- 1148-2:** DOE notes the commentor's concern regarding waste generation. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS assumes, for the purposes of analysis, that Yucca Mountain Nevada, would be the final disposal site for DOE's high-level radioactive waste and spent nuclear fuel. As directed by the U.S. Congress through the Nuclear Waste Policy Act, as amended, Yucca Mountain is the only candidate site currently being characterized as a potential geologic repository for high-level radioactive waste and spent nuclear fuel. DOE has prepared a separate EIS, "Draft Environmental Impact Statement for a Geologic Repository for the Disposal of Spent Nuclear Fuel and High Level Radioactive Waste at Yucca Mountain, Nye County, Nevada" DOE/EIS-0250D, July 1999), which analyzes the environmental impacts from construction, operation and monitoring, related transportation, and eventual closure of a potential geological repository.

- 1148-3:** DOE notes the commentor's interest in alternative energy sources, although issues of research and development of alternative energy sources are beyond the scope of this Nuclear Infrastructure PEIS. The DOE missions to be addressed in this EIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development, can currently only be met using nuclear reactor or accelerator technologies.

Public comment on Nuclear Infrastructure Draft Programmatic
Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

*We need renewable energy sources
I am opposed to the disastrous environmental
consequences of nuclear waste.*

Name Todd Ransford, Ph.D
Address 3105 NE 35th Place
City, state Portland OR Zip 97212

1149-1

1149-2

Response to Commentor No. 1149

1149-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1149-2: DOE notes the commentor's interest in alternative energy sources and concern over nuclear waste, although issues of research and development of alternative energy sources and the cleanup of existing nuclear waste sites are beyond the scope of this Nuclear Infrastructure PEIS. The DOE missions to be addressed in this EIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development, can currently only be met using nuclear reactor or accelerator technologies.

As discussed in Chapter 4 of Volume 1 (e.g. sections 4.3.1.1.13, 4.3.2.1.13, 4.3.3.1.13), waste will be generated by all of the alternatives, including the No Action Alternative. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. DOE activities associated with this program would not impact the schedule or available funding for existing cleanup activities at candidate sites for implementation of nuclear infrastructure alternatives.

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

ANY ACTIVITY OTHER THAN COMPLETE CLEANUP AT HANFORD IS A CRIME AGAINST HUMANITY LET ALONE TO OTHER SPECIES OTHER SOURCES MUST BE CONSIDERED FOR MEDICAL ISOTOPES. THE FFTF ENVIRONMENTAL IMPACT STATEMENT MUST ADDRESS THE ENTIRE HANFORD COMPLEX - ITS SAFETY - GROUND SEEPAGE FROM LEAKING CONTAINERS ETC. IT HAS BEEN PUBLICLY STATED THAT THE SILENT WILL NEVER BE CLEANABLE.

Name Christopher Ann (CHRISTOPHER ANN)
Address 748-A NE 76th Ave
City, state PORTLAND, OR Zip 97213

Response to Commentor No. 1150

- 1150-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
 - 1150-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford and the risk of contamination to the Columbia River. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
 - 1150-3: The United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements.
- Supplies of many research isotopes are not readily available from existing domestic or foreign sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed. Under the NI PEIS proposed action and consistent with its mandates under the Atomic Energy Act, DOE would enhance its existing nuclear facility infrastructure to, among other things, more effectively support production of radioisotopes for medical applications and research. DOE's intent is to complement commercial sector capabilities to ensure that a reliable supply of isotopes is available in the United States to meet future demand, and to encourage the commercial sector to privatize the production of isotopes that have established applications to a level that would support commercial ventures. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.
- 1150-1
 - 1150-2
 - 1150-3
 - 1150-4

- 1150-4: The purpose of this NI PEIS is to evaluate the environmental impacts of reasonable alternatives to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238 for NASA space missions, and nuclear

Commentor No. 1150: Christopher Ann (Cont'd)

Response to Commentor No. 1150

research and development. It is beyond the scope of this NI PEIS to consider other site-wide issues of safety and environmental contamination, as mentioned by the commentor, which neither affect nor are affected by the alternatives under consideration. Section 3.4.9.4 of Volume 1 does provide a discussion of the accident history of the Hanford Site as it relates to existing human health risk. Ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The cumulative impacts of the alternatives evaluated at each of the candidate sites are presented in Section 4.8 of Volume 1.

