentor No. 2622

2622-1: DOE notes the commentor's concerns regarding the high-level waste tanks at Hanford 200 Area. The high-level waste tank issues are not within the scope of this NI PEIS, as none of the alternatives described in Section 2.5 of Volume 1 would add to these waste volumes. The Hanford Site environmental restoration activities are a high priority to DOE and are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

With regard to groundwater contamination, it is currently limited to the Hanford Site and no food or water restrictions are currently in place outside the Hanford Reservation as a result of Hanford activities. All environmental parameters (e.g. air, soil, surface water, groundwater, vegetation, animals, etc.) in and around the Hanford Site are monitored on a periodic basis. The information is available to the public in annual monitoring reports.

With regard to the Hanford wildfire of 2000, the DOE Richland Operations Office, the State of Washington Department of Health, and U.S. Environmental Protection Agency performed environmental monitoring on and around the Site to assess potential radiological impacts. The wildfire did not cause a release of radioactive materials from any Hanford facilities but did result in resuspension of radioactive materials which were already in the environment. The very low levels of radioactive materials that were resuspended were slightly above natural

2622-1

Commentor No. 2622: Sandra Piper (Cont'd)

In the worst case scenerio; let's say the toxic wastes mingle with the waters of the Columbia, and bring the radiation along it's path out to the ocean. What effect would it have on our ecosystem and our food sources? Would you want to tell your children you were partly responsible? The prospects are grim and the consequences will be, local, national or even global.

I urge you to consider the futures of our children and make the truly courageous decision to shut down the reactors. Let's end the creation of more "unstorable" waste and refocus on cleaning up the area as carefully as possible.

Sincerely,

Sandra Piper

P.S. Please include my comments as part of the Draft Nuclear Infrastructure Peis on the FFTF Nuclear Reactor!

**=====
Sandy.**

2622-1

2622-2

2622-1

Response to Commentor No. 2622

background levels and required several days of analysis to quantify. Information on this event has been made available to the public and can be accessed at <http://www.Hanford.gov/envmon/index.html>. This site also provides a link to information on the independent offsite air monitoring that was conducted by the U.S. Environmental Protection Agency.

More specific to the stated missions presented in the NI PEIS, FFTF is located approximately 4.5 miles from the Columbia River and will have no discharges to the river and no radioactive or hazardous discharges to the groundwater. Analyses presented in Chapter 4 of the NI PEIS (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4) indicate that there would be no discernible impacts to groundwater or surface water quality from the stated missions.

It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

2622-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2623: Shelley Cimon

September 12, 2000

The Honorable Bill Richardson
Secretary of Energy
Forrestal Building
1000 Independence Avenue SW
Washington D.C. 20585

Dear Secretary Richardson:

This letter is in response to a request for comment on the recently issued draft Environmental Impact Statement that discusses the restart of Hanford Nuclear Reservation's Fast Flux Test Facility (FFTF) to meet expanded isotope production and nuclear energy research missions. I am adamantly opposed to the restart of FFTF for these missions. You must permanently shut down this reactor.

The Hanford Nuclear Reservation is a national, environmental disaster, the scale of which most Americans are unaware. I have formally participated in the cleanup dialogue for the past 13 years now, representing Oregon through a governor appointed board and currently as co-vice chair of the site specific advisory board. It is requisite that we keep our vision to the task at hand: the cleanup of Hanford.

We have seen no compelling need for the production of medical isotopes through a restart of FFTF. This mission, though important, is not of a magnitude great enough to justify the restart of an aging relic of the cold war when we currently have, at hand, an adequate source for these isotopes. A report published by a subcommittee of the Department of Energy's Nuclear Energy Research Advisory Committee states that FFTF is not economically viable, and that we have other reactors within the DOE complex which could serve that purpose. They are located in Tennessee and Missouri. They have been identified and their efficacy must be addressed in this EIS.

I have continually heard for countless years the DOE position that we cannot look outside of our country for isotopes, yet Canada is currently one of our major suppliers. They are also in the process of building two more heavy water reactors expressly for the purpose of producing medical isotopes. This stance does not hold water, (nor do 67 leaking tanks at Hanford). Our needs for an adequate supply for these isotopes can most certainly be met without a restart of FFTF.

It is incredible, to me, that this EIS ignored addressing very viable alternatives to fill the demands for isotopes. Nor did it include in it the issue of the waste produced by this proposed production and the inability and unwillingness of our government to address the fundamental cleanup issues of waste already produced and ill-managed at Hanford.

It is my understanding that in May NASA informed the Department of Energy that they would no

Response to Commentor No. 2623

2623-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.

2623-2: See response to comment 2623-1.

2623-3: DOE notes the commentor's concerns regarding high-level waste tank and cleanup issues at Hanford. The high-level waste tank issues are not within the scope of this NI PEIS, as none of the alternatives considered would add to these waste volumes. The Hanford Site environmental restoration activities are a high priority to DOE and are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.

FFTF is located approximately 4.5 miles from the Columbia River and will have no discharges to the river and no radioactive or hazardous discharges to the groundwater. Analyses presented in Chapter 4 of the NI PEIS (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4) indicate that no discernible impacts to groundwater or surface water quality would result from implementation of the alternatives described in Section 2.5 of Volume 1.

Chapter 4 of Volume 1 addresses the environmental impacts that would be due to the treatment, storage, and disposal of the waste generated by the nuclear infrastructure missions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

2623-4: The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically

2623-1

Commentor No. 2623: Shelley Cimon (Cont'd)

longer need the fuel that FFTF might have produced. This underscores, once again, the lack of missions which would justify economically or morally the restart of this reactor.

There is no justifiable mission for the restart of the FFTF. It is time to stop spending taxpayer money trying to build a structurally robust case for restart. Let's focus instead on structurally robust designs for containment of the waste we've already produced. People of the Northwest have paid dearly for the cold war effort. The Columbia River which is the lifeblood of the NW is already compromised. The future health of our children should not be jeopardized, too. Permanently shut down the FFTF. It is the morally right thing to do.

Sincerely,

Shelley Cimon

2623-7

2623-3

Response to Commentor No. 2623

attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

2623-5: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. Hanford Site

Commentor No. 2623: Shelley Cimon (Cont'd)

Response to Commentor No. 2623

cleanup is funded through the DOE Environmental Management Program Office. The stated missions considered in this PEIS would be funded by the DOE Office of Nuclear Energy, Science and Technology, which has no funding connection to cleanup and waste management activities. Therefore, the stated missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

The NI PEIS addresses the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed missions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and appropriate DOE orders.

- 2623-6:** A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.
- 2623-7:** DOE notes the commentor's opposition to restarting FFTF for expanding its existing nuclear facility infrastructure. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy

Commentor No. 2623: Shelley Cimon (Cont'd)

Response to Commentor No. 2623

Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

Draft PEIS Comment Form

HANFORD WATCH
2285 S.E. CYPRESS
PORTLAND, OR 97214
(503) 232-0848

September 12, 2000

The Honorable Bill Richardson
Secretary of Energy and Cleanup
Forrestal Building
1000 Independence Avenue SW
Washington, D.C. 20585

Dear Secretary Richardson:

I am writing you and sending a copy of this statement to Colette Brown rather than the reverse because I do not trust that you will get a full and accurate accounting of public comments here in the Northwest on the restart of the Fast Flux Test Facility. My doubts are based on past experience, since this is our fifth time in addressing these issues. After five different attempts and 8 years to get the public to support the restart of the waste producing FFTF and the FMEF (although it was not given a full view of environmental and cost impacts in the Draft PEIS), you can imagine the discouragement we feel as well as our outrage.

Before I summarize some of the specific faults in this promotional document, let me give you a sense of the public interest in this issue. In the last 3 hearings in Portland, we have had a turnout of 350, 400 and nearly 500 citizens. Hood River and Seattle have had significant attendance from their citizens as well – from 250 in the small town of Hood River to 400 at each of two of the Seattle hearings. This past week the Tri-City FFTF boosters made a concerted attempt to skew the sentiments across the region of Oregon and Washington by bussing around 50 supporters of the restart to each hearing. Yes, there are around 5 or 6 activists who travel to the Tri-Cities on these rounds of hearings to represent a different point of view, but we have not attempted to demonstrate to the U.S. DOE that there is mixed sentiment in the Tri-City area. Thus, I encourage you to look at the testimony coming from these hearings in an accurate light. This may not be presented to you by Ms. Brown and the Office of Nuclear Energy, Science and Technology, who obviously have their own financial interest at heart rather than the health and safety of the residents of this region.

It is of deep concern to us that at a recent meeting of the Environmental Restoration Committee of the Hanford Advisory Board, when Keith Klein, Richland DOE Manager presented us his vision for accelerated Hanford cleanup, he was surprised to learn that some of the buildings he envisioned being demolished in the 300 area at Hanford were included in the PEIS to support the restart of the FFTF. As usual there is a disconnect between local sites and Headquarters, between cleanup programs and production programs. Around 8,000 people over the past several years have wisely stated that the cleanup mission at Hanford is thwarted when production missions create more wastes. This PEIS stated that the wastes to be produced by restart of the FFTF were "insignificant" compared to the wastes already tallied at Hanford. In light of the lack of adequate funding and delays in the cleanup of no amount of waste can rightfully be considered INSIGNIFICANT.

Throughout the entire PEIS, the longest term view of wastes and impacts was for the supposed 35 years the reactor would be operating. The wastes from it (16 tons), while deemed miniscule in the draft publicity piece, are part of the everlasting gargantuan legacy of wastes that are not being

Response to Commentor No. 2625

2625-1: DOE, and the Secretary of Energy in particular, is aware that there is a considerable difference of public opinion regarding the alternatives evaluated in this NI PEIS to accomplish the DOE missions, including direct support as well as opposition to Alternative 1 (Restart FFTF).

The commentor's concerns regarding the attendance of persons from the Tri-Cities area at the Seattle, Washington and Hood River and Portland, Oregon public hearings are noted. It is DOE policy to encourage public input on matters of regional, national and international importance as part of its commitment to facilitate a public participation process that is open and unbiased. It is not uncommon or illegal under CEQ regulations for individuals and special interest groups, who may be for or against a particular proposed action or alternative, to attend multiple meetings including those outside their "home" area. However, DOE believes and strives to ensure that the hearing format used serves to promote open and equal representation by all individuals and groups, regardless of the motivation for attending.

CEQ (40 CFR 1500 et seq.) and DOE (10 CFR Part 1021) implementation regulations do not require inclusion of cost and nonproliferation studies in an environmental impact statement. The basic purpose of the NI PEIS is to describe the alternatives under consideration for implementation (Section 2.5 of Volume 1) and the environmental impacts that would occur if these alternatives were implemented (Chapter 4 of Volume 1). Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. The associated cost report and nonproliferation report were made available to the public on August 24, 2000 and September 8, 2000, respectively. DOE mailed these documents to approximately 730 interested parties, and these reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in public reading rooms. DOE has also provided summaries of the Cost Report and Nuclear Nonproliferation Impact Assessment in Appendixes P and Q, respectively, in the Final NI PEIS.

2625-1

2625-2

2625-3

2625-4

Commentor No. 2625: Paige Knight (Cont'd)
Hanford Watch

cleaned up at Hanford as promised us since 1989. Hanford is the only DOE site that has no tank waste treatment system, it is the most contaminated site in the Western Hemisphere, and it is the most urgent environmental disaster facing our nation. We continually face budget shortfalls. We are told that the money for FFTF comes from a different budget. We find this kind of rhetoric and money shell-game deceitful. The PEIS' exploration of environmental impacts and risks to the public is a sham. One of the speakers who has degrees in environmental science state that this PEIS is a bad piece of homework on the part of the writers. That is an understatement! It is hopefully the last in a long series of studies and documents that has cost the taxpayer millions of dollars. Just think of how much more work on cleanup could have been accomplished for the same price!

Let me summarize a few other aspects that lead so many of us to oppose the restart of the FFTF:

· The need for the use of this reactor is questionable at best: the PEIS refused to look at our current contractual supplies of PU-238 from Russia; NASA has stated that it no longer needs PU-238 in quantities to justify the restart of the reactor; we already have a ready supply of isotopes from Canada and other reactors—Colette Brown stated that the goal is to have all capacities for these product be within our own country — who has come up with this national policy in the midst of our country's dogged drive toward a global economy?

· The cost document on this proposal just arrived in the mail-after the hearings, as has the non-proliferation document. The DOE continues this duplicitous piece-mealing of issues which is also a tremendous waste of taxpayer money. For those who took the time to make their statements at the hearings, they now have to incorporate two new documents into their previous statements or not be heard.

· The subcommittee of the DOE's Nuclear Energy Research Advisory Committee states that the FFTF would not be an economically viable or dependable source of isotopes for research purposes and that other reactors are better suited to this mission. This committee's findings which were published in April, were completely missing from the PEIS which came out in August. Disconnect???? Deceit????

· Viable alternatives to the proposed uses for the FFTF were glossed over or disregarded in the PEIS.

It is obvious to those of us who stand to gain no jobs, but all of the ill effects of the restart of the FFT, that far too much time, energy, and money has been diverted by the special interests of the Nuclear Research Institute, Pacific Northwest National Laboratories and others. Dollars, time and energy diverted away from cleanup. This reactor is truly in search of a mission. The Department of Energy owes it to the Northwest region to close the reactor down and focus on Keith Klein's vision for cleanup of the Hanford site.

Sincerely,

Paige Knight, HANFORD WATCH

Response to Commentor No. 2625

In preparing the Final NI PEIS, DOE carefully considered comments received from the public. All pertinent information and public input will be provided to the Secretary so that he may make an informed and unbiased decision with respect to the alternatives presented in this NI PEIS.

- 2625-2: The 300 Area Revitalization Plan (DOE 1999) provides for continued Multi-program R&D operations in the 300 Area, including operation of various laboratories, office facilities, and services. It also provides for consolidation (but not complete elimination) of radiological operations, with support for Hanford Site facility transition and environmental restoration efforts. The plan does not require closure of the 325 and 306-E buildings as long as they are needed for active research projects. Operation of these facilities would not violate any existing agreements between DOE and stakeholders or other legal obligations, nor would it affect ongoing or planned environmental restoration and facility transition activities.
- 2625-3: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., DOE's Richland Operations Office, U.S. Environmental Protection Agency, and the State of Washington Department of Ecology). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF

Commentor No. 2625: Paige Knight (Cont'd)
Hanford Watch

Response to Commentor No. 2625

through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected. Therefore, FFTF restart would not impact the schedule or available funding for existing cleanup activities.

- 2625-4:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement.

As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (i.e., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

The cumulative environmental impact assessment provided in Section 4.8.3.3 takes into account the radiation exposure to the public from all reasonably foreseeable Hanford Site activities over the 35 year timeframe. The activities considered in the cumulative impact assessment

Commentor No. 2625: Paige Knight (Cont'd)
Hanford Watch

Response to Commentor No. 2625

include future waste management activities as estimated in the Hanford Comprehensive Land Use Plan, tank waste remediation, K Basin spent nuclear fuel management, decommissioned naval reactor plant disposal, Plutonium Finishing Plant Stabilization and the proposed NI PEIS operations at FFTF and FMEF or RPL. As shown in Table 4-173, the dose to the maximally exposed individual would be expected to remain well within regulatory limits. Based on an exposure period of 35 years, 0.21 (<1) latent cancer fatalities would be expected to occur among the local population over the 35-year period as a result of Hanford related radiation exposure.

2625-5: The commentor's concerns about the adequacy of the impact and risk assessments are noted.

The impact assessments performed for the NI PEIS are comprehensive in scope, employ state-of-the-art analytical methodologies, and are consistent with the approach taken by the Department in the preparation of numerous other environmental impact assessments. The results of the impacts associated with nuclear infrastructure actions that may be implemented are presented and discussed in Chapter 4; each of the environmental disciplines that may be affected is addressed. More detailed discussions of the impact methodology, including computer codes and other assessment techniques, are presented in Appendixes G through M. Appropriate references are given to support the presentations.

2625-6: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.

2625-7: Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the

Commentor No. 2625: Paige Knight (Cont'd)
Hanford Watch

Response to Commentor No. 2625

potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost.

The May 22, 2000, correspondence from NASA to DOE identifies that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily Molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. Further, supplies of many research isotopes are not readily available from existing foreign or domestic sources, causing a number of medical research programs to be

Commentor No. 2625: Paige Knight (Cont'd)
Hanford Watch

Response to Commentor No. 2625

terminated, deferred, or seriously delayed. As such, reliance on these other sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

- 2625-8:** The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without disturbing the existing missions of these facilities.
- 2625-9:** A number of alternatives to the use of FFTF were considered in the NI PEIS. In addition to FFTF, the PEIS evaluated ATR, HFIR, commercial light water reactors, a new accelerator(s), and a new research reactor. It also evaluated a number of other irradiation facilities; however, these were dismissed from further consideration for a variety of reasons (Volume 1, Section 2.6). Among the reasons they were dismissed was the fact that they lacked sufficient neutron production capacity, were fully dedicated to existing missions, were not capable of steady-state neutron production, had insufficient power to sustain adequate steady

Commentor No. 2625: Paige Knight (Cont'd)
Hanford Watch

Response to Commentor No. 2625

state neutron production, were unable to produce a constant, reliable source of neutrons due to dependency on operating schedules of their primary missions, are under construction with capacity fully dedicated to other panned mission, or have been permanently shut down.

2625-10: See response to comment 2625-6.

Commentor No. 2626: Barbara Clark

P.O. Box 1222
Walla Walla, WA 99362
September 5, 2000

Secretary Bill Richardson
US Department of Energy
Germantown, MD 20874-1290

Dear Mr. Richardson:

RE: PU-238/FFTF EIS

I was unable to attend the August 31 public hearing held in Richland regarding plutonium production at FFTF, and hope that this letter may be considered as testimony.

I am dismayed that once again it is proposed to add more waste to the Hanford site before the contamination already here is cleaned up. The existing soil and water contamination and leaking tanks are a serious and continuing hazard to health and safety.

The recent fire on the reservation and releases of plutonium into the air demonstrated clearly that existing wastes are not adequately confined or protected from spreading. It would be irresponsible and unfair of the DOE to add further contamination until we have learned how to deal with the waste that is already here.

Nor is it ethical to divert money from cleanup into production. Cleanup has to be the first and only mission of the Hanford site until it is completely accomplished. Although some work has been done, the most critical cleanup has not even begun.

At a time when the Northwest is being threatened with breaching of dams to save salmon, it certainly makes no sense to retard cleanup of the Columbia River and even possibly increase contamination of salmon habitat. Is there no coordination of policy in this area?

We have wasted unconscionable amounts of time, money, and energy since 1987 continually re-visiting the question of new production at Hanford. It's time to stop allowing the federal government and the majority who live in this region to be jerked around by a few people in Richland who can't see beyond their own personal wants. I spoke to one scientist who wants to re-start FFTF because "it's such an elegant little reactor"; others I've discussed this with consider cleanup to be trivial and unmanly..

The Tri-Cities economy does not need new production; cleanup provides immense amounts of federal money. What Tri-Cities does need is an unequivocal and final decision from DOE that there will be no re-start of plutonium production and equally unequivocal direction to get on with the cleanup that they're being paid to do.

Very truly yours,

Barbara Clark

2626-1

2626-2

Response to Commentor No. 2626

2626-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford and protection of the Columbia River.

Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

The stated mission is not resumption of weapons production. DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

Regarding the concerns over the possible migration of contaminants to the Columbia River, the Hanford Site has a comprehensive waste minimization and pollution prevention program in place as summarized in Section 3.4.11.8 of Volume 1 that would govern any proposed site

Commentor No. 2626: Barbara Clark (Cont'd)

Response to Commentor No. 2626

activities. More specific to the alternatives evaluated in the NI PEIS, FFTF is located approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to the groundwater. Analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6 3.2.4) indicate that there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of the existing Hanford facilities in support of the stated missions. Also, no water quality impacts would be expected as a result of permanent deactivation of FFTF (Section 4.4.1.2.4).

Regarding the Hanford wildfire of 2000, the DOE Richland Operations Office, the State of Washington Department of Health, and the U.S. Environmental Protection Agency performed environmental monitoring on and around the Hanford site to assess any potential radiological impacts. The wildfire did not cause a release of radioactive materials from any Hanford facilities, but did result in the resuspension of radioactive materials which were already present in the environment. The very low levels of radioactive materials that were resuspended were only slightly above natural background levels and required several days of analysis to quantify. Information on this event has been made available to the public and can be accessed at <http://www.Hanford.gov/envmon/indes.html>. This site provides a link to information on the independent offsite air monitoring that was conducted by the U.S. Environmental Protection Agency.

2626-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, for plutonium-238 production.

Commentor No. 2627: Eric L. Platz

1524 South Sunset Drive
Tacoma, Washington 98465

August 31, 2000

William Richardson
Secretary of Energy
USDE
James Forrestal Building
1000 Independence Ave. S. W.
Washington, DC
20585

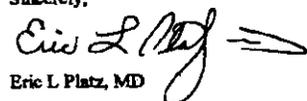

Dear Secretary Richardson,

I am writing as a member of Physicians for Social Responsibility to strongly protest the proposal to restart the Fast Flux Facility at the Hanford Nuclear Reservation. I am especially concerned that the public is being misled with bogus claims regarding a potential shortage of medical isotopes. It is my understanding that A) No such shortage exists, B) In the event of a shortage, a *clean* facility would be used for their production, and C) This issue is being used as a "Let's use Hanford to *cure cancer*" smokescreen to obscure the facts about plutonium production, the real motive for reactivation.

In addition, the Fast Flux restart issue potentially draws attention away from the mandate to clean up the entire Hanford Reservation, a *true* public health hazard.

Please put me on record as *absolutely opposed* to any plan to restart the Fast Flux Facility.

Sincerely,

Eric L. Platz, MD

Response to Commentor No. 2627

2627-1

2627-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2627-2

2627-2: DOE notes the commentor's opposition to restarting FFTF for enhancing its existing nuclear facility infrastructure. Consistent with its mandates under the Atomic Energy Act, DOE is proposing this enhancement for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio.

2627-3

DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications.

Commentor No. 2627: Eric L. Platz (Cont'd)

Response to Commentor No. 2627

These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

While some existing DOE reactors may possess the potential capability or capacity to support research isotope production, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without disturbing the existing missions of these facilities. Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short term (less than 5 years).

2627-3: DOE notes the concern of the commentor that the restart of the FFTF draws attention from the mandate to clean up the Hanford facilities. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.

Commentor No. 2627: Eric L. Platz (Cont'd)

Response to Commentor No. 2627

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2 of Appendix N, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "... ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

Commentor No. 2628: Donlee and William Deamud

1700 Fowler St.
Mount Vernon, WA 98274
September 7, 2000

Bill Richardson,
U.S. Energy Sec'y
Washington D.C.

Dear Mr. Richardson:

We can hardly believe that once again the issue of restarting a test reactor at Hanford has slithered onto the DOE table, smelling very much like pork barrel.

PLEASE! Let WA State be without more nuclear waste and let the gov't keep it's word in really cleaning up the horrific contamination of 50 years. There have been endless delays, promises, and much shifting of the blame with little progress. Now, even the glassification complex and process has been delayed to begin in 2007 with an extension to 2011, but DOE is willing to spend millions to restart the reactor.

Why doesn't the DOE and gov't officials just admit they don't know what to do with "IT" and will postpone dealing with "IT" indefinitely, that is, the tons of nuclear waste.

However, the U.S. has recently become interested in the world environment intending to help Russia clean up its nuclear sub base and save the oceans from further contamination. What other country might we volunteer to help out in this regard - maybe start bringing the waste from other countries to Hanford again as was done in the past.

So many people have been lied to regarding their health and safety in working in nuclear weapons production plants, exposure of persons to radiation releases, and from lies, servicemen have become ill from nuke tests and chemicals.

There are hazardous waste sites everywhere, fertilizers even showing up with radioactive material as well as asbestos and heavy metal products.

There are unbelievable amounts of chemical warfare canisters, stockpiled, (with some leakage), and it is not known how to safely dispose of them.

Does any of the above facts sound rational to you?

The U.S. needs to sign the non-proliferation treaty and become a true world leader, commanding respect at home and abroad.

Sincerely,

P.S. \$50 million or more
to Russia

2628-1

2628-2

2628-1

2628-3

2628-2

2628-4

Response to Commentor No. 2628

2628-1: Restoration of the Hanford Site and waste management activities are the primary missions at Hanford.

Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e. Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement.

Implementation of the nuclear infrastructure alternatives described in Section 2.5 of Volume 1 would not impact Hanford cleanup activities. Potential health effects associated with normal operations and releases from a spectrum of accidents, including severe accidents, were evaluated for the alternatives described in Section 2.5 of Volume 1. All of the alternatives, including the restart of FFTF, are shown to pose little risk to the health and safety of the public.

2628-2: The incremental impacts associated with managing an additional 16 metric tons of heavy metal of FFTF spent nuclear fuel were evaluated in Section 4.3.1.1.14 of the NI PEIS for the restart of the FFTF. The radiological impact to the public from overall radionuclide releases from the entire FFTF complex during the last year of reactor operation was less than 0.0001 mrem/year. Additionally, the dose contribution from FFTF spent nuclear fuel management would be expected to be a small fraction of the FFTF reactor operation dose. Therefore, it would have no discernable impact on the 0.1 mrem/year dose from the existing 2133 MTHM Hanford spent nuclear fuel inventory. The currently used FFTF specific spent nuclear fuel storage system designs (i.e., facility storage vessels and dry storage casks) are the key contributors for determining that the incremental radiological and environmental impacts are small.

In addition to evaluating on-site management of the NI PEIS related FFTF spent fuel, section 4.3.1.1.14 also states that "the spent [FFTF] nuclear fuel would be packaged in acceptable containers and shipped to a geologic repository for ultimate disposal." Disposal of DOE spent nuclear fuel is within the scope of a separate EIS titled, "Draft Environmental Impact Statement for a Geologic Repository for the Disposal of Spent

Commentor No. 2628: Donlee and William Deamud (Cont'd)

Response to Commentor No. 2628

Nuclear Fuel and High-Level Radioactive Waste at Yucca Mountain, Nye County, Nevada” (DOE/EIS-0250D, July 1999). As directed by the U.S. congress through the Nuclear Waste Policy Act, as amended, Yucca Mountain is designated, and is currently being characterized, as the candidate site for constructing a geologic repository for disposal of high-level radioactive waste and spent nuclear fuel.

2628-3: The purposes for which FFTF, and the other facilities evaluated under each of the alternatives, does not include any defense-related activities.

Current DOE safety regulations require the accurate reporting of radiological exposures. The data used to quantify offsite consequences is derived from reports (available to the public) on the normal operational releases at the facilities being evaluated (for example DOE/RL-99-41 Radiological Air Emissions Report for the Hanford Site Calendar Year 1998). These reports are generated in response to DOE requirements for radiological control. DOE Order 231.1 Environment, Safety, and Health Reporting requires an annual radiation dose summary addressing doses to workers and members of the public. DOE radiological control requirements are designed with the intent to meet the legal requirements of 10CFR 835, and there are provisions for enforcement actions should the requirements of 10CFR835 not be met. In order to meet these requirements, DOE has established the DOE Radiological Health and Safety Policy (DOE P 441.1, April 26 1996). Accuracy of radiological records is among the goals of this policy: the policy states in part “Ensure radiological measurements, analyses, worker monitoring results and estimates of public exposures are accurate and appropriately made.”

DOE notes the commentor’s concern regarding waste generation. As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE’s policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Commentor No. 2628: Donlee and William Deamud (Cont'd)

Response to Commentor No. 2628

The NI PEIS addresses the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed.

This NI PEIS has provided estimates of human health impacts associated with a range of reasonable alternatives for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems, including the restart of FFTF. The methodology used provides realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

2628-4: The U.S. has signed the nuclear non-proliferation treaty. The plutonium being considered for production in this EIS is plutonium-238 which is not an isotope of plutonium that is used in nuclear weapons. The production of plutonium-238 does not present a nonproliferation concern. DOE developed a separate Nuclear Infrastructure Nonproliferation Impact Assessment, published in September, 2000, that analyzed the nonproliferation impacts of the actions considered in this PEIS and found that, "There are currently no U.S. nonproliferation policies, laws, regulations or international agreements that preclude the use of any of the facilities in the manner described in the Draft NI PEIS."

*Commentor No. 2630: James R. Beaver, Mayor, City of
Kennewick*

August 31, 2000

The Honorable Bill Richardson, Secretary
U.S. Department of Energy
1000 Independence Avenue SW
Washington, D.C. 20585

RE: Fast Flux Test Facility (FFTF) Draft Environmental Impact Statement (EIS)

Dear Secretary Richardson:

The Tri-Cities offers a National Laboratory that is known throughout the world for its innovations. The Hanford Site brings to our community a highly skilled workforce that contributes greatly to the success of the Department of Energy. The restart of the FFTF for the production of isotopes for medicine, space missions and research and development projects will only add to the success of DOE and this community. I understand the Department of Energy's position for the EIS scoping hearings. Preparing an Environmental Impact Statement formally involves the public in any decision about FFTF's future. I want to address the positive effects of an expanded role for the FFTF.

Are Medical Isotopes needed? Medical isotopes are increasingly being used in research and in providing new, cost-effective, cutting-edge technologies for the diagnosis and treatment of disease, including cancer, heart disease, and arthritis. Diagnostic isotopes provide improved images of internal organs. This makes earlier detection possible and provides better data for diagnosis. The United States is importing more than ninety percent of the reactor-produced medical isotopes currently used to save a significant number of the lives of our citizens. Market projections for utilization of medical isotopes for diagnosis and treatment show our country will need new production sources to assure a domestic supply to meet the increasing demand.

Reactor Safety – The FFTF was designed, constructed, and safely operated as a state of the art reactor with world isotope production capabilities and is the newest, most sophisticated reactor in the U.S. Department of Energy's complex and as such is an irreplaceable national asset. The reactor's cooling system is inside a building that was designed and tested to meet stringent containment criteria. The reactor uses a safety system designed to automatically shutdown if there is an abnormal condition. Before FFTF began operation, the Nuclear Regulatory Commission and the advisory Committee on Reactor Safeguards performed an extensive review of the Plant design and the Final

Response to Commentor No. 2630

2630-1 2630-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

**Commentor No. 2630: James R. Beaver, Mayor, City of
Kennewick (Cont'd)**

Safety Analysis Report. Our community helped design and construct the operation of the FFTF and is very knowledgeable about the facility's track record for safe operation.

How Will Wastes Be Stored & Disposed? The current storage of contaminated waste from patients at hospitals and treatment centers has in some cases been managed poorly due to lack of proper training and facility needs. The DOE site has the capabilities and knowledge base on how to store waste associated with medical isotope research and treatment, and a final waste minimization plan will be conducted to include an analysis of all waste associated with medical isotopes.

FFTF should no longer be maintained in a stand-by mode. The citizens of our country deserve better. Our country needs the capability to provide isotopes for cancer victims. FFTF provides that solution.

Sincerely,

James R. Beaver
Mayor

Response to Commentor No. 2630

Commentor No. 2631: Stephen Bomkamp

3944 SW 97th St.
Seattle, WA 98136
8/31/00

Secretary of Energy
U.S. Department of Energy
Washington, D.C.

Secretary Bill Richardson:

Last night I attended the hearing in Seattle on the draft Environmental Impact Statement concerning the restart of the FFTF at Hanford and found it very interesting. I heard two groups giving conflicting testimony. It boiled down to an issue of credibility. Arguing against restart was Heart of America and the Physicians for Social Responsibility and some other groups and also a number of unaffiliated individuals. Arguing for restart was a group of men who identified themselves as "private citizens, representing no one but myself", who were, apparently, nuclear industry workers from Hanford, all wearing matching T-shirts.

The Hanford engineers have a large vested interest in this issue. I do not know if they work directly for the Department of Energy or if they work for private companies who do contract work for the DOE, but, either way, they probably have high-paying jobs, milking taxpayer money from the government cash cow. And here they were, lobbying the Energy Department for an expansion of their job opportunities while claiming to be just ordinary citizens concerned by the shortage of nuclear isotopes. They were well rehearsed and well orchestrated. Each speaker had a slightly different emphasis, leading me to believe that they had worked together on their prepared statements, so that all points would be covered without much overlap and repetition. Perhaps they did not even write their own statements but were merely reading pieces of their company position. If they were truly "private citizens" acting on their own, who just happened to have picked out the same T-shirts to wear last night, they all got themselves to the meeting on their own, taking vacation time as necessary. I suspect that it is more likely that they were paid to be there and arrived together in a bus chartered by their employer. I would not be surprised if this same group of men attended the hearings in Hood River, Portland and Richland as well as in Seattle. You might check with Colette Brown to verify this.

The people opposed to the restart of FFTF were not wearing matching T-shirts and were obviously private citizens who were not being paid to be there or, if they were being paid, it was by a non-profit organization subsisting on donations from other concerned citizens and dedicated to promoting a safer

2631-1

Response to Commentor No. 2631

2631-1: It is DOE policy to encourage public input on matters of regional, national and international importance as part of its commitment to facilitate a public participation process that is open and unbiased. It is not uncommon or illegal under CEQ regulations for individuals and special interest groups, who may be for or against a particular proposed action or alternative, to attend multiple meetings including those outside their "home" area. While DOE does not pay contractors working on DOE projects or its civil service personnel to attend public hearings, it does not specifically prohibit individuals from attending as private citizens.

2631-2: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information.

The United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. However Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

Commentor No. 2631: Stephen Bomkamp (Cont'd)

world. There is not much money to be made in opposing nuclear power. I felt more inclined to believe these people.

Each group accused the other of dishonesty, but I could see and hear the Hanford engineers misrepresenting themselves.

Also at the meeting was a woman who read a letter that Senator Gorton wrote for the meeting in which he said that Heart of America was lying. Senator Gorton is often referred to as "Slippery Slade". He is notorious for sneaking controversial legislation through the Senate by attaching the legislation as riders to important appropriations bills. I do not think Senator Gorton is an honest man. When he says someone is lying, it makes me think they are telling the truth.

One of the arguments presented in favor of restarting FFTF is that medical isotopes are in critically short supply. Is this true? If it is true, why do I not know about it? I know that transplantable organs are in critically short supply. Hardly a month goes by that I do not hear about someone on a waiting list for a heart or a liver. And I have known people undergoing cancer treatment and I hear about many more people in that situation and never once have I heard about medical isotope shortages. The only time I hear about isotope shortages is when people are arguing to restart the FFTF. Is this just more deception by the nuclear industry?

Ever since the Manhattan Project, the nuclear industry has been surrounded by secrecy, obfuscation and deceit. We are constantly reassured that nuclear power is safe. And we are constantly shocked by Three Mile Island, Chernobyl, Hanford downwinders, and on and on. How are we to believe assurances of safety this time after what has gone before?

It is utter lunacy to be manufacturing substances which will be lethal for ten times longer than our civilization has existed. It is even worse to be storing these substances in un-lined pits and allowing them to leak into the groundwater and into rivers. Until safe methods of storage and disposal are devised I promise I will oppose any moves to expand the nuclear industry. Please, Secretary Richardson, if you are a sane and honorable man, do not restart the FFTF. Please, clean up the mess at Hanford as you are required by the 1995 Tri-Party Agreement and put those engineers in matching T-shirts to work developing a safe, permanent waste-disposal system.

Sincerely,
Stephen Bomkamp

2631-2

2631-3

2631-4

2631-5

2631-6

Response to Commentor No. 2631

Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions basic energy sciences or defense. DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term (less than 5 years).

2631-3: DOE is required under the National Environmental Policy Act (NEPA) 42 U.S.C. 4321 et seq., to prepare an environmental impact statement when its actions could significantly affect the quality of the human environment. The NEPA public participation process has provided an opportunity for all interested parties, including members of the public, and local, state, and Federal officials, to independently review and comment on the Draft NI PEIS. Therefore, any interested party has the capability to examine the data, assumptions, and analytical techniques used in the assessments of the impacts of each alternative.

The analyses in the PEIS have been performed using radiological data taken from the three sites considered in the range of reasonable alternatives. This data is collected under controls instituted to meet DOE radiological control requirements which are in turn designed with the intent to meet the legal requirements of 10CFR 835, and there are provisions for enforcement actions should the requirements of 10CFR835 not be met. In order to meet these requirements, DOE has established the DOE Radiological Health and Safety Policy (DOE P 441.1, April 26, 1996). Accuracy of radiological records is among the goals of this policy: the policy states in part "Ensure radiological measurements, analyses, worker monitoring results and estimates of public exposures are accurate and appropriately made." DOE Order 231.1 Environment, Safety, and Health Reporting requires an annual radiation dose summary addressing doses to workers and members of the public. The data used to quantify offsite consequences has been derived from reports (available to the public) on the normal operational releases from operation of the facilities at Hanford, INEEL, and Oak Ridge (for example DOE/RL-99-41

Commentor No. 2631: Stephen Bomkamp (Cont'd)

Response to Commentor No. 2631

Radiological Air Emissions Report for the Hanford Site Calendar Year 1998).

- 2631-4:** The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

As discussed in Volume 1 of the NI PEIS (Section 3.4.11.2), low-level radioactive waste and mixed low-level radioactive wastes are the only types of radioactive wastes that can be disposed in a burial ground. Low level radioactive waste that would qualify for disposal by this method would have to meet stringent waste and package acceptance criteria (i.e. only short half-life radionuclide content, high integrity packaging, etc.). The Hanford Site's 200 Area's Low-Level Waste Burial Ground (i.e., trenches) are regulated by DOE under the Atomic Energy Act of 1954, as amended, and under DOE Order 435.1, Radioactive Waste Management.

The 200 Area's Low-Level Burial Ground also contain the following three active permitted mixed waste trenches whereby mixed low-level waste is both stored and disposed of: (1) Trench 31 is a permitted, lined Subtitle C disposal trench that is currently utilized for greater than 90-day storage of mixed low-level radioactive waste; (2) Trench 34 is permitted, lined Subtitle C disposal trench currently utilized for the disposal of mixed low-level radioactive waste that has been treated and is compliant with Land Disposal restrictions; and (3) Trench 94 is a permitted, unlined disposal trench utilized for the disposal of decommissioned naval reactor components. Use of Trench 94 for naval reactor compartments is authorized under a special exemption from the State of Washington Department of Ecology (Ecology). Currently, the Low-Level Burial Ground has a Part A Permit approved by Ecology under the State of Washington Dangerous Waste Regulations, State of Washington Administrative Code (WAC) 173-303, and, as such, is an interim status treatment, storage, and disposal (TSD) unit under the Resource

Commentor No. 2631: Stephen Bomkamp (Cont'd)

Response to Commentor No. 2631

Conservation and Recovery Act (RCRA). The permitted active and future mixed waste units of the Low-Level Burial Ground meet all regulatory requirements of WAC 173-303 and RCRA and will be incorporated into the Hanford Site RCRA Facility Part B Permit and will operate under final status regulations. In early June 2000, a working draft of the Hanford Site RCRA Facility Part B Permit application was submitted to Ecology.

- 2631-5:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 2631-6:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.

Commentor No. 2632: T. James Bigham

**T. James Bigham
6125 Rowena River Rd.
The Dalles, OR. 97058**

Secretary of Energy
U.S. Department of Energy
1000 Independence Ave.
Washington D.C. 20585

9-5-2000

Dear Mr. Richardson;

Are you listening? Do you have trouble understanding? I am opposed to the restart of the FFTF reactor for any reason. I ask you to stop this study process! If you proceed, I request you include the following in your environmental impact statement on this issue:

1. Demonstrate a compelling need for any new missions recommended, with full consideration of alternative means of meeting those needs.

2. Characterize all existing contaminant sources at Hanford and all other sites before adding additional waste. Analyze all potential new waste streams and their cumulative impact to the environment at all sites.

3. Do a cost benefit analysis for all alternatives, including total life cycle costs, waste treatment and disposal costs. Examples - Linear accelerator vs FFTF.

4. Analyze the cost to the current clean-up budget for both maintenance and possible restart. Accurate and verifiable startup figures must be calculated and included.

5. Include any other companion facilities and their costs, waste streams and potential impacts to the environment, including reprocessing.

6. Analyze all transportation costs and risks, including public safety and any counter terrorist actions that may be needed.

7. Allow for independent nuclear safety oversight of FFTF restart and operation if restart is recommended.

8. Analyze all impacts from additional spent fuel storage.

9. Disclose all safety and environmental risks associated with FFTF restart based on a new safety analysis.

In addition, there needs to be another alternative #5 that deactivates FFTF without new production missions.

Response to Commentor No. 2632

2632-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF. It should be noted that Alternative 5 as presented in the NI PEIS does not include any new missions.

2632-2: Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. The NI PEIS evaluates the environmental impacts of a range of reasonable alternatives for accomplishing this mission. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

2632-3: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., DOE's Richland Operations Office, U.S. Environmental Protection Agency, and the State of Washington Department of Ecology). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The current inventory of wastes managed at the Hanford Site are identified in Section 3.4.11.1 of Volume 1. In addition, the generation rates of wastes associated with the NI PEIS options that use Hanford facilities are compared with the current waste generation rates at the site in Section 4.3 of Volume 1. As stated in Sections 4.3.1.1.13, 4.3.3.1.13, and 4.4.3.1.13, the generation rates of wastes at Hanford associated with the options that utilize either FFTF, FMEF and or RPL/306-E would be much smaller than the current waste

2632-1

2632-3

2632-4

2632-5

2632-6

2632-7

2632-8

2632-9

2632-10

Commentor No. 2632: T. James Bigham (Cont'd)

I sent you the following some time ago. Perhaps you would do me the service of reading it. How many more do you suppose I will send before I decide that the department of energy of the United States does not serve me and does not work for me. That the department is not my servant but a monolithic juggernaut that caters to the interests of corporations while it ignores the citizens.

Please do the right thing- no ftf-complete clean-up now.

Sincerely,

T. James Bigham

Secretary of Energy
U.S. Department of Energy
1000 Independence Ave.
Washington D.C. 20585

1-24-99

Dear Mr. Richardson;

My family and I live in a house we have built on the banks of the Columbia River. We recognize the rarity of the natural beauty of this part of our land and do what we can to be responsible stewards of the Columbia and its environment. We have lived here for ten years and have sadly witnessed other Secretaries of the DOE backslide, prevaricate, or in the best of cases, stand idle while promised efforts to deal seriously with the environmental crisis of the Hanford area slip way unmet and unfulfilled.

The problems at Hanford are not being addressed in any meaningful way. The Department of Energy has not made a good faith effort to clean up the disgusting and lethal mess it has made. USDOE has constantly resisted acknowledging the seriousness of this problem and has resisted accepting responsibility for getting on with the clean-up.

Now you have announced that you have ordered an environmental impact study of restarting the FTF. Does your job have anything at all to

2632-11

2632-12

Response to Commentor No. 2632

generation rates at the site. These volumes would also be small in comparison to the existing inventory at the site (Section 3.4.11.1, Volume 1). These comparisons were also made for the other options which involved INEEL and ORR facilities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2632-4: NEPA does not require that cost-benefit analyses be provided in an EIS, and none have been provided in this Final NI PEIS. The estimated costs of the range of reasonable alternatives are presented in the Cost Report, summarized in Appendix P of the Final NI PEIS. However, the Cost Report is not a cost-benefit analysis. While it is reasonable to believe that the benefits of medical isotopes are substantial, the purpose of this NI PEIS is to describe the nuclear infrastructure missions (Section 1.2 of Volume 1), a range of reasonable alternatives for satisfying the mission requirements (Section 2.5 of Volume 1), and the environmental impacts that would result from implementation of the alternatives. According to 40 CFR Section 1502.23, if a cost-benefit analysis exists, it must be reported and summarized in the NI PEIS.

2632-5: Companion (to FTF) facilities at Hanford that have the potential to provide nuclear infrastructure support activities are FMEF and RPL Building 306-E. FMEF could support plutonium-238 and medical industrial production and nuclear research and development (Volume 1, Section 2.3.2.3 of the NI PEIS); RPL/Building 306-E could support medical/industrial isotope production and nuclear research and production (Volume 1, Section 2.3.2.4). FMEF is assessed in the NI PEIS for possible use in each alternative except Alternative 5, "Shutdown FTF." RPL/Building 306-E is assessed for possible use only in Alternative 1, "Restart FTF."

Potential impacts to the environment associated with FMEF and RPL Building 306-E operations are addressed in Chapter 4 of the NI PEIS. Consequences are shown to be small during normal operations; risks associated with postulated accidents are also shown to be small. Specific to waste streams, there would be no discharges to the Columbia River and no radioactive or hazardous discharges to groundwater; impacts to groundwater or surface water quality would not be discernible.

Commentor No. 2632: T. James Bigham (Cont'd)

do with the development and exercise of responsible energy policy?. Do you care that DOE has not lived up to its promise to clean up the Hanford site? Are you aware that DOE's request to relax the standards for cleanup violate state and federal standards and endanger the lives and the health of citizens, especially children, who live in this area? Do you understand that FFTF will generate more liquid high level radioactive waste, the very problem USDOE has thus far done so little to deal with?

I want to believe in my government. I want to believe in its laws and the administration of justice. I need you to now demonstrate that this government seeks to safeguard its citizens and act in the long term best interests of its people. In the warm months of the year, my family plays in the water of the Columbia nearly every day . We should be able to do this without the danger of being affected by our government's negligence.

Please, I beg you, shut down the FFTF. Do not mothball it. Do not delay a decision. Shut it down forever and get on with the real job at hand. Clean up the Hanford site so that you would feel safe feeding fish caught there to your family.

Sincerely,

T. James Bigham

2632-12
(Cont'd)

2632-13

2632-10

2632-12

Response to Commentor No. 2632

CEQ (40 CFR 1500 et seq.) and DOE (10 CFR Part 1021) implementation regulations do not require inclusion of cost studies in an environmental impact statement. The basic purpose of the NI PEIS is to describe the alternatives under consideration for implementation (Section 2.5 of Volume 1) and the environmental impacts that would occur if these alternatives were implemented (Chapter 4 of Volume 1). Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. The associated cost report was made available to the public on August 24, 2000.

2632-6: The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS. DOE made every effort to obtain, analyze, and disclose all required information to make a decision on expanding nuclear infrastructure. The costs and nuclear nonproliferation impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. As discussed in the response immediately above, a separate cost report was made available to the public on August 24, 2000. A nonproliferation report was made available to the public in September 8, 2000. DOE mailed these documents to more than 730 interested parties. Both reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided summaries of the Cost Report and Nuclear Nonproliferation Impact Assessment in Appendixes P and Q, respectively, Final NI PEIS.

Appendix J contains a comprehensive risk analysis of all materials transported under the alternatives defined in the NI PEIS. The results of the risk analysis is shown in detail in Table J-7 and J-8, and summarized in Chapters 2 and 4 of Volume 1 and the Summary Volume for this PEIS. These results show that the risk to the public is small under all alternatives.

Sections 2.4.3 and 2.4.4 of Volume 1 provide general descriptions of DOE's systems to protect special nuclear materials from possible terrorist activities. DOE would rely on the Transportation Safeguards System for overland transportation and purpose-built ships operating in accordance with International Atomic Energy Agency guidance for the at-sea transportation.

Commentor No. 2632: T. James Bigham (Cont'd)

Response to Commentor No. 2632

2632-7: At this time, an independent safety review of the restart of FFTF is not required. The FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

In the event that FFTF restart is selected in the Record of Decision, complete safety and operational readiness reviews will be performed prior to the restart. The FFTF Safety Analysis Report is routinely reassessed and updated when required to address any changes in plant configuration due to physical modifications or changes in plant operation procedures. The operational readiness review would assess the current updated Safety Analysis Report to ensure that the analyses bound the reactor-operating envelope for the stated missions. The analyses presented in this NI PEIS reflect the proposed changes to the reactor core (including fuel and irradiation targets) to perform the stated missions.

2632-8: The discussion in the Summary and Section 4.8.3.5 of Volume 1 on the cumulative impacts for spent nuclear fuel management at Hanford was revised to clarify that the management of the existing spent nuclear fuel at Hanford results in a dose of less than 0.1 millirem per year to the maximally exposed member of the public. This dose is well within the DOE limits given in DOE Order 5400.5. As discussed in that Order, the dose limit from airborne emissions is 10 millirem per year, as required by the Clean Air Act; drinking water is 4 millirem per year, as required by the Safe Drinking Water Act; and the dose limit from all pathways combined is 100 millirem per year. DOE has committed to remove the spent nuclear fuel at Hanford for ultimate disposition in a geologic repository.

2632-9: FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. This NI PEIS has examined the risks associated with the operation of the FFTF for 35 years for the purpose of producing isotopes for medical use, research and development, and for the production of radioactive heat sources for power supply systems. Section 4.3 of Volume 1 provides the results of

Commentor No. 2632: T. James Bigham (Cont'd)

Response to Commentor No. 2632

the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. (Accident analysis is described in Appendix I and the normal operations risk analysis is described in Appendix H.) The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

Additionally, in the event that FFTF restart is selected, a new Safety Analysis Report will be prepared and subjected to a thorough independent review process. The facility reanalysis as part of the Safety Analysis Report update process would ensure that the analyses bound the reactor-operating envelope for the duration of FFTF operation. The Safety Analysis Report would be routinely reassessed and updated when required to address any changes in plant configuration or changes in plant operation procedures. This continuing safety analysis updating would include analysis of changes that may occur as a result of facility aging during the 35 years of operation.

2632-10: See response to comment 2632-1.

2632-11: DOE policy encourages effective public participation in its decision making process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final PEIS, DOE has assessed and considered both oral and written comments received on the Draft PEIS during the public comment period and has responded to these comments in the Final PEIS. Volume 3 of the NI PEIS contains public comments received on the NI PEIS and DOE responses to those comments. These comments are summarized, tabulated, and cross-referenced by commentor, category, and method of submission. A summary discussion is also provided of the overall prevailing issues raised during the public comment period.

2632-12: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE

Commentor No. 2632: T. James Bigham (Cont'd)

Response to Commentor No. 2632

The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement.

A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Public meetings were held on this formal milestone change. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.

DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "... ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

Implementation of the alternatives described in Section 2.5 of Volume 1 would not relax the standards for cleanup or violate laws or regulations. Potential health effects associated with normal operations and releases from a spectrum of accidents, including severe accidents, were evaluated for the alternatives described in Section 2.5 of Volume 1. All of the alternatives, including the restart of FFTF, are shown to pose little risk to the health and safety of the public.

2632-13: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (i.e. solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. High-level radioactive waste would not be generated from merely operating FFTF. It is DOE's policy

Commentor No. 2632: T. James Bigham (Cont'd)

Response to Commentor No. 2632

that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The use of proposed alternative facilities associated with processing of neptunium-237 targets would have no impact on schedules or available funding for high-level radioactive waste programs at Hanford. The higher activity waste would be treated as a solid form via a stand-alone vitrification system, separate from any tank waste treatment system. Therefore, the existing Hanford high-level radioactive waste facilities would not be used, and as analyzed in the PEIS, no existing or planned high-level radioactive waste facilities would be used to treat the wastes resulting from processing the irradiated targets.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

Commentor No. 2633: Bob Anderson
Benton County Democratic Central Committee

Bob Anderson, Chairman
 Benton County Democratic Central Committee
 1108 W. 14th Avenue
 Kennewick, WA 99337
 (509) 586-8056

August 31, 2000

The Honorable William Richardson
 Secretary of the United States Department Of Energy
 1000 Independence Avenue SW
 Washington, D.C. 20585

Dear Secretary Richardson:

The Benton County Democratic Central Committee (BCDCC) met on October 20, 1999 and passed the attached resolution in support of restarting the Fast Flux Test Facility (FFTF) at Hanford.

On April 22, 2000 the Benton County Democratic Party adopted a platform, which states:

"Cancer is the second leading cause of death in this country, with 600,000 cancer victims dying annually. The American public cannot accept current expensive and agonizing traditional treatments with their devastating side effects. Chemotherapy and radiation use a buckshot approach which frequently causes nausea, hair loss, bone weakness, lymph edema, burned and blistering skin, chronic coughing, and increased susceptibility to shingles. These old-fashioned treatments are effective for 40 percent of the patients and cost \$105 billion annually. It is unconscionable not to devote all efforts to starting production of medical isotopes at the Fast Flux Test Facility (FFTF).

Good results with kinder and gentler treatment of cancer using medical isotopes have been achieved at the University of Washington Fred Hutchinson Cancer Treatment Center in Seattle. Outstanding success has been achieved in treating blood cancers, such as non-Hodgkin's lymphoma. Prostate cancer can be treated on an outpatient basis using medical isotope seeds instead of expensive surgery and hospitalization.

If these and additional new developments in cancer treatment are to be available to every American citizen in the future, we will need the production capability of FFTF to provide the quantity and quality needed of several different and new medical isotopes. The American public should not have to depend on medical isotopes produced in Canada, Russia, and South Africa when we have a facility right in our own back yard (Richland, Washington) which is not being adequately funded because of political manipulations and delays.

Response to Commentor No. 2633

2633-1

2633-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 2633: Bob Anderson (Cont'd)
Benton County Democratic Central Committee

Continued operation of FFTF has widespread support among scientists, educators, informed physicians, cancer survivors, and knowledgeable grass roots organizations because medical isotopes, which can be produced at FFTF, are an effective way of treating several kinds of cancer.”

The Nuclear Infrastructure Draft Programmatic Environmental Impact Statement released on July 21, 2000 has reinforced our belief for the need to restart FFTF.

As Chairman and spokesman for the Benton County Democratic Central Committee I ask that restart of FFTF be ordered.

Sincerely,

Bob Anderson, Chairman
Benton County Democratic Central Committee

Response to Commentor No. 2633

Attachment: Resolution in Support of Restarting FFTF adopted October 20, 1999

Commentor No. 2633: Bob Anderson (Cont'd)
Benton County Democratic Central Committee

**Resolution In Support of
 Restarting the Fast Flux Test Facility
 at Hanford ¹**

WHEREAS, medical isotopes are increasingly being used in research and in providing new, cost-effective, cutting-edge technologies for the diagnosis and treatment of disease, including cancer, heart disease, and arthritis; and

WHEREAS, the United States is importing more than ninety percent of the reactor-produced medical isotopes currently used to save a significant number of the lives of our citizens; and

WHEREAS, market projections for utilization of medical isotopes for diagnosis and treatment show our country will need new production sources to assure a domestic supply to meet the increasing demand; and

WHEREAS, the Hanford Fast Flux Test Facility (FFTF) has unique capabilities for providing large quantities and a wide variety of high quality medical isotopes; and

WHEREAS, the FFTF was designed, constructed, and safely operated as a state of the art reactor with world class isotope production capabilities and is the newest, most sophisticated reactor in the U .S. Department of Energy complex and as such is an irreplaceable national asset; and

WHEREAS, the FFTF is presently being maintained in a stand-by mode;

NOW, THEREFORE BE IT RESOLVED, the Benton County Democratic Central Committee hereby encourage U.S. Department of Energy Secretary William Richardson to order the restarting of the FFTF.

¹ Adopted by Benton County Democratic Central Committee on October 20, 1999

Response to Commentor No. 2633

Commentor No. 2634: Robert O. Olson, Sr.

Secretary of Energy William Richardson
US Department of Energy
James Forrestal Building
1000 Independence Avenue, SW
Washington, DC 20585

Dear Mr. Richardson:

I am writing as a Physician and Public Health advocate to urge you to not fund restarting of the Fast Flux Test Facility at Hanford Washington. Studies clearly show that this technology is not necessary for medical isotope purposes.. This facility needs all funding to be directed toward cleaning up that facility. Cleaning the facility would create far more jobs for the area and would finally stop the pollution to the air, soil, and ground water.

From a Medical standpoint, further testing and development for nuclear weapons or medical Isotopes will serve no worthwhile purpose and will just further contaminate the Hanford area. This is totally unacceptable. Please review testimony of groups supporting no further funding and I trust you will come to the right decision on this matter.

I shall be looking forward to your reply and thank you for your consideration.

Sincerely,

Robert O. Olson, Sr., MD

Response to Commentor No. 2634

- 2634-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 2634-2: The only missions being considered by DOE are those analyzed in the NI PEIS, which are the production of isotopes for medical, research, and industrial uses; plutonium production for future NASA space exploration missions; and U.S. nuclear research and development needs for civilian application. None of the alternatives in the NI PEIS include defense missions and would not contribute to future weapons testing and development.
- DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.
- 2634-3: The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Commentor No. 2634: Robert O. Olson, Sr. (Cont'd)

Response to Commentor No. 2634

Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.

Socioeconomic impacts of the alternatives are discussed throughout Chapter 4 of Volume 1. The analysis shows that none of the alternatives would significantly impact direct and indirect jobs in the potentially affected areas.

Commentor No. 2635: Spencer Marston

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Commentor No. 2636: Tom Clements
Nuclear Control Institute

From: Tom Clements [mailto:clements@nci.org]
 Sent: Thursday, September 28, 2000 2:41 PM
 To: INFRASTRUCTURE_PEIS, NUCLEAR
 Cc: Brown, Colette
 Subject: for NI PEIS

To Whom it Concerns:

The following facility which is discussed in a LANL news lease MUST be considered as part of DOE's NI PEIS. Exclusion of this facility and isotope production at Brookhaven National Laboratory in the final PEIS will taint the NEPA process.

Mention of isotopes in the news release underscores the need for the NI PEIS to present a list of all isotopes currently used and projected for use and which facilities currently produce them and which facilities could produce them in the future. All U.S. potential and actual production facilities must be included, not just FFTF, HFIR, and ATR.

Tom Clements

Nuclear Control Institute

New facility will ensure steady supply of medical isotopes
 Los Alamos National Laboratory

News Release

September 11, 2000

LOS ALAMOS, N.M., Sept. 11, 2000 __ To ensure that U.S. researchers have a steady supply of medical isotopes, the U.S. Department of Energy's Los Alamos National Laboratory is building a new Isotope Production Facility to replace an existing facility. Construction of the \$16.5 million IPF began in February, and the project should be completed in June 2002.

Once operational, the IPF will support eight months of isotope production annually. Combining its output with similar isotope production capabilities at

2636-1

Response to Commentor No. 2636

2636-1: DOE notes the commentor's views. The Isotope Production Facility (IPF) at Los Alamos National Laboratory produces radioisotopes using the Los Alamos Neutron Science Center's (LANSCE) half-mile accelerator that delivers medium-energy protons. Among other isotopes, the IPF's three major products include germanium-68, strontium-82, and sodium-22. As a result of changing DOE missions, the production of radioisotopes at target area "A" of the LANSCE has been rendered inoperable. In order to replace the level of production lost due to this change, DOE is completing a new and more efficient IPF that would allow DOE to continue to produce most of these same isotopes in an effort to meet existing demand. As addressed in Section 2.6.1 of the NI PEIS, IPF at LANSCE was considered but dismissed from further evaluation because, although it can be used in tandem with the Brookhaven Linac Isotope Producer (BLIP) located at the Brookhaven National Laboratory to supply near-term isotope requirements, it is unlikely that these facilities could accomplish reliable, increased isotope production at the level needed to support projected needs.

In 1998, an Expert Panel convened to forecast future demand for medical isotopes estimated that the expected growth rate of medical isotope use during the next 20 years will range between 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These growth projections were adopted by DOE as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. As addressed in Section 2.6.1 of the NI PEIS, IPF at LANSCE was considered but dismissed from further evaluation because, although it can be used in tandem with the Brookhaven Linac Isotope Producer (BLIP) located at the Brookhaven National Laboratory to supply near term isotope requirements, it is unlikely that these facilities could accomplish reliable, increased isotope production at the level needed to support projected needs.

For the purposes of analyses in the NI PEIS, a representative set of isotopes was selected on the basis of the recommendations of the Expert Panel, medical market forecasts, reviews of medical literature, and more than 100 types of ongoing clinical trials that use radioisotopes for the treatment of cancer and other diseases. These isotopes, which are

Commentor No. 2636: Tom Clement (Cont'd)
Nuclear Control Institute

Brookhaven National Laboratory in New York will ensure doctors and researchers an adequate, year-round supply of accelerator-produced medical isotopes.

U.S. researchers use medical isotopes to perform 36,000 diagnostic procedures daily and 50,000 therapies annually, along with 100 million lab tests annually. DOE's Office of Isotopes for Medicine and Sciences estimates the annual value of these procedures to the medical industry at between \$7 billion and \$10 billion.

Los Alamos' Neutron Science Center Division and Chemistry Division have produced some of these medical isotopes, such as Strontium-82 and Germanium-68, at Technical Area 53 for more than 20 years under DOE's Isotope Production and Distribution Program, said Carol Burns, deputy director for C Division.

"The program is an essential element of the nation's overall health-care system, and Los Alamos' ability to deliver key medical isotopes to customers is a critical part of the DOE program," she added.

Researchers use radioisotopes in clinical trials; to diagnose and treat diseases such as cancer, epilepsy and coronary artery disease; to perform research and development of new pharmaceuticals; and in other medical research and treatment applications. Millions of patients would be adversely affected if medical isotopes weren't available.

In the past, targets were irradiated with LANSCE's half-mile-long linear accelerator, then shipped to a Chemistry Division facility at Technical Area 48 for processing. Los Alamos processes irradiated targets obtained from other sources worldwide as well.

Needed upgrades to LANSCE's facility and accelerator eventually will make it impossible for Los Alamos to continue using the current isotope production facility. To avoid interruption of the nation's medical isotope supply and continue serving this important mission, DOE's Office of Nuclear Energy funded construction of the new Isotope Production Facility.

Response to Commentor No. 2636

comprised of both reactor- and accelerator- produced isotopes, are listed in Chapter 1, Volume 1 of the NI PEIS along with a brief description of their medical and/or industrial applications. These include research isotopes with currently limited availability, such as Copper-67, as well as commercial isotopes whose current application is inhibited by lack of availability or high cost, such as Palladium-103. However, the absence of any specific isotope from these tables should not be interpreted to mean that it could not be considered for production under the proposed action. DOE expects that the actual isotopes and specific amounts produced as a result of the proposed action would vary from year to year in response to the focus of clinical research and the specific market needs occurring at that time.

Commentor No. 2636: Tom Clement (Cont'd)
Nuclear Control Institute

The new facility, also located at TA_53, will irradiate a wide range of materials underground, including rubidium chloride, gallium and other targets, using a portion of the LANSCE proton beam. The irradiated targets will be raised to ground level via a specially designed transport system and placed in certified shipping containers. Los Alamos then will ship the targets to TA_48 for isotope processing and recovery via chemical processes.

The new building is a collaborative effort among Los Alamos, Michael S. Rich Contractors, Inc., J.B. Henderson Construction Co. and Merrick and Company. Los Alamos' Design Engineering Group and Accelerator Maintenance and Development Group designed the special beam line and target handling equipment for the IPF, in collaboration with experts inside and outside the Laboratory.

Richard Heaton of Los Alamos' Nuclear and Radiochemistry Group is the IPF project manager, and Armando Cordova of Los Alamos' Project Management Division is the engineering and construction project leader.

Subject: FFTF Statement

STATEMENT

Dr. Edward Deutsch

Director

University of Missouri Research Reactor

Columbia, Missouri

September 18, 2000

I am pleased to present the following statement regarding the programmatic environmental impact statement for the Fast Flux Test Facility. To provide context for my comments, I will first briefly describe my own background. I have extensive experience in the research, development and clinical use of medical isotopes. Prior to joining MURR as Director in 1997, I spent nearly nine years in the nuclear medicine and isotope industry as a Vice President for Research at a major U.S. radiopharmaceutical company. Prior to that, I spent more than twenty years in academic institutions where I and my students conducted research on isotopes of medical benefit. I personally know very well the medical isotope marketplace, including how isotopes are used for both diagnosing and treating human diseases.

Response to Commentor No. 3462

3462-1: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

The United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. Although other manufacturers produce medical isotopes, DOE remains the key provider for a large number of isotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large-enough quantities to make their production financially attractive to private industry. However, supplies of many research isotopes are not readily available from existing domestic or foreign sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed. Under the NI PEIS proposed action and consistent with its mandates under the Atomic Energy Act, DOE would enhance its existing nuclear facility infrastructure to, among other things, more effectively support production of radioisotopes for medical applications and research. DOE's intent is to complement commercial sector capabilities to ensure that a reliable supply of isotopes is available in the U.S. to meet future demand, and to encourage the commercial sector to privatize the production of isotopes that have established applications to a level that would support commercial ventures.

Commentor No. 3462: Edward Deutsch (Cont'd)
University of Missouri Research Reactor

Page 2 of 3

What I do not know, and do not believe anybody to know, is the future of the isotope industry. Prior to the advent of financial reimbursement for positron emission tomography (PET), for example, PET appeared destined to remain a research tool to be used only in the most advanced medical schools. Now, with reimbursement, it is rapidly becoming the tool of choice for diagnosing cancer in community hospitals around the nation. Similarly, several market studies, including one by Frost and Sullivan, forecast a boom in the use of radiopharmaceuticals for cancer therapy and other medical applications. Although some strides have been made in this area, including advances at my own institution, these advances have not had as great an economic or clinical benefit as hoped. The market demand for radioisotopes has simply not met the expectations of some of these studies. I am very skeptical, therefore, of market studies that promise a several hundred percent increase in future isotope sales. I am especially skeptical when these studies are used to justify investments of tens of millions of dollars in infrastructure aimed at isotope production and processing.

From the perspective of an organization that sells in isotopes to both academic and commercial customers, I do not foresee a huge near- or mid-term surge in demand for isotope production and processing for biomedical applications. Furthermore, there already exists substantial domestic capacity to meet any rationally foreseen demand. A relatively small federal investment into existing facilities, rather than a multi-million dollar capital investment, could much better serve the needs of domestic isotope customers.

My own organization, the University of Missouri's Research Reactor (MURR), for example, is a major player in both domestic and international isotope markets. MURR makes approximately 2,000 radioisotope shipments annually and thereby reaps several millions of dollars in sales each year. We supply the bulk of the world's phosphorus-32 and we are developing, either alone or in collaboration with private companies, new cancer therapeutics based on radiopharmaceuticals. MURR has three FDA-approved radiopharmaceuticals currently in the marketplace, and several in development. MURR's entire budget, however, is less than \$10 million annually, of which it receives very little support from the federal sector. MURR could do much more with small infusions of federal resources.

Despite its successes, however, either the marketplace or politics have kept private companies and the federal government from investing in MURR's infrastructure. My bottom line is: if MURR will not be able to make the next large leap in radiopharmaceutical production, processing, and distribution, then federal facilities, in the absence of significant subsidies, also will not be able to make such a jump. This is especially true given that MURR's overhead costs are a fraction of those at federal facilities, and our operating schedule is an enviable 6.5 days per week each and every week of the year.

MURR has safely produced and distributed radioisotopes nationally and internationally for over 30 years. From 1968 to 1983, MURR was a major supplier of technetium-99 for Mallinckrodt, Inc. and Medi-Physics, Inc. when this radioisotope was produced by neutron irradiation of molybdenum. MURR radioisotope production escalated in 1974 when the reactor was upgraded to 10MW. Because of demand for more continuous research capability and radioisotopes supply, the reactor went to an operating schedule of 155 hours/week in 1978. Since that time the reactor has operated at full power over 90% of all clock hours and greater than 100% of scheduled hours.

In addition, MURR is an integral part of the University of Missouri's medical R&D, health care delivery, and science and technology education programs. MURR is a multidisciplinary research center that serves the School of Medicine, College of Veterinary Medicine, College of Agriculture,

3462-1

3462-2

3462-3

Response to Commentor No. 3462

Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term (less than 5 years). Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

3462-2: DOE acknowledges that while some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the "NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000," it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without disturbing the existing missions of these facilities. As described in Table 2-4 of Volume 1 of the NI PEIS, the research reactor at the University of Missouri lacks sufficient neutron production capacity to support the proposed action without impacting existing missions.

3462-3: DOE notes the commentor's views and the University of Missouri Research Reactor's (MURR's) contributions to domestic isotope production. As described in Volume 1, Section 2.6 of the NI PEIS, DOE considered the use of MURR for supporting the proposed action, but subsequently dismissed it from further consideration. This was based on DOE's understanding that MURR could not likely accomplish reliable, increased production of isotopes at levels necessary to support projected needs without disturbing the existing missions of the facility.

Commentor No. 3462: Edward Deutsch (Cont'd)
University of Missouri Research Reactor

00/6/16 P.24

Page 3 of 3

College of Engineering, and the College of Arts and Science.

Specific to this statement, MURR is instrumental in: 1) developing and producing isotopes for use in cancer research and treatment; 2) developing and producing isotopes for cardiovascular research; and 3) providing a stable supply of radio- and stable-isotopes for biomedical applications. In addition, MURR is active in the commercialization of University technology *via* the creation of public-private partnerships.

MURR is the largest, most powerful university research reactor in the nation. It has an extremely consistent operations record that has provided unparalleled access for national and international researchers. Preparations are underway for renewal of the facility's Nuclear Regulatory Commission operating license. In addition, MURR is in the planning stages for a \$20 million building expansion aimed at providing state-of-the-art biomedical research laboratories. If managed to meet its full potential, MURR could amply provide unique resources and services aimed at radiopharmaceutical research, production and processing.

MURR is exploring collaborative partnerships with several DOE national laboratories in areas of mutual benefit. Coordinating MURR's research reactor capabilities, for example, with Los Alamos National Laboratory's accelerator-produced isotopes program seems to offer obvious benefits. Prior to making substantial, multi-year programmatic commitments, I urge that the Department of Energy consider fully all existing domestic isotope production and processing resources, such as MURR, and potential relationships that would obviate the need for substantial investment of federal resources in facilities such as FFTF.

Thank you.

3462-3
(Cont'd)

Response to Commentor No. 3462

Commentor No. 231: Form Letter A Columbia Riverkeeper

This Hearing is to comment on the draft Environmental Impact Statement on FFTF Restart. Tell USDOE :

- Your **compilations of prior public comment are seriously lacking** and show your failure to listen to the public. You fail to give any numerical breakdown for the 7000 comments received. You only say “Many of the commentors who attended the meetings in Seattle, Portland and Hood River were strongly opposed to the restart of FFTF.” Then you go on to say “Most of the comments received at the Richland meeting were in support of restart.” You need to state the numbers on these comments so Sec. Richardson is clear on where the people of the Northwest stand. You put the numbers in when it is to your advantage and leave them out when they are opposed. You also failed to mention the 5 City Council Resolutions opposing FFTF restart which means you have representatives of entire cities opposing it and their numbers should be included.
- You’ve **failed to demonstrate a compelling need** for the production of 1) plutonium for space, 2) medical or research isotopes or 3) nuclear energy research. Neither is there adequate justification for the **need to produce all of them at one site**. Neither is there justification for the **need to produce them domestically** (other than reference to some DOE policy) which makes no sense when we would continue to buy foreign nuclear fuel to run FFTF.
- You must include the recommendations of your own blue ribbon panel (**Subcommittee for Isotope Research and Production Planning**) that advised **against the use of FFTF for medical isotope production**. Furthermore, EIS Isotope demand projections are outdated and inadequate. They also fail to take into account possible cancer cures like gene therapy that could make medical isotopes unnecessary. In addition, medical isotopes can be adequately produced at other DOE sites if they are a high priority as implied. Current isotope production levels for DOE reactors are misstated in the EIS at near capacity when most are only at around 50%.
- You must **include the current demand estimates from NASA for Plutonium 238** which are considerably lower than your need projections and could easily be met under the current contract with Russia. A discussion of alternatives to plutonium fuel must be included. A renegotiated contract with Russia (at double the current cost) could meet future NASA needs at 1/3 the cost of FFTF restart.
- It is **improper to release the draft EIS for public comment without the critical information** requested by the public in the scoping meetings including:
 - cost analysis of restart and all alternatives with reasonable review time (FFTF will be much more expensive than reasonable alternatives by at least \$2 Billion.)
 - studies on treatment of wastes at all proposed sites and
 - nonproliferation impacts from FFTF and the importation of its necessary radioactive fuel from Europe. (**Violation of the Nonproliferation Agreement by use of Highly Enriched Uranium fuel alone is reason enough to stop restart of FFTF!**)
- You have **failed to adequately characterize environmental impacts from FFTF restart**. An example is the statement, “Environmental impacts associated with the existing inventory of spent fuel at Hanford site are minimal.” To imply that the existing spent nuclear fuel inventory poses no problems is massively incorrect. More than 2100 tons of corroding spent fuel sites in aging water-

Response to Commentor No. 231

- 231-1:** While all comments received during the scoping periods for both the Plutonium-238 Production EIS and the NI PEIS are part of the Administrative Record for the NI PEIS, Section 1.4 of Volume 1 and Appendix N are intended to provide a summary of the issues and associated trends identified during the scoping process rather than a tabulation of comments by specific issue. It should be noted, however, that NEPA and CEQ regulations do not require an agency to include and respond to each scoping comment as is required for public comments on a Draft EIS. In preparing the NI PEIS, DOE carefully considered scoping comments received from the public. Any perceived discrepancy in the grouping of comments raising any one particular issue or set of issues is attributable to the manner in which they were originally categorized and counted. For example, a number of statements, letters, or resolutions signed by multiple persons, such as city council resolutions mentioned by the commentor, were received by DOE (both for and against FFTF restart) in response to the request for scoping comments. Each such comment document was considered and counted as a single comment in the NI PEIS comment tracking system. The Office of Nuclear Energy, Science and Technology works closely with the Office of the Secretary to keep him informed of the progress on the NI PEIS, including stakeholder input.

For information purposes, approximately 6,900 submittals (written and oral related to the NI PEIS were received by DOE. Of all the comments received by DOE that were specific to FFTF restart, 68 percent were opposed to restarting FFTF and 32 percent were in favor.

At the NI PEIS scoping meetings held in Seattle, Portland, and Hood River, 172 people commented; 77 percent were opposed to restarting FFTF (14 percent were in favor and 9 percent did not express an opinion). At the NI PEIS scoping meeting in Richland, 49 people commented; 16 percent were opposed to FFTF restart (80 percent were in favor and 4 percent did not express an opinion). However, of all the comments received at the scoping meetings, 80 percent of the stakeholders were opposed to restarting FFTF (16 percent were in favor and 3 percent did not express an opinion).

- 231-2:** As discussed in Section 1.1 of Volume 1, consistent with its mandates under the Atomic Energy Act, DOE is proposing this enhancement for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and

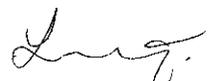

Commentor No. 231: Form Letter A (Cont'd)
Columbia Riverkeeper

filled basins near the Columbia River posing one of the largest problems for cleanup and an expected cost of more than \$1.6 billion. You must address all impacts on waste management and the environment at Hanford not dismiss them with erroneous statements.

- You must **include the cost of FFTF and all companion facilities decontamination and decommissioning in the restart** not just every other alternative. All facilities used in all other alternatives must show the cost of decontamination and decommissioning as well.
- You have **failed to assess all existing contaminant sources at Hanford** and all other sites before adding additional waste. You must assess current waste inventories and then assess the addition of any new waste to existing waste sources.
- You fail to adequately consider use of the Advanced Test Reactor (ATR) in Idaho and the High Flux Isotope Reactor (HFIR) in Oakridge for medical isotopes while acquiring Plutonium 238 from another source. You also fail to **analyze lower cost alternatives such as subsidizing university reactors or buying time from private accelerators or reactors.**
- **The No Action Alternative must include the shutdown of FFTF** not maintaining it on stand-by based on prior commitments of Secretaries O'Leary and Watkins and TPA milestones.
- You **failed to address the conflict of interest of using PNNL's evaluations** when they are a proponent of restart and stands to gain financially.
- You **fail to access the legality of introducing new programs and wastes into the highly contaminated 306 e or 325 buildings at Hanford** that would be used with FFTF.
- You must admit that the **real reasons** to restart FFTF are in a hidden agenda that includes **preserving jobs and starting new weapons research or other classified missions.**
- **The draft EIS must state the preferred alternative for adequate public review.**

USDOE should choose Alternative 5- SHUT DOWN FFTF, or Alternative 2- Produce at existing sites with shutdown of FFTF.

industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2 of Volume 1 describes these needs in more detail.

There is no requirement to conduct all of these missions at one site. In the Record of Decision process, DOE could choose to combine components of several alternatives in selecting the most appropriate strategy. For example, DOE could select a low-energy accelerator to produce certain medical, research, and industrial isotopes, and an existing operating reactor to produce plutonium-238 and conduct nuclear research and development. Should FFTF be selected for restart in support of these missions, DOE expects it could utilize a 15-year supply of mixed-oxide fuel that would be available from Germany under favorable economic terms (i.e., no charge for the fuel).

In view of DOE's responsibilities under the Atomic Energy Act of 1954, as amended, domestic production of plutonium-238 would ensure a reliable long-term supply of nuclear material to support NASA's space missions regardless of the international climate (See Section 12.2 of Volume 1). As discussed in Section 2.3.1.1.3 of Volume 1, it is economical to use available mixed-oxide fuel supplies.

231-3: The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian

applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

DOE has taken the Expert Panel and NERAC report recommendations under consideration in developing the range of alternatives evaluated in the NI PEIS. These reports were made available to the public at the NI PEIS public information centers and on the Internet at www.nuclear.gov.

DOE did not misstate isotope production levels in the Draft NI PEIS. Section 1.2.1 of Volume 1 identifies that "Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense)."

- 231-4:** Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. DOE could purchase plutonium-238 from Russia to satisfy its near-term responsibility to supply NASA with plutonium-238 to support

Commentor No. 231: Form Letter A (Cont'd)
Columbia Riverkeeper

Response to Commentor No. 231

future space exploration missions. Under the current contract set to expire in 2002, the United States is authorized to purchase up to 40 kilograms of plutonium-238, with the total available for purchase in any one year limited to 10 kilograms. However, DOE does not stockpile large quantities of Russian plutonium-238 long in advance of needs due to budget constraints and the additional processing required to remove decay products that occur following extended storage of the material. To date, DOE has purchased approximately 9 kilograms of plutonium-238 under this contract. The environmental impacts associated with procurement of plutonium-238 from Russia are evaluated as an element of the No Action Alternative. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Under the No Action Alternative, DOE would continue to purchase plutonium-238 to meet the space mission needs for the 35-year evaluation period considered in the NI PEIS. However, DOE recognizes that any purchase beyond what is currently available to the United States through the existing contract would likely require negotiation of a new contract and may require additional NEPA review.

The May 22, 2000, correspondence from NASA to DOE identifies that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, SRTG development efforts were stopped in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires one-third less plutonium-238 as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000, letter to DOE that large RTGs be maintained as backup. Section 1.2.2 of

***Commentor No. 231: Form Letter A (Cont'd)
Columbia Riverkeeper***

Response to Commentor No. 231

Volume 1 was revised to clarify plutonium-238 mission needs. DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

- 231-5:** CEQ (40 CFR 1500 et seq.) and DOE (10 CFR Part 1021) implementation regulations do not require inclusion of cost and nonproliferation studies in an environmental impact statement. The basic purpose of the NI PEIS is to describe the alternatives under consideration for implementation (Section 2.5 of Volume 1) and the environmental impacts that would occur if these alternatives were implemented (Chapter 4 of Volume 1). Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. The associated cost report and nonproliferation report were made available to the public on August 24, 2000 and September 8, 2000, respectively. DOE mailed these documents to approximately 730 interested parties, and these reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in public reading rooms.
- 231-6:** See Response to Comment Number 231-5 above.
- 231-7:** This NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.
- 231-8:** The use of mixed oxide or highly enriched uranium to fuel the FFTF has been rigorously evaluated in the Nuclear Infrastructure Nonproliferation Impact Assessment. This report confirms that the manner in which these fuels would be used, as described in the PEIS, is consistent with

Commentor No. 231: Form Letter A (Cont'd)
Columbia Riverkeeper

Response to Commentor No. 231

nonproliferation policy. In the event that a decision is made to restart FFTF, the first six years of operation would use existing onsite mixed oxide (MOX) fuel. DOE expects that an additional 15-year supply of mixed oxide fuel in Europe, owned by Germany, could be available for FFTF.

Further, use of the Hanford MOX fuel would dispose of a significant U.S. stockpile of fresh plutonium fuel by conversion to spent fuel through irradiation in FFTF. This represents a safe, low-cost, high benefit opportunity to reduce U.S. civilian plutonium without chemical or bulk processing. Use of the German MOX fuel represents a similar advantage with respect to the German stockpile of separated civilian plutonium. During the period of MOX fuel use, in support of U.S. nonproliferation policy directives, DOE's Office of Nonproliferation and National Security would undertake a study under Reduced Enrichment for Research and Test Reactors (RERTR) to consider the technical feasibility of using low enriched uranium to fuel the FFTF. Under this nonproliferation protocol, if use of low enriched uranium fuel is found infeasible in FFTF for meeting assigned missions, policy would allow DOE to subsequently procure highly enriched uranium fuel for use in FFTF. Again, this approach is consistent with U.S. nonproliferation policy.

231-9: DOE notes the concern expressed in the comment on the potential health and environmental impacts of FFTF startup. All air emissions and wastewater discharges would be in accordance with applicable permit and regulatory requirements. The releases of air pollutants and contaminated liquid are addressed in Section 4.3 of Volume 1. The release of air pollutants would result in concentrations well below Federal and state air standards (Table 4-13). The release of radioactivity and hazardous chemicals into the atmosphere would have a negligible effect on human health (Tables 4-17 and 4-19, respectively). There would be no discernible impacts to groundwater or surface water quality (Section 4.3.1.1.4). All impacts on ecological resources, including animals and fish, associated with operation of FFTF would be small (Section 4.3.1.1.6).

The discussion in the Summary and Section 4.8.3.5 of Volume 1 on the cumulative impacts for spent nuclear fuel management at Hanford was

Commentor No. 231: Form Letter A (Cont'd)
Columbia Riverkeeper

Response to Commentor No. 231

revised to clarify that the management of the existing spent nuclear fuel at Hanford results in a dose of less than 0.1 millirem per year of the maximally exposed member of the public. This dose is well within the DOE limits given in DOE Order 5400.5. As discussed in that Order, the dose limit from airborne emissions is 10 millirem per year, as required by the Clean Air Act; drinking water is 4 millirem per year, as required by the Safe Drinking Water Act; and the dose limit from all pathways combined is 100 millirem per year. DOE has committed to remove the spent nuclear fuel at Hanford for ultimate disposition in a geologic repository.

- 231-10:** Decommissioning of FFTF and all other candidate facilities considered, including associated costs and cleanup, is not within the scope of the NI PEIS. Before decommissioning activities were undertaken, DOE would prepare the appropriate environmental documentation to address the associated environmental impacts. Cost assessments would also be prepared.

Deactivation costs for FFTF are included in the ancillary Cost Report and are properly assigned to support the alternatives as they are defined in Chapter 2, Volume 1 of the PEIS.

DOE remains committed to cleaning up the Hanford Site independent of ultimate decision on FFTF. The amounts of wastes associated with decommissioning FFTF would be small. The schedule for cleaning up these other wastes would not be affected if FFTF were restarted.

- 231-11:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Commentor No. 231: Form Letter A (Cont'd)
Columbia Riverkeeper

Response to Commentor No. 231

The current inventory of wastes managed at the Hanford Site is identified in Volume 1, Section 3.4.11.1 of Volume 1. In addition, the generation rates of wastes associated with the NI PEIS options that use Hanford facilities are compared with the current waste generation rates at the site in Section 4.3 of Volume 1. As stated in Sections 4.3.1.1.13, 4.3.3.1.13, and 4.4.3.1.13, the generation rates of wastes at Hanford associated with the options that utilize either FFTF, FMEF and/or RPL/306-E would be much smaller than the current waste generation rates at the site. These volumes would also be small in comparison to the existing inventory at the site (Section 3.4.11.1). These comparisons were also made for the other options which involved INEEL and ORR facilities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

231-12: Both ATR and HFIR are currently producing medical isotopes and under the No Action Alternative both would continue to do so. Further, under this alternative DOE would not establish a domestic source of plutonium-238 production but could instead continue to purchase it from Russia to meet the needs of future U.S. space missions.

DOE considered the use of irradiation facilities other than those addressed under Alternatives 1 through 4. However, their use was dismissed for a variety of reasons as discussed in Volume 1, Section 2.6.1.

The No Action alternative is required under Council on Environmental Quality regulations (40 CFR 1502.14(d)). It provides a point of comparison for the action alternatives. The No Action Alternative generally represents the status quo; that is, it includes those actions that would normally take place without the proposed action. Since the status quo involves maintaining FFTF in standby and not its deactivation, it is not appropriate to include its deactivation as part of the No Action Alternative. Deactivation of FFTF is included as Alternative 5, Permanently Deactivate FFTF, and as part of Alternative 2, Use Only Existing Operational Facilities, Alternative 3, Construct New Accelerator(s), and Alternative 4, Construct New Research Reactor.

Commentor No. 231: Form Letter A (Cont'd)
Columbia Riverkeeper

Response to Commentor No. 231

231-13: PNNL is not preparing this PEIS, although it has offered technical comments on it. These comments have been evaluated by DOE and the contractor preparing the PEIS. PNNL has also previously provided technical and cost analyses on matters related to the FFTF, which have undergone independent scrutiny, and have helped confirm the need for the environmental review now being independently developed. PNNL's work does not present a conflict of interest. Ultimately, DOE has full control over the contents of the PEIS.

The 300 Area Revitalization Plan (DOE 1999) provides for continued multi-program R&D operations in the 300 Area, including operation of various laboratories, office facilities, and services. It also provides for consolidation (but not complete elimination) of radiological operations, with support for Hanford Site facility transition and environmental restoration efforts. The plan does not require closure of the 325 and 306-E buildings as long as they are needed for active research projects. Operation of these facilities would not violate any existing agreements between DOE and stakeholders or other legal obligations, nor would it affect ongoing or planned environmental restoration and facility transition activities.

The 306-E facility is not contaminated and is being proposed as a location to conduct activities that do not involve radioactive materials. While the 325 Building has a large inventory of radionuclides associated with ongoing activities at the facility, the building is not contaminated in worker accessible areas. Operations at the 325 Building are conducted in accordance with applicable federal and state regulations and appropriate DOE Orders. The need to restart FFTF is described in Chapter One of the Final NI PEIS. In Chapter Four, the socioeconomic impacts of restarting FFTF are described. The economic welfare of Hanford and all DOE sites is important to DOE. However, any economic impact is secondary to the proper expenditure of taxpayer dollars. The expenditure must be connected to the mission of the facility.

DOE has not identified any classified missions or weapons research that will be undertaken at FFTF. If changes are proposed, the public will be informed and the appropriate NEPA documentation will be prepared.

Commentor No. 231: Form Letter A (Cont'd)
Columbia Riverkeeper

Response to Commentor No. 231

- 231-14:** At the time the Draft NI PEIS was completed and published, DOE did not have a preferred alternative. DOE used the environmental evaluation in the Draft NI PEIS, and also other reports on cost and nonproliferation impacts, as well as input from the public to develop its preferred alternative. Council on Environmental Quality regulations (40 CFR 1502.14(e)) do not require the inclusion of a preferred alternative in a draft EIS if one has not been identified at that time. However, the regulations do require identification of a preferred alternative in the final document. DOE has identified a preferred alternative in Section 2.8 of the Final NI PEIS.
- 231-15:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, or Alternative 2, Use Only Existing Operational Facilities.

628-1

Response to Commentor No. 628

628-1: The annual doses to the public from the Hanford site and proposed NI PEIS activities above are very small. The cumulative impact assessment determined that the incremental annual radiation dose to the maximum exposed public individual from the NI-PEIS proposed operations at FFTF and FMEF or RPL would be 0.0054 mrem. This assessment also determined that 0.0045 latent cancer fatalities would be expected to occur among the local population as a result of the NI-PEIS related radiation exposure over the 35 year period.

For perspective, the radiation dose the average American receives from natural sources is about 300 mrem each year. Based on the same 35 year time period used above, approximately 2,000 latent cancer fatalities would be expected among the same population as a result of this natural non-Hanford related) radiation exposure. In that same 35 years, about 19,000 cancer fatalities from all causes (nonradiological causes included) would be expected in the same population.

It is there fore highly unlikely that current or future Hanford operations will impact public health.

Commentor No. 1172: Charles Walden

Name: Charles Walden

Address: 34 Wenonah Ave Oakland, NJ 07436

Additional Comments:

I own property in Hood River and I think that Hanford could adversely affect the value of my land. I lived in the Gorge for 7 1/2 years and did not like seeing the toxic barges traveling up to Hanford. They were sent up in the middle of the night, so the public would not see them. I think Hanford should be cleaned up and shut down. I think it is time that you listen to the people. Do not contaminate the Columbia River any more.

Sign and return to Columbia Riverkeeper or mail by Sept. 18th to: Colette Brown, NE-50, USDOE, 19901 Germantown Rd., Germantown, MD 20874 / e-mail: nuclear.infrastructure-PEIS@hq.doe.gov

1172-1

1172-2

Response to Commentor No. 1172

1172-1: The alternatives considered in the PEIS do not include any actions that should result in the change in property value in the Hood River area.

1172-2: Although not within in the scope of the NI PEIS, DOE notes the commentor's concerns regarding river transportation of waste to the Hanford Site and cleanliness of the Columbia River. In general, hazardous wastes are not shipped to Hanford by barging on the Columbia River. There are two exceptions to this: 1) transport of Trojan Nuclear Reactor components for disposal in a commercial disposal site, and 2) transport of decommissioned submarine reactor compartments for burial at Hanford. Any night transports resulted from scheduling and convenience factors (e.g. arriving at Hanford during daylight hours).

Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

1531-1

1531-2

Response to Commentor No. 1531

- 1531-1:** DOE notes the commentor's opposition to the restart of the FFTF.
- 1531-2:** DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The environmental impacts associated with operation of the FFTF are addressed in detail in Section 4.3 of this NI PEIS. The impacts are shown to be small. These impacts specifically include the risks to human health during normal operations and associated with postulated accidents. Over the 35-year operational period no fatalities would be expected among workers or in the general public in the vicinity of Hanford or at distant locations. For perspective, the radiation dose the average American receives from naturally occurring sources is about 300 mrem each year. Based on the same 35 year time period used above, approximately 2,600 latent cancer fatalities would be expected among the local population as a result of natural (non-Hanford related) radiation exposure.

Response to Commentor No. 1532**Response to Commentor No. 1533**

1532-1

1532-1: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

1532-2

1532-2: DOE is committed to discharging its responsibilities in an open and unbiased manner and providing the public with comprehensive environmental reviews of its proposed actions. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the environmental impact analysis of DOE's proposed alternatives for meeting mission requirements. In preparing the Final NI PEIS, DOE carefully considered comments received from the public

1533-1

1533-1: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

Carol Douglass

Response to Commentor No. 1535

1535-1: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

1535-2: DOE notes the commentor's views including the need for public dialog and education as a prerequisite for informed public participation. It is DOE policy to encourage public input on matters of national and international importance. In doing so, DOE has established reading rooms near DOE sites to provide easy access to information about DOE programs and encourages the use of this source of information. Further, DOE has numerous web sites, including one for NE (<http://www.nuclear.gov>), that provide up-to-date-information complete with fact sheets, news releases, and other materials. DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings.

Commentor No. 1535: Carol Douglass (Cont'd)

Response to Commentor No. 1535

Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Although research to identify other potential fuel sources to support these space exploration missions has been conducted, no viable alternative to using plutonium-238 has been established. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

In January 1997, President Clinton tasked his Committee of Advisors on Science and Technology (PCAST) to evaluate the current national energy research and development portfolio and to provide a strategy that ensures the United States has a program to address the Nation's energy and environmental needs for the next century. In its November 1997 report responding to this request, the PCAST Energy Research and Development Panel determined that restoring a viable nuclear energy option to help meet our future energy needs is important and that a properly focused research and development effort to address the potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) was appropriate. The PCAST panel further recommended that DOE reinvestigate its nuclear energy research and development activities to address these potential barriers. Section 1.2.3 of Volume 1 provides information on the nuclear energy research and development mission.

1975-1

Response to Commentor No. 1973

Response to Commentor No. 1975

1973-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site.

A Tri-Party Agreement change was made to place the milestones for FTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Public meetings were held on this formal milestone change. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

1973-2: DOE notes the commentor's opposition to Alternative 1, Restart FTF.

1975-1: DOE policy encourages effective public participation in its decision making process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public. No final decisions have been made with regard to the facilities and locations evaluated to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238 for NASA space missions, and nuclear research and development. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

→ We DON'T NEED MORE plutonium-238 from anywhere!!!

1979-1: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

1983-1

1983-2

1986-1

1983-1: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

1983-2: DOE notes the commentor's concern regarding waste generation. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

1986-1: DOE gave equal consideration to all comments received as a result of the scoping process and made a number of changes in the Draft NI PEIS in response to these comments (see Section 1.4 of Volume 1). The evaluations presented in Chapter 4 for Alternative 1 options (i.e., 4.3.1 to 4.3.6) address the radiological and chemical impacts on human health and the environment associated with normal FFTF operations and from postulated accidents.

As explained in Appendix H, the radiological impacts assessment (for both normal operations and accidents) considered deposition to soils and uptake and ingestion through foodstuffs as well as direct inhalation and external exposure. Releases were calculated to air only because there

Commentor No. 1986: Yellow Thunder (Cont'd)

Response to Commentor No. 1986

are no radiological effluent liquid pathways to the environment from FFTF. For normal operations, the analyses indicate that impacts on human health would be small (less than 0.1 millirem annually to the maximally exposed member of the public), which is well below the annual limit of 10 millirem for air emissions. In addition, a complete spectrum of accidents was evaluated for FFTF (see Appendix I). All of the accidents evaluated for FFTF resulted in doses of less than 1 rem to the maximally exposed individual, which is below the U.S. EPA's Protective Action Guidelines of 1 to 5 rem. These analyses are subject to independent review by virtue of being published in the NI PEIS. All data used is referenced and publicly available with the methods of analysis based on accepted procedures and documented in the NI PEIS Administrative Record.

For impacts to ecological resources, it should also be noted that human health impacts are generally assumed to be conservative of the impacts to other organisms and therefore protective of ecological resources in general. According to International Atomic Energy Agency guidance, a dose rate of 100 millirem per year to the maximally exposed human will lead to dose rates to plants and animals of less than 0.1 rad per day. The IAEA concluded that a dose rate of 0.1 rad per day or less for animals and 1 rad per day or less for plants would not affect these populations. The largest individual dose for any of the alternatives (inclusive of FFTF normal operations) evaluated is below 0.1 millirem annually, three orders of magnitude less than the IAEA identified threshold level. This is well below the IAEA benchmark. Therefore, all of the proposed alternatives would have no effect on the plants and animals around the proposed sites.

Commentor No. 1989: Michael Mulhall

Name: Michael Mulhall

Address: Hood River, OR

Additional Comments: We can no longer afford to create more nuclear waste. I am against the re opening of the FFTF. I am for Alternative 5, shut down FFTF now. God is watching. *Michael Mulhall*

Hood River, Oregon 97031

|| 1996-1
|| 1996-2
|| 1996-3
|| 1996-4

Response to Commentor No. 1996

1996-1: DOE notes the commentor's opposition to Alternative 1, Restart FFF.

1996-2: DOE acknowledges that other manufacturers can produce certain isotopes that are economically attractive. In fact, the United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements.

Although other manufacturers produce medical radioisotopes, DOE remains the key provider for a large number of radioisotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large-enough quantities to make their production financially attractive to private industry. However, supplies of many research isotopes are not readily available from existing domestic or foreign sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed. Under the NI PEIS proposed action and consistent with its mandates under the Atomic Energy Act, DOE would enhance its existing nuclear facility infrastructure to, among other things, more effectively support production of radioisotopes for medical applications and research. DOE's intent is to complement commercial sector capabilities to ensure that a reliable supply of isotopes is available in the U.S. to meet future demand, and to encourage the commercial sector to privatize the production of isotopes that have established applications to a level that would support commercial ventures. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

1996-3: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency,

Commentor No. 1996: Art Lewellan (Cont'd)

Response to Commentor No. 1996

and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Hanford cleanup is funded by DOE's Office of the Assistant Secretary for Environmental Management (EM). FFTF funding is provided through the Office of Nuclear Energy, Science & Technology (NE). Further, two different congressional subcommittees oversee the appropriations for these activities. No monies have been or will be taken from any EM projects at Hanford to support the FFTF. Restart of FFTF would not impact current cleanup schedules.

- 1996-4:** This NI PEIS provides an estimate of the potential human health impacts associated with a range of reasonable alternatives for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

*Shut down FFTF
\$ For cleanup now,*

Sign and return to Columbia Riverkeeper or mail by Sept. 18th to: Colette Brown, NE-50, USDOE, 19901 Germantown Rd., Germantown, MD 20874 / e-mail: nuclear.infrastructure-PEIS@hq.doc.gov

|| 2010-1

Response to Commentor No. 2010

2010-1: The commentor's opposition to Alternative 1, Restart FFTF, and support for cleanup at the Hanford Site are noted. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

**Commentor No. 70: Form Letter B
Varsity Construction**

August 17, 2000

Colette Brown
NE-50
US Dept. of Energy
19901 Germantown Rd.
Germantown, MD 20874

Dear Ms. Brown:

I would like to add my voice for the restart of the FFTF facility. This state-of-the-art facility can produce medical isotopes for the diagnoses and treatment of cancer and it sits dormant.

In 1999 over half a million Americans died from cancer. In 2000 over a million new cases will be diagnosed. I realize that dying of cancer is not the most politically correct form death, but most of us have a friend or a relative who has been affected by cancer and we know its devastating effect.

I wonder how many more lives will be lost if the research and development of these life saving medical isotopes is not fully exploited. If someone you loved life could be saved by using these one medical isotopes, don't you hope that they would be available.

Millions of patients already benefit from the improved diagnoses with medical isotopes. In fact, more than 40,000 such procedures are performed each day in the United States. We have this exciting new technology in our back yard. Let's use it.

In a time of budget surpluses, let us invest in our future health and that of our children and see that the FFTF reactor is restarted again for the production of medical isotopes.

Respectfully,

Ed Deen
1519 South Union Court
Kennewick, WA 99338

Commentor No. 2333: Form Letter C
No Nuclear Power for Space Missions

Secretary, The

To: Secretary, The
Subject: No Nuclear Power for Space Missions

Dear Mr. Richardson:

I am opposed to the use of nuclear devices in space for energy generation in any space craft, to any destination, for any purpose.

The dangers of nuclear accidents and nuclear pollution are too real to ignore. Not only should we not endanger life on earth with nuclear accidents, we should not send nuclear-powered craft into space where they might cause unforeseeable dangers.

I urge you, Secretary Richardson, to order the National Aeronautics and Space Administration and all other space-oriented agencies to develop non-nuclear power sources for space craft.

Sincerely,

2333-1

Response to Commentor No. 2333

2333-1: DOE notes the commentor's opposition to NASA's use of nuclear materials for space missions and support for development of alternative energy sources. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch.

Nuclear Infrastructure EIS

We support the restart of the FFTF Reactor Facility at Hanford to meet the national needs for medical isotopes and other peaceful nuclear materials. The FFTF is the most economical, safe, and environmental friendly method available to meet these needs.

Rename the facility to make away up care factor something like "Cancer Medical isotope production"

Very truly yours,

Joretta G. Pritchett

Response to Commentor No. 661

661-1: DOE acknowledges the commentor's support for Alternative 1, Restart FFTF, and their desire to rename the FFTF. The purpose of this NI PEIS is to evaluate the environmental impacts of reasonable alternatives to fulfill the requirements of the proposed missions, which include the production of medical and industrial isotopes, the production of plutonium-238, and nuclear research and development. The Record of Decision for the PEIS will be based on a number of factors including environmental impacts, costs, nonproliferation issues, schedules, technical assurance, policy, and program objectives.

DRAFT PROGRAMMATIC ENVIRONMENTAL STATEMENT
FOR
ACCOMPLISHING EXPANDED CIVILIAN NUCLEAR
ENERGY RESEARCH AND DEVELOPMENT AND
ISOTOPE PRODUCTION MISSIONS IN THE UNITED STATES
INCLUDING THE ROLE OF THE FAST FLUX TEST FACILITY (NI PEIS)

Dear Ms. Brown:

On September 13, we forwarded to your office, 433 signature cards supporting the selection of the FFTF restart option as the preferred method of meeting future requirements for nuclear isotope production and nuclear infrastructure research and development. Enclosed is an additional 386 signature cards in support of the FFTF.

These signature cards continue to show the support that exists in the Tri-Cities area and in other parts of Oregon and Washington for the restart of the FFTF to meet national program needs.

These signature cards are separate from and in addition to a number of similar postcards, which have been mailed directly to your office.

Please include these additional statements of support for the FFTF in the record of the NI-EIS public hearing record.

Very truly yours,

Sam Volpentest
Executive Vice President

Commentor No. 2078: Amber Waldref
Heart of America Northwest

Heart of America Northwest

"Advancing our region's quality of life."

Ms. Colette Brown
Office of Space and Defense Power Systems
U.S. Department of Energy
19901 Germantown Road
Germantown, MD 20874

Dear Ms. Brown:

Please find enclosed comments made by citizens throughout the Pacific Northwest regarding the Draft Nuclear Infrastructure PEIS on the FFTF Nuclear Reactor. I have included three sets of comments, with the originals being sent to Sec. Bill Richardson. The first set of comments is postcards addressed to Sec. Richardson which I have copied eight to a page. I have also included letters to the Secretary. Finally, citizens wrote their comments on a piece of butcher paper before and after giving their public testimony at the Seattle hearing. I have sent copies of some of these comments.

I ask you to include these comments in the official record for the Pu-238/FFTF Environmental Impact Statement and also, to respond to the concerns voiced by the citizens of the Pacific Northwest. We hope that you will share these written comments and all those spoken at the public hearings with Sec. Richardson so that he can make a well-informed decision on FFTF at the end of the year. It is extremely important that he is briefed on the needs and desires of the people of this region --an essential part of the public involvement process.

Sincerely,

Amber Waldref
Field Organizer
Heart of America Northwest

2078-1

Response to Commentor No. 2078

2078-1:

DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and to providing ample opportunity for public comment on those actions. DOE takes this participation seriously. Further, DOE, and the Secretary of Energy in particular, are aware that there is a considerable difference of public opinion regarding the alternatives evaluated in this NI PEIS to accomplish the missions, including direct support as well as opposition to Alternative 1, Restart FFTF. In preparing the Final NI PEIS, DOE has carefully considered and responded to all comments received from the public during the comment period, regardless of how or where they were received. DOE's responses are contained in the NI PEIS Comment Response Document, and all comments received during the public comment period have been entered into the Administrative Record for this NI PEIS. All pertinent information and public input will be provided to the Secretary so that he may make an informed and unbiased decision with respect to the alternatives presented in this NI PEIS.

Comments received as enclosures to this submittal are individually considered as numbers 2079 through 2322.

Commentor No. 2079: Betty Shakal

220 10TH St S
La Crosse, WI
Aug 28, 2000

Bill Richardson, Sec of Energy
Hanford Public Interest Network
1305 Fourth Avenue #208
Seattle WA 98101

Dear Mr. Richardson:

Friends of mine live in the south central Washington state area, near the city of Richland. They tell us about the discussions taking place regarding the restarting of the FFTF Nuclear Reactor in order to produce plutonium. In July your department released a report called PEIS supporting plutonium production in restarting the FFTF Nuclear Reactor. A FFTF restart violates the clean-up agreement of 1989, and will instead add more liquid radioactive waste to Hanford's already leaking and explosive high level nuclear waste tanks.

Before the restarting of this reactor, some very serious questions need to be addressed: Is restart safe? Does it harm clean up? Is there any legitimate reason to restart the reactor? Has the Department of Energy properly and thoroughly studied the need for restart, as well as the impacts of restart?

Please, for the benefit of my friends and all others who live in the area, **do not allow the FFTF Nuclear Reactor to restart. Do not** allow production of Plutonium. **Ban adding** more waste to Hanford's already high level nuclear waste system. **Demand** that Hanford take the responsibility to clean up their waste system.

Sincerely,

Betty Shakal, Science teacher

Response to Commentor No. 2079

2079-1: As discussed in Section 1.2 of Volume 1, plutonium-238 would be produced to support NASA's deep space missions. Plutonium-238 is not used to produce nuclear weapons. All missions considered in the NI PEIS are for civilian purposes.

DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. That proposed TPA milestone change was the subject of previous public meetings.

2079-2: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. High-level radioactive waste would not be generated from merely operating FFTF. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

2079-3: FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1,

Commentor No. 2079: Betty Shakal (Cont'd)

Response to Commentor No. 2079

including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

Complete safety and operational readiness reviews would be performed prior to the restart. The FFTF Safety Analysis Report is routinely reassessed and updated when required to address any changes in plant configuration due to physical modifications or changes in plant operation procedures. The analyses presented in this NI PEIS reflect the proposed changes to the reactor core (including fuel and irradiation targets) to perform the DOE missions.

2079-4: See response 2079-1 and 2079-2.

As discussed throughout Section 4.3 of Volume 1, none of the proposed alternatives would add waste to the high-level waste tanks at Hanford.

2079-5: Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. The NI PEIS evaluates a range of reasonable alternatives for accomplishing the proposed action, one of which includes use of FFTF. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

2079-6: The environmental impacts associated with operation of the FFTF and support facilities at Hanford during normal operations and from postulated accidents are presented and discussed in Section 4.3 of the NI PEIS. All impacts to human health and to ecological resources would be small both in the immediate area of the Hanford site and at all distant locations.

2079-7: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Commentor No. 2080: Fred E. Schilling

Seattle, WA
06 September, 2000

Office of the Vice President
Albert Gore, Jr.
The White House
1600 Pennsylvania Ave.
Washington, D.C. 20500

Dear Vice President Gore:

Plans to restart the FFTF Nuclear Reactor at Hanford Washington continue to be at odds with the mission of cleaning up that radioactive waste dump.

How many years ago was it we were assured everything was: 1) under control; 2) even if it wasn't, it would be soon; 3) because the Congress had budgeted money for a clean-up?

We didn't mark it on the calendar, or write it down, or save the clippings, because there it was - the government was finally putting dollars where it's mouth was, and, surely, dollars would finally bring us peace of mind and security from accidents.

How many years, sir? Why should we remember when the promise was that the increasing threat of radioactive pollution was going to be dealt with. Why should we have to record this promise? Why should we have to rally again and again, write letters again and again, leave messages with answering machines again and again. Waste our time and yours, again, over a problem that should have been handled.

How could we have been so naive? How, after the years, (or is it now decades?), of scandal about the incompetent and careless storing of deadly waste so near the great river we share with Oregon could we believe our worries were over?

What is the administration waiting for - a message from God? If divine intervention is all that is going to save us, hadn't we better spend the next billion on prayer halls!

I don't know about you, but I for one feel the need for a head start.

Cheers,

Fred E. Schilling
8307 54th Ave. S.
Seattle, WA 98118

2080-1

Response to Commentor No. 2080

2080-1:

DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Steady and consistent progress in restoring the Hanford Site is documented in annual reports. These are available at www.hanford.gov.

Commentor No. 2081: Arundel B. Pritchett

602 Boyer Ave., #11
Walla Walla, WA 99362

August 21, 2000

Secretary Richardson
Department of Energy

Dear Secretary Richardson:

I am writing to express my concerns about the proposed restart of the FFTF nuclear reactor at the Hanford Reserve in Washington State. Due to leakage and potential explosion, Hanford's tanks already severely threaten the Columbia River. Restarting the FFTF nuclear reactor would create more high-level nuclear waste, thereby increasing the already present dangers. I ask you to please honor the Clean-up Agreement and shut down the FFTF nuclear reactor.

Sincerely,

Arundel B. Pritchett

Response to Commentor No. 2081

2081-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford and protection of the Columbia River. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

As discussed throughout Section 4.3 of Volume 1, none of the proposed alternatives would add waste to the high-level waste tanks at Hanford.

2081-2: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. 8/29/00

Mr. Bill Richardson

Is restart of the reactor safe? Does it harm clean up? Is there any legitimate reason to restart the reactor?

Has the Department of Energy properly & thoroughly studied the need to restart, as well as the impacts of restart?

Do Not Allow the FFTF Nuclear Reactor to restart!!!

Concerned Citizen
 Anna Ruhl

2084-1

2084-2

2084-3

2084-4

2084-5

Response to Commentor No. 2084

2084-1: FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

Complete safety and operational readiness reviews would be performed prior to the restart. The FFTF Safety Analysis Report is routinely reassessed and updated when required to address any changes in plant configuration due to physical modifications or changes in plant operation procedures. The analyses presented in this NI PEIS reflect the proposed changes to the reactor core (including fuel and irradiation targets) to perform the DOE missions.

2084-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2084-3: Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs:

Commentor No. 2084: Anna Ruhl (Cont'd)

Response to Commentor No. 2084

- 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;
- 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and
- 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. The NI PEIS evaluates a range of reasonable alternatives for accomplishing the proposed action, one of which includes use of FFTF. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

2084-4: The environmental impacts associated with operation of the FFTF and support facilities at Hanford during normal operations and from postulated accidents are presented and discussed in Section 4.3 of the NI PEIS. All impacts to human health and to ecological resources would be small both in the immediate area of the Hanford site and at all distant locations.

2084-5: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Commentor No. 2085: Rita Griffith

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

Restarting the reactor will
 delay clean-up at Hanford and
 create unacceptable risk of
 contamination and destruction
 of the Columbia River and the
 Pacific NW.

Sincerely,

|| 2090-1 || 2090-2

2090-3

2090-2

Response to Commentor No. 2090

- 2090-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2090-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2090-3:** The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. Although other manufacturers produce medical radioisotopes, DOE remains the key provider for a large number of radioisotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large-enough quantities to make their production financially attractive to private industry. However, supplies of many research isotopes are not readily available from existing domestic or foreign sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed. Under the Ni PEIS proposed action and consistent with its mandates under the Atomic Energy Act, DOE would enhance its existing nuclear facility infrastructure to, among other things, more effectively support production of radioisotopes for medical applications and research. DOE's intent is to complement commercial sector capabilities to ensure that a reliable supply of isotopes is available in the U.S. to meet future demand, and to encourage the commercial sector to privatize the production of isotopes that have established applications to a level that would support commercial ventures. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

Commentor No. 2091: Betty Marsh

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

As an intelligent leader of this great country, I cannot understand how you could delay the Hanford-Clean-Up and actually even consider restarting the FFTF Nuclear Reactor! Please reconsider and think of the possible consequences you wouldn't want a catastrophe on your conscience!

Sincerely,

Name Betty Marsh Address 11549 15th Ave. N.E.
City Seattle State WA ZIP 98135

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2091-1 || 2091-2

2091-1

2091-3

Response to Commentor No. 2091

- 2091-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.
- 2091-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2091-3:** FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

Commentor No. 2092: Mike Keary

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

RESTART WOULD BE UNCONSCIONABLE IN THE
FACE OF THE FAILURE TO CLEAN UP HANFORD.
THE THREAT TO THE COLUMBIA RIVER, THE
RIVER OF THE WEST AND THE SOUL OF
THE NORTHWEST IS SOMETHING WE CANNOT
TOLERATE. CLEAN IT UP!

Sincerely, *M Keary*

Name MIKE KEARY Address 2522 MOURDE CT NE
City RENTON State WA ZIP 98056

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2092-1 || 2092-2

2092-1

Response to Commentor No. 2092

2092-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford and protection of the Columbia River. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

2092-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2093: Kurt Munnich

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

The world already has too much Plutonium. We should be spending our energy and money immobilizing radioactive stuff and cleaning up or isolating radioactive wastes, like at Hanford. We have already contaminated our land and some of our people. We need to clean up the mess we have made, not create more of it!

Sincerely,

Kurt Munnich 8-19-08
 Name Kurt Munnich Address 4704 W. Glenhaven Dr
 City Everett State WA ZIP 98203-1735

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. ~~Also, please respond to my comments and concerns.~~

|| 2093-1 || 2093-2

|| 2093-3

|| 2093-1

Response to Commentor No. 2093

2093-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram funds designated for Hanford cleanup, regardless of the alternative(s) selected.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2093-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2093-3: The purpose of the NI PEIS is to evaluate the environmental impacts of a range of reasonable alternatives to fulfill the proposed actions, one of which is the domestic production of plutonium-238. Plutonium-238, used to support NASA space missions, is not weapons-grade plutonium (i.e., plutonium-239). Whereas the United States is currently planning for the disposition of tons of surplus plutonium-239 that is not needed to support the U.S. nuclear weapons stockpile, there are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems and the plutonium-238 that fuels them for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in

Commentor No. 2093: Kurt Munnich (Cont'd)

Response to Commentor No. 2093

September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, DOE anticipates that the existing plutonium-238 inventory will be exhausted by approximately 2005. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for re-establishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Commentor No. 2094: Aleta Woodruff

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2094-1 || 2094-2

Enough already!
 Enough plutonium!
 Enough Nuclear Waste!
 Enough delays in Clean-up!

Sincerely,

Name Aleta Woodruff Address 2143 NE 95th Ave
 City Portland State Oregon ZIP 97220

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2094

- 2094-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2094-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2095: Carol Hebert

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

I beg you not to allow the FFTF to be restarted. Statistics show that the probability of a sodium-cooled fast reactor operating reliably is about 50%. And the danger is simply too high - both in terms of the danger of accidents and also in the creation of yet more high-level nuclear waste in an area which is yet to contain and dispose of previously created waste. Please help. Sincerely, Carol Hebert

Name Carol Hebert Address PO Box 433
 City Gambell State OR ZIP 97148

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2095-1 || 2095-2
 || 2095-3
 || 2095-4
 || 2095-5
 || 2095-6

Response to Commentor No. 2095

- 2095-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). DOE is fully committed to honoring this agreement. This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site.
- 2095-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.
- 2095-3:** See response to comment 2095-2.
- 2095-4:** FFTF is a 400 MW(t) fast reactor cooled by sodium. The reactor achieved initial criticality in February 1980, and full-power operation in December of that year. During the ensuing operational period until shutdown in 1992, FFTF performance, as a test reactor was appropriately measured by operational efficiency (i.e., a measure of how well the plant performed its planned research activities compared to the planned schedules). FFTF often achieved operational efficiencies approaching 100 percent. When sustained operation at power was the goal, FFTF achieved capacity factors in excess of 75 percent.
- 2095-5:** FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.
- 2095-6:** As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. High-level radioactive waste would not be generated from merely operating FFTF. It is DOE's policy

Commentor No. 2095: Carol Hebert (Cont'd)

Response to Commentor No. 2095

that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

DOE worker and public health and safety are of paramount and primary importance to DOE. There have been no serious safety related accidents causing significant injury or harm to workers, or posing any threat or harm to the offsite public at FFTF during its lifetime. The environmental impacts associated with operation of the FFTF are addressed in detail in Section 4.3 of Volume 1. The impacts are shown to be small. These impacts specifically include the risks to human health during normal operations and associated with postulated accidents. Over the 35-year operational period no fatalities would be expected among workers or in the general public in the vicinity of Hanford or at distant locations.

Commentor No. 2096: Peter A. Giese

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

*Where will the waste
be stored? The present
facilities do not work!*

Sincerely, *Pete Giese*
Name *Pete Giese* Address *Captain Peter A. Giese
P.O. Box 16303
Seattle, Washington 98116*
City _____ State _____ ZIP _____

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2096-1 || 2096-2

|| 2096-3

Response to Commentor No. 2096

- 2096-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2096-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2096-3:** Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g. see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

Commentor No. 2097: Elise Kloter

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

once & for all, let's get this time bomb
for disaster out of our backyard.
We fought hard & won a clean-up
agreement. What do we teach
our kids about honoring our
agreements? Do it now!

Sincerely,

City 1800 Ridgecrest Drive State _____ ZIP _____
Lake Oswego, OR 97034

→ Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2103

2103-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2103-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2103-3: The commentor's opposition to the restart of FFTF is noted. This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives (including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

The NI PEIS identifies (in Chapter 3 of Volume 1) endangered species that live on or near all of the candidate sites, as well as aquatic and wetlands areas that may be impacted by operations at candidate locations. According to an International Atomic Energy Agency (IAEA) publication (IAEA Technical Report Series No. 332, Effects of Ionizing

Commentor No. 2103: Jeanette R. Egger (Cont'd)

Response to Commentor No. 2103

Radiation on Plants and Animals at Levels Implied by Current Radiation Protection Standards), a dose rate of 100 millirem per year to the most exposed human will lead to dose rates to plants and animals of less than 0.1 rad per day. The IAEA concluded that a dose rate of 0.1 rad per day or less for animals and 1 rad per day or less for plants would not affect these populations. The largest individual dose for any of the nuclear infrastructures alternatives under normal operations would be less than 0.1 millirem, which is three orders of magnitude less than the IAEA threshold for adverse effects. Therefore, implementation of any of the range of reasonable nuclear infrastructure alternatives analyzed would not be expected to result in adverse impacts on plants and animals living in potentially affected areas around the candidate sites.

Commentor No. 2104: W. Ashmenal

Commentor No. 2105: Michael S. Vlooses

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

Currently, clean up of Hanford's nuclear waste is extremely important, as we again have been reminded by the release of radioactive material into the environment in recent wildfire. Please stop the foolish plan to generate more waste under the guise of medical supplies and stop contamination making the air, land, and water of the US.

Sincerely,
Name Michael S. Vlooses Address 224 W. Euclid
City Spokane State WA ZIP 99205

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2105-1 || 2105-2

2105-1

Response to Commentor No. 2105

2105-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Regarding the Hanford wildfire of 2000, the DOE Richland Operations Office, the State of Washington Department of Health, and the U.S. Environmental Protection Agency performed environmental monitoring on and around the Hanford site to assess any potential radiological impacts. The wildfire did not cause a release of radioactive materials from any Hanford facilities, but did result in the resuspension of radioactive materials which were already present in the environment. The very low levels of radioactive materials that were resuspended were only slightly above natural background levels and required several days of analysis to quantify. Information on this event has been made available to the public and can be accessed at <http://www.Hanford.gov/envmon/index.html>. This site provides a link to information on the independent offsite air monitoring that was conducted by the U.S. Environmental Protection Agency.

As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. High-level radioactive waste would not be generated from merely operating FFTF. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Commentor No. 2105: Michael S. Vlooses (Cont'd)

Response to Commentor No. 2105

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

All air emissions and wastewater discharges would be in accordance with applicable permit and regulatory requirements. The releases of air pollutants and contaminated liquid are addressed in Section 4.3 of the draft NI PEIS. The release of air pollutants would result in concentrations well below Federal and state air standards (Table 4-13). The release of radioactivity and hazardous chemicals into the atmosphere would have a negligible effect on human health (Tables 4-17 and 4-19, respectively). There would be no discernible impacts to groundwater or surface water quality (Section 4.3.1.1.4). All impacts on ecological resources, including animals and fish, associated with operation of the FFTF would be small (Section 4.3.1.1.6). It is concluded that operation of the FFTF would have small adverse effects on the environment.

2105-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2106: Rosemary E. Brodie

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

The FFTF is a dinosaur that is too expensive to keep on standby indefinitely. It is too expensive to use for making materials we don't need and if we did, they can be made more cheaply & safely with existing plants elsewhere.

Sincerely,

Name ROSEMARY E. BRODIE Address 3842 NE 90th St
 City Seattle, WA ZIP 98115

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2106-1 || 2106-2

2106-3

2106-4

Response to Commentor No. 2106

- 2106-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2106-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2106-3:** DOE notes the commentor's opinion. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.
- 2106-4:** DOE notes the commentor's opposition to restarting FFTF for medical isotope production. DOE acknowledges that other manufacturers can produce certain isotopes that are economically attractive. In fact, the United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

Commentor No. 2107: Mason S. Taylor

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

My father was stationed at the Tri Cities during WW II in the NAVY. He later developed cancer which killed him. He also had heart disease. I was born in Pasco, developed Anemia, and later Type 1 Diabetes. Nuclear Power is dangerous, too dangerous. Shut it down!

Sincerely, *Mason S Taylor*

2107-1 2107-2

2107-2

Response to Commentor No. 2107

- 2107-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2107-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2108: Mayme Hartl

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2108-1 || 2108-2

*Washington State is the most beautiful
State in the Union. Now I hear we
excepted Radioactive waste from Spain.
My God 'STOP' making Washington a
Radioactive dump. Or we will
lose this beautiful state.*

2108-3

Sincerely,

Name Mayme Hartl Address 6216 Douglas
City Wenatchee State WA ZIP 98801

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2108

- 2108-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NIPEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2108-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2108-3:** The referenced waste from the country of Spain was disposed at the U.S Ecology Site. This site disposes of commercial radioactive waste under a Washington State Department of Health license. The waste did not belong to DOE and DOE has no responsibility or authority over that waste.

Commentor No. 2109: Merle Ann McVay

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

The health and well-being of this, future generations, and the environment are primary. Let's develop safe and clean alternative energy sources.

Sincerely,

Merle Ann McVay
 Name *Merle Ann McVay* Address *4635 N.E. 33rd Ave.*
 City *Portland* State *OR* ZIP *97211*

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

2109-1 || 2109-2

2109-2

2109-3

Response to Commentor No. 2109

- 2109-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2109-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF. Included in the NI PEIS are the results of analyses that show the risks associated with operating the FFTF are very small.
- 2109-3:** DOE notes the commentor's interest in alternative energy sources, although issues of research and development of alternative energy sources are beyond the scope of this Nuclear Infrastructure PEIS. The DOE missions to be addressed in this EIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development, can currently only be met using nuclear reactor or accelerator technologies.

Commentor No. 2110: Maxine R. Wilkins

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

Hanford never should have been placed on a large and wonderful place as the Columbia River. The cleanup needs to be completed and follow through on the commitment to shut down the FFTF.

Sincerely, *Maxine R. Wilkins*

Name *Maxine Wilkins* Address *13703 S.E. Clay St*
City *Portland* State *OR* ZIP *97233*

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2110-1 || 2110-2

2110-1

Response to Commentor No. 2110

2110-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Public meetings were held on this formal milestone change. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2110-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2111: Donna Joy and Dennis Neuzil

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2111-1 || 2111-2

Please do not restart Hanford's

FFTF Nuclear Reactor. We do not want more liquid high-level nuclear wastes to further threaten the Columbia River

Sincerely,

Donna Joy Neuzil
Dennis R. Neuzil

Response to Commentor No. 2112

- 2112-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.
- 2112-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2113: Davis Wilkins

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

No one wants this project in their own back yard - and this particular back yard is truly a sensitive ecological area - one that holds much life - human and otherwise. Please - take the 15% initiative seriously (Ben Cohen) - we do not need this reactor. Let's clean it up safely.

Name DAVIS WILKINS Address 3856 NE 88th St.
City SEATTLE State WA ZIP 98115

Univ of Washington School of Medicine

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2113-1 || 2113-2

|| 2113-3
|| 2113-4
|| 2113-1

Response to Commentor No. 2113

- 2113-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2113-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2113-3:** DOE notes the commentor's opinion that the 15 percent initiative be adopted.
- 2113-4:** Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs:
- 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;
 - 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and
 - 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. The NI PEIS evaluates a range of reasonable alternatives for accomplishing the proposed action, one of which includes use of FFTF. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

Commentor No. 2114: Bill Hlavacek

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

|| 2114-1 || 2114-2

THERE ENOUGH PROBLEMS WITH
CLEANING UP HANFORD WITHOUT
RUNNING THE FFTF REACTOR
AND CREATING MORE NUCLEAR
WASTE.

2114-2

Sincerely,

Name BILL HLAVACEK Address 4350 SW TRENTHAM ST
City SEATTLE State WA ZIP 98136

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2114

2114-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2114-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposal) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

Commentor No. 2115: S. Penkman

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

*Given the existing enormous problems of
cleaning - or even containment - of dangerous wastes
at Hanford, it makes no sense to consider
producing more. And there is no credible
justification for more plutonium production.*

Sincerely,

Name S. Penkman Address 123 Madison Ave. N.
City Bainbridge Island State WA ZIP 98110

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2115-1 || 2115-2

2115-1

2115-3

Response to Commentor No. 2115

- 2115-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2115-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2115-3:** The purpose of the NI PEIS is to evaluate the environmental impacts of a range of reasonable alternatives to fulfill the proposed actions, one of which is the domestic production of plutonium-238. Plutonium-238, used to support NASA space missions, is not weapons-grade plutonium (i.e., plutonium-239). Whereas the United States is currently planning for the disposition of tons of surplus plutonium-239 that is not needed to support the U.S. nuclear weapons stockpile, there are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems and the plutonium-238 that fuels them for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, DOE anticipates that the existing plutonium 238 inventory will be exhausted by approximately 2005. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Commentor No. 2116: Aina Doczi

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2116-1 || 2116-2

It is insidious to propose to add to the danger of the clean-up while at the same time stressing its importance. please shut down the FFTF nuclear reactor

2116-2

Sincerely, *Aina Doczi*

Name Aina Doczi Address 6837 - 47th Ave NE
City Seattle State WA ZIP 98115

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2116

2116-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2116-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposal) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

Commentor No. 2117: Mark Wahl

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

*We can't play with our children's futures
by polluting the Columbia with deadly toxins
— and sending fish from these (irrigated farm
vegetables also) to all over the country.
Please be sensitive to this issue and don't
pit short term wargames against our children's future.*

Sincerely,

Name Mark Wahl Address 416 4th St.
City Langley State WA ZIP 98260

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2117-1 || 2117-2

2117-3

2117-4

Response to Commentor No. 2117

2117-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2117-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2117-3: The commentor's opposition to the restart of FFTF is noted. This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives (including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

The NI PEIS identifies (in Chapter 3 of Volume 1) endangered species that live on or near all of the candidate sites, as well as aquatic and wetlands areas that may be impacted by operations at candidate locations. According to an International Atomic Energy Agency (IAEA)

Commentor No. 2117: Mark Wahl (Cont'd)

Response to Commentor No. 2117

publication (IAEA Technical Report Series No. 332, Effects of Ionizing Radiation on Plants and Animals at Levels Implied by Current Radiation Protection Standards), a dose rate of 100 millirem per year to the most exposed human will lead to dose rates to plants and animals of less than 0.1 rad per day. The IAEA concluded that a dose rate of 0.1 rad per day or less for animals and 1 rad per day or less for plants would not affect these populations. The largest individual dose for any of the nuclear infrastructures alternatives under normal operations would be less than 0.1 millirem, which is three orders of magnitude less than the IAEA threshold for adverse effects. Therefore, implementation of any of the range of reasonable nuclear infrastructure alternatives analyzed would not be expected to result in adverse impacts on plants and animals living in potentially affected areas around the candidate sites.

- 2117-4:** DOE notes the commentor's views. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs:
- 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;
 - 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and
 - 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. However, no component of the proposed action is for the purpose of supporting any defense or weapons-related mission. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

Commentor No. 2118: Maye Thompson

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

I know there is a need for the medical products to be made by the fast flux reactor, but we absolutely must clean up the current mess before we make more nuclear waste

Sincerely,

Name Maye Thompson, RN Address 734 SE 47th Ave
City Portland State OR ZIP 97215

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2118-1 || 2118-2

2118-1

Response to Commentor No. 2118

- 2118-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2118-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2119: Daphne Hyde

Dear Secretary, Washington,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

|| 2119-1 || 2119-2

I am extremely concerned regarding the
leaching of Nuclear waste towards the pristine
Columbia River. — We do NOT want
further Nuclear Waste deposited at this site
which is a peril as it is, at present! We
do not want the Reactor activated causing
further Nuclear Waste & pollutants.

2119-1

2119-3

Sincerely,

Name Daphne Hyde Address P.O. Box 5485
 City Kent State WA ZIP 98064

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns. ✓

Response to Commentor No. 2119

- 2119-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.
- FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.
- 2119-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.
- 2119-3:** See response 2119-2.

Commentor No. 2120: Lyndra Saunders

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

Because of deregulation, NRC downsided staff, which means less tests... NOT including aging. (OPB radia, 8/18/00) We must not allow the dangerous FFTF Nuclear Reactor to restart. Our water, fish, + quality of life will suffer. Nuclear industry must be monitored ^{more} carefully.

Sincerely,

Name LYNDRA SAUNDERS Address 13790 S.W. KNAUS Rd.
City LAKE OSWEGO State OR ZIP 97034

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2120-1 || 2120-2

2120-3

2120-4

2120-5

Response to Commentor No. 2120

- 2120-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2120-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.
- 2120-3:** See response to comment 2120-2.
- 2120-4:** All air emissions and wastewater discharges would be in accordance with applicable permit and regulatory requirements. The releases of air pollutants and contaminated liquid are addressed in Section 4.3 of the draft NI PEIS. The release of air pollutants would result in concentrations well below Federal and state air standards (Table 4-13). The release of radioactivity and hazardous chemicals into the atmosphere would have a negligible effect on human health (Tables 4-17 and 4-19, respectively). There would be no discernible impacts to groundwater or surface water quality (Section 4.3.1.1.4). All impacts on ecological resources, including animals and fish, associated with operation of the FFTF would be small (Section 4.3.1.1.6). It is concluded that operation of the FFTF would have small adverse effects on the environment.
- 2120-5:** DOE notes the commentor's concern over safety of the nuclear industry, although this general issue is beyond the scope of this Nuclear Infrastructure PEIS. The health and safety of workers and the public is a priority of the nuclear infrastructure program, regardless of which approach is chosen. Operation of the facilities would comply with applicable Federal, State, and local laws and regulations governing radiological and hazardous chemical releases.

Commentor No. 2121: Michael R. Maine

Dear Secretary NICHOLSON,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

*You have a schedule and a "Plan" Let Schedule
To go / speed things up and get the CLEANUP
DONE!!*

*Also, until you clean-up what's there now, it
makes no sense to "Make" more.*

Sincerely, *Michael R. Maine*

Name *Michael R. Maine* Address *3001 So. 288th #165*

City *Federal Way* State *WA* ZIP *98003*

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2121-1 || 2121-2

2121-1

Response to Commentor No. 2121

2121-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposal) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

2121-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2122: Bruce Howard

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

NO GOOD, HOWEVER MEASURED, JUSTIFIES THE
MANY THOUSANDS OF YEARS OF RISK ^{FROM} THE
NUCLEAR PROGRAM WASTE. IF YOU BELIEVE
IT IS SAFE TO CONTINUE, TAKE ONE CORE
URANIUM FUEL ROD HOME WITH YOU
THEN SHOWE IT UP YOUR ASS.

Sincerely, ANOTHER STUPID HUMAN,

Name BRUCE HOWARD Address 1615 TAYLOR
 City HOOD RIVER State OR ZIP 97031

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2122-1 || 2122-2

2122-3

Response to Commentor No. 2122

- 2122-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2122-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2122-3:** The commentor's positions on nuclear programs and spent nuclear fuel disposition are noted. DOE policy regarding the risk associated with the storage of nuclear waste has been developed on the basis of extensive review and analysis of data, as well as development of waste management technologies. The PEIS is premised on and consistent with such DOE policy, and confirms small additional risks associated with proposed actions.

Commentor No. 2123: Linda Malan

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

*Please focus on the clean-up
and do not add more waste
to an already dangerous sit-
uation. Please do not restart
the FFTF reactor*

Sincerely,

Linda Malan

Name LINDA MALAN Address 830 OLYMPIC AVE
City EDMONDS State WA ZIP 98020

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2123-1 || 2123-2

2123-1

2123-3

Response to Commentor No. 2123

2123-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposal) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

2123-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.

2123-3: See response to comment 2123-2.

Commentor No. 2124: Don Pennell

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2124-1 || 2124-2

*We join with Oregon in
trying to protect the
Columbia River!
And why are we burying
NEW waste there?*

2124-1

Sincerely,

Name M/M DON PENNELL Address 9029 NE 36TH ST.
City BELLEVUE State WA ZIP 98004-1201

(Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.)

Response to Commentor No. 2124

2124-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

The Hanford Site has both commercial and DOE waste disposal sites permitted by the State of Washington. The permit conditions ensure hazardous wastes are treated, stored, and disposed in a safe manner.

2124-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2125: Nancy Hannah

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

It is difficult for me to understand why you would even be considering a move to restart the FFTF nuclear reactor. The danger seems overwhelming. We need to take care of the mess we have already created - Please do not start this reactor up again.

Sincerely,

Name Nancy Hannah Address 7526 27th Ave NE
City Seattle, State WA ZIP 98115

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Secretary Richardson,

|| 2125-1 || 2125-2

2125-3

Response to Commentor No. 2125

- 2125-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2125-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2125-3:** DOE notes commentor's opposition to Alternative 1, Restart FFTF.

Commentor No. 2126: Jacquet Weisen

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

Restarting the nuclear reactor will increase the danger of accidents + further contamination in the Northwest. Don't do it. Shut it down as quickly. Prevention of Columbia River contamination is vital for all human concerns. We want much more high level nuclear waste production. Honor your clean up plan!

Sincerely,

Jacquet Weisenbach

Name Jacquet Weisenbach Address 67A 56th Ave. So
 City Seattle State WA ZIP 98118

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2126-1 || 2126-2

2126-3

2126-1

2126-4

2126-1

Response to Commentor No. 2126

2126-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford and the protection of the Columbia River. DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram funds designated for Hanford cleanup, regardless of the alternative(s) selected.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

2126-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2126-3: FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

2126-4: DOE notes the commentor's concern regarding high-level radioactive waste generation. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed.

Commentor No. 2126: Jacquinet Weisen (Cont'd)

Response to Commentor No. 2126

These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Commentor No. 2127: Kathy Lobry

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

We are having a hard enough time trying to clean up and contain the waste that is already there. Why would we want to create more waste and start all over again???

We need to clean up the waste. It is already too close to a major water source. Please do not create more problems!!

Sincerely,

*Kathy Lobry*Name *Kathy Lobry* Address *8519 N.E. 19th Ave.*City *Vancouver,* State *WA,* ZIP *98665*

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2127-1 || 2127-2

2127-1

Response to Commentor No. 2127

2127-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford and the protection of the Columbia River. DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram funds designated for Hanford cleanup, regardless of the alternative(s) selected.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

2127-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2128: Gene Derig

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2128-1 || 2128-2

I've written to you before on this
subject so I'll be briefer this time:
- Shut down the FFTF Reactor.
- Stop violating the clean-up agreement
- Footdragging is causing delays that
only add to the chances of disaster.

2128-2

2128-1

Sincerely,

[Signature]
Name GENE DERIG Address 1302 K. AVE (P.O. Box 34)
City Anacortes State WA ZIP 98221

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2128

- 2128-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2128-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2129: Anonymous

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

Is DOE saying the DEIS of Hanford's
FFTF is NONsignificant by their
Determination? --WRONG!!!

Please Mr. Richardson, speak the
Truth about this travesty of justice.

Jerome + JoAnn Klacsan

Sincerely,

Name _____ Address POB 533
City North Bend State WA ZIP 98045

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2129-1 || 2129-2

2129-3

Response to Commentor No. 2129

- 2129-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2129-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2129-3:** It is not suggested that there are no environmental impacts associated with restart and operation of the FFTF. However, the impacts to the biosphere would indeed be small as demonstrated by the results of the detailed assessments performed for the NI PEIS. All air emissions and wastewater discharges to the environment would be in accordance with applicable permit and regulatory requirements. The releases of air pollutants and contaminated liquids associated with FFTF operations are addressed in detail in Section 4.3 of the draft NI PEIS. The release of criteria air pollutants would result in concentrations well below Federal and state air standards (Table 4-13); the releases of radioactivity and hazardous chemicals into the atmosphere would have a negligible effect on human health (Tables 4-17 and 4-19, respectively); and no discernible impacts to groundwater or surface water quality would result from water discharges (Section 4.3.1.1.4).

Commentor No. 2130: Florence B. Wager

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

*It would appear that citizens down
river from Hanford have more to fear about
a nuclear threat from their own country
than from a foreign foe. No more
nuclear waste should be added to the
leaking tanks existing. Clean it up!*

Sincerely,

Name Florence B Wager Address 7100 Topika In
City Unconville State WA ZIP 98664

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2130-1 || 2130-2

2130-3

2130-4

Response to Commentor No. 2130

- 2130-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2130-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2130-3:** The commentors's opposition to the restart of FFTF is noted. This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives (including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

The NI PEIS identifies (in Chapter 3 of Volume 1) endangered species that live on or near all of the candidate sites, as well as aquatic and wetlands areas that may be impacted by operations at candidate locations

Commentor No. 2130: Florence B. Wager (Cont'd)

Response to Commentor No. 2130

According to an International Atomic Energy Agency (IAEA) publication (IAEA Technical Report Series No. 332, Effects of Ionizing Radiation on Plants and Animals at Levels Implied by Current Radiation Protection Standards), a dose rate of 100 millirem per year to the most exposed human will lead to dose rates to plants and animals of less than 0.1 rad per day. The IAEA concluded that a dose rate of 0.1 rad per day or less for animals and 1 rad per day or less for plants would not affect these populations. The largest individual dose for any of the nuclear infrastructures alternatives under normal operations would be less than 0.1 millirem, which is three orders of magnitude less than the IAEA threshold for adverse effects. Therefore, implementation of any of the range of reasonable nuclear infrastructure alternatives analyzed would not be expected to result in adverse impacts on plants and animals living in potentially affected areas around the candidate sites.

2130-4: As discussed throughout Section 4.3 of Volume 1, none of the proposed alternatives would add waste to the high-level waste tanks at Hanford. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Commentor No. 2131: Evelyn Swann

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2131-1 || 2131-2

We already have despoiled our land
and water by so-called nuclear "defense",
plus powerplants, to add to our
suicidal evolution. THE FFTF will only
serve to hasten the day. Please come
to your senses!

Sincerely,

Name Evelyn Swann Address 1016 Key St.
City Bellingham State WA. ZIP 98225
Evelyn Swann SAME

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

2131-2

Response to Commentor No. 2131

- 2131-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2131-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF; however, it should be noted that FFTF would not have any defense missions under the proposed action.

Commentor No. 2132: Marjorie Worthington

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

Once again, I find myself shocked & saddened that rather than attempt to have changed the DOE's agenda, to shut down the FFTF Reactor, with its devastating potential to add more toxic waste to the most polluted area imaginable, cleanup of which has met delay after delay over many years since the Tri-Party Agreement. Why are the citizens of this area - those most affected by the mess of toxic waste being ignored by a government agency with that much capability to ensure, to continue to assert power that denies the rights of citizens in this area to Sincerely live in a safe environment. This agenda is clearly not in the public interest!

Name Marjorie Worthington Address 1947 Clovercrest St.
City Enumclaw State WA ZIP 98022

* I have attended many public hearings over the last few years and sent letters of protest, but please honor the cleanup agreement & shut down the FFTF Reactor or shut it down!
Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

2132-1 2132-2

2132-1

2131-3

2131-4

2131-3

Response to Commentor No. 2132

2132-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposal) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

2132-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2132-3: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S.

Commentor No. 2132: Marjorie Worthington (Cont'd)

Response to Commentor No. 2132

Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2132-4: The purpose of this NI PEIS is to evaluate the environmental impacts of a range of reasonable alternatives to fulfill the requirements of the stated missions, which include the production of medical and industrial isotopes, the production of plutonium-238 for future NASA missions, and civilian nuclear research and development.

DOE policy encourages effective public participation in its decision making process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

Commentor No. 2133: Carol Gordon

DATE: _____ / _____ / _____

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

It has been proven that the leaking tanks are a danger to our Columbia River. Nothing has been done to remedy this problem and now the DOE wants to restart the FFTF. What is to become of our natural resources? Shame on the DOE.

Sincerely,

Name Carol Gordon Address 9021 26th Ave S.
City Lakewood State WA ZIP 98499

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2133-1 || 2133-2

2133-1

Response to Commentor No. 2133

2133-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposal) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

2133-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2134: David Austin

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

We haven't figured out how to safely store
the high level waste already present -
I don't think we should ask to it.

Sincerely,

Name David Austin Address 2107 N. 62nd
City Seattle State WA ZIP 98103

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

2135-1

Response to Commentor No. 2135

2135-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NIPeIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

No food or water restrictions are in place outside the Hanford Reservation as a result of Hanford activities.

2135-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2136: Howard Pellett

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

|| 2136-1 || 2136-2

*It is disgraceful that we are still talking about clean-up
of the Hanford site after all the taxpayers' money that
has been spent and all the hearings and all of the public
testimony. We will not tolerate more danger, more waste,
and more plutonium production at Hanford. It's time to
listen to the public!*

2136-1

Sincerely,

Name Howard Pellett Address 5293 SUMNER ISLAND RD
City ANACORTES State WA ZIP 98221-9841

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2136

2136-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposal) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

2136-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2137: Irene Kelly

Please honor the Clean-up Agreement and

we shall not tolerate
more danger, waste
and plutonium production
at Hanford.

Commentor No. 2138: Kathryn Rolery

Dear Secretary (Kernaruski),

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

*I am very concerned about the move
of restocking the FFTF. Money needs to be
spent in clean up + CANCER prevention
programs - not in destruction. When
are we going to shut building - not
destroying life! SAY NO to ALL!*

Sincerely,
Name Kathryn Rolery Address 722 W. Allen
City Walla Walla State WA ZIP 99362

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2138-1 || 2138-2

2138-3

2138-4

Response to Commentor No. 2138

- 2138-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2138-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2138-3: As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram funds designated for Hanford cleanup, regardless of the alternative(s) selected.

There is no relationship between monies appropriated by Congress for DOE and those set aside for cancer prevention programs; thus, there will be no impact on funding for cancer research whether or not Alternative 1 is selected as a record of Decision.
- 2138-4: The NI PEIS provides an estimate of the incremental potential human health impacts associated with each of the alternatives proposed for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 through 4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from implementation of a range of reasonable alternative, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with implementation of any of the analyzed alternatives would be small.

Commentor No. 2139: Susan Hamilton

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

It is of utmost concern that we take measures to contain and hopefully eliminate the highly explosive ~~contaminants~~ contaminants and toxic wastes that are stored and seeping inches away from the Columbia River. This is a global concern. we have to do something we can no longer wait.

Sincerely,
Name Susan Hamilton Address 443 Washington St.

Response to Commentor No. 2142

- 2142-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2142-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.
- 2142-3: Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs:
 - 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;
 - 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and
 - 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. The NI PEIS evaluates a range of reasonable alternatives for accomplishing the proposed action, one of which includes use of FFTF. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.
- 2142-4: See response to comment 2142-2.

Commentor No. 2143: Roy G. Farrell

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

WE DO NOT NEED MEDICAL ISOTOPE
PRODUCTION FROM THE FFTF, NOR
DO WE NEED ANY MORE WASTE
PRODUCTION AT HANFORD. PLEASE
FOCUS ALL ACTIVITY & ATTENTION ON
CLEAN UP.

Sincerely,

Name ROY G. FARRELL, MD Address ROY G. FARRELL, MD
1403 McGILVRA BLVD. E.
SEATTLE, WA 98112

City _____ State _____ ZIP _____

|| 2143-1 || 2143-2

2143-3

2143-1

Response to Commentor No. 2143

- 2143-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NIEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.
- 2143-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2143-3:** DOE notes the commentor's opposition to restarting FFTF for medical isotope production. Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term (less than 5 years). Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

Commentor No. 2144: Michaela M. Buchanan

Dear Secretary Richardson,

- 2145-3:** See response to comment 2145-2.
- 2145-4:** This EIS has provided an estimate of the potential human health impacts associated with a range of reasonable alternatives for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Sections 4.3 through 4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from implementation of a range of reasonable alternatives (Alternative 1 includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with any of the analyzed alternatives and with restarting FFTF would be small.
- Chapter 4 of the PEIS provides a comprehensive assessment of the environmental consequences of each of a range of reasonable alternatives. (The results of these assessments are also summarized in Chapter 2.) These analyses include assessments of the impacts on land resources, water resources, air quality, geology and soils (in addition to the human health impacts discussed in the preceding paragraph). For all alternatives that consider the use of facilities at Hanford, the environmental impact on all of these resources is small. The NI PEIS identifies (in Chapter 3 of Volume 1) endangered species that live on or

Commentor No. 2145: Dawn Marie Dancey (Cont'd)

Response to Commentor No. 2145

near all of the candidate sites, as well as aquatic and wetlands areas that may be impacted by operations at candidate locations. According to an International Atomic Energy Agency (IAEA) publication (IAEA Technical Report Series No. 332, Effects of Ionizing Radiation on Plants and Animals at Levels Implied by Current Radiation Protection Standards, a dose rate of 100 millirem per year to the most exposed human will lead to dose rates to plants and animals of less than 0.1 rad per day. The IAEA concluded that a dose rate of 0.1 rad per day or less for animals and 1 rad per day or less for plants would not affect these populations. The largest individual dose for any of the nuclear infrastructures alternatives under normal operations would be less than 0.1 millirem, which is three orders of magnitude less than the IAEA threshold for adverse effects. Therefore, implementation of any of the analyzed nuclear infrastructure alternatives would not be expected to result in adverse impacts on plants and animals.

Commentor No. 2146: Marilyn D. Ream

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2146-1 || 2146-2

We have no coherent plan for coping with the nuclear waste already threatening the Columbia River. The FFTF Nuclear Reactor is in no way needed to produce medical isotopes.

2146-1

2146-3

Sincerely,

Restarting the FFTF
 Marilyn D. Ream M. D.
 Name Marilyn D. Ream MD Address 324 W. Gibbs Rd
 City Spokane State WA ZIP 99224

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2146

- 2146-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.
- 2146-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2146-3:** DOE notes the commentor's opposition to restarting FFTF for medical isotope production. Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term (less than 5 years). Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

Commentor No. 2147: William C. Burns

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2147-1 || 2147-2

Since I live in the area and like my drinking water sans the nuclear waste, I can understand in difference you don't live here. But what would you do if you did? It's not your family but what if yours? Would you want your mother, grand mother threatened by this accident waiting to happen? me either!!!!

Sincerely,

Name William C. Burns Address 2905 NE 13th
City GRESHAM State OR ZIP 97030

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2148-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2148-3:** Metallic uranium nuclear fuel has been successfully used in power and research nuclear reactors worldwide for over 40 years. The nuclear fuel which is planned to be used at FFTF is oxide fuel and not metallic uranium fuel.

Commentor No. 2149: James Leeman

Dear secretary richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

We cannot handle more radioactivity or pollution than is already seeping into the Columbia River and soil. And as a quaker - our churches stand for no war & less money on missiles and destroying our environment.

Sincerely,
Name James Leeman Address 11717 S.E Beckman
City Milwaukie State OR ZIP 97222

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2149-1 || 2149-2

2149-1

2149-3

Response to Commentor No. 2149

2149-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

2149-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2149-3: DOE notes the commentor's views on defense and preservation of the environment. As discussed in Section 1.2 of Volume 1, the nuclear infrastructure missions are concerned with civilian applications and research only. They are unrelated to national defense. Environmental effects that would result from implementation of the nuclear infrastructure alternatives are described in Chapter 4 of Volume 1.

Commentor No. 2150: Holly G. Graham

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

It is appalling that all these years after we shut down Hanford's DIRTY operations, you even consider this disastrous, hazardous, & blatantly unnecessary act a cover-up for US's increased ARMS industry, Star Wars, TMD, etc. WE SAY NO! NO!!!

Sincerely,

Name Holly Quinn Graham Address 5900 B Penner NW
City Olympia State WA ZIP 98502

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2150-1 || 2150-2

2150-3

Response to Commentor No. 2150

- 2150-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2150-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2150-3:** DOE notes the commentor's views. The NI PEIS evaluates a range of reasonable alternatives for expanding DOE's existing nuclear facility infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. However, no component of the proposed action is for the purpose of supporting any defense or weapons related mission.

Commentor No. 2151: Lucile Wyers

Dear Secretary Richardson,

Commentor No. 2153: Carol G. Watts

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

|| 2153-1 || 2153-2

We're got enough problems with leaking waste tanks already - leaks that threaten to invade the Columbia River very shortly. Let's not get into activities that will generate more waste, not to mention increasing the danger of accidents. Let's honor the clean-up agreement and focus on cleaning up the existing mess.

2153-1

2153-3

2153-1

Sincerely,
Name CG Watts Address 6247 26th Ave NE
City Carol G. Watts State WA ZIP 98115
Seattle

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2153

2153-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposal) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

As discussed throughout Section 4.3 of Volume 1, none of the proposed alternatives would add waste to the high-level waste tanks at Hanford.

2153-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2153: Carol G. Watts (Cont'd)

Response to Commentor No. 2153

2153-3: FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

Commentor No. 2154: Sandra Crespinel

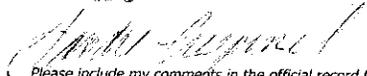

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2154-1 || 2154-2

We don't need to add more waste to Hanford. already producing waste. It's very important we do not re-activate the Hanford Clean Up Agreement & further pollute the Columbia River. Any benefit would not outweigh the contribution of the people of Washington.

Sincerely,

Name Sandra Crespinel ESS
City 4817 SW Findlay St.
Seattle, WA 98136 ZIP

|| 2157-1 || 2157-2

2157-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2157-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2158: Ted Grudowski

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

NASA DOES NOT NEED IT, THE STATE OF
WASHINGTON DOES NOT NEED IT. STOP THIS
INSANITY! THE DAY YOU STORE THE
NUCLEAR WASTE IN YOUR HOME IS THE DAY
YOU CAN RESTART THE REACTOR

Sincerely,

Name TED GRUDOWSKI Address 1409 NE 65TH ST
City SEATTLE State WA ZIP 98115

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2158-1 || 2158-2

2158-3

2158-4

Response to Commentor No. 2158

2158-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2158-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.

2158-3: DOE notes the commentor's opposition to expanding its existing nuclear facility infrastructure. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs:

1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;

2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long term, assured supply; and

3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. The NI PEIS evaluates a range of reasonable alternatives for accomplishing the proposed action, one of which includes use of FFTF. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining

Commentor No. 2158: Ted Grudowski (Cont'd)

Response to Commentor No. 2158

the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Although research to identify other potential fuel sources to support these space exploration missions has been conducted, no viable alternative to using plutonium-238 has been established. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

2158-4: See response to comment 2158-2.

Commentor No. 2159: Rosemary Harris/Howard R. Harris

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2159-1 || 2159-2

Nuclear waste has become the next century's primary problem. We must begin to solve it, not create more. Military waste is the worst. We must eliminate nuclear weapons, not plan to increase them. The idea of restarting the FFTF nuclear reactor alarms us.

2159-3

2159-4

2159-5

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2159

2159-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2159-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.

2159-3: DOE notes the commentor's concern regarding waste generation. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The purpose of the NI PEIS is to evaluate the environmental impacts of reasonable alternatives to enhancing DOE's existing nuclear facility infrastructure to support production of isotopes for medical, research, and industrial uses, production of plutonium-238 for use in future NASA space exploration missions, and U.S. nuclear research and development needs for civilian application. No component of the proposed action is for the purpose of supporting any other defense or weapons-related mission.

2159-4: Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs:

1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;

***Commentor No. 2159: Rosemary Harris/Howard R. Harris
(Cont'd)***

Response to Commentor No. 2159

2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and

3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. No component of the proposed action is for the purpose of supporting any defense or weapons-related mission. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

2159-5: See response to comment 2159-2.

Commentor No. 2160: Jill Refschneider

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

|| 2160-1 || 2160-2

I cannot believe that anyone
would dream up a plan to produce
plutonium on a site which currently
threatens our safety and environment.
Clean Up Hanford! Do not create
new High-Level Nuclear Waste!

2160-1

2160-3

Sincerely,

Jill Refschneider

Name Jill Refschneider Address 14846 74th PINE
City Kenmore State WA ZIP 98028

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2160

2160-1: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2160-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2160-3: DOE notes the commentor's concern regarding the generation of high level radioactive waste. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Commentor No. 2161: Judith Alexander

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2161-1 || 2161-2

*There is too much risk
to the Columbia River coast
the environment to all
more liquid High Level Nuclear
Waste at Hanford. Please
shut down the FFTF Reactor*

2161-3

Sincerely,

Name *Judith Alexander* Address *1831 14th St*
City *Seattle* State *WA* ZIP *98145*

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2161

2161-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2161-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2161-3: The commentor's concern about high-level radioactive waste generation at Hanford is noted. As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35 year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. High level radioactive waste would not be generated from merely operating FFTF.

The use of proposed alternative facilities associated with reprocessing of neptunium-237 targets would have no impact on schedules or available funding for high-level radioactive waste programs at either Hanford or the INEEL sites. The higher activity waste would be treated as a solid form via a stand-alone vitrification system, separate from any tank waste treatment system. The existing Hanford high-level radioactive waste facilities would also not be used, and as analyzed in the PEIS, no existing or planned high-level radioactive waste facilities would be used to treat the wastes resulting from processing the irradiated targets.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Commentor No. 2161: Judith Alexander (Cont'd)

Response to Commentor No. 2161

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Commentor No. 2162: Russ and Meg Hamlet

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

PLEASE DON'T ADD TO THE HARM ALREADY
DONE TO OUR ENVIRONMENT AND PUT ALL
OF US IN GREATER DANGER. DO YOU WANT
TO BE REMEMBERED AS A SHORT SIGHTED
INDUSTRY INFLUENCED PERSON OR A HOLISTIC
VISIONARY?

Sincerely,

Name RUSS + MEG HAMLET Address 10501 MANITOU PARK NE
 City B.I. State WA ZIP 98110

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2162-1 || 2162-2

2162-3

Response to Commentor No. 2162

2162-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2162-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2162-3: The commentors's opposition to the restart of FFTF is noted. This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives (including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

The NI PEIS identifies (in Chapter 3 of Volume 1) endangered species that live on or near all of the candidate sites, as well as aquatic and wetlands areas that may be impacted by operations at candidate locations. According to an International Atomic Energy Agency (IAEA) publication (IAEA Technical Report Series No. 332, Effects of Ionizing

Commentor No. 2162: Russ and Meg Hamlet (Cont'd)

Response to Commentor No. 2162

Radiation on Plants and Animals at Levels Implied by Current Radiation Protection Standards), a dose rate of 100 millirem per year to the most exposed human will lead to dose rates to plants and animals of less than 0.1 rad per day. The IAEA concluded that a dose rate of 0.1 rad per day or less for animals and 1 rad per day or less for plants would not affect these populations. The largest individual dose for any of the nuclear infrastructures alternatives under normal operations would be less than 0.1 millirem, which is three orders of magnitude less than the IAEA threshold for adverse effects. Therefore, implementation of any of the range of reasonable nuclear infrastructure alternatives analyzed would not be expected to result in adverse impacts on plants and animals living in potentially affected areas around the candidate sites.

Commentor No. 2163: Marge Stamper

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

It is scandalous that DOE would consider restarting FFTF & producing more radioactive materials when they have yet to deal with the serious hazards posed by Hanford's status as the EPA's biggest Superfund site. Contaminants are already leaking into the environment, endangering the public & workers. The recent fire at Hanford is further proof of the

Sincerely,
 Name Marge Stamper Address 5214 S. Brandon St
 City Seattle State WA ZIP 98118

Hazards there to DOE's contempt for public & worker health, exemplified by their denials of radiation release during the fires.

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2163-1 || 2163-2

2163-1

Response to Commentor No. 2163

2163-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposal) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Commentor No. 2163: Marge Stamper (Cont'd)

Response to Commentor No. 2163

In regards to the Hanford wildfire of 2000, the DOE Richland Operations Office, the State of Washington Department of Health, and U.S. Environmental Protection Agency performed environmental monitoring on and around the Site to assess potential radiological impacts. The wildfire did not cause a release of radioactive materials from any Hanford facilities but did result in resuspension of radioactive materials which were already in the environment. The very low levels of radioactive materials that were resuspended were slightly above natural background levels and required several days of analysis to quantify. Information on this event has been made available to the public and can be accessed at <http://www.Hanford.gov/envmon/indes.html>. This site also provides a link to information on the independent offsite air monitoring that was conducted by the U.S. Environmental Protection Agency.

2163-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2164: Alicelia and Robert Warren

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

We already don't know what to do with the nuclear waste we have, & clean-up of what exists is way behind schedule & over budget. We urge you NOT to restart the FFTF nuclear reactor. Please protect the Columbia River & the citizens & wildlife in the Northwest.

Sincerely,

Alicelia & Robert Warren

2171-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2171-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2172: Donald N. Wheeler

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

I feel strongly on this issue, because I was born and raised in the little town of White Bluffs on the Hanford Reach of the Columbia River. In 1943, my family along with all the other inhabitants was given 30 days to get out, to make room for plutonium production. Let's have Sincerely, no more plutonium! Atom bombs a violation of international law!

Name Donald N. Wheeler Address 10674 Falk Road NE
City Frederick Island State WA ZIP 98110

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2172-1 || 2172-2

2172-3

Response to Commentor No. 2172

- 2172-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2172-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2172-3:** DOE notes the viewpoint expressed by the commentor. As discussed in Section 1.2 of Volume 1, plutonium-238 would be produced to support NASA's deep space missions. Plutonium-238 is not used to produce nuclear weapons. All missions considered in the NI PEIS are for civilian purposes.

Commentor No. 2173: D. Eggers

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

The ill effects of nuclear power have been tolerated long enough. CANCER/Global warming Etc. Its time to follow Germanys lead - Stop this madness
→ FUEL Cells ←

Sincerely,

Name D Eggers Address 3816 Ardilla
City Atascadero State Ca ZIP 93422

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

2173-1 2173-2

2173-3

Response to Commentor No. 2173

- 2173-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2173-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2173-3:** The commentor's positions on nuclear power, cancer, global warming, and fuel cells are noted. As discussed in Chapter 4 of Volume 1 (e.g. 4.3.1.1.9, 4.3.2.1.9, 4.3.3.1.9), implementation of the alternatives described in Section 2.5 would pose no significant radiological risks or adverse impacts on air quality. The missions described in Section 1.2 can be accomplished only with a nuclear reactor or accelerator. Development of alternative energy sources such as fuel cells is outside of the scope of this NI PEIS.

Commentor No. 2174: Henry Perry

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

Sincerely,

Name Henry Perry Address 3215 E. Morley Way
 City Seattle State WA ZIP 98112

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2174-1 || 2174-2

Response to Commentor No. 2174

- 2174-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2174-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2175: Lupito Flores

Secretary, Hanford Site,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

|| 2175-1 || 2175-2

Please spend money cleaning up
the site, not generating more waste
or importing more from other sites.

|| 2175-1

Sincerely,

Name Lupito Flores Address 1518 W. Cedar
City Spokane State WA ZIP 99203

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2175

2175-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2175-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2176: Erma Norton

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

*We do not want nuclear accidents
in the Northwest. We value our
people and our natural blessings too
much to incur any unnecessary
hazards. Thank you for helping to
preserve our land as it is.*

Sincerely, *Erma Norton*

Name Erma Norton Address 437 Westbay Dr NW
City Olympia State WA ZIP 98502

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2176-1 || 2176-2

2176-3

Response to Commentor No. 2176

- 2176-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2176-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2176-3:** FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

Commentor No. 2177: Nancy Parrish

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

I have 2 young children and I owe it to them to be responsible and not contribute to more pollution and waste on this planet. Please vote against any Restart of Hanford and vote for cleanup. Enough damage to our environment has already been done.

Sincerely, Nancy H. Parrish

Name Nancy Parrish Address 25512 151 PL SE
City Covington State WA ZIP 98042

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2177-1 || 2177-2

|| 2177-3

|| 2177-1

Response to Commentor No. 2177

- 2177-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2177-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.
- 2177-3:** See response to comment 2177-2.

Commentor No. 2178: Elizabeth Bareheld

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

My family and I are very concerned about
Plutonium production and storage. We
do not support restarting Hanford's
FFTF Nuclear reactor

Sincerely,

Name Elizabeth Bareheld Address 10533 NE 184th St
City Bornheli State WA ZIP 98011

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2178-1 || 2178-2

|| 2178-3

Response to Commentor No. 2178

- 2178-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2178-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.
- 2178-3:** See response to comment 2178-2. The NI PEIS evaluates the risks and environmental impacts of plutonium production and storage at the candidate sites/facilities in Chapter 4 of Volume 1. The plutonium isotope under consideration is plutonium-238 which is not weapons material.

Commentor No. 2179: U. Andrews

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2179-1 || 2179-2

*It is time to get off top service
and onto actions.
Hanford is dangerous! Clean
it up and stop misusing
the appropriated funds!*

2179-1

Sincerely, *U. Andrews*

Name *U. Andrews* Address *5930-2612 NW*
City *Stanwood* State *WA* ZIP *98292*

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2179

2179-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. FFTF restart would not impact the schedule or available funding for existing cleanup activities.

Hanford cleanup is funded by the Office of the Assistant Secretary for Environmental Management (EM). Funding for FFTF is provided through the Office Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted fund designated for Hanford cleanup, regardless of the alternative(s) selected.

2179-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2180: Susan Witt

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

Hanford is unsafe and hazardous to both the environment and humans. Those individuals in charge of the clean-up have failed to ask Congress for enough money to safely handle the current waste. Adding more danger by supporting plutonium production in an unstable area is irresponsible and dangerous.

Name Susan Witt Address 1214 Cascade
City Head River State OR ZIP 97031

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2180-1 || 2180-2

2180-1

2180-3

Response to Commentor No. 2180

2180-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

The NI PEIS evaluated the maximum cumulative radiation exposure to the public from all reasonably foreseeable Hanford Site activities over the 35 year time-frame. As shown in section 4.8, the maximum annual dose to the public would be on the order of 1.9 millirem per year. This dose is well within the dose limits of 10 mrem/year (as required by the EPA Clean Air Act) and 4 mrem/year (as required by the EPA Safe Drinking Water Act), as implemented by DOE Order 5400.5. All environmental parameters (e.g. air, soil, surface water, groundwater, vegetation, animals, etc.) in and around the Hanford Site are monitored on a set frequency. The information is available to the public in annual monitoring reports. No food or water restrictions are currently in place outside the Hanford Reservation as a result of Hanford activities.

More specific the missions proposed in the NI PEIS, the environmental impacts associated with operation of the FFTF and support facilities at Hanford during normal operations and from postulated accidents are presented and discussed in Section 4.3 of the draft NI PEIS. All impacts to human health and to ecological resources are shown to be small in the immediate area of the Hanford Site and negligible at all distant locations.

Commentor No. 2180: Susan Witt (Cont'd)

Response to Commentor No. 2180

- 2180-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2180-3:** This PEIS has provided an estimate of the incremental potential human health impacts associated with a range of reasonable alternatives (one of which includes the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of these alternatives, including normal operations and a spectrum of accidents that included severe accidents. Plutonium is one of many substances that have been considered in the analysis of health and safety impacts for this PEIS. Plutonium is the primary contributor to the health impacts associated with the processing of irradiated neptunium targets at any of the neptunium target processing facilities. The environmental analysis showed that radiological and nonradiological risks associated with each of the analyzed alternative and with restarting FFTF would be small. As stated in Appendix H of the EIS, other human health impacts (non-fatal cancers and genetic mutations) occur with a lower frequency for the same level of exposure to low levels of radiation. Since the most likely impact on the population from all of the alternatives is no additional fatalities, it follows that the expected result for these other health impacts is no additional impact.

Commentor No. 2181: Brandon July

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

You don't know the reason why, then,
create more? Nuclear waste remains
dangerous for millennia - stop this madness
right now! Shut down the reactor and
clean up your messes!

Sincerely,

Name Brandon July Address 4038 90th Ave SE
 City Mercer Island State WA ZIP 98040

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2181-1 || 2181-2

|| 2181-3

|| 2181-2

|| 2181-1

Response to Commentor No. 2181

- 2181-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2181-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2181-3:** DOE notes the commentor's concern regarding waste generation. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Commentor No. 2182: Neil McCauley

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

I HAVE NOT YET BEEN GIVEN DATA AND REASON
TO SUPPORT CONTINUING THE REACTOR AND
PROLONGING THE CLEAN-UP. EITHER DO YOUR
JOB - CLOSE THE REACTOR AND CLEAN UP HANFORD,
OR TELL ME WHY NOT.

Sincerely,

Name NEIL MCCAULEY Address 7835 SW 67th AVE., APT. 4
City PORTLAND State OR ZIP 97223

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2182-1 || 2182-2

|| 2182-1

|| 2182-2

|| 2182-1

Response to Commentor No. 2182

2182-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. FFTF restart would not impact the schedule or available funding for existing cleanup activities.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

More specific to the stated mission, section 1.2 of the NI PEIS provides information on the purpose and need for DOE's proposed expansion of the nuclear infrastructure to ensure the availability of isotopes for medical industrial, and research applications; providing plutonium-238 for NASA, and undertaking research and development activities related to development of nuclear power for civilian use.

2182-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2183: Julie Smith

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

440 billion gallons of radioactive waste has been poured into the ground at Hanford. In 1957, 34,000 curies of radiation per day were flushed into the Columbia River. People downwind of Hanford are some of the most irradiated people on earth. Enough is enough! Please end all nuclear activity Sincerely, at Hanford except Clean Up.

Name Julie Smith Address 1816 W 10th Ave #1
 City Spokane State WA ZIP 99804

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2183-1 || 2183-2

2183-1

Response to Commentor No. 2183

2183-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford and the risk of contamination to the Columbia River. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Restoration of the Hanford Site and waste management activities are the primary missions at Hanford. Although prior Hanford Site events are not within the scope of this PEIS, the referenced releases at Hanford were terminated with the shutdown of the last single pass-cooling reactor in 1971.

The proposed actions delineated in the NI PEIS would not have an impact on the Columbia River. FFTF is located approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to the groundwater. Analyses presented in Chapter 4 of the NI PEIS (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4) indicate that there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of the Hanford facilities that would support the proposed actions. Also, no water quality impacts would be expected as a result of permanent deactivation of FFTF (Section 4.4.1.2.4).

2183-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2184: Mary Burki

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2184-1 || 2184-2

Time and again "we" have proceeded ahead with actions that "seemed like a good idea at the time."
Far too often "we" later discover it wasn't such a good idea and the environment and our health suffer as a consequence.

Sincerely, Please get to cleaning up Hanford and do not restart the reactor
Name MARY BURKI Address 4324 Phinney No.
City Seattle, WA State ZIP 98103

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2184

- || 2184-1 || 2184-3
- 2184-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2184-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.
- 2184-3: See response to comment 2184-2.

Commentor No. 2185: Lynn Reer

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

 Please protect our children
 and our environment. Please
 honor agreements with citizens
 of this country.

Sincerely,

 Lynn Reer
 Name LYNN REER Address 3246 NE 54th Ave
 City Portland State OR ZIP 97213

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2185-1 || 2185-2

2185-1

Response to Commentor No. 2185

- 2185-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities to protect human health and the environment are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2185-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2186: G. D. Kerlick

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

There is no compelling public need for this project. It is a corporate boondoggle which will, once more, leave the public holding the bag and make eventual cleanup vastly more expensive

Sincerely,

Name G. D. Kerlick, Ph.D, Physics. Address 6342 34 Ave SW
City Seattle State WA ZIP 98126-3148

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2186-1 || 2186-2

2186-3

Response to Commentor No. 2186

2186-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2186-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2186-3: DOE notes the commentor's opposition to expanding DOE's existing nuclear facility infrastructure. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs:

1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;

2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and

3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

The proposed action would not have an impact on the schedule or available funding for existing cleanup activities at candidate sites. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Commentor No. 2187: Gloria Black

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

|| 2187-1 || 2187-2

*For the benefit of all our future
generations we must do what is responsible
and makes sense for the long term.*

This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2188-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2188-3: DOE notes the commentor's concern for the global environment.

Commentor No. 2189: Ola Edwards

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

|| 2189-1 || 2189-2

*** No more nuclear waste at Hanford.***** No delay to Hanford Cleanup.***** No more threat to the Columbia R.**

Sincerely,

Ola EdwardsName **OLA EDWARDS** Address **4025 NE 57**City **Seattle** State **WA** ZIP **98105**

2189-1

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Thanks**Response to Commentor No. 2189**

2189-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

2189-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2190: Diane W. Slota

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

While it may be true there is a small need for
medical-grade plutonium, Hanford is currently
such a large mess that more clean-up needs to
be done before beginning any discussion of FFTF
We citizens of Washington state care about restoring
Hanford to safe environmental condition.

Sincerely,

Name Diane W. Slota Address 11001 NE 145th St.
City Kirkland State WA ZIP 98034-4412

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2190-1 || 2190-2

2190-1

Response to Commentor No. 2190

2190-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Plutonium-238 will not be generated for direct medical applications in these DOE missions. This isotope is needed for NASA space exploration missions.

2190-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2191: Leanne Stagsdill

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2191-1 || 2191-2

The time has come for us to take responsibility for what we have already done to our environment, instead of repeating the mistake of our predecessors by handing even more destruction down to our children for our own short-lived immediate gain. The people have a right to know what is going on at Hanford!

Name Leanne Stagsdill Address 137 NE 112th
City Seattle State WA ZIP 98125

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments.

2191-1

Response to Commentor No. 2191

- 2191-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.
- 2191-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2192: R. G. Armajian

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

|| 2192-1 || 2192-2

Its extremely foolish for the powerful of this generation to allow the resources that are absolutely necessary for human survival (clean water, air) etc to be destroyed simply for the sake of greed & personal gain.

2192-3

Sincerely,

Name R. G. Armajian Address 10031 1st Ave NW
City Seattle State WA ZIP 98107

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2192

2192-1: DOE notes the commentor’s concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2192-2: DOE notes the commentor’s support for Alternative 5, Permanently Deactivate FFTF.

2192-3: The concerns expressed in this comment with respect to the impacts of an FFTF restart have been noted.

The impacts that would result from restart of the FFTF are addressed in Section 4.3 of the NI PEIS. Operation of the FFTF would result in releases of materials to the environment via airborne and liquid pathways. However, all air emissions and wastewater discharges would be in accordance with applicable permit and regulatory requirements. The releases of air pollutants and contaminated liquid are addressed in Section 4.3 of the NI PEIS. The release of air pollutants would result in concentrations well below Federal and state air standards (Table 4-13). The release of radioactivity and hazardous chemicals into the atmosphere would have a negligible effect on human health (Tables 4-17 and 4-19, respectively). There would be no discernible impacts to groundwater or surface water quality (Section 4.3.1.1.4). All impacts on ecological resources, including animals and fish, associated with operation of the FFTF would be small (Section 4.3.1.1.6).

The purpose and need for the production of isotopes and support of research and development is addressed in Volume 1, Section 1.2 of the NI PEIS. There is no greed or personal gain involved in DOE’s commitment to supply the necessary irradiation services.

Commentor No. 2193: Cathy Ferbiachi

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

*Please live up to your agreements
Please think about "doing the right thing"
Think about the future, beyond your own life.
Do something that may impact your career
unfavorably, but will inspire many by your courage
and let you sleep at night, and die in peace*

Sincerely,

Respectfully,

me Cathy Ferbiachi Address 2500 24th St SE
y Bethell State WA ZIP 98001

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2193-1 || 2193-2

2193-3

Response to Commentor No. 2193

- 2193-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2193-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2193-3:** DOE is committed to discharging its responsibilities in an open and unbiased manner and providing the public with comprehensive environmental reviews of its proposed actions.

Commentor No. 2194: Susan Perkins

Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

*I am appalled that you plan to produce yet more
expensive nuclear waste. The money you spend
on operating the FFTF reactor should instead be
spent to clean up the nuclear waste tanks.*

Sincerely,

Susan Perkins
Name Susan Perkins Address 7731 14th Ave NW
Seattle State WA ZIP 98117

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2194-1 || 2194-2

|| 2194-3

|| 2194-1

Response to Commentor No. 2194

2194-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. FFTF restart would not impact the schedule or available funding for existing cleanup activities.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2194-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2194-3: DOE notes the commentor's concern regarding waste generation. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Commentor No. 2195: Chris Fosse

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

*We already have enough dangerous waste
at Hanford and the clean up is hopelessly
behind schedule!*

Sincerely,

Name Chris Fosse Address 6531 15th Pl SE
City Belleue State WA ZIP 98006

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2195-1 || 2195-2

|| 2195-1

Response to Commentor No. 2195

- 2195-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2195-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2196: Jeannine Florance

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2196-1 || 2196-2

*until the current clean-up is done it makes
no sense to further jeopardize our
environment & the health of people.
There are too many incidents of cancer today.
A surgeon friend feels there is a strong
link to environmental causes. Please help
prevent such risks.*

Sincerely,
Name Jeannine Florance Address 2417 N. 45th St.
City Seattle State WA ZIP 98103

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

2196-3

Response to Commentor No. 2196

- 2196-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2196-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2196-3:** The commentor's concern regarding the completion of cleanup efforts at Hanford is noted. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Cancers are believed to be caused by a combination of hereditary and environmental factors, including exposure to ionizing radiation and chemical agents. This NI PEIS provides an estimate of the potential human health impacts associated with a range of reasonable alternatives considered for the production of radioisotopes for medical and industrial uses, research and development, and as heat sources for radioisotope power systems (See Sections 1.2 and 2.5 of Volume 1). The methodology used in the analysis of health effects, which is detailed in Appendixes H through J, is based upon our current knowledge of the health impacts that may result from exposure to low doses of ionizing radiation and chemical agents. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

Commentor No. 2197: Mary Whittenberger

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

*The credibility of official statements
 re Hanford and its environmental/health
 damage is negative, and has been for
 decades.*

*The FFTF Nuclear Reactor is no
 exception.*

Sincerely, *Mary J. Whittenberger*

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2197-1 || 2197-2

2197-3

Response to Commentor No. 2197

- 2197-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2197-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2197-3:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding official statements on Hanford missions and environmental impacts.

DOE radiological control requirements are designed with the intent to meet the legal requirements of 10 CFR 835, and there are provisions for enforcement actions should the requirements of 10 CFR 835 not be met. In order to meet these requirements, DOE has established the DOE Radiological Health and Safety Policy (DOE P 441.1, April 26 1996). Accuracy of radiological records is among the goals of this policy: the policy states in part "Ensure radiological measurements, analyses, worker monitoring results and estimates of public exposures are accurate and appropriately made."

The human health effects information presented in the NI PEIS is based on data collected at various DOE sites (specifically ORR, INEEL, and Hanford). The data used to quantify offsite consequences is derived from reports (which are available to the public) on the normal operational releases at the facilities being evaluated (for example DOE/RL-99-41 Radiological Air Emissions Report for the Hanford Site Calendar Year 1998). These reports are generated in response to DOE Order 231.1 "Environment, Safety, and Health Reporting" which requires an annual radiation dose summary addressing doses to workers and members of the public.

Commentor No. 2198: Paul Moyer

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2198-1 || 2198-2

The National Research Council's recently released "Study of U.S. Nuclear-Waste Sites Calls DOE's Cleanup Approach Inadequate" (Wall Street Journal, 8/8/6) merely restates what we already know. I strongly urge you to select ALTERNATIVE 5. Let's Clean-up our waste before creating more.

Response to Commentor No. 2199

- 2199-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2199-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2199-3:** FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

Commentor No. 2200: Victor and Roberta Moore

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

We moved here to tri-cities 3 yrs. ago believing that
the Hanford Mission was no longer production but was
now mission CLEAN-UP!! The FFTF will
put us back into plutonium production & create
MORE waste on top of the mountains of waste
we have already! Let N.Y.C. or Wash.D.C. be the
Sincerely, Victor & Roberta Moore NEXT Nuclear Producti
Center

Name Victor Moore Address 8149 W. Clearwater Pl.
City Hennewick State WA. ZIP 99336

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2200-1 || 2200-2

2200-1

Response to Commentor No. 2200

2200-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposal) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

2200-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2201: Richard Dilian

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

You can't keep burying ~~the~~ radioactive
waste material - some where the insanity
of our actions must stop - please
make it now - Summary alternative
forms of energy could be more fully
developed instead of playing with deadly
radioactive ^{poison}

Sincerely,

Help!

Name Richard Dilian Address 1801 10th Ave E
City Seattle State WA ZIP 98102

|| 2203-1 || 2203-2

2203-1

Response to Commentor No. 2203

2203-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford and protection of the Columbia River. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

2203-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2204: Bob Anderson

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

|| 2204-1 || 2204-2

Response to Commentor No. 2204

2204-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

No food or water restrictions are currently in place outside the Hanford Reservation as a result of Hanford activities.

2204-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2204-3: Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. The NI PEIS

Commentor No. 2204: Bob Anderson (Cont'd)

Response to Commentor No. 2204

evaluates a range of reasonable alternatives for accomplishing the proposed action, one of which includes use of FFTF. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Although research to identify other potential fuel sources to support these space exploration missions has been conducted, no viable alternative to using plutonium-238 has been established. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Commentor No. 2205: Lisa Kelsey/Bill Kelsey

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

- 1) do not add waste to the Hanford site
- 2) do not create more Plutonium - the world does not need more Plutonium
- 3) do not delay the cleanup of Hanford
- PLEASE, PLEASE, PLEASE

Sincerely,

Lisa Kelsey
Name Bill Kelsey Address 14536 78th Ave NE
City Kenmore State WA ZIP 98028

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2205

- || 2205-1 || 2205-2
- || 2205-3
- || 2205-4
- || 2205-5

- 2205-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2205-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2205-3:** DOE notes the commentor's concern regarding waste generation. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.
- 2205-4:** The purpose of the NI PEIS is to evaluate the environmental impacts of a range of reasonable alternatives to fulfill the proposed actions, one of which is the domestic production of plutonium-238. Plutonium-238, used to support NASA space missions, is not weapons-grade plutonium (i.e., plutonium-239). Whereas the United States is currently planning for the disposition of tons of surplus plutonium-239 that is not needed to support the U.S. nuclear weapons stockpile, there are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems and the plutonium-238 that fuels them for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. Based on NASA

Commentor No. 2205: Lisa Kelsey/Bill Kelsey (Cont'd)

Response to Commentor No. 2205

guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, DOE anticipates that the existing plutonium-238 inventory will be exhausted by approximately 2005. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

- 2205-5:** DOE notes the commentor's concerns regarding the possible delay of the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Commentor No. 2206: Paul Behodn

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

Sincerely, *Paul J. Behodn*

Name PAUL BEHODN Address 503 E. HARRISON
City SEATTLE State WA ZIP 98102

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2206-1 || 2206-2

Response to Commentor No. 2206

- 2206-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this Agreement.
- 2206-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2207: Julie A. Hockett

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

*We do not want more nuclear waste
at Hanford. We absolutely do not need
plutonium produced from the FFTF. This
is an abomination.
Do not restart this reactor. Enough
is enough.*

Sincerely,

Name Julie A. Hockett Address 222 174th PI NE
City Bellevee State WA ZIP 98008

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

2207-1 2207-2

2207-3

2207-4

2207-5

Response to Commentor No. 2207

- 2207-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Public meetings were held on this formal milestone change. Implementation of the alternatives The missions described in Section 1.2 of Volume 1 would not have an impact on ongoing Hanford cleanup activities
- 2207-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.
- 2207-3:** DOE notes the commentor's concern regarding waste disposal at the Hanford Site. Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.
- 2207-4:** DOE notes the commentor's opposition to restarting FFTF for plutonium 238 production. Through a Memorandum of Understanding with NASA,

Commentor No. 2207: Julie A. Hockett (Cont'd)

Response to Commentor No. 2207

DOE provides radioisotope power systems and the plutonium-238 that fuels them for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, DOE anticipates that the existing plutonium-238 inventory will be exhausted by approximately 2005. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

2207-5: See response to comment 2207-2.

Commentor No. 2208: Kristin Hanson

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2208-1 || 2208-2

IF YOU DON'T KEEP YOUR AGREEMENTS

WHAT WILL YOU KEEP?

Kristin Hanson.

Sincerely,

Name KRISTIN HANSON Address 692 ALDER ST.
City EDMONDS State WA ZIP 98020

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

2208-1

Response to Commentor No. 2208

- 2208-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Prior public meetings were held on this formal milestone change. The alternatives delineated in the NI PEIS would not have an impact on meeting the schedules for the Hanford cleanup activities.
- 2208-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2209: Marion S. Moor

Dear Secretary (interchangeably),

8/13/2000

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

2209-1 2209-2

During the Washington State Democratic State Convention, members of Heart of America held a consultation with you, Mr. Secretary, in an attempt to secure your support of allowing a favorable decision regarding plutonium production from the site of Hanford FFTF nuclear reactor. W. Moors & W. Citizens would not tolerate this

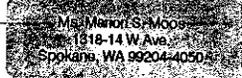

2209-3

Sincerely,

M. Moor

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2209

2209-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

As discussed in Section 4.3 of Volume 1, implementation of Alternative 1, Restart FFTF, would pose no significant risk to human health or safety.

2209-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.

2209-3: See response to comment 2209-2.

Commentor No. 2210: Jean Cypher

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

I understand & sympathize with the need for radioactive isotope production. I also find arguments for this use of a defunct reactor site compelling, economically. However, any productive use of Hanford cannot be viewed separately from its enormous subsurface contamination problems. The environmental, health & therefore economic implications of these are so overwhelming I feel all efforts at Hanford should be devoted exclusively to cleanup.

Name Jean Cypher DVM Address 6900 Hwy 30
City The Dalles State OR ZIP 97058

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2213

- 2213-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2213-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2214: Joshua Berger

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

UNTIL A CONCRETE PLAN IS IN PLACE
 TO CLEAN UP THE ALREADY SEVERELY CONTAMINATED
 HANFORD NUCLEAR RESERVATION, I AM 110%
 OPPOSED TO ANY NEW PLUTONIUM PRODUCTION.
 RESTARTING FFTF IS CARELESS, DANGEROUS
 AND VERY VERY IRRESPONSIBLE.

Sincerely,

Name JOSHUA BERGER Address 1123 SE 36TH
 City PORTLAND State OR ZIP 97214

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2214-1 || 2214-2

2214-1

2214-3

Response to Commentor No. 2214

2214-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford and opposition to plutonium-238 production. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The missions described in Section 1.2 of Volume 1 would not have an impact on ongoing Hanford cleanup activities.

As discussed in Section 1.2.2 of Volume 1, plutonium-238 would be produced to support NASA's deep space missions.

2214-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.

2214-3: This PEIS provides estimates of the human health impacts associated with a range of reasonable alternatives (including restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

2219-4

Response to Commentor No. 2219

- 2219-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The missions described in Section 1.2 of Volume 1 would not have an impact on ongoing Hanford cleanup activities.
- 2219-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.
- 2219-3:** See response to comment 2219-2. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram funds designated for Hanford cleanup, regardless of the alternative(s) selected.
- 2219-4:** DOE notes the commentor's concern regarding waste generation. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Commentor No. 2220: Kathleen M. Tibbet

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2220-1 || 2220-2

We can see the results of pollution all around us. What can the gains possibly be? against the risk of destroying the Columbia River and its area around it. How can you conscientiously further this abomination.

Sincerely,
 Kathleen M. Tibbet
 Name: Kathleen M. Tibbet Address: 12235 SW James
 City: Tigard State: OR ZIP: 97223

2220-3

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2220

- 2220-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford and support for Alternative 5 (Deactivate FFTF with no new missions). Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The missions described in Section 1.2 of Volume 1 would not have an impact on ongoing Hanford cleanup activities.
- 2220-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2220-3:** DOE notes the commentor's concern regarding the potential risk of contaminating the Columbia River. The proposed actions delineated in the NI PEIS would not have an impact on the Columbia River. FFTF is located approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to the groundwater. Analyses presented in Chapter 4 of the NI PEIS (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4) indicate that there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of the Hanford facilities that would support the proposed actions. Also, no water quality impacts would be expected as a result of permanent deactivation of FFTF (Section 4.4.1.2.4).

Although not within the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. Such cleanup would greatly reduce the potential for contaminating the Columbia River. The proposed actions delineated in the NI PEIS would not have an impact on these Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup.

Commentor No. 2221: B. Goodsitt

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

|| 2221-1 || 2221-2

There are too many health risks and dangers to the environment. As a former Washington resident, I implore you to shut down the FFTF nuclear reactor

2221-3

2221-2

Sincerely,
Name B. Goodsitt Address 3247 Bellflower Ct
City Ann Arbor State MI ZIP 48103

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Dear Secretary Richardson:

Response to Commentor No. 2221

2221-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.

2221-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2221-3: The commentor's opposition to the restart of FFTF is noted. This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives (including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

The NI PEIS identifies (in Chapter 3 of Volume 1) endangered species that live on or near all of the candidate sites, as well as aquatic and wetlands areas that may be impacted by operations at candidate locations. According to an International Atomic Energy Agency (IAEA) publication (IAEA Technical Report Series No. 332, Effects of Ionizing Radiation on Plants and Animals at Levels Implied by Current Radiation Protection Standards), a dose rate of 100 millirem per year to the most exposed human will lead to dose rates to plants and animals of less than 0.1 rad per day. The IAEA concluded that a dose rate of 0.1 rad per day or less for animals and 1 rad per day or less for plants would not affect these populations. The largest individual dose for any of the nuclear

Response to Commentor No. 2221

infrastructures alternatives under normal operations would be less than 0.1 millirem, which is three orders of magnitude less than the IAEA threshold for adverse effects. Therefore, implementation of any of the range of reasonable nuclear infrastructure alternatives analyzed would not be expected to result in adverse impacts on plants and animals living in potentially affected areas around the candidate sites.

Commentor No. 2221: B. Goodsitt (Cont'd)

Commentor No. 2222: Betty L. Hawkins

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

*We do not want more plutonium
production at Hanford. We do
not want to endanger
the Columbia River. Work
should be on clean-up.*

Sincerely,

Name Betty L. Hawkins Address 25801 Stuckey SW
City Washou State WA ZIP 98070

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2222-1 || 2222-2

2222-3

2222-1

Response to Commentor No. 2222

- 2222-1:** DOE notes the commentor’s concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.
- 2222-2:** DOE notes the commentor’s support for Alternative 5, Permanently Deactivate FFTF.
- 2222-3:** DOE notes the commentor’s opposition to plutonium production at Hanford and position concerning impacts to the Columbia River from FFTF restart. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Commentor No. 2223: Sara Moses

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

|| 2223-1 || 2223-2

Feel very strongly. Family
votes based on this issue.

Name Sara Moses Address POB 5
City Had River State OR ZIP 97031

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2223

- 2223-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.
- 2223-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2224: Gretchen Johnson

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2224-1 || 2224-2

We sure don't want Underground High level Nuclear Waste Tanks - leaking or not.

|| 2224-1

Sincerely,

Name *Gretchen Johnson* Address *1208-8th W*
City *Seattle* State *WA* ZIP *98119*

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2224

- 2224-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities. As discussed throughout Section 4.3 of Volume 1, none of the proposed alternatives would add waste to the high-level waste tanks at Hanford.
- 2224-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2225: Dawn Paymaut

Dear Secretary (Name/Address),

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

There is so much propaganda about the salmon being endangered. Surely the radioactivity leaking into the Columbia River can't be good for the salmon or any other living thing!

Name Dawn Paymaut Address 1541 Olympic View Ln
Silverdale Redmond
City _____ State WA ZIP 98383

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2225-1 || 2225-2

2225-1

Response to Commentor No. 2225

2225-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater, surface water, or aquatic life in the Columbia River from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

2225-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2226: Frank Hull

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

IT IS UNNECESSARY, DANGEROUS IN
THE EXTREME, & I POSITIVELY STRID
TO LEAD THE WORLD BACK INTO ANOTHER
NUCLEAR ARMS RACE. THIS IS A
HIDDEN PART OF THE RIDICULOUS ANTI-
MISSILE CAMPAIGN, I'M AFRAID, NATIONAL
sincerely, DEFENSE WOULD BE WEAKENED, NOT
STRENGTHENED & ONLY THE CONTRACTORS
Name FRANK HULL Address 821 SHOSHONE
City LA CONNER State WA ZIP 98257-9621
WORLD BENEFIT.

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

2226-1 2226-2

2226-3

Response to Commentor No. 2226

- 2226-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.
- 2226-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2226-3:** DOE notes the commentor's views. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. However, no component of the proposed action is for the purpose of supporting any defense or weapons related mission. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

Commentor No. 2227: Therese Gesell

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2227-1 || 2227-2

Nuclear waste is poisonous! Why use it at all! There are other resources available for creating energy, ie wind, water, solar, gas etc., none of those create poison as a product. At this point in your technology, it is very irresponsible to use Nuclear Power.

Sincerely,

Name Therese Gesell Address 11427 40th DR SE
City Everett State WA ZIP 98208

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

2227-3

Response to Commentor No. 2227

- 2227-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.
- 2227-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2227-3:** DOE notes the commentor's interest in alternative energy sources and opposition to the use of nuclear power, although issues of research and development of alternative energy sources are beyond the scope of this Nuclear Infrastructure PEIS. The DOE missions to be addressed in this EIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development, can currently only be met using nuclear reactor or accelerator technologies.

Commentor No. 2228: David Turnoy

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2228-1 || 2228-2

Please!

Sincerely,

Name David Turnoy Address 811 Wendy Court
City West Linn State OR ZIP 97068

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2228

- 2228-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.
- 2228-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2229: Ron Hsik

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

|| 2229-1 || 2229-2

I, and everyone I talk to, cannot believe you would even consider restarting anything at Hanford. We know you would say, we will make it perfectly clear, No new nuclear work at Hanford; you it up and shut it down!

Sincerely,

Ron Hsik
Name Ron Hsik Address 2216 24th St. N.E.
City Bellevue State WA ZIP 98007

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2229

2229-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.

2229-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2230: Dorothy Kimbill

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

|| 2230-1 || 2230-2

*We must clean up existing waste
and not make more!*

|| 2230-1

*We must shut down the FFTF
reactor*

Sincerely,

City *Des Moines* State *Wa* ZIP *98198*

*Please do all you can to
stop making nuclear waste. Thank you!*

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2230

- 2230-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.
- 2230-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2231: Mary Rivard

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2231-1 || 2231-2

*HANFORD/The World has enough radioactive
WASTE - STOP ALREADY ->*

No MORE PLUTONIUM production

*I bet YOU don't want more
radioactive poison either secretary
Richardson - Please do the right
thing for the WORLD -*

Sincerely,

Name *Mary Rivard* Address *3620 Burke Ave. Nth*
City *Seattle* State *WA* ZIP *98103*

2231-3

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2231

2231-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.

2231-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2231-3: DOE notes the commentor's opposition to additional plutonium production and concern regarding waste generation. The plutonium isotope under consideration, plutonium-238, is not weapons material.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Commentor No. 2232: Barbara J. Zook

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

|| 2232-1 || 2232-2

Please do not let it take an explosion of a leaking nuclear waste tank to make you realize that this is so wrong & legally, morally, and ethically! Clean it up and leave it shut down! You are endangering many lives & futures.

Sincerely,

Name Barbara J Zook Address 1906 - 24th Ave So.
City Seattle State WA ZIP 98144

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

2232-1

Response to Commentor No. 2232

2232-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

As discussed throughout Section 4.3 of Volume 1, no high-level waste would be added to the high-level waste tanks at Hanford. Radiological and non-radiological risks that would result from implementation of Alternative 1 would be small.

The commentor's support for Alternative 5 (Deactivate FFTF with no new missions) is noted.

2232-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2233: Janet F. Warrington

Dear Secretary Nicholson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

*I grew up in the Yakima Valley in the 1940's
 & 1950's less than 70 miles from Hanford.
 Certainly the population in the NW has been
 at risk long enough!*

Sincerely,

Name *Janet F. Warrington* Address *2616 NE 26 Ave*
 City *Portland, OR* State *OR* ZIP *97212-4866*

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2233-1 || 2233-2

2233-3

Response to Commentor No. 2233

- 2233-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.
- 2233-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2233-3:** This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small. As stated in Appendix H of the EIS, other human health impacts (non fatal cancers and genetic mutations) occur with a lower frequency for the same level of exposure. Since latent cancer fatalities would not be expected among the public, it follows that the expected result for other radiological health impacts would also be small.

Commentor No. 2234: Marian Schwarzenbach

Dear Secretary Richardson,

8/24/00

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor; || 2234-1 || 2234-2

- 1. The Columbia River, a major fish spawning river in the country, a major water source, must not be polluted with radioactive waste. || 2234-3
- 2. The ground water in E WA, a major food producing area, must not be ruined. || 2234-1
- 3. The order to clean up was made, the \$ allocated - What Sincerely, part of "NO" don't you understand?

Name Marian Schwarzenbach Address 5102-46 Ave NE
 City Seattle State WA ZIP 98105
 P.S. And didn't the wild fires of this summer point up the additional dangers? We + everyone downstream were extremely lucky - this time.
 Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2234

2234-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.

As stated in Section N.3.2 of Appendix N, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

With regard to the Hanford wildfire of 2000, the DOE Richland Operations Office, the State of Washington Department of Health, and U.S. Environmental Protection Agency performed environmental monitoring on and around the Site to assess potential radiological impacts. The wildfire did not cause a release of radioactive materials from any Hanford facilities but did result in resuspension of radioactive materials which were already in the environment. The very low levels of radioactive materials that were resuspended were slightly above natural background levels and required several days of analysis to quantify. Information on this event has been made available to the public and can be accessed at <http://www.Hanford.gov/envmon/indes.html>. This site also provides a link to information on the independent offsite air monitoring that was conducted by the U.S. Environmental Protection Agency.

2234-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2234-3: DOE notes the commentor's position regarding impacts to the Columbia River and groundwater from FFTF restart. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Commentor No. 2235: Steven C. Peterson

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

I AM AGAINST ANY EFFORTS TO RESTART
HANFORD'S FFTF NUCLEAR REACTOR. I
HAVE A FAMILY THAT LIVES IN WASHINGTON
AND I AM SHOCKED THAT THE D.O.E.
IS SUPPORTING THE RESTART OF THE FFTF
REACTOR. MY FAMILY AND I ARE AGAINST
ANY FURTHER PRODUCTION OF HIGH
LEVEL WASTE.

Sincerely,

Name STEVEN C. PETERSON Address 15635 20TH AVE SW
 City SEA State WA ZIP 98166

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

2235-3

2235-4

Response to Commentor No. 2235

- 2235-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.
- 2235-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2235-3:** See response to comment 2235-2.
- 2235-4:** DOE notes the commentor's concern regarding high-level radioactive waste generation. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Commentor No. 2236: Don MacRae

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2236-1 || 2236-2

*We must not allow
more liquid High-Level Nuclear
waste to be added to explosive
and leaking tanks that already
threaten the Columbia River!!!*

2236-3

*We must protect the future of
Sincerely, our health, our children, and our
environment. Don MacRae*

- 2237-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2238: Beth Call

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

How can you propose to spend clean-up funds on restarting FFTF which will add more liquid high-level nuclear waste to explosive and leaking tanks which already threaten the Columbia River? This directly violates the Hanford Cleanup Agreement & threatens the entire Pacific NW with potential accidents & further nuclear contamination. Just last night (Aug. 21) VP Gore pledged to make cleaning up. Sincerely, Hanford a top priority. Don't make a bar out of him.

Name Beth Call Address 102 Otis
City Walla Walla State WA ZIP 99362

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2238-1 || 2238-2

|| 2238-1
|| 2238-3
|| 2238-1
|| 2238-4
|| 2238-1

Response to Commentor No. 2238

2238-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2 of Appendix N, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Public meetings were held on this formal milestone change. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.

2238-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2238-3: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Commentor No. 2238: Beth Call (Cont'd)

Response to Commentor No. 2238

As discussed in Section 4.3 of Volume 1, no high-level radioactive waste would be added to the high-level radioactive waste tanks at Hanford.

- 2238-4:** FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

Commentor No. 2239: Martha Reynuzzo

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2239-1 || 2239-2

*In the wake of our children and
our earth and common sense -
nuclear reactors are dangerous
expensive (especially cleanup) and
not needed. We have many
other options!!!!*

2239-3

2239-4

Sincerely,

Martha Reynuzzo
Name MARTHA REYNUZZO Address _____
City Seattle Wa State _____ ZIP 98109

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2239

- 2239-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.
- 2239-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2239-3:** The commentors's opposition to the restart of FFTF is noted. FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives (including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 which includes restart of FFTF, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small. As stated in Appendix H of the EIS, other human health impacts (non-fatal cancers and genetic mutations) occur with a lower frequency for the same level of exposure. Since latent cancer fatalities would not be expected among the public, it follows that the expected result for other radiological health impacts would also be small.

The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS. DOE made every effort to obtain, analyze, and disclose all required information to make a decision on expanding nuclear infrastructure. The costs analysis of proposed actions is not required by NEPA and CEQ

Commentor No. 2239: Martha Reynuzzo (Cont'd)

Response to Commentor No. 2239

regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. The report were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms.

- 2239-4:** Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs:
- 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;
 - 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and
 - 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

Commentor No. 2240: Kyle Allan Cleys

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

It is incomprehensible to me how the Department of Energy can even think of restarting Hanford's FFTF nuclear reactor. The last thing we need is more high-level nuclear waste. Please reject the lunacy and instead focus the Department's resources on cleaning up existing waste.

Sincerely, *Kyle Allan Cleys*

|| 2247-4

Response to Commentor No. 2247

- 2247-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.
- 2247-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2247-3:** DOE notes the commentor's concerns for impacts to the Columbia River from existing contamination at Hanford and from FFTF restart. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.
- 2247-4:** The commentor's opposition to the restart of FFTF is noted. This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives (including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation.

Commentor No. 2247: Walter Smick (Cont'd)

Response to Commentor No. 2247

Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

Commentor No. 2248: Laila Atallah

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

It is highly distressing to me that we
 are considering restarting the FFTF Reactor.
 The current tanks are leaking toxins
 and our resources would best be used in
 fixing the current hazardous conditions,
 rather than exacerbating them.

Sincerely,

Thank you for your consideration.
Laila Atallah

Name Laila Atallah Address 3130 Woodland PK AVEN,
 City Seattle State WA ZIP 98103 upper

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2248-1 || 2248-2

2248-3

2248-1

Response to Commentor No. 2248

2248-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.

As discussed in Section 4.3 of Volume 1, implementation of Alternative 1, Restart FFTF, none of the proposed alternatives would add waste to the high-level waste tanks at Hanford. As stated in Section N.3.2 of Appendix N, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2248-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.

2248-3: See response to comment 2248-2.

Commentor No. 2249: Albert J. Penta

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

The Time is long past to honor the
Hanford Clean-up Agreement & Stop the
folly of further plutonium production. Please
do not Re-start the dangerous FFTF Nuclear reactor.
Thank you.

Sincerely,

Name Albert J. Penta Address PO Box 1057
City MONROE State WA ZIP 98272

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2249-1 || 2249-2

|| 2249-1

|| 2249-3

Response to Commentor No. 2249

2249-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford and opposition to the production of plutonium-238. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.

As discussed in Section 1.2.2 of Volume 1, plutonium-238 would be produced in support of NASA's deep space missions.

2249-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.

2249-3: See response to comment 2249-2.

Commentor No. 2250: Gordon Ruffiles

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

At 86, I cannot attend the hearing, but I have read the arguments on both sides and believe that the weight of the evidence is that the FFTF should be shut down.

Sincerely,

Gordon Ruffiles
 Name Gordon Ruffiles Address 11318 Riverview Pl NE
 City Seattle State WA ZIP 98125-5960

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2250-1 || 2250-2

2250-2

Response to Commentor No. 2250

- 2250-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.
- 2250-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2251: Dolores Koger

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

*Why do we need more
plutonium production? Starting
up the reactor will just
add more waste to an already
overpolluted site contaminated by
the Columbia River*

Sincerely,

Dolores Koger

Name *Dolores Koger* Address *3838 138th Ave NE*

City *Bellevue* State *WA* ZIP *98005*

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2251-1 || 2251-2

|| 2251-3

|| 2251-4

Response to Commentor No. 2251

- 2251-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.
- 2251-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2251-3:** The purpose of the NI PEIS is to evaluate the environmental impacts of a range of reasonable alternatives to fulfill the proposed actions, one of which is the domestic production of plutonium-238. Plutonium-238, used to support NASA space missions, is not weapons-grade plutonium (i.e., plutonium-239). Whereas the United States is currently planning for the disposition of tons of surplus plutonium-239 that is not needed to support the U.S. nuclear weapons stockpile, there are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems and the plutonium-238 that fuels them for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, DOE anticipates that the existing plutonium 238 inventory will be exhausted by approximately 2005. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.
- 2251-4:** As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g.,

Commentor No. 2251: Dolores Koger (Cont'd)

Response to Commentor No. 2251

solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

Commentor No. 2252: Joyce A. Harman

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: !! || 2252-1 || 2252-2

Please
"Think of our Children"

Sincerely, Thank you - Joyce A. Harman

Name _____ Address _____
City _____ State _____ ZIP _____

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2252

- 2252-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.
- 2252-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2253: F. K. Mead

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

|| 2253-1 || 2253-2

*This has gone on for
too long. Please put politics
aside and honor the clean-up
agreement which will help future
generations live free of the dangers
of this reactor.*

Sincerely,

Name F. K. Mead Address 1901 38th Ave E
City Seattle State WA ZIP 98112

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

2253-1

Response to Commentor No. 2253

2253-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.