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because: *It's*

extremely dangerous (for thousands of years) there's no rational solutions for dealing with the nuclear waste already in existence, much less future waste, it's totally unnecessary, a corrupt rogue technology, incredibly expensive and sets a bad example to the world.

Name Rayner Ward
Address 2235 N. Alberta St.
City, state Portland, OR Zip 97217

Response to Commentor No. 1152

- 1152-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 1152-2:** DOE notes the commentor's concern regarding waste generation. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS assumes, for the purposes of analysis, that Yucca Mountain Nevada, would be the final disposal site for DOE's high-level radioactive waste and spent nuclear fuel. As directed by the U.S. Congress through the Nuclear Waste Policy Act, as amended, Yucca Mountain is the only candidate site currently being characterized as a potential geologic repository for high-level radioactive waste and spent nuclear fuel. DOE has prepared a separate EIS, "Draft Environmental Impact Statement for a Geologic Repository for the Disposal of Spent Nuclear Fuel and High Level Radioactive Waste at Yucca Mountain, Nye County, Nevada" DOE/EIS-0250D, July 1999), which analyzes the environmental impacts from construction, operation and monitoring, related transportation, and eventual closure of a potential geological repository.

- 1152-3:** DOE notes the commentor's opposition to restart of the FFTF. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action. The NI PEIS evaluates the environmental impacts of a range of

Response to Commentor No. 1152

reasonable alternatives for accomplishing DOE's mission. In addition to restarting the FFTF, the NI PEIS also evaluates alternatives that would either employ the use of existing facilities or rely on the construction of new facilities. Potential cost impacts associated with these alternatives are presented in an ancillary report.

Commentor No. 1152: Rayner Ward (Cont'd)

Commentor No. 1153: John F. Perfect

Response to Commentor No. 1153

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

Having been involved with Nuclear reactor since 1963 been both Navy Nuclear and Civilian operator (SRO) and DOE Certified. I am acutely aware of the impact of losing capabilities and competent staff on nuclear research and production. I feel our country must stay active and competent in nuclear technology for the present and future of our country. The FFTF is one of the last vestiges of engineering and technology at its best. Therefore it is worthy of being held active and available for entering our knowledge and experience (training and operation) besides the benefits that the medical research and technology provide.

We need FFTF, please restart it!

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

- attending public meetings and giving your comments directly to DOE officials
- returning this comment form to the registration desk at the meeting or to the address below
- calling toll-free and leaving your comments: 1-877-562-4593
- faxing your comments toll-free to: 1-877-562-4592
- commenting via e-mail: Nuclear.Infrastructure-PEIS@hq.doe.gov

1153-1

1153-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

FINAL Programmatic Environmental Impact Statement
for Accomplishing Expanded Civilian Nuclear Energy
Research and Development and Isotope Production Missions in the
United States, Including the Role of the Fast Flux Test Facility

Volume 3 Book 2—Comment Response Document

Cover photograph and illustration identification, beginning at top center and going clockwise:

- Radioisotope tagged monoclonal antibodies, “smart bullets,” target malignant cells for diagnosis and treatment of diseases
- The Fast Flux Test Facility at the Hanford Site near Richland, Washington
- Illustration of a satellite that could use radioisotope power systems
- The High Flux Isotope Reactor at the Oak Ridge National Laboratory near Oak Ridge, Tennessee
- The Advanced Test Reactor at the Idaho National Engineering and Environmental Laboratory near Idaho Falls, Idaho
- Tip of a remote-handling arm, used for work in developing industrial and medical isotopes

AVAILABILITY OF THE FINAL NI PEIS

General questions regarding this PEIS or for a copy of this PEIS, please contact:

Reader's Guide

Volume 3, the *Comment Response Document*, is organized into three chapters:

- Chapter 1 - Overview of the Public Comment Process and the Comment Response Document
- Chapter 2 - Written Comments and DOE Responses
- Chapter 3 - Oral Comments Presented at the Public Hearings and DOE Responses

These chapters are divided among the three books of Volume 3 as follows:

- Book 1 - Chapter 1 and Chapter 2 (pages 2-1 through 2-931)
- Book 2 - Chapter 2 (pages 2-932 through 2-1914)
- Book 3 - Chapter 2 (pages 2-1915 through 2-2344) and Chapter 3

Chapter 1, “Overview of the Public Comment Process and the Comment Response Document,” summarizes key issues raised during the comment period on the Draft NI PEIS. It also identifies major changes made to this NI PEIS after publication of the Draft in response to these comments and incorporates new information that was unavailable at the time of the issuance of the Draft NI PEIS.