As discussed in Section 4.3 of Volume 1, implementation of Alternative 1 (Restart of FFTF) would pose little risk to the health and safety of the public.

2253-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2254: Ruth Newland

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

The recent fire at the Hanford Nuclear Site only points up the fact of how dangerous Hanford really is with all its closet skeletons and decaying facilities. We simply do NOT want nuclear work in our area. So do NOT start FFTF

Sincerely, *Nuclear Reactor again & get the site cleaned up*

Name *Ruth Newland, Ph.D* Address *3004 Riverside Road*
City *Yalima* State *WA* ZIP *98901-8540*

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

2254-1 2254-2

2254-1

2254-3

Response to Commentor No. 2254

2254-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.

With regard to the Hanford wildfire of 2000, the DOE Richland Operations Office, the State of Washington Department of Health, and U.S. Environmental Protection Agency performed environmental monitoring on and around the Site to assess potential radiological impacts. The wildfire did not cause a release of radioactive materials from any Hanford facilities but did result in resuspension of radioactive materials which were already in the environment. The low levels of radioactive materials that were resuspended were only slightly above natural background levels and required several days of analysis to quantify. Information on this event has been made available to the public and can be accessed at <http://www.Hanford.gov/envmon/index.html>. This site also provides a link to information on the independent offsite air monitoring that was conducted by the U.S. Environmental Protection Agency. As discussed in Appendix I, an assessment of the risk of a wildfire indicated that, in the worst case, it could lead to a loss of offsite power, which the FFTF, because of its passive cooling capability, could withstand without overheating the core or leading to the release of any radioactivity.

2254-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.

2254-3: See response to comment 2254-2.

Commentor No. 2255: Peter Gay

Dear Secretary (Mr. ...),

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2255-1 || 2255-2

As a downstream Columbia River resident
for almost 40 years, I am especially
concerned about challenges associated
with Hanford "Clean-Up." Re-starting the
FFTF Nuclear Reactor at Hanford seems
like a step in the wrong direction to me

Sincerely,

Name Peter Gay Address 910 E. 15th Place
City The Dalles State OR ZIP 97058

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

2255-1

2255-3

Response to Commentor No. 2255

- 2255-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.
- 2255-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.
- 2255-3:** See response to comment 2255-2.

Commentor No. 2256: Ann Kremer

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

Do not further threaten the life
of the Columbia River.

Do not endanger the lives of our
children by producing more nuclear waste

Ann Kremer
Sincerely,

Name Ann Kremer Address 10041 42 SW
City Seattle State WA ZIP 98146

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2256-1 || 2256-2

|| 2256-3

|| 2256-4

Response to Commentor No. 2256

- 2256-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.
- 2256-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2256-3:** FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.
- 2256-4:** DOE notes the commentor's concern regarding waste generation. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Commentor No. 2257: Anne E. Zald

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

|| 2257-1 || 2257-2

Progress on the clean-up is held in check while storage tanks continue to degrade and leak, pollute our groundwater and countryside. Why is the clean-up held hostage to the FFTF and increasing amounts of waste?

Sincerely,

Name ANNE E. ZALD Address 9522 18th AVE NE B1
 City SEATTLE State WA ZIP 98115

2257-1

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2257

2257-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities. Further, none of the mission activities discussed in the NI PEIS would add waste to the high-level waste tanks at Hanford.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2 of Appendix N, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2257-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2258: Jim Trombald

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

*We have a long, complicated
cleanup mission at Hanford, crucial
for disaster prevention!
Any production such as FFTF
disturbs from cleanup mission
plus adds waste stream!*

Sincerely,

Name *Jim Trombald, M.D.* Address *4851 88th Place SE*
City *Mercer Island* State *Wash.* ZIP *98040*

*I will make similar comments in
person 8/30/08. JT.*

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2258-1 || 2258-2

2258-1

Response to Commentor No. 2258

2258-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.

As discussed in Section 4.3 of Volume 1, waste that would be generated under the alternatives described in Section 2.5 would not significantly impact the waste management infrastructure at Hanford.

2258-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2259: Donn Colby

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2259-1 || 2259-2

Hanford is the most contaminated nuclear site in the western world. The main goal for the site is to clean it up. Producing more radioactive waste at Hanford is contrary to that goal. After 8 years on stand-by, it is time to close FFTF and focus on clean-up.

Sincerely,

Don Colby

Name Don Colby, MD Address 318 17th Ave E

City Seattle State WA ZIP 98112

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

2259-1

Response to Commentor No. 2259

2259-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.

As discussed in Section 4.3 of Volume 1, waste that would be generated under the alternatives described in Section 2.5 would not significantly impact the waste management infrastructure at Hanford.

The commentor's support for Alternative 5 (Deactivate FFTF with no new missions) is noted.

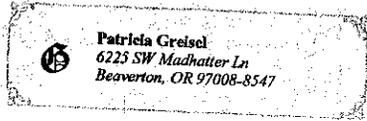

2259-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2260: Patricia Greisel

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2260-1 || 2260-2

Sincerely, *Patricia Greisel*

- 2261-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2261-3:** DOE notes the commentor's interest in alternative energy sources, although issues of research and development of alternative energy sources are beyond the scope of this Nuclear Infrastructure PEIS. The DOE missions to be addressed in this EIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development, can currently only be met using nuclear reactor or accelerator technologies.

Commentor No. 2262: Emmalee Weibel

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

The American public has made abundantly clear that they do not want additional nuclear industry in the U.S. The only time people go along is when they aren't aware what's being done. Do the responsible thing.

Name *Emmalee Weibel* Address *5020 SW Carmen Dr.*
City *Lake Oswego* State *OR* ZIP *97035-3346*

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2262-1 || 2262-2

2262-3

Response to Commentor No. 2262

- 2262-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.
- 2262-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2262-3:** DOE policy encourages effective public participation in its decision making process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

Commentor No. 2263: Elizabeth B. Bushnell

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

IF THIS DOES NOT HAPPEN - NOT ONLY
WILL THE COLUMBIA RIVER BE THREATENED
BUT LIVES IN THE NORTHWEST WILL BE
AT RISK. DO UNTO OTHERS AS YOU
WOULD HAVE THEM DO TO YOU!

Sincerely,

Elizabeth B. Bushnell

Name ELIZABETH B. BUSHNELL Address 1665 SW FILMORA,
City PORTLAND State OR ZIP 97225-42

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2263-1 || 2263-2

2263-1

Response to Commentor No. 2263

2263-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

2263-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2264: Phyllis Clausen

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

I strongly oppose restart of the FFTF nuclear reactor. Do not add any more nuclear waste. Instead pledge the DOE to cleaning up the leaking tanks already on the site. We deserve cleanup, not the further burden of waste you are proposing.

Sincerely,

Name Phyllis Clausen Address 37 Stoller Rd
City Trent Lake State WA ZIP 98650

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2264-1 || 2264-2

|| 2264-3

|| 2264-4

|| 2264-1

Response to Commentor No. 2264

- 2264-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy) This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.
- 2264-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.
- 2264-3:** See response to comment 2264-2.
- 2264-4:** DOE notes the commentor's concern regarding waste generation. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Commentor No. 2265: Walter and Jean Walkinshaw

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

+ permit no further storage of nuclear
waste at Hanford

Sincerely,

Name Walter + Jean Walkinshaw Address 1303 E. Lynn
City Seattle State WA ZIP 98002

Commentor No. 2266: Jennifer Martin

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

The Hanford Plant is dangerous enough as it is. It needs to be made safer and not less so. I think this summer's fire helped prove that one. Please don't restart the FFTF reactor. It's not worth the risks and the wastes.

Sincerely,

Name Jennifer Martin Address 707 Valencia
City Walla Walla State WA ZIP 99362

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2266-1 || 2266-2

|| 2266-1

|| 2266-3

Response to Commentor No. 2266

2266-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Prior public meetings were held on this formal milestone change. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

With regard to the Hanford wildfire of 2000, the DOE Richland Operations Office, the State of Washington Department of Health, and U.S. Environmental Protection Agency performed environmental monitoring on and around the Site to assess potential radiological impacts. The wildfire did not cause a release of radioactive materials from any Hanford facilities but did result in resuspension of radioactive materials which were already in the environment. The very low levels of radioactive materials that were resuspended were slightly above natural background levels and required several days of analysis to quantify. Information on this event has been made available to the public and can be accessed at <http://www.Hanford.gov/envmon/index.html>. This site also provides a link to information on the independent offsite air monitoring that was conducted by the U.S. Environmental Protection Agency.

2266-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.

2266-3: See response to comment 2266-2.

Commentor No. 2267: Eric Andersen

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

The FFTF Nuclear Reactor should not be
 started on the issue of public safety.
 Respect the wishes of the public and clean
 up the Hanford area.

|| 2267-1 || 2267-2

|| 2267-3

|| 2267-1

Sincerely, Eric Andersen

Name ERIC ANDERSEN Address 73 STATE ST
 City Hood River State OR ZIP 97031

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2267

- 2267-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2267-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2267-3:** The commentor's opposition to the restart of FFTF is noted. FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives (including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 which includes restart of FFTF, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

Commentor No. 2268: Roy Metcalf

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2268-1 || 2268-2

*no more nuc waste in the
Columbia River,*

|| 2268-3

Sincerely,

Name *Roy Metcalf* Address *2455 Bellevue Ter.*
City *W. Lion* State *OR* ZIP *97068*

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2268

- 2268-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2268-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2268-3:** DOE notes the commentor's position regarding impacts to the Columbia River from FFTF restart. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. Section 3.4.4 of Volume 1 of the NI PEIS describes the current condition of water resources potentially affected by the Hanford Site, with specific discussions of surface water and groundwater resources in the Hanford 400 Area, where FFTF is located, provided in Sections 3.4.4.1.2 and 3.4.4.2.2, respectively. This information indicates that the only impact that 400 Area operations have had on water resources to date is contamination of the unconfined aquifer system with nitrate from sanitary sewage disposal. The source of this contamination has since been removed resulting in nitrate levels diminishing over time. The effects of maintaining FFTF in its current standby mode for 35 years are described in Section 4.2.1.2.4 of Volume 1, and this analysis indicates that the impact on water resources would be negligible. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Commentor No. 2269: Deanna Lynch

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

I have sent in so many of these already - what will it take to make you listen?

Sincerely,

Deanna Lynch
 Name Deanna Lynch Address 22511 NE 99th St
 City Newcower State Wash WA ZIP 981682

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2269-1 || 2269-2

2269-3

Response to Commentor No. 2269

- 2269-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2269-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2269-3:** DOE policy encourages effective public participation in its decision making process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

Commentor No. 2270: Beverly J. Witte

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

*The Columbia river is already
threatened by leaking tanks of nuclear
waste so we don't want any more
high level nuclear waste to be added.
We need to protect the future of our
health, the health of our children and our
environment.*

Sincerely,
Mrs. Beverly J. Witte

Name BEVERLY J. WITTE Address 4534 Warren Ave. N.
City Seattle State Wa. ZIP 98109

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

2270-1 2270-2

2270-3

2270-4

Response to Commentor No. 2270

- 2270-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2270-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2270-3:** High-level radioactive waste would not be generated by the activities proposed for any of the alternatives or alternative options. The additional radioactive waste that would be generated from the restart of FFTF (i.e., low-level radioactive waste) would not be stored in the high-level radioactive waste tanks located at Hanford. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.
- 2270-4:** The commentor's opposition to the restart of FFTF is noted. This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives (including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal

Commentor No. 2270: Beverly J. Witte (Cont'd)

Response to Commentor No. 2270

operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small. As stated in Appendix H of the EIS, other human health impacts (non-fatal cancers and genetic mutations) occur with a lower frequency for the same level of exposure. Since latent cancer fatalities would not be expected among the public, it follows that the expected result for other radiological health impacts would also be small.

The NI PEIS identifies (in Chapter 3 of Volume 1) endangered species that live on or near all of the candidate sites, as well as aquatic and wetlands areas that may be impacted by operations at candidate locations. According to an International Atomic Energy Agency (IAEA) publication (IAEA Technical Report Series No. 332, Effects of Ionizing Radiation on Plants and Animals at Levels Implied by Current Radiation Protection Standards), a dose rate of 100 millirem per year to the most exposed human will lead to dose rates to plants and animals of less than 0.1 rad per day. The IAEA concluded that a dose rate of 0.1 rad per day or less for animals and 1 rad per day or less for plants would not affect these populations. The largest individual dose for any of the nuclear infrastructures alternatives under normal operations would be less than 0.1 millirem, which is three orders of magnitude less than the IAEA threshold for adverse effects. Therefore, implementation of any of the range of reasonable nuclear infrastructure alternatives analyzed would not be expected to result in adverse impacts on plants and animals living in potentially affected areas around the candidate sites.

Commentor No. 2271: Kathleen A. Lawrence

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

More waste will then be added to tanks if the FFTF Nuclear Reactor is restarted. More danger of accidents and further contamination of the Columbia.

Sincerely,

Name Kathleen A. Lawrence Address _____
City anacortes State WA ZIP 98665

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2271-1 || 2271-2

|| 2271-3

|| 2271-4

Response to Commentor No. 2271

- 2271-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2271-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2271-3:** As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.
- As discussed in Section 4.3 of Volume 1, no high-level radioactive waste would be added to the high-level waste tanks at Hanford.
- 2271-4:** FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

Commentor No. 2272: Patricia Sims

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

*There is enough leakage already.
The danger of restarting the
nuclear reactor is too high.*

*Listen to those of us who live
here & will be affected by your
sincerely, Decision.*

Commentor No. 2277: Doris Dreyfuss

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

The Department of Energy should be giving priority to clean-up. We cannot afford to add to the pollution burden when we seem to lack the technical + financial ability to deal with the hazards already in place.

Continue to import medical isotopes from Canada + purchase plutonium-238 from foreign sources.

Sincerely, *Doris Dreyfuss*

Name Doris Dreyfuss Address 2104 NW 127th St.
City Vancouver State WA ZIP 98685

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2277-1 || 2277-2

2277-1

2277-3

Response to Commentor No. 2277

- 2277-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.
- 2277-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, as well as support for the continued importation of medical isotopes from Canada and purchase of plutonium-238 from Russia.
- 2277-3:** See response to comment 2277-2.

Commentor No. 2278: Irene R. Japha

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

*We have seen recent serious problems with
the Hanford storage tanks and probable leakage
into the surrounding areas. Unless you can
reassure the citizens of Washington that Hanford poses
no threat to the populace, our waterways, and lands
I urge you to shut down the reactor & clean up Hanford*
Sincerely,

Name Irene R. Japha, MD Address 3405 26th W
City Seattle State WA ZIP 98199

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2278-1 || 2278-2

2278-1

Response to Commentor No. 2278

2278-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The environmental impacts associated with operation of the FFTF and support facilities at Hanford during normal operations and from postulated accidents are presented and discussed in Section 4.3 of this NI PEIS. All impacts to human health and to ecological resources would be small in the immediate area of the Hanford Site and negligible at all distant locations.

2278-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2279: Caroline Coreta

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2279-1 || 2279-2

Please use your high & responsible
 office to start putting the atomic
 nuclear genie back in its box -
 This can happen by not restarting
 the FFTF Nuclear Reactor. NOW!!

2279-3

Sincerely,

Name Caroline Coreta Address 9606-48th St
 City Seattle State WA ZIP 98136

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2279

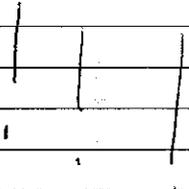

- 2279-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2279-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.
- 2279-3:** See response to comment 2279-2.

Commentor No. 2280: Irene Myers

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

|| 2280-1 || 2280-2

Sincerely,

Name Irene Myers Address P.O. Box 9763
City Seattle State WA ZIP 98107

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2280

- 2280-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2280-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2281: Bonnie Orme

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2281-1 || 2281-2

Sincerely,

Bonnie Orme
 Name 1949 Perkins Lane W. Address _____
Seattle, WA 98119
 City _____ State _____ ZIP _____

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2281

- 2281-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2281-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2282: Elizabeth Roberts

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

I have attended at least 3 hearings on this matter already. You are obligated to spend the DoE Hanford budget on cleaning up that mess. DO NOT study this issue any more. Take FFTF off standby NOW and meet your obligation to clean up Hanford!

Sincerely,

Elizabeth Roberts

Name Elizabeth Roberts Address 2132 NE Sunset Ln.
City Bremerton State WA ZIP 98310-4646

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2282-1 || 2282-2

2282-1

Response to Commentor No. 2282

2282-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2282-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2283: Brian Watson

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

*How many times do I have to say this?
FFTF needs to be shut down and all
DoE resources need to go toward
remediation + clean-up efforts! Using FFTF
to produce more Pu contradicts the
obligations under the Clean Up Agreement!*

Sincerely,

Brian E. Watson

Name Brian E. Watson Address 2132 NE Sunset Ln.

City Bremerton State WA ZIP 98310

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2283-1 || 2283-2

2283-1

Response to Commentor No. 2283

2283-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy) This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

DOE-RL, EPA, and Ecology agreed to a change in this agreement to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on FFTF's future. Public meetings were held on this formal milestone change. The NI PEIS missions would not have an impact on Hanford cleanup activities.

2283-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2284: Rhoda Stockwell

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

We citizens do not want further contamination of our land and rivers. An agreement has already been made by the Federal and State Governments - Please honor this agreement.

Sincerely, *Rhoda Stockwell*

Name RHODA STOCKWELL Address 816 So. 216th St. Tr.#100
City Des Moines State WA ZIP 98195

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2284-1 || 2284-2

2284-1

Response to Commentor No. 2284

2284-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The environmental impacts associated with operation of the FFTF and support facilities at Hanford during normal operations and from postulated accidents are presented and discussed in Section 4.3 of this NI PEIS. All impacts to human health and to ecological resources would be small in the immediate area of the Hanford Site and negligible at all distant locations.

2284-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2285: Dorli T. Rainey

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

NOTHING SHOULD BE DONE AT
HANFORD - NO STARTING - NO
STORING, UNTIL THE COMPLETE
CLEAN UP OF HANFORD IS SATIS-
FACTORILY COMPLETED.

Dorli T. Rainey
 sincerely,

Name DORLI T. RAINEY Address 30443 3RD AVE S.
 City FEDERAL WAY State WA ZIP 98003

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2285-1 || 2285-2

2285-3

2285-1

Response to Commentor No. 2285

2285-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

DOE has developed a draft "Waste Minimization and Management Plan for FFTF" to incorporate pollution prevention and waste minimization practices in its consideration of the future of FFTF. If a decision were made to restart FFTF, this plan would be used to ensure that optimum opportunities are provided for characterizing potential waste streams, identifying source reduction and recycling strategies, evaluating management, treatment, and disposition options, developing sustainable designs, and implementing effective management strategies for all waste streams related to the restart and operation of FFTF.

2285-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, opposition to Alternative 1, Restart FFTF, and opposition to storing of additional nuclear materials at Hanford.

2285-3: See response to comment 2285-2.

Commentor No. 2286: Linda J. Clifton

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

We must clean up the current mess of waste there, and not add more to it with more nuclear production, waste and contamination.

Sincerely,

Name LINDA J. CLIFTON Address 4462 Whitman N.
City SEATTLE State WA ZIP 98103

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2286-1 || 2286-2

2286-1

Response to Commentor No. 2286

2286-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

DOE has developed a draft "Waste Minimization and Management Plan for FFTF" to incorporate pollution prevention and waste minimization practices in its consideration of the future of FFTF. If a decision were made to restart FFTF, this plan would be used to ensure that optimum opportunities are provided for characterizing potential waste streams, identifying source reduction and recycling strategies, evaluating management, treatment, and disposition options, developing sustainable designs, and implementing effective management strategies for all waste streams related to the restart and operation of FFTF.

2286-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2287: Arthur Rolfe

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

~~I am both frightened and astounded at your position concerning Hanford activities. Nuclear waste storage intent is being ignored. Past promises and legal requirements are being ignored. No permanent disposal solution for any nuclear waste generated to date is at hand. Our existing nuclear weapons are in fact unusable because we would end up in self destructive retaliation (to whom?). I resent being forced to live in a "sword of Damocles" environment created by my government based on statements of "fake science" that are not credible, repeatable science.~~

Sincerely,

Arthur Rolfe

Name ARTHUR ROLFE Address 12420 SE 27th St
City Belleve State WA ZIP 98005

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2287-1 || 2287-2

|| 2287-1

|| 2287-3

|| 2287-4

|| 2287-5

Response to Commentor No. 2287

- 2287-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2287-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2287-3:** DOE notes the commentor's concern regarding waste generation. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.
- 2287-4:** DOE notes the commentor's view on nuclear weapons, although nuclear weapons issues are beyond the scope of this Nuclear Infrastructure PEIS. The DOE missions addressed in this EIS (Section 1.2 of Volume 1) include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development. The three missions are civilian nuclear energy missions and are not defense-related. Neither nuclear weapons nor components for nuclear weapons would be produced under any of the nuclear infrastructure alternatives.
- 2287-5:** DOE notes the commentor's views.

Commentor No. 2288: Nell Wolever

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

How can government officials possibly consider adding more liquid high-level nuclear waste to leaking tanks by proposed "start-up" of nuclear reactors? How can you ignore the death sentence this would bring to the Columbia River and populace surrounding that river?

Name Nell Wolever Address Bx 394
City North Bend State Wa ZIP 98054

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2288-1 || 2288-2

2288-3

2288-4

Response to Commentor No. 2288

- 2288-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2288-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2288-3:** As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.
- As discussed in Section 4.3 of Volume 1, no high-level radioactive waste would be added to the high-level waste tanks at Hanford.
- 2288-4:** FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1. In addition, Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

Commentor No. 2289: Jane Civiletti

Dear Secretary Nicholson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

We, the people of the Pacific NW, want
no more nuclear facilities located here.
Our only desire for DOE tax dollars is to
have former nuclear sites "cleaned up" knowing
that this will never be totally possible.
Please, contaminate us no longer.

Sincerely,

Name Jane Civiletti Address 14614 SE Fair Oaks Ave
 City Milwaukie State OR ZIP 97267

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 2290

- 2290-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2290-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2291: Leo Stammer

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

*We have so much garbage
in our water, air. I guess I
should say Palutants - please
don't add anymore. Clean it
up. Our electric bill already
went up so it would be done*

Sincerely,

Name Leo M. Stammer Address 13620 S.W. Beet Bend Rd'
City Thigard State Or ZIP 97224 #27

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2291-1 || 2291-2

2291-1

Response to Commentor No. 2291

2291-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Implementation of the alternatives described in Section 2.5 of Volume 1 would have no impact on electric power rates.

2291-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2292: Margaret K. Letherman

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

*More waste should not be added to the potentially
explosive and leaking tanks that already threaten
the Columbia River & people in E. Washington!
The danger of accidents will be increased!*

Cleanup, yes! More radioactivity - NO!

Margaret K. Letherman

Sincerely,

Name *Margaret K. Letherman* Address *1956 Golden Pine*
City *Goldendale* State *WA* ZIP *98620*

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2292-1 || 2292-2

2292-3

2292-4

|| 2292-1 || 2292-2

Response to Commentor No. 2292

2292-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2292-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF. With respect to the commentor's concern about radioactivity, the NI PEIS has provided an estimate of the potential human health impacts from normal operations, accident, and transportation related activities for each of the alternatives and options presented in Volume 1, Chapter 4. These impacts are summarized in Chapter 2, Tables 2-6 and 2-7.

2292-3: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

As discussed in Section 4.3 of Volume 1, no high-level radioactive waste would be added to the high-level waste tanks at Hanford.

2292-4: FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

Commentor No. 2293: Amy Ingram

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

*I don't know how much simpler
it can be, I would like to see
all environment cleaned up &
heed of nuclear pollution along with
other man made pollution.
WHAT CAUSES CANCER?!?*

Sincerely,

Amy Ingram

Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2293-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2294: Rachel Golden

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

Hanford has a bad track record.
Plutonium 238 is highly toxic.
Restarting the FFTF Nuclear Reactor to produce
Pu-238 would create a potentially exceptionally
dangerous situation as well as toxic waste,
which Hanford has already proven they are
Sincerely, unable to contain or dispose of safely.
Rachel Golden

|| 2294-3

|| 2294-4

2294-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2294-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2294-3: The commentor's opposition to the restart of FFTF is noted. This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives (including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. Plutonium-238 is one of many substances that have been considered in the analysis of health and safety impacts for this PEIS. Plutonium-238 is the primary contributor to the health impacts associated with the processing of irradiated neptunium targets at any of the proposed processing facilities. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

2294-4: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (i.e. solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all

Commentor No. 2294: Rachel Golden (Cont'd)

Response to Commentor No. 2294

wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Commentor No. 2295: Rolf Skar

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

*As a proud citizen of Oregon
I cannot accept the start-up or
continued "standby" of the FFTF reactor.
Stop putting our region, our economy
and our children at risk. Stop wasting
taxpayer money. SHUT DOWN FFTF for good.*

Sincerely,
Name ROLF SKAR Address 2227 SE MADISON
City PORTLAND State OR ZIP 97214

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

2295-3

2295-4

2296-2

Response to Commentor No. 2295

2295-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2295-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, opposition to Alternative 1, Restart FFTF, and concern for taxpayer dollars. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS.

2295-3: See response to comment 2295-2.

2295-4: This NI PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives (including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

The NI PEIS identifies (in Chapter 3 of Volume 1) endangered species that live on or near all of the candidate sites, as well as aquatic and wetlands areas that may be impacted by operations at candidate locations.

Commentor No. 2295: Rolf Skar (Cont'd)

Response to Commentor No. 2295

According to an International Atomic Energy Agency (IAEA) publication (IAEA Technical Report Series No. 332, Effects of Ionizing Radiation on Plants and Animals at Levels Implied by Current Radiation Protection Standards), a dose rate of 100 millirem per year to the most exposed human will lead to dose rates to plants and animals of less than 0.1 rad per day. The IAEA concluded that a dose rate of 0.1 rad per day or less for animals and 1 rad per day or less for plants would not affect these populations. The largest individual dose for any of the nuclear infrastructures alternatives under normal operations would be less than 0.1 millirem, which is three orders of magnitude less than the IAEA threshold for adverse effects. Therefore, implementation of any of the range of reasonable nuclear infrastructure alternatives analyzed would not be expected to result in adverse impacts on plants and animals living in potentially affected areas around the candidate sites.

Commentor No. 2296: Margaret Koenig

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

Shut down Hanford's FFTF Nuclear reactor. I am gravely concerned re: the environmental + health problems that already exist at this site. To even consider the resumption of Plutonium processing at Hanford is ludicrous in light of the fact sincerely that we already have leaking High-Level Nuclear waste Tanks

Name Margaret Koenig Address 1214 Lincoln St
City Haas River State OR ZIP 97031

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 2296-1 || 2296-2

2296-1

Response to Commentor No. 2296

2296-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The use of proposed alternative facilities associated with reprocessing of neptunium-237 targets would have no impact on schedules or available funding for high-level radioactive waste programs at either Hanford or the INEEL sites. The higher-activity waste would be treated as a solid form via a stand-alone vitrification system, separate from any tank waste treatment system. The existing Hanford high-level radioactive waste facilities would also not be used, and as analyzed in the PEIS, no existing or planned high-level radioactive waste facilities would be used to treat the waste resulting from processing the irradiated targets.

2296-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2297: Dorothy Arque

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2297-1 || 2297-2

The Columbia River is too important to risk radioactivity in its waters. Plutonium production is wrong, wrong, wrong! and highly dangerous

Response to Commentor No. 2297

- 2297-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2297-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2297-3:** The FFTF and fabrication/processing facilities at the Hanford Site can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.2-4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from implementation of the alternatives involving Hanford facilities, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with Hanford site would be small.
- FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Commentor No. 2298: Michael Zemar

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor: || 2298-1 || 2298-2

I was born in the H.R. Valley & am 3rd generation here. our children and our
children's children 7 generations
hence before we claim to
know what we "NEED" —
we don't NEED Pu 238 or any
other nuclear waste!

Pennie Stasik O'Grady
(Mother of 2)

2300-1

Response to Commentor No. 2300

2300-1: Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems and the plutonium-238 that fuels them for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, DOE anticipates that the existing plutonium-238 inventory will be exhausted by approximately 2005. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

DOE notes the commentor's concern regarding waste generation. It is DOE's policy that all wastes be managed (i.e., treated, stored, and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

**Commentor No. 2301: Thalia Syracopoulos
National Organization for Women**

Thalia Syracopoulos
Seattle Chapter National Organization for Women
Testimony on Hanford FFTF

30 August 2000

My name is Thalia Syracopoulos and I am speaking on behalf of the Seattle Chapter of the National Organization for Women.

Among us, we have found no information in the lay media verifying your claim that restarting the Hanford Fast Flux Test Facility is required in order to produce isotopes necessary for medical diagnosis, treatment or research.

My own profession requires that I read a wide variety of medical journals published in the United States and all over the world. At no time in the last 10 years have I encountered a single article in any medical journal mentioning the need for additional sources of isotopes required for medical diagnosis, treatment or research.

Prior to coming here I ran a search on the word "Hanford" in the medical literature. I reviewed the abstracts of the first 100 articles published between 1993 and 2000. There was no mention of any need for additional sources of isotopes.

There is no public health reason to restart the FFTF at Hanford. There are numerous public health reasons NOT to restart the FFTF. There is substantial medical and scientific evidence that the entire Hanford Reservation needs to be cleaned up, not perpetuated.

2301-1

2301-2

Response to Commentor No. 2301

2301-1: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term (less than 5 years).

2301-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy).

***Commentor No. 2301: Thalia Syracopoulos (Cont'd)
National Organization for Women***

Response to Commentor No. 2301

This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "... ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Commentor No. 2302: Magna

It is time for the DOE to shut down the dangerous FFTF reactor and put their focus back into clean-up of Hanford. This is on public safety of the citizens of Northwest. — Magna

2302-1

2302-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2302-2

2302-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Commentor No. 2303: Linda Rasmussen

Production, waste management, and health risk disclosure has not been honest or admirable in the past. We do not need more of the same. Emphasis should be on cleaning + disposing of the waste we have. ^{leaving this, for future} generations is unethical ^{waste}
Linda Rasmussen

2303-1

Response to Commentor No. 2303

2303-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Commentor No. 2304: Donn Colby

We have the most contaminated
in the Western world in our backyard. FFT
has been on standby for years without a

stop wasting the taxpayers money, and finish
cleaning up the nuclear mess that already
exists.

Donn Colby, MD
Seattle, WA

If you can
with the
... tru.

2304-1

2304-2

2304-1

Response to Commentor No. 2304

- 2304-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2304-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2305: Amy Choyani

Dear Secretary
Please don't rob my
daughter of a healthy
environment to grow
up in. The children
are our future Don't
let this 7777 bull ~~shit~~
up our children's
future from
them.
Amy Choyani

2305-1

Response to Commentor No. 2305

2305-1: The concerns expressed in this comment with respect to the possible impacts of proposed NI PEIS actions are noted. The environmental impacts associated with all nuclear infrastructure activities are presented in Chapter 4 of the NI PEIS.

All air emissions and wastewater discharges would be in accordance with applicable permit and regulatory requirements. The release of air pollutants would result in concentrations well below Federal and state air standards. The release of radioactivity and hazardous chemicals into the atmosphere would have a negligible effect on human health. No long term adverse health effects, including cancer and genetic disorders, would be anticipated. There would be no discernible impacts to groundwater or surface water quality. The management of wastes generated at the various sites would be in accordance with applicable Federal and state laws and regulations and appropriate DOE orders, and would not be expected to adversely affect the environment. All impacts on ecological resources, including animals and fish, would be small.

It is concluded that nuclear infrastructure activities would have small effects on the environment both in the short- and long-term time periods, and would not rob anyone of growing up in a healthy environment.

Commentor No. 2306: Shirley Morrison

How many times do we
 have to tell you.
 No. No. No.
 Clean up, clean up
 that mess -
 and don't make any
 more -
 Shirley Morrison
 19 grandchildren
 let them have
 decent world. CLE

2306-1

2306-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2306-2

2306-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Commentor No. 2307: Liesl Zappler Rogers

It is inconceivable to me that the DOE would even THINK of starting up the FFTF at Hanford - the costs, the wastes, the risks to human & environmental life (including CANCER) are far too great. Clean it up - Don't start it up!
Liesl Zappler Rogers

2307-1

2307-2

2307-3

Response to Commentor No. 2307

2307-1: The concerns expressed in this comment with respect to impacts and costs of FFTF startup are noted. The environmental impacts associated with restart of the FFTF, both during normal operations and from postulated accidents, are presented in Section 4.3 of the NI PEIS. The impacts to humans and also to the biosphere (air, water, and land) are shown to be small. No fatalities among workers or in the general public from cancer or other causes would be expected from operations over the full 35-year period. The management of wastes would be in accordance with applicable Federal and state laws and regulations and appropriate DOE Orders and would not be expected to adversely affect the environment.

The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. The cost report was made available immediately upon release of the NI PEIS on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. A summary of the cost report is included as Appendix P in the final NI PEIS.

2307-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2307-3: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Commentor No. 2308: Anonymous

The isotopes
are not needed
for medical needs -
we have a steady
& plentiful supply
from domestic sources +
~~Canada~~ Canada.
do not re-start
FFTF under the
guise of saving
people with
cancer!!
It's a lie, & a
dishonor to the
of cancer.

2308-1

2308-1: The United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

2308-2

Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term (less than 5 years).

2308-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF. In ongoing clinical testing, therapeutic radioisotopes have proven effective in treating cancers and other illnesses while minimizing adverse side effects, making their use an attractive alternative to traditional chemotherapy and radiation treatments.

Commentor No. 2309: Anonymous

Hanford's waiting for disaster
Rest assured and have no fear
Patty Murray's isotopes will cure
whatever ills you bear
So what's a little cancer
in your kid's anatomy
It builds our GNP

2309-1

Response to Commentor No. 2309

2309-1: The commentor's opposition to the restart of FFTF is noted. This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives (including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

Commentor No. 2310: Dick Burton

This is the most polluted
 site in North America! Are
 you crazy?! Shut it down immediately
 and start a real clean-up!
 - Dick Burton
 Seattle, WA

|| 2310-1
 || 2310-2

Response to Commentor No. 2310

- 2310-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2310-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Commentor No. 2311: Wenonah Hauter
Public Citizen

No nuclear boondogle -
No more squandering
taxpayer money. Spend
public money cleaning up
the nuclear disaster at
Hanford - not creating more
waste.
Wenonah Hauter
WASH. I

2311-1

Response to Commentor No. 2311

2311-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Commentor No. 2312: P. Zicher

You can't handle
 the waste you've got.
 We don't need The FFTF -
 we need CLEANUP.
 F. Zicher

2312-1

Response to Commentor No. 2312

2312-1: DOE notes the commentor's opposition to Alternative 1, restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Commentor No. 2313: Naomi Gundle

End the Madness!
We are against restarting
the FTF. Listen to facts
and people and safety concerns,
not corporate propaganda

Naomi Gundle
Seattle, WA teacher

2313-1

2313-1: DOE notes the commentor's opposition to Alternative 1, Restart FTF.

2313-2

2313-2: Comment noted. DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and to providing ample opportunity for public comment on those actions. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

Commentor No. 2314: Mark Taylor-Canfield

I am very concerned about potential hazards associated with the use, delivery and storage of radioactive material. Due to common human errors, computer glitches and unseen accidents we are never really sure if we can avoid contaminating our environment for many generations to come (our children).

I'm also concerned that we may cause as many cancers as we cure due to contamination. I do not think you should approve this. Please read Chief Seattle's speech upon the treaty at Elliott point. Thank you,

Mark Taylor-Canfield
 Capitol Hill Community Council
 Citizen's Committee for Government
 Accountability

2314-1

2314-1: This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives (including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

2314-2

The NI PEIS identifies (in Chapter 3 of Volume 1) endangered species that live on or near all of the candidate sites, as well as aquatic and wetlands areas that may be impacted by operations at candidate locations. According to an International Atomic Energy Agency (IAEA) publication (IAEA Technical Report Series No. 332, Effects of Ionizing Radiation on Plants and Animals at Levels Implied by Current Radiation Protection Standards), a dose rate of 100 millirem per year to the most exposed human will lead to dose rates to plants and animals of less than 0.1 rad per day. The IAEA concluded that a dose rate of 0.1 rad per day or less for animals and 1 rad per day or less for plants would not affect these populations. The largest individual dose for any of the nuclear infrastructures alternatives under normal operations would be less than 0.1 millirem, which is three orders of magnitude less than the IAEA threshold for adverse effects. Therefore, implementation of any of the range of reasonable nuclear infrastructure alternatives analyzed would not be expected to result in adverse impacts on plants and animals living in potentially affected areas around the candidate sites.

2314-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Commentor No. 2315: Tom Caryts

all:
 NOT AGAIN! How
 MANY TIMES MUST WE SAY
 IT? WE DON'T WANT MORE
 PLUTONIUM PRODUCTION AT
 SMO. STOP FFTF.
 Tom Caryts

SMO
 MUST
 SM.

2315-1

Response to Commentor No. 2315

2315-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF. As discussed in Section 1.2 of Volume 1, plutonium-238 would be produced to support NASA's deep space missions. Plutonium-238 is not used to produce nuclear weapons. All missions considered in the NI PEIS are for civilian purposes.

Commentor No. 2316: Amber Waldref

 I have found several items
 missing from the PEIS, including
 a lack of study on waste management
 disposal and an independent asses
 of the need for particular medical
 Please take my comments into consi
 and shut down FFTF
 Amber Waldref

2316-1

2316-2

2316-3

Response to Commentor No. 2316

2316-1: Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

2316-2: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

2316-3: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 2317: Anonymous

Should not be any further.

2319-1

Response to Commentor No. 2319

2319-1: DOE notes the commentor's support for Alternative 1, Restart FFTE.

Commentor No. 2320: Charal Stamper

It is scandalous to think that DOE would consider restarting FFTF and producing more radioactive materials when they have yet to deal with the serious hazards posed by Hanford's status as the EPA's biggest Superfund site. Containers are already leaking into the environment, endangering ^{local} residents, as well as people across the country through contamination of agricultural areas & the Columbia River & salmon runs. The recent fire at Hanford is further proof of the dangers lurking, as well as the contempt for public & worker health exemplified by DOE's initial denials of any escape radiation.

We demand that DOE responsibly clean up the radioactive contamination & not create any more deadly isotopes.

Charal Stamper
Seattle, WA

2320-1

Response to Commentor No. 2320

2320-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington Department of Ecology, Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. All environmental parameters (e.g., air, soil, surface water, groundwater, vegetation, animals, etc.) in and around the Hanford Site are monitored on a set frequency. The information is available to the public in annual monitoring reports. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

No radioactive materials were "released" in the Hanford Wildfires of 2000. Wildfires did resuspend some materials already in the environment. The resuspended materials were low, slightly above natural background levels. Real-time measurement equipment does not detect environmental contaminant levels. The low levels required several days of analysis to quantify. DOE reported information as it became available. Worker and public safety are of paramount importance to DOE.

Commentor No. 2321: Orion Berdick

When is this threat
to public health going to
be dealt with in an
adequate manner? Waste
is leaking toward the Columbia!
Shut down FFTF and
fund clean-up!
— Orion Berdick

2321-1

2321-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2321-2

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Chapter 3

*Oral Comments Presented at the Public Hearings
and DOE Responses*

Comments from the Oak Ridge, Tennessee, Public Hearing (August 22, 2000)

Commentor No. 2360: Daniel Axelrod

2360-1 — I want to highlight again, as I did over a year ago at a hearing here in Oak Ridge, that I favor Pu-238 radioisotope power supplies for the international space station.

I estimate that we could save at least a billion dollars in the space station costs in using radioisotope power supplies in preference to solar cells and to say nothing of mission reliability as we saw with the difficulty with the solar cells when the Mir space station was impacted and also the need to provide fuel to put the space station into higher orbit because of the solar-cell drag.

And this already has happened in one of the space shuttle missions where they had to put the preliminary space station — not even the completed one — into higher orbit from about a hundred to two hundred miles. I find it a little disconcerting that if you're talking of expanding nuclear energy requirements that Pu-238 is such a minor usage. It takes so much discussion and is so prominent in the discussions of your PEIS.

2360-2 — I think if you talk nuclear you ought to include fusion as well as fission. And without going into my report on this six billion dollar program for fusion development back in the early seventies, I would highlight at least the need for a 14 mg fusion neutron generator to test 14 mg neutrons against, first, raw materials and other portions of fusion reactors.

So I think this will be an entirely new concept that's not enunciated in your report. That should be addressed and I'm sorry it isn't listed in some of the major comments received during scoping which, I assume, would include my 24 July comments.

2360-3 — Third, as I mentioned, I want to talk of the justification for expansion of infrastructure and missions identified by DOE. In my letter to Secretary Richardson, and others of July 20th this year, I sent comments on world oil running out and I said that Mr. Richardson had made a great strategic mistake in trying to get OPEC to turn off the spigot rather than informing the public.

In summary, I talk of a need for five hundred coal to oil synthetic fuel plants each the size or equivalent of the Bull Run steam plant here in town.

2360-4 — In light of this need for nuclear power in this century, I would recommend there's a need for a test reactor for the WSHWBR, World Standard Heavy Water Breeder Reactor, which I have proposed as part of my campaign for President of the United States, and this also would be a major new facility that I can personally identify that is not at all mentioned in your presentation.

Response to Commentor No. 2360

2360-1: DOE notes the commentor's support for the use of plutonium-238 in space missions and its inclusion in the NI PEIS. However, NASA, not DOE, is responsible for spacecraft design and for determining what electric power source best suits its mission-specific needs.

2360-2: DOE notes the commentor's interest in fusion energy research, although issues of research and development of fusion energy are beyond the scope of this NI PEIS. The scope of this NI PEIS is limited to analysis of alternatives to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development.

2360-3: DOE notes the commentor's interest in synthetic fuel plants and using the nation's coal resources, although these issues are outside of the scope of this NI PEIS. The scope of this NI PEIS is limited to the analysis of environmental impacts that would result from implementation of alternatives to fulfill the requirements of the DOE missions described in Section 1.2 of Volume 1.

2360-4: DOE notes the commentor's interest in heavy water breeder reactor research, although this type of research is beyond the scope of this NI PEIS.

Comments from the Oak Ridge, Tennessee, Public Hearing (August 22, 2000)

Commentor No. 2360: Daniel Axelrod (Cont'd)

2360-5 — I identified that for each ten million barrels a day of oil loss production compared with about seventy to eighty-five million barrels per day at total peak production. For each ten million barrels per day for loss production we needed the equivalent of eight hundred million tons of coal, the equivalent of almost the entire U.S. production of coal and 400 gigawatt nuclear, which at the time was the top — still is the approximate total nuclear power in the entire world after 50 years of effort.

Response to Commentor No. 2360

2360-5: DOE notes the commentor's interest in expanding domestic energy infrastructure, although issues of energy production are beyond the scope of this NI PEIS.

Comments from the Oak Ridge, Tennessee, Public Hearing (August 22, 2000)

Commentor No. 2359: George G. Flanagan

2359-1 — I believe, the assumptions used in the medical isotope production are excessively high in terms of revenue and the amount of materials used. We've been in business for almost 30 years and we have not seen that kind of sudden increase in the needs for medical isotopes.

I would recommend that we look at nominal value, the high-end value, and low-end value. I think it can sway the determination of whether you would need an infrastructure expansion project for production or monitor what the existing facilities are capable of in meeting demand.

I do not think you can give an alternative in terms of amount or demand without producing a report. I remember from Battelle. And that report has come under a lot of criticism by a lot of people as not particularly well founded, including congressional hearings.

My other comment is that in price the HFIR right now is very unrealized in both isotope production and material irradiation capabilities and it has been for the last 9 years or 10 years, since it was operated in 1990. We do not right now see missions, which are coming down the line, of increasing that utilization over what it has been over the last 10 years.

So that goes along with my first comment. I think the demand doesn't seem to be following what is assumed in this particular program.

2359-2 — The second point is you have a point in there about HFIR is essentially interfere only for medical isotope or isotope production. The only process for the basic energy science program is instigated in HFIR for a review of what we put into the reactor and that there's an anticipated five percent in either flux or fuel cycles. And the only materials in which that happens with are material radiation stems which are highly shielded.

And there has only been a few of those in the facilities. Medical isotope production and reactors have so far not impacted the flux at the (unintelligible) in either fuel cycle maintenance or from the maintenance to the production, as far as flux is concerned.

2359-3 — The last one is you have an indication that the HFIR expansion to a 100 megawatts, which it was originally designed for, has been reduced because of the concerns about ethyl and apparently are essentially not allowable. I'm not sure that's the word that's been used. But the impact was there would be extremely long outages necessary to implement going to this operation. That isn't incorrect.

We estimate something less than a month, if an outage is required to implement and change the instrument settings, what have you, to go to a 100 megawatt; noting some estimate of time and money expenditures are needed for changing

Response to Commentor No. 2359

2359-1: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1 2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs. Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term (less than 5 years). There currently is little room for growth of medical isotope production at HFIR. The ability to expand medical isotope targets into additional reactor locations is limited by the potential impacts that the targets have on the primary experiments in the reactor. Medical isotope targets and neptunium-237 targets are not in competition for the same locations at HFIR. NEPA and CEQ regulations do not require the cost of alternatives to be included in an EIS. However, a separate Cost Report was prepared to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. The Cost Report was mailed to interested parties on August 24, 2000 and made available on the NE website (<http://www.nuclear.gov>) and in the public reading rooms. DOE has provided a summary of the Cost Report in this Final NI PEIS.

2359-2: The magnitude and nature of any impact on neutron flux levels or core cycle length due to using HFIR for plutonium-238 production or greater medical/industrial

Comments from the Oak Ridge, Tennessee, Public Hearing (August 22, 2000)

Commentor No. 2359: George G. Flanagan (Cont'd)

the authorization basis for the HFIR to proceed to a 100 megawatts. So there would be no impact from the operational facilities time wise in getting this operational plant to 100 megawatts, and that is under consideration.

The only concern we have is that we don't impact the mission of the organization based in terms of fuel cycle life while we're doing that. And there are other options available to do both at the same fuel cycle and increase the power to a 100 megawatts. That would, in fact, increase HFIR production by 15 percent.

Response to Commentor No. 2359

radioisotope production will be dependent on the number, composition, and location of targets. Core local flux reduction would be expected in the region around the target. Any significant changes in flux levels throughout the reactor due to addition of enhanced isotope production activities would be reviewed by appropriate representatives of the DOE Office of Science for approval. The commentor's statement that isotope production at HFIR, to date, has not impacted maintenance or production is noted.

2359-3: As stated in EIS Volume 1, Section 2.3.1.3, HFIR's power level was reduced to 85 megawatts for the purpose of extending the useful life of the reactor. Since the reduction to 85 megawatts, additional studies have determined that the useful operating life could be until 2035 at 100 megawatts with appropriate maintenance programs. The commentor's estimate of the time necessary to uprate the HFIR reactor to 100 megawatts and impacts on fuel cycle length is noted.

Comments from the Idaho Falls, Idaho, Public Hearing (August 25, 2000)

Commentor No. 2362: Ronald Ayers, Jr.

2362-1 — Item 1, direct to the EIS. It appears, from a casual observance of the information that was presented, that you have some alternatives that have a very high electrical load requirement associated with them, specifically the accelerators.

I did not see anything at all presented at this point that speaks to the environmental impacts of — of the higher level of electrical usage on that one than it did on the others. So, that might be something you would want to consider for inclusion in the EIS in the Final.

2362-2 — Item 2, I want to talk to the mission. At this point in time, it has been very interesting to — to note that down through history there has been several pieces and items that we have discovered as a nation and turned our back on, to our chagrin, in a later time.

I wish to point out aircraft. I wish to point out rockets. Liquid propulsion rockets specifically were developed in the United States. The whole quality aspects of the — that the — the quality aspects of production and building things in a quality manner with full quality controls on them was invented basically within the United States. We found that out — how well that could be worked at us in recent years in the automobile industry. This is another industry that we seem to be turning our back on, or another area of endeavor that we are turning our back on. And I am extremely concerned that the further we go and turn our back on these types of aspects, we're going to find ourselves in real trouble further downstream.

So, I think, in that aspect, we need to support this effort. We need to support this effort because it supports scientific efforts by our country, it supports medical efforts by our people, and it supports basically the — the industrialization of items and things that we have been studying here at the INEEL, in some cases since as early as the 1950s.

2362-3 — I would support the use of ATR and also the fluorinel process and CPP-651. I would also support the use of — follow the use of an additional production reactor-type facility that would begin to support this. My preference is for a nuclear reactor, although the accelerator is one that would be of interest and consideration. And I can't think of a better place to put it than right here.

2362-4 — The EIS - this EIS should break the wastes down in accordance with low-level waste, possibly transuranics, since that is a DOE-only definition, and high-level waste — okay — to better present to the public the hazards that may be presented with the disposal of these waste materials.

Low-level waste is readily disposable in many facilities, both by DOE and like those licensed by the NRC. High-level waste, which was cited by some people here, is a different situation. And this material does not meet the — the defini-

Response to Commentor No. 2362

2362-1: The commentor is correct in his observation that some alternatives would have high electrical load requirements associated with them. A discussion of the electricity needs for each alternative follows. Under both "No Action" and Alternative 5, "Permanently Deactivate FFTF," additional electrical power would not be required or would be very small. Under Alternative 2, "Use Only Existing Operational Facilities," the bounding additional electricity needs at Oak Ridge, INEEL and Hanford are presented in Tables 4-163, 4-167, and 4-171 of the NI PEIS. At ORR and INEEL, the additional electrical consumption would be negligible. At Hanford, the additional electrical consumption would be 55,000 megawatt-hours per year, which represents only 2.2 percent of the total site's electrical capacity. Under Alternative 3, "Construct New Accelerator(s)," the additional electrical consumption would be approximately 250,000 megawatt-hours per year and under Alternative 4, "Construct New Research Reactor" the additional electrical consumption would be approximately 25,000 megawatt^hours per year. For the accelerator alternative DOE acknowledges that a significant load would be added to the local electrical grid. In the event the Record of Decision selects the accelerator alternative for implementation, subsequent NEPA review would assess grid stability and other electrical load assessment criteria in the evaluation of alternative site locations. Included, as necessary, would be detailed electricity needs for each facility. Although implementation of the reactor alternative would require a much smaller amount of additional electricity, similar NEPA documentation would assess electrical grid capabilities for the various alternative sites. The environmental impacts of operating numerous electrical power generation facilities supporting the grid is not within the scope of the NI PEIS.

2362-2: DOE notes the commentor's support for expanding DOE's nuclear infrastructure to meet its stated missions.

2362-3: DOE notes the commentor's support for Option 2 of Alternative 2, Use Only Operational Facilities, as well as their support for Alternative 4, Construct New Research Reactor (or possibly Alternative 3, Construct New Accelerator(s)), to be located at INEEL.

2362-4: This NI PEIS addressed waste produced for each alternative, as well as cumulative impacts related to waste production. The Waste Management sections of Chapter 4 provided waste volume generations for each of the waste types expected to be generated. These waste categories, referenced in DOE Manual Chapters, are consistent with definitions found in the nuclear science and waste management literature.

*Comments from the Idaho Falls, Idaho, Public Hearing (August 25, 2000)****Commentor No. 2362: Ronald Ayers, Jr. (Cont'd)***

tion of high-level waste, which is basically the first cycled raffinates or the — or the spent fuel that is coming off of power production of nuclear production facilities.

Okay. And that would be — the lack of differentiation is confusing to the people who are unused to the differences in the hazards associating with nuclear waste, specifically those in the public.

Response to Commentor No. 2362

Comments from the Idaho Falls, Idaho, Public Hearing (August 25, 2000)

Commentor No. 2363: Beatrice Brailsford Snake River Alliance

2363-1 — The issuance of this Draft EIS, unaccompanied by a nonproliferation assessment, I think highlights the question and answers the question: Is this administration actually concerned about proliferation of nuclear weapons and materials? And the answer is: Not very.

This is not the first time that we have had to look at a project before the nonproliferation assessment comes out. You say it will be out next week. That's after six of the seven hearings on this project have occurred. It seems to me, in the year 2000, "will this present a proliferation risk" should be one of the first questions the Department of Energy asks itself.

I would, therefore, suggest that you will probably have to extend the comment period more than the additional week you already have.

2363-2 — Second, the Fluorinel Dissolution Process Facility must not be reopened because the Idaho National Engineering and Environmental Laboratory must not return to aqueous reprocessing. I would note that my memory says that in 1992, when it was shut down by declaration, it had already been shut down quite a while because it could not meet current standards and could not be licensed under RCRA. I would suggest that might still be a pending issue.

In Appendix A, and somewhere else in the document — but I can't — I couldn't find it right before this meeting — there's a sentence that says the Fluorinel — that we're looking for a new mission for the Fluorinel Dissolution Process Facility. And that was something of a surprise to me.

And I would appreciate INEEL officials contacting the alliance and explaining what the range of new facilities for an extraordinarily unfortunate facility might be.

2363-3 — I note that if you choose to use ATR for the production of plutonium-238 you would actually compromise the infrastructure for the production of medical isotopes. We would lose that task here at INEEL.

2363-4 — And then a couple of questions about the waste. It does seem to me that there is a fair amount of liquid waste over the 35 years. I'm assuming this liquid waste is from reprocessing. And it looks like it would be about 288,000 gallons. Right now we're tying ourselves in knots trying to figure out how to get rid of liquid waste. It is recognized as a hazard above the aquifer. I don't understand how this can be low-level if it comes to us from reprocessing.

2363-5 — I would also just ask if the evaporator at the chem plant is fully licensed. I know that there was a fair amount of controversy about running the calciner, which is the following step to the evaporator, without a permit. And I would just suggest you check that.

Response to Commentor No. 2363

2363-1: DOE notes the commentor's concerns regarding nuclear proliferation risk related to the proposed actions under the NI PEIS. DOE is committed to ensuring domestic and international security and stability by upholding nonproliferation as one of the nation's highest national security priorities. DOE does not take this responsibility and burden lightly. DOE prepared a separate Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on September 8, 2000. The report was made available immediately upon release on the NE web site <http://www.nuclear.gov> and in the public reading rooms. DOE has also provided a summary of the Nuclear Infrastructure Nonproliferation Impact Assessment in Appendix Q in the Final NI PEIS. Although DOE did not further extend the public comment period, DOE considered comments submitted after the close of the comment period to the extent practicable.

2363-2: The use of proposed alternative facilities associated with processing of neptunium-237 targets would have no impact on schedules or available funding for high-level radioactive waste programs at either Hanford or INEEL. At INEEL, the tanks would not be used although certain facilities at the Idaho Nuclear Technology Engineering Center (INTEC) would be used to treat the wastes resulting from processing the irradiated targets. These are reliable systems that would process a maximum of 1,050 cubic meters of low-level radioactive waste over the 35-year nuclear infrastructure operational period. The higher activity waste would be treated as a solid form via a stand-alone vitrification system, separate from any tank waste treatment system. At Hanford, the existing high level radioactive waste facilities would not be used, and as analyzed in the PEIS, no existing or planned high-level radioactive waste facilities would be used to treat the wastes resulting from processing the irradiated targets.

2363-3: As stated in EIS Volume 1, Section 2.3.1.2, ATR would continue to meet its medical and industrial radioisotope production mission for the no action and most other alternatives considered where ATR is not used for the production of plutonium-238. If ATR were to be used as a production facility for plutonium-238 (options 1, 2, 3, 7, 8, and 9 under Alternative 2), it would support medical and industrial radioisotope production to the extent possible. DOE would try to minimize the impact of the new mission on current medical and industrial radioisotope production.

2363-4: The use of proposed alternative facilities would not impact the schedule or funding for existing cleanup activities at Hanford, INEEL or ORR. The NI PEIS addressed

Comments from the Idaho Falls, Idaho, Public Hearing (August 25, 2000)

Commentor No. 2363: Beatrice Brailsford (Cont'd)
Snake River Alliance

2363-6 — And then there's the issue of newly generated transuranic waste that is not part of the defense program and, therefore, could not be disposed of at WIPP and would, therefore, presumably, be stored here in Idaho until a high-level waste repository is opened.

The State of Idaho has very firm deadlines for the removal of transuranic wastes from this state, and they are not matched with the deadline for making certain that high-level waste is ready to leave the state. There's no deadline for the removal of high-level waste.

Response to Commentor No. 2363

the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. Approximately 1050 cubic meters (which is 280,000 gallons; not 288,000 gallons) of liquid low-level radioactive waste would be generated in total over the 35-year period of nuclear infrastructure operations from processing target for plutonium-238. High-level radioactive waste would not be generated.

2363-5: Both the INTEC Process Equipment Waste Evaporator and the INTEC High-Level Waste Evaporator have RCRA interim status.

2363-6: The Settlement Agreement (i.e., Spent Fuel Settlement Agreement, dated October 16, 1995) between U.S. DOE and the State of Idaho established schedules for the treatment of existing high-level radioactive waste, transuranic waste, mixed waste and removal of transuranic waste and spent nuclear fuel from the state. This agreement is not applicable to newly generated wastes. However, one of the most important mechanisms to address newly generated waste at the INEEL is via the Site Treatment Plan and Consent Order signed on November 1, 1995 by DOE and the State of Idaho. It requires that before an activity begins, all waste streams be identified with disposition and treatment plans identified and approved.

Comments from the Idaho Falls, Idaho, Public Hearing (August 25, 2000)

*Commentor: John Commander
Coalition-21*

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 1655.

Comments from the Idaho Falls, Idaho, Public Hearing (August 25, 2000)

**Commentor No. 2365: Lowell Jobe
Coalition-21**

2365-1 — . . .people who are opposed to nuclear energy have always been sending out comments without necessarily having anything solid, science and facts, behind them. And I challenged them to offer a solution, just one solution, that would be positive, constructive.

And one — we have one person here. The other one isn't here. And he answered, we didn't create the problem, so why should we solve it?

It seems apparent to me that they have no intention of ever doing anything positive, constructive, to give us an alternative which would be worthy of even considering.

And I think we still have, if anything, a federal government which has gone even further down the line of ignoring the facts, and all they do is try to put fears there. The country and the world is never going to go anywhere with that kind of mentality and outlook.

The additional oral comments were submitted in written form and are addressed in the responses to Commentor No. 100.

Response to Commentor No. 2365

2365-1: DOE notes the commentor's views and observations.

Comments from the Idaho Falls, Idaho, Public Hearing (August 25, 2000)

Commentor No. 2361 Dave Kuhn

2361-1 — I guess the thing that I wanted to impress the most is that I think here in Idaho we've been in the nuclear business long enough to prove to everybody that we can take care of business, and we've got a good track record. And the projects that — you know, the alternatives that you've got laid out there, you know, we can take care of here in Idaho, and we can do it right.

Americans have learned long and hard that we can stay on the leading edge of technology and we can still cleanup our messes. And, you know, it's a moot point really. Hanford doesn't have — you know, there's no way that starting up a new facility is going to interfere with their cleanup. But, if they'll let it, then we'll take care of business here in Idaho. And so — we've got the facilities.

2361-2 — And, you know, I'm sure there's going to be some people here today that don't want nuclear business in Idaho. They've been here before. And, you know, when the people who come here and they support the programs, they're the people who know about the nuclear business from the inside. We have facts, we have proof, we have everything.

The people who don't want the business to come here, they don't really have any ideas, they don't have any real proof, and they don't have any facts. So, somehow it doesn't seem like a valid argument.

2361-3 — . . . it's long been obvious that the people who don't support the nuclear program don't have any other answers that can fix the problems that the nuclear program does; however, that doesn't stop them from trying to prevent an answer to the waste problem, which I really don't believe that this environmental impact statement really has anything to do with nuclear waste. It's about moving ahead with the program.

The waste problem has to be solved, and it will be solved. And it's, evidently, going to be really painful, but — when it gets solved. But there's no use in not moving ahead with nuclear energy just because there's some problems that still need to be solved, so we can fix it.

Response to Commentor No. 2361

2361-1: The commentor's position regarding capabilities of the Idaho National Engineering and Environmental Laboratory is noted.

2361-2: DOE notes the commentor's views and observations.

2361-3: DOE notes the comment. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Comments from the Idaho Falls, Idaho, Public Hearing (August 25, 2000)

Commentor No. 2364: Tony Laporta

2364-1 — I would like to indicate that the process that we're talking about here for a new infrastructure, new research and development, is extremely important.

We need to — and I know that the Department of Energy has talked about the brain drain that's going on out here [INEEL]. And part of the reason is that we have no projects worthy of individuals taking part in them. And this is a start of a project like that.

2364-2 — With specifics to this environmental impact statement, I do find it somewhat curious that a decision is going to be made before January, which may be by a lame duck Department of Energy chairman. And I know that the — the vice-president is an individual who has expressed publicly his opposition to nuclear energy. And I find it curious that such a decision would be made by a lame duck — potentially a lame duck administration.

2364-3 — I do also concur that the Alternative 2, which is the use of existing facilities, specifically the ATR, to produce the necessary requirements for the plutonium-238 is a number one option, I believe, with the following option to build a new facility here in Idaho.

2364-4 — The concept that, well, we might use ATR or we might use Oak Ridge to do the irradiation and then use a fluorinel facility to do the reprocessing, only increases the risks of — of the potential hazard. And, therefore, any decision that should be made should include both the irradiation and processing within close proximity to minimize any hazard to the public by transportation back and forth and everything else.

2364-5 — If we talk about the hazard of liquid waste generation, it's curious to me that we've shut down the calciner [at INEEL], which was processing liquid waste. And so now we sit with over a million gallons of high-level waste, liquid waste, sitting in tanks, waiting for somebody to come up with another solution while the calciner was perfectly acceptable, even though it was not licensed.

2364-6 — . . . I would just like to make the comment that has been expressed here before, that we need to take charge of our future in this country. We need to regain the leadership that we had and not become the — I would say the laughing stock of the technological world by European countries looking at us and saying, where have you gone with your leadership in engineering and nuclear energy?

Response to Commentor No. 2364

2364-1: The commentor's positions on research and development and its effects on INEEL are noted. Civilian nuclear research and development is one of the nuclear infrastructure missions discussed in Section 1.2.3 of Volume 1.

2364-2: DOE notes the concerns expressed in this comment; the issues addressed in the comment are outside the scope of this PEIS.

2364-3: DOE notes the commentor's support for (ATR Options) of Alternative 2, Use Only Operational Facilities, as well as their support for a new facility (unspecified as to whether it would be an accelerator or reactor) at INEEL.

2364-4: DOE notes the commentor's support for alternatives in which the processing and irradiation facilities are in close proximity. Alternative 1, Options 3 and 6, and Alternative 2, Option 2 minimize transportation impacts, as shown in Table J-7. Impacts for alternatives involving unspecified commercial light water reactors or newly constructed reactors or accelerators cannot be determined and are bounded in DOE's analysis. The NI PEIS analysis, summarized in Table J-7, shows that it is unlikely that the transportation activities covered by the NI PEIS will cause an additional latent cancer fatality. The NI PEIS transportation activity with the highest risk is the air shipment of medical isotopes, which is needed for most alternatives. The analysis conservatively assumes that every isotope shipment is by air, and that each shipment requires an intermediate stop, for a total of about 500 shipments per year. The risk to the public from these shipments is far lower than the risk from background radiation. Other transportation risks are several factors of ten lower, and not significantly different for the alternatives considered. Transportation risk is only one factor in DOE's decision. Accordingly, DOE has identified its preferred alternative in Section 2.8 of Volume 1 and included a discussion of DOE's reasons for selecting it. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

2364-5: The INTEC nuclear waste calcining facility (NWCF) was shut down on June 1, 2000 and is in standby pending facility upgrades and issuance of a new air permit. INEEL met the requirements of a December 1991 consent order with the State of Idaho and EPA to calcine all the high level radioactive waste by June 30, 1998. About 5,300 cubic meters (1.4 million gallons) of liquid-sodium-bearing waste remain in the INTEC Tank Farm. New treatment processes for the remaining liquid-sodium-bearing wastes are being analyzed in the "Idaho High-Level waste and Facilities Disposition Environmental Impact Statement."

2364-6: DOE notes the viewpoint expressed in this comment.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2370: Anonymous

2370-1 — I am truly appalled that you would consider at all to add to the contamination that's there. It can moved from this contaminated place to that contaminated place. You know, not in our backyard. That's not really what we're asking for. We're asking for a cessation of creation of this toxic waste.

2370-2 — I was going to speak about this fire. You know, no problem. We're just out here. Nothing is happening. We get a fire. They deny everything. Then they admit something. And the news that I caught on the radio said, "Oh, it's just equal to one dental X-ray." You know, I'm a dentist. I take X-rays every day. I don't put any plutonium in those people's lungs.

Response to Commentor No. 2370

2370-1: DOE notes the commentor's concern regarding waste generation. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

2370-2: Direct effects of the fire on the land and biota are addressed in this NI PEIS consistent with the scope of the affected environment descriptions for the Hanford Site provided in Section 3.4. The secondary effects of the Hanford wildfire of June 27-July 2, 2000 (known as the 24 Command Fire and the Two Forks Fire) are beyond the scope of this NI PEIS. Nevertheless, a brief description of the environmental monitoring and results associated with the Hanford wildfire follows. No radioactive materials were "released" in the Hanford Wildfires of 2000. Wildfires did resuspend some materials already in the environment. The resuspended materials were low, slightly above natural background levels. Since the initial stages of the fire and continuing to the present, DOE, in conjunction with the Washington State Department of Health and the Federal EPA, have conducted environmental monitoring on and near the Hanford Site to assess potential radiological releases. Monitoring will also continue over the long term. DOE has made these monitoring results available to the public as rapidly as possible with the results to date posted on a dedicated page on the Hanford web site at <http://www.hanford.gov/>. Regarding plutonium releases, DOE monitoring data has shown elevated levels (above levels normally seen) of plutonium in the Hanford 200 Areas. The most recent monitoring data available from EPA shows elevated levels (above background) of plutonium associated with 6 of the 61 ambient air filters collected from 23 locations surrounding the Hanford site. All of these DOE and EPA results are below EPA's "protective action guides" for emergency situations, EPA National Emission Standards for Hazardous Air Pollutants, hazardous air pollutant dose limits set by the State of Washington, and within or below EPA's acceptable risk range for protecting public health and the environment. DOE will continue to work with the Washington State Department of Health and the EPA and will post additional monitoring results as they become available. Equivalent doses of ionizing radiation can be absorbed from a variety of natural and manmade sources, including cosmic radiation, medical and dental x-rays, plutonium-238, naturally-occurring radon, or any other radioactive isotope. The evaluation of potential human health impacts presented in Chapter 4 assumed that any dose of

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2370: Anonymous (Cont'd)

Response to Commentor No. 2370

ionizing radiation, no matter how small, could cause a fatal cancer. That assumption is conservative, but there is currently no scientific consensus on its accuracy. Some scientist believe that the assumption is true, while others believe that there is a threshold below which radiation doses are harmless.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2373: Anonymous

2373-1 — I'm opposed to starting the Hanford

2373-2 — ...just looking at the past track record and how the clean-up has gone so poorly, and I think it's absurd to try to do new projects when the old projects aren't cleaned up.

Response to Commentor No. 2373

2373-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2373-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2375: Anonymous

2375-1 — I'm opposed to the start-up of the FFTF reactor for all the reasons stated previously, but mostly because there is no way to dispose of the waste safely.

2375-2 — And I've said this already three times. So my question is: is this getting to Mr. Richardson, who is making the ultimate decision, or where are our comments going?

Response to Commentor No. 2375

2375-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF. Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

2375-2: The Office of Nuclear Energy, Science and Technology works closely with the Office of the Secretary to keep him informed of the progress on the NI PEIS, including stakeholder input. It is the Secretary of Energy who will make the programmatic decisions with respect to the alternatives presented in this NI PEIS to accomplish the DOE missions. Decisions made will be published in the Record of Decision no sooner than 30 days after publication of this NI PEIS. All pertinent information and public input will be provided to the Secretary so that he may make an informed and unbiased decision with respect to the alternatives presented in this NI PEIS.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2384: Anonymous

2384-1 — I'd like to address some comments specifically to the draft EIS and ask, as is required by law, that you include the things that I requested originally in my two prior comments during scoping.

I see in many, many areas — one of the flaws I see in the draft is that there's a lot of blanket statements made. "This will not cause that. This will not do this. This will do this." But I don't really see enough justification of that explanation of that deduction and of the statements that I'm seeing in the draft.

The draft is pretty thick, and it's really hard to read. So justification for those things in lay people's terms would be very helpful in the final.

2384-2 — Things that were not addressed in the draft EIS that need to be included are the other medical problems aside from cancer fatalities and non- fatal cancers, the ones that people survive; thyroid disorders. There's low thyroid, high thyroid, Graves Disease, and a number of other thyroid disorders which we know are caused from specific types of nuclear radiation that are not addressed in this draft.

There are also a number of immune system dysfunctions, stillbirths, miscarriages, and other specifically radiation related sicknesses that are not addressed.

I specifically requested that the costs, the medical costs of these projected illnesses to the American public and to tribes be included in that, and it was not. Those projections need to be specifically for low level radiation exposures, as well as catastrophic radiation incidents.

I also don't see anything in there about the hospitals in our region that will be asked to take on the overload that can't be handled in the hospitals in the Hanford area. I know some of the hospitals here have addressed this issue in their ERs, and they are not prepared for your overload, and I'd like to see that addressed as well.

You know, we all know what happened when people were drinking cow's milk from cows that were eating the radioactive grasses, and it's just not in your draft, and it must be included in there.

2384-3 — In the assessment of low income and minority populations, something that's drastically missing specifically for the tribes is I don't see anything in there for specific populations who gather roots, who use the medicines from the land, and who eat the fish and the wild meat, as I do. It's just not covered, and those things have to be taken into consideration.

Response to Commentor No. 2384

2384-1: CEQ regulations for implementing NEPA require that public comment be solicited to assisting in defining the scope of an EIS. Section 1.4 of Volume 1 of this NI PEIS, as supplemented by an expanded discussion provided in Appendix N, summarizes the prevailing issues and concerns raised during the scoping process to include identification of prevalent issues raised at individual scoping meetings. In fact, based on the scoping comments received, the scope of the NI PEIS was expanded in a number of areas as outlined in Section 1.4 and Appendix N. It should be noted, however, that NEPA and CEQ regulations do not require an agency to include and respond to each scoping comment as is required for public comments on a Draft EIS. While all comments received during the scoping periods are part of the Administrative Record for the NI PEIS, Section 1.4 and Appendix N are intended to provide a summary of the issues and associated trends identified during the scoping process rather than a tabulation of comments by specific issue. In preparing the NI PEIS, DOE carefully considered all scoping comments received from the public. CEQ regulations for implementing NEPA require that EISs be written in plain language so that they can be more easily understood and that the EIS be accompanied by a summary of the EIS's content (40 CFR 1502.8 and 1502.12, respectively). DOE strives to produce NEPA documentation and related materials that are easily understood by the public by avoiding the use of jargon, defining technical terms and concepts through the use of common comparisons, avoiding the use of acronyms to the extent possible, and provision of a summary that is clear and concise, among other means. In order to improve the public's comprehension and understanding of the PEIS, this Final NI PEIS reflects revisions that have been made to eliminate some redundant and extraneous information while some sections have been reorganized to improve readability. For example, the summary of environmental impacts (Section 2.7) has been reorganized by environmental resource area so that impacts to each area (e.g., waste management) can be quickly gauged across all alternatives.

2384-2: Appendix H provides information on potential health effects other than fatal cancers. Of the three health impacts from low levels of radiation exposure (nonfatal cancers, hereditary effects, and fatal cancers), fatal cancers have the highest probability of occurrence, roughly 500 excess cancer fatalities per million person-rem. Nonfatal cancers and hereditary effects appear at rates of approximately 20 and 26 per cent of this number. Using a single number for human health impacts provides a simple direct means to compare impacts and risks among the alternatives. Cancer fatalities, being the largest impact, were selected for presentation throughout the NI PEIS. This PEIS has provided an estimate of the incremental potential human health impacts associated with each of a range of reasonable alternatives (Alternative 1 includes the restart of FFTF)

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2384: Anonymous (Cont'd)

2384-4 — There was a woman that left on the break, and she asked me to please remind you that there's a lot of activity in Canada producing these radioactive isotopes, and many of the things that we are considering in this draft are available from Russia, which we have a contract for, and also from Canada. There are three new isotope reactors in Canada.

And I also want to remind you that I was one of the experimental — one of the people involved with the experimental populations in my formative years, and that I have survived my early cancer, and that no radiation and no chemicals were necessary for me to be cured from this. There are many, many alternatives to radiation and to radioactive isotopes.

Response to Commentor No. 2384

for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Sections 4.3 through 4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from implementation of each of the alternatives, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with each of the analyzed alternatives and with restarting FFTF would be small. The low number of health effects from normal operations or accidents projected as a result of the selection of any of these alternatives should not impact health care capabilities. The DOE has developed a comprehensive Hanford Emergency Management Plan that provides emergency response measures for radiological events at the Hanford site.

2384-3: Radiological impacts on minority and low-income populations residing within potentially affected areas surrounding the Hanford Site are addressed in Section K.5.3 of Appendix K (Environmental Justice Analysis). Models for estimating radiological health impacts (discussed in Appendixes H and I) assumed that all locally grown food supplies would be subject to radiological contamination throughout the project duration, and that all locally grown food supplies would be consumed by residents in the potentially affected area. The analysis of radiological effects that would result from implementation of the nuclear infrastructure alternatives indicates that the radiological risk to persons residing in the potentially affected area would be so small that no credible pattern of food consumption (or other ingestion pathways) would be expected to result in a latent cancer fatality.

2384-4: DOE notes the commentor's views. The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes primarily molybdenum-99, and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1 2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs. DOE notes the commentor's support for purchasing plutonium-238 from other sources to satisfy DOE's near-term responsibility to supply NASA with the necessary fuel to support future space exploration missions. DOE could

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2384: Anonymous (Cont'd)

Response to Commentor No. 2384

purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Under the current contract set to expire in 2002, the United States is authorized to purchase up to 40 kilograms of plutonium-238, with the total available for purchase in any one year limited to 10 kilograms. To date, DOE has purchased approximately 9 kilograms of plutonium-238 under this contract. Under the No Action Alternative, DOE would continue to purchase plutonium-238 to meet the space mission needs for the 35-year evaluation period considered in the NI PEIS. However, any purchase of plutonium-238 from Russia beyond what is currently available to the United States through the existing contract would likely require negotiation of a new contract and may require additional NEPA review.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2387: Anonymous

2387-1 — So the production of isotopes that are, on one hand, being promoted by the medical establishment to cure cancer may also be the cause of the same cancer that it's being used to treat. And as a matter of fact, treatment itself can be carcinogenic.

And so that's kind of one side of this parallel. Instead of talking about iatrogenic medicine, which is physician induced medicine, we talk about only palliative medicine, about the kind of medicine that treats the symptoms and not the causes, not the root causes.

Tonight we really should be looking at radiation not as a cure for disease, but as a cause.

Response to Commentor No. 2387

2387-1: The radiation effects of the alternatives on the public and workforce are discussed in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.9, 4.3.2.1.9, 4.3.3.1.9) and are shown to be small. Genetic research and other research will hopefully lead to other ways to fight cancers. However, certain radioisotopes currently offer effective treatment for some cancers. Consistent with its mandates under the Atomic Energy Act, DOE is proposing this enhancement for the purposes of addressing three primary needs: 1) to support the increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and for which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear energy research and development in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2394: Anonymous

2394-1 — I'm going to tell a little bit about myself. I'm 17. I go to high school across the river. I mean, I know what an isotope is. I know what it can do. I know good side effects of it, and I know the bad side effects. I mean I've taken my basic science classes.

I mean, you guys are talking to us like we're like — it's stuff I learned like in fifth grade. I'm like, "Oh, really?"

But now it's just like, okay, get on with it, and I don't know what to say about that except for come on. Tell us something we want to hear, not stuff we've already heard.

Response to Commentor No. 2394

2394-1: DOE notes the observations made by the commentor.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2403: Anonymous

2403-1 — In June during the Hanford fire, U.S. DOE lied about plutonium releases. Four years ago, U.S. DOE promised independent regulation of reactors, including FFTF. U.S. DOE has lied and broken its promises again. How can we trust you to run an unsafe, unregulated reactor?

Hanford's high level nuclear waste tanks are already leaking radioactive waste into the groundwater, which is moving closer and closer to the Columbia River, which flows right outside our back door here and threatens the life of the river and all the people who use it and all the creatures that live within it and around it.

2403-2 — Restarting the FFTF for a plutonium-238 mission or any mission is an irresponsible action.

2403-3 — It will add more waste to Hanford's leaking and explosive, high level nuclear waste tanks.

2403-4 — The U.S. DOE has not disclosed the cost of restarting FFTF in the effects of waste production and transportation. Without access to this information, the public does not have full disclosure. It is not okay to wait until after the public hearings to make this information available.

2403-5 — Northwest citizens have repeatedly voiced their concerns over FFTF, telling U.S. DOE to shut it down for once and for all.

2403-6 — And it's about our future and the future of our children and their children's children. Doesn't it seem obvious that radioisotopes cause cancer? I don't understand.

Response to Commentor No. 2403

2403-1: DOE notes the commentor's concerns with the Hanford high-level waste tanks and concern with migration of contaminants to the Columbia River. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is committed to honoring this agreement. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1. In regard to the Hanford wildfire of 2000, the DOE Richland Operations Office, the Washington State Department of Health, and U.S. Environmental Protection Agency performed environmental monitoring on and around the Site to assess potential radiological impacts. The wildfire did not cause a release of radioactive materials from any Hanford facilities but did result in resuspension of radioactive materials which were already in the environment. The low levels of radioactive materials that were resuspended were slightly above natural background levels and required several days of analysis to quantify. Information on this event has been made available to the public and can be accessed at <http://www.Hanford.gov/envmon/indes.html>. This site also provides a link to information on the independent offsite air monitoring that was conducted by the U.S. Environmental Protection Agency. In regards to safe operation of the FFTF, the environmental impacts associated with operation of the FFTF are addressed in detail in Section 4.3 of the NI PEIS. This section specifically evaluates the incremental radiological impact to the public associated with both normal operation and postulated accident conditions. As discussed, if FFTF were to operate for 35 years, this risk would be small (less than 1 additional latent cancer fatality). For perspective, the radiation dose the average American receives from natural sources is about 300 mrem each year. Based on the same 35 year time period used above, approximately 2,000 latent cancer fatalities would be expected among the same population as a result of this natural (non-Hanford related) radiation exposure. In that same 35 years, about 19,000 cancer fatalities from all causes (non radiological included) would be expected in the same population. As identified in Section N.4.2 of the NI PEIS, the subject of independent regulation is not within the scope of the NI PEIS but is an operational issue to be considered only if FFTF restart is selected in the Record of Decision.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2403: Anonymous (Cont'd)

Response to Commentor No. 2403

2403-2: DOE notes the commentor's opposition to the use of FFTF to produce plutonium-238 or for any other mission. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. The NI PEIS evaluates a range of reasonable alternatives for accomplishing the proposed action, one of which includes use of FFTF. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

2403-3: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. High-level radioactive waste would not be generated from merely operating FFTF. It is DOE's policy that all wastes be managed (i.e., treated, stored, and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

2403-4: The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://>

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2403: Anonymous (Cont'd)

Response to Commentor No. 2403

www.nuclear.gov) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS. Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site. Also, the risks and potential human health risks from roadway and marine (for Alternative 1) transportation of all materials (mixed-oxide fuel under Alternative 1, target materials, and isotopes) are addressed in the applicable sections of Chapter 4 (e.g., Section 4.3.1.1.11 and 4.3.3.1.11) of Volume 1. Associated environmental and human health impacts are assessed, with a revised summary of impacts provided in Section 2.7 of Volume 1 of this NI PEIS.

- 2403-5:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 2403-6:** This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small. Cancers are believed to be caused by a combination of hereditary and environmental factors, including radiological and chemical agents. Statistics from the National Cancer Institute indicate that the rate of cancer incidence and the rate of cancer

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2403: Anonymous (Cont'd)

Response to Commentor No. 2403

mortality has dropped during the 1990s [NCI webpage (as of 10/19/2000) - <http://cancernet.nci.nih.gov/statistics.shtml> article entitled "Cancer Death Rate Declined in the 1990s for the First Time Ever"]. A survey sponsored by the National Cancer Institute and published in the Journal of the American Medical Association in 1991 (JAMA 1991:1403-1408) detected no general increase in the risk of cancer death for people living in 107 counties adjacent to or containing 62 nuclear facilities. The Hanford Site, Idaho National Engineering and Environmental Laboratory, and Oak Ridge Reservation were included in the survey. The study used cancer mortality data from Benton, Franklin, and Grant Counties in the survey for the Hanford Site (See Section 3.4.9.3 of Volume 1).

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2400: Ruth

2400-1 — In the '70s we talked about alternative energy. It's there. It's not a secret either. It's an option. It's a good option, in my opinion.

2400-2 — And I'd like to say there's a project there, but that project is clean-up because a good planet is hard to find.

Response to Commentor No. 2400

2400-1: DOE notes the commentor's interest in alternative energy sources. Issues of research and development of alternative energy sources are beyond the scope of this Nuclear Infrastructure PEIS. Despite advances in many energy technologies, America's future energy security will depend on a robust mix of energy sources which necessarily includes nuclear power generation. It is the current United States policy that clean, safe, reliable nuclear power continue as a viable component of the United States' energy portfolio. In recognition of this need, the government has initiated nuclear energy research and development programs to address potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) and to ensure that current nuclear power plants can continue to deliver adequate and affordable energy supplies. An enhanced DOE nuclear facility infrastructure is required to support such nuclear energy research and development for civilian applications.

2400-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2399: Steve Andress

2399-1 — I just want to put in my word that I'm totally opposed to the restart of the FFTF operation in Hanford.

Response to Commentor No. 2399

2399-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2368: Scott Bergeran

2368-1 — I am opposed to the restarting of this nuclear reactor.

2368-2 — Your compilations of prior public comment are seriously lacking and show your failure to listen to the public. You failed to give any numerical breakdown for the 7,000 comments received. You only say “many” of the commentors who attended the meetings in Seattle, Portland, and Hood River were strongly opposed to the restart of FFTF.

Then you go on to say “most” of the comments received at Richland meeting were in support of the restart. You need to state the numbers of these comments. You need to state the numbers on these comments so Secretary Richardson is clear on where the people of the Northwest stand. You put the number in where it is to your advantage, and you leave them out when they are opposed. You also fail to mention the five city council resolutions opposing FFTF restart, which means you have representatives of entire cities opposing it, and their numbers should be included.

2368-3 — You have failed to demonstrate a compelling need for the production of plutonium for space, medical research isotopes, or nuclear energy research. Neither is there adequate justification for the need to produce all of them at one site. Neither is there justification for the need to produce them domestically, which makes no sense when we would continue to buy foreign nuclear fuel to run FFTF.

You must include recommendations of your own blue ribbon panel, Subcommittee, Isotope Research and Production Planning, that advised against — I say again “against” — the use of FFTF for medical isotope production.

Furthermore, EIS isotope demand projections are outdated and inadequate. They also fail to take into account possible cancer cures like gene therapy that could make medical isotopes unnecessary.

In addition, medical isotopes can be adequately produced at other DOE sites if they are a high priority as implied. Current isotope production levels for DOE reactors are misstated in the EIS at near capacity when most are only around 50 percent.

2368-4 — You must include the current demand estimates from NASA for Plutonium 238, which are considerably lower than your need projections and could easily be met under the current contract with Russia.

A discussion of alternatives to plutonium fuel must be included, and a renegotiated contract with Russia that double the current costs could meet future NASA needs at one third the cost of FFTF restart.

Response to Commentor No. 2368

2368-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2368-2: While all comments received during the scoping periods for both the Plutonium-238 Production EIS and the NI PEIS are part of the Administrative Record for the NI PEIS, Section 1.4 of Volume 1 and Appendix N are intended to provide a summary of the issues and associated trends identified during the scoping process rather than a tabulation of comments by specific issue. It should be noted, however, that NEPA and CEQ regulations do not require an agency to include and respond to each scoping comment as is required for public comments on a Draft EIS. In preparing the NI PEIS, DOE carefully considered scoping comments received from the public. Any perceived discrepancy in the grouping of comments raising any one particular issue or set of issues is attributable to the manner in which they were originally categorized and counted. For example, a number of statements, letters, or resolutions signed by multiple persons, such as city council resolutions mentioned by the commentor, were received by DOE (both for and against FFTF restart) in response to the request for scoping comments. Each such comment document was considered and counted as a single comment in the NI PEIS comment tracking system. The Office of Nuclear Energy, Science and Technology works closely with the Office of the Secretary to keep him informed of the progress on the NI PEIS, including stakeholder input.

2368-3: DOE notes the views of the commentor. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost. Section 1.2.2 of Volume 1 has been revised to clarify DOE's role in plutonium production for future NASA space missions. In ongoing clinical testing, therapeutic radioisotopes have proven effective in treating cancers and other illnesses while minimizing adverse side effects, making their use an attractive alternative to traditional chemotherapy and radiation treatments. DOE has sought independent analysis of trends in the use of medical radioisotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it has established two expert

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2368: Scott Bergeran (Cont'd)

2368-5 — It is improper to release the draft EIS for public comment without the critical information requested by the public in the scoping meetings, including cost analysis of restart and all alternatives with reasonable review, with review time; studies on treatment of waste at all proposed site and nonproliferation impacts from FFTF and the importation of its necessary radioactive fuel from Europe.

2368-6 — Violation of the nonproliferation agreement by use of highly enriched uranium fuel alone is reason enough to stop restart of FFTF.

2368-7 — You have failed to adequately characterize environmental impacts from FFTF restart. An example is the statement, "environmental impacts associated with the existing inventory of spent fuel at the Hanford site are minimal."

2368-8 — To imply that the existing spent nuclear fuel inventory poses no problems is massively incorrect. More than 2,100 tons of corroding spent fuel sites in aging water filled basins near the Columbia River pose one of the largest problems for clean-up and an expected cost of more than \$1.6 billion. You must address all impacts on waste management and the environment at Hanford, not dismiss them with erroneous statements.

2368-9 — You must include the cost of FFTF and all companion facilities' documentation and decommissioning in the restart, not just every other alternative. All facilities used in all other alternatives must show the cost of decontamination and decommissioning as well.

2368-10 — You have failed to assess all existing contaminant sources at Hanford and all other sites before additional waste. You must assess current waste inventories and then assess the addition of any new waste to existing waste sources.

2368-11 — You have failed to adequately consider the use of the advanced test reactor in Idaho and the high flux isotope reactor in Oak Ridge for medical isotopes, while acquiring plutonium-238 from another source.

2368-12 — You also failed to analyze lower cost alternatives, such as subsidizing university reactors or buying time from private accelerators or reactors.

2368-13 — No action alternative must include the shutdown of FFTF, not maintaining it on standby based on prior commitments of Secretary O'Leary and Watkins and TPA milestones.

2368-14 — You failed to address the conflict of interest using PNNL's evaluations, when they are a proponent of restart and stands to gain financially.

You failed to assess the legality of introducing new programs and waste into the highly contaminated 306E or 325 buildings at Hanford that would be used with FFTF.

2368-15 — You must admit that the real reasons to start FFTF are in a hidden agenda that includes preserving jobs and starting new weapons research or other classified missions.

Response to Commentor No. 2368

committees. The first, a thirteen-member Expert Panel convened in 1998 to forecast future demand for medical isotopes, included academicians from leading medical universities and schools of public health, and professional affiliations ranging from the National Cancer Institute to manufacturers of radiopharmaceuticals. The second consists of a subcommittee of DOE's Nuclear Energy Research Advisory Committee (NERAC), established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. The members of this Subcommittee were selected based upon their expertise and experience in the production, processing, distribution, and application of stable and radioactive isotopes in the biological and physical sciences, and in medicine. The members included basic and clinical scientists, administrators, and users of isotopes from academia, industry, and the federal government. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information. The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs. The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and

*Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)**Commentor No. 2368: Scott Bergeran (Cont'd)*

Response to Commentor No. 2368

conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities. DOE does not believe that isotope production levels were misstated in the Draft NI PEIS. Section 1.2.1 identifies that "Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense)." DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term (less than 5 years). It is the current United States policy that clean, safe, reliable nuclear power continue as a viable component of the United States' energy portfolio. In recognition of this need, the government has initiated nuclear energy research and development programs to address potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) and to ensure that current nuclear power plants can continue to deliver adequate and affordable energy supplies. An enhanced DOE nuclear facility infrastructure is required to support such nuclear energy research and development for civilian applications. This mission is described in Section 1.2.3 of Volume 1. There is no requirement to conduct all of these missions at one site. In the Record of Decision process, DOE could choose to combine components of several alternatives in selecting the most appropriate strategy. For example, DOE could select a low-energy accelerator to produce certain medical, research, and industrial isotopes, and an existing operating reactor to produce plutonium-238 and conduct nuclear research and development. Should FFTF be selected for restart in support of these missions,

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2368: Scott Bergeran (Cont'd)

Response to Commentor No. 2368

DOE could utilize a 15-year supply of mixed-oxide fuel that would be available from Germany under favorable economic terms (i.e., no charge for the fuel).

2368-4: Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium 238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium 238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost. DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions. Potential cost impacts associated with the NI PEIS alternatives are presented in a separate Cost Report.

2368-5: The costs and nuclear nonproliferation impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such ancillary documents need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed these documents to more than 730 interested parties on August 24 and September 8, 2000, respectively. Both reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided summaries of the Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment in Appendixes P and Q, respectively, in the Final NI PEIS. The draft Waste Minimization and Management Plan for the Fast Flux Test Facility (May 2000) was referenced in the NI PEIS and made available prior to the public hearings.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2368: Scott Bergeran (Cont'd)

Response to Commentor No. 2368

2368-6: The use of mixed oxide or highly enriched uranium to fuel the FFTF has been rigorously evaluated in the Nuclear Infrastructure Nonproliferation Impact Assessment. This report confirms that the manner in which these fuels would be used, as described in the PEIS, is consistent with nonproliferation policy. In the event that a decision is made to restart FFTF, the first six years of operation would use existing onsite mixed oxide (MOX) fuel. DOE expects that an additional 15-year supply of mixed oxide fuel in Europe, owned by Germany, could be available for FFTF. MOX fuel does not use highly enriched uranium. Further, use of the Hanford MOX fuel would dispose of a significant U.S. stockpile of highly attractive fresh plutonium fuel by conversion to spent fuel through irradiation in FFTF. This represents a safe, low-cost, high benefit opportunity to reduce U.S. civilian plutonium without chemical or bulk processing. Use of the German MOX represents a similar advantage with respect to the German stockpile of separated civilian plutonium. During the period of MOX fuel use, in support of U.S. nonproliferation policy directives, DOE's Office of Nonproliferation and National Security would undertake a study under Reduced Enrichment for Research and Test Reactors (RERTR) to consider the technical feasibility of using low enriched uranium to fuel the FFTF. Under this nonproliferation protocol, if use of low enriched uranium fuel is found infeasible in FFTF for meeting assigned missions, policy would allow DOE to subsequently procure highly enriched uranium fuel for use in FFTF. Again, this approach is consistent with U.S. nonproliferation policy.

2368-7: The concerns expressed in this comment with respect to the adequacy of the characterization of FFTF restart impacts, are noted. The environmental impacts associated with restart and operation of the FFTF during normal operations and from postulated accidents are presented and discussed in detail in Section 4.3 of the NI PEIS. All impacts to human health and to environmental media including air, water, and land are shown to be small. No fatalities would be expected from the 35-year operating period of the FFTF. Any discharges would be in accordance with applicable permit and regulatory requirements and the impacts on air and water quality would be small. The potential impacts to the Hanford area and transportation corridors to and from Hanford associated with FFTF operations are also shown to be small. DOE also notes the commentor's concern with defense mission (non FFTF related) spent nuclear fuel (SNF) currently stored in the water basins at the 100 Area. As stated in DOE/EIS-0245F, Final Environmental Impact Statement for Management of Spent Nuclear Fuel from the K Basins (January 1996), DOE has placed a high priority on taking expeditious action to reduce risks to public health and safety and the environment by removing [defense mission] SNF from the K Basins and, subsequently, to take action to manage the SNF in a safe and environmentally

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2368: Scott Bergeran (Cont'd)

Response to Commentor No. 2368

sound manner for up to 40 years or until ultimate disposition decisions are made and implemented. Consistent with the purpose of a cumulative impact assessment (i.e., to evaluate the sum of the impacts from normal operations within various environmental categories, such as public health and land use) and in full recognition of DOE's position to take expeditious action in regards to management of the defense mission SNF, Section 4.8.3.5 of the NI PEIS addresses the cumulative impacts of the existing spent fuel and the spent fuel that would be associated with operation of FFTF. It is shown in the documents cited in that section that the radiological impact to the public from the management of the existing 2133 metric tons heavy metal (MTHM) inventory of SNF at Hanford (which consists of 2103.4 MTHM defense mission SNF, 11.0 MTHM of existing (non defense mission) FFTF SNF stored at 400 Area, and 18.4 MTHM of other non-defense-mission SNF) is less than 0.1 mrem/year. This dose is well below the EPA's Clean Air Act Standard of 10 mrem/year and the Drinking Water Standard of 4 mrem/year, as implemented by DOE Order 5400.5. The incremental impacts associated with managing an additional 16 MTHM of FFTF SNF were evaluated in Section 4.3.1.1.14 of the NI PEIS for the restart of the FFTF. The radiological impact to the public from overall radionuclide releases from the entire FFTF complex during the last year of reactor operation was less than 0.0001 mrem/year. The dose contribution from FFTF SNF management would be expected to be a small fraction of the FFTF reactor operation dose. Therefore, it would have no discernable impact on the 0.1 mrem/year dose from the existing 2133 MTHM Hanford SNF inventory. The currently used FFTF-specific SNF storage system designs (i.e., facility storage vessels and dry storage casks) are the key factors in the determination that the incremental radiological and environmental impacts would be small.

2368-8: Although not within the scope of the NI PEIS, DOE notes the commentor's concern with defense mission (non-FFTF related) spent nuclear fuel (SNF) currently stored in the water basins at the 100 Area. As identified in DOE/EIS-0245F Final Environmental Impact Statement for Management of Spent Nuclear Fuel from the K Basins (January 1996), DOE has not dismissed this threat but has placed high priority on taking "expeditious action to reduce risks to public health and safety and the environment by removing (defense mission) SNF from the K Basins and, subsequently, to take action to manage the SNF in a safe and environmentally sound manner for up to 40 years or until ultimate disposition decisions are made and implemented."

2368-9: DOE assumes that the commentor is referring to deactivation, not decommissioning. Decommission costs were not included for any alternative. Deactivation of FFTF is

*Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)**Commentor No. 2368: Scott Bergeran (Cont'd)**Response to Commentor No. 2368*

not part of implementing Alternative 1, Restart FFTF. Deactivation of FFTF is part of implementing Alternatives 2, 3, 4, and 5 and including the cost of FFTF deactivation in the implementation costs for these alternatives is appropriate. The Cost Report was structured to identify the implementation costs of the various alternatives so the Secretary of Energy would have this information along with other data for consideration.

2368-10: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. Ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The current inventory of wastes managed at the Hanford Site are identified in Section 3.4.11.1 of Volume 1. In addition, the generation rates of wastes associated with the NI PEIS options that use Hanford facilities are compared with the current waste generation rates at the site in Section 4.3 of Volume 1. As stated in Sections 4.3 1.1.13, 4.3.3.1.13, and 4.4.3.1.13, the generation rates of wastes at Hanford associated with the options that utilize either FFTF, FMEF and or RPL/306-E would be much smaller than the current waste generation rates at the site. These volumes would also be small in comparison to the existing inventory at the site (Section 3.4.11.1, Volume 1). These comparisons were also made for the other options which involved INEEL and ORR facilities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2368-11: The potential production of plutonium-238 using ATR, HFIR, or a commercial reactor was evaluated in the NI PEIS because it would be compatible with the operating requirements of these facilities' existing missions. However, different irradiation requirements are associated with the production of medical, industrial, and research isotopes. While ATR, HFIR, or a commercial reactor may possess the potential capability or capacity to support isotope production, it is unlikely that reliable, increased isotope production to support projected needs could be accomplished using these facilities without disturbing their existing missions. There is little room for growth of medical isotope production at either ATR or

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2368: Scott Bergeran (Cont'd)

Response to Commentor No. 2368

HFIR. At ATR the neptunium-237 targets for plutonium-238 production will compete for space in the reactor. There are potential negative impacts to the private company that leases reactor space for the production of radioisotopes due to being assigned less desirable irradiation space. At HFIR, the ability to expand medical isotope targets into additional reactor locations is limited by the potential impacts that the targets have on the primary experiments in the reactor. Medical isotope targets and neptunium-237 targets are not in competition for the same locations in at HFIR.

2368-12: The NI PEIS considered the use of a wide range of irradiation facilities, including those operated by universities and private concerns. Privately owned and operated CLWRs were added to the PEIS scope for the production of plutonium-238 and were analyzed in detail in the document. University reactors were considered, but were dismissed because they do not have sufficient available core volume to accommodate the required missions. Section 2.6.2 provides a complete discussion of irradiation facilities considered but dismissed.

2368-13: The No Action alternative is required under Council on Environmental Quality regulations (40 CFR 1502.14(d)). It provides a point of comparison for the action alternatives. The No Action Alternative generally represents the status quo; that is, it includes those actions that would normally take place without the proposed action. Since the status quo involves maintaining FFTF in standby and not its deactivation it is not appropriate to include its deactivation as part of the No Action Alternative. Deactivation of FFTF is included as Alternative 5, Permanently Deactivate FFTF, and as part of Alternative 2, Use Only Existing Operational Facilities, Alternative 3, Construct New Accelerator(s), and Alternative 4, Construct New Research Reactor.

2368-14: PNNL is not preparing this PEIS, although it has offered technical comments on it. These comments have been evaluated by DOE and the contractor preparing the PEIS. PNNL has also previously provided technical and cost analyses on matters related to the FFTF, which have undergone independent scrutiny, and have helped confirm the need for the environmental review now being independently developed. PNNL's work does not present a conflict of interest. Ultimately, DOE has full control over the contents of the PEIS. DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2368: Scott Bergeran (Cont'd)

Response to Commentor No. 2368

Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2368-15: Other than the missions discussed in the NI PEIS, no alternate uses for FFTF are being considered. None of the alternatives in the NI PEIS include defense missions nor would they contribute to future weapons production. Socioeconomic impacts associated with Alternative 1 are discussed in Section 4.3 of Volume 1.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2409: Kim Birkland
Columbia Riverkeeper

2409-1 — The Department of Energy's compilations of prior public comment are seriously lacking and show the department's failure to listen to the public. You failed to give any numerical breakdown for the 7,000 comments received. You only say "many" of the commentors who attended the meetings in Seattle, Portland and Hood River were strongly opposed to the restart of FFTF.

That needs to be quantified, and Secretary Richardson needs to hear the exact number of folks who are opposed to the restart.

It is improper to release the draft EIS for public comment without the critical information requested by the public in scoping meetings, including the cost analysis of restart and all alternatives with reasonable review time.

The draft EIS must state the preferred alternative for adequate public review, and I am really surprised that there is no preferred alternative in this EIS. I've never seen that before in an EIS, and it gives us no opportunity to comment adequately. It just sets us back where we were in the scoping process.

2409-2 — You failed to demonstrate a compelling need for the production of plutonium for space, medical, or research isotopes or nuclear energy research. Neither is there adequate justification for the need to produce all of them at one site.

This is a cover-up for some other reason to be starting the nuclear facility because tritium was the primary reason for restarting at the last meeting I attended, and it is now off the list. So there must be some other reason why the Department of Energy wants to restart. The department must include the recommendations of your own blue ribbon panel, the Subcommittee for Isotope Research and Production Planning that advised against the use of FFTF for medical isotope production.

You must include the current demand estimates for NASA for Plutonium-238, which are considerably lower than your need projections and could easily be met under the current contract with Russia.

2409-3 — The FFTF will be much more expensive than reasonable alternatives by at least \$2 billion.

2409-4 — Studies on treatment of wastes at all proposed sites [needed in EIS]. To imply that the existing spent nuclear fuel inventory poses no problems is massively incorrect.

2409-5 — ...the nonproliferation impacts from FFTF and the importation of its necessary radioactive fuel from Europe, which is a violation of the nonproliferation agreement by use of highly enriched uranium fuel alone, and that's reason enough to stop the production at FFTF facility or stop the restart of FFTF

Response to Commentor No. 2409

2409-1: Section 1.4 of Volume 1 of this NI PEIS, as supplemented by an expanded discussion provided in Appendix N, summarizes the prevailing issues and concerns raised during the scoping process to include identification of relevant issues raised at individual scoping meetings. It should be noted, however, that NEPA and CEQ regulations do not require an agency to include and respond to each scoping comment as is required for public comments on a final EIS. While all comments received during the scoping periods are part of the Administrative Record for the NI PEIS, Section 1.4 and Appendix N are intended to provide a summary of the issues and associated trends identified during the scoping process rather than a tabulation of comments by specific issue. The Office of Nuclear Energy, Science and Technology works closely with the Office of the Secretary to keep him informed of the progress on the NI PEIS, including stakeholder input. The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS. As outlined in 40 CFR Part 1502.14 (e), an agency is not required to specify a preferred alternative or alternatives in the Draft EIS if one does not exist, but must do so in the Final EIS. Accordingly, DOE has identified its preferred alternative in Section 2.8 of Volume 1 that includes a discussion of DOE's reasons for selecting it. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

2409-2: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2409: Kim Birkland (Cont'd)
Columbia Riverkeeper

2409-6 — You have failed to adequately characterize environmental impacts from FFTF restart. An example is a statement that environmental impacts associated with the existing inventory of spent fuel at the Hanford site is minimal.

2409-7 — More than 2,100 tons of corroding spent fuel sits in aging water filled basins near the Columbia River posing one of the largest problems for cleanup at an expected cost of more than \$1.6 billion. You must address all impacts on waste management and the environment at Hanford, not just dismiss them with erroneous statements.

Right across from Hanford there's a critical area that protects the shrub ecosystem in Washington State. That ecosystem is endangered. That ecosystem is also highly radioactive. Those are the only species that we have that are remaining in Washington State, and that is not considered in this impact statement.

...especially when I look down river from the Hanford site, and there is evidence and tests indicated that the nuclear fuel that has been disposed of in the past is already in the river.

2409-8 — . . .nor is any other health risk aside from cancer, which I find very disturbing,

2409-9 — The no action alternative must include shutdown of FFTF

2409-10 — . . .you must admit the real reasons to restart FFTF are a hidden agenda that includes preserving jobs and starting new weapons research or other classified missions.

2409-11 — And the U.S. DOE should include the alternative — should choose the Alternative 5, shutdown FFTF, or Alternative 2, produce at existing sites with the shutdown of FFTF at Hanford as much too contaminated to start up again.

Response to Commentor No. 2409

future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1 2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs. The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities. DOE has taken the Expert Panel and NERAC report recommendations under consideration in developing the range of alternatives evaluated in the NI PEIS. These reports were made available to the public at the NI PEIS public information centers and on the Internet at www.nuclear.gov. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Although research to identify other

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

*Commentor No. 2409: Kim Birkland (Cont'd)
Columbia Riverkeeper*

Response to Commentor No. 2409

potential fuel sources to support these space exploration missions has been conducted, no viable alternative to using plutonium-238 has been established. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost. DOE could purchase plutonium 238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions. A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium 238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions. In January 1997, President Clinton tasked his Committee of Advisors on Science and Technology (PCAST) to evaluate the current national energy research and development portfolio and to provide a strategy that ensures the United States has a program to address the Nation's energy and environmental needs for the next century. In its November 1997 report responding to this request, the PCAST Energy Research and Development Panel determined that restoring a viable nuclear energy option to help meet our future energy needs is important and that a properly focused research and development effort to address the potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) was appropriate. The PCAST panel further recommended that DOE reinvigorate its nuclear energy research and development activities to address these potential barriers. Section 1.2.3 provides information on the nuclear energy research and development mission. There is no requirement to conduct all of these missions at one site. In the Record of

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2409: Kim Birkland (Cont'd)
Columbia Riverkeeper

Response to Commentor No. 2409

Decision process, DOE could choose to combine components of several alternatives in selecting the most appropriate strategy. For example, DOE could select a low-energy accelerator to produce certain medical, research, and industrial isotopes, and an existing operating reactor to produce plutonium-238 and conduct nuclear research and development. Should FFTF be selected for restart in support of these missions, DOE expects it could utilize a 15-year supply of mixed-oxide fuel that would be available from Germany under favorable economic terms (i.e., no charge for the fuel). The Record of Decision for the PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives. DOE has no hidden agenda for the use of FFTF. The only missions currently being considered are those analyzed in the NI PEIS, which are the production of isotopes for medical, research, and industrial uses; plutonium-238 production for future NASA space exploration missions; and U.S. nuclear research and development needs for civilian application.

2409-3: DOE notes the commentor's opinion.

2409-4: The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored, and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. The discussion in the Summary and Section 4.8.3.5 of Volume 1 on the cumulative impacts for spent nuclear fuel management at Hanford was revised to clarify that the management of the existing spent nuclear fuel at Hanford results in a dose of less than 0.1 millirem per year to the maximally exposed member of the public. This dose is well within the DOE limits given in DOE Order 5400.5. As discussed in that Order, the dose limit from airborne emissions is 10 millirem per year, as required by the Clean Air Act; drinking water is 4 millirem per year, as required by the Safe Drinking Water Act; and the dose limit from all pathways combined is 100 millirem per year. DOE has committed to remove the spent nuclear fuel at Hanford for ultimate disposition in a geologic repository.

2409-5: DOE notes the nonproliferation concern expressed in the comment, and can assure that its proposed action in the PEIS supports U.S. nonproliferation goals. This has been confirmed by the Nuclear Infrastructure Nonproliferation Impact

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2409: Kim Birkland (Cont'd)
Columbia Riverkeeper

Response to Commentor No. 2409

Assessment, published in September 2000. Although this policy analysis is not required under NEPA, DOE considers it to be an essential element in the decision-making process for the DOE nuclear infrastructure, and has included a summary of the assessment in Appendix Q in the Final NI PEIS. In the event that a decision is made to restart FFTF, the first six years of operation would use existing onsite mixed oxide fuel. DOE expects that an additional 15-year supply of mixed oxide fuel in Europe, owned by Germany, would be available for FFTF. The Nuclear Infrastructure Nonproliferation Impact Assessment for the NI PEIS alternatives stated that using the two different sources of existing mixed oxide (MOX) fuel for FFTF (existing FFTF fuel and German MOX fuel) is consistent with U.S. nonproliferation policy, and, additionally, represents a safe, low-cost opportunity to reduce civilian plutonium without chemical or bulk processing, which would afford substantial nonproliferation benefits. DOE's approach to potential use of HEU in FFTF is also consistent with U.S. nonproliferation policy. The FFTF is an existing research reactor capable of performing its research missions using HEU fuel, if MOX fuel is not available. U.S. nonproliferation policy provides for such a circumstance as part of the effort to reduce and discourage HEU use. During the period of MOX fuel use, in compliance with U.S. nonproliferation policy directives, DOE's Office of Nonproliferation and National Security would undertake a study under the Reduced Enrichment Research and Test Reactor (RERTR) program to consider the technical feasibility of using low enriched uranium to fuel the FFTF. Under this nonproliferation protocol, if use of low enriched uranium fuel is found feasible, it will be used; if found infeasible for meeting assigned missions in the FFTF, an already existing research reactor, policy would allow DOE to subsequently procure highly enriched uranium fuel for use in that facility. This approach is consistent with U.S. nonproliferation policy.

2409-6: The concerns expressed in this comment on the potential environmental impacts associated with FFTF restart are noted. The environmental impacts from restart and operation of the FFTF during normal operations and from postulated accidents are presented and discussed in Section 4.3 of the NI PEIS. All impacts to human health and to environmental media including air, water, and land are shown to be small. No fatalities would be expected from the 35-year operating period of FFTF. Any discharges would be in accordance with applicable permit and regulatory requirements and the impacts on air and water quality would be small. The potential impacts to the Hanford area and transportation corridors to and from Hanford associated with FFTF operations are also shown to be small.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2409: Kim Birkland (Cont'd)
Columbia Riverkeeper

Response to Commentor No. 2409

2409-7: Although not within the scope of the NI PEIS, DOE notes the commentor's concern with the defense mission (non-FFTF related) spent nuclear fuel (SNF) currently stored in the water basins at the 100 Area. As identified in DOE/EIS-0245F Final Environmental Impact Statement for Management of Spent Nuclear Fuel from the K Basins (January 1996), DOE has not dismissed this threat but has placed high priority on taking "expeditious action to reduce risks to public health and safety and the environment by removing (defense mission) SNF from the K Basins and, subsequently, to take action to manage the SNF in a safe and environmentally sound manner for up to 40 years or until ultimate disposition decisions are made and implemented." The incremental impacts associated with managing an additional 16 MTHM of FFTF SNF were evaluated in Section 4.3.1.1.14 of the NI PEIS for the restart of the FFTF. The radiological impact to the maximally exposed member of the public from overall radionuclide releases from the entire FFTF complex during the last year of reactor operation was less than 0.0001 mrem/year. Additionally, the dose contribution from FFTF SNF management would be expected to be a small fraction of the FFTF reactor operation dose. Therefore, it would have no discernable impact on the 0.1 mrem/year dose from the existing 2133 MTHM Hanford SNF inventory. The currently used FFTF-specific SNF storage system designs (i.e., facility storage vessels and dry storage casks) are the key contributors for determining that the incremental radiological and environmental impacts are small. Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site. In regards to the commentor's concern with the shrub ecosystem, no ecosystems across from Hanford are "highly radioactive" as a result of Hanford activities. No food or water restrictions are in place outside

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2409: Kim Birkland (Cont'd)
Columbia Riverkeeper

Response to Commentor No. 2409

the Hanford Reservation as a result of Hanford activities. Annual environmental monitoring reports are publically available.

- 2409-8:** Appendix H provides information on potential health effects other than fatal cancers. Of the three health impacts from low levels of radiation exposure (nonfatal cancers, hereditary effects, and fatal cancers), fatal cancers have the highest probability of occurrence, roughly 500 excess cancer fatalities per million person-rem. Nonfatal cancers and hereditary effects appear at rates of approximately 20 and 26 per cent of this number. Using a single number for human health impacts provides a simple direct means to compare impacts and risks among the range of reasonable alternatives. Cancer fatalities, being the largest impact, were selected for presentation throughout the NI PEIS. Low risk (low health impact) from fatal cancers implies low risk for all other radiological induced health consequences.
- 2409-9:** The No Action alternative is required under Council on Environmental Quality regulations (40 CFR 1502.14(d)). It provides a point of comparison for the action alternatives. The No Action Alternative generally represents the status quo; that is, it includes those actions that would normally take place without the proposed action. Since the status quo involves maintaining FFTF in standby and not its deactivation, it is not appropriate to include its deactivation as part of the No Action Alternative. Deactivation of FFTF is included as Alternative 5, Permanently Deactivate FFTF, and as part of Alternative 2, Use Only Existing Operational Facilities, Alternative 3, Construct New Accelerator(s), and Alternative 4, Construct New Research Reactor.
- 2409-10:** Other than the missions discussed in the NI PEIS, no alternate uses for FFTF are being considered. None of the alternatives in the NI PEIS include defense missions nor would they contribute to future weapons production. Socioeconomic impacts associated with Alternative 1 are discussed in Section 4.3 of Volume 1.
- 2409-11:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, or Alternative 2, Use Only Existing Operational Facilities.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2376: Brian Carlson

2376-1 — I was going to state this at the beginning, but I think I probably should anyway. I am opposed to the restart of FFTF.

2376-2 — The river, Columbia River, is the life blood of Gorge communities, especially Hood River, well, because I live there. That's my point of view. Without a healthy river, our communities will fall apart. In 1986, Congress created the Columbia Gorge scenic area, not the Columbia Gorge toxic sewer pipe. One of the things I tell my kids is, "Please clean up your toys before you take out any more." What I need to say to the Department of Energy: clean up your toys and stop the madness.

Response to Commentor No. 2376

2376-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2376-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor: Michael Contini
National Association of Cancer Patients

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 1700.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2367: Stephen J. Curley

2367-1 — The claimed plutonium and isotope needs for which our region would be subjected to the risks of FFTF nuclear reactor restart are now revealed to be illusionary claims by the proponents of this dangerous project.

2367-2 — The draft EIS is deeply flawed by its failure to disclose information that is essential to informed decision making. Therefore, the most prudent course of action would be to remove restart of the FFTF reactor from consideration until these concerns are addressed.

2367-3 — There is no justification for either NASA or medical isotopes.

U.S. DOE's own panel of experts conclude that FFTF is not a viable source of medical research isotopes. Even the Washington State Medical Association says there is not need for FFTF as an additional source of medical isotopes. Why wasn't this information included in the EIS?

2367-4 — Hanford needs to be cleaned up. The DOE has lied to the public on radiation gas releases in the past, and we do not believe you any longer. Do not start FFTF, and clean up the mess you have already created.

2367-5 — I guess it is legal to go from meeting to meeting, but let the record stand that the few voices you're going to hear tonight that are for the FFTF are from Richland. They bus themselves down here. I'm sorry. I don't go to your meetings. I don't believe you should come to ours.

Response to Commentor No. 2367

2367-1: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1 2.1 of Volume I was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs. DOE has taken the Expert Panel and NERAC report recommendations under consideration in developing the range of alternatives evaluated in the NI PEIS. These reports were made available to the public at the NI PEIS public information centers and on the Internet at www.nuclear.gov. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Under the No Action Alternative, DOE would continue to purchase plutonium-238 to meet the space mission needs for the 35-year evaluation period considered in the NI PEIS. However, DOE recognizes that any purchase beyond what is currently available to the United States through the existing contract would likely require negotiation of a new contract and may require additional NEPA review. The May 22, 2000, correspondence from NASA to DOE identifies that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2367: Stephen J. Curley (Cont'd)

Response to Commentor No. 2367

238 to support deep space missions. Rather, SRTG development efforts were stopped in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires one-third less plutonium-238 as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000, letter to DOE that large RTGs be maintained as backup. Section 1.2.2 of Volume 1 was revised to clarify plutonium-238 mission needs. This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

2367-2: This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS. Further, DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives. The facilities and locations evaluated in this NI PEIS specifically represent a range of reasonable alternatives for accomplishing DOE missions and serve to enable DOE to meet its responsibilities under the Atomic Energy Act. Therefore, there is no basis for removing any particular alternative from consideration. DOE made every effort to obtain, analyze, and disclose all required information to make a decision on expanding nuclear infrastructure.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2367: Stephen J. Curley (Cont'd)

Response to Commentor No. 2367

- 2367-3:** See response to 2367-1. The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.
- 2367-4:** DOE notes the commentor's opposition to FFTF restart and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 2367-5:** DOE notes the commentor's views. It is DOE policy to encourage public input on matters of regional, national and international importance as part of its commitment to facilitate a public participation process that is open and unbiased. It is not uncommon or illegal under CEQ regulations for individuals and special

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2367: Stephen J. Curley (Cont'd)

Response to Commentor No. 2367

interest groups, who may be for or against a particular proposed action or alternative, to attend multiple meetings including those outside their "home" area. However, DOE believes and strives to ensure that the hearing format used serves to promote open and equal representation by all individuals and groups, regardless of the motivation for attending.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2404: Les Davenport

2404-1 — I do support the restart of the FFTF, specifically Alternative 1, and I support expanding the DOE infrastructure because we do have a mission to supply isotopes for both research and medical and do experiments for life extension for the current nuclear reactors.

2404-2 — Two of the alternatives here are to build another nuclear reactor somewhere or to build two accelerators somewhere. We also know that the other reactors in the United States that are producing isotopes currently, the advanced test reactor and the high flux isotope reactor, in about five years will be fully booked, and they cannot keep up with demand.

2404-3 — As Colette pointed out, the radiation risks of the isotopes and the FFTF is really driven by the processing facility. I'll point out it is impossible with the targets and the material that's being created, the isotopes that's being created, it is impossible to have a criticality accident. Plutonium-238 will not go critical. It will melt itself down and the other radioisotopes will not support criticality. So you're mixing up criticality with the production of the isotopes.

2404-4 — I hear a lot about the Hanford clean-up, either people saying that it's not going fast enough or nothing's happening at all. I'd like to call your attention to the large sheets in the very far back panel. There are four of them, and this gives the plan for Hanford clean-up, and more specifically to date, there have been over two and a half million tons of dirt containing radionuclides that have been scraped up from along the river and put into a licensed CERCLA approved disposal facility in the central plateau of Hanford. Two and a half million tons has been cleaned up from along the river shore.

Secondly, one reactor has been cocooned, and two more are in process. The paper work and the biological clean-up on two more is ongoing, and by 2005 we expect to have five of those reactors cocooned so that they're not a hazard to the environment.

By 2010, they expect that all the river clean-up will be completed, and eight of the reactors cocooned.

2404-5 — First of all, the fuel for the FFTF exists. It's already manufactured. It just needs to be put into the reactor, and we'll take it for a little over six years. If the German fuel were used to extend the time, it comes from the BNR-300 reactor. That fuel is already fabricated also. It exists. It's in this world with us. All it needs to do is to be put into an outer shroud that's a hexagonal structure about six inches across on flats. That's about all that has to be done. There is no waste from repackaging this German fuel and from using the FFTF fuel to get into the reactor. That will take it out about 21 years of operation.

Response to Commentor No. 2404

2404-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

2404-2: A discussion of DOE's isotope production capability is addressed in Section 1.2.1. Assuming a midpoint growth curve for future isotope demand and a diversity and redundancy of isotope supply, it is likely that DOE's isotope production facilities, would be fully used within a 5- to 10 year timeframe if no enhancements to the existing nuclear facility infrastructure are implemented.

2404-3: DOE agrees that the possibility of a criticality is extremely low. Procedures and controls will be in place to protect personnel and facilities from contamination. Both neptunium-237 and plutonium-238 would be stored in shielded containers in quantities and configurations that preclude criticality. Target preparation and postirradiation processing would be carried out in batches involving quantities well below those at which criticality could occur.

2404-4: Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2404-5: The commentor is correct in stating that, including the unirradiated German MOX fuel currently stored in Europe, there currently exists enough fuel to operate FFTF for 21 years and that this fuel is already fabricated.

2404-6: DOE notes the comment.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2404: Les Davenport (Cont'd)

2404-6 — Now, let's consider what happens when this fuel comes out of the reactor. It, along with all the spent nuclear fuel from commercial reactors, will be treated the same, namely, it will eventually go to a geologic repository. This may be Yucca Mountain. Who knows? Whenever the government makes a decision. And it will not be reprocessed. It will not create high level waste. So there will be nothing in high level waste to go into the Hanford tanks, and every time I hear that it's going to create new, high level waste in the Hanford tanks, that's wrong, patently false, and I wish people would stop using these false statements so frequently.

The low level waste, yes, it would go into 55 gallon drums. It would have to be disposed, but this would come from reprocessing of the targets, which make the Plutonium-238 or the radioisotopes for industrial or medical, and it's that small quantity, a few dozen 55 gallon drums that are created over the period of a year that would have to be dealt with and when you compare... The waste that would be generated from FFTF can be compared to about 80,000 drums of transuranic waste, which will have to be disposed from Hanford. Eighty thousand drums versus FFTF creating through developing isotopes a couple of dozen drums per year. It's a drop in the bucket. It's something that has to be dealt with properly. No question. But it can be done, just as the waste from Hanford can be taken care of.

Response to Commentor No. 2404

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

**Commentor No. 2391: Cyndy deBruler
Columbia Riverkeeper**

2391-1 — I express extreme, extreme sadness at the fact that this meeting was called for a Monday night the last week of summer vacation. You do not encourage public participation in that manner, and you need to acknowledge the fact that over 200 people turned out in spite of that fact tonight, the first night of Monday night football, and at a 6:30 hearing when every hearing in 12 years I've ever been to has been scheduled at seven o'clock. So three strikes against us, but we're here anyway. So please listen.

Columbia River Keeper has prepared extensive comments since obviously you're not listening to our simple appeals, and I urge any members of the audience who haven't gotten one to please pick up one of the white sheets, fill it out, and we will see that we count them before sending them in so that we know how many comments were submitted, even though DOE does not count them or forward them on to Secretary Richardson obviously in looking at what happened with the last round of meetings.

It's interesting to note that there were five city council resolutions, and four of them right here in the Gorge, Portland, Seattle, Hood River, the Town of Bingen, Town of Mosher, and the Town of Lyle. All passed city resolutions opposing the restart.

Where are those representatives and those number of the population base represented? They're not even mentioned in the EIS.

I ask that be included and that Secretary of State or Secretary of Energy Richardson be made aware of those city resolutions.

Also, there's an extensive letter from Wyden's office here. Please make sure that Richardson receives that, as well.

Why don't you listen? You know, the comments have been made, and they're not being received in any way or forwarded. You have not taken what we gave you last time, which were very specific comments about the scoping of the EIS.

2391-2 — You've not justified the need. Instead you've totally ignored NASA's updated amounts of plutonium that they really need and forged ahead with this as your major mission and reason for this restart. It's not valid.

2391-3 — You need to go back and redo all of your numbers. Your cost numbers which just came out, and for some strange reason, even though you said that everybody received them, we did not get them. We've gotten them second hand from other parties.

There's not sufficient time to evaluate those numbers, but our best guess looks like about two billion more would be spent to restart FFTF than to produce medical isotopes elsewhere and buy the plutonium from Russia. So all of those numbers need to be justified.

Response to Commentor No. 2391

2391-1: The schedule for the public hearings was determined in part by CEQ guidelines for implementing NEPA that require that the hearings be held no sooner than 15 days after release of the Draft NI PEIS. Days and times were set to ensure that the expected level of public input could be fairly accommodated within the course of each scheduled hearing and that the schedule of hearings be completed in a timeframe that would enable DOE to thoroughly consider and respond to the public's comments. Section 1.4 of Volume 1 and Appendix N of the NI PEIS are intended to provide a summary of the issues and associated trends identified during the scoping process rather than a tabulation of comments by specific issue. Each such comment document was considered and entered in the NI PEIS comment tracking system. All comments received are part of the Administrative Record for this NI PEIS. In preparing this NI PEIS, DOE carefully considered all scoping comments received from the public. In fact, based on the scoping comments received, the scope of the NI PEIS was expanded in a number of areas as outlined in Section 1.4 to include adding a new alternative (Alternative 5) that would permanently deactivate FFTF. As referenced by the commentor, a number of statements, letters, or resolutions signed by multiple persons, such as city council resolutions mentioned by commentor, were received by DOE both for and against FFTF restart) in response to the request for scoping comments. The Office of Nuclear Energy, Science and Technology works closely with the Office of the Secretary to keep him informed of the progress on the NI PEIS, including stakeholder input. In preparing the Final PEIS, DOE has assessed and considered both oral and written comments received on the Draft PEIS during the public comment period and has responded to these comments in the Final PEIS. Volume 3 of the NI PEIS contains public comments received on the NI PEIS and DOE responses to those comments.

2391-2: Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2391: Cyndy deBruler (Cont'd)
Columbia Riverkeeper

2391-4 — It's on the environmental statements. They say, "Environmental impacts associated with existing inventory of spent fuel at Hanford site are minimal."

If that is what they're writing, the whole EIS needs to be thrown out and redone.

Response to Commentor No. 2391

domestic supply of plutonium 238, DOE's ability to support future NASA space exploration missions may be lost. The May 22, 2000, correspondence from NASA to DOE identifies that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium 238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

2391-3: The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Volume 2, Appendix P in the Final NI PEIS.

2391-4: DOE notes the commentor's concern with the existing inventory of defense mission spent nuclear fuel (SNF) currently stored in the water basins at the 100 Area. As stated in DOE/EIS-0245F, Final Environmental Impact Statement for Management of Spent Nuclear Fuel from the K Basins (January 1996), DOE has placed a high priority on taking expeditious action to reduce risks to public health and safety and the environment by removing (defense mission) SNF from the K Basins and, subsequently, to take action to manage the SNF in a safe and environmentally sound manner for up to 40 years or until ultimate disposition decisions are made and implemented. Consistent with the purpose of a cumulative impact assessment (i.e., to evaluate the sum of the impacts from normal operations within various environmental categories, such as public health and land use) and in full recognition of DOE's position to take expeditious action

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

*Commentor No. 2391: Cyndy deBruler (Cont'd)
Columbia Riverkeeper*

Response to Commentor No. 2391

in regards to management of the defense mission SNF, Section 4.8.3.5 of the NI PEIS addresses the cumulative impacts of the existing spent fuel and the spent fuel that would be associated with operation of FFTF. It is shown in the documents cited in that section that the radiological impact to the public from the management of the existing 2133 metric tons heavy metal (MTHM) inventory of SNF at Hanford (which consists of 2103.4 MTHM defense mission SNF, 11.0 MTHM of existing ((non defense mission)) FFTF SNF stored at 400 Area, and 18.4 MTHM of other non-defense- mission SNF) is less than 0.1 mrem/year. This dose is well below the EPA's Clean Air Act Standard of 10 mrem/year and the Drinking Water Standard of 4 mrem/year, as implemented by DOE Order 5400.5. The incremental impacts associated with managing an additional 16 MTHM of FFTF SNF were evaluated in Section 4.3.1.1.14 of the NI PEIS for the restart of the FFTF. The radiological impact to the public from overall radionuclide releases from the entire FFTF complex during the last year of reactor operation was less than 0.0001 mrem/year. The dose contribution from FFTF SNF management would be expected to be a small fraction of the FFTF reactor operation dose. Therefore, it would have no discernable impact on the 0.1 mrem/year dose from the existing 2133 MTHM Hanford SNF inventory. The currently used FFTF specific SNF storage system designs (i.e., facility storage vessels and dry storage casks) are the key factors in the determination that the incremental radiological and environmental impacts would be small.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

**Commentor No. 2369: Greg deBruler
Columbia Riverkeeper**

2369-1 — Now, let's talk about the EIS. I've spent the last 11 years looking at environmental impacts at Hanford, and we all remember the winds that were blowing up here at the fire last time, and they said there was no radiation released from Hanford ever during the fires. Broad statement. Secretary of Energy: no radiation release.

Banner headlines in the paper: "no radiation release." And the people outside here are going, "Wait a second. Does that makes sense? How could there be no radiation released at Hanford?"

Now all of a sudden we learn that the plutonium levels were 1,000 times above what they normally get, and then in the newspaper they come up and say, "Oh, the plutonium is just circulating the globe and it's everywhere."

2369-2 — The Department of Energy is here because they want to perpetuate making more waste. They want to perpetuate their game, and when I asked last time that they consider all the environmental impacts that will occur from processing to decommissioning, I didn't mean just to look at the human health risk. I meant to look at every risk that's out there.

In other words, if you tear a facility down, where is the waste going? Where is that waste going to go and what dump is it going into? And how much waste do you have in the existing dump?

2369-3 — So if you have a landfill and you've got ten million curies and you add another five million curies, what's the long-term risk for as long as those materials remain hazardous?

2369-4 — So if it's for Uranium-238, 4.4 billion years. I want a cost analysis that looks at every drop of waste produced in these perpetual missions, every existing amount of waste, because you have to know what you have currently before you can assess how much more you can add, and then look at the long-term risks.

2369-5 — The EIS has failed miserably. It is not a quality document and will end up in a court of law if they decide that FFTF is going to be a chosen option.

2369-6 — Environmental impact statement, I pride myself in knowing a lot about Hanford and knowing a lot about environmental impacts, and you know, the scientific world is an amazing things when they think of the environment as some species or maybe they say, "Oh, it's the salmon," because that's the hot thing to think about. So they do a risk analysis on the salmon.

But they forget about the clams. They forget about the lamprey in the river. They forget about the sturgeon.

Response to Commentor No. 2369

2369-1: DOE notes the commentor's views and concerns to include plutonium releases from the recent Hanford wildfire. Direct effects of the fire on the land and biota are addressed in this NI PEIS consistent with the scope of the affected environment descriptions for the Hanford Site provided in Section 3.4. The secondary effects of the Hanford wildfire of June 27-July 2, 2000 (known as the 24 Command Fire and the Two Forks Fire) are beyond the scope of this NI PEIS. Nevertheless, a brief description of the environmental monitoring and results associated with the Hanford wildfire follows. Since the initial stages of the fire and continuing to the present, DOE, in conjunction with the Washington State Department of Health and the Federal EPA, have conducted environmental monitoring on and near the Hanford Site to assess potential radiological releases. Monitoring will also continue over the long term. DOE has made these monitoring results available to the public as rapidly as possible with the results to date posted on a dedicated page on the Hanford web site at <http://www.hanford.gov/>. Regarding plutonium releases, DOE monitoring data has shown elevated levels (above levels normally seen) of plutonium in the Hanford 200 Areas. The most recent monitoring data available from EPA shows elevated levels (above background) of plutonium associated with 6 of the 61 ambient air filters collected from 23 locations surrounding the Hanford site. All of these DOE and EPA results are below EPA's "protective action guides" for emergency situations, EPA National Emission Standards for Hazardous Air Pollutants, hazardous air pollutant dose limits set by the State of Washington, and within or below EPA's acceptable risk range for protecting public health and the environment. DOE will continue to work with the Washington State Department of Health and the EPA and will post additional monitoring results as they become available.

2369-2: Decommissioning FFTF, including associated costs and cleanup, is not within the scope of the NI PEIS. Before decommission activities were undertaken, DOE would prepare the appropriate environmental documentation to address the associated environmental impacts. Cost assessments would also be prepared. DOE remains committed to cleaning up the Hanford Site independent of ultimate decision on FFTF. The amounts of wastes associated with decommissioning FFTF would be small. The schedule for cleaning up these other wastes would not be affected if FFTF were restarted.

2369-3: The risks associated with long term disposal of waste depends upon the disposal option selected. Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2369: Greg deBruler (Cont'd)
Columbia Riverkeeper

They forget about every living thing that exists in the environment, every living thing.

The science done at Hanford would make a real high quality scientist just shrivel up and walk away from the process because of what they failed to assess and what they failed to look at.

You call this an environmental impact statement. I call it an industrial development statement. It does not, does not address the environmental impacts that will occur at any of these sites or all of these sites, and it does not address the environmental impacts.

If you were to ask them what they would want the science to look at, they would simply tell you every living thing that depends on clean air, clean dirt, clean water, every living thing. So if you were to do an EIS, you would have to assess, first of all, how much waste you have at Hanford currently in the ground, in vessels that are going to fail in the time frame that they're going to be there before they're ever treated.

Then you'd have to assess those impacts to all the little critters on the surface, on the land, and in the water, because eventually that waste is going to move, and eventually it's going to migrate to the Columbia River.

And then you would have to take all of your waste that you're proposing to make, this new mission at all these different sites, and you'd have to lay that waste in on top of it, and then look at that risk over time.

The problem with our risk assessments are we look out ten years, 30 years. Maybe we try 1,000 years, but we kind of quite and shrivel up and go. We just can't handle that. Our science can't handle what I'm requiring you to do, but you can get a heck of a lot closer by doing a valid environmental impact statement.

This environmental impact statement, I guarantee you, if the Secretary of Energy was to make a decision today based on this and it was to go pro FFTF, you would lose when it comes to a court of law just in the environmental side of it, not counting all the other things you left out. Just in the assessment side of it, it fails miserably.

And I had a conversation last fall, and, Colette, you weren't in the room. It was with Shane and some other people after all the requirements we wanted in this EIS, and we had kind of a nice round table discussion, and the round table discussion really ended up with some people talking straight, and they all said, "In the time frame we have, there's no way we can do a totally credible EIS."

Response to Commentor No. 2369

that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

2369-4: The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS. With respect to waste management and cleanup issues, the Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this Agreement. FFTF milestones were placed in abeyance in the final Tri Party Agreement, as agreed by all three parties, until a decision is made on the future of the facility by the Secretary of Energy. Hanford Site cleanup is funded through the DOE Environmental Management Program Office. The alternatives considered in this PEIS would be funded by the DOE Office of Nuclear Energy, Science and Technology, which has no funding connection to cleanup activities. Waste management costs for existing cleanup activities were not presented in the Cost Report because they are beyond the scope of this NI PEIS. FFTF restart would not impact the cleanup missions at Hanford.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2369: Greg deBruler (Cont'd)
Columbia Riverkeeper

The resources are not there; manpower is not there; and the time allotted isn't there. So I don't know what we do to make this a decision that's based on credible science, which is what Secretary of Energy Richardson wants, because there is not credible science used in this.

Some of the statements in here are really appalling.

2369-7 — And I mean think of it this way. When we talk about clean-up at Hanford, we talk about CERCLA and we talk about MTCA or RCRA, the three laws we play with out there. MTCA is the one that the United States Department of Energy wants to roll over and ignore. Washington State Department of Ecology is trying to ignore it right now in the 300 area. Those laws don't even go close enough to the trust responsibility that this Federal government has to the tribes, the three sovereign nations, not counting the other 14 nations that live up and down the river.

2369-8 — One of the things that I do appreciate you putting in was Option No. 5, and I appreciate you putting in Option No. 5 because that's what I brought up.

So if Richardson doesn't make a decision in the no action alternative, shut down FFTF.

2369-9 — I would like to make a change to Option No. 1, the no action.

And in the to action, if there is no action, FFTF is shut down and decommissioned immediately, in the no action alternative, and the only simple reason is this. Two prior Secretaries of Energy, O'Leary and Watkins, both made a commitment to the people of the Northwest and the Congress that the end of the Cold War was over, that the mission at Hanford was clean-up, and that there were no further production missions at Hanford.

It was so clear that in 1995, they put it in the tri-party agreement and said they will decommission and shut this thing down, drain the sodium out of it, and put it to death. Dead, goodbye, it's finished. That's their commitment.

So if you're going to go further and delay it by no action, you owe the American taxpayers \$360 million for the last nine years that you let this thing sit around on standby and you can't allow the political morass to continue.

Response to Commentor No. 2369

2369-5: This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives. This was accomplished through review and analysis of site-specific information on the environmental conditions prevailing at ORR, INEEL, and Hanford to include a comprehensive analysis of the associated environmental and health risks of each alternative. DOE made every effort to obtain, analyze, and disclose all required information to make a decision on expanding nuclear infrastructure.

2369-6: No aspects of the impacts analysis have been omitted rather, the NI PEIS discusses impacts in proportion to their significance as specified by CEQ regulations for implementing NEPA (40 CFR 1502.2). For Alternative 1, Restart FFTF, it was determined that there was little to no potential for impacts to such resources as land use, noise, geology and soils, ecological resources (including aquatic life), and cultural and paleontological resources. DOE considers the level of detail already provided for most resource areas to already exceed that which is commensurate with the level of expected impact, as specified by CEQ regulations. The cumulative impacts of the alternatives, including Alternative 1, with respect to resource use, air quality, public and occupational health and safety, and waste management are presented in Section 4.8 of Volume 1.

2369-7: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2369-8: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2369-9: The No Action Alternative is required under Council on Environmental Quality regulations (40 CFR 1502.14(d)). It provides a point of comparison for the action alternatives. The No Action Alternative generally represents the status quo; that is, it includes those actions that would normally take place without the proposed action. Since the status quo involves maintaining FFTF in standby and not its

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

*Commentor No. 2369: Greg deBruler (Cont'd)
Columbia Riverkeeper*

Response to Commentor No. 2369

deactivation, it is not appropriate to include its deactivation as part of the No Action Alternative. Deactivation of FFTF is included as Alternative 5, Permanently Deactivate FFTF, and as part of Alternative 2, Use Only Existing Operational Facilities, Alternative 3, Construct New Accelerator(s), and Alternative 4, Construct New Research Reactor. A 1999 change to the Tri-Party Agreement (TPA) removed the planned milestone for total deactivation of the FFTF until its ultimate fate was assessed. That proposed TPA milestone change was the subject of previous public meetings.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2401: Dirk Dunning

2401-1 — I'm surprised to hear that the EIS or the Fast Flux Test Facility has not been used or considered for military missions. I think I remember a time just one ago here where it was proposed to produce tritium to produce hydrogen bombs. Somehow I think that's used for nuclear weapons.

2401-2 — I remember when I first came to work for the state, one of the very first things I ended up running into is some documents that were part of the restart arguments from a couple of times ago. I've been through three of them now. There were three before that. This thing has more lives than a cat, and one of the most discouraging things that I heard was from Al Farabee last week because when I came into this issue, I frankly don't have an opinion about whether this reactor should run or not as we started. I've developed an opinion since then, but the discouraging word that I heard from Al was that once this decision is made and we get to the end of this process in December and the Secretary makes a decision, whichever way it goes, that if the decision is against it or even if the decision is for it, for that matter, that we can expect when the administration changes next January 20th that we're going to get to reconsider it again.

2401-3 — The last one I want to comment on is the K basins. In the EIS it says that there is no significant environmental hazard from the spent fuel already on site. That's bilge.

The 2,300 metric tons of rotting fuel in those basins is a tremendous hazard. That fuel is in a condition that DOE describes as deteriorating. It's incredibly horrible. On the order of seven percent of the fuel has dissolved away into the water and left a sludge on the bottom of the basins.

The basins, when they were originally designed, were designed to leak. They're not physically joined to the reactor block. There's a seam that's a designed leakage seam, and in the case of one of the basins, K West, that seam was painted with epoxy and sealed. In the other basin, K East, it was not.

That basin has leaked probably continuously since it was first filled with water. Because that fuel is rotting, the nearest adjacent well, the K-30 well, has tritium levels of several million pica curies per liter. There's also high levels of cesium, strontium, Carbon-14, and other things, and this is 500 yards off the Columbia River.

To call that not an environmental hazard is a farce, and then to compare the 16 tons of spent fuel from the FFTF to that is just ludicrous.

Response to Commentor No. 2401

2401-1: Other than the missions discussed in the NI PEIS, no alternate uses for FFTF are being considered. None of the alternatives in the NI PEIS include defense missions and would not contribute to future weapons production.

2401-2: DOE notes the commentor's views and concerns regarding implementation of the Record of Decision for the NI PEIS. It is DOE's expectation that the Record of Decision would not be reconsidered by the new administration.

2401-3: The discussion in the Summary and Section 4.8.3.5 of Volume 1 on the cumulative impacts for spent nuclear fuel management at Hanford was revised to clarify that the management of the existing spent nuclear fuel at Hanford results in a dose of less than 0.1 millirem per year to the maximally exposed member of the public. This dose is well within the DOE limits given in DOE Order 5400.5. As discussed in that Order, the dose limit from airborne emissions is 10 millirem per year, as required by the Clean Air Act; drinking water is 4 millirem per year, as required by the Safe Drinking Water Act; and the dose limit from all pathways combined is 100 millirem per year. DOE has committed to remove the spent nuclear fuel at Hanford for ultimate disposition in a geologic repository.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2385: Rob Gosman, Jr.

2385-1 — I'd like to speak to the term "commitment" that I heard from these spokespeople here. I heard the statement you're reiterating the commitment to the Hanford clean-up. "Commitment" is a big word for me. It's a big word for most people. I've been taught to respect the word "commitment," and I'd just like to state that I, with what education I do have, have seen no proof of any kind of commitment to the people that live on this planet regarding these concerns, which kills people.

The plain language is that there is no proof that you can clean it up or that you're even willing to or that you're committed to it. You can only state it, okay, and then reiterate it, and then we can all come back and hear you state it and reiterate it again, but there is no real proof that you can actually clean it up.

2385-2 — Because we're talking about these medical and industrial isotope production, okay, and production of fuel to power future NASA missions and civilian nuclear research and development, and I'd like to speak for my family and most of all for my father. If he was here right now, he would say, "Stop."

Response to Commentor No. 2385

2385-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2385-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2405: Karen Harding

2405-1 — I work with children, and that's a pretty scary thought, dead world. I can step outside my house with a baby in my arms, and we live in the woods. You know, the air and the trees and the leaves moving, they're so alive to that. They need a world that's focused on a livable, sustainable energy source. They need a world where the adults are cleaning up, cleaning up the messes that I know are almost impossible. No one knows how to clean it up. That's why we come here for ten years, trying to figure it out.

Response to Commentor No. 2405

2405-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2374: Daniel Harvey

2374-1 — Dealing with the nuclear waste on site seems precarious to me. Dealing with the waste that already exists seems to be problematic.

The last point I'd like to make addresses the irony of creating something that is good medically, and by that very creation producing byproducts that are evil medically, creating the isotopes, and yet that's going to create more waste.

2374-2 — So if it's not clear yet, my wish is for Alternate 5.

2374-3 — I think we should spend our money on cleaning up, not on starting up.

Response to Commentor No. 2374

2374-1: DOE notes the commentor's concern regarding waste generation. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

2374-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2374-3: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2398: Harold Heacock

2398-1 — First, I'm a little bit puzzled by some of the dichotomies here tonight. Look at the amount of waste, low level, mixed waste to be generated in FFTF and the EIS, and then we looked at the amount that the hospitals in Oregon ship to Hanford for disposal, and there's substantially more waste coming out of medical uses in the State of Oregon that are disposed of at Hanford than would be generated by the FFTF. Secondly, last year Oregon fell all over itself wanting to ship us a reactor vessel from Trojan of some 26 million curies of radioactivity in it, but you know, that was safe to dispose of at Hanford, but we had to get it out of Oregon. But now we talk, well, we've got to clean Hanford up. Why don't you keep your waste?

2398-2 — I'd like to comment a few comments on some issues that have come up both in some of the handout material and in some of the comments. First is the FFTF was never intended for utilized nuclear weapons production and none are being considered by Department of Energy for it.

2398-3 — Secondly, the lower power operation of the reactor as proposed in the EIS adds substantial additional safety margin to those that already exist.

2398-4 — Accelerators to meet the isotope requirement are not available that have the energy level and size that would be required, nor are there any hard scientific data to support the construction of such an accelerator.

2398-5 — As far as start-up and operation of FFTF, it would be funded entirely separately from the clean-up mission, and as a number of folks here know, that funding is put through different committees. By law it's segregated from the clean-up money and will not interfere with the clean-up of the Hanford site.

2398-6 — You will find when you look at the total comments that are submitted on the EIS there is a substantial amount of comment provided in support of FFTF by labor, business, and governmental leaders.

In previous testimony on this subject, a large compilation of support letters, over 200 from different industrial organizations, governmental agencies, port districts and other interests were submitted to the department in support of FFTF, and we would request that these be included in the present record.

And in summary, we request the assets of FFTF receive an objective, balanced, realistic evaluation of the alternatives during the preparation of the record decision on this environmental impact statement.

Response to Commentor No. 2398

2398-1: The commentor's position on waste generation and disposal are noted. As discussed in Chapter 4 of Volume 1, if facilities at Hanford are selected to support the nuclear infrastructure missions, then waste generated during implementation of the alternative(s) would be disposed of in compliance with the Tri-Party Agreement for the Hanford Site.

2398-2: The commentor is correct in stating that FFTF was never designed for the production of nuclear weapons material and DOE is not considering any nuclear weapons related mission for FFTF.

2398-3: DOE agrees that FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small. In the event that FFTF restart is selected, a new Safety Analysis Report, including a Probabilistic Risk Assessment (PRA), will be prepared and it will address any changes in plant configuration, operating conditions and procedures. The revised safety analyses will be subjected to a thorough independent review process.

2398-4: DOE operates two accelerators that are being utilized for the production of medical isotopes, the Brookhaven Linac Isotope Producer (BLIP) located at the Brookhaven National Laboratory and the Los Alamos Neutron Science Center (LANSCE) located at the Los Alamos National Laboratory. DOE is currently in the process of upgrading the LANSCE facility with the 100 MeV isotope production facility. The upgrade is scheduled for completion in 2001. While DOE has the final design for accelerator with an energy level and size larger than the high-energy accelerator proposed in the NI PEIS, DOE has no conceptual, preliminary, or final design for an accelerator that has the energy level and size required to support the plutonium-238 production mission at the maximum production rate of 5 kilograms per year. The accelerator designs for Alternative 3 were developed to a level of detail that was adequate to assess the environmental impacts associated with the construction and operation of the proposed facilities and the technical feasibility of meeting the mission objectives. The commentor is not correct in his statement that there is no hard scientific data to support the design and construction of such a facility. Tests have been performed at LANSCE to support the design of large high-energy accelerators.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2398: Harold Heacock (Cont'd)

Response to Commentor No. 2398

2398-5: The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2398-6: DOE notes the commentor's view that there is strong support for FFTF by labor, business, and government leaders and desire for an objective and balanced evaluation of the alternatives. The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS. DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives. This was accomplished through review and evaluation of site-specific information on the environmental conditions prevailing at ORR, INEEL, and Hanford to include a comprehensive analysis of the associated environmental and health risks of each alternative. Public comments have been entered into the NI PEIS Administrative Record. In preparing the Final NI PEIS, DOE carefully considered comments received from the public. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2417: Michelle Hoffman

2417-1 — I just wanted to state for the record that I'm opposed to starting up FFTF. . .

2417-2 — I am in support of Alternative 5, which is to shut it down. . .

2417-3 — . . .clean up the waste that has already been made.

Response to Commentor No. 2417

2417-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.

2417-2: See response to comment 2417-1.

2417-3: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2411: John Hollinger

2411-1 — Your compilations of prior public comment are seriously lacking and show your failure to listen to the public. You failed to give any numerical breakdown for the 7,000 comments received. You only say “many” of the commentors who attended the meetings in Seattle, Portland, and Hood River were strongly opposed to the restart of FFTF. Then you go on to say “most” of the comments received at the Richland meeting were in support of restart.

You need to state the numbers of these comments so Secretary Richardson is clear on where the people of the Northwest stand. You put the numbers in when it is in your advantage and leave them out when they are opposed.

You also fail to mention the five city council resolutions opposing FFTF restart, which means that you have representatives of entire cities opposing it, and their numbers should be included.

You have totally misled the public. You’ve been told over and over again we don’t want this restarted. I would say pull your head out.

2411-2 — You have failed to demonstrate a compelling need for the production of plutonium for space, medical or research isotopes, or nuclear energy research. Neither is there adequate justification for the need to produce all of them at one site. Neither is there justification for the need to produce them domestically, which makes no sense when we would continue to buy foreign nuclear fuel to run FFTF.

You must include recommendations of your own blue ribbon panel, Subcommittee for Isotope Research and Production Planning. That panel advised against the use of FFTF for medical isotope production. Your own panel advised against it.

Furthermore, EIS isotope demand projections are outdated and inadequate. They also fail to take into account possible cancer cures like gene therapy that could make medical isotopes unnecessary.

In addition, medical isotopes can be adequately produced at other DOE sites if they are a high priority, as implied. Current isotope production levels for DOE reactors are misstated in the EIS at near capacity when most are only around 50 percent.

Response to Commentor No. 2411

2411-1: While all comments received during the scoping periods for both the Plutonium-238 Production EIS and the NI PEIS are part of the Administrative Record for the NI PEIS, Section 1.4 of Volume 1 and Appendix N are intended to provide a summary of the issues and associated trends identified during the scoping process rather than a tabulation of comments by specific issue. It should be noted, however, that NEPA and CEQ regulations do not require an agency to include and respond to each scoping comment as is required for public comments on a Draft EIS. In preparing the NI PEIS, DOE carefully considered scoping comments received from the public. Any perceived discrepancy in the grouping of comments raising any one particular issue or set of issues is attributable to the manner in which they were originally categorized and counted. For example, a number of statements, letters, or resolutions signed by multiple persons, such as city council resolutions mentioned by the commentor, were received by DOE (both for and against FFTF restart) in response to the request for scoping comments. Each such comment document was considered and counted as a single comment in the NI PEIS comment tracking system. The Office of Nuclear Energy, Science and Technology works closely with the Office of the Secretary to keep him informed of the progress on the NI PEIS, including stakeholder input.

2411-2: Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and of which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. The NI PEIS evaluates a range of reasonable alternatives for accomplishing the proposed action, one of which includes use of FFTF. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action. There is no requirement to conduct all of these missions at one site. In the Record of Decision process, DOE could choose to combine components of several alternatives in selecting the most appropriate strategy. For example, DOE could select a low-energy accelerator to produce certain medical, research, and industrial isotopes, and an existing operating reactor to produce plutonium-238 and conduct nuclear research and development. Should FFTF be selected for restart in support of these missions, DOE expects it could utilize a 15-year supply of mixed-oxide fuel that would be available from Germany under favorable economic terms (i.e., no

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2411: John Hollinger (Cont'd)

Response to Commentor No. 2411

charge for the fuel). The commentor also questions the need to produce these materials domestically. The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily Molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. Further, supplies of many research isotopes are not readily available from existing foreign or domestic sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed. As such, reliance on these other sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 was revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs. Whereas DOE could purchase plutonium-238 from Russia, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was similarly revised to clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions. DOE notes the commentor's concern regarding isotope demand projections and their relationship to other available therapies. In ongoing clinical testing, therapeutic radioisotopes have proven effective in treating cancers and other illnesses while minimizing adverse side effects, making their use an attractive alternative to traditional chemotherapy and radiation treatments. A forecast for future demand for medical isotopes and the expected growth rate of medical isotope use during the next 20 years is provided in Section 1.2.1 of Volume 1 of the NI PEIS. The growth projections were adopted by DOE as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information. The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2411: John Hollinger (Cont'd)

Response to Commentor No. 2411

for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities. DOE does not believe that isotope production levels were misstated in the Draft NI PEIS. Section 1.2.1 identifies that approximately 50 percent of DOE's isotope production capability is being used.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2377: Michael Hussman

2377-1 — And I've been to a lot of these meetings, and it's getting really tiring, but here I am again, and there's a lot of other people that would have liked to have been here tonight, but according to the scheduling that you guys came up with, they couldn't be here.

2377-2 — So, anyway, as far as my friends and neighbors are concerned, this is more or less the way they feel. So I kind of summed it up in a short, sweet comment, and it was you folks at the DOE really need to get a clue because the public doesn't want this going on. They're really tired of it, and until you can effectively or safely figure out a way to clean up your messes, the nuclear age is over.

Response to Commentor No. 2377

2377-1: DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and holding public hearings is an essential and required part of the NEPA process. The schedule for the public hearings was determined in part by CEQ guidelines for implementing NEPA that require that the hearings be held no sooner than 15 days after release of the Draft NI PEIS. The public also had the opportunity to comment on the Draft NI PEIS through the U.S. mail, e-mail, a toll-free fax number, and a toll-free phone number. DOE gave equal consideration to all comments, regardless of where or from whom received. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

2377-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2395: Chief Johnny Jackson

2395-1 — You know, my people, my people who live along this reservation, live along this river here and on the reservations used to enjoy live along this river, but it's kind of difficult to look at them today, to see and hear about what's happening to a lot of them.

The Yakimas who are neighbors of the Hanford Reservation, we've even opened up an area west of the Hanford — on the western side of the reservation and told my people that they can go and harvest the food there. I've seen some of it, and I told them that it wasn't worth it.

Many of my people on the reservation, in fact, on both reservations, Warm Springs, Umatilla, Colville, as well as Siakwa (phonetic) are starting to die of cancer. Leukemia, the kids and some of the young people; some of the men don't even reach the age of 30, and some of the women don't reach that age either, and they come down with cancer and die.

It never used to be that way, and it's all happened over around the Yakima Reservation, around the Colville Reservation.

We've went and we filed a suit for what is happening to the river for our people. The program was set up by the government and DOE, but the questionnaires we got and we filled out, they said, "You're not Downwinders."

In those forms, they never mentioned nothing about the water and the river, which is being contaminated and polluted by Hanford.

I caught fish quite a few years ago which started me to fight against Hanford. Right here in this river every one of them fish were contaminated. They were going back upstream. You've never seen fish with no eyes but still alive swimming up river, and the bodies of those fish that were badly mutilated.

I got them fish out of my nets, and I turned them over to the authorities who were supposed to send them to the laboratory for further studies. For some reason they didn't reach there because I never got no report back on them.

On a national conference up at Montana the year before last, some people came to that conference from the Colville Reservation to ask us for help. They wanted us to intervene in looking into a lawsuit or doing something about what is happening to their animals on the Colville Reservation, the wildlife.

2395-2 — You've never seen kids like I have in Arizona that are in the hospital that can't walk, can't talk and some that cry day and night, but still — you want to start up this Hanford, you're going to start up this reactor again. We can do without it and I hope you stop it.

Response to Commentor No. 2395

2395-1: The commentor's concerns about contamination of rivers and tribal lands are noted. As discussed in Chapter 4 of the NI PEIS, implementation of the nuclear infrastructure alternatives would not be expected to result in radioactive or chemical contamination of the Columbia River or land surrounding the Hanford Site. No food or water restrictions are in place outside the Hanford Site as a result of Hanford activities. As shown in Figures K-10 and K-11 of Appendix K (Environmental Justice Analysis), the western boundary of the Yakama Indian Reservation is approximately 30 kilometers (19 miles) southwest of the nearest boundary of the Hanford Site. Although the Yakima River flows along western boundary of the Yakama Reservation and along a portion of the southern boundary of the Hanford Site, the reservation is upstream from the Hanford Site. Prevailing winds at the Hanford Site blow from the south to south-southwest directions toward Grant County. Hence, Grant County would be expected to bear a major burden of wind borne contamination from the Hanford Site. As discussed in Section 3.4.9.3 of Volume 1, the question of whether residents in the Hanford area are subject to elevated cancer rates is unresolved. Existing studies and data suggest that cancer mortality rates in counties adjacent to the Hanford Site are not elevated. Although Yakima County was not included in the studies cited in studies cited in Volume 1, Section 3.4.9.3, the impacts of the Hanford site on counties adjacent to the site boundary would be expected to exceed the impacts on the Yakama Indian reservation. Available data and studies described in Volume 1, Section 3.4.9.3 do not exclude the possibility of elevated cancer mortality rates on the Yakama Reservation. Currently accepted factors for conversion of effective dose equivalence to latent cancer fatalities include age dependence, but no dependence on race or ethnic origins. Although the question of whether the Hanford Site causes or promotes excess cancer mortality rates on the Yakama reservation is unresolved, implementation of the Alternatives described in Volume 1, Section 2.5 of Volume 1 would not be expected to result in latent cancer deaths among the population residing on the Yakama reservation because the resulting radiation doses in Yakama County would be small in comparison to that required to produce an excess cancer fatality. The Colville Indian Reservation is approximately 320 kilometers (200 miles) north-northwest of the Hanford Site. Along the Columbia River, Colville Reservation is upstream from the Hanford Site. It is in the direction of prevailing winds from the Hanford Site. As discussed in the paragraph above, airborne radiological and chemical contaminants from the Hanford Site would be expected to primarily impact Grant County, and there is no evidence of excess cancer mortality in Grant County. Impacts on the Colville Reservation would be expected to be much less than those on Grant County because the airborne concentrations of radioactive materials and

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2395: Chief Johnny Jackson (Cont'd)

Response to Commentor No. 2395

hazardous chemicals decrease with increasing distance from the source. Operations at the Hanford Site would not be expected to adversely affect fish in the Yakama River. According to an International Atomic Energy Agency (IAEA) publication (IAEA Technical Report Series No. 332, Effects of Ionizing Radiation on Plants and Animals at Levels Implied by Current Radiation Protection Standards), a dose rate of 100 millirem per year to the most exposed human will lead to dose rates to plants and animals of less than 0.1 rad per day. The IAEA concluded that a dose rate of 0.1 rad per day or less for animals and 1 rad per day or less for plants would not affect these populations. As discussed in Section 3.4.9.1 1 of Volume 1, the largest individual dose to the public from normal operations at the Hanford Site in 1997 was 0.004 millirem, which is more than four orders of magnitude less than the IAEA threshold for adverse effects. For the same reason, impacts to ecological resources would be small in the immediate area of the Hanford Site and negligible at all distant locations.

2395-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2392: Robin Klein

2392-1 — This reactor [FFTF] has been in search of a mission for ten years, and this EIS has been uniquely crafted to specifically justify its restart, and that's despite the lack of demonstrated need.

2392-2 — And even so, the EIS shows that FFTF start-up would pose the largest risk from accident compared with the other alternatives.

2392-3 — It would create 6,000 cubic meters of new waste, contaminate an uncontaminated facility, the FMEF, which by the way doesn't get spoken about much, but the contamination and the volume of waste produced by that facility would be the vastest.

2392-4 — And it also doesn't mention that DOE would foot the entire bill for NASA's plutonium supply that would be produced there.

2392-5 — But here we are again, despite the many times we've been here before and despite the overwhelming opposition that has been brought up over and over again, and that is the city councils that have come up in full opposition. The two largest cities in this region have come out in full opposition.

Oregon state legislature two years ago specifically came out in opposition. That was overwhelming, bipartisan agreement, and a conservative Republican legislature.

We have had it over and over again, our congressional delegates speaking out against restart.

The message doesn't seem to be getting through, but I'm glad right now that we are at the end game here supposedly. The decision is to be made. We hear from Richardson by the end of the year. So I look forward to him honoring that commitment.

And I also see this as a challenge for democracy. This is the true test. If this decision that goes forward with the restart of FFTF, if he does not shut it down, then he has not heard anything. He has not heard that the citizens in the Northwest are overwhelmingly opposed to this facility, and I will no longer believe that we are living in a democracy, that Richardson, the Clinton-Gore administration and public process mean nothing.

Response to Commentor No. 2392

2392-1: Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. The NI PEIS evaluates a range of reasonable alternatives for accomplishing the proposed action, one of which includes use of FFTF. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

2392-2: FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Sections 4.2-4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from implementation of alternatives, including normal operations and a spectrum of accidents that included severe accidents. Although there are minor differences in the risks among alternatives, the environmental analysis showed that radiological and nonradiological risks associated with all the alternatives would be small.

2392-3: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (i.e. solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. DOE notes the commentor's concern regarding contamination of new facilities that have never been contaminated (i.e., FMEF). Information regarding waste generation from processing and fabrication or irradiated targets is discussed in Sections 4.3.3.1.13 and 4.4.3.1.13. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2392: Robin Klein (Cont'd)

Response to Commentor No. 2392

the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

- 2392-4:** The commentor is incorrect that DOE is responsible for the entire cost of NASA's plutonium-238 supply, although DOE is mandated by the Atomic Energy Act to provide isotope production support for other federal agencies. Through an interdepartmental arrangement with NASA, DOE is reimbursed for plutonium-238 production and for associated power system hardware.
- 2392-5:** DOE notes the commentor's views. The Secretary of Energy will make the programmatic decisions with respect to the alternatives presented in this NI PEIS to accomplish the DOE missions. Decisions made will be published in the Record of Decision no sooner than 30 days after publication of this NI PEIS. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2415: Bob Lanbeer

2415-1 — Anyway, I was a contractor in Olympia for many years, and you know, really the cleanup report of the Hanford site, boy, I was in the wrong business. I mean, get this. I bid on this contract. I went ten times over on my bid, right? Could walk away from the job, and I get paid all that money, and somebody else would come in and take the place and I did a good thing.

I really don't believe the Department of Energy is even the slightest bit interested in cleaning up their mess.

2415-2 — What the deal is, is in the back of their minds they know that somewhere in the next 20 years we're going to run out of oil. Right? When we run out of oil, all of a sudden now there's going to be this national emergency because people's cars are going to be at the gas stations. Everybody is going to say, "Hey, what can we do?"

All of a sudden, hey, what about nuclear power? So by the Department of Energy just keeping these reactors going, keeping the technology going, people are going to make some really bad choices. All of a sudden they're going to say, "Hey, this is the best that we've got."

Hey, why don't we start spending some money doing renewable energy projects? Right now minimal dollars; I mean, the Department of Energy right now has a two million solar roof project, and basically what they're trying to do is they're trying to get solar power out there.

But the problem is they're not investing any money into it. There's no money available, but here we're going to spend billions of dollars to keep pushing a technology that we know is bad. Hey, let's get the price of solar energy down, and let's start looking at wind power. Let's start looking at, you know, micro hydroelectric power, start pushing those industries, start putting money into those industries because when the time comes we're out of oil, 2020 or whatever year they figure, hey, let's make some good choices.

Response to Commentor No. 2415

2415-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2415-2: DOE notes the commentor's interest in alternative energy sources, although issues of research and development of alternative energy sources are beyond the scope of this Nuclear Infrastructure PEIS. The DOE missions to be addressed in this EIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development, can currently only be met using nuclear reactor or accelerator technologies.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2366: Daniel Lichtenwald

2366-1 — The development of the NI PEIS glosses over the potential long-term barriers aspects and jumps heartily to the conclusion that DOE's nuclear R&D initiatives require an enhanced nuclear facility infrastructure in three basic categories: materials research, nuclear fuel research, and advanced reactor development, nothing about those potential long-term barriers to expanded use of nuclear power, like waste, proliferation, safety and economics.

2366-2 — Indeed, the analyses provided in all of the NI PEIS documents of the alternatives and relevant infrastructure and facilities devote a higher level of detail and evaluation to the FFTF than they do for all other elements supposedly under consideration.

2366-3 — Any R&D and consultant production at Hanford should be devoted to the as yet unresolved problems of containment, storage, and intricate processes and neutralization of toxics.

As I've said at previous meetings, DOE has a conflict of interest as a federal agency responsible for management of clean-up at the Hanford site. As long as DOE is committed to responsibilities that it sees as being to, "insure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development activities related to development of nuclear power for civilian use" it is not surprising that it can't keep its fingers out of the FFTF and perennially gives short shrift to the problems of clean-up at Hanford.

Opening up a toxic waste dump that is out of control to new sources of toxics is not a good idea. The needs to end World War II were met by the creation of a unique project and oversight at Hanford. Now we are living with a need to eliminate the hazard that Hanford has become for all life for all time in the region.

A new project and oversight needs to be created or brought in. We don't need a Department of Energy there. We need a department of clean-up.

2366-4 — Staying with the script, we prefer that Alternative 5 be selected, that the FFTF be taken out of standby, be deactivated and dismantled...

2366-5 — Alternative 3 can be considered if facilities resource — reluctantly considered if facilities, resources and activities at Hanford are not involved.

2366-6 — Alternative 4 is unacceptable as that calls for construction of another reactor and another source of toxic waste.

Response to Commentor No. 2366

2366-1: In January 1997, President Clinton tasked his Committee of Advisors on Science and Technology (PCAST) to evaluate the current national energy research and development portfolio and to provide a strategy that ensures the United States has a program to address the Nation's energy and environmental needs for the next century. In its November 1997 report responding to this request, the PCAST Energy Research and Development Panel determined that restoring a viable nuclear energy option to help meet our future energy needs is important and that a properly focused research and development effort to address the potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) was appropriate. The PCAST panel further recommended that DOE reinvigorate its nuclear energy research and development activities to address these potential barriers. Further information on the need for nuclear energy research and development is provided in Section 1.2.3 of Volume 1.

2366-2: In order to adequately evaluate and demonstrate the potential environmental consequences of Alternative 1, Restart FFTF, as contained in Chapter 4 of Volume 1, it was necessary to fully characterize the standby condition in both Chapters 3 and 4 so that the incremental impacts of restart could be clearly presented. Further, the facility descriptions for FFTF (e.g., as contained in Appendix D) are also somewhat detailed owing to the relative uniqueness of the facility's design and the need to discuss its historical operations and proposed operations after restart, including projected facility modifications. Although there are necessary additional informational elements contained in the NI PEIS for FFTF, a comparable level of detail has been provided for the other proposed facilities on such elements as core configuration and facility layout. Other factors that add to the additional level of discussion necessary for FFTF surround the fuel use options that are assessed for FFTF operation. A similar situation exists for FMEF in that it has never operated for its intended use requiring that an additional level of detail be provided in describing the baseline operating conditions of this facility and those during its proposed operation to support the DOE missions. Chapter 3 of Volume 1 has been revised to include additional, comparable baseline information for the other processing and irradiation facilities under consideration. However, DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives and candidate facilities. DOE made every effort to obtain, analyze, and disclose all required information to make a decision on expanding nuclear infrastructure.

2366-3: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research

*Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)**Commentor No. 2366: Daniel Lichtenwald (Cont'd)**Response to Commentor No. 2366*

applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission. DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. DOE also notes the commentor's desire for a separate department of cleanup.

2366-4: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, support for Alternative 3, Construct New Accelerator(s), at a site other than Hanford, and opposition to Alternative 4, Construct New Research Reactor. It should be noted that the FFTF would be deactivated and not dismantled under Alternatives 2, 3, 4, and 5.

2366-5: See response to comment 2366-4.

2366-6: See response to comment 2366-4.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2383: John P. Mansfield

2383-1 — Hydroelectric power is down the street. You did all kinds of studies, and what for? And you're going to open another nuclear power plant, poison the water, poison the fish, poison our children again?

Now, radioactivity versus geothermal energy. You've got all kinds of geothermal things around here. Why not use them instead? Costs too much money.

2383-2 — Okay. Mr. Clinton and Mr. Blair, you also failed to analyze lower cost alternatives, such as subsidizing university reactors. Great, or buying time from private accelerators or reactors.

2383-3 — Man has raped this planet since time immemorial, and I think, you know, the heavenly plan would be to get rid of Hanford. It's not a national asset. Gentlemen, it's a national liability.

Response to Commentor No. 2383

2383-1: DOE notes the commentor's interest in alternative energy sources, e.g., geothermal and hydroelectric, although issues of research and development of alternative energy sources are beyond the scope of this Nuclear Infrastructure PEIS. Chapter 4 of the PEIS evaluates potential environmental and waste management impacts, and makes clear that the PEIS alternatives would provide for safe waste management without adverse or harmful effect on the environment. The DOE missions addressed in this PEIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development, can currently only be met using nuclear reactor or accelerator technologies.

2383-2: The NI PEIS considered the use of a wide range of irradiation facilities, including those operated by universities and private concerns. Privately owned and operated CLWRs were added to the PEIS scope for the production of plutonium-238 and were analyzed in detail in the document. University reactors were considered, but were dismissed because they do not have sufficient available core volume to accommodate the required missions. Section 2.6.1 provides a complete discussion of irradiation facilities considered but dismissed.

2383-3: DOE notes the commentor's concerns regarding Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2407: Anne Moore

2407-1 — I also can't believe I'm coming back here again. It seems like this is just a process driven to wear us down maybe.

I'd like to start out with a favorite quote I have from Burl Ives in "Cat on a Hot Tin Roof." Maybe you remember this. "Mendacity, mendacity," because I think what we're hearing here are lies. We have lies from the DOE and lies from their corporate partners, TRIDEC, who sound a lot like a science fiction movie villain except they're real life, who by the way have presented us with a nice Orwellian propaganda table.

So what is this National Association of Cancer Patients? How come I've never heard of you? If there's so many of you, why have I never run into you before? And who are you sponsored by?

You know, people have been bused in to try to convince us that if we oppose the restart of FFTF, we want cancer patients to die. That's patently untrue.

2407-2 — My uncle is getting the radioactive isotopes for treatment from his cancer, and I certainly support that, and I don't want him to die. This is just a pure Orwellian smoke screen.

Few, if any, in here want to prevent medical research in cancer treatment, nor will it be prevented. As these people know, medical isotopes have been, are, and will continue to be available without the restart of the FFTF. There is no delay in time for my uncle to get treatment. I don't believe that there really is a shortage.

2407-3 — What we have here is a good, old fashioned and still popular greed fest. Hiding under a mask of social concern, we have a bureaucratic dinosaur government agency in a small desert community, have very selfish, money oriented people who put money above the continuance of life on earth, and these two groups are putting our lives and the lives of our children and all future generations at risk, all for a fast buck. That is the bottom line with this whole program.

2407-4 — Yes to Alternative No. 5, please.

2407-5 — And please clean up the mess you've already made.

Response to Commentor No. 2407

2407-1: DOE notes the commentor's remarks. DOE is committed to discharging its responsibilities in an open and unbiased manner and providing the public with comprehensive environmental reviews of its proposed actions.

2407-2: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs. The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs. Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term (less than 5 years).

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2407: Anne Moore (Cont'd)

Response to Commentor No. 2407

2407-3: DOE notes the commentor's concerns. DOE remains committed to its mission to serve the Nation in energy matters, and in particular, with respect to its nuclear facility infrastructure, to ensure the availability of isotopes for medical and industrial use, to meet the nuclear material needs of other Federal agencies, and to undertake research and development related to the application of nuclear energy for peaceful, civilian use.

2407-4: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2407-5: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2371: Michael Mulhall

2371-1 — . . .so that we don't see what happened here in Hanford since the start-up of all this go down. All I can say I'm against this.

2371-2 — I think we should take all this money that you're willing to throw away again, our money, the people's money, and start cleaning up the mess we've already created.

Response to Commentor No. 2371

2371-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2371-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2406: Wanda Munn
Nuclear Medical Research Council

2406-1 — I'm president of the Nuclear Medical Research Council. Our concern is over the use of isotopes and the shortage that exists in the United States. Therefore, we were very pleased to have the Department of Energy address nuclear infrastructure on a large scale.

It's very difficult to not react to many of the statement and misstatements that were made during the course of this evening, but I want to try to focus what my organization would be interested in, which is the contents of the EIS and what it means. There was one slight misrepresentation, I think, with respect to the need for additional medical isotopes just for research and development. The statement that this particular facility was not needed for that is slightly misleading.

It's true that most currently used R&D isotopes can be produced in smaller quantities elsewhere, but there is no other fast reactor that can produce some few which have caused the shutdown of some clinical trials because it was impossible to obtain them anywhere, either in the United States or in Canada.

The one thing that the EIS seems to have done quite well is to point out the major holes that exist in the infrastructure. Any objective assessment of the information that's given would see very clearly that the operation of the Fast Flux Test Facility would be the most expedient, would be the safest, and would be the most efficient way of filling those holes in the short term.

We urge the choice of Option 1 for restart.

Response to Commentor No. 2406

2406-1: DOE notes the commentor's support for Alternative 1, Restart FFTF. DOE assumes the commentor is also referring to conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000, regarding the suitability of FFTF for producing research isotopes in a timely and cost-efficient manner. However, these conclusions were made in the context of the facility producing research isotopes as its sole mission. Sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2378: Judy Nelson

2378-1 — Shame on you for holding these meetings in half of July, all of August, the top vacation times, and two weeks in September when everybody is getting their kids settled into school. That is inappropriate. It's unprofessional, and it's not plain fair. And then you slipped in at the beginning of the meeting that there were things that you sent out to 1,000 people so that we have information that we don't have access to, and you're going to release some more information in two more weeks, but we can read that and we can comment on it. My calculations, if this goes on until September the 18th, that would leave us four days to get hold of it and make comments if you're releasing it in two weeks. Not possible. Shame on you for doing it that way. It's not professional.

2378-2 — The analogy is Hanford is soiled, and it's growing as it reaches closer to the river and as it burns up in the grass, and for God's sake don't eat the jackrabbits or the deer up there on that reserve. They're all contaminated and radioactive, and the fish. In fact, there are people I know who used to come to Hood River every winter. They don't come anymore. So you think there's an economic impact? Yes, but there's a life impact.

Well, saying you want to start up Hanford again is like getting the old lady with 100 to 200 animals to promise she'll clean the place up and then, "Oh, by the way, would you take some more animals?"

So what you're wanting us to do is to believe that even though you have failed your promises in the millions and hundreds of millions of dollars that have been put in there to G.E., to Martin Marietta, to all the other companies, and about the time things get hot, they let loose of the contract and pass it on to the next guy. So they're really only paying off their stockholders.

It's a game. It's a shell game. It's also the people up there in Tri-Cities thinking they can't survive without you. Well, let me tell you folks up there, it's okay. You will survive without them. In fact, you may survive longer because you won't be dealing with the radioactivity. The analogy: Hanford is a mess. Clean it up. Don't break your promise. And listen to what the scientists have said they don't need.

2378-3 — And finally, I am a cancer survivor, ovarian cancer, 85 to 95 percent death rate. So every day to me is a gift. They don't know why it's come on so suddenly. Well, guess. Anything that's shot up in the past couple of decades. But let me tell you where my radiation came from. I lived 15 miles from Oak Ridge, Tennessee, when I went to college. It's in a valley, and I got radiation for four years because they were doing their own downwinder experiments at that time.

I lived near Paducah, Kentucky, and they just now this past year have told the dying men that, "Yes, you were right after all. We just didn't want to tell you before, but, yeah, you are dying from radiation sickness," which they knew all along, but they would not admit it to them.

Response to Commentor No. 2378

2378-1: The schedule for the public hearings was determined in part by CEQ guidelines for implementing NEPA that require that the hearings be held no sooner than 15 days after release of the Draft NI PEIS. DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and holding public hearings is an essential and required part of the NEPA process. The public also had the opportunity to comment on the Draft NI PEIS through the U.S. mail, e-mail, a toll-free fax number, and a toll-free phone number. DOE gave equal consideration to all comments, regardless of where or from whom received. In preparing the Final NI PEIS, DOE carefully considered comments received from the public. The costs and nuclear nonproliferation impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such ancillary documents need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed these documents to more than 730 interested parties on August 24 and September 8, 2000, respectively. Both reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided summaries of the Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment in Appendixes P and Q, respectively in the Final NI PEIS.

2378-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2378: Judy Nelson (Cont'd)

Response to Commentor No. 2378

designated for Hanford cleanup, regardless of the alternative(s) selected. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1. The environmental impacts associated with operation of the FFTF and support facilities at Hanford during normal operations and from postulated accidents are presented and discussed in Section 4.3 of the NI PEIS. All impacts to human health and to ecological resources would be small in the immediate area of the Hanford Site and negligible at all distant locations.

2378-3: The commentor's concerns about radiation from the Oak Ridge Reservation and Paducah are noted. Risks to the public that would result from implementation of the nuclear infrastructure alternatives are described in Chapter 4 of Volume 1.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2397: Christopher Nygard

2397-1 — I would like to say that I would like DOE to take Alternative 5, the shutdown of the FFTF reactor as the only option in your project.

2397-2 — I would also like to ask that you be accountable in numbers to report directly back in a report, in numbers, how many people have opposed and how many people are for the FFTF reactor. I feel that you've done us a great injustice.

Response to Commentor No. 2397

2397-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2397-2: Section 1.4 of Volume 1 of this NI PEIS, as supplemented by an expanded discussion provided in Appendix N, summarizes the prevailing issues and concerns raised during the scoping process to include identification of prevalent issues raised at individual scoping meetings. It should be noted, however, that NEPA and CEQ regulations do not require an agency to include and respond to each scoping comment as is required for public comments on a Draft EIS. While all comments received during the scoping periods are part of the Administrative Record for the NI PEIS, Section 1.4 and Appendix N are intended to provide a summary of the issues and associated trends identified during the scoping process rather than a tabulation of comments by specific issue. In preparing the Final PEIS, DOE has assessed and considered both oral and written comments received on the Draft PEIS during the public comment period and has responded to these comments in the Final PEIS. Volume 3 of the NI PEIS contains public comments received on the NI PEIS and DOE responses to those comments. These comments are summarized, tabulated, and cross-referenced by commentor, category, and method of submission.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor: Laurel Pippo

The oral comments were submitted in written form and are addressed in the responses to Commentors Nos. 410 and 1488.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

**Commentor No. 2380: Gerald Pollet
Heart of America Northwest**

2380-1 — Well, according to their cost report, they must — one of you has to take it home because under the alternative for restarting FFTF there's no cost assigned for ever shutting it down or cleaning it up. So I assume they expect someone to take it away for free. So check your trunks. Look in your back packs. Pieces of the nuclear waste are there. That's commercial disposal, too, I take it.

2380-2 — I'm . . .with Heart of America Northwest, and we joined the eight members of the United States Congress, the City Commission of Portland and mayor, members of the City Council of Seattle in saying that we are dismayed at the illegal action of the Department of Energy in pretending to disclose the environmental impacts in an environmental impact statement while hiding, one, what would be done with the wastes; a separate report — you can't see it until after the hearings.

Two, what the costs are; a separate report — you can study it after the hearing. Three, what are the nuclear nonproliferation impacts? Separate report — you can find out about the impacts and comment on them and see if we misled the public about those after the hearing.

2380-3 — Four, we failed to disclose to you, sorry, that NASA has totally changed the demand for plutonium-238.

Now, why should we trust this process? What does the environmental impact statement say about these specific reactors?

"Without these power systems, these types of space exploration missions could not be performed by NASA, speaking very specifically about the very specific reactors and their very specific plutonium needs."

But NASA wrote May 22nd, "We're not going to use that particular reactor at all. We have a new advanced technology."

Now, there was plenty of time to disclose this to you. Colette only disclosed it to us today after Senator Wyden and seven members of Congress wrote the Secretary of Energy today saying that they were dismayed like the rest of us about this lack of disclosure.

2380-4 — What else has not been disclosed? Oh, yes. A subcommittee that we were told to wait the report of. A blue ribbon medical advisory committee said, "You shouldn't think about using this reactor (a) for research medical isotopes and (b) you shouldn't be in the business of producing the 'commercial' radioisotopes either," and lists four highly recommended alternatives, which you won't find in the environmental impact statement. That's full disclosure.

2380-5 — Now, we come today, and I'm dismayed to find out that instead of what's in the EIS about what would be done with the nuclear wastes from FFTF reactor restart, the presentation today says, "Oh, we might violate the Secretary of

Response to Commentor No. 2380

2380-1: DOE notes the commentor's views. Deactivation of FFTF is not part of implementing Alternative 1, Restart FFTF. Deactivation of FFTF is part of implementing Alternatives 2, 3, 4, and 5 and including the cost of FFTF deactivation in the implementation costs for these alternatives is appropriate. The Cost Report was structured to identify the implementation costs of the various alternatives so the Secretary of Energy would have this information along with other data for consideration. Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

2380-2: Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site. Further, the draft Waste Minimization and Management Plan for the Fast Flux Test Facility (May 2000)

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2380: Gerry Pollet (Cont'd)
Heart of America Northwest

Energy's commercial disposal policy enunciated to Congress repeatedly that the Department of Energy will not use commercial disposal facilities", not to mention it is against the law for the Department of Energy to attempt to dispose of certain wastes at commercial disposal facilities.

So we have another moving target. What do we learn about these wastes? If you look at the environmental impact statement, "the restart of FFTF would not be expected to result in impacts on ecological resources, the facilities, research and developments for it would not result in impacts on ecological resources at Hanford facilities, and it has referred to the same chapter that Colette Brown referred me to in answer to the question earlier today."

And you turn to that section, and you find the following: what is the cumulative impact analysis? The cumulative impact analysis is this. Sufficient capacity would exist to manage the site wastes. The tanks are already in violation. The low level burial grounds are in violation of federal and state hazardous waste laws. The mixed waste burial ground permit says that it is predicated on the capacity for Hanford clean-up, not new additional wastes.

2380-6 — It is time for this environmental impact statement to withdraw FFTF

2380-7 — [It is time for this environmental impact statement to withdraw FFTF] and to be honest in its full disclosure.

Response to Commentor No. 2380

was referenced in the NI PEIS and made available prior to the public hearings. The costs and nuclear nonproliferation impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such ancillary documents need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed these documents to more than 730 interested parties on August 24 and September 8, 2000, respectively. Both reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided summaries of the Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment in Appendixes P and Q, respectively in the Final NI PEIS.

2380-3: DOE notes the commentor's concern about NASA's need for plutonium 238 for space missions. The May 22, 2000, correspondence from NASA to DOE identifies that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

2380-4: The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

*Commentor No. 2380: Gerry Pollet (Cont'd)
Heart of America Northwest*

Response to Commentor No. 2380

civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities. DOE has taken the NERAC report recommendations under consideration in developing the range of alternatives evaluated in the NI PEIS. This report was made available to the public at the NI PEIS public information centers and on the Internet at www.nuclear.gov. The NERAC report did not state that DOE should not be in the business of producing radioisotopes. Rather, the report stated that DOE should "Limit commercial isotope production to products where the DOE has a unique production capability and where other market supplies are not sufficient to meet U.S. demand." DOE's production and sale of radioisotopes fall into two categories, commercial and research, and both types of isotope production are considered under the proposed actions. Commercial radioisotopes are those that are produced in large, bulk quantities and sold to pharmaceutical companies or distributors, or to equipment or sealed source manufacturers. Examples of commercial radioisotopes produced by DOE include strontium-82 and germanium-68 for medical applications, and iridium-192 and californium-252 for industrial applications. DOE only produces commercial isotopes when there is no U.S. private sector capability or when foreign sources do not have the capacity to meet U.S. needs reliably. In contrast, research radioisotopes are typically produced and sold in small quantities in response to specialty orders from researchers preparing experiments in the field of medicine, with small quantities of these radioisotopes also purchased by industrial researchers. Because small-quantity production of research isotopes is not financially attractive to private-sector producers and is generally not undertaken, DOE attempts to provide all research radioisotopes that are requested, subject to production capability, inventory, and financial constraints. As successful application of a specific research isotope is established, the production and sales of that radioisotope may shift from research to commercial status. In recent years, over 95 percent of DOE's sales of radioisotopes by dollar volume were commercial and 5 percent have been for research. Additional discussion of how DOE's isotope program fits into the overall

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2380: Gerry Pollet (Cont'd)
Heart of America Northwest

Response to Commentor No. 2380

U.S. and foreign isotope production capabilities was incorporated into Section 1.2.1 of Volume 1.

2380-5: Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site. DOE Order 435.1 "Waste Management" gives responsibility to the DOE Field Element Managers to approve exemptions for use of non-DOE facilities for the storage, treatment or disposal of DOE radioactive waste based on certain requirements. One of these requirements is that the facility must have the necessary permits, licenses, and approvals for the specific waste. As discussed in DOE's "Commercial Disposal Policy Analysis for Low Level and Mixed Low-Level Wastes" dated March 9, 1999, there are three commercial low-level radioactive waste disposal facilities (i.e., Envirocare of Utah; Barnwell, South Carolina; and US Ecology, Richland, Washington) which are currently operating and licensed to receive low level radioactive waste. Envirocare of Utah also has a permit to receive RCRA hazardous wastes. DOE has and is currently disposing of low level radioactive waste and mixed low-level radioactive waste at Envirocare of Utah and has sent low-level radioactive waste to Barnwell, South Carolina. In June 1995, US Ecology submitted an unsolicited proposal to DOE for the disposal of DOE waste at the US Ecology facility. In November 1995, the State of Washington informed US Ecology and DOE that it would allow the disposal of DOE waste at the facility subject to certain conditions. The Low-Level Burial Ground trenches are regulated by DOE under the Atomic Energy Act of 1954, as amended, and under DOE Order 435.1, Radioactive Waste Management. This Burial Ground also contains the following three active permitted mixed waste trenches whereby mixed low-level waste is both stored and disposed of: (1) Trench 31 is a permitted, lined Subtitle C disposal trench that is currently utilized for greater

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2380: Gerry Pollet (Cont'd)
Heart of America Northwest

Response to Commentor No. 2380

than 90-day storage of mixed low-level radioactive waste; (2) Trench 34 is a permitted, lined Subtitle C disposal trench currently utilized for the disposal of mixed low-level radioactive waste that has been treated and is compliant with Land Disposal restrictions; and (3) Trench 94 is a permitted, unlined disposal trench utilized for the disposal of decommissioned naval reactor components. Use of Trench 94 for naval reactor compartments is authorized under a special exemption from the Washington State Department of Ecology (Ecology). Currently, the Low-Level Burial Ground has a Part A Permit approved by Ecology under the State of Washington Dangerous Waste Regulations, State of Washington Administrative Code (WAC) 173-303, and, as such, is an interim status treatment, storage, and disposal (TSD) unit under the Resource Conservation and Recovery Act (RCRA). The permitted active and future mixed waste units of the Low-Level Burial Ground meet all regulatory requirements of WAC 173-303 and RCRA and will be incorporated into the Hanford Site RCRA Facility Part B Permit and will operate under final status regulations. In early June 2000, a working draft of the Hanford Site RCRA Facility Part B Permit application was submitted to Ecology. The use of proposed alternative facilities associated with reprocessing of neptunium-237 targets would have no impact on schedules or available funding for high-level radioactive waste programs at Hanford. The higher activity waste would be treated as a solid form via a stand-alone vitrification system, separate from any tank waste treatment system. The existing Hanford high-level radioactive waste facilities would not be used, and as analyzed in the PEIS, no existing or planned high-level radioactive waste facilities would be used to treat the wastes resulting from processing the irradiated targets.

2380-6: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2380-7: This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS. Further, DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives. The facilities and locations evaluated in this NI PEIS specifically represent a range of reasonable alternatives for accomplishing the DOE missions and serve to enable DOE to meet its responsibilities under the Atomic Energy Act. Therefore, there is no basis for withdrawing any particular alternative. DOE made every effort to obtain, analyze, and disclose all required information to make a decision on expanding nuclear infrastructure.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2413: John Ritter

2413-1 — Just very briefly, I'm totally against FFTF restart, and that's all I have to say about this.

2413-2 — I can't believe that we're even dealing with this matter anymore, and I'm just hoping to God that the decision hasn't already been made.

Response to Commentor No. 2413

2413-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2413-2: DOE policy encourages effective public participation in its decision making process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public. No final decisions have been made with regard to the facilities and locations evaluated to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238 for NASA space missions, and nuclear research and development. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2418: Elizabeth See

2418-1 — The PEIS fails to assess non-cancer illnesses caused by the radiation for proposed restart at FFTF and the other facilities. This must be assessed from normal operations, low level exposure, and critical incidence.

These assessments must be made for fish, wildlife, insects, plants, and water. Analysis of biological and medical problems must be done with an independent medical information, such as from Helen Caldicott and Physicians for Social Responsibility.

2418-2 — Because there is no way to dispose of the waste created by FFTF . . .

2418-3 — . . .it [FFTF] should never be started.

Response to Commentor No. 2418

2418-1: Appendix H provides information on potential health effects other than fatal cancers. Of the three health impacts from low levels of radiation exposure (nonfatal cancers, hereditary effects, and fatal cancers), fatal cancers have the highest probability of occurrence, roughly 500 excess cancer fatalities per million person-rem. Nonfatal cancers and hereditary effects appear at rates of approximately 20 and 26 per cent of this number. Using a single number for human health impacts provides a simple direct means to compare impacts and risks among the range of reasonable alternatives. Cancer fatalities, being the largest impact, were selected for presentation throughout the NI PEIS. Low risk (low health impact) from fatal cancers implies low risk for all other radiological induced health consequences. This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives (including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, Restart FFTF, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small. The NI PEIS identifies (in Chapter 3 of Volume 1) endangered species that live on or near all of the candidate sites, as well as aquatic and wetlands areas that may be impacted by operations at candidate locations. According to an International Atomic Energy Agency (IAEA) publication (IAEA Technical Report Series No. 332, Effects of Ionizing Radiation on Plants and Animals at Levels Implied by Current Radiation Protection Standards), a dose rate of 100 millirem per year to the most exposed human will lead to dose rates to plants and animals of less than 0.1 rad per day. The IAEA concluded that a dose rate of 0.1 rad per day or less for animals and 1 rad per day or less for plants would not affect these populations. The largest individual dose for any of the nuclear infrastructures alternatives under normal operations would be less than 0.1 millirem, which is three orders of magnitude less than the IAEA threshold for adverse effects. Therefore, implementation of any of the range of reasonable nuclear infrastructure alternatives analyzed would not be expected to result in adverse impacts on plants and animals living in potentially affected areas around the candidate sites.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2418: Elizabeth See (Cont'd)

Response to Commentor No. 2418

2418-2: Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

2418-3: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

**Commentor No. 2390: Don Segna
Nuclear Medicine Research Council**

2390-1 — . . . But what I'd like to point out here is there's two sides to the story. There's two sides to the story, and we are hearing your side of the story now, and I think DOE does owe you something to insure that the risk is worth the benefit. I have to say it that way because there is no such thing in earth that doesn't have some risk to it, whatever you do.

So you have to look at the risk, and I've heard all the risk here. You know, we're all going to get cancer from the radiation and stuff like that. Do we really know that?

Response to Commentor No. 2390

2390-1: This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, Restart FFTF, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2414: Debra Seyler

2414-1 — I have noticed in the draft that there has been no addressing of other illnesses that are radiation related, except for cancer fatalities.

And so I would like also to make certain that in the final EIS credible medical evidence is brought forward from independent sources addressing thyroid disorders, immune system dysfunction, stillbirth, miscarriages, and all other radiation related sicknesses.

And also I ask that the cost of this to the American public be done, and that there is a local fact among the local hospitals that they are not prepared for the overflow from a high impact incident from Hanford

The tribes themselves are facing a crisis of high incidences of cancers and radiation related illnesses that are not limited to cancer, and this has not been fully disclosed or addressed in the draft.

Additionally, we've only begun the process of compensating people for their medical conditions in radiation related illnesses. The very first round was some of the workers being compensated or the widows or widowers or survivors of those who died from those past problems at Hanford.

And so what's going to be the economic cost of compensating the rest of the workers up there on cleanup and the people who handle any waste products made from the proposed start of the FFTF or the Tennessee facility or any other facility.

And for the people who are downwind from there or who may receive catastrophic doses of radiation, what is the cost to the American public in compensating them economically for their medical conditions and loss of life?

2414-2 — I see no actual justification in the draft EIS for the necessity for the restart of the FFTF for medical isotopes as these are currently being produced rapidly in three new facilities in Canada, and also that we have a contract for those products that the FFTF is being looked at for from Russia.

2414-3 — The scientific analysis of impacts to plants, animals, insects, fish, all of these things are just basically not addressed at all. We know from all over the world that within a couple hundred mile radius of nuclear reactors, because of the low level radiation that comes from them and also from storage facilities, that we have drosophila and other insect deformities, rabbit deformities, plant mutations, fish mutations. None of these are actually addressed.

And again, I would ask if independent scientific reporting would be included in that so that they're thoroughly analyzed, not just from government statistics, but also from people doing independent research who are not part of the federal government.

Response to Commentor No. 2414

2414-1: DOE notes the commentor's concern for the health of tribes and compensation for medical conditions related to past practices, although these issues are beyond the scope of this Nuclear Infrastructure PEIS. The health and safety of workers and the public is a priority of the nuclear infrastructure program, regardless of which approach is chosen. Operation of the facilities would comply with applicable Federal, state, and local laws and regulations governing radiological and hazardous chemical releases. Appendix H provides information on potential health effects other than fatal cancers. Of the three health impacts from low levels of radiation exposure (nonfatal cancers, hereditary effects, and fatal cancers), fatal cancers have the highest probability of occurrence, roughly 500 excess cancer fatalities per million person-rem. Nonfatal cancers and hereditary effects appear at rates of approximately 20 and 26 per cent of this number. Using a single number for human health impacts provides a simple direct means to compare impacts and risks among the alternatives. Cancer fatalities, being the largest impact, were selected for presentation throughout the NI PEIS.

2414-2: The United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily Molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs. DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

2414-3: Chapter 3 of the NI PEIS identifies plant and animal species that live on or near all of the proposed sites, as well as aquatic and wetlands areas that may be impacted by operations at all of the proposed locations. According to an International Atomic Energy Agency (IAEA) publication IAEA Technical Report Series No. 332 "Effect of Ionizing Radiation on Plants and Animals at Levels Implied by Current Radiation Protection Standards", a dose rate of 100 millirem per year to the most exposed human will lead to dose rates to plants and animals of less than 0.1 rad per day. The IAEA concluded that a dose rate of 0.1 rad per day or less for animals and 1 rad per day or less for plants would not affect these

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2414: Debra Seyler (Cont'd)

2414-4 — Under the human health risks and environmental cumulative impacts it's basically blown off. There are so many existing sites that are contaminated there, high and low level waste, that are not cleaned up and are not safely contained that it is basically insane to consider making more waste. We do not have a place to put the waste now.

We have inadequate storage facilities. We have nuclear waste in temporary holding facilities that are leaking and are cracked, and we do not need anymore of this kind of risk.

2414-5 — Also, again, the federal government has made agreements with other governments and the tribes that the mission, the sole mission at Hanford, would be cleanup, and that is not so.

. . .and no more missions except cleanup at Hanford.

2414-6 — We are continually fighting the proposed restart of the FFTF reactor, and it is time that reactor is closed for good.

No more excuses and coming up with reasons. Shut down the FFTF,...

2414-7 — The other thing is that in considering the minorities and the socioeconomic equations for the area around Hanford, other areas are not adequately assessed because the people doing the analysis have simply taken a few facts on what the populations look like in terms of numbers, but they have not considered tribal issues, such as my own people have, and that is that we eat the natural foods from the land and take our medicines from there, and many of the traditional gathering sites of the local tribes are sites that can no longer be used because of the contamination.

Response to Commentor No. 2414

populations. The largest individual dose for any of the alternatives evaluated is below 0.1 millirem, three orders of magnitude less than the IAEA identified threshold level. This is well below the IAEA benchmark. Therefore, all of the proposed alternatives would have no effect on the plants and animals around the proposed sites.

2414-4: The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2414-5: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2414-6: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.

2414-7: The commentor's concerns regarding contamination of natural foods, medicines, and traditional gathering sites is noted. Radiological impacts on minority and low-income populations residing within potentially affected areas surrounding the Hanford Site are addressed in Section K.5.3 of Appendix K (Environmental Justice Analysis). Models for estimating radiological health impacts (discussed in

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2414: Debra Seyler (Cont'd)

Response to Commentor No. 2414

Appendixes H and I) assumed that all locally grown food supplies would be subject to radiological contamination throughout the project duration, and that all locally grown food supplies would be consumed by residents in the potentially affected area. The analysis of radiological effects that would result from implementation of the nuclear infrastructure alternatives indicates that the radiological risk to persons residing in the potentially affected area would be so small that no credible pattern of food consumption (or other ingestion pathways) would be expected to result in a latent cancer fatality. Implementation of the nuclear infrastructure alternatives would not be expected pose a significant risk of radiological contamination of land within the potentially affected area.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2372: Donna Smollenrock

2372-1 — Until the DOE can identify and clean up the waste at Hanford, don't even consider creating new wastes.

2372-2 — So I am thoroughly opposed to the restart for any reason of the FFTF.

Response to Commentor No. 2372

2372-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford and opposition to FFTF restart. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2372-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2386: Kathy Sneider

2386-1 — The medical isotopes, you know, maybe the people do need them. I personally don't believe that you need those. There's a lot of other ways to deal with cancer. My family has had cancer. In my family, I'm third generation Oregon person. We've dealt with cancer in other ways.

2386-2 — At any rate, the last time I was here we talked about Alternative 5 and we wanted to promote an Alternative 5. This is not the Alternative 5 that I was pushing for. I don't know what happened to this Alternative 5 between the time that we were talking about it last time and now.

But Alternative 5 states deactivate FFTF, no new missions, and it says permanently deactivate FFTF, which I am totally in favor of. It says no domestic production of PU-238 or government production. No production of PU-238 at all, not just domestic. Let's have no production of it.

Shut it down.

2386-3 — The third point is continue medical and industrial isotope production and nuclear R&D activities at the current operating levels of existing facilities. I don't think so. We have to clean it up. We can't continue R&D activities, research and development activities, at the current operating levels. No, no, no, n-o. Read my lips.

2386-4 — Clean it up.

Response to Commentor No. 2386

2386-1: DOE notes the commentor's views that medical isotopes are not needed in the treatment of cancer. However, in ongoing clinical testing, therapeutic radioisotopes have proven effective in treating cancers and other illnesses while minimizing adverse side effects, making their use an attractive alternative to traditional chemotherapy and radiation treatments.

2386-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF. Alternative 5 was developed based on a number of comments from the public during the scoping hearings; thus, it likely could vary from the specific proposals of any one individual. Alternative 5 does not include the potential purchase of plutonium-238 from Russia.

2386-3: DOE notes the commentor's opposition to continued isotope production and nuclear research and development activities at current levels (i.e., the No Action Alternative). DOE also notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site.

2386-4: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2410: Rebecca Stonestreet

2410-1 — I'm here as a citizen of the United States to tell the United States Department of Energy to not — that I am against the FFTF restart at the Hanford nuclear site.

2410-2 — And as with the roadless policy that I commented on, and I had tears, heartfelt comment, this one is not that way. This one is a total disgust with the Department of Energy that we have to come here again to tell you that we do not want this thing restarted. Apparently you've been told that many times.

Response to Commentor No. 2410

2410-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2410-2: DOE policy encourages effective public participation in its decision making process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor: Leon Swenson

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 171.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2382: Matt Swire

2382-1 — I live in Hood River, and I'm an aerospace engineer by training, and I have actually worked on some of the NASA projects to do some space research in space flight, and I also recently lost my mother to cancer.

With that in mind, I would like to vehemently object to the restart of the reactor at Hanford prior to cleaning up the initial work that was done there.

Response to Commentor No. 2382

2382-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2402: Annie Tomlin

2402-1 — My first and foremost comment is that I'm absolutely dedicated to Alternative 5, permanently deactivating FFTF with no new missions.

2402-2 — I have been to many public hearings and am familiar with the endless reams of material put out by the DOE in its charade of responsibility to public involvement, and I am constantly amazed at the DOE's transparent disregard of its responsibility.

On page S-1 of the summary is a statement by the Chairman of the Nuclear Energy Research Advisory Committee, and I quote. "There is an urgent sense that the nation must rapidly restore an adequate investment in basic and applied research in nuclear energy if it is to sustain a viable United States capability in the 21st Century."

Who exactly does the DOE think the nation is? If the nation is not its citizens, then who exactly is in a state of such urgency?

The DOE knows it couldn't go out on the streets of Hood River or anywhere in the Pacific Northwest or the rest of the nation, for that matter, and have a clear mandate for the proliferation of this deadly industry.

So Secretary Bill Richardson just appoints some industry hack to say it for us.

I would like to think that it mattered if I responded to this draft EIS, but this document hides behind the illusion of science to intimidate and frustrate the people of this nation.

And this isn't about science anyway. This is about corporate welfare, criminal and political conspiracy, and genocide. Corporate welfare? What else would you call it when we, the people, are always here, but the pitch men from Westinghouse, Lockheed, Battelle, Bechtel, TRW Environmental, Fluora and Informatics never are?

This public comment hearing is not a legitimate democratic process. This is a sham and a farce, a cynical ritual where the public is supposed to vent its anger at the wall of indifference of the DOE. Then tomorrow it's business as usual.

2402-3 — Criminal conspiracy? What else would you call the plan to privatize the FFTF under a scheme cooked up by DOE's Dr. Terry Lash and Richard Thompson's advanced nuclear and medical systems, a plan they sold lock, stock and barrel to my two idiot Senators, Democrat Patty Murray and Republic Slade Gorton, with a ridiculous sales pitch that they could make tritium and cure AIDS. Does everybody remember that one? Now it's plutonium-238 and medical isotopes.

Response to Commentor No. 2402

2402-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.

2402-2: DOE notes the commentor's view. DOE policy encourages effective public participation in its decision-making process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

2402-3: Comment noted. DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "... ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental to accomplishing this mission from a range of reasonable alternatives. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

2402-4: DOE notes the commentor's opposition to nuclear power generation and opposition to NASA and defense funding, although these policy issues are beyond the scope of this Nuclear Infrastructure PEIS. The scope of this Nuclear Infrastructure PEIS is limited to analysis of alternatives to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development. None of the missions described in Section 1.2 of Volume 1 of the NI PEIS are defense- or weapons-related. The environmental impacts associated with operation of the FFTF and support facilities at Hanford during normal operations and from postulated accidents are presented and discussed in Section 4.3 of the NI PEIS. All impacts to human health and to ecological resources would be small in the immediate area of the Hanford site and negligible at all distant locations. The environmental impacts of a range of reasonable alternatives to fulfill the requirements of the DOE missions were disclosed and evaluated in the NI PEIS. DOE made every effort to obtain, analyze, and disclose all required information to make a decision on expanding nuclear infrastructure. The costs and nuclear nonproliferation impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report and Nuclear Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2402: Annie Tomlin (Cont'd)

2402-4 — Political conspiracy? What else do you call the boot licking of the Clinton-Gore administration to the Nuclear Energy Institute, a \$100 million a year trade organization that's kept busy usurping the Kyoto Protocol on global warming so that U.S. companies can cover the planet with green nuke plants?

Genocide? What else do you call an industry that has to calculate into its operating decisions the number of cancer deaths and associated risks to human health; an industry that works hand in hand with the Pentagon and NASA to gobble up billions of dollars of the annual budget at the expense of education, health care, affordable housing?