Chapter 2, “Written Comments and DOE Responses,” provides a side-by-side display of the written comments received (full-text reproductions) and DOE’s responses. Individual comments are numbered in the margins of the comment document, and DOE responses to each numbered comment are provided on the right side of each page.

The comment document numbers in Chapter 2 are in ascending order but are not sequential. Each comment document was assigned a sequential log number as it was received. When the same comment document was submitted by many individuals, it was designated as a campaign. The campaigns were grouped together for the purpose of responding to comments, and do not appear in numerical order.

Chapter 3, “Oral Comments Presented at the Public Hearings and DOE Responses,” provides a side-by-side display of the oral comments presented at the public hearings and DOE’s responses. The speakers’ names appear alphabetically by hearing location. Commentors who submitted their oral presentations in writing will find their submittals and DOE’s responses in Chapter 2.

To Find a Specific Comment Document and DOE Response

Refer to the “List of Commentors” immediately following the Volume 3 Table of Contents. This list is organized alphabetically and contains the corresponding page number(s) to find the comment document. The public officials, organizations, and interest groups appear first, then individuals are listed. City and state government bodies are listed under “City of” or “State of.” Members of Congress are listed alphabetically under “Members of Congress.”

DOE has made a good faith effort to interpret the spelling of names that were either written on comments or were recorded on the telephone comment line.

Chapter 1

Overview of the Public Comment Process and the Comment Response Document

Chapter 1

Overview of the Public Comment Process and the Comment Response Document

In July 2000, the U.S. Department of Energy (DOE) published the *Draft Programmatic Environmental Impact Statement for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the United States, Including the Role of the Fast Flux Test Facility (Nuclear Infrastructure Programmatic Environmental Impact Statement [NI PEIS])*. In accordance with the Council on Environmental Quality (CEQ) and DOE National Environmental Policy Act (NEPA) regulations, a Federal Register notice (65 FR 46443) announced the availability of the Draft NI PEIS and invited interested parties to provide comments. The Draft NI PEIS or Summary was distributed to approximately 6,000 individuals.

1.1 THE PUBLIC COMMENT PROCESS

NEPA regulations mandate a minimum 45-day comment period after the U.S. Environmental Protection Agency's (EPA) Notice of Availability of a draft EIS to provide an opportunity for the public to comment on the EIS analysis and results. The 45-day comment period on the Draft NI PEIS began on July 28, 2000, and to provide interested parties with additional time to comment, the deadline for transmittal of comments was changed from September 11, 2000 (as stated in the transmittal letter of the Draft NI PEIS and the Summary), to September 18, 2000. While the official comment period ended on September 18, 2000, DOE addressed late comments to the extent practicable and considered all comments received through October 31, 2000, in preparing the final NI PEIS. Comments that were received through September 25, 2000, along with corresponding responses, have been included in Chapter 2 of this volume. Direct responses are not included to comments that were received after September 25, 2000. However, all of these comments were considered and are characterized by other comments received during the comment period (for which a response has been provided).

1.2 PUBLIC HEARING FORMAT

During the 52-day comment period, DOE held seven hearings to discuss the proposed action and to receive oral and written comments on the Draft NI PEIS. The hearings were held near the locations that would be affected by the proposed alternatives, as well as some additional locations in Oregon and Washington in response to stakeholder requests. In addition, a hearing was held in the Washington, D.C. area. The hearing schedule and estimated attendance at each hearing are presented in **Table 1-1**. These attendance estimates are based on the number of registration forms completed and returned to DOE at each hearing, as well as a rough "head count" of the audience, and may not include all those present.

Table 1-1 Hearing Schedule and Attendance

Hearing Location	Date	Estimated Attendance
Oak Ridge, Tennessee	August 22, 2000	15
Idaho Falls, Idaho	August 25, 2000	20
Hood River, Oregon	August 28, 2000	265
Portland, Oregon	August 29, 2000	320

An independent facilitator was present at each hearing to direct and clarify discussions and comments. A comment recorder also was present at each hearing to record the proceedings. At the hearings in Oregon and Washington, a second comment recorder was available in a separate room to receive comments from attendees who were not able to attend the entire session, or who wanted to give their comments and leave. Transcripts of the hearings are available in DOE public reading rooms and libraries listed in Chapter 7 of Volume 1.