2402-5 — I think everyone in this room should start preparing themselves for the restart of the FFTF and be ready to put their bodies on the line, just like they had to do to stop the start-up of the N reactor because I really believe that's what it's going to come down to.

Response to Commentor No. 2402

may make an informed decision with respect to the alternatives presented in the NI PEIS. The costs of economic impacts are beyond the scope of this NI PEIS including any impacts on funding priorities. The proposed actions considered in this NI PEIS to accomplish the stated missions would be funded by the DOE Office of Nuclear Energy, Science and Technology, which has no direct funding connection to other federal agency activities.

2402-5: See response to comment 2402-1.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2389: Bart Vervloet

2389-1 — I really don't think my voice makes a damned bit of difference.

But there was 7,000 comments made, and my main objection to this thing is this is supposed to be a public process, and all the meetings that I've gone to for three years, 80, 90, 92 percent, 93 percent, ten percent effective, five percent better than last year's, new and improved, whatever; the majority of people who come to these hearings are opposed to FFTF, FFTF restart, Fast Flux Test Facility. Yet that doesn't come up. The only serious thing you can count at these meetings is the number of people opposed. Out of 7,000, how many people were opposed? Many, some, a few, maybe we'll need — you know, it's all vague.

So I'm here to basically state to you and Secretary Richardson and anyone else who's counting the numbers: how many of the 7,000 were opposed? I'd like to know that one fact. That's all I would ask for. Is it lost? Is it gone? Is it a checklist? Here's what my little public registration form says, and I'll just put it on the record so you're aware, my little public form here. This is my public process that I'm a democratic, free-loving American.

Let's put two and two together there. You're not being democratic. This is a democratic country. It's a process. It's a public process, and we're being ignored and lied to, and of all the little pre things that they gave us to say to tell the DOE, you are not compiling our public record. You are lying to us and not putting our vote to the top.

Response to Commentor No. 2389

2389-1: While all comments received during the scoping periods for both the Plutonium-238 Production EIS and the NI PEIS are part of the Administrative Record for the NI PEIS, Section 1.4 of Volume 1 and Appendix N are intended to provide a summary of the issues and associated trends identified during the scoping process rather than a tabulation of comments by specific issue. In preparing this NI PEIS, DOE carefully considered scoping comments received from the public. Any perceived discrepancy in the grouping of comments raising any one particular issue or set of issues is attributable to the manner in which they were originally categorized and counted. For example, a number of statements, letters, or resolutions signed by multiple persons, such as city council resolutions mentioned by the commentor, were received by DOE both for and against FFTF restart) in response to the request for scoping comments. Each such comment document was considered and counted as a single comment in the NI PEIS comment tracking system. The Office of Nuclear Energy, Science and Technology works closely with the Office of the Secretary to keep him informed of the progress on the NI PEIS, including stakeholder input.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

**Commentor No. 2408: Amber Waldref
Heart of America Northwest**

2408-1 — And I just wanted to make a few comments on the EIS because I know I had some concerns about what was not included, and the first concern I have that really hasn't been talked about to much because I don't want to talk about things that have already been underscored, but the nonproliferation study has not come out yet, and it was mentioned that it will probably come out in a couple of weeks, but that, of course, is far into the public comment period.

2408-2 — And I just was reading over the summary of the environmental impact statement, and I really have some concerns because I would have liked to have that study included in the PEIS because the two fuels are going to be used in FFTF, the mix oxide fuel and the highly enriched uranium, some combination of those over a depending number of years; that the U.S. nonproliferation policy, it says here, strongly discourages the use of highly enriched uranium fuel.

And so to be in compliance, like there's going to be further studies done, but so it says that right there that it strongly discourages the use of the highly enriched uranium fuel according to U.S. nonproliferation policy.

And then later on, it says if low enriched uranium fuel is found infeasible, DOE would subsequently procure highly enriched uranium fuel in a manner consistent with U.S. nonproliferation policy.

Response to Commentor No. 2408

2408-1: The nuclear nonproliferation impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on September 8, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Nuclear Infrastructure Nonproliferation Impact Assessment in Appendix Q in the Final NI PEIS.

2408-2: DOE notes the nonproliferation concern expressed in the comment, and can assure that its proposed action in the PEIS supports U.S. nonproliferation goals. This has been confirmed by the Nuclear Infrastructure Nonproliferation Impact Assessment, published in September 2000. Although this policy analysis is not required under NEPA, DOE considers it to be an essential element in the decision-making process for the DOE nuclear infrastructure, and has included a summary of the assessment in Appendix Q in the Final NI PEIS. In the event that a decision is made to restart FFTF, the first six years of operation would use existing onsite mixed oxide fuel. DOE expects that an additional 15-year supply of mixed oxide fuel in Europe, owned by Germany, would be available for FFTF. The Nuclear Infrastructure Nonproliferation Impact Assessment for the NI PEIS alternatives stated that using the two different sources of existing mixed oxide (MOX) fuel for FFTF (existing FFTF fuel and German MOX fuel) is consistent with U.S. nonproliferation policy, and, additionally, represents a safe, low-cost, high benefit opportunity to reduce civilian plutonium without chemical or bulk processing, which would afford substantial nonproliferation benefits. DOE's approach to potential use of HEU in the FTFF is also consistent with U.S. nonproliferation policy. The FFTF is an existing research reactor capable of performing its research missions using HEU fuel, if MOX fuel is not available. U.S. nonproliferation policy provides for such a circumstance as part of the effort to reduce and discourage HEU use. During the period of MOX fuel use, in compliance with U.S. nonproliferation policy directives, DOE's Office of Nonproliferation and National Security would undertake a study under the Reduced Enrichment Research and Test Reactor (RERTR) program to consider the technical feasibility of using low enriched uranium to fuel the FFTF. Under this nonproliferation protocol, if use of low enriched uranium fuel is found

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

*Commentor No. 2408: Amber Waldref (Cont'd)
Heart of America Northwest*

Response to Commentor No. 2408

feasible, it will be used; if found infeasible for meeting assigned missions in the FFTF, an already existing research reactor, policy would allow DOE to subsequently procure highly enriched uranium fuel for use in that facility. This approach is consistent with U.S. nonproliferation policy.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

**Commentor No. 2396: Bonnie White
Columbia Grower Audubon Society**

2396-1 — On behalf of the Columbia Grower Audubon Society, representing our 300-plus members in the mid-Columbia area, I would like to say we emphatically oppose any proposal to restart the FFTF at the Hanford facility.

2396-2 — CGAS insists that the DOE focus all available resources on hazardous waste clean-up. Unless we can isolate and control the mess we have made there, I believe there is no hope for our seventh generation.

2396-3 — If we have to choose an alternative, we choose Alternative 5.

2396-4 — I would like to ask that the testimony of the 13,000 employees of Hanford be identified as such and lumped together the same way that all of our testimony is lumped together. Their interests are single minded, and they are not the only recipients of the cancers their choices cause.

They continually come to the trough demanding our tax dollars be spent to finance their special interests, which are in conflict with all other life on earth.

The politicians continually pander to that minority. Why? Maybe it's because cancer is good business for corporate America. It opens the wallets of their victims. Their assets are redistributed to the medical establishment, doctors, hospitals, drug companies, instead of supporting their families.

It surprises me to hear people from Hanford acknowledging the high levels of cancer and then supporting further production of nuclear waste. I guess it shouldn't. They're trying to get more of our tax dollars for their salaries.

Response to Commentor No. 2396

2396-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.

2396-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2396-3: See response to comment 2396-1.

2396-4: DOE notes the commentor's views. It is DOE policy to encourage public input on matters of regional, national and international importance as part of its commitment to facilitate a public participation process that is open and unbiased. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2381: Kirk Williamson

2381-1 — There will be additional demand for isotopes as they are approved for clinical use, but we don't have the capacity to meet today's demand, much less provide for the future.

One of the most important values I learned here in the mid-Columbia is that we don't waste resources, natural or otherwise. To allow the purveyors of fear and ignorance to convince us to waste FFTF would be an insult to the memories of Dorothy and Amy and every other person who battles cancer.

I would urge Alternative 1.

Response to Commentor No. 2381

2381-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2412: Tom Wood

2412-1 — Based on the information primarily that I've read in the cost reports and from the draft of the EIS, I am against the start-up of the reactor, of the FFTF, and I'll tell you why, and I would like this to kind of sink home as best it can with public feedback.

2412-2 — Being an engineer, I know that financial information is typically what drives the start-up or development of some sort of a manufacturing facility. That's what I do myself.

From what I see in the financial information, you really had four adequate manufacturing solutions. When looking at the data in the cost report, of those four, all of the budgets other than Option 1 and Option 2 were padded with the deactivation of the FFTF at 281.2 million, and what's interesting is that it appears that Option 4 actually has a less initial capital investment than Option 1, which seems to be typically what drives decisions like this.

2412-3 — The way I see it is you have really Option No. 2 is the most appropriate step to take here, which is the expansion of current manufacturing facilities, because by far and large it is the cheapest of the different options available

2412-4 — . . .also it's not clear to me that the need for radioactive materials that would be developed at the FFTF manufacturing site has been clearly defined to you either by the medical community or NASA community, and that most of the projected needs are speculative at this point.

It's also interesting to me that the short-term and long-term needs of the products that we've produced here are not clearly defined also, or at least have the backing of several different officials in the communities that would be using that material. So I struggle with that.

2412-5 — Thirdly, I also struggle with the fact that currently you have a facility, which is Hanford, that is not manufacturing right now. So you'll essentially begin manufacturing at the Hanford facility, where you have a community that is not used to manufacturing. It's been closed down now for I'm guessing on the order of about 20 to 25 years, to the actual manufacturing of weapons grade plutonium and other products. And you have to go through the process of reeducating the community on the potential effects and hazards with having a nuclear facility in your backyard.

2412-6 — It seems to make a heck of a lot more sense to get a better bearing on what the long-term needs are going to be for the products that FFTF will be manufacturing, and make this decision at a later time instead of making it now when all the needs are considered speculative at this point.

Response to Commentor No. 2412

2412-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 2, Use Only Existing Operational Facilities. It is assumed that when the commentor mentions "Option No. 2," he is referring to Alternative 2.

2412-2: Deactivation of FFTF is not part of implementing Alternative 1, Restart FFTF. Deactivation of FFTF is part of implementing Alternatives 2, 3, 4, and 5 and including the cost of FFTF deactivation in the implementation costs for these alternatives is appropriate. The Cost Report was structured to identify the implementation costs of the various alternatives so the Secretary of Energy would have this information along with other data for consideration.

2412-3: See response to comment 2412-1.

2412-4: Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. The NI PEIS evaluates a range of reasonable alternatives for supporting these long-term needs over a 35-year operating period. DOE acknowledges the difficulty in reliably predicting isotopic needs for future uses in research and medicine. DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2412: Tom Wood (Cont'd)

Response to Commentor No. 2412

programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs. The United States currently purchases approximately 90% of its medical isotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium 238, DOE's ability to support future NASA space exploration missions may be lost. DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

2412-5: Work to deactivate the FFTF began in 1994. A complement of trained staff have been maintained since then to work necessary facility functions. Details of staff training for facility operation was provided in the companion NI PEIS Cost Report. For all options except the use of FMEF, processing of targets would be conducted in facilities that have ongoing DOE and commercial missions. These facilities have trained workers on staff, but would probably augment the staffing levels. Staff training/qualification would be conducted for the FMEF option.

2412-6: See above response to 2412-4.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2379: Cosmos Worth

2379-1 — I just want to let you all know that I'm in opposition here with my family tonight to starting up the FFTF.

2379-2 — We don't want any more nuclear waste.

2379-3 — "We join hands in UNITY

"To sing and shout our choice!

"Yes, we are ONE!

"ONE VOICE

"WE join hands in UNITY

"To sing and shout our choice!

"We're done being held prisoners

"Of the corporate empire's greed.

"We say 'NO TO MORE PLUTONIUM!'

"It sure isn't what we need!

"We say 'PUT ALL THE RESOURCES

"TO CLEAN UP WASTE AND LEAKY TANKS!'

"We say, 'YES TO LIFE, AND LOVE, AND FREEDOM!'

Response to Commentor No. 2379

2379-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2379-2: DOE notes the commentor's concern regarding waste generation. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

2379-3: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2393: Tim Young

2393-1 — One of the reasons that we have this nuclear energy research council is because of the Clinton-Gore administration wants to make green nuclear energy. The Kyoto Protocol says that, you know, carbon dioxide is causing global warming. So how do we cut back global warming? Well, gee, I guess nuclear energy is the new way to do it.

So basically all I want to say to you is that if anybody, who my environmental friends out there, think that Gore is against nuclear energy and continued nuclear weapon research, they're wrong.

Response to Commentor No. 2393

2393-1: DOE notes the commentor's interest in energy policy, although the production of electricity is beyond the scope of this Nuclear Infrastructure PEIS. The scope of this Nuclear Infrastructure PEIS is limited to analysis of alternatives to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development.

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2388: Catherine Zangar

2388-1 — I think that you're naive in thinking that you can run a nuclear reactor near a river or anywhere on this planet and not expect bad things to happen. There are human beings running that. There's room for error. There's room for sabotage. There's room for vandalism.

2388-2 — I worked in contracting construction. I talked to people who worked at Hanford and told me what they got away with when those things were constructed, when they were operated, and that will continue.

That's life. People cheat. They make mistakes. You have to expect that if you're flying radioactive materials around airplanes that someday something will happen.

2388-3 — If you look at population estimates for the next 25,000 years — is that the half-life of one of these things we're talking about? — and we look at the human geography of this region, is that taken into account in your environmental impact statement, how many people will be living along this region, what they would want, what the cost is to keep maintaining that dump that used to be a beautiful sage desert and was a place for animals to roam freely and what you've turned into a dump?

I am surprised that anybody would also have the silly idea to ask people whose jobs and livelihood depend on an industry what should be done with that industry. We don't go to loggers and say, "Should we keep any old growth?" We don't go to Navy bombers and say, "Should we keep bombing this island in the Atolls?" We don't go to people whose livelihood depend on things and say, "What do you think?" because they can't make an objective decision.

They're not usually well informed of the big picture, and that's so true of the tri-cities.

I still have family involved out at Hanford. I have research scientists in my family. I have people in tank maintenance, and we talk about this all the time, and they don't have as much information as people living in other parts of the country get.

You can read more in the Fisherman's Journal and in the Seattle PI, in the Oregonian than you can read in the Tri-City Herald, and it's sad that they're left out of the picture, but that's the way it is.

So I don't think you should be even quoting what people in the tri-cities want. Anywhere in the job market shouldn't be involved in the decision process. That's ridiculous, and I wouldn't do that.

I work in this area. Logging is important here. Farming is important here. You don't go to farmers and say how much pesticides do you get to put in the river. It just doesn't work that way because people will always look out for their jobs and money.

2388-4 — We know that the other FFTFs are all shut down, mothballed, thrown away, closed and inoperative for a good reason.

Response to Commentor No. 2388

2388-1: FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The accident spectrum included internal events, external events, natural phenomena, common-cause events, and sabotage and terrorist activities. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

2388-2: DOE notes the commentor's views regarding the quality of work and management at its facilities. The health and safety of workers and the public is the priority of the nuclear infrastructure program, regardless of which approach is chosen. Operation of the facilities would comply with applicable Federal, state, and local laws and regulations governing radiological and hazardous chemical releases. The transportation of medical isotopes is discussed in Appendix J.5.3 in Vol. 2. It is not likely that one additional latent cancer fatality will occur from transportation of medical isotopes.

2388-3: The commentor's question referencing population estimates over 25,000 years and half-life is unclear. This NI PEIS evaluates the environmental and human health impacts of operating the proposed facilities for 35 years to irradiate targets for medical and industrial isotope production, plutonium 238 production, and to meet nuclear research and development requirements. As described in Appendix H.2.2.2 of the NI PEIS which discusses the methodology for estimating radiological impacts on human health from facility operations, the population within 80 kilometers (50 miles) of the candidate sites was projected to the year 2020. These projections are based on the current population distribution around the sites. This projection was assumed to be representative of the site populations over the 35-year production campaign assuming steady population growth. The half-life for representative medical isotopes that could be candidates for production in the irradiation facilities under consideration, such as FFTF, is provided in Table C-1 of the NI PEIS. Plutonium-238 that would be produced to support NASA space missions has a half-life of 87.7 years. DOE assumes that the commentor also questions the cost of operation and maintenance of the Hanford Site. The cost of maintaining the Hanford Site over the 35-year mission is beyond the scope of this NI PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2388: Catherine Zangar (Cont'd)

It's an antique. It's a dinosaur, and it's not necessary.

I have not seen any compelling reasons that there aren't reasonable alternatives for starting up that reactor. I violently and adamantly oppose the start-up of the FFTF.

2388-5 — I think the risk hasn't been addressed.

You haven't looked at effects outside the cancer area.

2388-6 — The waste stream management hasn't been addressed.

2388-7 — You haven't looked at the effects on other creatures besides humans.

Response to Commentor No. 2388

informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS.

2388-4: DOE notes the commentor's opposition to Alternative 1, Restart FFTF. It should be noted that there is only one FFTF and it is currently in standby at Hanford.

2388-5: This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives including the restart of FFTF for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, Restart FFTF, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small. As stated in Appendix H of the EIS, other human health impacts (non fatal cancers and genetic mutations) occur with a lower frequency for the same level of exposure. Since latent cancer fatalities would not be expected among the public, it follows that the expected result for other radiological health impacts would also be small.

2388-6: Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In

Comments from the Hood River, Oregon, Public Hearing (August 28, 2000)

Commentor No. 2388: Catherine Zangar (Cont'd)

Response to Commentor No. 2388

addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

2388-7: The NI PEIS did examine the impact of each alternative and each option on ecological resources, including terrestrial resources, wetlands, aquatic resources, and threatened and endangered species. This evaluation may be found in Chapter 4 of the PEIS.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2421: Anonymous

2421-1 — I've been coming to these meetings for many years, since 1983 and I've been hearing the same thing. When they told us that Purex was okay, there would be no effect from Purex, no leakage, then we know that the radiation leaked from the 200 area. Then they said they wanted to keep the N reactor running. They had meetings in Portland to keep the N reactors running. You know, they wanted to keep it running up there. And they shut it down. Thank goodness for a lot of people. It's really hard, in 1983, we did a walk from Astoria to Hanford to the gates of Hanford. We were the first peace group to ever walk into Hanford and we started working to shut down Hanford with a lot of people's help.

I've been there when the breeder reactor was running in the early years and you know, the lives — I'm saying lives because I stood in front of the DOE office and I heard DOE officials say that you're not — you don't know what you're talking about when we told them about the leaks and everything happening. And now, look what's happening.

I can remember going to a meeting with some people and a Native American woman came up to me and she said why are you our children dying of leukemia? Remember the plutonium and the radiation that was mined on Native American land came to Hanford and now it's affecting people, Native American people.

You know, from the radiation down on the Navajo Reservation I saw kids with birth defects. Now you tell me that there's no — what happens if there's an accident at Hanford? And I just wanted to ask another question. What happened if you lost the water behind Grand Cooley Dam? What would happen? It would be over the top of Hanford. So I mean not many people talk about that. Yeah, it would be over everything, but you'd have a major nuclear accident. And it's real hard for me to get up here and speak because I've heard — I was up there years ago and listened to the stuff. My father worked up there and died of cancer. I mean it's — people — I hear certain comments from some of the Richland people, but you know, I know, it's you know. Just like the fire up there, you know, you said that there was no radiation leakage — I mean no radiation up there. Now the new paper that came out said oh, there was some allowable limits of plutonium? Does anybody know what allowable limits of plutonium or background radiation? Plutonium is a manmade subject and you know, it's made. It's not — there's no background to plutonium. It's made. And now it's — we let 300 balloons loose at Hanford in 1983 when we did that walk and they landed in a schoolyard in Hermiston, Idaho. That's how far the balloons went and that's the route of — there was another thing. There was a fire in the stack at Purex and they said there was nothing to be worried about, but the information came out that there was contamination released. So how do we know? I have heard this same thing over and over and over again. The DOE saying. I've been coming to these meetings, like I said, from 1983 and it's the same stuff coming out and I don't believe you. Maybe if they needed to start it up and maybe if there was an accident

Response to Commentor No. 2421

2421-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. In recognition of DOE's position to take expeditious action in regards to Hanford cleanup, the NI PEIS evaluated the maximum cumulative radiation exposure to the public from all reasonably foreseeable Hanford Site activities over the 35 year time-frame. These activities include future waste management activities (as estimated in the Hanford Comprehensive Land Use Plan), tank waste remediation, K Basin spent nuclear fuel management, decommissioned naval reactor plant disposal, and Plutonium Finishing Plant Stabilization (see section 4.8.3.3). As shown in Table 4-173, the dose to the maximally exposed individual would be expected to remain well within regulatory limits. Based on an exposure period of 35 years, 0.21 (<1) latent cancer fatalities would be expected to occur among the local population over the 35-year period as a result of Hanford related radiation exposure. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1. No radioactive materials were "released" in the Hanford Wildfires of 2000. Wildfires did resuspend some materials already in the environment. The resuspended materials were low, slightly above natural background levels. Since the initial stages of the fire and continuing to the present, DOE, in conjunction with the Washington Department of Health and the federal EPA, have conducted environmental monitoring on and near the Hanford Site to assess potential radiological releases. Monitoring will also continue over the long term. DOE has made these monitoring results available to the public as rapidly as possible with the results to date posted on a dedicated page on the Hanford web site at <http://www.hanford.gov/>. Regarding plutonium releases, DOE monitoring data has shown elevated levels (above levels normally seen) of plutonium in the Hanford 200 Areas. The most recent monitoring data available from EPA shows elevated levels (above background) of plutonium associated with 6 of the

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2421: Anonymous (Cont'd)

then people would realize. I've had people tell me that maybe what we need is an accident to wake up people. I mean, what do we want, a Chernobyl in the Northwest? The tank is leaking up there. I mean when you see children affected by the uranium on a Navajo Reservation from the tailings and you know, it makes you look and think about that.

Response to Commentor No. 2421

61 ambient air filters collected from 23 locations surrounding the Hanford site. All of these DOE and EPA results are below EPA's "protective action guides" for emergency situations, EPA National Emission Standards for Hazardous Air Pollutants, hazardous air pollutant dose limits set by the State of Washington, and within or below EPA's acceptable risk range for protecting public health and the environment. DOE will continue to work with the Washington Department of Health and the EPA and will post additional monitoring results as they become available. As stated in Chapter 5 of the NI PEIS, "it is DOE policy to conduct its operations in a manner that ensures the protection of public health, safety, and the environment through compliance with all applicable Federal and state laws, regulations, orders, and other requirements." This chapter also discusses the applicable Federal Environmental, Safety, and Health Laws, Regulations, and Executive Orders, U.S. Department of Energy Orders, and State Environmental Laws, Regulations, and Agreements that pertain to the NI PEIS alternatives.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2423: Anonymous

2423-1 — I'm here to say a definite no to starting Fast Flux Test Facility in a nuclear reservation for any reason including isotopes for medical purposes.

2423-2 — We don't need it [FFTF] and for nuclear weapons production be it material for the existing weapons under stewardship.

Response to Commentor No. 2423

2423-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2423-2: The only missions being considered for FFTF at this time are those analyzed in the NI PEIS, which are the production of isotopes for medical research, and industrial uses; plutonium production for future NASA space exploration missions; and U.S. nuclear research and development needs for civilian application. None of the alternatives in the NI PEIS include defense missions and would not contribute to future weapons production.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2424: Anonymous

2424-1 — We can turn the tide on cancer and we can make a difference. We must put aside antiquated environmental phobias and see the restart of FFTF for what it is, hope for the future.

2424-2 — Alternative 2, using existing facilities are totally unacceptable.

2424-3 — The No Action option is a death sentence for untold millions of people. I realize that by law, the report had to include this option, but it should not be seen as viable.

Response to Commentor No. 2424

2424-1: DOE notes the commentor's support for Alternative 1, Restart FFTF, and opposition to Alternative 2, Use Only Existing Operational Facilities, and the No Action Alternative.

2424-2: See response to comment 2424-1.

2424-3: See response to comment 2424-1.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2425: Anonymous

2425-1 — I want to follow, like the old gentleman here that talked following the officials. I'm kind of like him. I've been around a long time. Now I'd like to go back a little further than he did. I'm talking about atomic energy. Now I don't want to go all the way to Japan and so on, but I'd like to bring up the subject of the hell bomb. I wonder how many young people remember that. The hell bomb, they called it. It was fired on Bikini Island and I know that island. I was there on a ship one time before this happened. Anyway, a strange thing about it, when it was shot it was heard over the air oh, what a wonderful thing it was. It was a choke of sun, oh, what a glorious thing. At that time, can you imagine that? And no thought of what happened to those people that lived for ages on those islands. Think about the people for a change.

They had to take those people away from there to shoot that bomb. Okay, they sent them way south on another island and I found out about this afterwards. The article come out in the National Geographic Magazine, a very good expose of it, this come out in the 1960s. I forgot the issue, but it's there. And it exposed this. After 10 years, I believe it was, they — the authorities assumed that nature over the world would assimilate the problems around it and they would bring these people back and let them try to live there again. Well, they've come back and some of them and got some fish. I forgot one thing too, the Japanese fishermen warned us about it. They said some of the fish they caught there were not fit to eat. They had found out all this before. Okay, people were brought there to give it a try again and they couldn't stay. They started getting sick. So they sent them back to the island before. That is what the magazine said and that's the only report I've heard since. It's been a hush. I tell you, it's been a hush of that. And it's just about time that we quit this stuff.

Response to Commentor No. 2425

2425-1: DOE notes the commentor's opposition to nuclear weapons and concern over the effects on the public of weapons testing, although these issues are beyond the scope of this Nuclear Infrastructure PEIS. The scope of this Nuclear Infrastructure PEIS is limited to analysis of alternatives to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development. The three missions are civilian nuclear energy missions and are not defense-related.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2426: Anonymous

2426-1 — You haven't even cleaned up this mess from 60 years ago. And it's been what, it's been in the river?

My father worked at Hanford. He was an engineer there. He left me when I was two years old. It's like I don't trust really anything from this corporate state we live under any more. It's lied to me. It's lied to the Native American people here who were ripped off. Let's just put it on their land. Let's just bury it in the ground somewhere and hope it goes away. This is a waste that I think all your degrees that you have and learned about this process and Hiroshima and Nagasaki weren't enough. We should really look a little deeper.

2426-2 — We spend how much of our lives working for a government that has potentially is the greatest leadership capabilities in the world. But it doesn't follow its own words, so to speak. I just think it's time we started looking at alternatives. If, you know, research, you know, I think is a very important tool and we need to take and look at the alternatives other than just what allopathic medicine has conditioned us to believe and live by, standards that took its original core from the earth. . .

Response to Commentor No. 2426

2426-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

2426-2: DOE examined numerous alternatives and options (see Section 2.5) to meet the purpose and need of the proposed action (see Section 1.2) of the NI PEIS. It is beyond the scope of the PEIS to examine alternatives to the medical use of radioisotopes in the treatment of disease.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2427: Anonymous

2427-1 — I favor Alternative 5.

2427-2 — I've been to a lot of these meetings on FFTF over the past few years and I agree with the City of Portland City Council in September 1999 when they said no to the restarting of the FFTF.

2427-3 — Hopefully, the DOE will eventually be left behind and Hanford will be managed by some agency that can take care of it properly.

Restarting this 20-year-old sodium-cooled, liquid sodium-cooled reactor in an area that has been so poisoned and so desperately needs to focus on its cleanup mission is totally absurd and most people outside of the DOE and the Tri-Cities area do see that.

2427-4 — I think the DOE and its corporate friends still actually want to use the FFTF for tritium production and other things such as the purpose that they state on page D-16 of Volume II of the PEIS which says "there is a particular interest in materials testing associated with extension of commercial nuclear power plant license renewals."

Well, I don't want to see old ready to die nuclear plants retrofitted with things cooked up in a restarted FFTF on the shores of our Columbia River.

2427-5 — Build a new medical isotope reactor somewhere else, somewhere nowhere near one of the largest rivers on the Continent, please, if you must, but don't restart the FFTF.

Response to Commentor No. 2427

2427-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.

2427-2: See response to comment 2427-1.

2427-3: FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2427-4: The only missions being considered for FFTF at this time are those analyzed in the NI PEIS, which are the production of isotopes for medical research, and industrial uses; plutonium production for future NASA space exploration missions; and U.S. nuclear research and development needs for civilian application. No component of the proposed action is for the purpose of producing tritium. The commentor's reference to materials testing associated with extension of commercial nuclear power plant license renewals falls under the mission of nuclear research and development needs for civilian application, as discussed in Section 1.2.3 of Volume 1.

2427-5: If selected in the Record of Decision, Alternative 4, Construct New Research Reactor, would result in the construction of a new reactor at an as yet unidentified DOE site. If this alternative were selected, additional NEPA review would evaluate site location.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2428: Anonymous

2428-1 — My sister-in-law, she's on the Board of Directors for Citizens for Medical Isotopes. Now when I heard this, when she told me that she was trying, working hard to restart FFTF I thought that she had lost all her moral values. I was very angry. Now please listen to me, please, okay, because I've been down, I've taken this journey.

For the first time in my anti-nuclear life I opened my ears just a little tiny bit to listen, just a little bit because she was my sister-in-law and she was sitting in my front room, okay? I began to realize from her facts that can be substantiated by the U.S. Department of Energy, I would only listen to that, that's all she had to share with me. Only facts.

Response to Commentor No. 2428

2428-1: Thank you for your comment on the NI PEIS.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2429: Anonymous

2429-1 — This is a complex topic that you're talking about and complex information that you're giving us tonight, but I'm beginning to get the idea that the bottom line here is something about restarting a nuclear energy program for the supply of energy, even though nuclear energy is really not what the people want.

2429-2 — I would much rather you see the amount — use the amount of money that you have talked about tonight to do two things. One, to clean up the mess in Hanford to the best of your ability, . . .

2429-3 — . . .secondly, to use that money for research and development of wind energy and solar energy.

Response to Commentor No. 2429

2429-1: The only missions being considered for FFTF at this time are those analyzed in the NI PEIS, which are the production of isotopes for medical research, and industrial uses; plutonium production for future NASA space exploration missions; and U.S. nuclear research and development needs for civilian application. Restart of a nuclear energy program for the supply of energy is not within the scope of the NI PEIS. However, clean, safe, reliable nuclear power has a role today and in the future for our national energy security. In recognition of this need, nuclear energy research and development programs have been initiated to address potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) and to ensure that current nuclear power plants can continue to deliver adequate and affordable energy supplies. Because it is unlikely that existing facilities could fully and effectively support these nuclear energy research and development initiatives without disturbing their existing missions, DOE is proposing to enhance its nuclear facility infrastructure to also support these activities. Further information on the need for nuclear energy research and development is provided in Section 1.2.3 of Volume 1.

2429-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2429-3: DOE notes the commentor's interest in solar and wind energy sources, although issues of research and development of alternative energy sources are beyond the scope of this Nuclear Infrastructure PEIS. The DOE missions to be addressed in this EIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2429: Anonymous (Cont'd)

Response to Commentor No. 2429

development, can currently only be met using nuclear reactor or accelerator technologies.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2433: Anonymous

2433-1 — But I want to talk about something that I saw when I was there at the FFTF site when someone was doing some testing on the IVHM which is the in vessel handling machine that pulls these 2,000 pound, 20 foot long fuel pins from the core. The guy overrode some of the safety systems. He picked the pin up too high and broke the chain off which dropped this pin down into the core, buckling up some of the reflector shields and after the repair was done, I heard the number that it cost was somewhere around \$1 million. And I think these people should be able to have to take a look at this report and all the pictures that were taken if they're going to consider restarting this reactor. They really need the right to see the damage that happened to this core.

Response to Commentor No. 2433

2433-1: This incident occurred during construction testing in about 1978, prior to loading sodium or fuel into the reactor. As part of the testing, all of the IVHM safety systems were overridden which, coupled with an error in judgement by the test engineer, resulted in damage to the IVHM and a few baffle plates (which are outside of the core region). The baffle plates were repaired, and the damaged IVHM was replaced with the spare. Additionally, design changes were made to the IVHM to prevent this type of accident from reoccurring. Subsequent testing demonstrated full acceptability of these systems, which were successfully operated for more than 10 years without any indication of problems emulating from this construction accident. In retrospect, the design improvements that resulted from the incident actually increased the safety of IVHM operation.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2435: Anonymous

2435-1 — I'm also here to speak out for closing down — for Alternative 5.

2435-2 — And cleanup. Please start to clean up the goo.

Response to Commentor No. 2435

2435-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2435-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2440: Anonymous

2440-1 — That's a tough act to follow. Unlike a lot of you in this room I had 16 nuclear free years. I was 16 years when we dropped the bomb on Hiroshima. Six years later I was down at the Nevada test site and you dropped a bomb on me. I've listened to the lies of the AEC and the DOE told these many years. I remember the Atoms For Peace Program. In many ways, this resembles the Atoms For Peace Program because this is going to do everything. This is going to cure cancer. Atoms For Peace, they were going to dig a canal to cross Nicaragua. They were going to mine diamonds with it. The Russians even tried it. Killed off a lot of miners. So I'm here to tell you the DOE in my opinion is not a bastion of credibility or truth. I don't believe anything you people say. And that's unfortunate.

The insulation between the people and the government, much of it began at the advent of the nuclear program for the Manhattan Project because it became legitimate to lie to the people because it was in the people's best interest and that program and that attitude has persisted to this day. And I for one am really not sorry I'm as old as I am because I don't see anything bright about the future for this world, for this nation or this world because of the sword of Damocles that hangs over our heads.

2440-2 — And I want to register my opposition to the restart of the FFTF. . .

2440-3 — I want you to honor your obligation to shut it down. . .

2440-4 — I want you to honor your obligation to . . .clean it up.

Response to Commentor No. 2440

2440-1: DOE notes the commentor's concerns.

2440-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.

2440-3: See response to comment 2440-2.

2440-4: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2442: Anonymous

2442-1 — I don't know if you'd call me patient. It's a misnomer. Actually, I've been sort of pondering this whole pull out the number process and I think that there's a tremendous amount of time wasted and thus we have a very empty place compared to a lot of eloquent speakers we had here who are willing to come out for tonight, so something is wrong with this process. It didn't quite work like you had hoped.

So reasons against restart of the FFTF. First of all, and you I believe have heard from me, Colette, the process is flawed. A late cost analysis and a missing nonproliferation analysis make this the usual DOE piecemeal process. And so you brought your cost analysis tonight. We've all had a lot of time to read it and make comment on it.

2442-2 — The FFTF would add at least 16 tons of waste to the most polluted site in the Western Hemisphere. Unacceptable.

2442-3 — Production missions undermine clean up efforts at Hanford...

2442-4 — We already have agreements with Russia and Canada to supply us with isotopes and Pu-238. This is a quiet changing of policy by people inside the DOE and beholden to them to those who stand to benefit financially from a restart of the production at Hanford. One of the points that I'd like to make there is that PNNL, Pacific Northwest National Laboratory which sits up on Hanford land and makes a lot of money doing all sorts of research and very little of which has to do with clean-up, has written — has had a lot of input into this EIS and they have lobbied. The labs have a tremendous lobby in Congress for this kind of thing and also with the DOE Headquarters. And they're the ones who stand to benefit by restarting the FFTF. They're the ones who are going to get the jobs. They're the ones who are going to get more research, etcetera, etcetera. So Nancy was exactly right when she said there are different motives here and motive always lies in money and power.

2442-5 — This PEIS does not give a detailed analysis of the suitability of the use of the FFTF. You haven't really done a good analysis there. It is woefully inadequate in its analysis of the environment and socioeconomic-economic impacts. The use of the 300 Area buildings as support for operating FFTF was recently a complete surprise. Keith Klein, the manager of the Richland office of the DOE, who had been making up this wonderful clean up plan that's back there on the wall and he didn't know that you guys in D.C. were planning to use some buildings in the 300 Area which is laden with uranium. He was stunned when he mentioned it at a meeting recently.

Response to Commentor No. 2442

2442-1: The costs and nuclear nonproliferation impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such ancillary documents need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed these documents to more than 730 interested parties on August 24 and September 8, 2000, respectively. Both reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided summaries of the Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment in Appendixes P and Q, respectively in the Final NI PEIS.

2442-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. In full recognition of DOE's position to take expeditious action in regards to Hanford cleanup, the NI PEIS evaluated the maximum cumulative radiation exposure to the public from all reasonably foreseeable Hanford Site activities over the 35 year time-frame. These activities include future waste management (as estimated in the Hanford Comprehensive Land Use Plan), tank waste remediation, K Basin spent nuclear fuel management, decommissioned naval reactor plant disposal, and Plutonium Finishing Plant Stabilization (see section 4.8.3.3). As shown in Table 4-173, the dose to the maximally exposed individual would be expected to remain well within regulatory limits. Based on an exposure period of 35 years, 0.21 (<1) latent cancer fatalities would be expected to occur among the local population over the 35-year period as a result of Hanford related radiation exposure. The cumulative impact assessment also determined that the incremental annual radiation dose to the maximum exposed public individual from the NI-PEIS proposed operations at FFTF and FMEF or RPL, including the impact of storing the 16 metric tons of heavy metal of spent FFTF nuclear fuel (see section 4.3.1.1.14) that would be generated in the 35 year nuclear infrastructure operation period, would be 0.0054 mrem. This assessment also determined that

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2442: Anonymous (Cont'd)

2442-6 — I also would like to say that the policies or lack thereof are the cause of the tremendous number of cancers we humans are suffering from. The governmental policies, the lack of health care, the fact that the corporations run rough shot over us in getting loopholes to protect us, that's all part of this whole scene.

2442-7 — So those are my basic comments right now and I hope you get flooded of thousands of cards. I hope you take them all into consideration and I'm really sick of this, my third FFTF hearing. I'm sick of this. It has taken up a tremendous amount of time away from our efforts to get Hanford cleaned up.

Response to Commentor No. 2442

0.0045 latent cancer fatalities would be expected to occur among the local population as a result of the NI PEIS related radiation exposure over the 35 year period. Also note that in section 4.3.1.1.14, it is stated that upon cessation or reactor operation, or earlier, this spent fuel inventory would be shipped offsite to a geological repository for disposal. The annual doses to the public from the Hanford site and proposed NI PEIS activities above are insignificant. For perspective, the radiation dose the average American receives from natural sources is about 300 mrem each year. Based on the same 35 year time period used above, approximately 2,000 latent cancer fatalities would be expected among the same population as a result of this natural (non-Hanford related) radiation exposure. In that same 35 years, about 19,000 cancer fatalities from all causes would be expected in the same population.

2442-3: The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2442-4: DOE notes the commentor's views. The United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily Molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs. DOE could also purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2442: Anonymous (Cont'd)

Response to Commentor No. 2442

2442-5: The commentor's concerns regarding the adequacy of the assessments of impacts associated with FFTF restart are noted. DOE has performed a detailed environmental analysis of the suitability of the potential restart of FFTF. The results of the impact assessments presented in Section 4.3 of the NI PEIS demonstrate the environmental suitability of restarting FFTF. Operation of FFTF would result in releases of materials to the environment via airborne and liquid pathways. However, all air emissions and wastewater discharge would be in accordance with applicable permit and regulatory requirements. The release of criteria air pollutants would result in concentrations well below Federal and state air standards (Table 4-13). The release of radioactivity and hazardous chemicals into the atmosphere would have a negligible effect on human health (Tables 4-17 and 4-19). There would be no discernible impacts to groundwater or surface water quality (Section 4.3.1.1.4) or to ecological resources (Section 4.3.1.1.6). The management of all wastes associated with restart and operation of the FFTF is addressed in Section 4.3.1.1.13 of the NI PEIS. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. The management of these wastes would be well within management capacities and would not be expected to adversely affect the environment. Impacts on people and ecological resources would be small. The generation of spent nuclear fuel from 35 years of FFTF operations would represent less than 1 weight-percent of the total spent nuclear fuel inventory presently stored at Hanford (Section 4.3.1.1.14). For the socioeconomic analysis, the PEIS includes the socioeconomic impacts of the Region of Influence, which is the area in which 90 percent of the Hanford workers live. This assessment looks at the impacts on population, housing, and public services. It also includes a broader evaluation of the Regional Economic Area, defined as those counties that will be economically impacted by actions at the Hanford site. All socioeconomic impacts are shown to be small. Section G.8 provides an in depth discussion of the impact assessment method. Hanford 300 Area facilities included in options under consideration for nuclear infrastructure activities are the Radiochemical Processing Laboratory (RPL) and Building 306-E (refer to Volume 1, Section 2.3.2.4 of the NI PEIS). These facilities have never been precluded from supporting future DOE missions. There are no current plans to close down the RPL. However, Building 306-E is listed in the 300 Area accelerated closure plan (300 Area Initiative), with closure activities scheduled to begin in May, 2003. If a decision were made to implement an alternative option that utilizes Building 306-E, the building would be removed

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2442: Anonymous (Cont'd)

Response to Commentor No. 2442

from the list of facilities to be closed until its part of the activity were completed.

2442-6: The Department notes the concerns and views expressed in the comment.

2442-7: It is DOE policy to encourage public input on matters of regional, national and international importance as part of its commitment to facilitate a public participation process that is open and unbiased. In preparing the Final PEIS, DOE has assessed and considered both oral and written comments received on the Draft PEIS during the public comment period and has responded to these comments in the Final PEIS. Volume 3 of the NI PEIS contains public comments received on the NI PEIS and DOE responses to those comments. These comments are summarized, tabulated, and cross-referenced by commentor, category, and method of submission. A summary discussion is also provided of the overall prevailing issues raised during the public comment period.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2443: Anonymous

2443-1 — You cannot even talk about having an Environmental Impact Statement, let's not even talk about all that at Hanford. You can't even talk about this without adequate clean up of the waste produced there. There is no detailed outline of how waste produced in your proposed thing will be dealt with and how much that will cost and where it will be.

2443-2 — I haven't really read the whole thousand pages, but I don't need to. You should be embarrassed. Any person who is doing an EIS statement should be embarrassed of such an inadequate EIS statement. One other thing, EIS statements in general do not adequately consider the externalities and that includes people's health, environment, water, land and this is just no exception. This is just another waste of trees, basically.

Response to Commentor No. 2443

2443-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

2443-2: The NI PEIS is adequate. This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS. Further, DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives. This was accomplished through review and evaluation of site-specific information on the environmental conditions prevailing at ORR, INEEL, and Hanford to include a comprehensive analysis of the associated environmental and health risks of each alternative. DOE made every effort to obtain, analyze and disclose all required information to make a decision on expanding nuclear infrastructure.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2444: Anonymous

2444-1 — How can you even think about doing more when we don't have materials that are capable of lasting the half life of what it's storing?

Response to Commentor No. 2444

2444-1: The environmental impacts associated with managing the additional FFTF spent nuclear fuel at Hanford are discussed in Section 4.3 of Volume 1. As discussed in Section 4.3.1.1.14, the incremental impact associated with managing the additional FFTF spent nuclear fuel is extremely small and would have no discernible impact on the existing Hanford spent fuel management over NI PEIS evaluation period (see section 4.8.3.5 for cumulative impact). The currently used FFTF-specific spent nuclear fuel storage system designs (i.e., facility storage vessels and dry storage casks) are the key contributors for determining that the incremental radiological and environmental impacts are small. This section also states that the "spent [FFTF] nuclear fuel would be packaged in acceptable containers and shipped to a geologic repository for ultimate disposal." Disposal of DOE spent nuclear fuel is within the scope of a separate EIS titled, "Draft Environmental Impact Statement for a Geologic Repository for the Disposal of Spent Nuclear Fuel and High-Level Radioactive Waste at Yucca Mountain, Nye County, Nevada" (DOE/EIS-0250D, July 1999).

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2449: Anonymous

2449-1 — I keep hearing 54 million gallons, 54 million gallons of concentrated hot garbage? I mean — I hope it's separated. I mean at least there's enough water in there to keep it from getting very hot. I mean that's what the water is for is to separate the atoms that are breaking down.

I mean there's just — 54 million gallons. This is only going to produce what, 8 barrels a year of waste? That's assuming that it doesn't have hot gloves, hot coveralls. I don't know what else, people who handle the material get exposed to. Hot boxes if they're in there separating the material out of the targets. There's going to be isolator boxes that people are working in and some of those are going to be exposed to other material and they can use it again and again. But you're also going to create a chemical separation facility and that's proposed to be built on buildings that are already hot.

You're already going to have to build another chemical separation facility to deal with those 54 million gallons. So you're going to build this great big chemical separation facility to pump lots of fluid into and separate it and put it into glass so that rather than being separated by little atoms of water, all this hot stuff that's separated by atoms of glass. I kind of like that idea a little bit.

2449-2 — Should we get insurance on a 25-year-old nuclear reactor that somebody dropped a big part of it? A million dollars to repair the damage of one person overriding the safety features. A million dollars is nothing. I don't know. I think a million dollars is quite a bit and I hope they fixed it.

2449-3 — But I hope they shut it down.

Response to Commentor No. 2449

2449-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. Milestones for vitrification of the wastes from the high-level waste tanks are included in this agreement. As discussed in Section 4.3 of Volume 1, none of the proposed alternatives would add waste to the high-level waste tanks at Hanford.

2449-2: The incident referenced by the commentor occurred during construction testing in about 1978, prior to loading sodium or fuel into the reactor. As part of the testing, all of the In-Vessel Handling Machine (IVHM) safety systems were overridden which, coupled with an error in judgement by the test engineer, resulted in damage to the IVHM and a few baffle plates (which are outside of the core region). The baffle plates were repaired, and the damaged IVHM was replaced with the spare. Additionally, design changes were made to the IVHM to prevent this type of accident from reoccurring. Subsequent testing demonstrated full acceptability of these systems, which were successfully operated for more than 10 years without any indication of problems emulating from this construction accident. In retrospect, the design improvements that resulted from the incident actually increased the safety of IVHM operation.

2449-3: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2453: Anonymous

2453-1 — It was said that the risks from the Hanford — or from the fast flux restart would be from the processing, not from the irradiation. I have a problem believing that seeing how one of the major waste products is not even mentioned in this waste generation at Hanford, a handout that I received. It's footnoted as D and D says in part, "The inventory of bulk metallic sodium, Section 4.4.1.2.13 is not included because alternative sponsors and/or users will be found for its disposition." That seems kind of like a pipe dream to me, seeing how sodium, to the best of my understanding is a highly explosive material that explodes on contact with air.

I don't now anybody that would want to sponsor or use this material, especially in a radioactive form.

2453-2 — As far as NASA, I don't trust NASA. I don't think they should get any uranium whatever. The Cassini probe which they sent out and flew around Jupiter came back at a high rate of speed and circled the earth at 300 miles above the earth's surface before continuing its journey. That Cassini space probe had the uranium on board and they estimated that the chances of it actually striking the earth if they made some error were only 1 in 100, so I don't think that NASA should be allowed any more uranium to play with.

2453-3 — As far as the isotopes for curing cancer, I think that we should find another way besides restarting the fast flux reactor. According to what I heard the statement by Kitzhaber, there are other sources and it seems to me that the cure may be worse than the disease in this case because you may cure some individual cancers with the radioactive isotopes, but the radiation that is produced doing this will last for millions and millions and millions of years and probably or conceivably cause an incalculable number of additional cancers in other people. It seems a little selfish to insist on restarting a reactor that produces more harmful radioactive waste in order to fix a problem that has other sources of fixing. But anyway that concludes my statement. I'll yield back the remainder of my time.

Response to Commentor No. 2453

2453-1: If FFTF is deactivated, a site integrated approach has been identified for disposition of the sodium coolant from FFTF. The FFTF sodium could be converted to sodium hydroxide and then used in the planned caustic washing high-level waste pretreatment process. In addition to reducing costs for both FFTF and the tank waste program, this would result in a major waste minimization and chemical recycling achievement. This planned use of the sodium is documented in the Tri-Party Agreement milestones (M-81-00 and M-20-00 series) that were established for deactivation of FFTF (currently in abeyance pending the final NI PEIS decision). If the planned use of the sodium for the tank waste program does not materialize, the sodium would be converted to a stable form suitable for land disposal at Hanford.

2453-2: DOE notes the commentor's opposition to NASA's use of nuclear materials for space missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. The Cassini fly by occurred exactly as planned, with no release of nuclear material.

2453-3: Cancers are believed to be caused by a combination of hereditary and environmental factors, including radiological and chemical agents. In ongoing clinical testing, therapeutic radioisotopes have proven effective in treating cancers and other illnesses while minimizing adverse side effects, making their use an attractive alternative to traditional chemotherapy and radiation treatments. The NI PEIS provides an estimate of waste generation and potential human health impacts associated with each of the alternatives proposed for the production of medical, industrial and research. Any additional wastes generated in support of these missions would be managed (i.e., treated, stored, and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws, regulations, and applicable DOE orders. In terms of potential human health impacts, the NI PEIS analysis indicates that the most likely impacts would not result in additional cancer fatalities among the population surrounding the DOE facilities that may be selected for use. The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it

*Comments from the Portland, Oregon, Public Hearing (August 29, 2000)**Commentor No. 2453: Anonymous (Cont'd)**Response to Commentor No. 2453*

does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs. Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2458: Anonymous

2458-1 — ...FFTF should be closed.

2458-2 — I mean it's deja-vu. We hear it tonight, over and over. Deja-vu. So I'm going to deja-vu to last year and read you from one of these handouts. It commences "To the Hanford Advisory Board" last month, "Dr. David Johnson, a physicist who worked on the FFTF nuclear reactor in the 1970s recommended against restarting the reactor. A specially designed accelerator would make more isotopes than the FFTF, but without the large number of wastes of — nuclear wastes, without the large costs and without the large safety issues. FFTF is incapable of producing a diverse and economical supply of medical isotopes." And I underline this, "The real purpose of the medical isotope proposal is revealed in a memo from ANMS, a contractor, once interested in running the nuclear reactor." This memo says, "Focus all PR efforts on the humanitarian mission of the FFTF. Medical isotopes and materials research. Do not mention" and this is in large print, "Do not mention any proposals for increasing reactor activity. The humanitarian mission must be highlighted and exploited to the maximum."

2458-3 — Did you say that you had added another sixth alternative? Did I hear you say that?

2458-4 — I think the whole thing should be cleaned up. We've had too much and everybody has heard it tonight and over and over and over again and we're all tired of it and I'm sure you're tired of it.

Response to Commentor No. 2458

2458-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2458-2: DOE notes commentor's remarks.

2458-3: DOE has not added a sixth action alternative. However, if the No Action Alternative is included along with the 5 action alternatives, there are a total of 6 alternatives presented in the NI PEIS.

2458-4: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2459: Anonymous

2459-1 — For years we have had hearings and from the first ominous rumblings of the idea of restarting the FFTF, the project has been plagued with controversy and unsavory manipulations first advanced by, you remember, the Advanced Nuclear Medical Systems. These were the folks that wanted to and I quote, “focus all immediate planning and PR effects on the humanitarian mission of the FFTF and do not mention any proposals for increasing reactor activity or future breeder reactor and the undeniable worthiness of the humanitarian mission must be highlighted and exploited to the maximum sensitivity of our society.”

You see, they succeeded. Here we are tonight in having everybody embroiled in an emotional debate over medical isotopes.

2459-2 — . . . we are opposed to the restart of the FFTF for this mission [isotopes].

2459-3 — The Department of Energy wrote to Senator Kennedy on December 22, 1995. A quote from that letter from DOE says, “The FFTF has not produced medical isotopes since 1990 and it is not necessary to DOE isotope production mission.” DOE’s ATR and HFIR provide most all of the DOE’s reactor based commercial and medical isotope production and they have significant additional capacity to produce isotopes well into the next century if future market demands development. And furthermore, in April 2000, your Medical Advisory Panel recommended against the use of FFTF for medical isotopes and their alternatives and purchase from Canada ought to be considered.

2459-4 — The FFTF is a reactor in search of a mission and now they’ve tried tritium. That didn’t work. Now let’s consider plutonium-238. NASA will probably use other technologies for some of the missions and plutonium-238 is now available from Russia to purchase.

2459-5 — What about the third proposal, to support civilian nuclear energy research and development activities? New nuclear fuel forms and new reactor designs. To me, this is the crux of the matter. The FFTF was built to support the development of the liquid metal fast breeder reactor program. Supposedly, that program was closed. But in an August 8, 2000 Environmental News Service, we find that the experimental breeder reactor 2 in Idaho has not yet been closed as Congress directed in 1994. Why isn’t it closed DOE?

In July 1999 officials also associated with the breeder reactor program in France and Japan showed an interest in maintaining the FFTF as a fast reactor research facility. What a coincidence. The nuclear industry is desperate to survive in spite of the fact that wind and solar energy development and aggressive conservation can and will meet energy demands.

2459-6 — The industry lies outright to us, promoting nuclear as clean and ignoring the thousands of tons of spent fuel with no place to go and lethal forever.

Where is the detailed explanation of what happens to the spent fuel produced by FFTF?

Response to Commentor No. 2459

2459-1: DOE notes the commentor’s views and remarks.

2459-2: DOE notes the commentor’s opposition to Alternative 1, Restart FFTF.

2459-3: Subsequent to the time period of the letter noted by the commentor (i.e., 1995), DOE has sought independent analysis of trends in the use of medical radioisotopes, and of its role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert committees. In 1998, an Expert Panel convened to forecast future demand for medical isotopes estimated that the expected growth rate of medical isotope use during the next 20 years will range between 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by DOE’s Nuclear Energy Research Advisory Committee (NERAC), established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. The growth projections were also adopted by DOE as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE’s role in fulfilling the U.S. research and commercial isotope production needs. The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: “In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production.” In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2459: Anonymous (Cont'd)

Do not insult us either by saying that the amount is small and insignificant by Hanford standards. We will tolerate no more waste producing operations at Hanford. Our City Councils have said so. Our State legislatures have said so. Our Governor has said so and the people have said so. We are adamantly and unalterably opposed to more waste production at Hanford.

2459-7 — We are even more so opposed to the use of HEU or MOX fuels. We will not tolerate that which is more than nuclear madness.

2459-8 — We don't believe you have — sufficiently addressed the waste disposal issue, the fuel transport issue, the condition of the fuel stored to use, the real long term cost issues, the risk issues, the proliferation issues.

2459-9 — The values of the people in this region, we want all attention to focus on the major dilemmas of the tank wastes in K basins and the mission of clean up.

Response to Commentor No. 2459

support projected needs could be accomplished without impacting the existing missions of these facilities. There currently is little room for growth of medical isotope production at either ATR or HFIR. At ATR the neptunium-237 targets for plutonium 238 production will compete for space in the reactor. There are potential negative impacts to the private company that leases reactor space for the production of radioisotopes due to being assigned less desirable irradiation space. At HFIR, the ability to expand medical isotope targets into additional reactor locations is limited by the potential impacts that the targets have on the primary experiments in the reactor. Medical isotope targets and neptunium-237 targets are not in competition for the same locations in at HFIR.

2459-4: Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium 238, DOE's ability to support future NASA space exploration missions may be lost. DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

2459-5: Other than the missions discussed in the NI PEIS, no alternate uses for FFTF are being considered at this time. None of the alternatives in the NI PEIS include using FFTF to support the development of the liquid metal fast breeder reactor program. In January 1997, President Clinton tasked his Committee of Advisors on Science and Technology (PCAST) to evaluate the current national energy research and development portfolio and to provide a strategy that ensures the United States has a program to address the Nation's energy and environmental needs for the next century. In its November 1997 report responding to this

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2459: Anonymous (Cont'd)

Response to Commentor No. 2459

request, the PCAST Energy Research and Development Panel determined that restoring a viable nuclear energy option to help meet our future energy needs is important and that a properly focused research and development effort to address the potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) was appropriate. The PCAST panel further recommended that DOE reinvigorate its nuclear energy research and development activities to address these potential barriers. Further information on the need for nuclear energy research and development is provided in Section 1.2.3 of Volume 1.

- 2459-6:** The NI PEIS assumes, for the purposes of analysis, that Yucca Mountain Nevada, would be the final disposal site for DOE's high-level radioactive waste and spent nuclear fuel. As directed by the U.S. Congress through the Nuclear Waste Policy Act, as amended, Yucca Mountain is the only candidate site currently being characterized as a potential geologic repository for high-level radioactive waste and spent nuclear fuel. DOE has prepared a separate EIS, "Draft Environmental Impact Statement for a Geologic Repository for the Disposal of Spent Nuclear Fuel and High Level Radioactive Waste at Yucca Mountain, Nye County, Nevada" DOE/EIS-0250D, July 1999), which analyzes the environmental impacts from construction, operation and monitoring, related transportation, and eventual closure of a potential geological repository.
- 2459-7:** The commentor's opposition to the use of HEU or MOX nuclear fuel in FFTF and nuclear technology is noted.
- 2459-8:** The NI PEIS addresses all issues identified by the commentor that are within its scope. These include waste disposal (Section 4.3.1.1.13), fuel transport (Section 4.3.1.1.11 and Appendix J), and human health risk Sections 4.3.1.1.9 and 4.3.1.1.10 and Appendixes H and I). Nuclear nonproliferation impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. However, DOE prepared a separate Nonproliferation Impact Assessment which is available on the NE web site (<http://www.nuclear.gov>) and in public reading rooms. That document assesses the potential nonproliferation impacts associated with nuclear infrastructure activities. A summary of it is included in Appendix Q of the final NI PEIS. Assessments of the costs associated with nuclear infrastructure activities are also not required by NEPA and CEQ regulations to be included in a PEIS. However, a cost report was issued separately by DOE, which is available at the same locations as the nonproliferation report. A

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2459: Anonymous (Cont'd)

Response to Commentor No. 2459

summary is included as Appendix P of the final NI PEIS . Also not within the scope of the NI PEIS is, an assessment of the conditions of the MOX fuel stored at Hanford. This fuel is being maintained in a safe standby condition such that it could be utilized in the FFTF core if the FFTF Restart alternative were chosen for implementation.

2459-9: DOE notes the commentor's concerns regarding K Basin tank wastes and the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2462: Anonymous

2462-1 — Why aren't you accessing your students and why aren't you accessing the knowledge that's out there to take care of these problems and to look for innovative ways to do it? I know there are a lot of people put work into this and I don't understand why it's not being used. I'm one of paranoia conspiracy people. I've Tesla and just on that note, I know it's a little freaky, but I don't understand why you don't apply those type of things in understanding and why you always ignore those capacities.

2462-2 — So I guess I just wanted to say no [to restart]...

Response to Commentor No. 2462

2462-1: DOE notes the commentor's interest in innovative technologies and human capabilities, which are outside the scope of this PEIS. The PEIS is required to evaluate a range of reasonable alternatives. Approaches and technologies that are considered innovative could, if promising, be examined in other government and private programs.

2462-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2464: Anonymous

2464-1 — I have a suggestion. Maybe the DOE people and the Washington people should be the ones to speak last.

I liked that part. I just wanted to add that maybe everybody from Washington could be respectful of Oregonians. We try to when we go up there.

2464-2 — What's the half life of the plutonium that's going to be created?

2464-3 — Space Magazine was running an ad by one of the aerospace industries and the guy was saying our whole goal — and these people are talking to investors — our whole goal is to have our launches be as safe and as predictable as a truck driving down the road.

Now just recently we've had several truck accidents that caused major spills and killed fish and areas around here. So think about launching plutonium into space. Maybe we should start waiting a little bit until they are more safe than a truck. Has anybody considered this issue?

2464-4 — What's going to happen when funding that is desperately needed to clean up Hanford that's been diverted to clean up — to keep FFTF running is now needed to feed people so that they won't be rioting in the streets?

Think about it. Here we've got plutonium being produced. We've got waste being produced. We've got Hanford lighting up and being on fire. Those tanks have got flammable liquids in them. Alone on their own merits they're toxic. Add radioactive waste to it and you're going to have the equivalent of nuclear bomb blasts going off and drifting down to wherever the wind is going. Think about it. It took humans 50 thousand years, give or take a few, to evolve. What's going to happen when we've got long life radioactive waste circulating in vast quantities than we've got it now?

2464-5 — So I'm going to vote for the proposal that we just simply close down the FFTF.

Response to Commentor No. 2464

2464-1: DOE notes the commentor's views for the order of speaking position at DOE public hearings. The purpose of DOE's presentation at the Portland Oregon, public hearing and at all of the NI PEIS public hearings was to provide an overview of the Draft NI PEIS as a basis for facilitating relevant discussion and public input. Therefore, it is customary to present this background information before the start of the formal comment process. DOE works to ensure that the hearing format used serves to promote open and equal representation by all individuals and groups, regardless of the motivation for attending. One means used by DOE in trying to ensure equal representation at public hearings is by selecting the order of speakers through a random number drawing.

2464-2: Plutonium-238, the plutonium isotope intended for production in this EIS, has a half life of approximately 87 years.

2464-3: DOE notes the commentor's opposition to NASA's use of nuclear materials for space missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch.

2464-4: DOE notes the commentor's concerns regarding the high-level waste tanks at Hanford. The last Hanford underground waste storage tanks with organic loadings were recently removed from the Watch List indicating an explosion is no longer a credible accident. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As discussed in Section 4.3, Volume 1, no high-level radioactive waste would be added to the high-level waste tanks at Hanford. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE,

*Comments from the Portland, Oregon, Public Hearing (August 29, 2000)**Commentor No. 2464: Anonymous (Cont'd)**Response to Commentor No. 2464*

which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2464-5: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2467: Anonymous

2467-1 — Well, so I'm going to register against it [FFTF].

2467-2 — If you need energy, Nevada has enough solar energy to power the whole West Coast, so there's biomass fuels, there's solar, wind energy. If you need alternatives, do you know what I mean? So there's alternatives.

Response to Commentor No. 2467

2467-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2467-2: DOE notes the commentor's interest in alternative energy sources. Issues of research and development of alternative energy sources are beyond the scope of this Nuclear Infrastructure PEIS. Despite advances in many energy technologies, America's future energy security will depend on a robust mix of energy sources which necessarily includes nuclear power generation. It is the current United States policy that clean safe, reliable nuclear power continue as a viable component of the United States' energy portfolio. In recognition of this need, the government has initiated nuclear energy research and development programs to address potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) and to ensure that current nuclear power plants can continue to deliver adequate and affordable energy supplies. An enhanced DOE nuclear facility infrastructure is required to support such nuclear energy research and development for civilian applications.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2452: Jezreela Anderson

2452-1 — I am horrified that we have not already learned our lessons from over 50 years of radioactive contamination.

I am horrified that we are wasting our time and your time, even considering restarting the FFTF when the government does not have the technology, funds or political will to clean up the current mess.

I think that the blue ribbon panel that recently came saying that it will never be cleaned up, I thought, okay, there it is, we're done. It's never going to be cleaned up, so they'll never have to consider making more mess, right? Because we know it's never going to be cleaned up adequately, so let's put everything we have into clean up and this issue will go away, but here I am. So obviously, it hasn't gone away.

2452-2 — I do not believe that conversation tonight about restarting FFTF has anything to do with curing cancer. I believe it has everything to do with DOE and the U.S. military seeking something to do with all of the resources that we had basically siphoned off of our other programs for the last 50 years or more and put into the military industrial complex.

In the post-Cold War Era, the military industrial complex is looking for a purpose and what better purpose than curing cancer. And that's what this is really about. It's not about science. It's not about cancer. It's a big sham and it's really appalling.

2452-3 — I support alternative 5. I believe that FFTF should never be restarted, that the area should be cleaned up.

Response to Commentor No. 2452

2452-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2452-2: Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. The NI PEIS evaluates a range of reasonable alternatives for accomplishing the proposed action, one of which includes use of FFTF. However, no component of the proposed action is for the purpose of supporting any defense or weapons-related mission. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

2452-3: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2476: Elizabeth Atly

2476-1 — I think we should clean up Hanford and close it down. We don't need any more of this kind of pollution. I believe that Hanford has caused more cancers than possibly could be cured by the isotopes that are being proposed.

2476-2 — So shut it [FFTF] down.

Response to Commentor No. 2476

2476-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2476-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2480: Paul Beck

2480-1 — My confidence is very low. My ignorance is my burden and I guess that's what I need to work on, but just in the outset, being part of the ignorant masses, I don't see how we can continue to go on with what they're proposing if we can't keep in order what we already have [at Hanford]. And it seems to me it needs at least stopped at the very base so we can reconsider some alternatives as one angry gentleman had stated earlier.

Response to Commentor No. 2480

2480-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. FFTF can be operated safely to accomplish the stated missions. The environmental impacts associated with operation of the FFTF and support facilities at Hanford during normal operations and from postulated accidents are presented and discussed in Section 4.3 of the NI PEIS. All impacts to human health and to ecological resources would be small in the immediate area of the Hanford Site and negligible at all distant locations.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2420: Mary Lou Blazek
Oregon Office of Energy

2420-1 — And the Oregon Office of Energy just concluded 20 focus groups with the help and support of DOE to gain additional public input on the programmatic environmental impact statement. The process we designed was to encourage dialogue to get further Oregon input on the question of FFTF restart. Participants were chosen to represent a broad variety of backgrounds and interests. A high percentage of the participants who participated in the groups have reviewed the environmental impact statement summary and a few participants have reviewed part or all of the environmental impact statement. We are compiling the results of the opinions expressed by 76 participants in six communities into a report. The results, along with participant questions and concerns, will be forwarded to DOE.

It should be noted that this public involvement process was an informal sampling. We did not use traditional academic methods to select focus group participants. One group was selected at random by a market research firm. The remaining participants were chosen to provide a broad cross section of interests and approaches to issues.

We do not suppose that this process represents views of all Oregonians. We do believe the diversity of those involved in the discussion fairly represents a broad spectrum of opinion and gave the Oregon Office of Energy and will give DOE valuable insight into FFTF issues that concern Oregonians.

The Oregon Office of Energy staff prepared six opinion statements designed to gain specific public input on the environmental impact statement alternatives and cost information. The statements were designed to address issues raised in the Oregon Office of Energy scoping comments and to answer the questions on which DOE is seeking comment.

The following findings reflect the highest percentage of responses for each opinion.

The programmatic environmental impact statement demonstrates a compelling for all proposed missions. Sixty percent of the participants disagreed.

The programmatic environmental impact statement contains sufficient information to determine the best alternative. Forty-seven percent disagreed.

DOE should pursue alternative methods for meeting the missions. Eighty-one percent of the participants agreed.

DOE should identify the best alternative for each mission separately. Eighty-six percent of the participants agreed.

The public should have early access to cost analysis and nonproliferation study. Eighty-five percent agreed.

Response to Commentor No. 2420

2420-1: DOE notes the preliminary results stemming from community focus group polling compiled by the Oregon Office of Energy, Nuclear Safety Division. All comments documented in the Oregon Office of Energy report, "The Oregon Approach: Involving the Public in DOE's Nuclear Infrastructure Proposals Including Use of the Fast Flux Test Facility," dated September 2000, have been responded to in the final NI PEIS (see Commentor No. 2019).

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2420: Mary Lou Blazek (Cont'd)

We then asked the participants to choose an option that best supported their views.

Restart FFTF received 18 percent of the opinion.

Inadequate information to make a decision, 33 percent.

Shut down the FFTF reactor and use other facilities and shut down FFTF reactor were 45 percent of the participants we polled and only 4 percent did not answer. We'll be completing this report and providing it to DOE within the next two weeks.

Response to Commentor No. 2420

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

*Commentor: Earl Blumenauer
U.S. House of Representatives, OR*

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 210.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2473: Jay Bodzon

2473-1 — Leaving aside for the moment the ethical debates over the value of democracy in today's society, it seems critical that the public be permitted an active role in its decision making process such as this one. It is a sad fact of our political life though that in these complex times this means people will sometimes be deciding issues on which they have relatively little understanding. This necessarily opens this up to the potentials for rule by mob paranoia and hysteria.

I am a senior nuclear reactor operator at a local nuclear research facility and I feel safer handling radioactive and highly reactive fuel than I do expressing a pro-nuclear sentiment in that room.

That said, I don't know whether or not the Fast Flux Test Facility should be reopened. It seems that there are compelling arguments on both sides. I do know that medical isotopes present a miracle of science and we would be fools not to pursue them and that space exploration is truly the highest aspiration of our human achievement. Anything that furthers these developments is, in my opinion, worthwhile, but I think it is far more important that we allow these decisions to be made by public opinion, but an informed public opinion. Institutional causes of public ignorance are a daunting problem which I can't even begin to get into right now, but if we are to continue having meetings like this and be taken seriously, it is important that people be informed on the issues that they're commenting and not driven by stories and sound bytes.

Response to Commentor No. 2473

2473-1: DOE notes the commentor's views including the need for education as a prerequisite for informed public participation. It is DOE policy to encourage public input on matters of regional, national and international importance as part of its commitment to facilitate a public participation process that is open and unbiased. In doing so, DOE has established reading rooms near DOE sites to provide easy access to information about DOE programs and encourages the use of this source of information. Further, DOE has numerous web sites, including one for NE (<http://www.nuclear.gov>), that provide up-to-date-information complete with fact sheets, news releases, and other materials. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments in preparing the Final NI PEIS.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2493: Matthew Brener

2493-1 — I would just like to make this point to say that I am in favor of the mission that was laid out in this document that says that they need the isotopes and they need the plutonium. I support that entirely. I support whatever program that the DOE thinks would be the most, would be the best to carry out that mission, to get the isotopes and to make the plutonium-238. The most — the best and cost effective. If that's starting up the FFTF, I'm all for it. If there's a better way to do it, I'm all for that.

I would like the FFTF started up for research purposes to develop and to test and to have more information on the sodium aspect of it, liquid sodium reactor.

Response to Commentor No. 2493

2493-1: DOE notes the commentor's support for its missions as stated in the NI PEIS, and for their support for Alternative 1, Restart FFTF.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2486: Kelly Caldwell

2486-1 — I think that it [NI PEIS] doesn't adequately address, in particular, cleanup of the materials that will be generated. I mean not to mention all the existing cleanup issues. It doesn't adequately document how anything that will be created in the future will do with cleanup. And that's completely unacceptable.

Response to Commentor No. 2486

2486-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored, and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2475: Chris Carbine

2475-1 —...I wanted to thank Colette Brown and the Department of Energy for being courageous enough and open minded enough to gather information from the people that this affects.

2475-2 — I don't know enough information either about the process of what's involved, but I do know that I favor progress and I favor searching other alternatives, the possibility of looking to those who are already producing the isotopes and can we get them to produce enough to help us out, you know.

2475-3 — There seems to be a strong sentiment about Hanford cleanup and I agree that's necessary and important ...

Response to Commentor No. 2475

2475-1: DOE notes the commentor's support of the public participation process.

2475-2: A number of facilities, including those already producing isotopes, were considered but were dismissed from further consideration (see Volume 1, Section 2.6). Among the reasons that some were dismissed was the fact that they lacked sufficient neutron production capacity, were fully dedicated to existing missions, were not capable of steady-state neutron production, had insufficient power to sustain adequate steady-state neutron production, were unable to produce a constant, reliable source of neutrons due to dependency on operating schedules of their primary missions, are under construction with capacity fully dedicated to other planned mission, or have been permanently shut down

2475-3: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2455: Katherine Chuttie

2455-1 — I add my voice to those who tonight call for deactivating the FFTF and created no new missions.

Response to Commentor No. 2455

2455-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

*Commentor: Michael Contini
National Association of Cancer Patients*

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 1700.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2434: Stephen Curley

2434-1 — And there is uranium-238 in the ground at Hanford and it is leaching into the groundwater right now. You folks from Richland, you folks have a vested interest in this whole program. The start up is your salaries. It's your pensions. It's your jobs. It's your economy. It depends on it.

If I was up there, I'd probably be down here speaking for the darn thing too. Dr. Kitzhaber, our fine Governor, is a doctor. Vera Katz, the Mayor here in Portland, City Council, Brian Baird up in Washington, Ron Wyden, they're all against this start up. There is goo up there in Hanford. Lots of goo. It's the most toxic goo on this planet. It's up there at Hanford. I think you folks are familiar with that.

This is not just cow poop that you can just wash off of your arm if you get some cow poop on your arm. This toxic goo, we really don't know how to store. It's leaking and it's heading toward the second largest river in the United States, that would be the Columbia River.

It's leaking towards Umatilla. It's leaking towards the Dalles. It's leaking Hood River, Portland and then Astoria.

Do you want to water your crops with this goo, with this goo water?

Do you want to eat the fish that lives in this toxic goo water? Or throw the ball for your dog to go fetch in the Columbia, like I do with my little dog who has a tumor on her adrenal gland. Who knows where that came from?

Or maybe even windsurf in this toxic goo. I don't think you do because I know I don't. I don't think you want to drink this toxic goo water.

Clean up your toxic, deadly mess.

Response to Commentor No. 2434

2434-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2479: Jamaica Daras

2479-1 — All I'd really like to say is that I am a 22-year-old student and that basically my generation has been handed what the previous generations have created and couldn't stop and that is an environment and a home that is close to utter chaos and as I look around me as the next generation who is to step up and to come into power, I'd just like to say it's frustrating to be handed such a pile of #*\$! and to say now you have to fix your home and my home and the home of those around you and the home of the rest of the globe that are around you because basically we endure this human endeavor together and maybe this is one small corner and pocket of the world, but it is the point that a change needs to occur due to the fact that the way that we have been doing things hasn't produced a better environment and a better home.

Response to Commentor No. 2479

2479-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2490: Betty Davenport

2490-1 — I am in support of restarting FFTF for the production of medical isotopes. I feel it's unconscionable for a group of people to suppress technology that can save thousands and thousands of lives.

2490-2 — Much of the testimony that we've heard here in Hood River and in Portland evolves around false information. They feel that this is going to put more waste into the river when they don't seem to understand that FFTF is three miles away from the river and 20 miles away from the wartime reactors which has caused the leaking, the problem of pollution.

They don't seem to understand that whether or not FFTF started, it's not going to change the amount of funding relegated to the cleanup. I implore you to please make a decision based on facts, not through rhetoric that we've been hearing. I understand people fear what they don't know, but they just aren't willing to listen and visit the site and understand things.

Response to Commentor No. 2490

2490-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

2490-2: DOE notes the commentor's views and observations. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2466: Les Davenport

2466-1 — In terms of going to each other's meetings, I'd like to point out that the Richland meetings are well attended, in particular by Seattlites and some Oregonians. The last meeting a year ago we had about a third of the people there that came to speak in opposition to the FFTF. Why can't we attend your meetings if you attend ours or if you're going to keep Washingtonians out, you better start with the Heart of America Northwest.

The additional oral comments were submitted in written form and are addressed in the responses to Commentor No. 1788.

Response to Commentor No. 2466

2466-1: DOE notes the commentor's views and observations. It is DOE policy to encourage public input on matters of regional, national and international importance as part of its commitment to facilitate a public participation process that is open and unbiased.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2456: Vera Defoe

2456-1 — This one, of course, we're supposed to address the draft environmental impact statement so I will do that and say, of course, that I support alternative 5.

2456-2 — Many people spoke tonight with quite a lot of emotion and didn't actually address the EIS and I'm hoping that it was obvious that they were supporting alternative 5 if they would so be counted. I don't know how you tally it up, but then again, of course, this is not some sort of an election, how many votes for or against are going to matter anyway. I sort of wonder whether it even matters if we're here at all because of course this is one of the steps you have to do in the whole NEPA process.

2456-3 — Nonetheless, I will say what I said the last time I was at one of these hearings which is no. Don't do it [startup].

2456-4 — There can't be any other reason here. They've created this massive, massive amount of contamination, pollution. They seem unable to clean it up. It's leaking with increasing speed into the Columbia River. Everybody thinks it's a pretty big river and spread out and it probably doesn't matter all that much, but it does matter.

Response to Commentor No. 2456

2456-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.

2456-2: Comment noted. DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and holding public hearings is an essential and required part of the NEPA process. In preparing the Final PEIS, DOE has assessed and considered both oral and written comments received on the Draft PEIS during the public comment period and has responded to these comments in the Final PEIS. Volume 3 of the NI PEIS contains public comments received on the NI PEIS and DOE responses to those comments. These comments are summarized, tabulated, and cross referenced by commentor, category, and method of submission. A summary discussion is also provided of the overall prevailing issues raised during the public comment period. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

2456-3: See response to comment 2456-1.

2456-4: DOE notes the commentor's concerns regarding the migration of contaminants to the Columbia River. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2438: Barbara Drageux
Women's International League for Peace and Freedom

2438-1 — I would like to express my opposition and the opposition of Women's International League for Peace and Freedom, Portland Branch, to the restart of the Fast Flux Test Facility at Hanford Nuclear Reservation.

2438-2 — While we have not been given the facts about how much plutonium-238 NASA requires for its proposed space missions, we have learned that the need is little more than the United States already has on hand. The rest can easily be obtained from Russia through the agreement we have with that nation at close to the cost of keeping FFTF on hot standby for two years.

2438-3 — The additional benefit would be that of keeping weapons-grade plutonium out of circulation.

2438-4 — We understand that the FFTF is 25 years old and believe that in the Year 2000 when our personal computers need to be updated almost annually, FFTF can hardly be capable of operating adequately and economically. The cost of bringing it up to Year 2000 standards would be prohibitive and constitute a supreme disregard for those who are paying the bill.

2438-5 — The Department of Energy has a commitment to clean up Hanford, including some of the facilities proposed for the plutonium-238.

How can you suggest that the DOE budget be spread even further, just reducing the dollars available for cleaning up the mess left so irresponsibly by the nuclear programs of the United States?

2438-6 — How can a plan [restart FFTF] that will increase high level nuclear waste be justified?

Response to Commentor No. 2438

2438-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2438-2: DOE notes the commentor's concern about NASA's need for plutonium 238 for space missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium 238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium 238, DOE's ability to support future NASA space exploration missions may be lost. DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

2438-3: The plutonium-238 which NASA uses as an electric power source for deep space missions is not used in nuclear weapons. Therefore, purchase of plutonium-238 from Russia would not keep weapons grade plutonium out of circulation.

2438-4: As stated in EIS Section 2.3.1.1.2, several upgrades would be implemented if a decision to restart FFTF was made by DOE. These upgrades would improve efficiency and reliability, minimize waste, and conform to current industry standards. Although the FFTF is 20 years old it is DOE's newest reactor, it is in excellent condition and evaluations have been performed to show that it has sufficient life remaining to fully support the proposed 35 year mission. The separate cost report accounts for costs associated with expected FFTF facility modifications. Throughout the life of FFTF, the FSAR has been maintained via approved change control and engineering change notices. All updates and revisions have had the required reviews and approvals. No deficiencies in the FFTF design, analysis, facility condition, or operations have been identified or recognized that would prevent FFTF from meeting the safety objectives and

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2438: Barbara Drageux (Cont'd)
Women's International League for Peace and Freedom

Response to Commentor No. 2438

intent of commercial nuclear safety regulations for equivalent facilities. In the event that FFTF restart is selected in the Record of Decision, a new Safety Analysis Report, including a Probabilistic Risk Assessment (PRA), will be prepared and it will address any changes in plant configuration, operating conditions and procedures. The revised safety analyses will be subjected to a thorough independent review process.

- 2438-5:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.
- 2438-6:** As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. High-level radioactive waste would not be generated from merely operating FFTF. It is DOE's policy that all wastes be managed (i.e., treated, stored, and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2460: Andrew Eisman

2460-1 — It's totally absurd that we are talking about this. How can any intelligent person be talking about the creation of more nuclear waste?

I cannot understand it.

Response to Commentor No. 2460

2460-1: DOE notes the commentor's concern regarding the generation of wastes. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored, and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2487: Shamu Fenervesia

2487-1 — I'm for Alternative 5 against — for the recommissioning of the FFTF.

2487-2 — I think it's a terrific misappropriation, a misuse of funds considering where the cleanup is at and I think that money and that effort should be spent on cleanup.

2487-3 — I think there's an inadequate address of waste generation and other issues in the PEIS.

Response to Commentor No. 2487

2487-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.

2487-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2487-3: In the NI PEIS, DOE has evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow for a fair comparison among the various alternatives. This was accomplished through review and evaluation of site-specific information on the environmental conditions prevailing at ORR, INEEL, and Hanford to include a comprehensive analysis of the associated environmental and health risks of each alternative, including waste generation. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored, and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2468: Ken Ferguson

2468-1 — I'm in complete favor of complete deactivation of FFTF. Shut it down. It's old, unsafe. It's expensive. It detracts from and is contrary to Hanford's mission of clean up.

Response to Commentor No. 2468

2468-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF. Although the FFTF is 20 years old, it is DOE's newest reactor. It is in excellent condition and evaluations have been performed to show that it has sufficient life remaining to fully support the proposed 35-year mission. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2431: Len M. Ford

2431-1 — I also want to speak in favor of Alternative 5.

2431-2 — Even so, given the other problems of Hanford, given the fact you fired two people last week for falsifying and creating safety records on this reactor, given the stories about releases from the fire which changed almost as fast as the winds did out there, even so, the fact that under the most terrible assessments the total failure, inability to come anywhere close to even what the Department of Energy has stated they would try to do as far as cleanup, you know, most notably recently with the debacle with the BNFL and the vitrification plant, they're so far behind with that to expect to be trusted with anything remotely close to this is just, you know, I guess you should be a martyr for audacity.

Response to Commentor No. 2431

2431-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2431-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. In regards to the Hanford wildfire of 2000, the DOE Richland Operations Office, the State of Washington Department of Health, and U.S. Environmental Protection Agency performed environmental monitoring on and around the Site to assess potential radiological impacts. The wildfire did not cause a release of radioactive materials from any Hanford facilities but did result in resuspension of radioactive materials which were already in the environment. The very low levels of radioactive materials that were resuspended were slightly above natural background levels and required several days of analysis to quantify. Information on this event has been made available to the public and can be accessed at <http://www.Hanford.gov/envmon/indes.html>. This site also provides a link to information on the independent offsite air monitoring that was conducted by the U.S. Environmental Protection Agency.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2432: Joyce Fullington

- 2432-1** — Thank you for listening to Oregonians tonight and to consider my testimony to see the closure of the FFTF as an alternative course of action.
- 2432-2** — I would like to register my no vote regarding the start up of the FFTF.
- 2432-3** — The PEIS has revealed nothing that convinces me that the FFTF is needed.
- 3432-4** — We, the people, were given promises by the DOE in 1995 that they would shut down the FFTF and used the money saved for high priority cleanup. Instead, the DOE has spent over \$100 million of cleanup money to keep FFTF on hot standby.
- It is time to return to the initial mission and close the FFTF and focus on cleanup of Hanford.
- Most of us know that Hanford's high level nuclear waste tanks are leaking radioactive waste into the groundwater, close to the Columbia River.
- The cleanup must be our first priority.
- We are living at a time of prosperity and if we don't clean up Hanford now, it won't get done. It is our moral duty to each of our children to do nothing that diverts our attention from the clean-up of Hanford.
- In my visit to Hanford one year ago, I saw environmental disaster after environmental disaster as I visited the K-basins, stood on the shores of the Columbia where the stench of 90 leaks into the river every day, saw the tank farms that are leaking and in danger of explosion and saw the frustration of workers who admit there's not much that they understand about cleaning up this mess at Hanford in regards to the K-basins and so forth.
- 2432-5** — It is wrong to create more high level radioactive waste at the FFTF as we cannot contain the waste at Hanford now and we have no technology yet to permanently and safely store our nuclear waste.
- 2432-6** — My understanding is that NASA has stated that they have no need to purchase Pu-238 for the space missions at this time and yet this has been used to justify the restart of FFTF for about 90 percent of the mission. Thus, I feel this is not a reason to start FFTF.
- 2432-7** — It has been stated that 10 percent of the time and money spent on FFTF start up would be for medical isotopes. However, medical isotopes would be produced for much less money if an accelerator was built
- 2432-8** — . . .this option [accelerator] would be safer due to the ability of an accelerator to shut down immediately.

Response to Commentor No: 2432

- 2432-1:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.
- 2432-2:** See response to comment 2432-1.
- 2432-3:** Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. The NI PEIS evaluates a range of reasonable alternatives for accomplishing the proposed action, one of which includes use of FFTF. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.
- 2432-4:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Prior public meetings were held on this formal milestone change. FFTF restart would not impact ongoing cleanup missions at Hanford. Hanford tank waste issues are not within the scope of this PEIS. Implementation of the alternatives described in Section 2.5 of Volume 1 would not add waste to the high-level waste tanks at Hanford. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2,

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2432: Joyce Fullington (Cont'd)

2432-9 — Also, the production of high level radioactive wastes would not be produced [in accelerators] such as in the FFTF.

2432-10 — In addition, DOE's experts from the Subcommittee for Isotope Research and Production Planning concluded that FFTF was not a viable source for medical research isotopes. The Washington State Medical Association says there's no need for FFTF as an additional source of isotopes.

2432-11 — Medical history tells us that there was a time in recorded history where there were no cancers. John Gothen has recently produced two new books showing that many forms of radiation are causing cancers including breast cancer and ischemic heart disease.

2432-12 — You said in your presentation that the risk to the public and workers are highest if there's accidents by air or by land transport. You said the risk is less than background levels for radiation. That doesn't make sense. The person that's involved in that plane crash or that truck crash or the shipping accident has a much greater background radiation risk. Accidents have happened at the FFTF. The workers of Hanford have been sprayed with americium and have been victims of accidents.

I say let's not take the risks to public and to the workers.

Response to Commentor No. 2432

implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2432-5: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. High-level radioactive waste would not be generated from merely operating FFTF. It is DOE's policy that all wastes be managed (i.e., treated, stored, and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

2432-6: A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium 238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

2432-7: DOE notes the commentor's views. As identified in the Cost Report, the listed cost for each alternative is, by itself, not sufficient information to provide a mission decision. Each of the irradiation facility alternatives under consideration can meet various portions of DOE's identified need for expanded isotope production and nuclear research and development. The capability of

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2432: Joyce Fullington (Cont'd)

Response to Commentor No. 2432

each irradiation facility to support the proposed expanded mission areas would determine the extent that DOE would be able to meet its stated objectives. For example, the low-energy cyclotron is sized to produce moderate quantities of diagnostic isotopes, biomedical tracers, and a few types of therapeutic isotopes. Because of the 200 MeV energy threshold required for neutron spallation, the low-energy cyclotron cannot produce neutrons for the production of the neutron-rich isotopes which make up the bulk of the therapeutic market. FFTF has the largest target volume of the alternatives under consideration for the production of isotopes. It also has a high flux and flexible neutron spectrum suitable for large scale production of both diagnostic and therapeutic isotopes. Each facility has its own technical advantages and disadvantages. The relative capabilities of each alternative, the degree to which each alternative satisfies policy and programmatic objectives, as well as the relative cost of alternatives will be factors in the Record of Decision.

2432-8: Nuclear reactors and accelerators will shut down immediately when the electrical power is removed.

2432-9: See response to comment 2432-5.

2432-10: The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities. Currently, approximately 50 percent of DOE's isotope

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2432: Joyce Fullington (Cont'd)

Response to Commentor No. 2432

production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term (less than 5 years).

2432-11: The commentor's concern about cancer rates is noted. Cancers are believed to be caused by a combination of hereditary and environmental factors, including radiological and chemical agents. Statistics from the National Cancer Institute indicate that the rate of cancer incidence and the rate of cancer mortality has dropped during the 1990's [NCI webpage (as of 10/19/2000) - <http://cancernet.nci.nih.gov/statistics.shtml> article entitled "Cancer Death Rate Declined in the 1990s for the First Time Ever"]. A survey sponsored by the National Cancer Institute and published in the Journal of the American Medical Association in 1991 (JAMA 1991:1403-1408) detected no general increase in the risk of cancer death for people living in 107 counties adjacent to or containing 62 nuclear facilities. The Hanford Site, Idaho National Engineering and Environmental Laboratory, and Oak Ridge Reservation were included in the survey. The study used cancer mortality data from Benton, Franklin, and Grant Counties in the survey for the Hanford Site (See Section 3.4.9.3 of Volume 1). This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives (including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

2432-12: DOE notes the commentors concern about the risks to the public and workers. The NI PEIS transportation activity with the highest risk is the air shipment of medical isotopes. The analysis conservatively assumes that every isotope

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2432: Joyce Fullington (Cont'd)

Response to Commentor No. 2432

shipment is by air, and that each shipment requires an intermediate stop, for a total of about 500 shipments per year. The risk to the public from these shipments is far lower than the risk from background radiation. However, the risk from this transportation is in addition to the risk from background radiation. The NI PEIS analysis, summarized in Table J-7, shows that it is unlikely that the transportation activities covered by the NI PEIS will cause an additional latent cancer fatality. This risk is very small. For comparison, as discussed in section H.2.1.2 of the NI PEIS, the risk to a population of 100,000 people exposed only to natural background (0.3 rem per year, not including any manmade or Hanford-related sources) would be 15 latent cancer fatalities per year. Over the 35 year NI PEIS period, this would equate to 525 cancer fatalities.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2451: Patrick Garten

2451-1 — People haven't spoken much about the particular reactor and the particular type reactor and how unusually dangerous it is. I consider this a menace, even without its nuclear core.

Just the cooling system alone is an incredible environmental menace and it is both extremely expensive and extremely dangerous to maintain this condition

2451-2 — . . .some other things about the time frame of the radioactive waste at Hanford, both that's likely to be produced. The FFTF, if you restart it and the stuff that's already there which is just incredible in its dangerousness and its lifespan. A lot of it is going to be around further into the future than our history of the past.

2451-3 — It's an extremely emotional issue for me and I think it's ridiculous you keep calling us back here and I think it's a big show that you come and you listen to our comments and we say no and you come back a few months, a few years later and you say we're thinking of doing this again, different reason.

Response to Commentor No. 2451

2451-1: The FFTF meets all safety requirements established by DOE and the DOE requirements are consistent with those established and applied by other regulatory agencies such as the Nuclear Regulatory Commission. Analyses presented in the PEIS show that the risks associated with operation of the FFTF are extremely small, see Section 4.3. The FFTF operated safely and successfully from the time it started in 1980 until April 1992, when it was shutdown for a refueling outage. It has been safely maintained in a standby condition since that time. If a decision is made to restart FFTF, the status and condition of all safety systems will be addressed and appropriate action taken, as necessary, prior to startup to assure safe operation.

2451-2: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. High-level radioactive waste would not be generated from merely operating FFTF. It is DOE's policy that all wastes be managed (i.e., treated, stored, and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

2451-3: DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and holding public hearings is an essential and required part of the NEPA process. DOE policy encourages effective public participation in its decision-making process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

[for] Governor John A. Kitzhaber, OR*

The oral comments were submitted in written form by Governor John A. Kitzhaber and are addressed in the responses to Commentor No. 1648.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

***Commentor: Charlie Hales, Commissioner,
City of Portland***

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 2019.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2437: Carrie Halstein

2437-1 — I don't remember my first nuclear power protest, but I remember the first time I took my four children, it was November of 1971, I remember the day exactly, it was one of my sisters' birthday, November 3rd and there are two people in the room here tonight that were at that same protest. It was Amchitca Nuclear Underground Blast and my girl was a little, little girl then. My kids had conferences at school and they came home at 11 a.m. and I said gee, guess what we're going to do today? We're going to go protest nuclear power and that's where I met Lloyd. And 29 years later, here we still are.

So my message is simple. Clean up , clean up, clean up. No more waste. No more waste. And this is not a NIMBI, not in my background issue. No nuclear waste anywhere

2437-2 — Number 5, deactivation and your mission is not our mission.

Response to Commentor No. 2437

2437-1: The commentor's opposition to generating nuclear waste and support of cleanup is noted. The primary DOE mission at Hanford is cleanup. DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Public meetings were held on this formal milestone change. The alternatives delineated in the NI PEIS, including FFTF restart, would not have an impact on Hanford cleanup activities.

2437-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

*Comments from the Portland, Oregon, Public Hearing (August 29, 2000)**Commentor No. 2485: Colleen Hanson*

2485-1 — I being in the past very anti-nuclear, but in the last couple of months I have listened to facts given to me by these folks and they are just folks. They're not these nuclear fat cats that we all think they are. They're just folks and they tell me these facts and I know, I know that's what they are because they all begin to add up.

So I listened and by listening I started to not be afraid of nuclear energy any more and these people with their fears, it's because of their lack of information and it angers me so much that our State officials will stand up there and feed us these half truths and that's what they are. Each one. Even a lay person, such as myself in just the amount of time that I have been learning these different details I have seen that they were speaking in half truths. And at the very least we should be given — both should go on the table, both sides of the story. Finally, let's set a precedent. Let's just get it on the table. Not this one, but maybe a bigger forum, but just get it on the table and you know what? I am the person that tried to coordinate the media.

Response to Commentor No. 2485

2485-1: DOE notes the commentor's views.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2492: Karen Harding

2492-1 — I am very much opposed to the FFTF start up.

2492-2 — I feel that it's a dangerous signal to the powers that be that they can restart the nuclear industry in a time when the earth needs to put its research and development toward alternative energies. If they were given half a chance, they would be able to go and far surpass the poisons that are caused by the nuclear industry.

2492-3 — I would prefer a shutdown of the FFTF.

2492-4 — I would prefer that money be spent on the cleanup which sounds to me is realistically in the billions of dollars and not the millions.

The DOE has budgets for cleanup that don't even begin to cover what the real cleanup would cost. They do sort of a flat year by year budget which is maybe realistic to what they can get, but not realistic to what the cleanup is and the money is wasted and keeping that [FFTF] on hot standby.

2492-5 — I appreciate the comment period being extended to the public and I would hope that the next time there are some accounting for the number of comments that are opposed and for, I suppose, so that it's more of a tally and there can be more of a sense that the vast majority of comments are against this reactor.

Response to Commentor No. 2492

2492-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.

2492-2: DOE notes the commentor's interest in alternative energy sources. Issues of research and development of alternative energy sources are beyond the scope of this Nuclear Infrastructure PEIS. Despite advances in many energy technologies, America's future energy security will depend on a robust mix of energy sources which necessarily includes nuclear power generation. It is the current United States policy that clean, safe, reliable nuclear power continue as a viable component of the United States' energy portfolio. In recognition of this need, the government has initiated nuclear energy research and development programs to address potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) and to ensure that current nuclear power plants can continue to deliver adequate and affordable energy supplies. An enhanced DOE nuclear facility infrastructure is required to support such nuclear energy research and development for civilian applications.

2492-3: See response to comment 2492-1.

2492-4: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2492-5: In preparing the Final PEIS, DOE has assessed and considered both oral and written comments received on the Draft PEIS during the public comment period and has responded to these comments in the Final PEIS. Volume 3 of the NI PEIS contains public comments received on the NI PEIS and DOE

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2492: Karen Harding (Cont'd)

Response to Commentor No. 2492

responses to those comments. These comments are summarized, tabulated, and cross-referenced by commentor, category, and method of submission. A summary discussion is also provided of the overall prevailing issues raised during the public comment period.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2482: Keith Harding

2482-1 — My opinion is to immediately do the cleanup job ...

2482-2 — ... don't restart [FFTF] ...

Response to Commentor No. 2482

2482-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2482-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2488: Leonard Harville

2488-1 — I'm here tonight to express my support for the restart of the Fast Flux Test Facility ...

2488-2 — At the minimum, I believe the costs of electrical power and the capacity available need to be considered for all the options.

Response to Commentor No. 2488

2488-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

2488-2: As presented in the Cost Report, utility costs were considered in the operating costs of all alternatives. Electrical costs were specifically broken out for Alternative 3, Construct New Accelerator(s) and Alternative 4, Construct New Research Reactor, as a factor in the preconceptual design estimates (see Appendixes A and B, respectively of the Cost Report). DOE acknowledges that Alternative 3, Construct New Accelerator(s) will place a high electrical demand on the local electrical grid. The impact assessment of the electrical demands of Alternative 3 on the local electrical grid is a site specific assessment and will be evaluated during subsequent NEPA review if the Record of Decision selects Alternative 3.

[for] U.S. Senator Slade Gorton, WA***

The oral comments were provided in greater detail at the Seattle, Washington, hearing. For responses, see Commentor No. 2497 (Suzanne Heaston).

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2439: Robert Hedlund

2439-1 — My Name is Robert Hedlund and I live in Portland. I also worked around Echo when I was a kid over there, when you guys were releasing double the amount of atomic energy that was released at Chernobyl. You don't experiment on people.

You know, Slade Gorton ought to be ashamed of himself. Sixteen families around that place up there, their kids have died. Their cattle, 80 out of 200 were defective. These bimbos talking about it doesn't affect you, hey, I don't have any #*\$! hair on my legs, no teeth. My frigging hair fell out because of Trojan and your nuclear #*\$!, you know, up there.

The people of Oregon want the #*\$! mess cleaned up. They wanted the river cleaned up. We got to dredge this river, the Columbia River. How much of your crap is going to be put on the banks so our kids can go and play in it and die? I've had two #*\$! kids die because of the #*\$!, because of the crap between the St. John's Bridge and the Fremont Bridge. They knew the #*\$! was in the ground. They didn't tell us. Four of my friends are dead.

2439-2 — You talk about isotopes. We've got enough #*\$! medical isotopes and the rest of this stuff. The minute Bechtel blew into town I knew exactly what the hell you guys were up to. They're the key player and stuff.

Response to Commentor No. 2439

2439-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1. The commentor's concerns regarding contamination of the environment is noted. Radiological impacts on populations residing within potentially affected areas surrounding the Hanford Site are addressed in Section K.5.3 of Appendix K. Models for estimating radiological health impacts discussed in Appendixes H and I assumed that all locally grown food supplies would be subject to radiological contamination throughout the project duration, and that all locally grown food supplies would be consumed by residents in the potentially affected area. The analysis of radiological effects that would result from implementation of the nuclear infrastructure alternatives indicates that the radiological risk to persons residing in the potentially affected area would be so small that no credible pattern of food consumption (or other ingestion pathways) would be expected to result in a latent cancer fatality. Implementation of the nuclear infrastructure alternatives would not be expected pose a significant risk of radiological contamination of land within the potentially affected area.

2439-2: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE

*Comments from the Portland, Oregon, Public Hearing (August 29, 2000)**Commentor No. 2439: Robert Hedlund (Cont'd)**Response to Commentor No. 2439*

has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs. Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term (less than 5 years).

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2436: Nancy Hendrix

2436-1 — I'm here to ask that you do decommission the FFTF

2436-2 — . . .use all the monies for cleanup at Hanford and I won't be thanking you for this until that is done.

2436-3 — And what I'd like to talk about briefly, there have been many reasons, very well written, very well reiterated over and over again why this reactor should be shut down. I find it unfortunate that the powers that be and when I speak about the powers that be we all know what this about and that is about money and it is only about money. And what is happening with the Pacific Northwest National Lab is a weapons lab. We all know how money works and how power works and how it pits people against each other, people who would be joining forces and how it uses that and that's exactly what's happening with anybody who has cancer. I mean you can't help but feel for them and want what's best for them. But there is such a thing, as first of all, as this has been addressed in the past, the fact is there are other ways to get those radioisotopes. It does not have to be here. And what is being done is you're being used whether you know it or not, and you're being used by money, not by who you think you're helping or what you think you're doing, but you are being used by the powers that be that have other agendas, but the agenda is the real issue.

2436-4 — If it isn't so damn economical some other way, then do it some other way, but not here and not now and frankly, the amount of cancer that has been caused and will be caused in millennium and millennium and millennium by nuclear power, by the by-products of the reactor is so much more than any cancer that could be cured through promulgating it.

Response to Commentor No. 2436

2436-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2436-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2436-3: DOE notes the commentor's concerns. However, DOE has no hidden agenda for weapons production or use of FFTF for military missions. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. The NI PEIS evaluates a range of reasonable alternatives for accomplishing the proposed action, one of which includes use of FFTF. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

2436-4: The commentor's concern for cancers associated with the entire nuclear industry is noted. This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2436: Nancy Hendrix (Cont'd)

Response to Commentor No. 2436

alternatives (including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2469: Phillip Hiller

2469-1 — ... I think very strongly that we ought to open FFTF again for this production of medical isotopes.

Response to Commentor No. 2469

2469-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2447: Chuck Johnson

2447-1 — I personally do believe that there needs to be additional research into the use of some of these radioisotopes for cancer treatments and I think it's very important. It has the potential, as some people have said, to reduce the amount of radiation exposure to people who have cancer and to target that cancer treatment, specifically to the cells that need to be targeted. That doesn't mean that we need to produce those isotopes at Hanford and at FFTF. I believe that until we're certain that we're going to need the quantity of isotopes that we're talking about, there's no reason to go ahead. It's being speculated upon. There's no reason to go ahead with the restart of the FFTF merely on the speculation that we might need enormous amounts of isotopes.

We have other reactors that already exist that are operating that can produce those isotopes.

2447-2 — Some of these isotopes can be produced in linear accelerators, so it's premature, it seems, to make a decision of that type to run that facility merely for that purpose, particularly because this type of reactor, a liquid cooled metal reactor, cooled by sodium is a hazardous reactor, more hazardous if an accident occurs than some other designs of reactor.

The configurations that would be used in that reactor for producing the isotopes would be varied, would — there would need to be different configurations used to produce different types of isotopes and the complexity involved in that increases the chance that an error may occur with operators. You're not going to have that kind of a danger with an accelerator because you can simply switch off the electricity if you have a problem.

If you use more plutonium in that reactor, it's harder to control the chain reaction of a nuclear reactor that has a higher amount of plutonium in it because the fluctuations in heat happen much more rapidly than they do with uranium.

This could be an extremely dangerous reactor ...

2447-3 —...another thing that's not included in the cost estimate is the cost of decommissioning the reactor. It's included in the other options, in the options of using other alternatives that cost to decommissioning is added, but the cost of decommissioning is not added in the option for operating the FFTF reactor.

Are you anticipating to operate that reactor indefinitely and never close it down? And never have a cost for shutting it down? I think you need to look at that. That's an obvious mistake that you've made in your calculations for cost right there.

2447-4 — And I also think that you need — there needs to be some sort of basic estimate as to how long you anticipate this reactor could operate. Other reactors that have used higher concentrations of plutonium have had trouble with melting and have had to close down their reactors early.

Response to Commentor No. 2447

2447-1: DOE acknowledges the difficulty in reliably predicting isotopic needs for future uses in research and medicine. DOE has sought independent analysis of trends in the use of medical radioisotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it has established two expert committees. The first, a thirteen-member Expert Panel convened in 1998 to forecast future demand for medical isotopes, included academicians from leading medical universities and schools of public health, and professional affiliations ranging from the National Cancer Institute to manufacturers of radiopharmaceuticals. The second consists of a subcommittee of DOE's Nuclear Energy Research Advisory Committee (NERAC), established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. The members of this Subcommittee were selected based upon their expertise and experience in the production, processing, distribution, and application of stable and radioactive isotopes in the biological and physical sciences, and in medicine. The members included basic and clinical scientists, administrators, and users of isotopes from academia, industry, and the federal government. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs. The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs. Currently, approximately 50 percent of DOE's isotope production

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2447: Chuck Johnson (Cont'd)

If we put all our eggs in this one basket for these isotopes, what are you going to tell all these people who need cancer treatments if that thing melts and they can't get those isotopes that you say are so important?

2447-5 — I think you need to consider all of these things in your environmental impact statement and I would urge you to consider finding alternative sources Pu-238, avoiding the cost and the need for running a reactor or an accelerator for that and consider building a linear accelerator to meet the medical isotope needs.

Response to Commentor No. 2447

capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term.

2447-2: FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small. Prior to an FFTF restart, a revised safety analysis report and a probabilistic risk assessment would be prepared which would address any changes in plant configuration, operating conditions, and procedures. The revised safety analyses would be subjected to a thorough independent review process.

2447-3: While the Cost Report evaluates the cost of permanently deactivating FFTF as described in the NI PEIS, it does not consider the costs of ultimate decontamination and decommissioning of the facilities evaluated for the proposed actions. FFTF would be permanently deactivated should a decision be made to select any alternative other than Alternative 1 (Restart FFTF) or the No Action Alternative and those costs are appropriately applied to the other alternatives. Decommissioning FFTF, including associated costs, is not within the scope of the NI PEIS. Before decommission activities were undertaken, DOE would prepare the appropriate environmental documentation to address the associated environmental impacts. Cost assessments would also be prepared. DOE remains committed to cleaning up the Hanford Site independent of ultimate decision on FFTF. The amounts of wastes associated with decommissioning FFTF would be small. The schedule for cleaning up these other wastes would not be affected if FFTF were restarted.

*Comments from the Portland, Oregon, Public Hearing (August 29, 2000)**Commentor No. 2447: Chuck Johnson (Cont'd)**Response to Commentor No. 2447*

- 2447-4:** The FFTF can be operated safely to accomplish the stated missions. Evaluations have shown that FFTF has sufficient life remaining to fully support the 35 year mission proposed in the NI PEIS. As stated in EIS Section 2.3.1.1.2, several upgrades would be implemented if a decision to restart FFTF was made by DOE. These upgrades would improve efficiency and reliability, minimize waste, and conform to current industry standards. The age and condition of the FFTF facility infrastructure will be considered by DOE in its decision making process. The separate cost report accounts for costs associated with expected FFTF facility modifications. Throughout the life of FFTF, the FSAR has been maintained via approved change control and engineering change notices. All updates and revisions have had the required reviews and approvals. No deficiencies in the FFTF design, analysis, facility condition, or operations have been identified or recognized that would prevent FFTF from meeting the safety objectives and intent of commercial nuclear safety regulations for equivalent facilities. Included in the PEIS are the results of analyses that show that the risks associated with operating the FFTF are very small. If the Record of Decision concludes that FFTF should be restarted, a Probabilistic Risk Assessment would be completed and a new FSAR would be prepared in accordance with applicable regulations.
- 2447-5:** DOE notes the commentor's support for finding an alternative source for plutonium-238 and Alternative 3, Construct New Accelerator(s) (for medical isotope production only). The commentor should note that the No Action Alternative provides for the possible purchase of plutonium-238 from Russian. However, the stated goal of the NI PEIS is to enhance U.S. capabilities in this area.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2441: Kathleen Jurgens

2441-1 — Like many, many people here, I've been coming to these hearings year after year, hearing after hearing on the same subject and I'm getting really, really sick of saying the same thing over and over again and having you folks ignore it. What the people of Oregon and what I have been saying for years on this subject can be boiled down to one sentence and that is what part of no don't you people understand?

2441-2 — Shut down that damn reactor. . .

2441-3 — . . .start cleaning up the land.

Response to Commentor No. 2441

2441-1: DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and holding public hearings is an essential and required part of the NEPA process. DOE policy encourages effective public participation in its decision-making process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

2441-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2441-3: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2454: Matthew Kenega

2454-1 — The FFTF reactor is not wanted in this area. I think that's been made very clear. It's very emotional.

2454-2 — I'm not so sure that we need to expand at Hanford. We can't handle what we've got. We don't understand what we've got. Hanford, in particular, we have these tens of thousands of gallons of waste. We don't even know what a third of it is, let alone how to store it for the next several thousand years. Who is to say in a thousand years that we'll even know it's there? Let alone how to treat it. And by adding to that all of our facilities, anywhere, is irresponsible.

2454-3 — Perhaps we should change the mission statements to clean up in general of all the nuclear facilities in the whole world.

The French have been very strong in their research because they have complete reliance on nuclear power. The Soviets don't have any money or infrastructure for research and perhaps we need to put our money over there and take over their facilities, of what can be allowed at least. Maybe their waste needs to be handled by us because they certainly aren't able to do it. Everybody is going to end up with the net effect of this poorly developed program that we've done in the last 60 years.

Response to Commentor No. 2454

2454-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2454-2: DOE notes the commentor's concerns regarding the high-level waste tanks at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As discussed in Section 4.3, Volume 1, no high-level radioactive waste would be added to the high-level waste tanks at Hanford.

2454-3: DOE notes the commentor's interest in cleanup activities, although issues of waste cleanup activities are beyond the scope of this Nuclear Infrastructure PEIS. As discussed in Chapter 4 of Volume 1 (e.g. sections 4.3.1.1.13, 4.3.2.1.13, 4.3.3.1.13), waste will be generated by all of the alternatives, including the No Action Alternative. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. DOE activities associated with this program would not impact the schedule or available funding for existing cleanup activities at candidate sites for implementation of the nuclear infrastructure alternatives.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

*Commentor: Wayne Kenny
[for] U.S. Senator Ron Wyden, OR*

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 158.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2446: Toby Kentine

2446-1 — I want to find out if the mind of those who are making the decision or have you already made up your mind? I hope you haven't. I hope you're willing to look at all the things that are being said. I'm assuming that's the case.

2446-2 — The concern I have is how do we know, how do we know for sure that the radiation coming from the reactor is safe? If someone can say well a certain amount is safe, well, how do we know that for true absolute fact? A certain kind of safe, but there's evidence that it's accumulative, it's has a cumulative effect. In other words, you can get a little bit, a little bit more, a little bit more and gradually the body will build up. Do you follow what I'm saying?

How do we know how much is safe? Is it really proven absolutely true that a certain amount is safe? I don't think there's anybody who can actually say that a certain amount is safe and until it has been proven that it's safe, it's dangerous. There's the potentiality of tremendous serious negative things happening to us. And there's evidence — now, one of the things about the effects of radiation that the possible radiation will not get us now and then 30 to 40 years in the future is when people start getting the cancers or when they get the negative effects.

If you don't know that having radiation will or will not cause cancer, then why are we taking the risk with ourselves and with our children and with our future?

Response to Commentor No. 2446

2446-1: DOE policy encourages effective public participation in its decision making process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public. No final decisions have been made with regard to the facilities and locations evaluated to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238 for NASA space missions, and nuclear research and development. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

2446-2: Ongoing research into the effects of low level doses of ionizing radiation has the potential to impact the way in which low dose health effects are modeled. As indicated in Appendix H, the linear no threshold model utilizes dose to cancer conversion factors based upon studies of individuals who have received relatively large individual doses or have been members of groups who have received large population doses. This model assumes that any radiation dose, no matter how small, has the potential to result in the development of cancer. The current research is an attempt to develop a better health impacts model to based upon health impacts to groups who have been exposed to lower level doses. However this research has not yet yielded sufficient information to justify modification of the linear no threshold model. The linear no threshold model remains the currently accepted approach to modeling low level radiation health impacts. The research done to date does take into account the fact that many cancers appear long after the initial exposure to a carcinogen. Surveys of people exposed to radiation used as the basis for radiation dose to cancer conversion factors have been performed many years after the initial radiation exposure. This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2446: Toby Kentine (Cont'd)

Response to Commentor No. 2446

that radiological and nonradiological risks associated with restarting FFTF would be small.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2491: Chris Kerchum, et al.

2491-1 — I think that 20 years is long enough to have had Hanford tanks at least begun to be pumped and stored in a safe manner. We haven't been able to do that. We don't have any business starting up the Fast Flux Test Facility again. They can't fix what's already been broken. I think it's extremely dangerous to give more waste to this pile and as a Portland area resident I'm very sure that DOE would never tell me if there was an accident that threatened my life, much less my property values. They've lied to me in the past and they continue to lie. They continue to misrepresent the threat that this plant faces.

2491-2 — It's not a safe plant. It's 20 years old.

2491-3 — It [FFTF] should have been decommissioned and put out of service. I understand it takes years to do that even if you were to tell them to shut it down today it would take at least three to five years to fully shut it down.

2491-4 — ...we, the undersigned want the DOE to not restart the Fast Flux Test Facility nuclear reactor. And it's signed Chris Kerchum, Nancy Powell, Paul Almond, I think — I can't read his writing — Helen Warren, Bill Warren, Craig Barber, Art Thomas, Christina Lindstrom, Jeff Pegman, Keith Shaw, F.C. Poundstone, Elbadia Schultz, Jean Ann Dryer, Irene Williams who also share my belief that this is a plant that should be shut down.

Response to Commentor No. 2491

2491-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The environmental impacts associated with operation of the FFTF and support facilities at Hanford during normal operations and from postulated accidents are presented and discussed in Section 4.3 of the draft NI PEIS. All impacts to human health and to ecological resources would be small in the immediate area of the Hanford Site and negligible at all distant locations.

2491-2: This NI PEIS has examined the risks associated with the operation of the FFTF for 35 years for the purpose of producing isotopes for medical use, research and development, and for the production of radioactive heat sources for power supply systems. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. (Accident analysis is described in Appendix I and the normal operations risk analysis is described in Appendix H.) The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small. Based upon these analyses, as well as the previous safe operation of the facility, FFTF can be operated safely to accomplish DOE missions. Additionally, in the event that FFTF restart is selected, a new Safety Analysis Report will be prepared and subjected to a thorough independent review process. The facility reanalysis as part of the Safety Analysis Report update process would ensure that the analyses bound the reactor-operating envelope for the duration of FFTF operation. The Safety Analysis Report would be routinely reassessed and updated when required to address any changes in plant configuration or changes in plant operation procedures. This continuing safety analysis updating would include analysis of changes that may occur as a result of facility aging during the 35 years of operation.

2491-3: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF. Figure 2-35 presents the implementation schedule for Alternative 5.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2491: Chris Kerchum (Cont'd)

Response to Commentor No. 2491

2491-4: See response to comment 2491-3.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2461: William J. Kinsella

2461-1 — Assumption 1, that an expansion of the nuclear infrastructure along the lines proposed is necessary and mandated. In fact, the proposed expansion may well run counter to the public interest while serving the Office of Nuclear Energy's own institutional agenda. In this regard, the PEIS document is not a disinterested scientific study. Rather, it's a marketing tool which advocates for its authors' interests under the guise of scientific objectivity.

2461-2 — Restarting FFTF would contaminate buildings and areas that are not yet contaminated and would directly interfere with the existing clean up plan for the 300 Area.

Introducing any new waste to the site is unacceptable and would undermine the Department of Energy's own stated mission, to clean up Hanford and regain public trust.

The additional oral comments were submitted in written form and are addressed in the responses to Commentor No. 2046.

Response to Commentor No. 2461

2461-1: DOE notes the commentor's concern. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives.

2461-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor : Bruce Klos

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 406.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2465: Nancy Korbin

2465-1 — First, there is no medical need to restart FFTF for the production of isotopes. Telephone calls to local hospitals, clinics and isotopes suppliers all verify ample supplies of isotopes. We get iodine-131 and Xenon from Canada; iodine-123 and gallium-67 comes from St. Louis, Missouri; and 18 FDG which is used for PET scanning, that's not pet scan as in dogs and cats, that's positrons emission tomography, a little ahead of CAT scanning. That's being produced in Seattle and being brought to the Portland area at the present time.

The restart of the FFTF reactor to produce medical isotopes is unwarranted and much too expensive. There's no medical need and that is verified with both the Washington Medical Association and the Department of Energy's own blue ribbon committee. The DOE must include their subcommittees' recommendations against FFTF in the final EIS.

2465-2 — Second, restart of the FFTF, that may require the importation of plutonium to the Pacific Northwest ports which would traverse our highways. People in the Northwest have made it abundantly clear they do not want these radioactive shipments on their highways by a vote of 65 percent on Initiative 383. Washingtonians have spoken. We don't want any radioactive shipments coursing our highways.

2465-3 — Third, restart of the FFTF means there will be more nuclear waste to deal with and we have no means of doing that at Hanford. The plutonium finishing plant and the plutonium reprocessing plant are both closed down and inoperable.

We can't deal with the waste we already have at Hanford and that is the best reason not to create any more.

2465-4 — Fourth, restart of the FFTF violates the Tri-Party Agreement. According to the agreement entered into by the U.S. Department of Energy, the Washington State Department of Ecology and the U.S. Environmental Protection Agency, the FFTF is to be deactivated and decommissioned. The State of Washington and the EPA will have legal recourse against such action. When DOE's own internal documents recommend against restart, why is anyone even discussing any possibility of restarting FFTF.

In closing, the Department of Energy needs to put all its effort into what is legally required to do and that is to clean up the horrendous amount of radioactive waste at Hanford.

2465-5 — Ms. Brown, I was very disappointed to hear that Secretary Richardson was not informed of the fact that the Washington Medical Association opposes restart of the FFTF. I think that's an organization that carries a great deal of respect and I think that the Secretary needed to have piece of information and I do hope that you will convey that to him.

2465-6 — As if it's not obvious, I support Option 5. Shut it down.

Response to Commentor No. 2465

2465-1: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1 2.1 of Volume 1 was revised to incorporate this information. The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities. DOE has taken the Expert Panel and NERAC report recommendations under consideration in developing the range of alternatives evaluated in the NI PEIS. These reports were made available to the public at the NI PEIS public information centers and on the Internet at www.nuclear.gov. The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2465: Nancy Korbin (Cont'd)

Response to Commentor No. 2465

only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs. Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term (less than 5 years).

2465-2: DOE notes the commentor's opposition to the shipment of radioactive materials on Washington highways. Washington State Initiative Number 383 (Shall Washington ban the importation and storage of non-medical radioactive wastes generated outside Washington, unless otherwise permitted by interstate compact?) was approved in the General Election of 1980. No radioactive wastes generated outside the state of Washington will be imported into the state as a result of activities covered by the NI PEIS. Mixed oxide fuel is not a radioactive waste. Alternative 1 does postulate that DOE might decide at some point to import mixed oxide fuel from Europe to fuel FFTF. At this time, however DOE has not proposed to import this fuel through any specific port. If DOE ultimately decides to import fuel from Europe, it would perform a separate NEPA analysis to select a port. This review would address all relevant potential impacts of overseas and inland water transportation, shipboard fires, package handling, land transportation, as well as safeguards and security associated with the import of SNR-300 mixed oxide fuel through a variety of specific candidate ports on the east and west coasts. It would consider all public comments, including local resolutions, concerning the desirability of bringing mixed oxide fuel into the proposed alternative ports. In the event that DOE decides to enhance its nuclear infrastructure, it would not expose any population to high, unacceptable risks under any alternative. Any transportation activities that would be conducted by DOE would comply with U.S. Nuclear Regulatory Commission and U.S. Department of Transportation

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2465: Nancy Korbin (Cont'd)

Response to Commentor No. 2465

regulations. Associated transatlantic shipment would comply with International Atomic Energy Agency requirements. In Section J.6.2, DOE reviewed the potential maximum impacts from the marine transportation of mixed oxide fuel from Europe to a representative military port, Charleston, South Carolina, and overland transportation to Hanford. Also in that section, a bounding analysis demonstrates that the maximum potential radiological risks to the surrounding public from mixed oxide fuel shipments would be extremely small (e.g., less than 1 chance in a trillion for a latent cancer fatality per shipment from severe accidents at docks and in channels and less than 1 chance in 50 billion for a latent cancer fatality per shipment from overland highway accidents).

2465-3: Management of wastes that would be generated under implementation of Alternative 1 (Restart FFTF) is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

2465-4: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding violation of the Tri-Party Agreement. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. A Tri-Party Agreement change was approved by all signatories to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2465: Nancy Korbin (Cont'd)

Response to Commentor No. 2465

needs. Prior public meetings were held on this formal milestone change prior to its adoption. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2465-5: DOE notes the commentor's viewpoint. The Secretary of Energy has been informed of the comments relating to the organizations and members of the public who oppose the restart of FFTF.

2465-6: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor: Lloyd K. Marbet

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 230.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2489: Wayne Marshall

2489-1 — The most important thing is that I am here to voice the opinion that the FFTF restart option should be the preferred alternative.

2489-2 — I believe the EIS did a pretty good job of identifying how minor the environmental impacts are. After tonight's meeting though I have a new understanding of the concerns, the anxiety, the fear and the governmental distrust that is common, at least in Portland here and perhaps Hood River and Seattle. Clearly, that needs to be addressed with outreach, education programs, but I don't believe that should color the decision, the technical decision about the path forward.

2489-3 — I believe there is a misunderstanding about the supporters of FFTF, that they disregard the potential contamination of the river or the desire for cleanup. We, too, have those desires and those concerns, but the FFTF option needs to be selected and pressed forward and DOE needs to champion the funding necessary to clean-up Hanford as well as operate the FFTF.

2489-4 — I wonder, after hearing the concern for government funding, if the PEIS should address funding issues or should address how the funding issues can be separated or would be separated from Hanford cleanup costs and the performance. That seemed to be a major sticking point here, a concern that FFTF is robbing funds. Perhaps the PEIS could address it.

Response to Commentor No. 2489

2489-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

2489-2: DOE notes the commentor's views that environmental impacts as identified in the NI PEIS are minor and that public outreach and education are needed to address fear, anxiety, and mistrust in the public participation process. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

2489-3: DOE notes the commentor's support for Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2489-4: While cost is an important factor that will be considered in the final record of decision, costs are beyond the scope of the NI PEIS. A cost report for the NI PEIS alternatives was prepared and made available to the public. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

***Commentor: Bill Mead
Public Safety Resources Agency***

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 2027.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2450: Bill Michtom

2450-1 — First of all, the pages that were posted from the Hanford site by this man here talk about a funding shortfall, what is referred to as a compliance gap and that there will need to be trade offs. Well, we've been trading off for a long time, for 60 years at Hanford and I think that's where that statement comes from. It may be inaccurate, but if FFTF at its cheapest is going to be \$300 million and we have funding shortfalls, where there's \$300 million would go to cleaning up that we're using for something else.

2450-2 — Two, looking at the handouts and I think in the PEIS, one of the things that it talks about is the cancer latency rates at the three reactors at Hanford, Oak Ridge and Idaho, among the workers. Among the workers at Hanford the cancer latency is more than five times greater than it is at Oak Ridge and more than four times greater than it is at Idaho. And this is where you want to add more stuff, rather than cleaning it up. This seems to me flawed.

2450-3 — Another thing from talking with one of these folks here, I think this man here, but I can't remember now, was that the clean up is going to put the reactors and the nuclear stuff in cocoons that have a life span of 75 years and yet the half-lives of the two major radioactive items that are going to be in there range up to 90 years. So even the way you're protecting them doesn't even meet the requirements you know about right now which once again seems like what we've been dealing with for 60 years.

2450-4 — But the man I spoke to said that using the Fast Flux Test Facility to create nuclear radioisotopes for medical reasons is like using a sledge hammer to kill a flea. And that most of what's being produced is not medical isotopes. So there's something of a scam going on here.

2450-5 — It [FFTF] should be not started up...

2450-6 — ...the medical benefits that we can derive from radioisotopes can clearly be done differently, cheaper and better and more safely for the workers than what's happening at Hanford.

Response to Commentor No. 2450

2450-1: The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2450-2: The commentor's concern regarding the estimated total workforce dose (cumulative impact) for Hanford workers is noted. The estimated cumulative worker dose at Hanford is in part a result of the activities planned for waste management and tank remediation. These potential impacts are far greater than the incremental impact from the activities associated with the range of reasonable alternatives considered in the NI PEIS. There is little difference in the small incremental impact at all three sites; as shown in Sections 4.8.1.3, 4.8.2.3, and 4.8.3.3.

2450-3: The comment appears to be related to the cleanup of reactors and the nuclear material (i.e., the decommissioning of the nuclear reactor). The concern is that the nuclear reactor and nuclear materials associated with the nuclear reactor operation may be "cocoons," such as safe storage or entombment, and the nuclear materials have long half-lives for the storage. In the Generic Environmental Impact Statement on Decommissioning of Nuclear Facilities (see discussion in Section 4.6.1.3.9 of the NI PEIS), the Nuclear Regulatory Commission determined that the health impacts to the public from the decommissioning of reactors was "negligible." The NI PEIS does not involve site-specific issues in the decommissioning of nuclear reactors. For site-specific nuclear reactor, the decommissioning action at that time would be under a separate and appropriate environmental review process.

2450-4: DOE agrees that the FFTF's large size and configuration are not particularly well suited for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of the FFTF for the production of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the Nuclear Energy Research Advisory Committee (NERAC) report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2450: Bill Michtom (Cont'd)

Response to Commentor No. 2450

production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production". In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates use of the FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without disturbing the existing missions of these facilities. Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term (less than 5 years).

2450-5: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2450-6: DOE has examined a total of 6 alternatives, including the No Action Alternative, in the NI PEIS. Alternatives to the use of FFTF for the production of medical isotopes include continued production at existing facilities (all alternatives), construction of a new accelerator(s) (Alternative 3), and construction of a new research reactor (Alternative 4). It is also possible that DOE could decide on a combination of 2 or more alternatives in the Record of Decision. Thus, DOE has examined a number of different ways to produce medical isotopes other than the use of FFTF. Costs associated with the different alternatives are covered in a separate cost report. Worker safety (radiological protection) is a key element of the DOE's Radiological Health and Safety Policy (DOE P 441.1, April 26, 1996). This policy states in part that DOE facilities must "conduct radiological operations in a manner that controls the spread of radioactive materials and reduces exposure to the workforce and the general public and that utilizes a process that seeks exposure levels as low as reasonably achievable." Each DOE site, including Hanford, is required to implement a radiological control program with the intent to meet this policy goal. Based on the assessment of worker health impacts for all of the alternatives and options that make use of facilities at Hanford, the most likely impact of the use of these facilities for purposes addressed in the NI PEIS is no

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2450: Bill Michtom (Cont'd)

Response to Commentor No. 2450

increase in cancer fatalities among the facility workers. This assessment is based on operational data collected at the facilities during recent operation. For example, in Alternative 1, Option 1, all of the activities (target irradiation and processing) occur at Hanford facilities FFTF and the RPL [Area 300 Buildings]). As shown in Table 4-18 of the PEIS, the expected consequences are less than one additional fatal cancer among the workforce; that is, no additional fatal cancers are expected.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2495: Martin Mijal

2495-1 —...I don't want to see the reactor [FFTF] started again.

2495-2 — I want you to honor your 1993 or 1995 agreement to abolish the reactor. I think it's just terrible to create nuclear waste. It's not going to go away. It's going to be a problem for many, many eons, centuries in the future. So I think it just should stop making more nuclear waste and close down the Hanford — close down all nuclear sites and clean it up, although there's no real cleanup.

Response to Commentor No. 2495

2495-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2495-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF (with No New Missions), and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Public meetings were held on this formal milestone change. The alternatives delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2474: Mary Morgan

2474-1 — I came tonight as a request of a friend who was interested on the behalf of the medical isotopes and just as a member of the community and a citizen and a mother and a daughter and a wife and a sister and everything that many of the people are saying in there, I'm grateful and truly that's just what I want to express right now, is I'm grateful to the DOE for providing the opportunity for people to voice their opinion. I have yet, I think, to develop an opinion on this. I just wanted to express my gratitude, I guess, to the DOE for following the process and also for this great nation that we're a part of. I'm grateful that is such educational viewpoints or educated viewpoints from both points and thank you.

Response to Commentor No. 2474

2474-1: DOE notes the commentor's support of the public participation process.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2494: Bruce Noordhoff

2494-1 — I am very pleased with the quality, the professional quality of this document. I was distressed in only one area and that has to do with the degree of discussion concerning the consensus that appeared to be there at Hood River and Richland and Seattle and Portland and so on. It didn't seem to me that it was appropriate for an EIS, but it might be if you look at the various factors to be considered.

The EIS is essentially complete. I think it lacks little, somewhat, but not significant amounts. I think it's time now for it to go to a recommendation to the decision-makers. The past judgment on these findings I have two comments that I would like to address pertaining to the decision, offering this to the decision makers. First, I ask that they stay focused on the long-term needs of this country and avoid letting short term simplistic options govern their decision. This will be a decision that will affect our leadership role in the world for generations to come. The decision needs to provide capacity for the probable trend lines and the growth that is projected for the various needs in the nuclear area there. So I encourage them to take the long term perspective.

Secondly, I ask that this decision be reached with convictions based on technical merit and not on the consensus of meetings like this or unrelated pressures from the outside.

2494-2 — In closing, let me remind that 10 years ago the pressures from the opponents caused a premature shutdown of the Pulex facility before the heel of material was processed through and as a result of that heel of material now being stored in the K Basins, we have a concern for the City of Richland to the contamination of the river. We are spending \$1.5 billion of money that might be put on to the cleanup of the facility to move that heel of material away from the river, not to dispose of it permanently, but to babysit it in a facility forever. So it is a matter of concern that pressures cause decision makers to make wrong mistakes occasionally, wrong decisions and I implore this agency to hang tough and make the decisions based upon the technical factors and the guts decisions that they have come to with regard to the needs of the country.

Response to Commentor No. 2494

2494-1: DOE notes the commentor's views regarding the quality and completeness of the NI PEIS and for the need to base decisions on technical merit. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

2494-2: Comment noted.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2481: Gabriel Pettyjohn

2481-1 — I think there's a lot to be considered here and it really disappoints me that this is not as much in the public eye as I think it should be. The past failings of the Energy Department to manage Hanford have been egregious and I don't think that they've done really what's necessary to resurrect public trust and I think that's something that needs to be addressed.

2481-2 — Also, I think there's something inherent and this is on a philosophical note, inherent in the technology of nuclear power and its expansion, that's the continued centralization of power and I think the question needs to be asked who will benefit from this. It's being marketed as a benefit for individuals undergoing cancer therapy and also for scientific space exploration, but I have not seen any information or any report covering the contractors which will financially benefit from this. The lobbying process that they have undergone, there is no research or information that I've seen exactly who are the medical contractors who would benefit from this or their contributions to political campaigns in relation to this issue. Basically what I'm concerned about is that this decision will not be reflecting public safety or public interest, but private and corporate interest and private and corporate profit.

Response to Commentor No. 2481

2481-1: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to “ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use.” The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission. DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and to providing ample opportunity for public comment on those actions. DOE provided notice of scheduled public hearings in accordance with the requirements of CEQ and DOE regulations (i.e., 40 CFR Parts 1503.1 and 1506.6 and 10 CFR Part 1021.313, respectively). This included announcement of the hearings in the Federal Register as well as in the local media. In addition, copies of the Draft NI PEIS and/or the Summary (including the public hearing schedule) were sent to each individual or group listed to receive it at the address on record. DOE policy encourages effective public participation in its decision-making process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS DOE carefully considered comments received from the public.

2481-2: Selection of facilities and site locations for accomplishing expanded civilian nuclear energy research and development and isotope production missions is not being driven by special interests working on behalf of any corporate, institutional, or other nongovernmental entity with a stake in the decisions to be made. The facilities and locations evaluated in this NI PEIS represent a range of reasonable alternatives for accomplishing the DOE missions and serve to enable DOE to meet its responsibilities under the Atomic Energy Act. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2445: Laurel Piippo

2445-1 — You are obligated to clean up the mess at Hanford whether FFTF is restarted or not. Am I correct?

The additional oral comments were submitted in written form and are addressed in the responses to Commentor No. 410.

Response to Commentor No. 2445

2445-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2457: Gerald Pollet Heart of America Northwest

2457-1 — Let me start with the fact that in the scoping hearings we suggested that a reasonable alternative with a clear environmental benefit is for the Department of Energy to honor its 1996 promise and the words of the Secretary of Energy at the time “commitment” to end self-regulation of its reactor operations and nuclear processing. And under that commitment, the FFTF reactor, if restarted, and plutonium-238 operations and medical and industrial isotopes would all be independently externally regulated and there are clear differences between the external regulatory standards and their level of scrutiny and the Department of Energy’s. All that we need to do is examine what would happen at Hanford if we use the Nuclear Regulatory Commission requirements for a safety-conscious workplace. One example is that at Hanford we have incident after incident, of contractor retaliation against whistle-blowers. The NRC’s new standards say one, and you’re closed. And they’ve shown they’ve been serious about this with the Millstone Plant in Connecticut.

There are clear environmental benefits from external regulation and it is an example not just of a failure of the EIS, but another broken commitment of the Department of Energy.

2457-2 — Another environmental commitment that was broken was the one that said in 1995, signed by the Department of Energy that when the reactor is shut down the funds saved shall be used for higher priority clean up activities.

You have a \$200 million clean up compliance gap forecast for 2002. I would call that a higher priority environmental cleanup priority and it’s a clear environmental benefit to meet your TPA commitment from 1995 and I know this is boring, Colette, I’m sorry. Maybe some other people from the Department should have come as well to hear several hundred people, but you also failed to include in this environmental impact statement and in your letters to us, you’ve clearly shown that you do not understand what the possible environmental impact and benefit is of meeting the commitments to use \$30 million a year that was transferred away from NE at the request of the Department of Energy — excuse me, away from the environmental managements account to the NE account for the benefit of keeping the FFTF reactor on stand-by.

2457-3 — Going back to safety and the benefits of external regulation, throughout this document the Department of Energy assumes incorrectly that the maximum exposed public individual is four miles away from the site. Yesterday, a Republican candidate for Governor in what may have been illegal use of a federal facility, supported by the facility staff, which I assume you’re going to look into, held a news conference at the front gate, illustrating the fact that the public is currently invited to go by the front gate and it is quite likely that the maximum exposed individual is not four miles away, but instead under current plant Hanford site

Response to Commentor No. 2457

2457-1: FFTF meets all safety requirements established by DOE. Furthermore, DOE requirements are consistent with those established and applied by other regulatory agencies such as the Nuclear Regulatory Commission. On February 19, 1999, Secretary Bill Richardson sent a letter to the Senator John Warner, Chairman of the Committee on Armed Services to inform him of DOE’s efforts in exploring a potential move toward the external regulation of DOE’s nuclear facilities. Secretary Richardson reported that, based on DOE’s analysis, many of the potential benefits that were expected from external regulation had not been demonstrated, and appear to be outweighed by associated costs and difficulties raised in the pilot projects. As a result, DOE determined that submittal of legislation to exempt certain facilities from Departmental regulations was premature.

2457-2: DOE notes the commentor’s concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2457-3: Under the current regulatory framework, the facility safety bases are evaluated at uncontrolled locations outside the legal site boundary (or the most highly exposed location over which DOE has no control). Although the public has been allowed road access around FFTF and the 300 Area for many years, DOE can quickly control access in the event of an emergency. The accident analysis presented in the NI PEIS provides a basis for making comparisons between the consequences and risks of accidents associated with facilities identified in each of the alternatives and options presented in the NI PEIS. The accident analysis evaluated the consequences and risks to maximally exposed individuals, both workers and members of the public, during postulated accident scenarios. It

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2457: Gerald Pollet (Cont'd)
Heart of America Northwest

guidelines, actually invited and encouraged to be standing in the parking lot. In fact, you held a bicycle race staged in the parking lot recently. That's not four miles away.

2457-4 — The EIS ought to be analyzing the risks of using hydroxylamine nitrate in the plutonium-238 processing. This ought to be considered as a likely explosion risk because we've had an explosion, therefore we know it is likely to occur. But there's no mention of a hydroxylamine nitrate explosion, nor is there a calculation or consideration of the risk of what we call red oil explosion which is why the public in this region — would not allow you to restart the plutonium finishing plant.

2457-5 — In the early and mid-1990s there was a fight over the restart of Hanford's plutonium finishing plant and in 1994, the Department agreed to shut it down after admitting that it had to prepare an environmental impact statement if it wished to resume operations and that EIS would have to consider the risk of an explosion involving a self-catalytic exothermic reaction involving an organic liquid phase with plutonium nitrate and tributyl phosphate which is exactly the operation that will be used in plutonium-238 operations.

Furthermore, we discovered that an unresolved safety question had been declared and administrative controls put on it in place on the plutonium finishing plant and because of the possibility of such a reaction occurring at relatively low temperatures, far lower than the calciners were designed to operate at and we don't see in the EIS exactly what temperatures you're going to use for the calciners, but it's described as the same process, therefore one would expect that this would be analyzed.

The data is all there and failure to analyze it when you admitted that you had to analyze it in the early 1990s to restart the similar process of the PFP is certain to be a violation of analysis of all reasonable impact, foreseeable impacts.

2457-6 — You also have ignored the consequences of fires in 306 and 325 at Hanford and there is data published by Hanford about the consequences of those fires and the likelihood of those fires including in your own risk data sheets that is not referenced at all in this Environmental Impact Statement. The consequences of fires in those buildings can be horrifying and the public under the new plan of Keith Klein is to be invited into the 300 Area with no access restrictions. I believe that plan was posted on the wall earlier tonight.

2457-7 — Now if you are operating 306 and 325 and there are no access restrictions for the public, then you have highly contaminated facilities, facilities where there's out of facility contamination detected and you are going to (a) increase the cost of cleaning up the 300 Area by trying to maintain operations

Response to Commentor No. 2457

would not be necessary to conduct further analyses to determine the specific consequences and risks to an individual member of the public located closer to the source of an accident than that already evaluated in the NI PEIS. Any individual member of the public located in close proximity, regardless of distance, would be expected to experience consequences of a postulated accident that are more severe than the consequences to the general public. In fact, the closer an individual gets to the accident the more severe the consequence. However, the probability that a member of the public would be in close proximity to the facility would be relatively low and the associated risk to that individual would be bounded by the MEI risk. The use of the Hanford facilities, such as the use of the parking lot for a bicycle race or the front gate area for a news conference, would not impact the determination of the location for the maximally exposed individual from exposures related to normal operations. The determination of the maximum exposed individual takes into consideration the amount of time an individual is expected to be located at a particular location. The maximally exposed individual is assumed to be located at the most highly exposed location over which DOE has no control for the entire year (Exposure parameters used in the assessment of the dose to the maximally exposed individual are provided in Appendix H. Section H.2.2.2.) Short term exposures received while attending events in the facility parking areas or at the front gate would yield doses that are significantly smaller than the dose calculated for the maximally exposed individual. Additionally, the maximally exposed individual receives part of the dose from ingestion of food grown in the area, this is not necessarily true for the participants and spectators at the bicycle race or at the news conference. The PEIS has evaluated the risks to members of the public under normal operating conditions and found that over the 35-year operational period no fatalities would be expected among workers or in the general public in the vicinity of Hanford or at distant locations. (See for example sections 4.3.1.1.9, 4.3.2.1.9, and 4.3.3.1.9.)

2457-4: The plutonium-238 fabrication/processing facilities evaluated in the NI PEIS can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. The accident evaluation specifically accounted for the chemical processes likely to be used and considered a spectrum of accidents including internal events, external events, natural phenomena, and sabotage and terrorist activities. Sections 4.2-4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from implementation of the alternatives, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that the radiological and nonradiological risks associated with each of the

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2457: Gerald Pollet (Cont'd) Heart of America Northwest

there; and (b) you cannot meet your own requirements and emergency response planning guidelines if the public is now at the front door of the facility instead of at the site boundary.

Throughout the analysis, in fact, today, the public is available to be at the front door of FFTF and at the front door of these buildings, but they're not invited to the front door of anything in the 300 Area, but there's no security badge actually required for the public to go in.

2457-8 — That is going to change under DOE's current proposal. Throughout the EIS regarding accident calculations and doses for Hanford, the EIS refers to the GENII computer code and the referenced used is 1988. In 1989, an unusual occurrence was declared on site and for the discovery that the GENII air dispersion models to calculate environmental impacts of routine accidental releases of radiation from the Hanford site had a serious error in that it calculated wind directions for exposed public 180 degrees in the wrong direction.

I don't know if you used a changed version but the reference to 1988 version of GENII throughout this document seems to be that you used something with a hypothetical release with an error factor off by two, according to the unusual occurrence.

2457-9 — Finally, I want to close with much has been said about the fact that a final safety analysis report was done for this reactor before it was started and no reference is found in the environmental impact statement and I'm wondering — if the Secretary of Energy knows about this and who else probably doesn't, the findings of the Natural Research Council 1988 in safety issues at the DOE test and research reactors, page 67, "severe accidents in FFTF have not been assessed using state of the art methods built since the reactor began operation. Uncertainties in post-accident, heat removal and evolution of fission products from molten core debris are given as an example."

Response to Commentor No. 2457

alternatives would be small. The solvent extraction process involving the use of tributyl phosphate in hydrocarbon to separate and produce plutonium nitrate solution has been used extensively for years in the United States as well as in Japan, England, and Germany. Under a combination of off-normal conditions, there can be a reaction between nitric acid or nitrates and tributyl phosphate degradation products at higher than normal operating temperatures. Such a reaction could only occur in a heated evaporator or concentrator if there is excess tributyl phosphate impurity or residual in the plutonium nitrate liquid. This scenario will be analyzed as a potential design basis accident in developing the safety authorization basis and associated technical safety requirements for the chemical processing option chosen by DOE.

2457-5: The solvent extraction process involving the use of tributyl phosphate in hydrocarbon to separate and produce plutonium nitrate solution has been used extensively for years in the United States as well as in Japan, England, Germany, etc. Under a combination of off-normal conditions, there can be a reaction between nitric acid or nitrates and tributyl phosphate degradation products at higher than normal operating temperatures. Such a reaction could only occur in a heated evaporator or concentrator if there is excess tributyl phosphate "impurity" or residual in the plutonium nitrate liquid. This scenario will be analyzed as a potential design basis accident in developing the safety authorization basis and associated technical safety requirements for the chemical processing option chosen by DOE.

2457-6: RPL/306E can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. The accident evaluation considered a spectrum of accidents including internal events, external events, natural phenomena, and sabotage and terrorist activities. Section I.1.4.2.1 presents a postulated fire accident during medical isotope processing and describes the site historical fire data on which the accident frequency is based. Sections 4.3, 4.5, and 4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected from implementation of the alternatives which incorporate RPL/306E. The environmental analysis showed that radiological and nonradiological risks associated with these alternatives would be small.

2457-7: The 300 Area has access restrictions and security badges are required for access to the 306-E and 325 Buildings. The 306-E facility is not contaminated and is

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2457: Gerald Pollet (Cont'd)
Heart of America Northwest

Response to Commentor No. 2457

being proposed as a location to conduct activities that do not involve radioactive materials. While the 325 Building has a large inventory of radionuclides associated with ongoing activities at the facility, the building is not contaminated in worker accessible areas. Operations at the 325 Building are conducted in accordance with applicable federal and state regulations and appropriate DOE Orders. The 300 Area Revitalization Plan (DOE 1999) provides for continued multi-program R&D operations in the 300 Area, including operation of various laboratories, office facilities, and services. It also provides for consolidation (but not complete elimination) of radiological operations, with support for Hanford Site facility transition and environmental restoration efforts. The plan does not require closure of the 325 and 306 E buildings as long as they are needed for active research projects. Operation of these facilities would not violate any existing agreements between DOE and stakeholders or other legal obligations, nor would it affect ongoing or planned environmental restoration and facility transition activities. Under the current regulatory framework, the facility safety bases are evaluated at uncontrolled locations outside the legal site boundary (or the most highly exposed location over which DOE has no control). Although the public has been allowed road access around FFTF and the 300 Area for many years, DOE can quickly control access in the event of an emergency. The PEIS has evaluated the risks to members of the public and found these risks to be below the "level of concern". It is not illegal for members of the public to tour Hanford facilities. Tours of the 300 Area facilities can be arranged by contacting DOE-RL. Visitors are required to attend radiological safety training and to wear dosimeters during the tours. All visitors are escorted by personnel familiar with the facility being toured and trained in facility alarms and emergency responses.

- 2457-8:** The 1988 reference to the GENII code is a reference to the documentation associated with the code, i.e., the code description and user's manual. The version of the code used in the analysis is Version 1 485 dated December 1990.
- 2457-9:** The initial safety analysis report for the FFTF was driven by U.S. Nuclear Regulatory Commission Requirements. Any change in operating missions for the FFTF would require a revised safety analysis report (current format and methods) to be developed.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2463: Lynn Porter Hanford Watch

2463-1 — I've been working with Hanford Watch and going to these horrible meetings.

Some suggestions for improving the process next time we could bring in some cots. We could have DOE speak last and we could all leave before they speak.

Or I'd like to suggest that the next time we don't allow anyone from the State of Washington to speak at meetings in Portland. You know, they have their own meetings and they are not entitled to come here and take up time that should be going to Oregonians.

We shouldn't have to stay here this late to have our voice heard. But anyway, regardless, I think we all know that this is just the last stop in this process before we get to the lawsuit and the legislation to cut off their funding. That's the next step.

2463-2 — I think what we're really talking about here is a need for small amounts of isotopes for research and a possible larger need for isotopes for treatment later, if the research pays off. It seems we need to do the research first and DOE's own advisory committee said FFTF is not suited to produced isotopes for research.

2463-3 — I've been told that a sufficiently powerful accelerator could produce all of the desired medical isotopes. An accelerator produces very small amounts of short-lived nuclear waste.

2463-4 — FFTF would produce 16 tons of spent fuel which is high level radioactive waste, dangerous to human and other life for hundreds of thousands of years. And yet this environmental impact statement only evaluates environmental impacts for 35 years. How can you generate immoral waste and only evaluate the environmental impacts for 35 years. To me, that alone means that this environmental impact statement is invalid.

We have nowhere to put this 16 tons, no safe way to dispose of it, no sure way to contain it for the time in which it will be dangerous. Producing high level, long-lived nuclear waste is a bargain with the devil, a burden we have no right to place on our descendants.

2463-5 — If we really want to use medical isotopes as a weapon against cancer, we should build an accelerator powerful enough to produce them

2463-6 —...shut down FFTF.

Response to Commentor No. 2463

2463-1: It is DOE policy to encourage public input on matters of regional, national and international importance as part of its commitment to facilitate a public participation process that is open and unbiased. It is not uncommon or illegal under CEQ regulations for individuals and special interest groups, who may be for or against a particular proposed action or alternative, to attend multiple meetings including those outside their "home" area. However, DOE strives to ensure that the hearing format used serves to promote open and equal representation by all individuals and groups, regardless of the motivation for attending.

2463-2: The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

2463-3: A sufficiently powerful accelerator can produce many of the desired isotopes. No one single irradiation device, nuclear reactor or accelerator, can produce all of the desired medical isotopes. Wastes generated by the construction and operation of the accelerators evaluated for Alternative 3, Construct New Accelerators, are presented in the Draft NI PEIS on Tables 4-118 and 4-125 respectively.

2463-4: The NI PEIS assumes, for the purposes of analysis, that Yucca Mountain Nevada, would be the final disposal site for DOE's high-level radioactive waste

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2463: Lynn Porter (Cont'd)
Hanford Watch

Response to Commentor No. 2463

and spent nuclear fuel. As directed by the U.S. Congress through the Nuclear Waste Policy Act, as amended, Yucca Mountain is the only candidate site currently being characterized as a potential geologic repository for high-level radioactive waste and spent nuclear fuel. DOE has prepared a separate EIS, "Draft Environmental Impact Statement for a Geologic Repository for the Disposal of Spent Nuclear Fuel and High Level Radioactive Waste at Yucca Mountain, Nye County, Nevada" (DOE/EIS-0250D, July 1999), which analyzes the environmental impacts from construction, operation and monitoring, related transportation, and eventual closure of a potential geological repository.

2463-5: DOE notes the commentor's support for Alternative 3, Construct New Accelerator(s), and Alternative 5, Permanently Deactivate FFTF.

2463-6: See response to comment 2463-5.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2484: Grant Raven

2484-1 — I feel a contradiction about testifying before the Department of Energy because it seems there's clear evidence that it has lied to the citizens again and again about Hanford and what it is doing, but I'm giving this testimony just to add another voice.

2484-2 — I support Alternative 5 of shutting down and not restarting the fast flux test reactor.

Response to Commentor No. 2484

2484-1: DOE assumes the commentor is concerned about the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2484-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2477: Carlos Reyes

2477-1 — I think we should give all our efforts to cleaning it [Hanford] up...

2477-2 — I think we should give all our efforts to...shutting it [FFTF] down.

Response to Commentor No. 2477

2477-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2477-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2614: Ann Richardson
[for] U.S. Congressman David Wu, OR

2614-1 — Like you, I believe that not only is the FFTF a burden to taxpayers, but it is also an environmental hazard waiting to happen. We should not spend limited resource dollars restarting an experimental reactor upriver from hundreds of thousands of people who depend on the Columbia River.

2614-2 — ... we need to insure that clean water is protected by devoting resources to restore the already damaged Hanford environment.

Response to Commentor No. 2614

2614-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF. Included in the PEIS are the results of analyses that show that the risks associated with operating the FFTF are very small. FFTF is located approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to the groundwater. Analyses presented in Chapter 4 of the NI PEIS (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4) indicate that there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

2614-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford and the risk of contamination to the Columbia River. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities. The stated missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities. Also, no water quality impacts would be expected as a result of permanent deactivation of FFTF (Section 4.4.1.2.4). The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. Implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2471: David Rosoff

2471-1 — As a reactor operator I would just like to say that I'm grateful for this process existing. I'm grateful for the fact that the DOE comes out to gather public opinion. My only regret is that there's so much emotional outbursts and so many people who to my mind are clearly uneducated about the topics on which they're speaking.

I would just urge the DOE to please make the decision ... which seems the best to it and which will be most effectual in the missions most important to our country.

Response to Commentor No. 2471

2471-1: DOE notes the commentor's support of the public participation process. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

*Commentor No. 2448: Don Segna
Nuclear Medicine Research Council*

2448-1 — Now that is why this thing got started. It is not DOE. It's for a group of citizens just like you and I guess you want to say sitting on the other side of the fence and having cancer and they saw the results of this and Fred Hutchinson was the first really tests were done that shows the remissions. And there's been improvement since then.

Now I'd like to agree with this clean up and I like the context that sign does not equate and I think I've already talked to the gentleman over here. FFTF restart kills clean up. I think that's a separate issue.

Response to Commentor No. 2448

2448-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

**Commentor No. 2483: Kathryn Thomason
Physicians for Social Responsibility**

2483-1 — I'm a member of the Physicians for Social Responsibility, Oregon Chapter which is solidly behind Alternative 5, shutting down the plant FFTF.

2483-2 — Again in the statement that's been produced today, there is no accounting for where you're going to put the high level waste and I think until people come up with a plan, the Department of Energy comes up with a plan for what to do with these wastes and how to store them safely, it's totally irresponsible to continue to create more.

2483-3 — The second major point I have to say is that we don't trust the word of the Department of Energy. Leaks are occurring. Leaks continue to occur. The cleanup [at Hanford] is not being met in the order and fashion that it ought to be met in and we aren't getting good answers for that ...

2483-4 — The third thing is the money. It's expensive. I think there are viable alternatives for medical isotopes. I think that the whole issue of the cost of medical isotopes is a whole other department that you guys don't need to worry about because there are resources for it and this does not need to be created for that. The cost of cleanup is going to skyrocket and there was a recent report that you guys had to take out the people who were cleaning it up now because they're not doing the job. So the costs are incredible and so we don't want to incur more of these types of costs.

Response to Commentor No. 2483

2483-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2483-2: The DOE Manual 435.1. Radioactive Waste Management defines high level radioactive waste as "the highly radioactive waste material resulting from the reprocessing of spent nuclear fuel, including liquid waste produced directly in reprocessing and any solid material derived from such liquid waste that contains fission products in sufficient concentrations; and other highly radioactive material that is determined, consistent with existing law, to require permanent isolation." DOE has prepared an implementation guide to DOE M 435.1 to assist in implementing the requirements contained in that manual. For this particular "requirement," the definition of high-level radioactive waste, the guide is intended to facilitate the classification of indefinite waste as to whether or not they are high-level radioactive waste. It is recognized that the definition of high-level radioactive waste is not precise and is essentially a source-based definition that also alludes to concentrations of a given waste stream. Page II-8 of this guide notes that "For the purpose of managing high-level waste under DOE M 435.1-1 [sic], spent nuclear fuel includes spent driver elements and/or irradiated target elements that contain transuranium elements." This statement was included in the guide because the concentrations of long-lived isotopes are likely to be somewhat high during reprocessing and it also meets the source-based definition. As a result of reviewing this guide and to address the comments raised, DOE is considering whether the waste from processing of irradiated neptunium-237 targets should be classified as high-level radioactive waste and not transuranic waste. As a result, the Waste Management sections (Sections 4.3.1.1.13; 4.3.2.1.13; 4.3.3.1.13; and 4.4.3.1.13) of this NI PEIS have been revised to reflect this different classification from what was assumed in the draft NI PEIS. As discussed in these revised sections, irrespective of how the waste is classified (e.g., transuranic or high-level radioactive waste), the composition and characteristics are the same and the waste management (i.e., treatment and onsite storage) for this NI PEIS would be the same. In addition, even if the waste is managed as high-level radioactive waste it would have no impact on the existing high-level radioactive waste management infrastructure (e.g., high-level waste storage tanks), since the high activity waste from processing of the targets would be initially stored and vitrified within the processing facility (i.e., FMEF, REDC, or FDPF).

2483-3: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Physicians for Social Responsibility*

Response to Commentor No. 2483

restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2483-4: The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2470: Kelly Tkachenko

2470-1 — I plead with you, you and your wisdom to shut down FFTF reactor ...

2470-2 — ... put the money back into the cleaning up of Hanford and Hanford Nuclear Reservation.

Response to Commentor No. 2470

2470-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2470-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

**Commentor No. 2430: Amber Waldref
Heart of America Northwest**

2430-1 — And the main thing for me that I find that would be in the environmental impact statement that's lacking is the lack of information on where the waste is going to go that's produced with the emissions of plutonium-238 and the medical isotopes.

So I'm concerned about that because more waste to Hanford is not anything any of us want with already leaky tanks. . .

2430-2 — . . .other problems I have with the EIS is that the Department of Energy waited until this last Friday to disclose the costs of restarting FFTF. It was not included in the original study and also the nonproliferation study which hopefully will be coming out soon that would give us all a better chance to make informed comments during this public hearing process, because without access to this, we're unable to have full disclosure and give our public comment.

2430-3 — And then finally what I wanted to talk about was that in the — last fall during the scoping hearings one of the issues that people brought up was that they wanted more information on the tri-party agreement on Hanford and that be included in the environmental impact statement and supposedly it is, but I was unable to find it, any substantial information on it, so I would again remind the Department of Energy what this agreement was and that it's a covenant that was signed the Department of Energy, the EPA and the Washington State Department of Ecology that said in force we'll clean up deadlines for Hanford and in 1995 the clean up milestones were added that the FFTF would be deactivated and decommissioned, i.e., shut down, start the cleanup of the reactor and then we could use this money which was at that time \$30 million a year on cleanup. And now the Department of Energy says that with its current budget and the target budgets for the next coming years for cleanup, that they don't have enough money. The budgets are too low to meet the cleanup agreement. . . using the money for cleanup, because we want the Department of Energy to honor this agreement and hopefully move towards full cleanup of Hanford and no more missions.

2430-4 — So in my mind, I would advocate for Alternative 5 which is shutting down FFTF,

Response to Commentor No. 2430

2430-1: The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste treatment, storage, and disposal facilities for the wastes expected to be generated are identified in Chapter 4 of Volume 1 under the Waste Management sections of the NI PEIS, including the waste expected to be generated from the processing of irradiated targets. The cumulative impact tables for waste management in Section 4.8 of Volume 1 have been revised to include the individual site's storage, treatment and disposal capacities for comparison. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored, and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

2430-2: The costs and nuclear nonproliferation impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such ancillary documents need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed these documents to more than 730 interested parties on August 24 and September 8, 2000, respectively. Both reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided summaries of the Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment in Appendixes P and Q, respectively in the Final NI PEIS.

2430-3: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. A previous change to the Tri-Party Agreement removed the planned milestone for total deactivation of

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

*Commentor No. 2430: Amber Waldref (Cont'd)
Heart of America Northwest*

Response to Commentor No. 2430

the FFTF until its ultimate fate was assessed. That proposed TPA milestone change was the subject of previous public meetings. DOE notes the commentor's support for deactivation of FFTF.

2430-4: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2478: Jim Walling

2478-1 — The fact that I am here and still do not feel informed on the subject is illustrative of the lack of information available for the public. It is your responsibility to inform the people you intend to put at risk about the nature of that risk. Until you do that, you do not have the right to restart this reactor.

2478-2 — There's also the issue of trust. Due to the current state of Hanford and the hopeless task of cleaning up the mess that has been made, I simply do not trust those of you who are proposing to restart the FFTF reactor.

2478-3 — We need another process of evaluating the idea. As it stands, I cannot support it.

Response to Commentor No. 2478

2478-1: DOE is committed to discharging its responsibilities in an open and unbiased manner and providing the public with comprehensive environmental reviews of its proposed actions. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

2478-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., the Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2478-3: This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR 1500 through 1508 and 10 CFR 1021, respectively). The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS. Further, DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives. This was accomplished through review and evaluation of site-specific information on the environmental conditions prevailing at ORR, INEEL, and Hanford to include a comprehensive analysis of the associated environmental and health risks of each alternative. DOE made every effort to obtain, analyze and disclose all required information to make a decision on expanding nuclear infrastructure.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2422: Grace Weinstein

2422-1 — As taxpayers and citizens, you're asking a great deal of us. I'd like to turn it around and ask as a taxpayer and as a grandmother that you do some things for us.

Instead of spending money on treating cancer, spend that money on cleaning up the environment so we have less cancer in the environment.

And as taxpayers you ask us to send more missions into space. And I ask you to use that money to give everybody a health insurance plan in the United States.

And you ask us to spend taxpayer money to do research that might be used for weapons. And I ask you to demilitarize the United States.

Response to Commentor No. 2422

2422-1: DOE notes the commentor's interest in funding for environmental cleanup national health insurance, and demilitarization, although these issues are beyond the scope of this Nuclear Infrastructure PEIS. NASA establishes the need and requirements for space missions. Medical isotope requirements, benefits, and applications are determined by the medical community. The DOE missions to be addressed in this EIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development, can currently only be met using nuclear reactor or accelerator technologies. The three missions are civilian nuclear energy missions and are not defense-related.

Comments from the Portland, Oregon, Public Hearing (August 29, 2000)

Commentor No. 2472: John Young

2472-1 — I think the FFTF is probably a bad idea. Not for radiological damage as far as public opinion and people you face here. It's just going to compound your problem if you start this reactor up again.

2472-2 — I do believe that there needs to be some resource of medical isotopes whether it be the new accelerators or new reactors, but I don't know how far the accelerators would go and to affecting the public and endangering them, but from what I know about accelerators is that even though the cost is greater, I think this would be a good way to retain medical isotope production and allay some fears of the public here in Northwest.

Response to Commentor No. 2472

2472-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2472-2: DOE notes the commentor's support for Alternative 3, Construct New Accelerator(s), or Alternative 4, Construct New Research Reactor for the production of medical isotopes. Public and occupational health and safety impacts from both normal operations and accidents of these and all other alternatives are presented in Chapter 4.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2499: Anonymous

2499-1 — ... the DOE is forced to hold public hearings where they trick-up with their overheads and expand on statistics that are skewed, and all of it with a straight face. And we sit and listen, and sometimes we clap. ... and they [DOE] can leave things out of their statement and make us dig for them ...

2499-2 — ... the DOE tells the public that fires and explosions don't release any harmful material to the atmosphere, and then we find out it has been harmful.

2499-3 — ... the DOE can disregard its own subcommittee recommendations about isotopes not being suitable for production at FFTF ...

Response to Commentor No. 2499

2499-1: DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and holding public hearings is an essential and required part of the NEPA process. DOE policy encourages effective public participation in its decisionmaking process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public. No pertinent information has been overtly omitted from the NI PEIS. This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS. All references used in preparing the NI PEIS are cited in the reference section of each chapter and appendix. DOE has made these references and other material relevant to review of the NI PEIS and supporting the decisionmaking process available to the public in the designated public reading rooms. DOE made every effort to obtain, analyze, and disclose all required information to make a decision on expanding nuclear infrastructure.

2499-2: DOE notes the commentor's concern over reliability of information provided by the DOE in recent publicized events at the Hanford site. No radioactive materials were "released" in the Hanford Wildfires of 2000. Wildfires did resuspend some materials already in the environment. The resuspended materials were low, slightly above natural background levels. Real-time measurement instruments cannot detect very low levels in the field. The low levels required several days of analysis to quantify. DOE released information to the public as it became available. Based on information to date, this wildfire did not provide environmental releases harmful to the general public or the environment.

2499-3: The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2499: Anonymous (Cont'd)

Response to Commentor No. 2499

report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities. DOE has taken the NERAC report recommendations under consideration in developing the range of alternatives evaluated in the NI PEIS. This report was made available to the public at the NI PEIS public information centers and on the Internet at www.nuclear.gov.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2500: Raging Grannies of Seattle

2500-1 — Stop wasting money on FFTF and clean, clean, clean. Cleanup the messes you've already made and don't make any more.

2500-2 — ... shut down FFTF for once and all ...

2500-3 — ... we're not allowed — I had a sign in the back, and we are not allowed to have signs, either. How come the people in the back get to have signs? Look; they've got them.

The additional oral comments were submitted in written form and are addressed in the responses to Commentor No. 284.

Response to Commentor No. 2500

2500-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2500-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2500-3: Comment noted. Any use of signs or props at the Seattle, Washington public hearing was beyond the control of DOE. DOE had no control over nor provided oversight of security personnel deployed in the Washington State Convention and Control Center.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2511: Anonymous

2511-1 — I wasn't really expecting so many pro-FFTF people here. I just didn't think — it was, you know, really kind of a no-brainer for me, because nuclear waste doesn't go away. That's the biggest thing in my mind. Ten thousand years, 20,000 years, pretty much forever, as far as we human beings are concerned. We're not going to live that long, and it's always going to be there. And so we got to put it somewhere. Well, we put it in a bunch of tanks in Hanford, and we hoped that they didn't leak, and — well, some of them didn't and some of them did. And now, as far as — you know, it's like three kilometers away from the Columbia River in groundwater. And you just can't get rid of it.

2511-2 — And the one thing I guess I'd like to say about cancer is that a hundred years ago we didn't have near the cancer rate. We also didn't have nuclear waste, and we also didn't have toxic waste at near the level. There is a correlation.

Response to Commentor No. 2511

2511-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

2511-2: The commentor's concern about cancer rates is noted. Statistics from the National Cancer Institute indicate that the rate of cancer incidence and the rate of cancer mortality has dropped during the 1990's [NCI webpage (as of 10/19/2000) - <http://cancernet.nci.nih.gov/statistics.shtml> article entitled "Cancer Death Rate Declined in the 1990s for the First Time Ever"]. A survey sponsored by the National Cancer Institute and published in the Journal of the American Medical Association in 1991 (JAMA 1991:1403-1408) detected no general increase in the risk of cancer death for people living in 107 counties adjacent to or containing 62 nuclear facilities. The Hanford Site, Idaho National Engineering and Environmental Laboratory, and Oak Ridge Reservation were included in the survey. The study used cancer mortality data from Benton, Franklin, and Grant Counties in the survey for the Hanford Site (See Section 3.4.9.3 of Volume 1). This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives including the restart of FFTF for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2516: Anonymous

2516-1 — One [of my concerns] is the waste material. I am interested in the isotopes if it does help individuals to live a more — a more comfortable life, I suppose, or a life that has more — I don't know; I can't find the right word right now. But for me, it's about the waste material. And if it does have a half-life of 100,000 years, 20,000 years, what does that mean we're leaving behind for our children, our grandchildren, and so forth and so on.

2516-2 — The other thing that I was thinking about is the idea that if there is a possibility of these — of us being affected by radiation in the universe or in the world, then that's okay, but it's a matter of the concentration as it becomes more and more and more. That would concern me once again, not just the fact that we get this from the world already. But what happens when it's concentrated into a particular point? How does that affect us, as it was with Hiroshima and bombing that country or whatever.

2516-3 — Why is Germany giving this to us, giving it to us for no cost? I mean, I'm thinking to myself "Why are they doing that? Is it political, for political reasons, or is it because they are no longer building nuclear facilities any more? Why are they not pursuing something like this at all?" And that, to me, is a concern. Is it for a political favor that we'll have to repay at some point in time, even though it's at no cost? Because I think that in politics nothing is without a cost, and that's the unfortunate part about it.

2516-4 — My other thing is, when we're talking about statistics, I think of two particular missions that deal with space, the space shuttle Challenger, which if I'm not mistaken, it was either the third or fourth time that it — they were trying to get that space shuttle — or you know, tried to get it back and forth — and it blew up. And that, to me, is a concern, if it was the third or fourth time. Granted, there was an opportunity afterward to correct whatever deficiencies there were. But the fact that it was the third or the fourth time is something that needs to be looked at. And then you're talking about Apollo- 13, if I'm right about that one as well, the one that ended up going around the moon, and they weren't certain if those astronauts were able to come back. And granted, it may be only a few lives in the — in the effort of promoting the United States of America in its space mission. But the fact that it happened, and it was — it wasn't a million times, it was only like ten or thirteen or twenty or however many. That is a concern for me.

Response to Commentor No. 2516

2516-1: DOE notes the commentor's concern regarding waste generation. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. The environmental impacts associated with managing additional FFTF spent nuclear fuel are discussed in Subsection 4.3.1.1.14 of the NI PEIS. Under this section, it is stated that about 16 metric tons of heavy metal spent nuclear fuel would be generated in the 35-year nuclear infrastructure operation period. As discussed, the incremental impact associated with managing the additional FFTF spent nuclear fuel is extremely small and would have no discernible impact on the existing Hanford spent nuclear fuel management over NI PEIS evaluation period (see section 4.8.3.5 for cumulative impact). The currently used FFTF specific spent nuclear fuel storage system designs (i.e., facility storage vessels and dry storage casks) are the key contributors for determining that the incremental radiological and environmental impacts are small. This section also states that the "spent [FFTF] nuclear fuel would be packaged in acceptable containers and shipped to a geologic repository for ultimate disposal." Disposal of DOE spent nuclear fuel is within the scope of a separate EIS titled, "Draft Environmental Impact Statement for a Geologic Repository for the Disposal of Spent Nuclear Fuel and High-Level Radioactive Waste at Yucca Mountain, Nye County, Nevada" (DOE/EIS-0250D, July 1999).

2516-2: DOE strives to minimize public exposure to nuclear radiation resulting from its activities. Each site, including the Hanford Site is required to implement a radiological control program to meet the policy goal to: "conduct radiological operations in a manner that controls the spread of radioactive materials and reduces exposure to the workforce and the general public and that utilizes a process that seeks exposure levels as low as reasonably achievable." (DOE's Radiological Health and Safety Policy [DOE P 441.1, April 26 1996]). Section 3.4.9.1.1 of Volume 1 describes the natural background radiation environment in the vicinity of the Hanford Site. As described in Chapter 4 of Volume 1, radiation doses to the public and workers that would result from implementation of one of a range of reasonable alternatives (described in Section 2.5) would be at least a factor of 100 less than that due to the natural background. Radiation due to manmade sources in the potentially affected areas, including that due to implementation of the

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2516: Anonymous (Cont'd)

Response to Commentor No. 2516

alternatives, would add a small risk to the radiological risk due to the natural background. The amount of radiation risk that would be attributable to implementation of the alternatives is summarized in Section 2.7.1 of Volume 1.

2516-3: DOE notes the commentor's viewpoint.

2516-4: DOE notes the commentor's concern over the safety of NASA's space missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2522: Anonymous

2522-1 — The most important thing that I want to say tonight is that we are all individuals who are very important here, and everything that we have to say is extremely important and should be heard.

2522-2 — The thing that is not being heard is that our environment and our population is going to die off because of man. Man has created cancer to a huge extent. I have a lot of family who have died of cancer.... So you can say that medical isotopes are probably going to be the cure-all of cancer, but do you realize that making medical isotopes is causing cancer in a huge amount every day? And it's getting worse and worse. And like this wonderful man that was sitting over here earlier said, that there wasn't cancer a hundred years ago. That's true. Cancer has been created as much as we keep creating new technology, more pollution, nuclear pollution, nuclear waste, hazardous waste.

2522-3 — A huge polluter is the FFTF nuclear reactor. It is the second-largest polluted area in the world.

2522-4 — I am definitely against the restart of the FFTF, if not for myself, for my child's future.

Response to Commentor No. 2522

2522-1: Comment noted. It is DOE policy to encourage public input on matters of regional, national and international importance as part of its commitment to facilitate a public participation process that is open and unbiased. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS DOE carefully considered comments received from the public.

2522-2: This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives (including the restart of FFTF) for accomplishing the proposed action. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small. The NI PEIS identifies (in Chapter 3 of Volume 1) endangered species that live on or near all of the candidate sites, as well as aquatic and wetlands areas that may be impacted by operations at candidate locations. According to an International Atomic Energy Agency (IAEA) publication (IAEA Technical Report Series No. 332, Effects of Ionizing Radiation on Plants and Animals at Levels Implied by Current Radiation Protection Standards), a dose rate of 100 millirem per year to the most exposed human will lead to dose rates to plants and animals of less than 0.1 rad per day. The IAEA concluded that a dose rate of 0.1 rad per day or less for animals and 1 rad per day or less for plants would not affect these populations. The largest individual dose for any of the nuclear infrastructure alternatives under normal operations would be less than 0.1 millirem, which is three orders of magnitude less than the IAEA threshold for adverse effects. Therefore, implementation of any of the range of reasonable nuclear infrastructure alternatives analyzed would not be expected to result in adverse impacts on plants and animals living in potentially affected areas around the candidate sites. As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2522: Anonymous (Cont'd)

Response to Commentor No. 2522

the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposal) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed.

2522-3: The commentor's concerns about pollution from FFTF are noted. Environmental impacts associated with operation of the FFTF and support facilities at Hanford during normal operations and from postulated accidents are discussed in Section 4.3 of Volume 1. Impacts to human health and to ecological resources would be small in the immediate area of the Hanford Site and negligible at distant locations. Waste generated under the nuclear infrastructure alternatives would result in a small burden on the Hanford Site waste management infrastructure. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement.

2522-4: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2523: Anonymous

2523-1 — I notice that you commented on vitrification, or the ideas to melt this into silicon logs. The melting point of silica is 1,410 degrees centigrade. Of the ten elements listed in the radiation dose estimates from the Hanford radioactive releases to the air and the Columbia River declassified between 1944 and 1971, all of them melt below 1,410 degrees centigrade. And five of them are completely above the boiling point, which means that the element would be a vapor which would escape into the atmosphere. This is iodine-131, strontium-90, sodium-24, zinc-65, phosphorus-32, and arsenic-76. So vitrification cannot possibly contain any element which has a boiling point above the melting point of silica; it would have to go to vapor. The phase transition is the same as in ordinary life with an ice cube So to vitrify radioactive waste is to ignore the physical reality of physical chemistry. This cannot possibly work.

2523-2 — I noticed many statements about radioactive isotopes for use in medical purposes, and nowhere did I notice certain kinds of comments. The — I've read newspaper articles about implanting radioactive pellets next to a tumor or in a tumor in order to kill the tumor. But the radioactive pellet is shooting radioactive particles in all directions, which means it is also affecting the normal tissue. The energy of the radioactive decay is sufficient to break chemical bonds, which means that exposure to radioactivity damages DNA, which — and if you damage DNA, you can cause cancer.

2523-3 — I've heard several statements about plutonium low-level waste. I don't believe that it's possible to redefine plutonium as not a high-level waste.

2523-4 — If you were to have a meltdown of this mix of oxide/plutonium fuel, and the mixed oxide, whatever it may be, is a different density than the plutonium, surely the plutonium would separate and reach critical mass and blow up. I'm curious if these risk assessments mention such things.

The Encyclopedia Britannica lists sodium as readily oxidizable. Liquid sodium is readily oxidizable. So presumably, this means that if you heat it hot enough, it can burn in the presence of oxygen. If you've lost containment or some other accident, this seems like an unreasonable risk also.

2523-5 — At the last meeting [scoping] you said that you would send a response form to comments, and I received my response form, and there was no response to my comment on vitrification.

2523-6 — How many people died downwind of Hanford?

Response to Commentor No. 2523

2523-1: DOE notes the commentor's concern regarding vitrification of radioactive waste.

2523-2: Medical isotope production has been identified as one of the purposes and needs (Section 1.2.1 of Volume 1) for which DOE action is necessary. The NI PEIS addresses the environmental impacts that would be expected from the production of medical isotopes. Although the 12 million medical procedures a year utilizing radioisotopes would be expected to benefit public health, the evaluation of the impact of medical procedures is outside the scope of the NI PEIS.

2523-3: The DOE Manual 435.1. Radioactive Waste Management defines high level radioactive waste as "the highly radioactive waste material resulting from the reprocessing of spent nuclear fuel, including liquid waste produced directly in reprocessing and any solid material derived from such liquid waste that contains fission products in sufficient concentrations; and other highly radioactive material that is determined, consistent with existing law, to require permanent isolation." DOE has prepared an implementation guide to DOE M 435.1 to assist in implementing the requirements contained in that manual. For this particular "requirement," the definition of high-level radioactive waste, the guide is intended to facilitate the classification of indefinite waste as to whether or not they are high-level radioactive waste. It is recognized that the definition of high-level radioactive waste is not precise and is essentially a source-based definition that also alludes to concentrations of a given waste stream. Page II-8 of this guide notes that "For the purpose of managing high-level waste under DOE M 435.1-1 [sic], spent nuclear fuel includes spent driver elements and/or irradiated target elements that contain transuranium elements." This statement was included in the guide because the concentrations of long-lived isotopes are likely to be somewhat high during reprocessing and it also meets the source-based definition. As a result of reviewing this guide and to address the comments raised, DOE is considering whether the waste from processing of irradiated neptunium-237 targets should be classified as high-level radioactive waste and not transuranic waste. As a result, the Waste Management sections (i.e., Sections 4.3.1.1.13; 4.3.2.1.13; 4.3.3.1.13; and 4.4.3.1.13) of this NI PEIS have been revised to reflect this different classification from what was assumed in the draft NI PEIS. As discussed in these revised sections, irrespective of how the waste is classified (i.e., transuranic or high-level radioactive waste), the composition and characteristics are the same and the waste management (i.e., treatment and on-site storage) for this NI PEIS would be the same. In addition, even if the waste is managed as high-level radioactive waste it would have no impact on the existing high-level radioactive waste management infrastructure (e.g., high-level waste storage tanks), since the high

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2523: Anonymous (Cont'd)

Response to Commentor No. 2523

activity waste from processing of the targets would be initially stored and vitrified within the processing facility (i.e., FMEF, REDC, or FDPF).

2523-4: Mixed-oxide fuel is a homogeneous mixture of uranium dioxide and plutonium dioxide. Mixed oxide fuel has the same general characteristics as uranium dioxide fuel, such as a high melting point, irradiation stability, compatibility with metals and with reactor coolants, and ease of preparation. The NI PEIS accident analysis considered a spectrum of accidents, including fuel melting scenarios, criticalities, and liquid sodium releases. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected from implementation of Alternative 1. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

2523-5: It appears that the commentor is making reference to public participation proceedings under the Tri-Party Agreement (TPA) Community Relations Plan (CRP). The conduct and outcome from public hearings and meetings on matters that are unrelated to these DOE missions are beyond the scope of this NI PEIS. Specifically, the TPA, and its associated public involvement process, and NEPA, under which this NI PEIS is being prepared, are legally and functionally independent of each other. The TPA's public involvement process, as per the TPA CRP, is not required for NEPA reviews and public involvement, including public scoping meetings and Draft NI-PEIS public hearings.

2523-6: The commentor's concern for the current severe health impacts is noted. Prevailing winds at the Hanford Site blow toward Grant County, Washington from the south (14.2 percent of the time) and south southwest (11.5 percent of the time) directions. Hence Grant County would be expected to bear the major burden of wind borne contamination from the Hanford Site. A survey sponsored by the National Cancer Institute and published in the Journal of the American Medical Association in 1991 (JAMA 1991:1403-1408) detected no general increase in the risk of cancer death for people living in 107 counties adjacent to or containing 62 nuclear facilities. The Hanford Site, Idaho National Engineering and Environmental Laboratory, and Oak Ridge Reservation were included in the survey. The study used cancer mortality data from Benton, Franklin, and Grant Counties in the survey for the Hanford Site. The methodology used in the survey did not attempt to estimate actual exposures to ionizing radiation or hazardous chemicals and did not allow identification of areas within a given county that might have increased or decreased cancer rates relative to the county as a whole. If any excess cancer mortality risk was present in Grant County, it was too small to be detected with the methods employed in the survey. As discussed in Chapter 4 of Volume 1, no latent cancer fatalities among populations surrounding the Hanford site would be expected to result from implementation of Alternative 1, Restart FFTF.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2543: Anonymous

2543-1 — I am in support of the restart of FFTF.

2543-2 — I think you are doing things right and I think you're looking at it very technically and with concern for the American public.

Response to Commentor No. 2543

2543-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2543-2: DOE notes the commentor's support for its execution of the NEPA process.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2549: Linda Alexander

2549-1 — A restart of the FFTF would assure high quality isotopes are available for use more than just the select few for studies and the options you protect, or save, may some day be your only option left.

Response to Commentor No. 2549

2549-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor: Dan Arrigoni

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 282.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2537: India M. Bauer

2537-1 — I oppose the startup.

2537-2 — I think that the cost is prohibitive [for FFTF restart] and the funds, even though they come from a different agency, they could be used for clean-up [at Hanford].

2537-3 — I think for the doctors and businesses who argue in support of this [FFTF restart], I think they have a big incentive for doing that since it's their livelihood and I think the so-called treatment and prevention of cancer it's a big business and people are making a lot of money from it.

2537-4 — I think that even though you say it's low level toxic waste that we'll get, it's still toxic waste and we still don't have the technology to get rid of it.

Response to Commentor No. 2537

2537-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2537-2: The commentor's positions on the cost of Alternative 1, Restart FFTF, and funding for Hanford cleanup are noted. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. Funding is allocated by Congress and is not interchangeable between EM programs and NE programs. As stated in Section N.3.2 of Appendix N, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2537-3: The NEPA process provides a number of opportunities for the public to participate in the preparation of an EIS irrespective of their views. DOE takes this participation seriously. In preparing the Final Nuclear Infrastructure PEIS, DOE carefully considered comments received from the public.

2537-4: DOE notes the commentor's concern regarding waste generation. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 270.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2545: Gary Bozanke

2545-1 — The FFTF is the quickest and safest way to begin producing high quality isotopes needed by the medical and research communities while our national long term prediction strategy is finalized, and we citizens of Washington should be proud to be able to play a vital part in serving this growing need.

2545-2 — I've worked in commercial industry including shipyards and can assure those with concerns about waste that by design and proven after ten years of excellent operation ratings, there's no waste problem at FFTF.

Response to Commentor No. 2545

2545-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

2545-2: DOE notes the comment.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor: Shirley Breitenstein

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 269.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2513: John Brown

2513-1 — I haven't looked at the entire PEIS. I have looked at the summary you mailed me — thanks. I found something while I was sitting here listening, that stated that reactors operating in Canada were considered for supplying the radiation services for Pu-238. But since the use of the CANDU reactors does not meet — and this is the part that interested me — “the programmatic issue being addressed in the PEIS” — that is, “the enhancement of the United States infrastructure to support the proposed missions,” meaning that we're not looking for solutions, we're looking for “our” solution.

2513-2 — In the next paragraph down [in the Summary] it says, “Numerous existing U.S. processing hot-cell facilities possess the capabilities and capacity to support the proposed missions. Given this general availability, only existing processing facilities that are co-located at DOE's candidate irradiation facility sites,” like Oak Ridge, ARCO - or what do you call it now, the place in Idaho — and Hanford, “were evaluated in the PEIS.” What you call that in a card game is a stacked deck, or eliminating the outcome of non-preferred outcomes. And I'd like to say right off the bat that this is, on the surface, a draft programmatic environmental impact statement, and I'd like to say that it's one heck of a selling job.

2513-3 — I wondered about the expert panel that was mentioned in here a number of times. I didn't see the — any NERAC group was identified by name.

2513-4 — . . .with regard to the cancer patients, if they're playing politics by restricting the scope of this thing to derive a certain outcome that's based on our good national interest, whether we have to import the Pu-238 from Germany or not, just like our oil, they're playing politics with cancer patients. It isn't a question of trying to help everybody by doing this the right way; this is politics. And if you do build it that way and you do restrict these things, what if the Canadians come down and say, “Hey, we have a treaty, NAFTA, you know; we're supposed to have free trade. This is an item of trade.” What about the WTO? They can come in and say, “Hey, listen, you can't — you know, we can provide this cheaper. What are you guys building this for and keeping us out? Because it's related to your national security interest? Because it's nuclear?” Yeah, you could say that, and we could have a big argument and go to court.

Response to Commentor No. 2513

2513-1: Existing, operational commercial facilities were evaluated in the NI PEIS for supplying irradiation services. These were domestic commercial light water reactors, as opposed to foreign reactors. Although the CANDU reactors were not specifically evaluated as an alternative in the NI PEIS, the environmental impacts associated with transporting the nonirradiated and irradiated neptunium-237 targets between the CANDU reactors and the target fabrication and processing facilities in the United States are bounded by the evaluations presented in the NI PEIS for the commercial light-water reactor options of Alternative 2, Use Only Existing Operational Facilities. Environmental impacts from the operation of a CANDU facility does not fall under the National Environmental Policy Act and would not be evaluated in an environmental impact statement.

2513-2: As discussed in Section 2.6.2 of Volume 1, there are numerous hot cell facilities in the United States with the capabilities and capacity to support the DOE missions. Candidate processing facilities not collocated at one of the DOE irradiation facility sites were dismissed from further consideration. DOE's primary reason for this was to narrow the universe of alternatives and alternative-option combinations down to a manageable number that could be adequately and meaningfully assessed in this NI PEIS. Thus, the facilities remaining form part of the range of reasonable alternatives required by NEPA and CEQ regulations (see 40 CFR 1502.14) to be addressed and that are evaluated in this NI PEIS to accomplish the proposed actions.

2513-3: Information on the Nuclear Energy Research Advisory Committee (NERAC) is provided in Section 1.2 of the NI PEIS. The Nuclear Energy Research Advisory Committee (NERAC) was established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. The members of the NERAC Subcommittee for Isotope Research & Production Planning were selected based upon their expertise and experience in the production, processing, distribution, and application of stable and radioactive isotopes in the biological and physical sciences, and in medicine. The members included basic and clinical scientists, administrators, and users of isotopes from academia, industry, and the federal government, with several possessing a background in reactor production of isotopes.

2513-4: DOE notes the commentor's viewpoint.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2514: Tom Burke

2514-1 — Several people have suggested that a major issue in this decision is jobs. I can tell you, I work at FFTF. I'm interested in restarting FFTF, not for my job. I believe I will have a job at FFTF even if DOE decides today to shut FFTF down. It will take long enough that I will have a job until I decide to retire.

2514-2 — The reason that I support FFTF restart is that it is the best facility available to do the three very important missions that are described in the NI PEIS.

Response to Commentor No. 2514

2514-1: DOE is not considering restarting FFTF for the purpose of creating jobs, although socioeconomic impacts (e.g., number of new jobs created) are addressed in Sections 4.3.1.1.8, 4.3.2.1.8, and 4.3.3.1.8 for Alternative 1, Restart FFTF, Options 1 and 4, 2 and 5, and 3 and 6, respectively. The Record of Decision for the PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

2514-2: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2518: Norm Buske
Nuclear-Weapons-Free America

2518-1 — . . . basically, FFTF is the wrong facility for its mission. It's terribly expensive to produce neutrons at quarter-throttle on a reactor. In this PEIS it says that — the PEIS postulates that the FFTF would operate — would operate at a nominal power level of 100 megawatts, one quarter of the reactor design power level, to meet the irradiation requirements of the proposed missions.

2518-2 — Periodic increases in power level [at FFTF] between 100 and 400 megawatts may be required to support nuclear research and development activities. That's basically code words for clandestine bomb plant. The way this works is, the FFTF has to be restarted on a civilian mission. So the mission statement cannot and never will include bombs. It's restarted on a civilian mission, and then it basically goes into a clientele arrangement with DOD and DOE to produce super-fissile materials. I ask that in the final environmental impact statement, that the use of the reactor in what you call excursion be included, along with the product, its deployment, and use of the nuclear weapons that will be the ultimate product and consequence of this facility.

2518-3 — I also ask that the FFTF be shut down.

Response to Commentor No. 2518

2518-1: The operation of FFTF at 25 percent of its design power level of 400 megawatts (i.e., 100 megawatts) for the missions described in this EIS is not more expensive than 400 megawatt operation. A separate cost report evaluates the cost of each EIS alternative. The operation of FFTF at 100 megawatts requires less new nuclear fuel and discharges less spent nuclear fuel over the 35 year time period of the mission than if it operated at 400 megawatts.

2518-2: DOE has no hidden agenda for weapons production or use of FFTF for classified missions. The only missions being considered are those analyzed in the NI PEIS, which are the production of isotopes for medical research, and industrial uses; plutonium production for future NASA space exploration missions; and U.S. nuclear research and development needs for civilian application.

2518-3: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

**Commentor No. 2519: Tom Carpenter
Government Accountability Project**

2519-1 — We're concerned about the proposed operation and restart of the FFTF facility, simply from the perspective of the fact that if you look at what Hanford is, it's awash in radioactivity. And it's got radiation and contaminated soils beneath the Hanford waste tanks in unknown quantities — at least a million gallons is estimated, but it may be more, according to studies by Los Alamos. And the thing is that this waste has migrated through the groundwater, through the soils to the groundwater, and is either in the Columbia River right now or is heading that way. And this is a process, of course. It's not all there now, but it's happening. So the response of Hanford to this situation is "Well, we'll remove the waste from the tanks and classify that waste someday, if we can find a contractor and if it's technically feasible, and only 10 percent by the year 2028." Well, maybe that date is going to slip now by five years. Well, what about the waste that's leaked out of the tanks and is heading toward the groundwater and toward the river? The fact is that Hanford is — stores two thirds of the nation's high-level nuclear waste, and you all don't know what to do with — do about that, the fact that it's migrating into the environment. ... Focus on the cleanup.

2519-2 — And our environmental surveillance indicates that radiation levels are starting to increase along the shoreline of Hanford. Your own records indicate that there are spikes happening with tritium and strontium-90 and other levels continuing to escalate, which you would expect to see. This will start having probably more dramatic effects on Washington's crops and fish and people in the area as time goes on.

2519-3 — So this is the backdrop for reopening a reactor that will produce spent nuclear fuel. We don't have a disposal path for that fuel. So we're — it seems to me that you're committing a mistake all over again, which is making more stuff that you don't know what to do with, that's hazardous for a very, very long time. I hear talk of repository. Well, what repository? I mean, we've talked about repositories now in the United States for decades. They're fighting over Yucca Mountain, don't know if it will open or not. But it's certainly way too small to accommodate the volume of nuclear waste in the United States.

2519-4 — There's also talk of bringing in German fuel from a company called SBK. And I heard comments earlier that's not nuclear weapons- grade fuel, which I found a curious comment. It turns out that a whistle-blower, in fact, from a company called ANMS, leaked some documents out concerning this very fuel. And I've got here a letter from the lawyer for this German company to Secretary Hazel O'Leary dated June 13th, 1996, and he refers to the record of decision for the final environmental impact statement on a proposed nuclear weapons non-proliferation policy concerning foreign research reactors' spent nuclear fuel.

Response to Commentor No. 2519

2519-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2 OF Appendix N, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

2519-2: The commentor's concern for existing radiation levels at the Hanford shoreline are noted. The analysis presented in the PEIS addresses the potential for incremental impacts associated with facility operations associated with each of the alternatives proposed. Current levels of contamination and exposures to the workers and public are addressed in the assessment of cumulative impacts presented in Section 4.8. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2519: Tom Carpenter (Cont'd)
Government Accountability Project

That's the title — not my title, it's just the title; I just read it off, thank you. So this — he's saying, "Take back this German fuel, which is of U.S. origin, for non-proliferation reasons." This is nuclear weapons-grade material, according to the company that has this fuel right now. And it's not just offering to give it away, they're willing to pay somebody \$35 million to take it off their hands.

2519-5 — So don't restart the FFTF.

Response to Commentor No. 2519

Energy) This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

- 2519-3:** The NI PEIS assumes, for the purposes of analysis, that Yucca Mountain Nevada, would be the final disposal site for DOE's high-level radioactive waste and spent nuclear fuel. As directed by the U.S. Congress through the Nuclear Waste Policy Act, as amended, Yucca Mountain is the only candidate site currently being characterized as a potential geological repository for high-level radioactive waste and spent nuclear fuel. DOE has prepared a separate EIS, "Draft Environmental Impact Statement for a Geologic Repository for the Disposal of Spent Nuclear Fuel and High Level Radioactive Waste at Yucca Mountain, Nye County, Nevada" DOE/EIS-0250D, July 1999), which analyzes the environmental impacts from construction, operation and monitoring, related transportation, and eventual closure of a potential geological repository.
- 2519-4:** The commentor is correct in stating that the German MOX fuel currently stored in Europe represents a nonproliferation concern because it contains plutonium oxide mixed with uranium oxide. Chemical separation of the plutonium from this fuel could result in the extraction of weapons grade plutonium as discussed in the separate DOE Nuclear Infrastructure Nonproliferation Impact Assessment which was published and released to the public in September, 2000. However, this nonproliferation report also states that, "If a decision is made to restart FFTF, the German MOX fuel could serve an immediate civil nuclear programmatic interest of the U.S. Government and at the same time dispose of a significant stockpile of highly attractive fresh plutonium fuel by conversion to spent fuel through irradiation in FFTF."
- 2519-5:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

*Commentor: Katy Carter
[for] Heidi Wills, Seattle City Council*

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 271.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2526: Larry Chambers

2526-1 — To leave the FFTF reactor on line, to me, is a symbol of our willingness to continue producing either a near-grade plutonium bomb material, or perhaps like other people have suggested, that they will sneak that in.

2526-2 — The last public hearing I was to at — for Hanford, the BNF, or British Nuclear Fuels, was supposed to resolve the waste dilemma by vitrification. That scenario seems to have fallen through. ... DOE has constantly missed its past cleanups deadlines on the Tri-Party Agreement.

2526-3 — What are we going to do with the new waste? The logic of creating more high-level waste without any concrete cleanup escapes me. We have no national depository, no vitrification plants, no comprehensive plan in action.

2526-4 — Shut down the FFTF reactor, and adopt Alternative 5.

Response to Commentor No. 2526

2526-1: DOE has no hidden agenda for weapons production or use of FFTF to support defense missions. The only missions being considered are those evaluated in the NI PEIS, which are the production of isotopes for medical, research, and industrial uses; plutonium-238 production for future NASA space exploration missions; and U.S. nuclear research and development needs for civilian application.

2526-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford and delays in vitrification of waste. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. DOE has expedited procurement of the vitrification plant design and build services in anticipation of maintaining the TPA goal for processing the most hazardous tank wastes. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.

2526-3: The DOE Manual 435.1. Radioactive Waste Management defines high level radioactive waste as "the highly radioactive waste material resulting from the reprocessing of spent nuclear fuel, including liquid waste produced directly in reprocessing and any solid material derived from such liquid waste that contains fission products in sufficient concentrations; and other highly radioactive material that is determined, consistent with existing law, to require permanent isolation." DOE has prepared an implementation guide to DOE M 435.1 to assist in implementing the requirements contained in that manual. For this particular "requirement," the definition of high-level radioactive waste, the guide is intended to facilitate the classification of indefinite waste as to whether or not they are high-level radioactive waste. It is recognized that the definition of high-level radioactive waste is not precise and is essentially a source-based definition that also alludes to concentrations of a given waste stream. Page II-8 of this guide notes that "For the purpose of managing high-level waste under DOE M 435.1-1 [sic], spent nuclear fuel includes spent driver elements and/or irradiated target elements that contain transuranium elements." This statement was included in the guide because the concentrations of long-lived isotopes are likely to be somewhat high during reprocessing and it also meets the source-based definition. As a result of reviewing this guide and to address the comments raised, DOE is considering whether the waste from processing of irradiated neptunium-237 targets should be

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2526: Larry Chambers

Response to Commentor No. 2526

classified as high-level radioactive waste and not transuranic waste. As a result, the Waste Management sections (i.e., Sections 4.3.1.1.13; 4.3.2.1.13; 4.3.3.1.13; and 4.4.3.1.13) of this NI PEIS have been revised to reflect this different classification from what was assumed in the draft NI PEIS. As discussed in these revised sections, irrespective of how the waste is classified (i.e., transuranic or high-level radioactive waste), the composition and characteristics are the same and the waste management (i.e., treatment and on-site storage) for this NI PEIS would be the same. In addition, even if the waste is managed as high-level radioactive waste it would have no impact on the existing high-level radioactive waste management infrastructure (e.g., high-level waste storage tanks), since the high activity waste from processing of the targets would be initially stored and vitrified within the processing facility (i.e., FMEF, REDC, or FDPF).

2526-4: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2551: Donn Colby
Washington Physicians for Social Responsibility

2551-1 — There's no argument that they're necessary or that FFTF can produce them [medical isotopes]. The question is whether production at FFTF is affordable or economically feasible. The Department of Energy has looked for a private contractor for years to commit to medical isotope production at Hanford, and has been unable to find a single producer willing to commit to the project....

Nothing in the draft EIS indicates that isotopes produced by FFTF would be any more affordable than currently available isotopes. In fact, statement from DOE's own committees confirm that medical isotope production at FFTF is not commercially viable.

2551-2 — The fact is that there is no current shortage of medical isotopes. The National Institute of Medicine issued a report that stated that there is no current shortage of medical isotopes and that they could not foresee any shortage coming in the near future....

I'd like to remove the argument for medical isotope production from decision making process.

2551-3 — I'd like to ... ask that DOE permanently close the FFTF.

Response to Commentor No. 2551

2551-1: DOE notes the commentor's opinion. The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost-efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

2551-2: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1 2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

*Commentor No. 2551: Donn Colby (Cont'd)
Washington Physicians for Social Responsibility*

Response to Commentor No. 2551

2551-3: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FTFE.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2528: Mike Contini

- 2528-1** — I support Alternate 1, restart of FFTF for the production of medical isotopes and Pu-238.
- 2528-2** — I want a statement in the PEIS that provides a categorical exclusion of using FFTF at any time for production of weapons materials of any kind.
- 2528-3** — I want to now turn my attention to accountability. There is a sign here concerning two FFTF employees fired for falsifying work done. I am familiar with this; I work at FFTF. The event happened, and the employees paid the price: they were fired, as they should have been. Can we say this about Heart of America Northwest? The Government Accountability Project? Columbia River United, or whatever new name they have? Does accountability exist for them? They can distort, misquote, take out of context items of great concern — again, what accountability exists for the watchdogs of Hanford?
- 2528-4** —...want Hanford cleaned up as fast as — as fast and as safe as possible.

Response to Commentor No. 2528

- 2528-1:** DOE notes the commentor's support for Alternative 1, Restart FFTF.
- 2528-2:** The only missions being considered are those stated and evaluated in the NI PEIS, which are the production of isotopes for medical, research, and industrial uses; plutonium-238 production for future NASA space exploration missions; and U.S. nuclear research and development needs for civilian application. No component of the proposed action is for the purpose of supporting any defense or weapons-related mission. If, in the future, other missions are considered for FFTF, additional NEPA analysis would be conducted.
- 2528-3:** DOE notes the commentor's views and testimony.
- 2528-4:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2502: Megan Cornish Freedom Socialist Party and Radical Women

2502-1 — I'd like to support the other speakers who have exposed some of the facts for why the FFTF should not be restarted and should be permanently closed down.

2502-2 — I would like to just mention quickly, the bias of the draft is so blatantly obvious to me. And I'm not a person who's watched every tiny detail of this, the development of this process. But just listening to the proposal tonight, I've found the bias for restarting the reactor appalling.

2502-3 — Under capitalism, if you'll pardon the term, the science, the research, and the medicine that gets funded is only that which benefits corporations and the military. We do not trust or support medical or nuclear energy support that is in the hands solely of the profits system. ... Now civilian nuclear energy research — are you kidding? It's bad enough to have nukes and nuclear research under the control of the military, which at least reports to Congress and the executive branch, which are susceptible to public pressure. But why should we fund civilian profit-making nuclear energy research which will be accountable to no one? This is corporate welfare, and it's corporate welfare at the expense of public welfare. This is the use of a public facility for private business interests. I believe that this is not supposed to happen, and I believe that it's unethical as well as illegal.... This version of corporate welfare means ill-fare for thousands of people, hundreds of thousands of people. And I understand the concern of people, working people in the Tri-Cities area, but I believe that they're being held hostage. We should have money for safe jobs, not death traps and not nukes.

2502-4 — Furthermore, how ironic it is that this nuclear facility is being proposed as part of the war on cancer, given the numbers of people who are already sick and dying from Hanford's radiation.

2502-5 — For the victims of cancer, we demand: stop industrial pollution, stop toxic and nuclear waste, and provide free, nationalized health care. And you can solve the war on cancer.

2502-6 — And I don't think it's accidental that the Tri-Cities is an area with a high concentration of Chicano population and migrant farm workers who use the water in the area, work on it, and sleep on it.

2502-7 — Since the FFTF is not needed for medical research, and it's inappropriate to use it for commercial medical isotopes, and unneeded, and since it's not required by NASA for the space exploration missions that have also been raised as a reason for it, and since federal money should not be used for commercial nuclear energy research — and those were all the alternatives that were listed — and also, there are other alternatives for all of these missions that are far cheaper than the reactor, what is the real reason for the drive to restart the FFTF? Obviously, the reason is military. It is star-wars-type space missions from the U.S. space command, and the use of arms from space directed at earth. Come out and say what it's really all about, because that's the obvious underpinning of this.

Response to Commentor No. 2502

2502-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.

2502-2: DOE has made every effort to make this NI PEIS objective. This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives. This was accomplished through review and evaluation of site-specific information on the environmental conditions prevailing at ORR, INEEL, and Hanford to include a comprehensive analysis of the associated environmental and health risks of each alternative.

2502-3: DOE notes the commentor's concerns.

2502-4: The commentor's concern about cancer rates in the Hanford area is noted. Chapter 4 of Volume 1 and Appendixes H through J discuss radiological exposures to the public that would be expected to result from implementation of the nuclear infrastructure alternatives. This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives (including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small. Cancers are believed to be caused by a combination of hereditary and environmental factors, including radiological and chemical agents. Statistics from the National Cancer Institute indicate that the rate of cancer incidence and the rate of cancer mortality has dropped during the 1990's [NCI webpage (as of 10/19/2000) - <http://cancernet.nci.nih.gov/statistics.shtml> article entitled "Cancer Death Rate Declined in the 1990s for the First Time Ever"]. A survey sponsored by the National Cancer Institute and published in the Journal of the American Medical Association in 1991 (JAMA 1991:1403-1408) detected no general increase in the risk of cancer death for people living in 107 counties adjacent to or containing 62 nuclear facilities. The Hanford Site, Idaho National Engineering and

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2502: Megan Cornish (Cont'd)
Freedom Socialist Party and Radical Women

Response to Commentor No. 2502

Environmental Laboratory, and Oak Ridge Reservation were included in the survey. The study used cancer mortality data from Benton, Franklin, and Grant Counties in the survey for the Hanford Site (See Section 3.4.9.3 of Volume 1).

- 2502-5:** DOE notes the commentor's opposition to pollution and waste and support for national health care. As discussed in Chapter 4 of Volume 1 (e.g. sections 4.3.1.1.13, 4.3.2.1.13, 4.3.3.1.13), waste will be generated by all of the alternatives, including the No Action Alternative. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. DOE activities associated with this program would not impact the schedule or available funding for existing cleanup activities at candidate sites for implementation of the nuclear infrastructure alternatives. The purpose of this NI PEIS is to evaluate the environmental impacts of a range of reasonable alternatives to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238 for future NASA missions, and civilian nuclear energy research and development. The DOE mission requirements can currently only be met using nuclear reactor or accelerator technologies.
- 2502-6:** The commentor's position is noted. The racial and Hispanic composition of the potentially affected population surrounding the Hanford Site is discussed in Section K.5.3 of Appendix K (Environmental Justice Analysis). As discussed in Chapter 4 of Volume 1 and Appendix K, implementation of the nuclear infrastructure alternatives would pose no significant radiological or nonradiological risk to minority or low-income populations residing in the potentially affected area.
- 2502-7:** DOE has no hidden agenda for weapons production or use of FFTF for military missions. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. The NI PEIS evaluates a range

Freedom Socialist Party and Radical Women*

Response to Commentor No. 2502

of reasonable alternatives for accomplishing the proposed action, one of which includes use of FFTF. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor: William A. Dautel

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 431.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2506: Tiffany Devoy
Heart of America Northwest

2506-1 — I am with Heart of America Northwest, which I know in the eyes of many of you means whatever I say will be a half-truth. But what I think is very interesting is that you who have come here [Seattle] from the Tri-Cities are right, but Congressman McDermott is wrong. You are right, but the entire Seattle City Council is wrong. You are right, but Brian Baird, Adam Smith, Ron Wyden — they're all wrong. And all the people who have come here tonight to tell you that they are afraid, that they don't want this to happen, that they are worried about what will happen if it is restarted — they're all wrong, and their concerns are nothing, they're based on lies. And I think that's really disgraceful that you come in here to our city and tell us that our concerns are invalid, and that our representatives are wrong. And I very much object to that kind of attitude and to your presence here tonight.