DOE representatives were available to meet with the public for informal discussions prior to and after the hearings. In an effort to encourage interaction between members of the public and DOE representatives, DOE used an interactive format for the hearings. The format included a presentation, question and answer session, and a comment session. Each hearing opened with a welcome from the facilitator, followed by a presentation on the proposed action by a DOE representative. Next, the facilitator opened the question and answer session to give the audience a chance to ask questions about the material presented. This was followed by the comment session, during which attendees were randomly selected to provide their comments. Attendees received a numbered ticket from the staff at the registration table and the facilitator picked the tickets from a container to determine the order of speakers. To ensure that all attendees were given an opportunity to provide comments, each speaker was limited to 5 minutes. Those commentators who needed additional time were invited to speak again after everyone had an initial opportunity to provide their comments. Modifications to the format were made at each of the public hearings to fulfill any special requests of attendees.

1.3 COMMENTS ON THE DRAFT NI PEIS

The public was encouraged to submit comments on the Draft NI PEIS to DOE via U.S. mail, e-mail, telephone, fax, and at the public hearings. DOE received approximately 3,400 submittals containing over 6,200 comments addressing a wide range of issues. A number of written comments submitted during the hearings were also presented orally; those comments were counted once. All comments submitted to DOE during the comment period were given equal consideration in preparation of the Final NI PEIS. Comments determined to be beyond the scope of the NI PEIS were forwarded to the appropriate DOE office for consideration. **Table 1–2** lists the number of comments received by method of submission.

Table 1–2 Comment Submission Method

Method	Number of Submittals
U.S. mail	2,493
E-mail	332
Telephone	107
Fax	92
Comments submitted at hearings	439
Total	3,463

Upon receipt, all written submittals were date-stamped and assigned a sequential log number used in tracking during the comment response process. Oral comments presented at the hearings were similarly identified and assigned a sequential log number. All comments were then processed through the comment analysis and response system for inclusion in this document. Each comment was assigned to a specific category to facilitate response and provide an overview of the type of comments that DOE received. Documents identical in content are presented only once (e.g., a written comment that was presented orally at a hearing). Campaigns (e.g., identical comments submitted by numerous individuals) likewise are presented and responded to only once. However, campaign documents with additional comments are responded to separately. The comment categories are shown in **Table 1–3**.

Table 1–3 Comment Categories

Accelerator Design	Miscellaneous Cost Issues
Air Quality	NEPA Process (extension of comment period, public participation, availability of information, completeness of overall analysis, additional hearings, etc.)
Alternative 1 - Restart FFTF	No Action Alternative
Alternative 2 - Use Only Existing Operational Facilities	Noise
Alternative 3 - Construct New Accelerator(s)	Nonproliferation
Alternative 4 - Construct New Research Reactor	Nuclear Energy Research and Development
Alternative 5 - Permanently Deactivate FFTF (with no new missions)	Oak Ridge Reservation Site Issues
Applicable Laws, Regulations, and Other Requirements	Policy
Cost of Alternatives	Preferred Alternative
Cultural and Paleontological Resources	Processing Facilities
Cumulative Impacts and General Environmental Impacts	Production of Medical and Industrial Isotopes
Ecological Resources	Production of Plutonium-238
Environmental Justice	Public and Occupational Health and Safety - Facility Accidents
Existing Human Health Risks	Public and Occupational Health and Safety - Normal Operations
FFTF Investment	Purpose, Need, and Timing of Missions
General Alternative Issues (alternatives considered but dismissed, new alternatives, etc.)	Reactor Design
General Irradiation Needs	Relationship to Other DOE Programs
General Antinuclear	Scoping
Generic Support Facility Design	Socioeconomics
Geology and Soils	Transportation (incident-free and accidents)
Hanford Site Issues	Visual Resources
Idaho National Engineering and Environmental Laboratory Site Issues	Waste Management (includes spent fuel issues)
Irradiation Facilities	Water Resources
Land Resources	

Chapter 2 contains the comments (submitted in writing and by telephone) and the DOE responses presented in a side-by-side format, with each delineated comment receiving a separate response. Not all responses appear directly next to their corresponding comment due to the varying lengths of each response. However, all comments and responses are numbered with a comment identification number to facilitate matching a comment with its response. Where commentors presented support for, or opposition to, a specific alternative, this was noted. Where commentors provided additional statements supporting their positions, DOE responded in detail to those that needed clarification or were in error.