Response to Commentor No. 2506

2506-1: DOE notes the commentor's views and observations including views toward other speakers at the Seattle, Washington public hearing. It is DOE policy to encourage public input on matters of regional, national and international importance as part of its commitment to facilitate a public participation process that is open and unbiased.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

*Commentor: Tiffany Devoy
[for] Carole Woods, Sierra Club*

The oral comments were submitted in written form by the Sierra Club and are addressed in the responses to Commentor No. 262.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2527: Larry Ebersole

2527-1 — . . . everyone is concerned about cancer and preventing disease, and it sounds like tonight there is actually more support for publicly subsidized health care than I realized. And I would like, in sort of a tangent, to make sure that the Department of Nuclear Energy and the people here at this hearing convey to the people in Washington, D.C., at the appropriate level of government — I believe it would be what, Department of Health and Human Services? — that from what we hear tonight, there is really support for some sort of universal health care program that would address all of the relevant disease and their treatments such as cancer. And people haven't mentioned AIDS or major depression or post-trauma or anything like this. But I think, really, you know, definitely, public support for this is a very good idea. There is plenty of funding. Plenty of funding for it, when certain changes are made.

2527-2 — . . . why not find other ways to develop isotopes than restart a reactor? It seems like it's something out of a 1950s horror film, the idea of supporting public health by starting a nuclear reactor.

2527-3 — I wonder how this particular subject interacts with the rest of what the Department of Energy is doing, this stockpile steward program, which is basically modernizing the U.S. nuclear arsenal, preparing for what used to be called strategic defense initiative, the so-called missile defense system — which eventually would be nuclear most likely, because it wouldn't work. And it shouldn't work, because it doesn't have to be built, because there can be nuclear abolition every year. Congresswoman Pelosi, Sonoma, California, introduces an act called the Nuclear Disarmament and Economic Conversion Act. It would do exactly that, calling the president to initiate a treaty for nuclear abolition.

2527-4 — I'm in the "don't restart it" camp.

2527-5 — . . . in the table S-2, "Facilities lacking sufficient neutron production capacity to support the PEIS proposed action without impacting existing missions" — and there's a whole bunch of them listed. Well, one of them happens to be Los Alamos, and another one is Lawrence Livermore. I think the crux here is "Let's not challenge the existing missions"; well, that's the nuclear weapons part of it. So I think that is how these are related. So nuclear disarmament will be helpful.

Response to Commentor No. 2527

2527-1: DOE notes the commentor's interest in national health care, although this issue is beyond the scope of this Nuclear Infrastructure PEIS. The DOE missions addressed in this PEIS include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development.

2527-2: The commentor's opposition to the use of reactors for isotope production is noted. The PEIS addresses a range of reasonable alternatives for the production of isotopes. Among these are the use of existing DOE facilities including operating reactors at INEEL and Oak Ridge and the use of FFTF, currently in standby. Additionally, the PEIS considers two alternatives which would make use of new facilities. One would make use of a to-be-built reactor facility and another (Alternative 3) would make use of two to-be-built accelerators. The PEIS provides information that can be used to make the decision on which of these facilities, if any, are to be used for isotope production.

2527-3: DOE notes the commentor's opposition to nuclear weapons and strategic defense initiative, although these issues are beyond the scope of this Nuclear Infrastructure PEIS. The scope of this Nuclear Infrastructure PEIS is limited to analysis of alternatives to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development. The three missions are civilian nuclear energy missions and are not defense-related.

2527-4: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2527-5: DOE notes the commentor's views on nuclear disarmament. The evaluation of existing missions at facilities, whether they are nuclear weapons related or not, are not within the scope of this NI PEIS.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2539: Kirstin Ellstrom

2539-1 — I'm against the restart of this nuclear reactor.... My decision is that certainly further studies need to be made before we restart this reactor.

Response to Commentor No. 2539

2539-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF. DOE does not believe that further study is needed if Alternative 1 is selected in the Record of Decision. DOE has evaluated all appropriate information within the context of the NEPA process and believes that the decision-maker has sufficient information on which to base their final recommendation.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2550: Rachael Golden

2550-1 — The estimated cost of restarting the FFTF is roughly \$400 million dollars which could alternatively be spent on Hanford cleanup. Also, this is much, much more than it would cost to create an individual separate facility to create medical isotopes unto itself. And that's the cost.

2550-2 — I question whether there's any benefit to restarting FFTF, No. 1. The blue ribbon medical advisory committee stated FFTF is not a viable source of research isotopes and medical isotopes have been proven to be able to be made in the reactors in Tennessee, Idaho, and Canada.

2550-3 — Also, NASA released a statement on May 27th of this year that it no longer has a need for the quantity of plutonium-238 which would be produced by the FFTF, effectively eliminating them as a purchaser of this exceptionally toxic element.

2550-4 — On the other hand, at the DOE scoping hearing last October, Colette Brown stated that Pu-238 from FFTF would not be used for military purposes. However, it was brought to her attention at this hearing its production of FFTF would indeed free up the Pu-238 already stored around the country for military.

Therefore, if we're restarting the FFTF to produce Pu-238 would free up its use for military systems that are designed to destroy life, there is not only zero benefit to restarting FFTF but indeed it would be a detriment to the human race as nuclear war, even if fought from space, as well as increased nuclear waste and increased risk of nuclear accident ...

Response to Commentor No. 2550

2550-1: DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS.

2550-2: DOE assumes that the commentor is referring to the conclusions presented in the "NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000" regarding the suitability of the Fast Flux Test Facility (FFTF) to produce research isotopes in a timely and cost-efficient manner. These conclusions were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of the FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates use of the FFTF when coupled with the other proposed missions. There currently is little room for growth of medical isotope production at either ATR, in Idaho, or HFIR, in Tennessee. At ATR the neptunium 237 targets for plutonium-238 production will compete for space in the reactor. There are potential negative impacts to the private company that leases reactor space for the production of radioisotopes due to being assigned less desirable irradiation space. At HFIR, the ability to expand medical isotope targets into additional reactor locations is limited by the potential impacts that the targets have on the primary experiments in the reactor. Medical isotope targets and neptunium-237 targets are not in competition for the same locations in at HFIR. Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2550: Rachael Golden (Cont'd)

Response to Commentor No. 2550

associated with the facilities' primary missions basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term. The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

- 2550-3:** A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium 238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.
- 2550-4:** Small radioisotope thermoelectric generators (RTGs) using plutonium 238 are used to power electronic systems on some strategic weapons, some of which have become surplus due to strategic arms reductions. Although the exact configuration of these RTGs is classified, the amount of plutonium-238 in each unit is relatively small and the assay of the plutonium-238 is unacceptable (too low) for use in RTGs or radioisotope heater units for NASA spacecraft. Therefore, it is not a viable source for consideration in the NI PEIS.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2512: Roy D. Goodman

2512-1 — Let's do away with industrial, nuclear, chemical, and other man-made toxins which poison our environment and cause cancer, so we don't need medical isotopes.

2512-2 — Let's have speakers only speak once at any of these hearings. If you have people that come to these hearings and want to speak at a second hearing, let them go at the end of people who have waited to speak the first time. I don't know if that's happened tonight, but I know it does happen. In other words, if I spoke last night in Portland, I shouldn't get to speak tonight until everyone who hadn't spoken to you before got to speak. You know who those people are. I don't care which side they're speaking for. Your postcard I got in the mail had a toll-free number on it. I called two weeks ago with some questions about tonight; nobody called me back. A week ago I sent an e-mail; nobody e-mailed me back on my questions about tonight. You mailed out a packet of material, Volume 1, Volume 2, summary — it cost you \$10 in postage, plus I don't know what other costs were involved with that. Why don't you just send a postcard out to everybody first, ask them if they want these things. You'll save some money. You could apply it towards cleaning up Hanford, or pay somebody to respond to my toll-free call and my e-mail.

2512-3 — Hanford, it's in Washington State; I said Hanford, full of nuclear waste; I said Hanford suffers from your delay to honor your cleanup agreement.

2512-4 — It's time to shut down the FFTF.

The additional oral comments were submitted in written form and are addressed in the responses to Commentor No. 277.

Response to Commentor No. 2512

2512-1: DOE notes the commentor's concern regarding cancer causing material generation. As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives (including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

2512-2: DOE strives to ensure that the hearing format used serves to promote open and equal representation by all individuals and groups, regardless of the motivation for attending, at each and every public hearing. One means used by DOE in trying to ensure equal representation at public hearings is by selecting the order of speakers through a random number drawing. As suggested by the commentor, excluding speakers from speaking in the initial comment round at one hearing if they had already done so at a previous hearing would not be practical to enforce and would serve to undermine the representativeness of the body of concerned persons speaking at each hearing. The commentor's concerns for not receiving a response to questions on the Seattle, Washington public hearing are noted. Both the toll-free telephone line and e-mail were being answered during the course of the public comment period. DOE regrets that the commentor's request for information was not responded to and will take appropriate action to avoid such oversights in the future. DOE apologizes for sending a complete set of the Draft NI PEIS materials to the commentor that was not requested. DOE works

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2512: Roy D. Goodman (Cont'd)

Response to Commentor No. 2512

carefully to strike a balance between keeping the public informed about potential impacts from its proposed actions by making published materials available in a timely manner, as required by NEPA and CEQ regulations, and controlling the cost of the NEPA compliance process. Individuals and groups maintained in the NI PEIS mailing list received a postcard accompanied by either the NI PEIS Summary only or the complete document package (Summary and Draft NI PEIS in hardcopy or CD ROM) based on the preferences indicated in the mailing list. DOE will update the NI PEIS mailing list to ensure that the commentor does not automatically receive documents in the future. However, the commentor may of course request a copy of the Final NI PEIS and the Record of Decision, when published.

- 2512-3:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Public meetings were held on this formal milestone change. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities.
- 2512-4:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2547: Jack Griffith
Carpenters and Mill-Race Local 2403

2547-1 — I don't have any member of my family or immediate family who I can say who've have cancer, but I'm fully supportive of medical isotopes.

2547-2 — It's very unfortunate that we have some folks that do not see the value in what we [unions] do. The media's not our best friend. The media has the ability to send out information that isn't always true. The problem is they're not talking to the worker. Talk to me and I'll tell you what my belief is and what my fellow workers' belief is, and that is safety first. We're here to protect you, me, my family, your family and anybody else in need.

Response to Commentor No. 2547

2547-1: DOE notes the commentor's support of medical isotope production.

2547-2: DOE notes the commentor's view on the priority of safety and protection of the environment at Hanford.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2534: Norm Gundle

2534-1 — I want to state for the record that I am opposed to restarting the facility.

2534-2 — I think there's a myriad of reasons not to, including public safety,

2534-3 — I think there's a myriad of reasons not to, including ... the lack of disclosure by the DOE and many other numerous concerns that are not being addressed and weren't addressed during the EIS.

2534-4 — I don't think there's any reason to add to the nuclear waste we have stored at Hanford.

2534-5 — I think we should be focusing our efforts on doing something with that waste [at Hanford], disposing of it in an environmentally safe way and not contributing to that waste.

2534-6 — I really hope that the DOE can listen to our comments and I'm not swayed by the propaganda that I see at the public hearing. I find it kind of exasperating, they feel they need to sell it to us when it's really a comment period; we need to be giving our comments and not being tried to be swayed by glossy magazine-like ads on the walls.

Response to Commentor No. 2534

2534-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2534-2: The commentor's opposition to the restart of FFTF is noted. This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives (including the restart of FFTF) for the proposed action. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

2534-3: This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS. Further, DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives. All references used in preparing the NI PEIS are cited in the reference section of each chapter and appendix. DOE has made these references and other material relevant to review of the NI PEIS and supporting the decisionmaking process available to the public in the designated public reading rooms. DOE made every effort to obtain, analyze, and disclose all required information to make a decision on expanding nuclear infrastructure.

2534-4: Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2534: Norm Gundle (Cont'd)

Response to Commentor No. 2534

addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

- 2534-5:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities. Waste generation and management under Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1. Waste that would be generated under implementation of Alternative 1 would not pose a significant burden to the waste management infrastructure at the Hanford Site.
- 2534-6:** Comment noted. It is DOE policy to encourage public input on matters of regional, national and international importance as part of its commitment to facilitate a public participation process that is open and unbiased. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS DOE carefully considered comments received from the public.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2497: Suzanne Heaston
[for] U.S. Senator Slade Gorton, WA

2497-1 — One in three Americans is touched by cancer. Every hour of every day, a child is diagnosed with cancer. Fortunately, every year our nation's scientists develop new technologies for treating cancer and other diseases. Medical isotopes are used in new leading-edge technologies without the usual debilitating side-effects and at lower cost than traditional treatments. Unfortunately, developments are thwarted and treatments are suppressed because our country lacks the production capability for the variety, quantity, and quality of life-saving isotopes that are necessary to conduct research and treat our patients. Restarting the FFTF is imperative in order to meet our nation's needs for life-saving isotopes.

Dr. Reiner Storr, a founding member of the Fred Hutchinson Cancer Research Center in Seattle, wrote to me about his exciting research. He explained that so-called alpha-emitters are likely to make bone marrow transplantation and other cancer therapy much less toxic, more safe, and effective. However, he lamented that the Department of Energy is unable to offer a constant and affordable supply of these unique isotopes. He reported that his research results are, quote, 'nothing short of spectacular,' unquote. But taking the next step into clinical trials is impossible without the availability of alpha-emitting isotopes. FFTF is uniquely capable of producing high-quality alpha-emitters, which are isotopes for treating disease. These treatments dangle by a thread, and could be cut off at any moment by supply lapses or the whims of a crowd of well-intentioned but misinformed protesters. Meanwhile, lives are being lost.

While accelerators primarily produce isotopes for diagnosing disease, they cannot produce many of the isotopes for treating disease. For example, the isotopes for alleviating excruciating bone pain as a result of cancer can only be produced in a reactor. The draft PEIS confirms the need for, the safety of, and the lack of environmental impacts of restarting the FFTF. The accompanying cost analysis confirms the cost-effectiveness of utilizing the FFTF for the entire suite of identified missions.

The FFTF is our nation's newest, most versatile reactor. It can effectively meet our nation's needs for plutonium-238 for the space program and twenty-first century research and development needs. But most importantly, through its isotope program, the Department of Energy has an opportunity to greatly improve the quality of life for millions of Americans who suffer from cancer, cardiovascular, and other diseases. DOE must recognize and embrace its responsibility to provide the quality and quantity of isotopes needed to diagnose and treat our patients. We must have an adequate domestic production facility.

Response to Commentor No. 2497

2497-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2497: Heaston, Suzanne (Cont'd)

Let's not be held hostage to foreign sources of life-saving isotopes, like we are to oil and gasoline. Each day 1500 people die of cancer. What are we waiting for? Restart FFTF.

2497-2 — However, there are those who are reporting half-truths and lies in an effort to sway public opinion. I will address some of those lies here.

One, restarting the reactor would put Hanford back into plutonium production, producing more liquid waste for high-level nuclear waste tanks. The truth: plutonium-238 is used for space missions, and is not the same as plutonium-239, which is used in nuclear weapons. Pu-238 cannot be used to make bombs.

Also, the proposed new missions will not add a single drop of high-level waste to the tanks at Hanford, nor will it impact the Columbia River. The FFTF waste minimization plan was developed in consultation with the Washington State Department of Ecology and the Oregon Office of Energy.

Another lie: restarting FFTF will delay and take money away from Hanford cleanup. The truth: restarting FFTF will have no impact whatsoever with Hanford cleanup funding. FFTF is funded through a completely different program from the cleanup budget. And as a member of the Appropriations Committee, I am committed to fight for funding in the environmental management program for Hanford cleanup. Make no mistake, however. If DOE decides to shut down the FFTF, decommissioning activity, which will become part of Hanford cleanup, will be prioritized along with all the other more pressing problems of Hanford cleanup. One last lie: restarting the FFTF will have enormous environmental consequences for the Pacific Northwest. The truth: FFTF will produce no high-level waste. In full operation, producing life-saving isotopes for the entire nation, FFTF will produce low-level waste comparable to about four medical and research institutions like the University of Washington. Currently, the State of Oregon sends its low-level waste to the commercial repository at Hanford. It annually sends twenty-two times the waste FFTF would produce. In thirty-five years of operation, FFTF would produce a small amount of spent nuclear fuel, equivalent to .015 percent of our nation's inventory. The benefits of operating the FFTF to produce desperately needed isotopes are obvious.

Response to Commentor No. 2497

2497-2: DOE notes the commentor's views and observations. DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and to providing ample opportunity for public comment on those actions.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2504: Judith Hine

2504-1 — I have discovered the suitable geological facility. It is the black hole into which the information required for this to be a programmatic environmental impact statement has fallen. This is not an environment impact statement.... We don't know to what extent comments here [at the hearing] modified this document.

I think I don't know what frightens me more: the possibility, the magnitude of the possibility of harm to the people of the Northwest should a highly unlikely accident occur — one chance in a large number, but look at the magnitude — or the magnitude of the discrepancy between what this document purports to be and what the Department and the public and the Secretary need to make a rational, honest, open decision about whether FFTF should be closed as planned, as scheduled, or reopened on the basis of — some people say half-truths; I say half-information. The PEIS, at best, from this, is preliminary environmental impact statement.

2504-2 — Possibly [this would be an EIS] with addenda that are not available, possibly with corrections that were made verbally on the fly about the research isotopes not being a factor, it's still in the report, about agricultural use of radioisotopes, the question about the irradiation of food, still in there.

Response to Commentor No. 2504

2504-1: The NI PEIS is adequate and provides sufficient scope and detail on which to make mission decisions relative to the environmental impacts of alternatives. This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS. Further, DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives. This was accomplished through review and evaluation of site-specific information on the environmental conditions prevailing at ORR, INEEL, and Hanford to include a comprehensive analysis of the associated environmental and health risks of each alternative. DOE made every effort to obtain, analyze, and disclose all required information to make a decision on expanding nuclear infrastructure. In preparing the Draft NI PEIS, DOE carefully considered all scoping comments received from the public (see Section 1.4 of Volume 1 and Appendix N). In preparing the Final PEIS, DOE has assessed and considered both oral and written comments received on the Draft PEIS during the public comment period and has responded to these comments in the Final PEIS. Volume 3 of the NI PEIS contains public comments received on the NI PEIS and DOE responses to those comments. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

2504-2: DOE assumes the commentor is referring to the cost and nonproliferation reports when she refers to "addenda." The cost and nonproliferation reports are separate, ancillary documents that were made available to the public since the issuance of the Draft NI PEIS. Although other manufacturers produce medical radioisotopes, DOE remains the key provider for a large number of radioisotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large-enough quantities to make their production financially attractive to private industry. However, supplies of many research isotopes are not readily available from existing domestic or foreign sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed. Under the NI PEIS proposed action and consistent with its mandates under the Atomic Energy Act, DOE would enhance its existing nuclear facility infrastructure to, among other things, more effectively support production of radioisotopes for medical applications and research. DOE's intent is to complement commercial sector capabilities to ensure that a reliable supply of

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2504: Judith Hine (Cont'd)

Response to Commentor No. 2504

isotopes is available in the United States to meet future demand, and to encourage the commercial sector to privatize the production of isotopes that have established applications to a level that would support commercial ventures. The conclusions presented in the "NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000" regarding the suitability of the Fast Flux Test Facility (FFTF) to produce research isotopes in a timely and cost-efficient manner were made in the context of the facility producing research isotopes as its sole mission. DOE agrees that the FFTF's large size and configuration are not particularly well suited for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of the FFTF for the production of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. The availability of radioisotopes for the purposes of agricultural use or food irradiation is not the focus of DOE's proposed action. Although radiation sterilization of food is a possible application for certain industrial radioisotopes, including Cesium-137 and Cobalt-60, DOE does not anticipate a similar need for increased production of radioisotopes used for either of these purposes.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2496: Wenonah Hauter

2496-1 — I think you should have the — in keeping with the spirit of public, you should hold your presentation until the public speaks. Let the public speak first.

Response to Commentor No. 2496

2496-1: The purpose of DOE's presentation at the Portland Oregon, public hearing and at all of the NI PEIS public hearings was to provide an overview of the Draft NI PEIS as a basis for facilitating relevant discussion and public input. Therefore, it is customary to present this background information before the start of the formal comment process.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2498: Ken Kadlec

Representative for U.S. Representatives Jim McDermott, Brian Baird, Earl Blumenauer, Peter A. DeFazio, Darlene Hooley, Adam Smith, David Wu; and for U.S. Senator Ron Wyden

2498-1 — The letter focuses primarily on what is left out of the draft EIS — namely, what we do with the waste ...

2498-2 — . . .the actual true cost of restarting the FFTF, the impact on our nation's nonproliferation policies, and most basically, an assessment of the need and suitability of FFTF for its purported missions. To leave the discussion of these areas to separate reports, delivered after the hearings, makes a sham of the NEPA process. You owe the citizens of this state and our nation greater accountability.

2498-3 — I would like to point out the purpose of the draft EIS is to define the role of the FFTF in research, not commercial production, and sets forth four — originally, instead of three — possible research missions for the start of the FFTF. Your own research advisory committee and NASA have stated that FFTF was not suited to three of these missions. The only remaining is for the “unspecified” missions. This leaves us commenting on a draft EIS for an unspecified mission with an unspecified need, with an unspecified cost, with unspecified environmental impacts. It sounds like a project in search of a mission.

2498-4 — If I heard you correctly tonight, the decision has been made, and that you can make the decision independent of the decision of Secretary Richardson.

2498-5 — Let me leave you with the suggestion that you do have a mission at Hanford: it's called cleanup. That's a specified mission. That's a specified mission, and you've had it for twelve years now. Let's get on with it

2498-6 — ... let's put FFTF to bed.

Response to Commentor No. 2498

2498-1: DOE notes the commentor's concern regarding waste management. Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

2498-2: The costs and nuclear nonproliferation impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such ancillary documents need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed these documents to more than 730 interested parties on August 24 and September 8, 2000, respectively. Both reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided summaries of the Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment in Appendixes P and Q, respectively in the Final NI PEIS. Consistent with its mandates under the Atomic Energy Act, DOE is proposing this enhancement of its nuclear facility infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2498: Ken Kadlec (Cont'd)

Response to Commentor No. 2498

Purpose and need are discussed in Chapter 1 of Volume 1. The NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 and that of the Expert Panel are discussed in Chapter 1 relative to medical and industrial isotope production mission. DOE has taken the Expert Panel and NERAC report recommendations under consideration in developing the range of alternatives, including Alternative 1, Restart FFTF, evaluated in the NI PEIS. These reports were made available to the public at the NI PEIS public information centers and on the Internet at www.nuclear.gov.

2498-3: The only missions being considered by DOE are the three that are analyzed in the NI PEIS, which are the production of isotopes for medical research, and industrial uses; plutonium production for future NASA space exploration missions; and U.S. nuclear research and development needs for civilian application. No "unspecified" missions are being considered. DOE's production and sale of radioisotopes fall into two categories—"commercial" and "research" and both types of isotope production are considered under the proposed actions. Commercial radioisotopes are those that are produced in large, bulk quantities and sold to pharmaceutical companies or distributors, or to equipment or sealed source manufacturers. Examples of commercial radioisotopes produced by DOE include strontium-82 and germanium-68 for medical applications, and iridium-192 and californium-252 for industrial applications. DOE only produces commercial isotopes when there is no U.S. private sector capability or when foreign sources do not have the capacity to meet U.S. needs reliably. In contrast, research radioisotopes are typically produced and sold in small quantities in response to specialty orders from researchers preparing experiments in the field of medicine, with small quantities of these radioisotopes also purchased by industrial researchers. Because small-quantity production of research isotopes is not financially attractive to private-sector producers and is generally not undertaken, DOE attempts to provide all research radioisotopes that are requested, subject to production capability, inventory, and financial constraints. As successful application of a specific research isotope is established, the production and sales of that radioisotope may shift from research to commercial status. In recent years, over 95 percent of DOE's sales of radioisotopes by dollar volume were commercial and 5 percent have been for research. Additional discussion of how DOE's isotope program fits into the overall U.S. and foreign isotope production capabilities was incorporated into Section 1.2.1 of Volume 1. The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2498: Ken Kadlec (Cont'd)

Response to Commentor No. 2498

effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. The May 22, 2000, correspondence from NASA to DOE identifies that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, SRTG development efforts were stopped in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large a RTG be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

2498-4: No final decisions have been made with regard to the alternatives or to the facilities and locations evaluated to fulfill the requirements of the proposed actions. However, in accordance with Council on Environmental Quality regulations (40 CFR 1502.14(e)), DOE has identified its preferred alternative in Volume 1, Section 2.8 of the Final NI PEIS and includes a discussion of DOE's justifications for selecting it. It is the Secretary of Energy who will make the programmatic decisions with respect to the alternatives presented in this NI PEIS to accomplish the DOE missions. Decisions made will be published in the Record of Decision no sooner than 30 days after publication of this NI PEIS. All pertinent information and public input will be provided to the Secretary so that he may make an informed and unbiased decision with respect to the alternatives presented in this NI PEIS.

2498-5: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the progress of the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2498: Ken Kadlec (Cont'd)

Response to Commentor No. 2498

conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy) This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Prior public meetings were held on this formal milestone change.

2498-6: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2521: Hyun Lee

2521-1 — I oppose FFTF restart.

2521-2 — Restart of FFTF will lead to generation of what this draft EIS has referred to as aqueous high-activity waste, which sounds an awful lot like liquid high-level nuclear waste, to me, that will be sent to what's referred to as the evaporator tank feed while awaiting treatment and vitrification for disposal, which looks like a tank in the FMEF, in that schematic on page S-17. So that sounds like this waste is going to be stored in Hanford FMEF until about 2007, when the vit-plants will ostensibly be operable and a new contractor will have been, hopefully, found, I guess. Until then, which would be — this stuff would sit around for, maybe, like close to seven years. This would violate state and federal laws on hazardous waste disposal, which only allows a few months for the stuff to be stored before it has to be disposed of in some permanent way. Again, this is illegal, violating Washington State and federal law.

2521-3 — Just the possibility of FFTF restart has significantly delayed Hanford cleanup. I mention this in the context of the 325 and the 306-E buildings in the 300 Area, which are being kept erect until — for FFTF support. These are two highly contaminated buildings, with a long history of mishaps and radiation releases that date back to the '60s, and possibly the '50s.

2521-4 — Shipping FFTF waste to commercial disposal facilities, which was something that was mentioned at the last two hearings, violates existing U.S. DOE policy, that requires waste to be sent only to NRC-licensed facilities. You can see this in 64 Federal Register 1216. Thus far, only U.S. Ecology has been licensed in that capacity. And disposal of FFTF low-level and mixed waste at U.S. Ecology would violate the compact between the states, which Oregon has a veto in. Furthermore, disposing of FFTF at these type of facilities would just open the door to U.S. DOE becoming one of the biggest PRPs in Superfund history, which would probably ramp up FFTF operation costs quite a bit.

2521-5 — Having spoken to a number of people who have been here [at the hearings], who were planning to come here, they've just voiced a lot of frustration that — not being heard, that their message hasn't been heard by policy-makers.

Response to Commentor No. 2521

2521-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2521-2: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. High-level radioactive waste would not be generated from merely operating FFTF. The use of proposed alternative facilities associated with reprocessing of neptunium-237 targets would have no impact on schedules or available funding for high-level radioactive waste programs at either Hanford or the INEEL sites. The higher activity waste would be treated as a solid form via a stand-alone vitrification system, separate from any tank waste treatment system. The existing Hanford high-level radioactive waste facilities would also not be used, and as analyzed in the PEIS, no existing or planned high-level radioactive waste facilities would be used to treat the wastes resulting from processing the irradiated targets. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

2521-3: The commentor's concerns about delays in Hanford cleanup are noted. The 306-E facility is not contaminated and is being proposed as a location to conduct activities that do not involve radioactive materials. While the 325 Building has a large inventory of radionuclides associated with ongoing activities at the facility, the building is not contaminated in worker accessible areas. Operations at the 325 Building are conducted in accordance with applicable federal and state regulations and appropriate DOE Orders. The 300 Area Revitalization Plan (DOE 1999) provides for continued multi-program R&D operations in the 300 Area, including operation of various laboratories, office facilities, and services. It also provides for consolidation (but not complete elimination) of radiological operations, with support for Hanford Site facility transition and environmental restoration efforts. The plan does not require closure of the 325 and 306 E buildings as long as they

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2521: Hyun Lee (Cont'd)

Response to Commentor No. 2521

are needed for active research projects. Operation of these facilities would not violate any existing agreements between DOE and stakeholders or other legal obligations, nor would it affect ongoing or planned environmental restoration and facility transition activities. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e. Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement.

2521-4: DOE Order 435.1 "Waste Management" gives responsibility to the DOE Field Element Managers to approve exemptions for use of non-DOE facilities for storage, treatment or disposal of DOE radioactive waste based on certain requirements. One of these requirements is that the facility must have the necessary permits, licenses, and approvals for the specific waste. As discussed in DOE's "Commercial Disposal Policy Analysis for Low Level and Mixed Low-Level Wastes" dated March 9, 1999, there are three commercial low-level radioactive waste disposal facilities (i.e., Envirocare of Utah; Barnwell, South Carolina; and US Ecology, Richland, Washington) which are currently operating and licensed to receive low level radioactive waste. Envirocare of Utah also has a permit to receive RCRA hazardous wastes. DOE has and is currently disposing of low level radioactive waste and mixed low-level radioactive waste at Enirocare of Utah and has sent low-level radioactive waste to Barnwell, South Carolina. In June 1995, US Ecology submitted an unsolicited proposal to DOE for the disposal of DOE waste at the US Ecology facility. In November 1995, the State of Washington informed US Ecology and DOE that the State would allow the disposal of DOE waste at the facility subject to certain conditions.

2521-5: DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and to providing ample opportunity for public comment on those actions. In addition to the hearings, DOE provided opportunity to the public to comment on the Draft NI PEIS through the U.S. mail, e-mail, a toll-free fax number, and a toll-free phone number. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

***Commentor: Nick Licata
Seattle City Council***

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 2061.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2535: Richard Locke

2535-1 — I have a particular interest in the FFTF in as much as it's an asset in our battle, I believe, to fight cancer in this country.

Response to Commentor No. 2535

2535-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

**Commentor No. 2508: Fred Miller
Peace Action**

2508-1 — ... they [owner of the fuel] quoted from the [FRR] final environmental impact statement in that matter: "In countries where material control and accounting or physical accounting systems are not sufficiently rigorous, there is a risk of diversion or threat of theft of such materials. In addition, even in countries with effective nuclear test weapons nonproliferation commitments, the presence of unneeded stocks of plutonium could raise security concerns on the part of neighboring countries." I would submit that the United States is in the former category, not the latter, given the huge volume of plutonium that the DOE cannot account for. And I would say that the draft PEIS is incomplete until it does address very definitively the proliferation concerns that we're raising.

2508-2 — The Department of Energy has — and Hanford in particular has a long history of dishonesty, carelessness, neglect. And when you're saying definitively that there is, at most, this or that safety hazard, you are relying upon the estimates from an organization that in the past has lied in their estimates of similar hazards. We have to assume that they are not more honest than they were in the past. We have to assume that they are not more careful than they were in the past. Otherwise, we're going to come up with extravagant claims. And the extravagant claims that they've made in the past have not been fulfilled.

2508-3 — I oppose restart of the Fast Flux Test Facility for production of plutonium-238.

2508-4 — When I gave comments in the scoping process, I suggested that perhaps the biggest inventory of plutonium-238 in the United States is in the nuclear weapons arsenal. A warhead on any of our SLBMs or ICBMs has an RTG, and we have many of those surplus. You have not analyzed what happened to those and to that net stockpile of plutonium, which could possibly meet any NASA needs, no matter whose numbers you choose for many, many years.

Response to Commentor No. 2508

2508-1: The plutonium being considered for production in this NI PEIS is plutonium-238 which is not an isotope of plutonium that is used in nuclear weapons. The production of plutonium-238 does not present a nonproliferation concern. DOE developed a separate Nuclear Infrastructure Nonproliferation Impact Assessment, published in September, 2000, that analyzed the nonproliferation impacts of the actions considered in this PEIS and found that, there are currently no U.S. nonproliferation policies, laws, regulations or international agreements that preclude the use of any of the facilities in the manner described in the Draft NI PEIS. Although this policy analysis is not required under NEPA, DOE believes it to be an essential element in the decision making process for the DOE nuclear infrastructure, and has included a summary of the Nuclear Infrastructure Nonproliferation Impact Assessment in Appendix Q in the Final NI PEIS. It is also available on the DOE NE web site (<http://www.nuclear.gov>).

2508-2: Comment noted.

2508-3: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2508-4: Small radioisotope thermoelectric generators (RTGs) using plutonium-238 are used to power electronic systems on some strategic weapons, some of which have become surplus due to strategic arms reductions. Although the exact configuration of these RTGs is classified, the amount of plutonium-238 in each unit is relatively small and the assay of the plutonium-238 is unacceptable (too low) for use in RTGs or radioisotope heater units for NASA spacecraft. Therefore, it is not a viable source for consideration in the NI PEIS.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor: Jim Montano

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 261.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor: Rick Mounce

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 278.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2541: Paul Myer

2541-1 — I want to question the DOE's assertion that there is a near term and urgent need by NASA for Pu-238....

NASA is planning two Rovers in 2003, but they are solar powered and battery powered and not 238 powered. They don't use RTGs....

Part of the reason they're probably not talking about these things [NASA missions] is that the power systems that they would need have not yet been developed, and if you're talking about missions out there around 2010 or so, there will be advancements, the need for 238 may be very small, if at all. And to start up this reactor now on that kind of a flimsy thing appears to me to be a, as it's been said before, a process in search of a mission.

2541-2 — NASA is very concerned about putting such contaminants on the surface of any planet other than Earth. We seem to be willing to live with it here.

Response to Commentor No. 2541

2541-1: The commentor should note that DOE is providing NASA, plutonium-238 fueled heater units for the rover missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions. A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

2541-2: DOE notes the commentor's view on the effect of NASA's space missions on other planets. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2541: Paul Myer (Cont'd)

Response to Commentor No. 2541

NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2546: Charles Nelson

2546-1 — I'm a firm believer that FFTF can save lives and could possibly save my life some day, if I'm unfortunate enough to come down with cancer, and my son's life which is more important than anything in the world.

And I would hope that the Department of Energy would see that and would restart the FFTF reactor. Of, if not FFTF reactor, whatever is necessary to produce these isotopes that makes it one minute closer to saving my son's life.

Response to Commentor No. 2546

2546-1: DOE notes the commentor's support for Alternative 1, Restart FFTF, or whatever is necessary to produce medical isotopes.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor: Hans Nesse

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 272.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2548: Pennie S. O'Grady

2548-1 — I'm very concerned that the hearings are not being done in a way that is truly no preference. Not knowing a lot of details, I walked in cold, and I saw a preference [for FFTF].

2548-2 — ... the perspective I do come from is an alternative five and I would really like to feel that truly the truth and that, you know, my concerns are going to be equally important.

2548-3 — I have great concern that there's a lot of corporate use of plutonium-238 and that use is for profits for large corporations and big industry in the medical industry and NASA and space technology and Boeing and all of that.

And I would like to have a government of, by and for the people so that the Department of Energy is truly responsive to all of the people and does not weigh the concerns of industry over the concerns of the many citizens, because I live in what is supposed to be a democracy and I'd like to uphold the principles of our democracy.

2548-4 — I am not for anything which risks the ultimate health and well being of our citizens, my children, their children.

I want to ask what's causing the level of cancer and ill health in our population in the first place.... We need to look at solutions to the underlying problems that are presumably addressed by the FFTF and its products, and not use a supposedly low risk technology that has devastating potential consequences should our human infallibility kick in.

Response to Commentor No. 2548

2548-1: DOE has made every effort to make this NI PEIS objective. This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives. This was accomplished through review and evaluation of site-specific information on the environmental conditions prevailing at ORR, INEEL, and Hanford to include a comprehensive analysis of the associated environmental and health risks of each alternative.

2548-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF. DOE appreciates all comments it receives on the NI PEIS and all are given equal consideration.

2548-3: DOE notes commentor's view. DOE policy encourages effective public participation in its decisionmaking process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

2548-4: The commentor's concerns about finding the causes of and addressing the underlying problems associated with cancer are noted. Chapter 4 of Volume 1 and Appendixes H through J discuss radiological exposures to the public that would be expected to result from implementation of the nuclear infrastructure alternatives. While radiation is a known cause of cancer, the analysis in Chapter 4 provides the results of the evaluation of potential health impacts that would be expected to result from a range of reasonable alternatives (Alternative 1 includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The evaluation of both normal operations and accidents took into consideration the potential for human error in determining the risks associated with each of the alternatives. The environmental analysis showed that radiological and nonradiological risks associated with each of these alternatives and with restarting FFTF would be small.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

***Commentor: Marlene Oliver
National Association of Cancer Patients***

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 1700.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2507: Henry Perry
Plymouth Church Peace Action Group

2507-1 — I am against the further use of nuclear weapons or nuclear energy for any reason whatsoever, other than — if we could be convinced that the national security required this, I might change my mind. But I don't see that's the case. I think that, although the statements have been made here [Seattle] that this [FFTF] — the risks are very slight, I think when we're dealing with nuclear weapons, we're playing with fire, and should move away from that process as rapidly as process.

2507-2 — I think we should shut down the Fast Flux Test Facility now.

2507-3 — If we do restart it [FFTF], among other things, we're violating agreements that we've entered into before: the Tri-Party Agreement of 1995, which the state and the environmental agency and the Hanford all signed and agreed to ...

2507-4 — furthermore . . .the nonproliferation treaty. In this, we have said that we will be moving away from the development of nuclear weapons, rather than continuing with this process.

2507-5 — So I strongly oppose any plan to restart the nuclear facility [FFTF] with the cost ... that's involved.

2507-6 — So I strongly oppose any plan to restart the nuclear facility [FFTF] with the ... risk that's involved.

Response to Commentor No. 2507

2507-1: The commentor's positions on nuclear weapons, nuclear energy, and national security are noted. The scope of this Nuclear Infrastructure PEIS is limited to analysis of alternatives to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development. The three missions, described in Section 1.2 of Volume 1, are civilian missions and are unrelated to the national defense. Neither nuclear weapons nor components for nuclear weapons would be produced under the nuclear infrastructure alternatives described in Section 2.5.

2507-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2507-3: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Public meetings were held on this formal milestone change.

2507-4: The actions proposed in the PEIS neither support nor involve weapons material development. The alternatives evaluated in the PEIS support U.S. nonproliferation policy, as confirmed in the Nuclear Infrastructure Nonproliferation Impact Assessment, published in September 2000. Although this policy analysis is not required under NEPA, it is an essential element in the decisionmaking process for the DOE nuclear infrastructure. A summary of the Nuclear Infrastructure Nonproliferation Impact Assessment is included in Appendix Q in the Final NI PEIS. It is also available on the DOE NE website (<http://www.nuclear.gov>).

2507-5: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, on the basis of cost.

2507-6: The commentor's opposition to the restart of FFTF is noted. This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives (including the restart of FFTF)

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

*Commentor No. 2507: Henry Perry (Cont'd)
Plymouth Church Peace Action Group*

Response to Commentor No. 2507

for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2520: Sheila Pfeiffer

2520-1 — I just want you to know that it doesn't make any sense for us to say we do not know where cancer comes from. We know where it comes from. It comes from the environment, it comes from places like this, it comes from the crummy air that we breathe, the horrible water that we drink, and the groundwater that we're ruining right now. ... But we have to recognize that people are dying every day from a cancer that we created. And we can't sit here and act like we don't know where it comes from.

2520-2 — And yet here we go again, and say that we're going to start this thing [FFTF]; it's got these great isotopes and it's going to save lives. Well, it's just not true.

2520-3 — We have to start focusing on our environment. And we have to start finding alternatives to different ways of dealing with energy. We can get energy from the sun, we can get energy from the wind. We can find other ways to do it.

Response to Commentor No. 2520

2520-1: Environmental factors are a contributing factor to the incidence of cancer. Chapter 4 of Volume 1 and Appendixes H through J discuss radiological exposures to the public that would be expected to result from implementation of any of the range of reasonable alternatives analyzed in the NI PEIS. While radiation is a known cause of cancer, Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 which includes restart of FFTF, including normal operations and a spectrum of accidents that included severe accidents. The methodology used to produce these results is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

2520-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2520-3: DOE notes the commentor's interest in alternative energy sources, although issues of research and development of alternative energy sources are beyond the scope of this Nuclear Infrastructure PEIS. The DOE missions to be addressed in this EIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development, can currently only be met using nuclear reactor or accelerator technologies.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

**Commentor No. 2501: Gerald Pollet
Heart of America Northwest**

2501-1 — Twice in the last three years the Department of Energy had plutonium releases at Hanford. Twice in the last three years the people who will be responsible for resuming plutonium processing operations at Hanford lied to emergency responders, public officials, and the public about whether or not there were plutonium releases.

The first incident, in May of 1997, the Department of Energy officials claimed that they took nasal smears from workers exposed to the plume from the explosion at the plutonium finishing plant. And they told the public that there was no plutonium found from the workers, and no plutonium found outside the plant, and that there was no plutonium release whatsoever. Can we trust these people? What happened to their nasal smears? They were never taken, they were lost. What happened to the plutonium? It did leave the plant.

What happened in the wildfire in June of this year? Plutonium released. But you all heard on the radio and TV and read in the paper that the Department of Energy Hanford management repeatedly said no area of contamination burned — they said for days. Then they got it — had to admit that was a lie. They said, "Yes, but there was no radiation released." No radiation released? Bill Richardson was lied to, and he relied on them. "How many times must the plutonium fly before Hanford officials are permanently replaced?" That's what the song's next verse should be. And the answer, my friends, is, Hanford's plutonium is blowing in the wind. Hanford's cancer is blowing in the wind. Now we're talking about resuming plutonium processing, and all its attendant dangers. I don't know who fed Senator Gorton lies and half-truths; it wasn't our side.

2501-2 — The EIS clearly says plutonium-238 targets, quote, would be "cut up into small pieces and leached with nitric acid. Undissolved cladding would be discarded as waste." And it continues, after treatment with tributylphosphate, quote, "the high activity" — "the high activity aqueous waste phase would then be sent to tanks awaiting treatment and vitrification for disposal." What we are talking about — and we have the schematics from DOE's own waste-management documents blown up at the back of the room. What we are talking about is high-level nuclear waste. You can call it something else, but it's the same exact chemical process that was used for processing plutonium-239. What are we going to do with liquid high-activity waste awaiting vitrification? That means that some other wastes in the leaking high-level nuclear waste tanks will not get vitrified. DOE's plan for this vitrification plant, until recently, was 10 percent of the wastes would get turned into glass by the year 2018. We'll all be dead by the time they get around to the most dangerous tanks being vitrified. And they want to add more waste, and they want to tell you that it's not the same. But it's going to await vitrification for disposal, and it's going to this place, wastes that are currently in tanks that will be leaking.

Response to Commentor No. 2501

2501-1: Previous events at other facilities (other than FFTF) are outside the scope of the NI PEIS. The emergency management and response federal laws, regulations, and executive orders that relate to the NI PEIS alternatives are provided in section 5.3 of the NI PEIS. In regards to the Hanford wildfire of 2000, the DOE Richland Operations Office, the State of Washington Department of Health, and U.S. Environmental Protection Agency performed environmental monitoring on and around the Site to assess potential radiological impacts. The wildfire did not cause a release of radioactive materials from any Hanford facilities but did result in resuspension of radioactive materials which were already in the environment. The very low levels of radioactive materials that were resuspended were slightly above natural background levels and required several days of analysis to quantify. Information on this event has been made available to the public and can be accessed at <http://www.Hanford.gov/envmon/indes.html>. This site also provides a link to information on the independent offsite air monitoring that was conducted by the U.S. Environmental Protection Agency. With respect to plutonium processing, no defense-mission processing or weapons material production is being proposed by this NI PEIS. All proposed activities are for civilian purposes.

2501-2: The DOE Manual 435.1. Radioactive Waste Management defines high level radioactive waste as "the highly radioactive waste material resulting from the reprocessing of spent nuclear fuel, including liquid waste produced directly in reprocessing and any solid material derived from such liquid waste that contains fission products in sufficient concentrations; and other highly radioactive material that is determined, consistent with existing law, to require permanent isolation." DOE has prepared an implementation guide to DOE M 435.1 to assist in implementing the requirements contained in that manual. For this particular "requirement," the definition of high-level radioactive waste, the guide is intended to facilitate the classification of indefinite waste as to whether or not they are high-level radioactive waste. It is recognized that the definition of high-level radioactive waste is not precise and is essentially a source-based definition that also alludes to concentrations of a given waste stream. Page II-8 of this guide notes that "For the purpose of managing high-level waste under DOE M 435.1-1 [sic], spent nuclear fuel includes spent driver elements and/or irradiated target elements that contain transuranium elements." This statement was included in the guide because the concentrations of long-lived isotopes are likely to be somewhat high during reprocessing and it also meets the source-based definition. As a result of reviewing this guide and to address the comments raised, DOE is considering whether the waste from processing of irradiated neptunium-237 targets should be classified as high-level radioactive waste and not transuranic waste. As a result,

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2501: Gerald Pollet (Cont'd)
Heart of America Northwest

2501-3 — And you use the calciners and you add the tributylphosphate, and you have an organic phase, and you have the same risk of an explosion that the Department of Energy admitted in the early 1990s for use of the same process in the plutonium finishing plant. And the same chemicals will be involved. And you also have hydroxylamine nitrate which will be involved in the processes, which is the chemical that blew up at the plutonium finishing plant. But you don't have any mention in the environmental impact statement of events that, because they happened, by DOE's own planning guidelines, must be deemed to fall into the "likely to occur" category. But they're never mentioned.

2501-4 — Let me just close, then, by saying the other thing that is shocking is not in this EIS, is the risk of a port fire. What led the City of Seattle to pass its resolution, and the City of Tacoma, what led our brothers and sisters in the ILWU to refuse to offload these casks when it was proposed in the past, was this: shipboard fires burn for up to twenty-four hours at 2,000 degrees Fahrenheit. And that is not analyzed in this EIS.

Response to Commentor No. 2501

the Waste Management sections (i.e., Sections 4.3.1.1.13; 4.3.2.1.13; 4.3.3.1.13; and 4.4.3.1.13) of this NI PEIS have been revised to reflect this different classification from what was assumed in the draft NI PEIS. As discussed in these revised sections, irrespective of how the waste is classified (i.e., transuranic or high-level radioactive waste), the composition and characteristics are the same and the waste management (i.e., treatment and on-site storage) for this NI PEIS would be the same. In addition, even if the waste is managed as high-level radioactive waste it would have no impact on the existing high-level radioactive waste management infrastructure (e.g., high-level waste storage tanks), since the high activity waste from processing of the targets would be initially stored and vitrified within the processing facility (i.e., FMEF, REDC, or FDPF).

2501-3: The plutonium-238 fabrication/processing facilities evaluated in the NI PEIS can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. The accident evaluation specifically accounted for the chemical processes likely to be used and considered a spectrum of accidents including internal events, external events, natural phenomena, and sabotage and terrorist activities. Sections 4.2-4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from implementation of the alternatives, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that the radiological and nonradiological risks associated with each of the alternatives would be small. The solvent extraction process involving the use of tributyl phosphate in hydrocarbon to separate and produce plutonium nitrate solution has been used extensively for years in the United States as well as in Japan, England, and Germany. Under a combination of off-normal conditions, there can be a reaction between nitric acid or nitrates and tributyl phosphate degradation products at higher than normal operating temperatures. Such a reaction could only occur in a heated evaporator or concentrator if there is excess tributyl phosphate impurity or residual in the plutonium nitrate liquid. This scenario will be analyzed as a potential design basis accident in developing the safety authorization basis and associated technical safety requirements for the chemical processing option chosen by DOE.

2501-4: Alternative 1 does postulate that DOE might decide at some point to import mixed oxide fuel from Europe to fuel FFTF. At this time, however DOE has not proposed to import this fuel through any specific port. If DOE ultimately decides to import fuel from Europe, it would perform a separate NEPA analysis to select a port. This review would address all relevant potential impacts of

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2501: Gerald Pollet (Cont'd)
Heart of America Northwest

Response to Commentor No. 2501

overseas and inland water transportation, shipboard fires, package handling, land transportation, as well as safeguards and security associated with the import of SNR-300 mixed oxide fuel through a variety of specific candidate ports on the east and west coasts. It would consider all public comments, including local resolutions, concerning the desirability of bringing mixed oxide fuel into the proposed alternative ports. In the event that DOE decides to enhance its nuclear infrastructure, it would not expose any population to high, unacceptable risks under any alternative. Any transportation activities that would be conducted by DOE would comply with U.S. Nuclear Regulatory Commission and U.S. Department of Transportation regulations. Associated transatlantic shipment would comply with International Atomic Energy Agency requirements. In Section J.6.2, DOE reviewed the potential maximum impacts from the marine transportation of mixed oxide fuel from Europe to a representative military port, Charleston, South Carolina, and overland transportation to Hanford. Also in that section, a bounding analysis demonstrates that the maximum potential radiological risks to the surrounding public from mixed oxide fuel shipments would be extremely small (e.g., less than 1 chance in a trillion for a latent cancer fatality per shipment from severe accidents at docks and in channels and less than 1 chance in 50 billion for a latent cancer fatality per shipment from overland highway accidents).

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

[for] U.S. Representatives Adam Smith and Brian Baird*

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 158.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2533: Dorli Rainey

2533-1 — I understand that the Department of Energy has updated plans to restart the Fast Flux test facility reactor. This facility is already leaking towards the Columbia River and has not only not been cleaned up, but it had to take a back seat to funding of the restart studies and maintaining the restart capabilities.

It is time that citizens start to question the administration's commitment to cleanup of the high level nuclear waste. The new plan would only add to the nuclear waste stream at the most contaminated nuclear site in the Western world. Already, the FFTF has diverted much needed cleanup funds to keep the reactor on the standby mode pending an approved mission.

The time has come to ... seriously begin the cleanup of the existing nuclear waste now present at Hanford.

2533-2 — The time has come to permanently shut down the FFTF reactor.

Response to Commentor No. 2533

2533-1: Restarting FFTF is one of the six alternatives described in Section 2.5 of Volume 1. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2 of Appendix N, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected. As identified in Section 4.3.1.1.13 of Volume 1, restarting FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations. High-level radioactive waste would not be generated from merely operating FFTF. It is DOE's policy that all wastes be managed (i.e., treatment, storage and disposal) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e. Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement.

2533-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2530: Eliza Reed

2530-1 — Hanford — I recall the director of waste disposal, who quit Hanford, said, "I will refuse to work for an organization that is this unsafe." And in the newspaper — what, three months ago? One of the people who was the head of — a high official; I can't remember his name. He said that there was so much danger in some of the nuclear waste, that he was — a quote in the newspaper — he was amazed people weren't freaking out, that everybody wasn't freaking out. The Columbia River happens to be one of the most radioactive rivers on the planet. Salmon are getting three eyes. It's very dangerous.

2530-2 — I just want to implore the people that are the elite, the power elite that have the money, that think that they're thinking in this linear, scientific method, the progress way, to really be honest with yourself. Look in your heart. Really study the fallibility, and look at what the — how you might be rationalizing to yourself your financial gains.

2530-3 — I have complete compassion for anybody who has cancer, and I want them to have whatever means it takes for them to cure their cancer. But I do not want that means to be a cause of trillions of other people getting cancer — of many people getting cancer.

2530-4 — Stop this Fast Flux.

Response to Commentor No. 2530

2530-1: The Hanford Officials referenced above were quoted in a local (Tri Cities, Washington) newspaper as departing because of organizational and project management reasons. Workers at the Hanford Site are free to, and in fact encouraged to, disclose safety hazards associated with DOE activities. Workers are protected against reprisals by legislation applicable to the U.S. Departments of Energy and Labor. No food or water restrictions are in place outside the Hanford Reservation as a result of Hanford activities. Environmental parameters e.g. air, soil, surface water, groundwater, vegetation, animals, fish, etc.) in and around the Hanford Site are monitored on a periodic basis. Results of the measurements are available to the public in annual environmental monitoring reports.

2530-2: DOE notes the commentor's views and remarks.

2530-3: This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

2530-4: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

**Commentor No. 2529: Nancy Rising
Peace Action of Washington**

2529-1 — I'm the Chairperson of Peace Action of Washington, representing almost 18,000 households in Western and Eastern Washington. Peace Action's members have been concerned about Hanford for many years. We want the DOE to stick to first things first. We want the clean up of Hanford to become the primary objective of the DOE, without distractions such as a return to production of nuclear waste for whatever purpose. Until you have shown that you can clean out all leaking or "watch list" tanks, and stabilize all high-level waste in a timely and cost-effective fashion, that is your job. Until you have identified all significant bodies of pollution on the site and downstream, and taken appropriate measures to keep them out of the Columbia and out of our environment, that is your job. Until you've thoroughly decontaminated usable land and facilities, so that they can again make positive contributions to the region and the nation, that is your job. Until Hanford workers are free to speak out when they see safety hazards, incompetence or corruption, without fear of reprisal, that is your job. Other priorities can wait.

2529-2 — The Department of Energy's draft NI PEIS is neither complete nor objective. Whether deliberate or inadvertent, the cumulative effect of numerous omissions to the PEIS are unprofessional and bias the PEIS in favor of a de-facto "preferred alternative," the restart of the Fast Flux Reactor. Many have already been brought to your attention, especially the NASA letter should have been included in the discussion of the need for Pu-238. An omission that hasn't been mentioned since it was pointed out by Peace Action members during the scoping process is the military Pu-238 stockpile. Since the START treaty, the number of deployed nuclear warheads has been drastically reduced. Further reductions are expected. The Pu-238 used to power the electronics on these warheads can now be used to power spacecraft, if necessary. The omission of any discussion of this resource tends to bias the PEIS further in favor of restarting FFTF.

2529-3 — Although we talk a lot about science here, what really comes out is emotions and people's concerns. And I would like us to think a little about that, because I have been to a lot of these hearings, as have many of these other people. I am very, very willing to grant sincerity of belief to the people that think differently than I. But I would certainly hope that sincerity of belief could be granted to me without having people say, "You people over here want us to have cancer and don't want radioactive isotopes to be available to treat cancer." Now, I don't know where they got that idea, but if that seed is being planted over east of the mountains, I think that's a travesty and a tragedy. Because it certainly is totally untrue. We all care about each other.

2529-4 — I just want to say we hear, mostly east of the mountains, about how we don't care about jobs, and this is about jobs. I would like to point out that in the draft, in the EIS on page 4-39, and then in another place, we have the possibility of increasing, with this restart of the fast flux reactor, from 56 to a hundred jobs, total.

Response to Commentor No. 2529

2529-1: DOE notes the commentor's concerns regarding priority of the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e. Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission. Workers at the Hanford Site are free to, and in fact encouraged to, disclose safety hazards associated with DOE activities. Workers are protected against reprisals by legislation applicable to the U.S. Departments of Energy and Labor.

2529-2: This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS. Further, DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives. This was accomplished through review and evaluation of site-specific information on the environmental conditions prevailing at ORR, INEEL, and Hanford to include a comprehensive analysis of the associated environmental and health risks of each alternative. DOE made every effort to obtain, analyze, and disclose all required information to make a decision on expanding nuclear infrastructure. DOE assumes that the commentor's reference to the "NASA letter" refers to the May 22, 2000 correspondence from NASA Headquarters to the DOE Office of Space and Defense Power Systems. This letter is in fact cited in Volume 1, Section 1.2.2 of the Draft and Final NI PEIS (Volume 1) with regard to the discussion of plutonium-238 needs for future space missions. This letter identifies that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2529: Nancy Rising (Cont'd)
Peace Action of Washington

Response to Commentor No. 2529

missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires one-third less plutonium-238 as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000, letter to DOE that large RTGs be maintained as backup. Section 1.2.2 was revised to clarify plutonium-238 mission needs. Both NASA letters have been included in Appendix R of this Final NI PEIS. As further suggested by the commentor, the acquisition and use of surplus defense-related plutonium-238 was not considered and is outside the scope of the non-defense missions considered in this NI PEIS. Specifically, the commentor is correct that small RTGs using plutonium-238 are used to power electronic systems on some strategic weapons, some of which have become surplus due to strategic arms reductions. Although the exact configuration of these RTGs is classified, the amount of plutonium-238 in each unit is relatively small and the assay of the plutonium-238 is much lower than that needed for use in NASA spacecraft.

2529-3: DOE notes the commentor's views and remarks.

2529-4: DOE is not considering restarting FFTF for the purpose of creating jobs, although socioeconomic impacts (e.g., number of new jobs created) are addressed in Sections 4.3.1.1.8, 4.3.2.1.8, and 4.3.3.1.8 for Alternative 1, Restart FFTF, Options 1 and 4, 2 and 5, and 3 and 6, respectively. The Record of Decision for the PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2536: Jennifer Rubinstein

2536-1 — I oppose restarting the FFTF reactor.

2536-2 — I believe that adding more waste to the Hanford waste tanks is dangerous and it cannot be justified by the development of isotopes for civilian purposes.

2536-3 — So far as the PEIS is concerned, I regret the omission of crucial facts and data. For example, the Washington State Medical Association says there is no need for the FFTF reactor for medical isotopes. A similar finding emerged from the DOE's own subcommittee.

2536-4 — NASA is on record as saying they do not need plutonium-238 for a space mission and yet this purported need has been used by DOE to justify restarting the FFTF.

2536-5 — I also find unconvincing DOE's assertions that money will not be diverted from the Hanford clean-up.

2536-6 — . . .my husband worked for ten years at Hanford and died of cancer in 1993 at age 57. And while I don't know for a fact that the situation at Hanford caused his death, it certainly is a possibility that it led to his cancer and so I do find somewhat upsetting the linkage of the FFTF startup with the war on cancer without considering how these nuclear products contribute to the etiology of cancer itself.

Response to Commentor No. 2536

2536-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2536-2: DOE notes the commentor's concern regarding waste generation. High level radioactive waste would not be generated from the processing of targets for medical isotope production. Section 4.3.1.1.13 of the NI PEIS provides information on the waste generated from medical isotope production at RPL/306-E.

2536-3: DOE assumes that the commentor is referring to the conclusions presented in the "NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000" regarding the suitability of the Fast Flux Test Facility (FFTF) to produce research isotopes in a timely and cost-efficient manner. These conclusions were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of the FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates use of the FFTF when coupled with the other proposed missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without disturbing the existing missions of these facilities.

2536-4: DOE assumes that the commentor is referring to the May 22, 2000, letter from NASA Headquarters to the DOE Office of Space and Defense Power Systems. This correspondence identifies that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2536: Jennifer Rubinstein (Cont'd)

Response to Commentor No. 2536

22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

2536-5: The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2 of Appendix N, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2536-6: This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives (including the restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small. Worker safety (radiological protection) is a key element of DOE's Radiological Health and Safety Policy (DOE P 441.1, April 26 1996). This policy states in part that Department of Energy facilities must "conduct radiological operations in a manner that controls the spread of radioactive materials and reduces exposure to the workforce and the general public and that utilizes a process that seeks exposure levels as low as reasonably achievable." Each Department of Energy site, including Hanford, is required to implement a radiological control program with the intent to meet this policy goal. Based on the assessment of worker health impacts for the range of reasonable alternatives and options that make use of Hanford facilities, the most likely impact of the use of these facilities is no increase in cancer fatalities among the facility workers. For example in Alternative 1 option 1, all of the activities (target irradiation and processing) occur at Hanford facilities. As shown in Sections 4.3.1.1.9 and 4.3.2.1.9, the expected consequences are less than one additional fatal cancer among the workforce; that is, no additional fatal cancers are expected.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2505: George Ruge

2505-1 — I strongly urge the Department of Energy to restart the FFTF, to support the three missions described in the nuclear infrastructure PEIS, because it is the best technical and the lowest-cost option for meeting the identified important needs.

2505-2 — In fact, contrary to the statements made by Senator Wyden and others in a letter from NASA to DOE dated May 22nd, 2000, it was affirmed that the NASA deep-space systems programs would transition from small isotope, radioisotope thermoelectric generators, to the more efficient Sterling radioisotope power systems. This system also uses plutonium-238 as its power source, a fact which Senator Wyden neglected to mention in his letter either due to being misinformed, ignorance on his part and/or his staff, or outright deception. In any event, this letter, which contains numerous misstatements, is a disservice to the citizens of the Pacific Northwest. I urge DOE to consider all the available information related to the nuclear infrastructure PEIS, without political bias or undue consideration of anti-nuclear rhetoric.

2505-3 — There are significant technical issues and uncertainties associated with plutonium-238 production using either the new accelerator or the new reactor alternatives, as described in the nuclear infrastructure PEIS.

For example, it is unlikely that they will have — it is likely that they will have difficulty producing material at the purity level required by NASA. While these issues might eventually be resolved, their solution is likely to require significant time and funding.

2505-4 — There is a comment that I would like to make specific to the PEIS: the document needs to be updated to reflect NASA's recent change to the Sterling generator, which still requires plutonium-238.

Response to Commentor No. 2505

2505-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

2505-2: DOE notes the commentor's remarks regarding the May 22, 2000 correspondence from NASA Headquarters to the DOE Office of Space and Defense Power Systems. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000, letter to DOE that large RTGs (which require relatively larger quantities of plutonium-238) be maintained as backup. Section 1.2.2 of Volume 1 was revised to clarify plutonium-238 mission needs. Also, as referenced by the commentor, the consideration and selection of facilities and site locations for accomplishing expanded civilian nuclear energy research and development and isotope production missions is not a political decision and will not be biased. DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives. DOE made every effort to obtain, analyze, and disclose all required information to make a decision on expanding nuclear infrastructure. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

2505-3: Because of the unique attributes associated with each of the irradiation facility alternatives, the purity of the plutonium-238 produced will differ. In irradiating neptunium-237 target material to produce plutonium-238, other plutonium isotopes are also produced as impurities within the target material. These include plutonium-236 and plutonium-239. Of these impurities, plutonium-236 is important because daughter products resulting from radioactive decay of the plutonium-236 give off high-energy gamma rays which are difficult to shield. The plutonium-236 level present at the end of irradiation can be reduced by allowing it to decay over a period of time prior to processing or prior to use in fabricating heat sources. Plutonium-238 can also be blended with existing plutonium-238 stock that has less than 1 part per million plutonium-236 to lower the plutonium-236 concentration. The combination of plutonium-236 decay with blending as necessary would result in a plutonium-238 product that would meet NASA's needs, provided the plutonium-236 level is relatively low at the end of irradiation. The alternative selected to produce plutonium-238 will be required to ensure this impurity requirement is met. As detailed planning for a selected alternative progresses, this could result in the need for target design or facility modifications. The Record of Decision will be based on a number of factors including environmental impacts, costs, nonproliferation issues, schedules, technical assurance, public input, policy, and program objectives.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2505: George Ruge (Cont'd)

Response to Commentor No. 2505

2505-4: A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2540: Agnes Schmoe

2540-1 — We've not yet cleaned up the mess that we've created over the last 55 or more years replacing the Columbia River. If the highest priority of the U.S. Department of Energy was cleanup, I believe it would have already been done.

2540-2 — There are other ways to fight cancer that doesn't create a lot more cancer-causing materials.

2540-3 — We, the USA, said we would destroy our huge stock of nuclear weapons. So far this has not been happening. The Trident subs, for example, have bombs equaling eight Hiroshima bombs. Some are to be mothballed but others upgraded four times. These are not weapons. They are destructive to ourselves as to any other person in the world as well as animals and everything else on the planet. If we had only two it would be too many. I don't know how many we have but it's a huge number.

2540-4 — I do not believe the FFTF should be restarted.

2540-5 — Until we have something that will be "nuke off" and destroy the nuclear waste, I believe we have absolutely no business in creating any more.

Response to Commentor No. 2540

2540-1: Restoration of the Hanford Site and waste management activities are the primary missions at Hanford. Although beyond the scope of this NI PEIS ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e. Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

2540-2: DOE notes the commentor's concern regarding cancer-causing materials generation. As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. This PEIS has provided an estimate of the incremental potential human health impacts associated with a reasonable range of alternatives for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Sections 4.3 through 4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from implementation of any of the analyzed alternatives (Alternative 1 includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2540: Agnes Schmoe (Cont'd)

Response to Commentor No. 2540

nonradiological risks associated with each of the alternatives and with restarting FFTF would be small.

2540-3: DOE notes the commentor's interest in reducing the arsenal of nuclear weapons, although issues of nuclear weapons production, dismantlement of weapons, and elimination of weapons systems are beyond the scope of this Nuclear Infrastructure PEIS. The DOE missions addressed in this EIS are civilian nuclear energy missions and are not defense-related.

2540-4: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

2540-5: DOE notes the commentor's concern regarding waste generation and treatment. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2510: Peggy Scott

2510-1 — I feel the area [Hanford] should be cleaned up.

2510-2 — I also feel that medical isotopes is important....

I only needed to look at one cancer education source to come to grips with how staggering the health impacts will be to our future and our children's future. Each and every one of us has a one in three chance of being diagnosed with cancer during our lifetime. In the year 2000 alone, over one million people in the U.S. will be diagnosed with cancer. With the treatments we have today, their overall chance of survival is only a little more than fifty-fifty. Every person in this room will be heartbreakingly aware of the painful truth of these statistics at some time.

But FFTF can change this story for many....this story will be a tragedy for many if FFTF does not produce these isotopes.

Response to Commentor No. 2510

2510-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

2510-2: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2503: Stan Scott

2503-1 — I would like to rebut some of the inflammatory rhetoric offered by anti-nuclear organizations such as Heart of America Northwest, Columbia River-Keeper, and Physicians for Social Responsibility.... The anti-nuclear groups love this report [NERAC] because they can pull little sound bites out of it and have you believe that the whole report backs the fact that the FFTF isn't a viable source. Well, the report says that the FFTF is not a viable source of research radioisotopes. Now, of course, this is taken out of context.... In reality, if the FFTF and associated PNNL facilities are operated to produce large quantities of isotopes, the production of research quantities of isotopes will be done at almost no cost, and essentially have a free ride with the other missions performed at the FFTF....

A couple of other comments I've read in some of the propaganda I've seen: "Supplies of medical isotopes are readily available from Canada and non-DOE sources in the U.S." Yes, it is true that certain isotopes are readily available, but most are not.... When talking about the large-scale production of isotopes, Heart of America Northwest says, "Commercial suppliers and hospitals with cyclotrons can produce these and meet the projected need." This might make you think that the commercial or private sector is producing lots of isotopes. This statement is another half-truth. The fact is that the only non-DOE reactor in the U.S. that is currently producing medical isotopes is a small 10-megawatt reactor at the University of Missouri. The rest of the commercial isotope production actually occurs at DOE reactors. The FFTF operated, it would be the key source for these commercial suppliers.

Response to Commentor No. 2503

2503-1: DOE notes the commentor's views and observations regarding the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 and on the production and availability of research and medical isotopes.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

**Commentor No. 2532: Don Segna
Nuclear Medicine Research Council**

2532-1 — Also, I've heard that — several times, that we got to buy the Pu-238 from the Russians. Now, to me, that's us taxpayers paying for nuclear technology in foreign countries. And also we ought to buy from the Canadians. And there was one case where Dr. Darrell Fisher couldn't get his iso- — he had to go to Peru. They've got reactors in Peru. We then paid for a little bit of nuclear technology in a foreign country. And we need the people like the watchdogs that we have here — we need them in the foreign countries, and they ain't there yet. When you do get them there, then we ought to be buying from the Russians and, you know, wherever the cheapest is. But right now, that is not the case. And I think you really need to take this back to your people to understand that we should not buy nuclear technology and keep their infrastructure going and let ours completely die, and then they can go off and do what they want with bombs.

2532-2 — What are we telling the rest of the world? We're producing weapons-grade — excuse me; by definition, it's not weapons-grade material. But every watchdog group, when they looked at FFTF producing it, said it was weapons-grade. We are now telling the rest of the world "You can produce tritium in your civilian reactors." And I think the watchdog groups have let this country down because of things like that.

Response to Commentor No. 2532

2532-1: DOE notes the commentor's opposition to buying foreign nuclear materials that are produced under conditions different than in the U.S., although the issue of foreign nuclear program safety is beyond the scope of this Nuclear Infrastructure PEIS. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted within the next several years. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost. DOE could purchase plutonium-238 from Russia; however, information is limited concerning nuclear safety and domestic safeguards of foreign plutonium-238 production facilities. Therefore, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

2532-2: DOE notes the commentor's opposition to producing tritium in a civilian reactor, although this issue is beyond the scope of this Nuclear Infrastructure PEIS. The scope of this Nuclear Infrastructure PEIS is limited to analysis of alternatives to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development. The three missions are civilian nuclear energy missions and are not defense-related.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2515: Valerie Shubert

2515-1 — I've heard people talking about isotopes all night long, and I have hardly heard any isotopes actually mentioned. And I just — I wish I'd brought my periodic table, because there actually is a table of them in here, in the — in the NERAC report. And I would like to know more about what specific isotopes are being needed, and how much of them are needed, and whether they can or can't be provided by other sources. And I just don't feel that's been adequately addressed.

Response to Commentor No. 2515

2515-1: For the purposes of analyses in the NI PEIS, a representative set of isotopes was selected on the basis of the recommendations of the Expert Panel, medical market forecasts, reviews of medical literature, and more than 100 types of ongoing clinical trials that use radioisotopes for the treatment of cancer and other diseases. These isotopes are listed in Table 1-1 of Volume 1, along with a brief description of their medical and or industrial applications. Unlike Table C-1 of Volume 2, which lists representative isotopes that could be produced using FFTF, the isotopes listed in Table 1-1 include both reactor- and accelerator- produced isotopes. The absence of any specific isotope from the Table 1-1 should not be interpreted to mean that it would not be considered for production under the proposed action. Rather, these isotopes are a representative sample of possible isotopes which could be produced, and DOE expects that the actual isotopes and specific amounts produced as a result of the proposed action would vary from year to year in response to the focus of clinical research and the specific market needs occurring at that time. The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2524: Dane Spencer

2524-1 — I do not advocate the restart of the flux reactor.

2524-2 — I think personally I might be more open to having you restart the reactor, if first you did what you said you were going to do in the first place, which was to cleanup the Hanford Nuclear Reservation. Now, you can't — you can't do both at the same time. It directs time, energy, and money away from the priority, which is to cleanup the nuclear reservation.... I had the harebrained idea of stopping in at the Hanford Reservation, because I'd never been there....And that happened to be the week when the wildfires had gone over Area 300, which is right where we were. And then the next day I read in the paper how the plutonium had been released into the air. So me and my wife had been exposed to your plutonium. And so I'm wondering if you will treat me and my wife when you use these isotopes, when you start this new reactor.... We want to know the truth. We've been lied to in the past. We don't believe you.

2524-3 — About 1993 we were talking about starting the flux reactor to produce tritium. No, we're not talking about that now, but I'm not sure why. Why has that all of a sudden gone away as an issue? Has it just kind of gone under the rug, and we're not going to talk about that? Is this an issue that's been classified, and we're not going to know for sure? We'll find out.

2524-4 — Shut down the FFTF.

Response to Commentor No. 2524

2524-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.

2524-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. No radioactive materials were "released" in the Hanford Wildfires of 2000. The DOE Richland Operations Office, the State of Washington Department of Health, and U.S. Environmental Protection Agency performed environmental monitoring on and around the Site to assess potential radiological impacts. The wildfire did not cause a release of radioactive materials from any Hanford facilities but did result in resuspension of radioactive materials which were already in the environment. The very low levels of radioactive materials that were resuspended were slightly above natural background levels and required several days of analysis to quantify. Information on this event has been made available to the public and can be accessed at <http://www.Hanford.gov/envmon/indes.html>. This site also provides a link to information on the independent offsite air monitoring that was conducted by the U.S. Environmental Protection Agency.

2524-3: DOE has no hidden agenda for weapons production or use of FFTF for classified missions. The only missions being considered are those analyzed in the NI PEIS, which are the production of isotopes for medical research, and industrial uses; plutonium production for future NASA space exploration missions; and U.S. nuclear research and development needs for civilian application. DOE addressed tritium production in the "Final Programmatic Environmental Impact Statement for Tritium Supply and Recycling" (DOE/EIS-0161) and subsequent Record of Decision (60 FR 63878). On December 22, 1998, the Secretary of Energy announced his selection of the commercial light water reactor as the primary tritium supply and that an accelerator would be developed but not constructed. In addition, DOE decided that FFTF would have no role in tritium supply plans.

2524-4: See response to comment 2524-1.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2509: Margaret T. Swartzman

2509-1 — ... we have an existing problem at Hanford that the public has high priority, first priority to have addressed. That is the existing nuclear material that we know is leaking and is a problem. We want to address that. And there, connected with that, is the concern of the public that monies that have been associated with the FFTF have drained from that fund of cleanup. Now, I don't know whether that is accurate or not. But my concern and my voice is to make sure that you make sure. You are our protector. And I want to make sure that you are examining that. If you're — if you're holding FFTF on line and that money is taken from cleanup, then I think you're doing the citizens of the state a disservice, because that's the purpose that we voted for that money. You know, we designated that money for cleanup. And that is why organizations like Heart of America appeal to us, because they — whether they have information that is correct or not, we feel at least they are examining what is going on and creating the opportunity for these dialogues.

Response to Commentor No. 2509

2509-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2517: Tim Takaro
Washington Physicians for Social Responsibility

2517-1 — Tragically, about 1500 people in the United States will die of cancer today and tomorrow and for the foreseeable future. Unfortunately, FFTF cannot save them. To suggest such is manipulative, and it plays to the fears that we all have of cancer, since each of us has likely been affected by cancer, either in ourselves or in our loved ones.

2517-2 — The National Academy of Science Institute of Medicine report on the nation's isotope needs in 1995 specifically recommended against using existing reactors because they were not designed for this use.

2517-3 — The PEIS we are discussing tonight has an Alternative 4, a so-called new reactor, which is also a straw man. It doesn't take a nuclear physicist to know that a reactor designed forty years after the FFTF, specifically for the production of medical isotopes, would perform better than the FFTF for that mission. The National Academy of Sciences settled that question five years ago.

Response to Commentor No. 2517

2517-1: DOE notes the commentor's view.

2517-2: The FFTF started operation in 1982. Although it was originally designed and operated as a science test bed for U.S. liquid metal fast reactor programs, it also produced a wide variety of medical isotopes. In addition HFIR, ATR, and other foreign and domestic reactors, not designed for medical isotope production, also produce a very wide variety of medical isotopes.

2517-3: The commentor's preference for Alternative 4, Construct New Reactor, over Alternative 1, Restart FFTF, is noted. FFTF and a new research reactor are two of the six alternatives, including no action, that were analyzed in detail in this PEIS. Each alternative offers specific technical, environmental, economic, and nonproliferation advantages and disadvantages, which will be considered by DOE in its decisionmaking process. The National Academy of Sciences has not determined that a new research reactor would perform better than FFTF for the missions described in this PEIS.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2538: Tom Tucker

2538-1 — I'm here to speak in favor of restarting the Hanford Fast Flux Test Facility.

2538-2 — I fear that opponents have an unscientific and emotional fear of waste that is left over from World War II and bomb production during the '50s and '60s, that this is contaminating their view of what we should be doing today.

2538-3 — Too often, unscientific people are victimized by propaganda into believing that a fuel rod is nothing but waste and toxic and cannot be got rid of, when in fact it can in fact — and should be — reprocessed. Irradiated fuel rods contain waste products and useful products, meaning isotopes, and an abundance of fuel that could be turned into new reactor fuel.... I will say, however, that having people closely involved with the reprocessing of fuel rods is probably unnecessary. That is 1970's technology again. I see no reason that small fully automated, hermetically sealed modules can and should be used to reprocess radioactive fuels. These would be sealed, negative pressure, humans should be kept at a great distance using virtual reality, etc. to process the waste. This is can and should be done and I don't see the DOE doing this and I think this is my only criticism.

2538-4 — Regarding tank leaks. Who is really to blame? I worked for a company back in the 70s that asked Congress, our congressional representative, please let us build double walled tanks to stop the leaking, to replace those old single walled iron tanks. And you know what Congress said? We can't afford it. ... We should make the right decision now, put in the double walled tanks, reprocessed fuel, etc.

Response to Commentor No. 2538

2538-1: DOE notes the commentor's support of Alternative 1, Restart FFTF.

2538-2: DOE notes the commentor's views concerning the perception of waste from weapons production. The generation of wastes from the proposed action, which are small in comparison to the candidate sites' current generation rates, are discussed for each alternative in Chapter 4 of Volume 1. The additional waste generated would only have a small impact on the management of wastes at the candidate sites.

2538-3: The commentor's support of reprocessing spent nuclear fuel rods and automated technology for this reprocessing is noted. Reprocessing of spent nuclear fuel is not considered nor is it part of any actions or missions considered in this EIS.

2538-4: Hanford tank waste issues are not within the scope of this PEIS, as none of the alternatives considered would add to these waste volumes. However, underground waste tanks at Hanford built from the 1970s on are double-contained with leak detection and pumping capability. No double shell tank at Hanford has leaked. Hanford is in the last stages of transferring the pumpable portion of liquids from single shell tanks to double shell tanks.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

**Commentor No. 2525: Amber Waldref
Heart of America Northwest**

2525-1 — And the first one [issues not addressed in PEIS] is the non-proliferation issues, and it [the Summary] says that a separate nuclear infrastructure non-proliferation impacts assessment report will be completed in the summer of 2000, to also address non-proliferation issues. Well, unfortunately, this is not available to me yet. And I'm very curious about this document and what it will say, because according to U.S. non-proliferation policy, the U.S. strongly discourages the use of highly enriched uranium fuel in civilian, research, and test reactors. And in the event that a decision is made to restart FFTF, the Office of Non-Proliferation and National Security would undertake a study to consider the technical feasibility of low-enriched uranium fuel, but if that doesn't work, DOE would procure highly enriched uranium fuel. And I can't imagine how we could restart FFTF with this fuel, using this fuel, if it's strongly discouraged under U.S. non-proliferation policy.

2525-2 — The PEIS was to look at the transition of FFTF stewardship after it is deactivated, and the appropriate transition information was to be included. And a comment on this: in the cost report which was released Friday, DOE added the cost of deactivation of FFTF to each alternative, you know, of the five alternatives, except the restart of FFTF. So it's — to me, it's kind of skewed, because it makes it look like FFTF is the most economically feasible option. But yet, the additional cost of shutting it down is not included in that total cost. So it's unclear to me how this could be left out if we do intend someday to deactivate FFTF.

2525-3 — . . . restarting of FFTF and budget constraints were to be included [in the PEIS]. DOE made a commitment that implementation of the record of decision will not divert budgeted funds designated for Hanford cleanup, and that they're also supposed to include information on the Tri-Party Agreement. And I just wanted to make a comment on — some people were speaking about the Tri-Party Agreement earlier. And shutdown of FFTF was included after the initial Tri-Party Agreement. It's part of the Tri-Party Agreement. And in 1995, cleanup milestones were added, that if FFTF was to be deactivated and decommissioned — and the U.S. Department of Energy promised to shut down FFTF then, basically, and use the money saved every year on cleanup. And that just seems like good fiscal policy, to me.

Now the U.S. Department of Energy admits that its current budget for the next six years is too low to meet cleanup deadlines and commitments. So you know, I would advocate that we should use the money that we were going to use, that we're using right now for keeping FFTF on hot standby or for restarting it, for — instead, for cleanup.

2525-4 — I'm not convinced that this PEIS adequately ... demonstrates the need to restart FFTF for the proposed plutonium-238 or medical isotope production missions.

2525-5 — Shut it [FFTF] down.

Response to Commentor No. 2525

2525-1: DOE notes the nonproliferation concern expressed in the comment, and can assure that its proposed action in the PEIS supports U.S. nonproliferation goals. The alternatives evaluated in the PEIS support U.S. nonproliferation policy, as confirmed in the Nuclear Infrastructure Nonproliferation Impact Assessment, published in September 2000. Although this policy analysis is not required under NEPA, it is an essential element in the decisionmaking process. A summary of the Nuclear Infrastructure Nonproliferation Impact Assessment is included in Appendix Q in the Final NI PEIS. It is also available on the DOE NE website (<http://www.nuclear.gov>). In the event that a decision is made to restart FFTF, the first six years of operation would use existing onsite mixed oxide fuel. DOE expects that an additional 15-year supply of mixed oxide fuel in Europe, owned by Germany, would be available for FFTF. The Nuclear Infrastructure Nonproliferation Impact Assessment for the NI PEIS alternatives stated that using the two different sources of existing mixed oxide (MOX) fuel for FFTF (existing FFTF fuel and German MOX fuel) is consistent with U.S. nonproliferation policy, and, additionally, represents a safe, low-cost opportunity to reduce civilian plutonium without chemical or bulk processing, which would afford substantial nonproliferation benefits. DOE's approach to potential use of HEU in the FFTF is also consistent with U.S. nonproliferation policy. The FFTF is an existing research reactor capable of performing its research missions using HEU fuel, if MOX fuel is not available. U.S. nonproliferation policy provides for such a circumstance as part of the effort to reduce and discourage HEU use. During the period of MOX fuel use, in compliance with U.S. nonproliferation policy directives, DOE's Office of Nonproliferation and National Security would undertake a study under the Reduced Enrichment Research and Test Reactor (RERTR) program to consider the technical feasibility of using low enriched uranium to fuel the FFTF. Under this nonproliferation protocol, if use of low enriched uranium fuel is found feasible, it will be used; if found infeasible for meeting assigned missions in the FFTF, an already existing research reactor, policy would allow DOE to subsequently procure highly enriched uranium fuel for use in that facility. This approach is consistent with U.S. nonproliferation policy.

2525-2: Deactivation of FFTF is not part of implementing Alternative 1, Restart FFTF. Deactivation of FFTF is part of implementing Alternatives 2, 3, 4, and 5 and including the cost of FFTF deactivation in the implementation costs for these alternatives is appropriate. The Cost Report was structured to identify the implementation costs of the various alternatives so the Secretary of Energy would have this information along with other data for consideration.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2525: Amber Waldref (Cont'd)

Response to Commentor No. 2525

- 2525-3:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Public meetings were held on this formal milestone change. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2 of Appendix N, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.
- 2525-4:** Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. The NI PEIS evaluates a range of reasonable alternatives for accomplishing the proposed action, one of which includes use of FFTF. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.
- 2525-5:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor: Marjorie Worthington

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 636.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2531: Barbara Zepeda

2531-1 — We are playing a game here, like, you know, it's us against you. We are not after the truth. And until we're after the truth, we cannot solve the problem. When you start using objective data that is produced by people who don't have an interest in the outcome, a personal interest, a monetary interest, then you'll begin to get accurate information. And until we do that, we're playing a game that none of us can win.... Objective agencies, such as the International Atomic Energy Agency, that have not been contractors or officials, could be used to approach the truth. The truth is necessary to solve these problems.

2531-2 — FFTF is said, by similar corporate interests, to be able to introduce cheap isotopes for whatever government agencies want. And a footnote to that is that the industrial isotopes are probably a cover for military production.

Response to Commentor No. 2531

2531-1: DOE notes the commentor's views on the necessity for reliance on objective, scientific data as the basis for sound decisionmaking. DOE has made every effort to make this NI PEIS objective. This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives. This was accomplished through review and evaluation of site-specific information on the environmental conditions prevailing at ORR, INEEL, and Hanford to include a comprehensive analysis of the associated environmental and health risks of each alternative. NEPA compliance is DOE's responsibility. IAEA has no role in NEPA compliance and DOE decisionmaking.

2531-2: DOE has no hidden agenda for weapons production or use of FFTF for classified missions. The only missions being considered are those stated and evaluated in the NI PEIS, which are the production of isotopes for medical, research, and industrial uses; plutonium production for future NASA space exploration missions; and U.S. nuclear research and development needs for civilian application.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor: Richard O. Zimmerman

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 323.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2542: Mike Zotter

2542-1 — ... It makes no sense to me to restart this reactor [FFTF] when public safety can be definitely affected. People have died from plutonium, that's pretty much a fact....

... I think anyone will tell you, any science teacher will tell you, the best way not to get cancer is to prevent it. The best way to prevent it is not to have plutonium....

2542-2 — I think most people would feel that cleanup would be a priority versus making money off of restarting this reactor.

... we already know that there is a lot of radioactive material up there and that it is leaking toward the Columbia River from 69 leaking tanks. I know this and there's no way I'd trust the Department of Energy to say that there won't be anything leaked. I mean it might not even necessarily be their fault but that's just what's going to happen and there should not be any more plutonium made at Hanford.

2542-3 — I know that if this reactor is restarted it will produce waste. That's pretty clear. Where will this waste be stored? I don't think that it will be stored completely safely and quickly because the waste that's already there has not been stored. That's pretty much known, etc. And what we need to do is make sure the waste does not hit the Columbia River until they ruin that. That is what irrigates our crops, that's where our fish come from.

2542-4 — I don't think that my kids deserve to have to make a choice to live anywhere around the Northwest if there's a spill. That's always a chance when you move this plutonium or when you produce it, there's always a chance this will happen and it's not necessary.

Response to Commentor No. 2542

2542-1: The commentor's position concerning exposure to plutonium and the restart of FFTF is noted. Chapter 4 of Volume 1 and Appendixes H through J discuss the radiological risks that would result from operation of reactors and fabrication/processing facilities, target storage, transportation activities, waste generation, and waste management. The methodology used provides realistic results based upon our current knowledge of the health impact of low doses of radiation. Both radiological and chemical impacts, including impacts from exposure to plutonium, were addressed in the analysis (See Appendix H). Sections 4.3 through 4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from a range of reasonable alternatives (Alternative 1 includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. Plutonium is the primary contributor to the health impacts from normal operations associated with the processing of irradiated neptunium targets at any of the proposed processing facilities. The environmental analysis showed that radiological and nonradiological risks associated with each of these alternatives and with restarting FFTF would be small.

2542-2: DOE notes the commentor's positions regarding the existing cleanup mission at Hanford, the risk of contamination to the Columbia River, and production of plutonium-238 at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities. Missions delineated in the Section 1.2 of Volume 1 would not have an impact on the Columbia River. FFTF is located approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to the groundwater. Analyses presented in Chapter 4 of the NI PEIS (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4) indicate that there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of the existing Hanford facilities in support of the stated missions. Also, no water quality impacts would be expected as a result of permanent deactivation of FFTF (Section 4.4.1.2.4). As discussed in Section 1.2.2 of Volume 1, plutonium-238 would be produced to support NASA's Deep space missions. Plutonium-238 is not used to make nuclear weapons. Hanford tank waste issues are not within

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2542: Mike Zotter (Cont'd)

Response to Commentor No. 2542

the scope of this PEIS. None of the alternatives described in Section 2.5 of Volume 1 would add to these waste volumes.

- 2542-3:** As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. The proposed activities delineated in the NI PEIS would not have an impact on the Columbia River. FFTF is located approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to the ground water. Analyses presented in Chapter 4 of the NI PEIS (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4) indicate that there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of the existing Hanford facilities in support of the alternatives. Also, no water quality impacts would be expected as a result of permanent deactivation of FFTF (Section 4.4.1.2.4).
- 2542-4:** The FFTF and fabrication/processing facilities at the Hanford Site can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with Alternative 1 would be small. DOE notes the commentor's concern regarding the safety of nuclear materials transportation. DOE is committed to safety and safeguards for its facilities and the transport of materials. As discussed in Appendix J of the NI PEIS, all transportation activities conducted by DOE (including SST/SGT operations discussed in Section J.3.4) would take place in accordance with U.S. Nuclear Regulatory Commission (NRC) and U.S. Department of Transportation (DOT) regulations. Transatlantic shipments would also be in accordance with the International Atomic Energy Agency (IAEA) regulations which are consistent with DOT and NRC regulations (see Section J.3.1). Type B shipping casks, which are designed to protect and retain their contents under transport accident conditions, and purpose-built ships, which are specifically designed to safely

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

Commentor No. 2542: Mike Zotter (Cont'd)

Response to Commentor No. 2542

transport casks containing radioactive materials, would be used to transport most nuclear materials covered in the NI PEIS.. Type B shipping casks have been used for thousands of shipments by road, rail, and water and there have been no cases of a major release of radioactive materials (see Section J.3.2.1). As shown in Volume 1, Section 2.7 , the transportation impacts would be small for any of the NI PEIS alternatives. Transportation risks are summarized in Section 2.7.1.6 of Volume 1 and are discussed in more detail throughout Chapter 4 and Appendix J.

Comments from the Seattle, Washington, Public Hearing (August 30, 2000)

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 302.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2565: Anonymous

2565-1 — Coming back from Portland, we drove up to Crown Point Observation, and I saw the Columbia River spread before me and I clutched my heart. You better clean up that garbage dump out there. I don't want that waste seeping into my river. It is my river too.

2565-2 — But anyway, the cancer did come back on the scar tissue of the right breast. So I had 35 radiation treatments, where you are radiated until you are red, burned, bloody and blistered, and those people in Portland and Hood River had the gall and the arrogance to tell me that we should clean up Hanford — I agree 100 percent — and don't do anything about cancer until Hanford is cleaned up. So that is the suffer and die cult that wants to make this decision. They don't give a rats #*\$! if you all suffer and die from cancer.

Response to Commentor No. 2565

2565-1: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford and the risk of contamination to the Columbia River. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities. The stated missions delineated in the NI PEIS would not have an impact on the Columbia River. FFTF is located approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to the groundwater. Analyses presented in Chapter 4 of the NI PEIS (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4) indicate that there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of the existing Hanford facilities in support of the stated missions. Also, no water quality impacts would be expected as a result of permanent deactivation of FFTF (Section 4.4.1.2.4).

2565-2: DOE notes the commentor's views and testimony.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2569: Anonymous

2569-1—This is a letter to Colette Brown, DOE. “Dear Ms. Brown, as Washington’s oldest and largest statewide business organization, whose 3,700 members employ more than 600,000 people, we are writing this letter to express our continued support for the ongoing environmental review process initiated by the Department of Energy for the Fast Flux Test Facility on the Hanford Nuclear Reservation. We believe that the Department must continue the process leading to the bringing on-line of the FFTF for medical isotope research and treatment. It is obvious that there is a need for additional sources of medical isotopes for research and treatment. The benefits of these isotopes to the patients are numerous.

Clearly the Fast Flux Test Facility represents the lowest risk since it is an existing facility where the medical isotope activities have already been performed. It also appears that FFTF provides greater flexibility to meet the multiple missions identified in the EIS, whereas the other alternatives appear to be dedicated to a single purpose with limited growth potential.” It concludes with, “We hope the Department will proceed expeditiously with the environment review and we surely hope it will lead to the safe and efficient restart of the operation of the FFTF.”

2569-2—We have additional concerns which we believe should be surfaced in the ongoing environmental review process. With the very recent national energy electric shortages coupled with concerns about global warming, there is a need for additional nuclear energy-based research. Given the concerns about carbon monoxide emissions from fossil fuel generating facilities and the fact that existing non-fossil fuel, non-nuclear technologies and conservations are not able to fill the gap, research to find acceptable solutions to the issues facing nuclear power production is necessary. If we are to have sufficient electricity to power our computers, heat and cool our homes and operate our facilities, nuclear power must be explored as an option for the future. At the very least, this proven source of energy production should be reexamined.

Response to Commentor No. 2569

2569-1: DOE notes the commentor’s support for Alternative 1, Restart FFTF.

2569-2: DOE notes the commentor’s support for civilian nuclear energy research.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2571: Anonymous

2571-1—And just yesterday during a CBS 11:00 p.m. local news broadcast, a commentator stated no harm has been done by the fallout since the National Monument wildfire. Inhaling plutonium particles in Hanford dust is not harmless. At the same time an ABC commentator announced high levels of radiation equal to Hanford was detected at Sunnyside. Which one of them was telling the truth or where did they get their information? That is a problem for people like me. Hanford officials reported two employees who falsified FFTF records and were fired, which the officials insist is an isolated incident. Which US DOE official can successfully convince anyone that no other records are falsified. FFTF is old and deteriorated like a lot of facilities at Hanford. They just won't hold up. That is the fact of it. You can talk to any nuclear operator that has left Hanford, and they will tell you the same thing. Disease is sometimes a sophisticated substitute for force used by people intending to prevail. If anyone believes the US can't delegate some of the US DOE delegates accountability, then please allow me to put you in touch with many witnesses who can enlighten you and provide you with other falsified record. Certain populations as well as children are suffering with various respiratory and other medical problems since the Hanford wildfire destroyed over 191,000 acres of national monument. Beginning back to when the wind blows, I have to stay inside and wear a mask. I have an exhibit attached here. The fire turned just six minutes either way from my north Richland home.

Response to Commentor No. 2571

2571-1: No radioactive materials were “released” in the Hanford wildfires of 2000. The DOE Richland Operations Office, the State of Washington Department of Health, and U.S. Environmental Protection Agency performed environmental monitoring on and around the Site to assess potential radiological impacts. The wildfire did not cause a release of radioactive materials from any Hanford facilities but did result in resuspension of radioactive materials which were already in the environment. The very low levels of radioactive materials that were resuspended were slightly above natural background levels and required several days of analysis to quantify. Information on this event has been made available to the public and can be accessed at <http://www.Hanford.gov/envmon/index.html>. This site also provides a link to information on the independent offsite air monitoring that was conducted by the U.S. Environmental Protection Agency. The FFTF reactor at Hanford was constructed and initiated operations in the mid- 1980s making it the DOE's newest reactor. It has no structural flaws that would prevent safe operations. The FFTF facility has a quality assurance program and a number of other management systems in place to identify deficiencies with safety-related work. These systems worked as discussed in the referenced case.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2591: Anonymous

2591-1—You guys have heard a lot from me. I am not sure I have said a lot in the past meetings, but I do think there is a concern relative to the NERAC Committee and the Frost and Sullivan report for the demand, and I think that the Committee was accelerator biased. So somebody is quoting NERAC as the actual fact. I think there should be some other details looked at. And the rationale I came up with is that the demand — a demand that is left out of there is this is life threatening. And I think you have heard it a lot, Owen, that once it gets FDA approved, you go from maybe treating the rate of 100 per year in phase III and now all of a sudden, you may have 10,000 to 20,000 patients who want that particular treatment. And you look at areas like thermogenic. They took a little while to get going and once they said, well, this looks like a pretty good isotope, they went for four years in a row at 70 percent a year. Now the system needs to accommodate looking at a single isotope that may be required at a demand rate that goes sky high. And that infrastructure needs to look at how that can be done. Now Frost and Sullivan did include — I think it was the year 2005, they expected five FDA approvals on nuclear medicine isotopes, and they went — I think I got it right — 700 percent in one year. And they came back and I said, where did you get that? And he said, well, there is going to be five different isotopes being approved by FDA. That was his estimate. But I think the point is that needs to be looked at very closely. Plus, when you look at the demand, you've got to account for prevalent patients. There are patients out there that have been treated and a lot of these demand schedules are not included in there. If they would be included, what you would see is a high ramp up, a large peak while the prevalent patients are being treated along with the new patients that are added to the list every year, and then it comes down as you have treated the patients and they are better or they die of other causes. Then it will actually come down. So those types of peaks need to be included in the demand curve. It needs to be looked at. Maybe I was wrong when I did it. But when I did the curves for FFFF to just try to get some feel for when is it going to be economical, you had to include the prevalent patients to treat. Because if a guy is on the third treatment, as you see those are the only ones they get to treat in clinical trials anyway. So they need to be included in that demand rate. And the infrastructure out there needs to look at that.

Response to Commentor No. 2591

2591-1: DOE notes the commentor's views concerning the Frost and Sullivan report. DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs. Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term (less than 5 years).

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

*Commentor No. 2560: Nancy Aldrich,
Mayor Pro-Temp, City of West Richland*

2560-1—There is no doubt that West Richland would experience an economic boom if FFTF is restarted. But as a cancer survivor and a sufferer of rheumatoid arthritis, I want those medical isotopes available to not just me, but to the citizens of West Richland if we should need them at any point in our lives. On a lighter note, I have a 10-year-old son whose goal is to be an astronaut and to be part of a NASA mission to Mars. I would hate to have him be disappointed in those goals because the reason not to produce those isotopes were based on fear and not sound science. So, therefore, I and my community support the restart of FFTF.

Response to Commentor No. 2560

2560-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2612: Linda Alexander

2612-1—I'm not a scientist, but I worked with the scientists, and I do recall, just after FFTF radioisotopes were discontinued, there was a young intern that came over from Fred Hutchinson. He was going to personally escort a sample that he had been guaranteed was just as good as FFTF's. I watched this young scientist get really discouraged because we brought that in and we opened up the package. He had to run some tests, and he said oh, you know.

He said that the chemical toxicity was so high that the radionuclide would help the patient, but the chemicals would harm him. This is a scientist that said well, the chemical could be used on a lab rat, but not on a human. He was pretty discouraged.

It really had a big impact on me because I could tell that these people weren't doing this scientific. They really cared about how the radioisotopes made it easier for people to recover, and if they didn't receive them, that their chances were next to none.

Response to Commentor No. 2612

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2590: Bob Anderson
Benton County Democratic Central Committee

2590-1—What I am here tonight is to represent Democrats in Benton County. That was another one of the assertions that I had a problem with Mr. Pollet that he spoke for or that he made the statement that most Democrats oppose restart of FFTF. I know that is not the case in Benton County and Franklin County. I don't know how he is a spokesperson for the Democratic Party, but part of our burden is to basically put the facts out. And the facts in Benton County are that back in October of 1999, we passed a resolution in support of restarting the Fast Flux Test Facility. At the last public hearing, I submitted a copy of that. So I am not going to read that resolution again, but I have attached a copy to the written comment. And in April of this year, our Benton County Democratic Party also adopted a platform which states in part, "Cancer is the second leading cause of death in this country with 600,000 cancer victims dying annually. The American public cannot accept current, expensive and agonizing traditional treatments with their devastating side effects. Chemotherapy and radiation use a buckshot approach which frequently causes nausea, hair loss, bone weakness, lymphedema, burned and blistering skin, chronic coughing and increased susceptibility to shingles. These old-fashioned treatments are effective for 40 percent of the patients and cost \$105 billion annually. It is unconscionable not to devote all efforts to starting production of medical isotopes at the FFTF.

In summary, the Nuclear Infrastructure Draft Programmatic Environmental Impact Statement released on July 21 of this year has reinforced our belief for the need to restart FFTF.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

**Commentor No. 2563: Leo Bowman,
Benton County Commissioner**

2563-1—As Chairman Pro-temp of the Board of Benton County Commissioners, I want to restate the County's longstanding and unwavering support for the restart and continued operation of the FFTF. The County has passed several resolutions in recent years supporting the study, the operations and the restart of the Fast Flux Test Facility.

I would like to emphasize four points in your draft EIS. One of them is when you consider what it costs to build the FFTF, when you consider what it would cost to build a similar facility today, what it would cost to decommission the FFTF, and what it would cost to leave the facility in limbo, we believe that anything other than the restart and operation of the FFTF for the long term would be an abuse of taxpayer dollars.

Two, as in your EIS, it explains no other Department of Energy facility, existing or proposed, have the capabilities of producing all three missions for the Department of Energy — the production of plutonium-238, the research and development of nuclear fields, and the production of nuclear and industrial isotopes.

Three, currently the United States imports over 90 percent of all the medical isotopes used to save the lives of citizens in Benton County and the United States, and ironically we purchase all of our plutonium-238 supplies from Russia.

And four, contrary to the fears of under-informed detractors, renewed operation of the FFTF would not generate any new high level waste, would not support any military missions or weapons programs, and would not take any money from clean-up. Those budgets are separate. We believe that when the Department of Energy carefully and sensibly weighs its alternatives, the restart of the FFTF would be the obvious choice in meeting the nation's isotope research, development and production objectives for the next century.

Response to Commentor No. 2563

2563-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2568: Mark Beck Citizens for a Clean Eastern Washington

2568-1—What I would like to see included in the PEIS is more explicit statement of the environmental impacts associated with restarting the FFTF.

Furthermore, there are no statements about the environmental impacts of new accelerators or a new reactor. That is completely ignored in the environmental impact statement. If this is an environmental impact statement, those impacts have to be included in it.

2568-2—I have looked at the cost statement that was made available on Friday, specifically the cost of the waste streams. The storage treatment of waste are not included anywhere in that cost statement. Those have to be included in the PEIS. And those costs should be calculated for — not just for the 35 years of the mission, but have to be calculated for the entire time over which these wastes are threatening to the human life.

Let me just point out some of the costs. Some people have mentioned here that it must be cheaper to run the FFTF since it is already built. Well, I ran some of the numbers here. Considering \$314 million to start the thing up, at \$60 million a year for 35 years, that is \$2.4 billion over the course of 35 years. Let's consider what I call alternative 6, which would consider buying the plutonium-238 from Russia. That costs \$10 million a year. Do that for 35 years. Build a low energy accelerator which will produce the medical isotopes and the research isotopes. It costs \$35 million to build this accelerator. That is in the cost statement that was posted on the Web. \$35 million for a low energy accelerator. Not the billion dollars for the large accelerator to build a Pu-238. This accelerator won't make Pu-238. But if you buy that from Russia, you don't need to build a billion dollar accelerator. You can build a \$35 million accelerator. Okay? It costs \$4.5 million a year to operate that thing. Total that all up, accelerator and buying Pu-238 from Russia, that is \$500 million over 35 years. That is one-fifth the cost of operating the FFTF.

2568-3—You must include the findings of your blue ribbon task force here, the Nuclear Energy Research Advisory Committee. It has been mentioned a few times here. I won't read the quotes. They have already been stated several times. I realize that this specific document refers to research documents and what you have said here now is that the FFTF is actually being considered more for therapeutic and diagnostic treatments. That sounds like commercialization. But the EIS does not include anything about commercialization. If commercialization of the FFTF is what you intend, that has to be considered in the EIS.

2568-4—Further, you must include recent developments with NASA with regards to the Sterling engine. The PEIS assumes 5 kilograms of Pu-238 a year. While that may be true in the near future, in the long term, especially over a 35-year mission, that number is going to go down. That means all of the alternatives have to be reconsidered with consideration of lower amounts of Pu-238. That means for

Response to Commentor No. 2568

2568-1: The environmental impacts associated with operation of the FFTF during normal operations and from postulated accidents are explicitly presented and discussed in Section 4.3 of the draft NI PEIS. All impacts to human health and insults to environmental media including air, water, and land are shown to be small. No fatalities would be expected from the 35-year operating period of the FFTF. Any discharges would be in accordance with applicable permit and regulatory requirements and the impacts on air and water quality would be small. The potential impacts to the Hanford area and transportation corridors to and from Hanford associated with FFTF operations are also shown to be small. The environmental impacts associated with the construction and operation of new accelerators and of a new reactor are presented and discussed in Sections 4.5 and 4.6, respectively, of the NI PEIS. As indicated in Sections 2.5.4 and 2.5.5, site selection for Alternatives 3 and 4 is not evaluated as part of this NI PEIS. In the event one of these alternatives were selected for subsequent consideration, follow-on NEPA assessments would evaluate potential locations for these new facilities.

2568-2: As noted by the commentor, waste management costs were not presented in the Cost Report. Again, Neither NEPA nor the CEQ regulations for implementing NEPA require the inclusion of a cost analysis, including for waste generation. Wastes would be generated by all alternatives and all sites including for the implementation of Alternative 1, Restart FFTF, at Hanford, which makes these costs not a particularly useful discriminator among the alternatives considered. Also, the ultimate disposition of some of these wastes in terms of acceptable waste form and disposal site (onsite or off-site commercial) have yet to be determined. This adds an additional uncertainty to any attempt to quantify waste costs, thus, making any estimates highly presumptive and speculative at best. The commentor's proposed alternative consists of elements from the No Action Alternative and Alternative 3, Construct New Accelerator(s). Other combinations of alternative elements could also be selected to meet the DOE mission requirements to some level. As indicated in the NI PEIS, the Record of Decision can select elements from one or more alternatives evaluated in the NI PEIS. The proposed low-energy accelerator, an element of Alternative 3, can produce a select set of medical isotopes. The FFTF can produce a diverse set of medical and industrial isotopes plus meet the requirements of the civilian nuclear energy research and development mission. The commentor's proposed alternative does not meet any of the civilian nuclear energy research and development missions requirements. DOE considers all three missions of equal importance.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2568: Mark Beck (Cont'd)
Citizens for a Clean Eastern Washington

smaller — for new reactor design, that would mean a smaller new reactor. For accelerator designs, that would mean smaller accelerators. That would mean for cheaper alternatives for numbers of the others.

2568-5—In my testimony at the scoping hearing, I stated that all possible waste streams must be considered, including target fabrication and transportation, field fabrication and transportation, spent fuel from the reactor, unused isotopes themselves, and all solid and liquid wastes in processing targets and extracting isotopes. There are no detailed statements in the environmental impact statement of exactly where these wastes are going to be disposed of, and that has to be included in the statement.

2568-6—If you must decide that you have a reactor, although my organization does not explicitly support the use of a reactor, we would state that you should consider alternative three a much more attractive alternative to alternative one.

2568-7—Building a new reactor costs the same amount to build as it would to restart the FFTF, [and] would have far lower operating costs...

2568-8—[New reactor] would have a far smaller amount of waste production [than FFTF].

Response to Commentor No. 2568

2568-3: The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities. DOE's production and sale of radioisotopes fall into two categories "commercial" and "research" and both types of isotope production are considered under the proposed actions. Commercial radioisotopes are those that are produced in large, bulk quantities and sold to pharmaceutical companies or distributors, or to equipment or sealed source manufacturers. Examples of commercial radioisotopes produced by DOE include strontium-82 and germanium-68 for medical applications, and iridium-192 and californium-252 for industrial applications. DOE only produces commercial isotopes when there is no U.S. private sector capability or when foreign sources do not have the capacity to meet U.S. needs reliably. In contrast, research radioisotopes are typically produced and sold in small quantities in response to specialty orders from researchers preparing experiments in the field of medicine, with small quantities of these radioisotopes also purchased by industrial researchers. Because small-quantity production of research isotopes is not financially attractive to private-sector producers and is generally not undertaken, DOE attempts to provide all research radioisotopes that are requested, subject to production capability, inventory, and financial constraints. As successful application of a specific research isotope is established, the production and sales of that radioisotope may shift from research to commercial status. In recent years, over 95 percent of DOE's sales of radioisotopes by dollar volume were commercial and 5 percent have been for research. Additional discussion of how DOE's isotope

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2568: Mark Beck (Cont'd)
Citizens for a Clean Eastern Washington

Response to Commentor No. 2568

program fits into the overall U.S. and foreign isotope production capabilities was incorporated into Section 1.2.1 of Volume 1.

- 2568-4:** DOE notes the commentor's concern about NASA's need for plutonium-238 for space missions. A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions. DOE chose a 5-kilogram per year production rate as an upper bound due to uncertainties in the SRPS technology development requirements for backup units and variability.
- 2568-5:** The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste treatment, storage, and disposal facilities for the wastes expected to be generated are identified in Chapter 4 of Volume 1 under the Waste Management sections of the NI PEIS. Spent nuclear fuel generation and management are discussed in the Spent Nuclear Fuel sections of Volume 1 of the NI PEIS. The cumulative impact tables for waste management in Section 4.8 of Volume 1 have been revised to include the individual site's storage, treatment and disposal capacities for comparison. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.
- 2568-6:** DOE notes the commentor's support for Alternative 3, Construct New Accelerator(s), over Alternative 1, Restart FFTF.
- 2568-7:** DOE notes the commentor's views and observations. A separate Cost Report was prepared to provide additional pertinent information to the Secretary of

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

*Commentor No. 2568: Mark Beck (Cont'd)
Citizens for a Clean Eastern Washington*

Response to Commentor No. 2568

Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. The information provided in the report is not required by NEPA and CEQ regulations to be included in the NI PEIS. The Cost Report was mailed to interested parties on August 24, 2000 and made available on the NE website (<http://www.nuclear.gov>) and in the public reading rooms. For information purposes, about 730 people were mailed the Cost Report. DOE has provided a summary of the Cost Report in this Final NI PEIS.

2568-8: The operational wastes generated by a new research reactor may be somewhat less than that of operating FFTF. However, the wastes that would be generated by the construction of a new research reactor must also be considered.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2609: Martin Benske

2609-1—There are several possibilities relative to the assertion that FFTF start-up and operation will detract from funds that would otherwise be dedicated to Hanford clean-up. One possibility is that Congress has publicly stated that the Hanford clean-up budget will be the source of FFTF funding, and I am simply unaware of those public statements. Doc Hastings actually put that one to bed.

A second possibility is that Congress has made secret agreements to fund FFTF with funds that would otherwise be allocated to Hanford clean-up, and while we ordinary folks have not been privy to these secret agreements, they have been leaked to environmental activists in Seattle, Portland, and Hood River.

A third, and in my opinion most likely possibility is that the spokesmen for Heart of America Northwest and Columbia River United are liars. Liars is, of course, a strong word, but it is hurled at the Department of Energy so casually and irresponsibly and so often by these same activist groups that I see no reason to gloss over a reasonably obvious truth.

My purpose in appearing before you is first to ask you to focus on what you expect to derive from these meetings and to recognize that testimony from people right on the scene is more important than testimony from distant, anti-nuclear activists whose agendas go far beyond FFTF and Hanford clean-up. Their purposes are obstruction and sabotage of any nuclear activities. FFTF and Hanford clean-up are just the activities of the moment that need to be discredited.

2609-2—More important, I want to express my belief and the belief of most people in this community that we would welcome the opportunity to operate FFTF in any way that will serve this nation.

Response to Commentor No. 2609

2609-1: DOE notes the commentor's views and remarks. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

2609-2: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor: Brian Berglin

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 281.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2582: Bill Brem

2582-1—What I am concerned about is the one-sided stories that appear in some of the newspapers and the bad press that Hanford generally gets all the time about all the problems, bad work. It says very little about the people really trying to clean the place up and working hard. Some of it seems to have carried over into the newspapers' discussion of the hearings and the restart of FFTF. So it is especially enlightening to see the article in "The Oregonian" two days ago.

I would like to encourage the Energy Department to follow Oregon's lead and objectively consider the benefits of restarting FFTF for treating cancer. The cancer patients deserve it.

Response to Commentor No. 2582

2582-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor: Tom Burke

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 286.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2606: Beth Call

2606-1—I should state at the beginning that I support alternative five, deactivation of the Fast Flux Testing Facility.

2606-2—The DOE's programmatic environmental impact statement suggests the possibility of shipping weapons plutonium through Puget Sound to fuel FFTF, despite recent vehement protests of nearby residents and the Seattle and Tacoma city councils against receiving even spent nuclear fuels. I just heard a speaker say that probably wouldn't be done. It would probably be brought through the east coast because that would be less expensive, which leaves one wondering how on earth they would get it safely across the continent. How often do we hear of train wrecks and truck wrecks? I can't think of a safe way of transporting it across the continent either.

Response to Commentor No. 2606

2606-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2606-2: The commentor appears to express the concern that DOE would expose people in the Puget Sound area to risks associated with the transport of weapons-grade plutonium. None of the proposed alternatives involved the shipment of any weapons-grade plutonium to any port in the United States. Alternative 1 does postulate that DOE might decide at some point to import mixed oxide fuel from Europe to fuel FFTF. At this time, however, DOE has not proposed to import this fuel through any specific port. If DOE ultimately decides to import fuel from Europe, it would perform a separate NEPA analysis to select a port. This review would address all relevant potential impacts of overseas and inland water transportation, shipboard fires, package handling, land transportation, as well as safeguards and security associated with the import of SNR-300 mixed oxide fuel through a variety of specific candidate ports on the east and west coasts. It would consider all public comments, including local resolutions, concerning the desirability of bringing mixed oxide fuel into the proposed alternative ports. In the event that DOE decides to enhance its nuclear infrastructure, it would not expose any population to high, unacceptable risks under any alternative. Any transportation activities that would be conducted by DOE would comply with U.S. Nuclear Regulatory Commission and U.S. Department of Transportation regulations. Associated transatlantic shipment would comply with International Atomic Energy Agency requirements. In Section J.6.2, DOE reviewed the potential maximum impacts from the marine transportation of mixed oxide fuel from Europe to a representative military port, Charleston, South Carolina, and overland transportation to Hanford. Also in that section, a bounding analysis demonstrates that the maximum potential radiological risks to the surrounding public from mixed oxide fuel shipments would be extremely small (e.g., less than 1 chance in a trillion for a latent cancer fatality per shipment from severe accidents at docks and in channels and less than 1 chance in 50 billion for a latent cancer fatality per shipment from overland highway accidents).

*Commentor No. 2596: Mel Chapman
International Brotherhood of Electrical Workers, Local 112*

2596-1—I think it's time for Department of Energy to move off of dead center, make a positive step, restart this plant, stop the procrastination, and let's move forward. The life that they save might be their own.

Response to Commentor No. 2596

2596-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2598: James Chung

2598-1—In summary, I think the most important point that I'm trying to make is that the FFTF should not only be restarted for the missions that have been outlined more eloquently than I can, but also for the future of our country's nuclear power program.

Response to Commentor No. 2598

2598-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor: Frank E. Cole

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 389.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2584: Michael Contini

2584-1—I support alternative 1, restart of the FFTF for the production of medical and commercial isotopes, Pu-238 and research. However, I want a statement in the PEIS that provides a categorical exclusion of using FFTF at any time for the production of nuclear weapons materials at any kind.

2584-2—I now want to turn my attention to accountability. There is or was a sign here concerning two FFTF employees fired for falsifying work done. I am familiar with this event since I work at FFTF. This event happened and the employees paid the price. They were fired. In one of the other meetings, there was mention of the event where an in-vessel handling machine was damaged by bypassing interlocks. Again, the individuals responsible, predominantly the operations engineer after an investigation was fired.

Can we say this about Heart of America Northwest, the Government Accountability Project and Columbia River United? What accountability exists for them? They can distort, misquote, take out of context items of great concern. They giggle at hearings. Again, what accountability exists for Watchdogs of Hanford? "Who will watch the Watchman" is a quote I have often heard. I think Julius Caesar said this. The above methods used by these organizations to foster public support, both verbal and financial, are radical and extreme.

2584-3—I am concerned with the environment. I want Hanford cleaned up as safe as possible. A small quantity of waste in comparison to the huge quantities already there that FFTF will produce for the missions of the PEIS is a small price to pay for the benefits gained. I want the Willamette River cleaned up, thus helping to keep the Columbia River clean.

Response to Commentor No. 2584

2584-1: DOE notes the commentor's support for Alternative 1, Restart FFTF. The production of nuclear weapons materials is not one of the missions for which FFTF would be restarted, if Alternative 1 were selected in the Record of Decision.

2584-2: DOE notes the commentor's views and observations.

2584-3: The commentor's positions on the Hanford cleanup and waste generation benefits under Alternative 1, Restart FFTF, are noted. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. Cleanup of the Willamette River is outside of the scope of this PEIS.

Commentor: Jim Davis

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 401.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

*Commentor No. 2554: Jerome Delvin
Washington State Representative*

2554-1—I strongly urge the Department of Energy to adopt alternative 1 of the Draft Environmental Impact Statement, which would reactivate the FFTF and use it to produce medical and industrial isotopes and assist with nuclear research. The draft EIS prepared by DOE has identified a clear need for additional reactor capacity, capacity that can be readily provided by FFTF. Use of the FFTF will create the greatest and most efficient use of current resources of our national research and medical isotope needs. The taxpayers would be best served by putting this facility to work for both the Federal Government and for the economy of central Washington. With the need for medical isotopes projected to increase dramatically, America finds it is increasingly dependent on overseas facilities to meet its needs. Radioactive isotopes are frequently used to treat cancer and it is important that we develop a domestic facility for production of these isotopes.

Response to Commentor No. 2554

2554-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

**Commentor: Ken Dobbin, Councilman,
City of West Richland, WA**

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 400.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

*Commentor No. 2577: Amy Evans
Citizens for Medical Isotopes*

2577-1—So what I have to say is we have already waited too long. We are not about to grab an opportunity that lies ahead of us. We have already waited far too long to provide the reliable and affordable supply of medical isotopes that are needed to move new cancer treatments forward. And I think my comment about the PEIS would be choose the option that is going to provide the best reliable supply of quality and quantity isotopes that we are going to need for research and treatment in the shortest amount of time. And that answer is restart the FFTF.

Response to Commentor No. 2577

2577-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2601: Martin Evans

2601-1—I recommend alternative number five, the shutdown and permanent closure of all activities of the Fast Flux Test Facility reactor.

2601-2—It is my belief that the medical benefits of nuclear isotopes, while large, are outweighed by the risks to public health that come with any increase in the amount of nuclear waste in our region of the type generated by FFTF.

Response to Commentor No. 2601

2601-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2601-2: DOE notes the commentor's concern regarding waste generation. As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. This NI PEIS has provided estimates of human health impacts associated with a range of reasonable alternatives for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems, including the restart of FFTF. The methodology used provides realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 which includes restart of FFTF, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2574: Darrel Fisher
Nuclear Medicine Research Council

2574-1—I would like to compliment the Department of Energy on the work that it has been doing in this area, and I support alternative #1, restart of the Fast Flux Test Facility.

2574-2—My statements tonight address the need for medical isotopes. There was a quotation in the Seattle Post Intelligence this morning quoting Dr. Harry Kramer that we have all the isotopes that we need and that there is not a need for any more production. That is blatantly false and irresponsible. I worked today with Dr. Julie Park and Dr. Dana Matthews at the Fred Hutchinson Cancer Research Center putting together a protocol for FDA approval of a new treatment of neuroblastoma in children. Dr. Park is at Children's Hospital and Dr. Matthews at Fred Hutchinson Cancer Research Center. These physicians recognize that the only effective treatment of this disease is a combination of surgery and radiolabeled antibodies, in particular to treat the micrometastatic disease, combined with chemotherapy, additional radiation therapy, and in some places a marrow transplantation. This is a very aggressive therapy for an otherwise incurable disease.

If we are able to produce these isotopes in the reactor in Richland, the physicians in Seattle will be first in line to use them, each and every one. The physicians that I have talked to, they cannot depend on the FFTF if it is closed or if it is in standby. That is why the statements that you see, we cannot depend on FFTF for our isotopes because it is not operating. Each one that I have talked to, including physicians at the University of Washington in the Nuclear Medicine Division, has said you make the isotopes, we will use them.

Response to Commentor No. 2574

2574-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

2574-2: DOE notes the commentor's support for the use of FFTF to produce medical isotopes.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor: Dennis A. Fitzgerald

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 426.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2605: Mike Fox

2605-1—I'm a supporter of the restart of FFTF.

2605-2—I was in a meeting with the Society of Nuclear Medicine in 1994 where Hazel O'Leary spoke to the national meeting. I took notes from her meeting that I have here that she presented to the Society of Nuclear Medicine. Among her points, she say one, I am proposing a vision, a world class nuclear medicine program for the 21-st century.

Two, we should eliminate the full cost recovery. I don't know why in the world we're demanding economic viability when the government throws \$6 billion contracts as basic physics and NASA and so forth and don't ask for an economic recovery. She was very explicit in saying we should eliminate the full cost recovery.

We must advance the frontiers of nuclear medicine and radiopharmacy and biotechnology and instrumentation and so forth. Something near and dear to me, the DOE. She obligated the DOE to work together in demystifying all things nuclear, reducing fear, healing mistrust.

Now, that was the Department of Energy making those commitments, and yet I would describe them, as I have here, as broken promises. I think that the Department of Energy has led to this public fear, because I have been involved at times when the Department of Energy would call me up in my career and ask if I had certain pamphlets and booklets that had been produced in the early 70's.

This was by Tina Hobson, who was in the Carter Administration, head of the Office of Communications. She was a Naderite that got appointed in the Carter Administration. She confiscated those documents, and I later learned that they were destroyed. There isn't a whole lot of difference here from the burning of the books in 1930 Germany.

So, I think that if there's someone, if there's a will within DOE headquarters to re-examine what DOE has done and what they have promised and established a scientifically defensible approach to these things, an approach such as beneficial, I think the DOE could enhance its own public trust.

Response to Commentor No. 2605

2605-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

2605-2: DOE notes the commentor's viewpoint.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2581: Gary Greene

2581-1—One doesn't have to look too far to see what the quality of the infrastructure in Russia is right now. I can't expect the EIS to capture what the environmental impact might be to the world in general and other nations and other populations in the PEIS, but I think that it should be noted that we would be putting a great number of people at risk by obtaining those isotopes from other sources.

2581-2—The comment about keeping eastern Washington clean rankles me because that is the height of not in my backyard. What I think is that, yes, in my backyard because we have the regulatory infrastructure. We have the oversight and safety. We have, I know, the skill of our work force, and we have the tools necessary to carry out these important missions at FFTF and in a safe environmental free manner.

2581-3—Also, that we will — and this is a probabilistic kind of thing. We stand a better chance of accomplishing those missions than the other options that are listed in the PEIS.

Response to Commentor No. 2581

2581-1: The commentor's interest in the safety of isotope production and distribution capabilities in Russia is noted. Under the No Action Alternative, plutonium-238 would be purchased from Russia to support NASA's deep space missions. However, evaluation of potential health impacts in Russia is outside the scope of this NI PEIS.

2581-2: The commentor's support for Alternative 1, Restart FFTF, is noted. The commentor's position on safety and skills of the Hanford Site workforce is noted.

2581-3: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor: R. K. Greenwell

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 411.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

***Commentor No. 2552: Patricia Hale, Washington State Senator,
8th Legislative District***

2552-1—The Fast Flux Test Facility has long been the crown jewel of the nuclear industry and that has been borne out by ten years of operating excellence. But the Government has never tapped into the enormous potential of this remarkable facility and the time has come for us to do so.

With the FFTF, as Congressman Hastings said, we have a unique facility that can produce the variety, the quality of isotopes that will be needed in the decades ahead. Why then is our nation supporting 100 reactors in more than 40 foreign countries? It is incomprehensible to me that we would do that, invest in foreign facilities, when we have by far the most superb facility right here at home.

Obviously there is a clear and compelling need for medical isotopes. This year in the United States alone, half a million people will die from cancer and more than twice that from heart disease. Our country can no longer afford to turn its back on an existing state-of-the-art facility, already paid for by taxpayer dollars that could and should lead the world in medical isotope production and research. Nor should we risk heavy reliance on foreign sources, no matter how friendly, for our isotope supply. Without the FFTF, we will continue to be reliant for 90 percent of our isotope needs on foreign sources. And history is filled with grim reminders of the consequences that happen when political winds change, and they do.

And finally, at this time when the world is struggling with scientific challenges in medicine and energy production and waste management and space exploration, it would be both wasteful and foolhardy for the Government to dismantle this versatile facility that could boost our national capabilities and lead the way to important new discoveries.

Response to Commentor No. 2552

2552-1: DOE notes the commentor's support for Alternative 1, Restart FFTF. DOE also notes the commentor's statement about the Foreign Research Reactor Program; however, this program managed by the DOE Office of Environmental Management, is separate from the proposed action in this PEIS.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

*Commentor No. 2557: Larry Haler
Richland City Council and Chairman, Hanford Communities*

2557-1—I had the opportunity a year ago to testify before the NERAC Committee which made the decision to do this PEIS for the FFTF. I flew back to Washington, D.C. and listened to some very learned people make that decision, some very impressive minds that the Energy Secretary had gathered from industry as well as science and as well as from the universities who made this decision. But one thing that was brought out during that one day of testimony and presentations that were given was that we do not have enough reactor volume in this country to generate the kind of isotopes that are needed to save lives. And if we were to use the existing DOE reactor facilities, we would be pushing some of the programs out — and I believe you mentioned this earlier, Colette. Some of those programs would be the critical defense programs that we have.

The only reactor in the United States that could generate — or I should say the only facility that can generate the type of quality isotopes that we need for cancer patients to effectively cure cancer in those patients that the isotopes would be applied to is the FFTF. Let's not kid ourselves. An accelerator does not, and that was brought out in the NERAC committee meeting. Accelerators do not generate the quality of neutrons and the quality of proton isotopes that are needed and only the FFTF can do that.

Response to Commentor No. 2557

2557-1: DOE notes the commentor's support for Alternative 1, Restart FFTF. The commentor should note the DOE reactors and accelerators are currently producing medical isotopes for research and clinical use.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor: Susan Hamilton

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 2139.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

*Commentor No. 2553: Shirley Hankins, Washington State
Representative, 8th Legislative District*

2553-1—The United States Government has a great opportunity to save lives with continued research at FFTF. If continued hearing or studies are needed, my attitude is you should get on with it.

Our community has developed ways to take care of waste. We have the research personnel to treat cancer patients. Please let us go forward. This will be good for your family, for members of my family, and the members of every family in the United States.

Response to Commentor No. 2553

2553-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

***Commentor: Doc Hastings,
U.S. House of Representatives, WA***

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 387.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2579: Harold Heacock

2579-1—What I would like to do tonight is simply touch on a few of the claims that have been made in the testimony this week. First is FFTF is an inherently safe reactor designed and built to the highest standards available in the country and is the safest of all of the available DOE facilities. It will operate at a lower power level than was designed for adding to the margins of safety. There are no significant environmental releases from that reactor.

The fuel — there is a fuel supply available which can be utilized for the first 15 years of operation and there are alternatives available for use beyond that point which are nonproliferation.

2579-2—There are no significant waste streams from it. And there is no high level waste generated by the FFTF because there is no fuel reprocessing planned. Rather the spent fuel will be stored in dry casts and disposed of. So the words we have heard about adding high level waste to already leaking tanks is not relevant. It is insupportable.

2579-3—The FFTF was not designed or ever operated for military programs and there are none proposed in the current EIS.

2579-4—The possibility of accelerators? Yes, accelerators can produce a lot of materials. But an accelerator the size and power that would be required to equal the capacity of the FFTF does not exist even on paper and is extremely doubtful to be built in the near future.

2579-5—The idea of bringing plutonium in through Puget Sound is simply unrealistic. The national port for shipping spent fuel materials, not fresh fuel, into this country is the Navy port of Charleston, South Carolina, which routinely handles those shipments.

2579-6—In terms of impact to clean-up, the FFTF is currently funded from separate funds from the Environmental Management budget and if it were to be started up and operated, it would be funded out of entirely separate funding. It would not take funding from the clean-up program.

2579-7—On the other hand, if the decision were made to shut down and decommission the reactor, then it would be transferred to the Environmental Management Program at an estimated cost of some \$200 million for decommissioning, and that would have to come out of an already inadequate EM budget here at Hanford.

2579-8—Look at all the facts and all the issues. You can only come to one conclusion and that is that FFTF is the best solution to meet the programmatic needs.

Response to Commentor No. 2579

2579-1: DOE notes the commentor's support for Alternative 1, Restart FFTF. FFTF can be operated safely to accomplish the stated missions. The analyses presented in this NI PEIS reflect the proposed changes to the reactor core (including fuel and irradiation targets) to perform the stated missions. The Record of Decision for the PEIS will be based on a number of factors including environmental impacts, costs, public input, nonproliferation issues, schedules, technical assurance, policy, and program objectives. In the event that FFTF restart is selected in the Record of Decision, a new Safety Analysis Report, including a Probabilistic Risk Assessment (PRA), will be prepared and it will address any changes in plant configuration, operating conditions and procedures. The revised safety analyses will be subjected to a thorough independent review process.

2579-2: DOE notes the commentor's observations regarding waste generation. As identified in Section 4.3.1.1 13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. High-level radioactive waste would not be generated from merely operating FFTF. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

2579-3: DOE notes the commentors statement concerning the actions proposed for FFTF and evaluated in the NI PEIS. The only proposed actions being considered are those analyzed in the NI PEIS, which are the production of isotopes for medical, research, and industrial uses; plutonium production for future NASA space exploration missions; and U.S. nuclear research and development needs for civilian application. None of the alternatives in the NI PEIS include defense missions, nor would they contribute to future weapons production.

2579-4: While DOE has the final design for accelerator with an energy level and size larger than the high-energy accelerator proposed in the NI PEIS, DOE has no conceptual, preliminary, or final design for an accelerator that has the energy level and size

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2579: Harold Heacock (Cont'd)

Response to Commentor No. 2579

required to support the plutonium-238 production mission at the maximum production rate of 5 kilograms per year. The accelerator designs for Alternative 3 were developed to a level of detail that was adequate to assess the environmental impacts associated with the construction and operation of the proposed facilities and the technical feasibility of meeting the mission objectives. Figure 2.33 indicates that design and construction of the high-energy accelerator would be completed in 5 years plus an additional 2 years would be required for startup and testing of the facility. DOE operates two accelerators that are being utilized for the production of medical isotopes, the Brookhaven Linac Isotope Producer (BLIP) located at the Brookhaven National Laboratory and the Los Alamos Neutron Science Center (LANSCE) located at the Los Alamos National Laboratory. DOE is currently in the process of upgrading the LANSCE facility with the 100 MeV isotope production facility. The upgrade is scheduled for completion in 2001.

2579-5: Alternative 1 does postulate that DOE might decide at some point to import mixed oxide fuel from Europe to fuel FFTF. At this time, however DOE has not proposed to import this fuel through any specific port. If DOE ultimately decides to import fuel from Europe, it would perform a separate NEPA analysis to select a port. This review would address all relevant potential impacts of overseas and inland water transportation, shipboard fires, package handling, land transportation, as well as safeguards and security associated with the import of SNR-300 mixed oxide fuel through a variety of specific candidate ports on the east and west coasts. It would consider all public comments, including local resolutions, concerning the desirability of bringing mixed oxide fuel into the proposed alternative ports. In the event that DOE decides to enhance its nuclear infrastructure, it would not expose any population to high, unacceptable risks under any alternative. Any transportation activities that would be conducted by DOE would comply with U.S. Nuclear Regulatory Commission and U.S. Department of Transportation regulations. Associated transatlantic shipment would comply with International Atomic Energy Agency requirements. In Section J.6.2, DOE reviewed the potential maximum impacts from the marine transportation of mixed oxide fuel from Europe to a representative military port, Charleston, South Carolina, and overland transportation to Hanford. Also in that section, a bounding analysis demonstrates that the maximum potential radiological risks to the surrounding public from mixed oxide fuel shipments would be extremely small (e.g., less than 1 chance in a trillion for a latent cancer fatality per shipment from severe accidents at docks and in channels and less than 1 chance in 50 billion for a latent cancer fatality per shipment from overland highway accidents).

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2579: Harold Heacock (Cont'd)

Response to Commentor No. 2579

- 2579-6:** The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities.
- 2579-7:** The commentor should note, that the NI PEIS addresses deactivation of FFTF, not decommission of FFTF. Deactivation of FFTF is a Hanford cleanup cost.
- 2579-8:** DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor: Patricia Heasler

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 392.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

*Commentor: Suzanne Heaston
[for] U.S. Senator Slade Gorton, WA*

The oral comments were submitted in greater detail at the Seattle, Washington, hearing. For responses, see Commentor No. 2497 (Suzanne Heaston).

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2589: Raymond Issacson

2589-1—I look at FFTF as our prize jewel. And as has been said by many, including some pretty high level members of the Department of Energy, that is exactly what it is. It operated, as you have heard tonight, for a long time without fault. It was idle for some time. Many missions have been looked at. But I think this is the first one that really is the most humanitarian mission of all that this community was willing to support.

But nonetheless, FFTF is there. It is there for us to again utilize in the defense of people of the United States and other places against diseases. Not just cancer but heart diseases, osteoporosis as was mentioned earlier and a few other things of that nature.

2589-2—I got a chance to handle tons of plutonium during the inspection process as we shipped that stuff out. The fear of plutonium I think is over exaggerated. It is dangerous and you've got to handle it carefully. There is no question about that, both from a critical mass standpoint and from the safety standpoint. We did have accidents, yes. But darn few with respect to what happened out there

2589-3—Some of the people spoke to the issue of how much power it takes to run these accelerators. And was that factored into the overall cost analysis, including the infrastructure required to produce the power? Because in some cases, you know, we talk about the size of a reactor, and you can't build a reactor today for less than about a billion dollars.

Response to Commentor No. 2589

2589-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

2589-2: Procedures and controls will be in place to protect personnel and facilities from contamination. Both neptunium-237 and plutonium-238 would be stored in shielded containers in quantities and configurations that preclude criticality. Target preparation and postirradiation processing would be carried out in batches involving quantities well below those at which criticality could occur.

2589-3: The cost of the electric power required to the support accelerator operation was included in the annual operating cost estimate for Alternative 3. The infrastructure associated with generating that power was not considered.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2558: *Charles Kilbury, Councilman,
City of Pasco, WA*

2558-1—I am a Councilman and former Mayor of the City of Pasco. In addition, I am also chairman of the Franklin County Democratic Central Committee, a trustee of the Southeastern Washington Central Labor Council and an officer of the United Transportation Union Local 977, and I am speaking in behalf of all four bodies. These four bodies are quite familiar with the abilities of the Fast Flux Test Facility, having followed its beginning to completion and its operation for the Department of Energy. And each body has passed numerous resolutions supporting the resumption of operations for the FFTF, assured this facility is properly the most capable and the most financially reasonable method of accomplishing the proposed functions desired by the Department of Energy.

The FFTF can probably produce the greatest profusion of new isotopes for use as required for medical treatment of disease, including that their sale will go a long ways toward paying for the operation of the FFTF, and will certainly eliminate the importation of particles from the CANDU reactors in Canada. In addition, the production of plutonium-238 to provide power for the operation of our instruments traveling through space is a use which can be provided for a reasonable cost and with more production than in any other avenue.

Finally, the FFTF already has demonstrated its capability to function as a nuclear science and radiation services users facility. That function has already taken place during ten years of operation and it worked quite well. Therefore, these four projects are well adapted to the FFTF and the entities desire to see that they are carried out.

2558-2—...we expect to see them carried out without use of any clean-up money.

Response to Commentor No. 2558

2558-1: DOE notes the commentor's support for Alternative 1, Restart FFTF. FFTF operation would not eliminate the need to acquire isotopes from foreign sources, including Canada. DOE has revised Section 1.2 of Volume 1 of the PEIS to clarify the availability of isotopes from other producers.

2558-2: The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2 of Appendix N, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor: *Bruce Klos*

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 406.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2564: Jim Knight

2564-1—Now we are looking at something else that would help people. A way to reduce cancer, to kill cancer cells and give people an extension of their lives. This is something we can do with the FFTF. Now as with food irradiation, it is like if we had a house on fire there and our neighbors, which had the radioisotopes that prevent the contamination, wouldn't turn on their fire hose. We are looking at the same thing here. The fire hose being the radioisotopes from the FFTF and the fire being these people whose lives are flaming out early, prematurely, because of not having the radioisotopes. Right now we are in a position — Colette and DOE and, you, the bureaucracy, are in the position of playing God. You can make a decision. You can start the FFTF and reduce the death and pain of these cancer patients, or you can sit by and spend days, months and years doing these studies and at the rate of, what is it, 1,000 or 1,500 people dying each day.

2564-2—How many days are we going to look at these many people dying because the DOE and bureaucracy are sitting on all these studies in Washington and using these smoke screens that are set up by Heart of America and by these other anti-nuclear who do not have to bear any responsibility of any of these people dying, but they can certainly help you keep your hand on the faucet and not turn the water on to help save these people.

Response to Commentor No. 2564

2564-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

2564-2: DOE notes the commentor's views and concerns particular with regard to delays in the medical isotope production mission. DOE is committed to discharging its responsibilities in an open and unbiased manner and providing the public with comprehensive environmental reviews of its proposed actions. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives. Decisions made will be published in the Record of Decision no sooner than 30 days after publication of this NI PEIS.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2607: Ava Kruse-Chung

2607-1—As a health care professional, it's my recommendation for the start-up of FFTF.

Response to Commentor No. 2607

2607-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2600: Molly Lewis

2600-1—I would be a great proponent of alternative five, which would be no start-up for the FFTF.

2600-2—I'm really concerned about the waste. The contamination is already going into the Columbia without any method of stopping or controlling the waste.

I'm also extremely concerned that the EIS has no proposed clean-up plan in their statement. I'm very concerned that it would just contribute to the waste that is already going into the Columbia, which is becoming more and more polluted. I'm very worried about that because I see the Columbia becoming a more and more polluted river, and I don't think that we need to do anything to endanger its health any further.

2600-3—Also, as far as cancer research goes, none of these isotopes have been FDA approved for the cancer patients, and I think that needs to be taken into account, that these isotopes might not even be approved by the FDA and therefore not used for cancer. Therefore, the FFTF would already have been started up without any benefit to anyone, really.

Also, the medical team that the Department of Energy sent out to look at the possible options for the FFTF said that the FFTF was not well suited for the production of medical isotopes. It seems very ludicrous to me that the FFTF would be restarted for these medical isotopes if it's not well suited to it, where other facilities are much more well suited for this project.

Response to Commentor No. 2600

2600-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

2600-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

2600-3: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs. The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However,

*Comments from the Richland, Washington, Public Hearing (August 31, 2000)**Commentor No. 2600: Molly Lewis (Cont'd)**Response to Commentor No. 2600*

sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities. DOE has taken the Expert Panel and NERAC report recommendations under consideration in developing the range of alternatives evaluated in the NI PEIS. These reports were made available to the public at the NI PEIS public information centers and on the Internet at www.nuclear.gov. The list of isotopes shown in Table 1-1, Volume 1 of the Draft NI PEIS are a representative set of isotopes selected on the basis of the recommendations of the Expert Panel, medical market forecasts, reviews of medical literature, and more than 100 types of ongoing clinical trials that use radioisotopes for the treatment of cancer and other diseases. Although these isotopes are a representative sample of possible isotopes that could be produced, DOE expects that the actual isotopes produced as a result of the proposed action would vary from year to year in response to the focus of clinical research and the specific market needs occurring at that time. Therefore, unless used for research and development or clinical trials, medical isotopes that have not been approved for use by the Food and Drug Administration would not be produced.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2566: Ellen Magan

2566-1—I am here on behalf of my son who a year and a half ago got hit in the eye with a golf ball and lost his eye. He had three surgeries in two weeks. Sometime after that, we had to go to the hospital to see what the swelling was doing in the implant in his eye. They didn't have to give him IV's. They didn't have to put him to sleep. He didn't have to go in for surgery. He simply got a shot of an isotope. They did a scan and they were able to tell the condition of his eye without going in there and invading it at all. And I would just ask you to keep the isotopes coming for people like him.

Response to Commentor No. 2566

2566-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2588: Bill Martin
Tri-City Industrial Development Council

2588-1—TRIDEC strongly supports the objectives of DOE's nuclear energy program and specifically endorses the implementation of the missions identified in the draft EIS. We also strongly support the identification of the FFTF as the preferred option for accomplishing these missions. The draft EIS clearly shows the capability and superiority of the FFTF over the other alternatives considered. FFTF is the most modern reactor available. It was designed and constructed to meet DOE and NRC standards and operated flawlessly over a 10-year period with no significant safety incidents or issues.

In fact, the operation of FFTF will provide very positive economic and social impacts, not only in the Pacific Northwest but also the nation. Local business, labor and government organizations strongly support the restart of FFTF.

2588-2—FFTF has been clearly identified in the EIS to be the preferred option for meeting the identified program missions without negative social, environmental or economic impacts.

We request that the assets of FFTF receive an objective, balanced and realistic evaluation during the preparation of the record of decision.

Response to Commentor No. 2588

2588-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

2588-2: DOE notes the commentor's views. In accordance with Council on Environmental Quality regulations (40 CFR 1502.14(e)), DOE has identified its preferred alternative in Volume 1, Section 2.8 of the Final NI PEIS and included a discussion of DOE's reasons for selecting it. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

*Commentor No. 2595: Pat McDaniel
Mid-Columbia Engineering*

2595-1—We have a facility out here that is just essentially rotting away that the American taxpayer has paid literally billions of dollars for, and it does have a lot of use for the production of plutonium for the use for health purposes. As our aging community gets older and older, there is continued use in new developments for these types of isotopes, and that's why I think it's very important that we keep the FFTF alive and put it back into production.

Response to Commentor No. 2595

2595-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2578: Debbie Mensinger

2578-1—I want to see medical isotopes produced here at FFTF so that we have an adequate local source of supply and are not forced to go to a foreign country.

FFTF is the only reactor in the Western Hemisphere capable of producing large quantities of several high specific activity isotopes like iodine-131. The FFTF reactor could produce enough copper-67 and alpha-emitting isotopes for cancer treatment options.

My message is simple. Restart FFTF immediately. Include in its mission the production of medical isotopes.

2578-2—As a taxpayer, I am hopeful that the Department of Energy will look at the facts behind each alternative and not be swayed by political pressure or anti-nuclear groups spreading misinformation while using scare tactics.

Response to Commentor No. 2578

2578-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

2578-2: DOE notes the commentor's views including the need for reliance on factual information as the basis for sound decisionmaking. The selection of facilities and site locations for accomplishing expanded civilian nuclear energy research and development and isotope production missions is not a political decision. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

*Commentor No. 2561: Armand Minthorn
Confederated Tribes of Umatilla*

2561-1—This evening, I come here to cite our concerns with the consideration that is being deliberated about the Fast Flux Test Facility. I come here not only to listen, but to learn and to not make any hasty judgments. A lot of the people in this room my tribe have to work with and I have to work with. And by no means do I want to interfere with those working relations. But there comes a time when we have to make a choice and we have to make a decision. I would hope that any decisions that are made here wouldn't be criticized. I am not here to criticize anyone for the decision that they are going to make.

This evening, I come here and I join Governor Kitzhaber, the State of Oregon, in opposing the restart of Fast Flux Test Facility.

Response to Commentor No. 2561

2561-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor: Victor Moore

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 408.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2599: Derek Mosely

2599-1—I'm testifying for my best friend, Andrew Sniden. I'm 15 years old. I'm a sophomore at Richland High School. Andrew and I, we were born on the same day, October 25, 1984, in Northwest Hospital in Seattle, Washington.

We were really close friends because we were born, you know, the same day, friends at birth, soul mates, like brothers. No matter where we lived, whenever we got together, we just clicked.

Well, Andrew got real sick in February of 1997 when he was 12, and they diagnosed him with AML, which stands for acute myelogenous leukemia.... Nuclear medicine, or radioisotopes, could have been able to save my best friend, Andrew.

Don't let someone die just because you don't understand the possibilities that FFTF means to others with cancer, especially if they're only 14.

Response to Commentor No. 2599

2599-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

**Commentor No. 2556: Carol Moser, Mayor Pro-Temp,
City of Richland, WA**

2556-1—The FFTF holds the possibility to cure some cancers in our lifetime. Already radioisotope therapy has been used successfully in treating many types of human diseases including rheumatoid arthritis and some forms of leukemia.

The draft PEIS shows that the FFTF could be used for many other missions as well, and you will hear lots of expert testimony testifying to the technology and its possibilities. I am here because it is time to make a positive decision to restart the FFTF. For this community, it is a mission that we deserve. A possibility to overcome the stigma that our nuclear legacy has left us with and to put the U.S. citizens past investments to good use, especially in the efficient production of isotopes for commercial demand. Let's not hold future generations hostage because we are afraid to take the steps of progress. I strongly urge the adoption of alternative 1 of the draft PEIS.

Response to Commentor No. 2556

2556-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2567: Rick Mouts

2567-1—I was not surprised that the PEIS confirmed that there was essentially no public risk associated with operation of the FFTF to support an expanded isotope mission. Since I have been associated with operation of the FFTF for many years, I can personally attest to its high standards of safety.

2567-2—One brochure I have read from front to back is entitled “Hanford in the River”, by Columbia River United. This brochure identifies the major areas in past operations at Hanford that have impacted the Columbia River. I would like to point out that the FFTF operated for nearly 10 years. FFTF is not mentioned one single time in this activist publication for impacting the Columbia River. Why? Because the operation of FFTF has absolutely no impact on the River.

I honestly do not understand the basis for many of Heart of America Northwest claims that restarting FFTF will have enormous environmental consequences for the Pacific Northwest for generations to come. Or their claim that the public must demand that DOE shut down FFTF to prevent more disasters at Hanford and save the future of Hanford clean-up.

2567-3—Another handout I read was from Columbia Riverkeeper. In it they demand that the following statement be removed from the PEIS summary on spent fuel management. “The environmental impacts associated with the existing inventory of spent fuel at the Hanford site are minimal.” I agree that this statement should be removed. Instead, the PEIS summary should reflect DOE’s well publicized and appropriate commitment to remove the 2,100 metric tons of corroded defense mission spent fuel from Hanford’s 100 area water basins. This defense mission’s spent fuel does not include the 16 metric tons of non-defense spent FFTF fuel. The PEIS summary should also discuss the minimal environmental impacts associated with the spent FFTF fuel on its own merits. Namely, that it is not corroded and is stored in dry storage casts, not aging defense mission water basins. This section should also be consistent with Chapter 4 of the PEIS which correctly states that the FFTF spent fuel will be shipped to the repository for disposal.

Another activist statement made by Seattle-based Heart of America Northwest contends, “Restart of the FFTF nuclear reactor will have enormous environmental consequences for the Pacific Northwest for generations to come. Restart of the FFTF nuclear reactor will mean importations of weapons grade plutonium and mixed oxide fuel to Hanford from Germany and production of 35,000 pounds of high level nuclear waste.” Here they mean the 16 metric tons of spent FFTF fuel, “Waste which US DOE has no idea where or how to dispose of. But the report,” — and here they mean the PEIS — “just concludes that the waste can be stored indefinitely in Hanford.”

Response to Commentor No. 2567

2567-1: FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

2567-2: The stated mission delineated in the NI PEIS would not impact the Columbia River. FFTF is located approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to the groundwater. Analyses presented in Chapter 4 of the NI PEIS (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4) indicate that there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of the existing Hanford facilities in support of the stated missions. Also, no water quality impacts would be expected as a result of permanent deactivation of FFTF (Section 4.4.1.2.4).

2567-3: The discussion in the Summary and Section 4.8.3.5 of Volume 1 on the cumulative impacts for spent nuclear fuel management at Hanford was revised to clarify that the management of the existing spent nuclear fuel at Hanford results in a dose of less than 0.1 millirem per year of the maximally exposed member of the public. This dose is well within the DOE limits given in DOE Order 5400.5. As discussed in that Order, the dose limit from airborne emissions is 10 millirem per year, as required by the Clean Air Act; drinking water is 4 millirem per year, as required by the Safe Drinking Water Act; and the dose limit from all pathways combined is 100 millirem per year. DOE has committed to remove the spent nuclear fuel at Hanford for ultimate disposition in a geologic repository. In full recognition of DOE’s position to take expeditious action in regards to Hanford cleanup, the NI PEIS evaluated the maximum cumulative radiation exposure to the public from all reasonably foreseeable Hanford Site activities over the 35 year time-frame. These activities include future waste management (as estimated in the Hanford Comprehensive Land Use Plan), tank waste remediation, K Basin spent nuclear fuel management, decommissioned naval reactor plant disposal, and Plutonium Finishing Plant Stabilization (see section 4.8.3.3). As shown in Table 4-173, the dose to the maximally exposed individual would be expected to remain well within regulatory limits. Based on an exposure period of 35 years, 0.21 (<1) latent cancer fatalities would be expected to occur among the local population over the 35-year period as a result of Hanford related radiation exposure. The cumulative impact assessment also determined that the

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2567: Rick Mouts (Cont'd)

First, the FFTF fuel is not nor could it ever been classified as weapons grade plutonium. Also, had Heart of America Northwest read Chapter 4 of the PEIS, they would know that DOE did not in any way conclude that the spent fuel would be stored indefinitely at Hanford. Instead they would know that the disposition path for the 16 metric tons of spent FFTF fuel is to ship it to the repository for disposal. The same process as for the nation's 105,000 metric tons of commercial reactor fuel. They would also know that the timeline for doing this is either during operation or at cessation of reactor operation. Furthermore, if Heart of America Northwest really had public education in mind, they would be knowledgeable about the status of the repository at Yucca Mountain. They would then know that the FFTF fuel is suitable for repository disposal in its current form and that its contribution to the overall projected repository inventory is only 0.015 percent.

2567-4—Heart of America Northwest must provide accurate, credible analysis to substantiate their claims. They must also be willing to come to the table with their concerns so that they can be resolved. Operation of FFTF to produce isotopes for this nation is too important to throw out based on the hearsay of a few activist groups. By using unsubstantiated claims in an attempt to manipulate the public into forcing DOE to shut down FFTF, it is my opinion that Heart of America Northwest has seriously undermined the NEPA process and their own credibility as a stakeholder.

2567-5—I fully support the restart of FFTF to produce medical isotopes.

Response to Commentor No. 2567

incremental annual radiation dose to the maximum exposed public individual from the NI-PEIS proposed operations at FFTF and FMEF or RPL, including the impact of storing the 16 metric tons of heavy metal of spent FFTF nuclear fuel (see section 4.3.1.1.14) that would be generated in the 35 year nuclear infrastructure operation period, would be 0.0054 mrem. This assessment also determined that 0.0045 latent cancer fatalities would be expected to occur among the local population as a result of the NI PEIS related radiation exposure over the 35 year period. Also note that in section 4.3.1.1.14, it is stated that upon cessation of reactor operation, or earlier, this spent fuel inventory would be shipped off-site to a geological repository for disposal. The annual doses to the public from the Hanford site and proposed NI PEIS activities above are insignificant. For perspective, the radiation dose the average American receives from natural sources is about 300 mrem each year. Based on the same 35 year time period used above, approximately 2,000 latent cancer fatalities would be expected among the same population as a result of this natural (non-Hanford related) radiation exposure. In that same 35 years, about 19,000 cancer fatalities from all causes would be expected in the same population.

2567-4: DOE notes the commentor's views on the need for accurate, credible analysis to substantiate claims and concerns that unsubstantiated claims undermine the NEPA process.

2567-5: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2597: Mark Naulty

2597-1—I support the restart of the Fast Flux Test Facility outside of Richland. I think it will be a huge benefit to our community and nation with its research and its development of isotopes.

2597-2—I also believe that some things are not being looked at, such as the cost of power. The cost of power in the last year has quadrupled to enormous rates, and that the addition of a generator on the Fast Flux Test Facility would also help pay for its cost.

Response to Commentor No. 2597

2597-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

2597-2: DOE notes the commentor's view that FFTF could generate power to help pay for its cost. However, the purpose of the NI PEIS is to evaluate the environmental impacts of reasonable alternatives to expanding DOE's existing nuclear facility infrastructure. FFTF was not designed for the production of electric power. For example, it has no turbine generators and actually requires some electric power for operations (see description of FFTF in Volume 1, section 2.3.1.1). Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. These missions do not include the generation of power. A separate "Cost Report for the Alternatives Presented in the Draft NI PEIS" was issued by DOE in August 2000, which is available at the NI PEIS public information centers and on the Internet at www.nuclear.gov.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2613: Jack Nelson

2613-1—Restart and operation of the Fast Flux Test Facility is a pro-active step in meeting our nation's medical, industrial, and space exploration isotopes needs, a progressive approach to nuclear power research, and a wise use of public dollars.

2613-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

**Commentor No. 2559: Jerome Peltier, Mayor,
City of West Richland**

2559-1—The restart of FFTF means giving cancer patients a choice, that choice medical isotopes. Yes, the choice can be as simple as life or death. Ask yourself what is a life worth. It is my position that if the restart of FFTF could save just one life, then it is worth it.

My comments this evening at this hearing are directed to the Department of Energy Fast Flux Test Facility Draft Programmatic Environmental Impact Statement release in July. It is essential that the final PEIS contain all of the facts as they relate to the capability of FFTF, which has the greatest capability of producing the quantity, the variety and the quality of medical isotopes required by the medical industry. In addition, FFTF has the capability of producing industrial isotopes, space batteries and can be a world leader in nuclear research.

The final PEIS should designate FFTF as the preferred alternative for the production of medical isotopes because it is the only facility that can accommodate all the demands of the medical isotope program as well as industry, space and research.

2559-2—These capabilities are far too important to get lost in the extreme tactics of the anti-nuclear movement as demonstrated in the previous hearings on FFTF. These groups lie, misrepresent facts and present alternatives that are far more expensive and technically inadequate.

Finally, let me say that the capabilities, flexibility, technology, cost benefits and the saving of lives must be the drivers behind the decision to restart FFTF. Politics should not drive or prevent the restart, which in the past has had a tendency to overshadow the merits of the technology. The FFTF is a safe reactor and can produce medical isotopes that can save

thousands of lives. Do not listen to comments of an anti-nuclear faction whose only goal is to stop a lifesaving medical isotope mission in Hanford, create fear, raise money for their cause and deprive cancer patients of their lives.

2559-3—I specifically would like the following data included in the PEIS — isotope quantity, quality and availability particularly for research isotopes and isotopes with high specific activity. It is essential that a domestic supply of these isotopes be identified as well as the current production facilities. The PEIS should include DOE's facilities including reactors, cyclotrons and accelerators

Response to Commentor No. 2559

2559-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

2559-2: DOE notes the commentor's views. The selection of facilities and site locations for accomplishing expanded civilian nuclear energy research and development and isotope production missions is not a political decision. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

2559-3: DOE notes the commentor's views. For the purposes of analyses in the NI PEIS, a representative set of isotopes was selected on the basis of the recommendations of the Expert Panel, medical market forecasts, reviews of medical literature, and more than 100 types of ongoing clinical trials that use radioisotopes for the treatment of cancer and other diseases. These isotopes are listed in Table 1-1 of Volume 1, along with a brief description of their medical and/or industrial applications. Unlike Table C 1 of Volume 2, which lists representative isotopes that could be produced using FFTF, the isotopes listed in Table 1-1 include both reactor- and accelerator- produced isotopes. The absence of any specific isotope from the Table 1-1 should not be interpreted to mean that it would not be considered for production under the proposed action. Rather, these isotopes are a representative sample of possible isotopes that could be produced, and DOE expects that the actual isotopes and specific amounts produced as a result of the proposed action would vary from year to year in response to the focus of clinical research and the specific market needs occurring at that time. Therefore, the NI PEIS cannot identify how short-lived isotopes that will be produced by DOE in the future will be transported to treatment centers, as requested by the commentor. DOE also does not believe that a cost-benefit analysis of radioisotope therapy alone or in combination with older treatments is warranted and is not, therefore, included in the NI PEIS. While some existing DOE reactors other than those considered in the NI PEIS may possess the potential capability or capacity to support research isotope production, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without disturbing the existing missions of these facilities.

2559-4: DOE notes the commentor's support for Alternative 1, Restart FFTF, and concern regarding medical wastes. Medical wastes are regulated by the U.S. EPA and authorized states. It is not under DOE's purview.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2559: Jerome Peltier, Mayor, (Cont'd)
City of West Richland

and address which of these isotopes will come from which source. Current committed missions in DOE facilities should be accounted for, and the methods for meeting both mission and isotope demands should be identified. The PEIS should further identify where short-lived isotopes will be produced and how they will be transported to treatment centers. The PEIS should contain a cost/benefit analysis of radioisotope therapy alone or in combination with older treatments such as surgery, chemotherapy and external beam radiation. This study should be based on statistics presented for the various FDA approved cancer radioisotope treatments and clinical studies.

2559-4—The final waste minimization plans should include an analysis of all the waste associated with cancer treatment. The plan should address FFTF waste as well as the waste from the medical community. Cancer patients today produce a lot of waste, from both surgery waste and chemotherapy, which are both toxic and infectious. Currently these wastes are being stored in 55-gallon drums in hallways, under stairwells, on loading bays and even in parking lot spaces at many hospitals and treatment centers. These wastes represent an unrecognized hazard that far exceeds the hazard of the waste that will be produced at FFTF.

Response to Commentor No. 2559

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2583: James Polleri

2583-1—The report also includes some vitally important plans such as a statement in the summary report that DOE proposes to enhance its existing nuclear infrastructure to provide for the three needs of isotope production, production of Pu-238 for space batteries and research and development. In my opinion and in those of many others, the successful meeting of these needs is of vital importance to America's future, including both personal health and our national energy security.

The FFTF offers many advantages compared with the other PEIS alternatives. For example the use of an existing facility rather than a new facility and lesser environmental impacts. In addition, the FFTF would make a positive contribution to nonproliferation by transmuting PU-239 in both existing FFTF and German reactor fuel. In view of these and other considerations, alternative #1, restart FFTF, should be identified as the preferred alternative in the PEIS.

2583-2—Some improvements that should be made in the PEIS are as follows: One, a table should be included, preferably in the summary report, that identifies which of the 30 medical isotopes that are covered by the EIS can be made in each facility in sufficient specific activity, purity and quantity for commercial purposes. Without such information, a valid comparison cannot be made between the relative merits of each facility and the environmental impacts.

2583-3—Two, a table should be added, preferably in the summary report, that provides a comparison of attributes for the various facilities such as neutron volume, flux level, thermal temperature, et cetera. This will allow the reader to readily evaluate the relative merits of each facility based on facility capability and environmental impact.

2583-4—Three, the comparisons between the various facilities with respect to the number of latent cancers that are potentially developed by the public that are given in the summary report figures do not appear to be statistically meaningful. If true, the figures should be deleted or a note added to the figures that addresses the uncertainty.

2583-5—Four, transportation [and environmental impacts of replacing fuel and ATR, higher and new research reactor during the 35-year operating period should be addressed in the PEIS]. Without inclusion of these impacts, the PEIS is incomplete and potentially misleading.

Response to Commentor No. 2583

2583-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

2583-2: DOE notes the commentor's views. For the purposes of analyses in the NI PEIS, a representative set of isotopes was selected on the basis of the recommendations of the Expert Panel, medical market forecasts, reviews of medical literature, and more than 100 types of ongoing clinical trials that use radioisotopes for the treatment of cancer and other diseases. These 37 representative isotopes are listed in Table 1-1 of Volume 1, along with a brief description of their medical and/or industrial applications. Unlike Table C-1 of Volume 2, which lists representative isotopes that could be produced using FFTF, the isotopes listed in Table 1 1 include both reactor- and accelerator- produced isotopes. The absence of any specific isotope from the Table 1-1 should not be interpreted to mean that it would not be considered for production under the proposed action. Rather, these isotopes are a representative sample of possible isotopes that could be produced, and DOE expects that the actual isotopes and specific amounts produced as a result of the proposed action would vary from year to year in response to the focus of clinical research and the specific market needs occurring at that time.

2583-3: The summary of environmental impacts (Volume 1, Section 2.7.1) has been revised and reformatted in the Final NI PEIS. Section 2.7.3, Comparison of Mission Effectiveness Among Alternatives, has been revised in the Final NI PEIS to identify the medical isotopes that can be produced using accelerator technology (Alternative 3) and reactor technology alternatives (Alternatives 1 and 4). The designs for Alternatives 3 and 4 were developed to a level of detail that was adequate to assess the environmental impacts associated with the construction and operation of the facilities and the technical feasibility of meeting the mission objectives.

2583-4: The comparison of expected latent cancer fatalities provided for each of the alternatives provides information that can be used to differentiate between the environmental impacts of a range of reasonable alternatives. The radiological risks are, indeed, small and similar. However, the sizes and similarities of the values for public risk are useful information for the public and the Department's decision makers. While the results shown in the figures are statistically meaningful, the physical significance of estimated values for latent cancer fatalities at low dose rates is currently an issue of scientific debate. Some scientist believe that the linear, no threshold theory is valid. Some scientist believe that there is a threshold below which radiation dose is not harmful. Neither side can present conclusive proof. Calculations of radiological health effects in this NI PEIS are based on the

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2583: James Polleri (Cont'd)

2583-6—Four, [transportation] and environmental impacts of replacing fuel and ATR, higher and new research reactor during the 35-year operating period should be addressed in the PEIS. Without inclusion of these impacts, the PEIS is incomplete and potentially misleading.

2583-7—In a very recent report on the Heart of American Website, the title is given of “Tokimara Japan’s nuclear disaster could easily happen at Hanford, an uncontrolled nuclear reaction of criticality, especially if the FFTF reactor is restarted.” The statement that there is a similar risk to our region due to FFTF restart is incorrect. Concerns were raised in the report regarding processing fuel to go on the FFTF and the processing of irradiated targets with nitric acid. If additional FFTF fuel is needed later, it would not be located at Hanford, but in a commercial facility. If processing of targets will be done at Hanford, criticality safety controls will be imposed and strictly enforced with emphasis on engineer safety features. However, not mentioned in the Heart of America report is that Pu-238 and 237 cannot be critical in any amount when mixed with water or nitric acid. Also, no criticality has ever occurred in the free world, excluding reactor cores in critical facilities, involving fuel that was in solid, non-solution form.

Response to Commentor No. 2583

linear, no threshold theory because it is conservative. Numerical values calculated for the range of reasonable alternatives are presented, regardless of the relative size of the impact.

2583-5: Periodic replacement of nuclear fuel at the reactors identified in the comment would be part of normal reactor operations. Use of the operating reactors (ATR and HFIR) would result in a change of the mission profile, but no increased useage of fuel. Therefore, transportation impacts are not within the scope of the NI PEIS. For Alternative 4 - Construct New Research Reactor the impacts of providing fuel to the reactor are in the scope of the NI PEIS. The low-enriched uranium fuel for the new research reactor would be made in the United States and transported commercially. The per-shipment risk factors are shown in Table J-5, and the impacts are included in Alternative 4. See sections 4.6 1.2.11, 4.6.2.2.11 and 4.6.3.2.11.

2583-6: Periodic replacement of nuclear fuel at the reactors identified by the commentor would be part of reactor operations. For presently operating reactors, the proposed use of ATR and HFIR would result in no incremental impacts to involved workers, to individuals in the general public, or to other environmental resources. This is because these reactors would already be operating to provide other irradiation services (Sections 4.4.1.1.9 and 4.4.7.1.9 of the NI PEIS). For this same reason, there would be no incremental impacts associated with transporting fuel for these reactors. Normal operations of the new research reactor (which includes spent fuel handling), would result in an annual dose to the maximally exposed individual member in the general public of 0.000068 mrem. This dose is well below the EPA’s Clean Air Act standard of 10 mrem per year that is cited in DOE Order 5400.5 (see section 4.6.1.2.9). Doses to workers would also be small. Fuel handling accidents are discussed in section 4.6 1.2.10 and Appendix I of the PEIS. Risks to the public are seen to be small, with no latent cancer fatalities expected from 35 years of operations. Transportation of uranium fuel is addressed in Section 4.6.1.2.11; risks to the public and to transport workers during normal transportation or postulated accidents would also be small, with no fatalities expected.

2583-7: The commentor correctly concluded that a criticality accident during processing is not expected. Both neptunium-237 and plutonium-238 would be stored in shielded containers in quantities and configurations that preclude criticality. Target preparation and postirradiation processing would be carried out in batches involving quantities well below those at which criticality could occur.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

**Commentor No. 2585: Gerald Pollet
Heart of America Northwest**

2585-1—And earlier this summer, we were encouraged that some members of this community were brave and courageous enough to say they would engage in a dialogue with opponents of FFTF to try to find common ground. And indeed it is clear to me that takes some courage in this community. Because what we have heard tonight representative of four nights is that many in the community think that the way to change public policy is by character assassination. By calling people liars. By saying they are fanatics. And then when all is said and done and that is over with, they would like us to work with them to continue to secure over a billion dollars a year in clean-up funding every year and help us convince members of Congress how vital our information is about the jeopardy to the Columbia River or the risk of a high level tank leak or the risks of the 300 area. And they would like our support to accelerate the clean-up of the 300 area, something actually my organization has advocated for a decade because of the risks in the 300 area. And to get more money to do that, which will take quite a bit more money than the current target budgets, at a time when the current target budget for 2002 is over \$200 million short of what is required to meet the Hanford clean-up agreement. \$200 million short.

But why should anyone in the world listen to us because we are fanatics, we are lunatics, we lack integrity, we can't do math. But you'd like our support. Unlike less than a decade and a half ago, when my organization first started working on clean-up and we came to this community and we said, let's create a Hanford Clean-up Task Force to build support for funding Hanford clean-up, which was just at \$30 million a year at that time. And a leading elected official summarized how many people may still feel about clean-up when that official was quoted in the paper as saying, "Talking about clean-up is like dragging a dead skunk through town." And he wanted to have no part of it.

Well, why doesn't the EIS consider simply raising the 306 and 325 buildings as part of the accelerated clean-up and using new facilities. Simple. Change the cost picture.

A lot has been said about how FFTF and related operations won't have any impact on clean-up programs and costs. You can't clean up the 300 area to an unrestricted status and meet DOE planning guidelines. You can't meet MOCA, state clean-up law, or CERCLA unless you close these buildings and build new ones if you want to restart FFTF. That ought to be in the EIS.

2585-2—Let's talk about those risks in the 300 area, one of our concerns about the current proposal for FFTF. The proposal for FFTF relies on use of the 306 and 325 buildings. There are serious risks here. I quote, "The consequences for a major fire event occurring at the 325 building according to the latest draft 325 safety analysis report are 11 REM ED to the off-site MEI, maximum exposed

Response to Commentor No. 2585

2585-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. Additionally, the DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF, 306E, and the 325 Facility at the Hanford Site were included in the listing of existing DOE resources that was assessed for this mission. Regarding the accelerated cleanup of the 300-area, the 300 Area Revitalization Plan provides for continued multi-program R&D operations in the 300 Area, including operation of various laboratories, office facilities, and services. It also provides for consolidation (but not complete elimination) of radiological operations, with support for Hanford Site facility transition and environmental restoration efforts. The plan does not require closure of the 325 and 306-E buildings as long as they are needed for active research projects. Operation of these facilities would not violate any existing agreements between DOE and stakeholders or other legal obligations, nor would it affect ongoing or planned environmental restoration and facility transition activities.

2585-2: With regard to the analyses in the Building 325 Safety Analysis Report, the fire scenario referred to in the comment represents the maximum credible fire at the facility based on a recent fire hazards analysis by an independent organization. A fire of the severity evaluated in the Safety Analysis Report is categorized as "extremely unlikely" for purposes of establishing the facility safety basis, which implies a frequency between 1 in 1 million and one in ten thousand years. Based on the history of fires involving radiological facilities at Hanford, that estimate is likely on the conservative side. In addition, the radionuclide releases for the fire scenario are based on a hypothetical maximum radionuclide inventory in the facility and conservative estimates of the fraction of material that could be released in the event. The facility does not currently operate with anywhere near that maximum inventory, nor would it in the future. Administrative controls

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

***Commentor No. 2585: Gerald Pollet (Cont'd)
Heart of America Northwest***

individual, 91 REM ED to the on-site MEI. Now 91 REM, in fact, would be the public dose under Keith Kline's current vision for Hanford clean-up, which is to accelerate clean-up of the 300 area except for these facilities and invite, in his own words, the public in on a regular basis. Take down the fence, have a bike path and open it up for public use. So the public would be at the doorstep of an operating facility with a potential 91 REM dose. That dose is 670 times at least higher than any dose for fire discussed in this Programmatic Environmental Impact Statement. It is written by the same agency, and yet that type of risk is not disclosed. And it is a devastating risk that I think everyone in this community is concerned about, cleaning up in the 300 area.

The additional oral comments were submitted in written form and are addressed in the responses to Commentor No. 158.

Response to Commentor No. 2585

maintain the total radionuclide inventory in the facility well below the maximum evaluated in the Safety Analysis Report. The current Safety Analysis Report analyzes dose to a maximally exposed individual member of the public on the near river shore, and the onsite colocated worker is within 100 meters of the facility in the worst case downwind direction. If DOE decisions regarding access to the 300 Area change the location of the safety basis public maximally exposed individual, the total allowable radionuclide inventory in the facility would be adjusted to keep the potential dose within DOE guidelines for any credible accident scenario. Processing of medical isotopes at Building 325 for missions described in the NI PEIS would be conducted within administrative controls on radionuclide inventory in effect at the time. Therefore the risk to a member of the public from all activities in the facility, including medical isotope processing, would remain within the approved facility safety analysis wherever that individual might be located. The results of the NI PEIS accident analyses for medical isotope processing are lower than the results for corresponding events in the Safety Analysis Report because the NI PEIS radionuclide inventories are based on realistic production quantities and needs of the medical community, not on the hypothetical maximum radionuclide inventory for all work conducted in the facility. The Safety Analysis Report bounds the cumulative accident risk from all activities at the 325 building, and the medical isotope missions described in the NI PEIS would be expected to contribute a relatively small fraction of that total if the work were conducted there.

2610-1—I support the restart of the FFTF. I believe it to be the only alternative identified in the PEIS that could fulfill all the requirements you have set forward.

Response to Commentor No. 2610

2610-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2576: Bob Schenter
Citizens for Medical Isotopes

2576-1—I want to address the issue of the ability of FFTF to make research isotopes. As a nuclear physicist, I was a site manager and involved with the production of medical research isotopes from the period of 1985 through 1996, and I was the Hanford site manager on that. During that period, we produced a large number of medical isotopes for research very effectively and very cost effectively. And I would plan to provide the information to challenge the concept and the quotes about that FFTF is not effective in producing research isotopes. It will play a very major role in producing research isotopes.

I have two examples. In 1990, we sent to the Children's Hospital in Boston an isotope of osmium that was produced in the FFTF that was used for blood flow studies for the research devoted to looking at blood flow in premature babies. In addition, there are over 60 medical isotopes produced in various manners that piggyback with other missions and this was done very cost effectively. And I will submit some of the detailed written information from institutions such as the Children's Hospital and National Institute of Health commenting on the quality of these research isotopes.

Response to Commentor No. 2576

2576-1: DOE notes the commentor's views that FFTF can adequately and cost effectively support DOE's medical research isotope mission when "piggybacked" with other missions.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

The oral comments were submitted in written form and are addressed in the responses to Commentor No. 267.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2570: Peggy Scott

2570-1—But what about the risks of operating FFTF to provide these treatments for the public? With our current mode of treatment, more than 400,000 people are expected to die from cancer during the next 35 years in Seattle, Portland and Spokane and tri-cities areas alone. During that same time, the PEIS concluded that not a single cancer fatality would occur as a result of operating FFTF, even if there was a severe accident. Operating the FFTF to produce life-saving isotopes is not a health risk to the citizens of the Pacific Northwest, cancer is. So I am asking you what is your perspective? Should we deny the hope of an effective cancer treatment to the 42 million Americans who in the next 35 years will discover often too late that they have cancer? I know what my answer is.

Response to Commentor No. 2570

2570-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2575: Stan Scott

2575-1—I have a comment that I want to read about the PEIS, but first there is a couple of things I heard tonight I wanted to clarify. The first was an absolutely correct statement by Owen Lowe that we do have accelerator technologies that allow us to make neutrons from spallation. I wanted to also point out that the low energy cyclotron can in no way produce those. The minimum threshold energy for that reaction is 200 million electron volts. The low energy cyclotron in the PEIS does 30 million to 70 million electron volts. It is also a very small machine at only 300 to 500 microamps, and is not at all what we need to produce large quantities of therapeutic isotopes.

2575-2—The second thing I wanted to talk about was I picked up some what I would call anti-FFTF propaganda in the back generated by Heart of America Northwest. I won't call it anti-nuclear because we heard earlier that the young lady said they were not an anti-nuclear organization. Now I do have some detailed knowledge in the area of medical isotopes. I have studied them for the last five years. I also was on the DOE's expert panel for forecasting the future demand of isotopes. So when I read through here, I felt a little upset at some of the comments in here. There is just enough truth in here to make things slightly believable. But those with some knowledge know that there are many that are also complete fabrications. One such statement is, "For instance, the Hanford forecast uses a rate of growth of medical isotope usage that would grow from one percent of the public per year using medical isotopes to 99 percent." I have always wondered what kind of curriculum law students have. But Jerry I know one thing now for sure and that is it doesn't have enough math and science.

2575-3—But my comments tonight will focus on the third major objective of the programs outlined in the PEIS, which is to enhance the nation's nuclear research and development needs for civilian applications.

Although this application is somewhat hard to define, you recently released a strategic plan from your own office and NERAC's long term nuclear energy research and development plan which has also been just released provides some hard goals and objectives which must be taken into consideration when the ultimate alternative is picked.

It is plain to see that the no-action alternative, alternative 2, the use of existing operation facilities, and alternative 5, permanent shutdown of the FFTF can in no way meet the vision, mission, goals and objectives towards meeting America's nuclear technology future and should not be considered in the final decision making process.

Response to Commentor No. 2575

2575-1: DOE notes the commentor's views on the restart of FFTF.

2575-2: DOE notes the commentor's views and observations.

2575-3: The NERAC plan has been considered in the preparation of the NI PEIS (see Chapter 1 of Volume 1) and will be considered in the Record of Decision. The commentor is correct in stating that the No Action Alternative, Alternative 2, Use Only Existing Operational Facilities, and Alternative 5, Permanently Deactivate FFTF, do not meet all the projected nuclear infrastructure needs. However, as noted in Section 1.5, it is possible during the Record of Decision process that a combination of alternatives could be selected such that all missions would be met to some degree.

2575-4: The commentor's observations about nuclear technology and the restart of FFTF are noted. Volume 1, Section 2.7.1.2.3 of the Draft NI PEIS presents a comparison of mission effectiveness among alternatives. This section has been revised in the Final NI PEIS (see Section 2.7.1.8, "Comparison of Mission Effectiveness Among Alternatives") to provide the reader a better understanding of the medical isotopes that can be produced using accelerator technology (Alternative 3) and reactor technology alternatives (Alternatives 1 and 4).

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2575: Stan Scott (Cont'd)

2575-4—On the other hand, your vision that the benefits of nuclear technology to our society can and should be expanded and your mission to advance the application of nuclear technology by investing in new or innovative opportunities for its expanded use could not be better served than by a restart of the FFTF. This facility is the premier research reactor in the world. And to allow it to remain dormant or worse yet to shut it down in light of our nation's needs is unconscionable. The PEIS should also provide a summary of the real capabilities of the various options to meet all three of the stated mission objectives. Until such a comparison is done, a valid decision will not be made. Based on my 21 years working in the nuclear technology field, I am confident that the FFTF will stand head and shoulders above any other facility towards meeting America's nuclear technology future.

Response to Commentor No. 2575

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2580: Dan Simpson

2580-1—I conclude that the restart of operation of the FFTF should be a key element in your programs, the programs covered by this PEIS together with utilization of existing thermal neutron reactor radiation facilities to the extent of their capability and availability. In other words, restart of the FFTF needs to be the most important element but continued utilization of existing facilities and perhaps expanded utilization of existing facilities would probably also be appropriate.

In conclusion, the thorough analyses by DOE have shown that restart of the FFTF and operation as a neutron irradiation facility is in the national interest. Furthermore, a long period of operation of this service can be expected. The FFTF was conceived, designed and built to develop advanced technology for civilian nuclear program needs. It was subject to high standards and exacting criteria. The safety of the design and adequacy of the safety analysis were confirmed by detailed independent review by the Nuclear Regulatory Commission staff and the National Advisory Committee on reactor safeguards. The FFTF remains today a modern facility with a demonstrated record of safe and successful operation. It was designed for irradiation of diverse materials and components in the reactor core, provides inherent flexibility that fits well with the missions of isotope production. Both the facility design and its procedures are consistent with such uses. For example and in particular, there are well developed procedures for safety analysis, review and approval of different types of irradiation target specimens.

2580-2—The PEIS states that alternative 1, restart of the FFTF, provides the greatest vision and effectiveness of the alternatives evaluated. Recent news reports on the cost analysis indicate that analysis confirms that the Fast Flux Test Facility is the most effective means for meeting the entire suite of missions proposed by DOE.

2580-3—The PEIS indicates no environmental impact bar to any of the alternatives, that is any of them can be done within appropriate regulations, sound practices and standards.

2580-4—The report indicates to me from my interpretation of it that the national mission needs would be best met by a combination of the fast neutron reactor and one or more thermal reactors available for irradiation services. FFTF restart is the obvious path for fast reactor capability. ATR is an excellent thermal radiation reactor facility but limited in availability due to prior decommission. It would be logical to utilize the radiation capability of Canadian reactors in cooperation with Canada that has been made in the past. At some point we can anticipate that both the FFTF capability and thermal neutron irradiation capability will be exceeded — additional capability will be needed, at which point the construction of the new research reactor would become logical. A key reason for

Response to Commentor No. 2580

2580-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

2580-2: DOE notes the commentor's opinion.

2580-3: DOE notes the commentor's statement that the NI PEIS indicates no bars to any of the alternatives with respect to environmental impacts.

2580-4: The commentor's support of FFTF and ATR with the potential for a new research reactor in the future is noted. As stated in PEIS Volume 1, Section 2.6.1, the use of Canadian reactors was considered and dismissed because this does not meet the programmatic issue of enhancing the United States infrastructure to support the missions described in the PEIS. The commentor is correct in stating that some radioisotopes require fast neutrons for their production while others require thermal neutrons.

2580-5: DOE notes the commentor's view. DOE considers Alternative 3, Construction of New Accelerators, a reasonable alternative for large scale isotope production and evaluates the environmental impacts associated with the construction and operation of the accelerators and associated support facilities in the NI PEIS.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2580: Dan Simpson (Cont'd)

providing both fast reactor and thermal reactor irradiation capability is to produce the wide variety and purity of isotopes for which there is a need. Some isotopes are produced most effectively and efficiently in a high energy neutron flux of a fast reactor and others by thermal neutrons. FFTF target assemblies can be configured to accomplish thermal energy neutron irradiations as well as the more direct utilization of the existing Fast Flux capability, which may be the higher value utilization of FFTF.

2580-5—It appears from the information provided that the particle accelerators — at least I don't find much support for particle accelerators for the purpose of large scale isotope production.

Response to Commentor No. 2580

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2602: Laura Smith

2602-1—I find it unacceptable that the environmental impact statement considers only the short term, especially when one of the costs is something as lasting as nuclear wastes. Especially threatening are the low level wastes which are disposed in unlined, unfiltered ditches.

2602-2—Please heed the subcommittee for isotopes research and production committee of the Nuclear Energy Research Advisory Committee when they conclude, and I quote, that the FFTF will not be a viable source of research radioisotopes. Anticipated income from sales likely will not meet expectations, thereby curtailing operations and reducing the FFTF's capability to produce research radioisotopes in a timely and cost efficient manner.

Response to Commentor No. 2602

2602-1: The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. The Hanford Site's 200 Area's Low-Level Waste Burial Ground are regulated by DOE under the Atomic Energy Act of 1954, as amended, and under DOE Order 435.1, Radioactive Waste Management. The 200 Area's Low-Level Burial Ground also contain the following three active permitted mixed waste trenches whereby mixed low-level waste is both stored and disposed of: (1) Trench 31 is a permitted, lined Subtitle C disposal trench that is currently utilized for greater than 90-day storage of mixed low-level radioactive waste; (2) Trench 34 is permitted, lined Subtitle C disposal trench currently utilized for the disposal of mixed low level radioactive waste that has been treated and is compliant with Land Disposal restrictions; and (3) Trench 94 is a permitted, unlined disposal trench utilized for the disposal of decommissioned naval reactor components. Use of Trench 94 for naval reactor compartments is authorized under a special exemption from the State of Washington Department of Ecology (Ecology). Currently, the Low-Level Burial Ground has a Part A Permit approved by Ecology under the State of Washington Dangerous Waste Regulations, State of Washington Administrative Code (WAC) 173-303, and, as such, is an interim status treatment, storage, and disposal (TSD) unit under the Resource Conservation and Recovery Act (RCRA). The permitted active and future mixed waste units of the Low-Level Burial Ground meet all regulatory requirements of WAC 173-303 and RCRA and will be incorporated into the Hanford Site RCRA Facility Part B Permit and will operate under final status regulations. In early June 2000, a working draft of the Hanford Site RCRA Facility Part B Permit application was submitted to Ecology.

2602-2: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC,

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2602: Laura Smith (Cont'd)

Response to Commentor No. 2602

established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1 2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs. The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities. DOE has taken the Expert Panel and NERAC report recommendations under consideration in developing the range of alternatives evaluated in the NI PEIS. These reports were made available to the public at the NI PEIS public information centers and on the Internet at www.nuclear.gov.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2592: Dea Strand

2592-1—I believe it would be a tremendous waste if we don't restart FFTF, if only from the standpoint of the isotopes to fight cancer.

Response to Commentor No. 2592

2592-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2586: Thomas Tenforde

2586-1—I am speaking here tonight as a staunch advocate for the restart of the Fast Flux Test Facility to produce medical isotopes and to conduct other nuclear services and science missions of importance to the United States. The need for FFTF as a major supplier of isotopes for the treatment of cancer, cardiovascular disease and other human health problems is beyond question. At the present time, as others have said, there are no other reactors in the United States with the capabilities of FFTF for producing medical radioisotopes and currently the U.S. must rely on foreign suppliers for many of the isotopes used, both for the diagnosis and treatment of disease. In addition to its remarkable capabilities for producing isotopes for medicine, industry and research, the FFTF has demonstrated its capability for safe and reliable operations over a 10-year period dating from the early 1980's to 1992.

2586-2—My recommendation to DOE, however, goes beyond just the restart of FFTF for producing isotopes to treat cancer and other diseases. There are several diagnostic isotopes in short supply such as iodine 123 which is used in imaging to detect tumors of the brain and other soft tissues. These isotopes can only be produced by cyclotrons. My opinion and strong recommendation to DOE is that a hybrid option should be chosen in which FFTF is restarted and in addition for a relatively small incremental cost on the order of 15 percent, the cyclotron with an energy of 50 to 100 MEV and a high beam current should be constructed at an existing DOE site that has existing radiochemical processing capabilities.

This cyclotron would then be used to provide a reliable year-round supply of diagnostic isotopes that are not available from accelerator sources at the present time. Because the programmatic EIS considers both the FFTF and a low energy cyclotron option, only site specific environmental documentation would be required for the cyclotron option in order to implement this full course of action. These additional NEPA studies could be carried out in parallel with the initial stages of work required to start FFTF, thereby avoiding any additional delays in reactivating FFTF.

The combined FFTF and low energy cyclotron option would provide the capability to produce the full set of radioisotopes needed by nuclear medicine physicians for the diagnosis and treatment of cancer and other diseases as well as for medical research. It is in my opinion the optimal approach to take for improving the quality of healthcare of Americans in a cost effective manner that uses the full range of technology offered by modern nuclear medicine.

Response to Commentor No. 2586

2586-1: DOE notes the commentor's support for a combination of Alternative 1, Restart FFTF, and Alternative 3, Construct New Accelerator(s).

2586-2: See response to comment 2586-1.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2603: Elise Thatcher

2603-1—With regard to medical possibilities from the Fast Flux Test Facility here in eastern Washington, a committee developed by the United States Department of Energy reviewed the Fast Flux Test Facility and determined that the use and start of this facility is not only a viable source of medical isotopes but is not cost effectively. Recently, two facilities in Canada have been started solely for the purpose of developing medical isotopes, which will be a possible source for the United States.

In May of this year, NASA contacted the U.S. Department of Energy and disclosed that new technology, which is to be used in the future, will need approximately

2603-2—one-fifth of the plutonium-238 that was previously needed by NASA. This is a product which is to be developed by the Fast Flux Test Facility in the future, if it is started.

2603-3—Finally, it is important to address the results of the Fast Flux Test Facility here in the tri-cities area in the state of Washington. Any waste to be produced during the start-up and use of the Fast Flux Test Facility is to be laid in unlined and unregulated dishes in the Hanford area. This leads to a projected amount of 5,000 cubic meters of low level waste.

2603-4—After reviewing the greater political, medical, and local levels of the Fast Flux Test Facility and the ramifications which it will cause, I support alternative five.

Response to Commentor No. 2603

2603-1: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1 2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs. The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities. DOE has taken the Expert Panel and NERAC report recommendations under consideration in developing the range of alternatives evaluated in the NI PEIS. These reports were made available to the public at the NI PEIS public information centers and on the Internet at www.nuclear.gov. The United States currently purchases approximately 90 percent

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2603: Elise Thatcher (Cont'd)

Response to Commentor No. 2603

of its medical isotopes from foreign producers, most notably Canada. However Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. The commentor noted that Canada is constructing two new reactors for the production of medical isotopes. These reactors will replace an aging Canadian reactor that is currently producing molybdenum-99. With the addition of the two new Canadian reactors, the United States is assured that Canada will continue to provide a reliable supply of this vital isotope in the future. DOE's intent is to complement commercial sector capabilities to ensure that a reliable supply of isotopes is available in the U.S. to meet future demand, and to encourage the commercial sector to privatize the production of isotopes that have established applications to a level that would support commercial ventures. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

2603-2: A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

2603-3: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and

*Comments from the Richland, Washington, Public Hearing (August 31, 2000)**Commentor No. 2603: Elise Thatcher (Cont'd)**Response to Commentor No. 2603*

state laws and regulations and applicable DOE orders. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The Hanford Site 200 Area's Low-Level Waste Burial Ground is regulated by DOE under the Atomic Energy Act of 1954, as amended, and under DOE Order 435.1, Radioactive Waste Management. The 200 Area's Low-Level Burial Ground also contain the following three active permitted mixed waste trenches whereby mixed low-level waste is both stored and disposed of: (1) Trench 31 is a permitted, lined Subtitle C disposal trench that is currently utilized for greater than 90-day storage of mixed low-level radioactive waste; (2) Trench 34 is permitted, lined Subtitle C disposal trench currently utilized for the disposal of mixed low level radioactive waste that has been treated and is compliant with Land Disposal restrictions; and (3) Trench 94 is a permitted, unlined disposal trench utilized for the disposal of decommissioned naval reactor components. Use of Trench 94 for naval reactor compartments is authorized under a special exemption from the State of Washington Department of Ecology (Ecology). Currently, the Low-Level Burial Ground has a Part A Permit approved by Ecology under the State of Washington Dangerous Waste Regulations, State of Washington Administrative Code (WAC) 173-303, and, as such, is an interim status treatment, storage, and disposal (TSD) unit under the Resource Conservation and Recovery Act (RCRA). The permitted active and future mixed waste units of the Low-Level Burial Ground meet all regulatory requirements of WAC 173-303 and RCRA and will be incorporated into the Hanford Site RCRA Facility Part B Permit and will operate under final status regulations. In early June 2000, a working draft of the Hanford Site RCRA Facility Part B Permit application was submitted to Ecology.

2603-4: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

**Commentor No. 2555: Robert J. Thompson, Mayor,
City of Richland, WA**

2555-1—The city [Richland] has stated in several letters to the Department of Energy over the past years that we unequivocally support the use of FFTF for production of isotopes for medicine, space missions as well as other research and development projects. In 1996, we formed an advisory committee with over 30 participants from a wide spectrum of interests in our community. They studied the use of FFTF and other Hanford facilities for isotope production and plutonium disposition. The committee concluded that the FFTF, which was designed to operate with MOX fuel has more than a 20-year remaining life and should be used to produce medical isotopes and other products. Operating the facility has added the advantage of disposing of the surplus weapons and material by converting it to reactor fuel and irradiating it to the spent fuel standard, which makes the material unavailable for weapons.

2555-2—In the City of Richland, we are trying to do something that is unique in government. We are looking at a return on an investment perhaps for the first time. That is not something the government is particularly known for. But the idea is when you spend your money, you spend it wisely. And you don't waste the money that you have spent. This is a two-fold proposition. One, if you have to create some new accelerators, there is a time for the new EIS's that are going to have to be prepared and the tremendous cost that is going to be generated. Not only do you have that cost, but you also have the downside of not being able to produce medical isotopes. And I have a very difficult time when I go out in the community and I see people and I go and I have people who have been ill in my family with cancer and tell them, well what we have got to do is we have got to wait about another 10 or 15 years while we go through another EIS study because we decided to forget starting FFTF. That just doesn't make sound policy sense from an economic standpoint and from an emotional standpoint, a humanistic standpoint. And I think sometimes we lose sight of that as well.

2555-3—And one final comment. I think there is a lot of concern and there is a lot of emotion that comes into these issues, especially when I listen to people who are against the restart of FFTF. And I think their concern was invalid in this respect. I think Doc touched on this point of view. We have got two separate pools of money in regards to where the funding restart would come from FFTF as opposed to a clean-up mission. The City of Richland has probably gone out on a limb in regards to supporting monument status of the Columbia River. I have four children. There are plutonium plumes that head for the river. You think it is not in my interest and in my family's interest to have that clean-up not go on? If in any respect that I and my fellow council members felt that clean-up would not go on based on the restart of FFTF, we wouldn't be here. We would not be supporting the restart. It is that important. But my family's concern is paramount and my role is to protect the health and safety of the citizens of Richland. We are going to do that and we can do both.

Response to Commentor No. 2555

2555-1: DOE notes the commentor's support for Alternative 1, Restart FFTF, and opposition to Alternative 3, Construct New Accelerator(s). It should be pointed out that the NI PEIS evaluated the operation of FFTF under Alternative 1 for 35 years.

2555-2: See response to comment 2555-1.

2555-3: DOE notes the commentor's support for Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. The missions described in Section 1.2 of Volume 1 would not impact ongoing Hanford cleanup activities. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2 of Appendix N, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

**Commentor No. 2573: Amber Waldref
Heart of America Northwest**

2573-1—Just one response to Representative Hastings' comments about weapons grade plutonium. He said — just to make it clear, it is weapons grade plutonium that will be used to produce Pu-238. MOX fuel and highly enriched uranium are both weapons grade and this is a nonproliferation issue which I am going to talk about later. At last October's public scoping hearings, different issues were identified that Ms. Brown spoke about today to be included in the PEIS, and I just want to address some of them because I believe they haven't been adequately addressed in the PEIS. The number one issue is the nonproliferation — separate nuclear infrastructure nonproliferation impacts assessment will be completed, so unfortunately I don't have that before me right now. I am very curious about the document, because according to U.S. nonproliferation policy, at this time it strongly discourages the use of highly enriched uranium fuel in civilian research and test reactors. And in the event that a decision is made to restart FFTF, if low enriched uranium fuel is not technically feasible, then highly enriched uranium fuel will be used, and this is a nonproliferation issue. So that is the first point I found that wasn't adequately addressed.

2573-2—Secondly, the transition of FFTF stewardship after it is deactivated. The comment I had was in the cost report, DOE added the cost of the deactivation of FFTF to each alternative except the restart. So in my mind, it was a huge error because it skewed it in favor of restarting FFTF because the cost of shutting it down was not included. And it is unclear to me how this can be left out. Because eventually I hope we intend to deactivate the reactor after the 35 year mission. So that was another error that I found.

[And so just in conclusion, I am not convinced that the PEIS adequately addresses...] The errors in the cost analysis, which I mentioned,...

2573-3—And also the restart of FFTF and budget constraints. DOE has made a commitment that implementation of the record of decision will not divert or reprogram budgeted funds designated for Hanford clean-up. And I just wanted to point out that part of the tri-party agreement has been to shut down the FFTF reactor. In 1995, it was supposedly supposed to be shutdown, deactivated and decommissioned and the money saved each year would go to clean-up. And now with the Department of Energy looking at clean-up, which is so important and which is continuing to go on, it is saying that the current budget is not going to meet the deadlines and the timelines for clean-up. So in my mind it makes sense to use the money for clean-up.

2573-4—And so just in conclusion, I am not convinced that the PEIS adequately addresses these issues from the previous hearing,

2573-5—[And so just in conclusion, I am not convinced that the PEIS adequately addresses these issues from the previous hearing,]

Response to Commentor No. 2573

2573-1: DOE notes the nonproliferation concern expressed in the comment, and can assure that its proposed action in the PEIS supports U.S. nonproliferation goals. This has been confirmed by the Nuclear Infrastructure Nonproliferation Impact Assessment, published in September 2000. Although this policy analysis is not required under NEPA, DOE considers it to be an essential element in the decision-making process for the DOE nuclear infrastructure, and has included a summary of the assessment in Appendix Q in the Final NI PEIS. It may also be found on the DOE NE web site (<http://www.nuclear.gov>). In the event that a decision is made to restart FFTF, the first six years of operation would use existing onsite mixed oxide fuel. DOE expects that an additional 15-year supply of mixed oxide fuel in Europe, owned by Germany, would be available for FFTF. The Nuclear Infrastructure Nonproliferation Impact Assessment for the NI PEIS alternatives stated that using the two different sources of existing mixed oxide (MOX) fuel for FFTF (existing FFTF fuel and German MOX fuel) is consistent with U.S. nonproliferation policy, and, additionally, represents a safe, low-cost opportunity to reduce civilian plutonium without chemical or bulk processing. This would afford substantial nonproliferation benefits, since as indicated in the comment, the plutonium in the MOX, if extracted by chemical processing would be of weapons grade. DOE's approach to potential use of HEU fuel in the FFTF is also consistent with U.S. nonproliferation policy. The FFTF is an existing research reactor capable of performing its research missions using HEU fuel, if MOX fuel is not available. U.S. nonproliferation policy provides for such a circumstance as part of the effort to reduce and discourage HEU use. During the period of MOX fuel use, in compliance with U.S. nonproliferation policy directives, DOE's Office of Nonproliferation and National Security would undertake a study under the Reduced Enrichment for Research and Test Reactors (RERTR) Program to consider the technical feasibility of using low enriched uranium to fuel the FFTF. Under this nonproliferation protocol, if use of low enriched uranium fuel is found feasible, it will be used; if found infeasible for meeting assigned missions in the FFTF, an already existing research reactor, policy would allow DOE to subsequently procure highly enriched uranium fuel for use in that facility. This approach is consistent with U.S. nonproliferation policy.

2573-2: Deactivation of FFTF is not part of implementing Alternative 1, Restart FFTF. Deactivation of FFTF is part of implementing Alternatives 2, 3, 4, and 5 and including the cost of FFTF deactivation in the implementation costs for these alternatives is appropriate. The Cost Report was structured to identify the implementation costs of the various alternatives so the Secretary of Energy would have this information along with other data for consideration.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2573: Amber Waldref (Cont'd)
Heart of America Northwest

or that it justifies the need to restart up FFTF for the proposed plutonium-238 or medical isotope production mission.

[And so just in conclusion, I am not convinced that the PEIS adequately addresses these issues from the previous hearing...]

... the failure to include the information from the NERAC report which was released before this PEIS which recommends that FFTF not be considered as a viable source of research radioisotopes — we have heard that tonight — which is the only type of — the research radioisotopes are the only type being considered as far as I know in this study.

2573-6—[And so just in conclusion, I am not convinced that the PEIS adequately addresses...] ... the lack of information on nuclear waste disposal management ...

2573-7—So this leads me to call for the most prudent course of action which is to not choose FFTF for any of these missions. I propose that we shut it down, alternative 5, and use the money for clean-up as promised.

Response to Commentor No. 2573

2573-3: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE remains committed to upholding this agreement. Hanford Site cleanup is funded through the DOE Environmental Management Program Office. The stated missions considered in this PEIS would be funded by the DOE Office of Nuclear Energy, Science and Technology, which has no funding connection to cleanup and waste management activities. Therefore, the alternatives delineated in the NI PEIS would not have an impact on Hanford cleanup activities. If the decision is made to shutdown the FFTF then cleanup dollars will be needed to deactivate the facility, which will impact the Hanford cleanup budget.

2573-4: DOE assumes that the commentor is concerned that the NI PEIS does not adequately address the issues of cost, nuclear nonproliferation, and funding for Hanford cleanup which were raised during the NI PEIS scoping hearings. The costs and nuclear nonproliferation impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such ancillary documents need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed these documents to more than 730 interested parties on August 24 and September 8, 2000, respectively. Both reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided summaries of the Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment in Appendixes P and Q, respectively in the Final NI PEIS. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Funding for Hanford cleanup is addressed in DOE's previous response to the commentor (2573-3).

2573-5: DOE has sought independent analysis of trends in the use of medical radioisotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

*Commentor No. 2573: Amber Waldref (Cont'd)
Heart of America Northwest*

Response to Commentor No. 2573

committees. In 1998, an Expert Panel convened to forecast future demand for medical isotopes estimated that the expected growth rate of medical isotope use during the next 20 years will range between 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by DOE's Nuclear Energy Research Advisory Committee (NERAC), established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. The growth projections were also adopted by DOE as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at a rate consistent with the Expert Panel findings. For nearly 50 years, DOE has actively promoted the use of isotopes to improve the health and well-being of U.S. citizens. DOE's use of its unique technologies and capabilities to develop isotopes for civilian purposes has enabled the widespread application of medical isotopes seen today. While its market share is a small fraction of total world radioisotope production, DOE remains the key provider for a large number of isotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large enough quantities to make their production financially attractive to private industry. DOE's intent is to compliment commercial sector capabilities to ensure that a reliable supply of isotopes is available in the U.S. to meet future demand, and to encourage the commercial sector to privatize the production of isotopes that have established applications to a level that would support commercial ventures. The conclusions presented in the "NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000" regarding the suitability of the Fast Flux Test Facility (FFTF) to produce research isotopes in a timely and cost-efficient manner were made in the context of the facility producing research isotopes as its sole mission. DOE agrees that the FFTF's large size and configuration are not particularly well suited for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of the FFTF for the production of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2573: Amber Waldref (Cont'd)
Heart of America Northwest

Response to Commentor No. 2573

on its operational feasibility, the NI PEIS only evaluates use of the FFTF when coupled with the other proposed missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without disturbing the existing missions of these facilities. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost.

2573-6: DOE notes the commentor's concern regarding waste generation and management. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

2573-7: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2608: Dave Watris

2608-1—I say let's get on with the alternative one. Use the FFTF whether or not we use FMEF, but I encourage highly the use of FMEF as a support facility for FFTF.

Response to Commentor No. 2608

2608-1: DOE notes the commentor's support for Alternative 1, Restart FFTF, especially Options 3 and 6, which use FMEF as a support facility for FFTF.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2604: Avi Weiner

2604-1—I support the restart of FFTF for radioisotopes.

Response to Commentor No. 2604

2604-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

**Commentor No. 2611: Gerald Woodcock
American Nuclear Society**

2611-1—FFTF needs to be restarted for several reasons, the principal one of which is that people right now today are dying due to the lack of radionuclides and the radioisotopes necessary for their treatment for not only cancer, but for a variety of brain studies, bone studies, and other medical procedures.

2611-2—The EIS needs to consider the cost to, not only American society, but to civilization around the world if FFTF does not operate and if its products are not made available.

Response to Commentor No. 2611

2611-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

2611-2: The estimated costs of the range of reasonable alternatives are presented in the Cost Report, summarized in Appendix P of the Final NI PEIS. However, the Cost Report is not a cost-benefit analysis. While it is reasonable to believe that the benefits of medical isotopes are substantial, the purpose of this NI PEIS is to describe the nuclear infrastructure missions (Section 1.2 of Volume 1), a range of reasonable alternatives for satisfying the mission requirements (Section 2.5 of Volume 1), and the environmental impacts that would result from implementation of the alternatives. According to 40 CFR Section 1502.23, if a cost-benefit analysis exists, it must be reported and summarized in the NI PEIS.

Comments from the Richland, Washington, Public Hearing (August 31, 2000)

Commentor No. 2587: Richard O. Zimmerman

2587-1—I attended last night's hearing in Seattle and the comments regarding the hidden code words really intrigued me. That was spoken by the wonderful tie-dyed gentleman that typically always attends and is featured for sending jam to famous people. Anyway, it piqued my curiosity. And with the aid of the CD-ROM, I was able to analyze when I got home from Seattle today a code word for myself buried within the PEIS. I counted this particular word 386 times in the draft PEIS. I went through the entire document. Not just the summary, as it appears maybe some people did for comments today. Though largely combined with other words, the word stands as a strong reminder of the responsibility of the DOE and associated contractors no matter what EIS alternative is chosen. Let me now state what the code word is in the forms it is provided in the PEIS. Safety, public safety, environmental safety, safety of workers, safety shipments, nuclear safety, plant safety, criticality safety, system safety, operational safety, safety features, reactor safety, safety performance, safety design, safety considerations, safety factors, health and safety, safety structures, safety impacts, safety rods, safety and reliability, safety analysis, safety and security, safety technologies, safety significance, federal safety objectives, safety basis, safety impact, and finally safety laws. This code word is not hidden from view. It is one that I truly believe every FFTF employee holds dear to their heart

2587-2—...and I come in support of the restart of FFTF.

The additional oral comment was submitted in written form and is addressed in the response to Commentor No. 396.

Response to Commentor No. 2587

2587-1: DOE notes the commentor's view on the priority of safety to FFTF employees.

2587-2: DOE notes the commentor's support for Alternative 1, Restart FFTF.