Chapter 3 contains the comments that were submitted during oral presentations at the public hearings held in August and September 2000. The chapter is organized alphabetically by speaker's name according to the hearing location. The format and response procedures used in Chapter 2 were followed in Chapter 3.

Commentors who submitted their oral presentations in writing will find their submittals and responses in Chapter 2. The full transcripts from each hearing are available at DOE reading rooms and libraries listed in Chapter 7 of Volume 1.

An alphabetical List of Commentors with corresponding page numbers has been provided immediately following the Volume 3 Table of Contents to assist the reader in finding specific comment documents and

DOE responses. Public officials, organizations, and interest groups appear first, then individuals are listed. City and state government bodies are listed under “City of” or “State of.” Members of Congress are listed alphabetically under “Members of Congress.”

1.4 ENVIRONMENTAL PROTECTION AGENCY RATING OF THE NI PEIS

EPA reviewed and rated the Draft NI PEIS as Environmental Concerns - Insufficient Information (EC-2). To a large extent, a lack of information in the Draft NI PEIS was the basis for their environmental concerns. EPA was also concerned that the cost and nonproliferation reports were not made available to the public until well into the comment period on the Draft NI PEIS. A copy of the EPA rating is included among the written comments in Chapter 2 of this volume.

1.5 ISSUES RAISED DURING THE PUBLIC COMMENT PERIOD ON THE DRAFT NI PEIS

During the public comment period on the Draft NI PEIS, DOE received approximately 3,400 submittals containing over 6,200 comments addressing a wide range of issues. DOE considered comments received after the close of the public comment period to the extent practicable (see Section 1.5.6).

The following discusses the major issues raised, and DOE’s responses to these issues. Changes made in response to comments received on the Draft NI PEIS are described in Section 1.6.

Major issues raised addressed purpose and need for the proposed action; impact of FFTF on Hanford cleanup; waste management and spent nuclear fuel; cost of the various alternatives; nuclear nonproliferation policy; public involvement; and environmental impacts. Aside from comments on the proposed action and its environmental impacts, many commentors expressed support for or opposition to FFTF restart, the major point of public controversy associated with the NI PEIS.

1.5.1 Purpose and Need for the Proposed Action

Many commentors expressed the opinion that DOE failed to demonstrate a compelling argument for the projected need for medical isotopes, and that such medical isotopes could be produced or purchased elsewhere, particularly in Canada. In contrast, a large number of commentors expressed support for expanded isotope production by sharing personal stories of how medical isotopes had either saved a relative or friend, or could have saved them had isotopes been available. As presented in Section 1.2.1 of Volume 1, DOE sought independent analysis of trends in the use of medical isotopes, and established two advisory bodies, the Expert Panel and the Nuclear Energy Research Advisory Committee (NERAC). DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. While Canada currently provides a large amount of the medical radioisotopes used in the United States, it only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS.

A number of commentors also questioned the suitability of using FFTF for producing research isotopes in light of findings presented in the NERAC Subcommittee for Isotope Research and Production Planning Report. While it would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if FFTF were operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. In recognition of these

constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF for isotope production when coupled with these other missions.

Commentors also questioned the need for the United States to reestablish domestic production of plutonium-238. In particular, commentors pointed to the availability of plutonium-238 that could be purchased from Russia, and recent guidance from NASA stating that DOE no longer needed to support certain radioisotope power systems. As discussed in Section 1.2.2 of Volume 1, DOE could purchase plutonium-238 from Russia. However, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Current NASA guidance to DOE is also discussed in Section 1.2.2. The May 22, 2000, correspondence from NASA identifies that it no longer has a planned requirement for Small Radioisotope Thermoelectric Generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, SRTG development efforts were stopped in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling radioisotope power systems technology generator. This new radioisotope power system, referred to in the subject correspondence, requires one-third less plutonium as its fuel source. Because the Stirling radioisotope power systems technology is developmental, NASA has requested in a September 22, 2000, letter to DOE that the plutonium-238 needed for a large radioisotope thermoelectric generator be maintained as a backup.

1.5.2 Impact of FFTF Restart on Hanford Cleanup

A number of commentors expressed concern that DOE's primary mission at Hanford needs to be cleanup, including compliance with the Tri-Party Agreement. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford environmental restoration activities are conducted in accordance with the Tri-Party (i.e., DOE's Richland Operations Office, EPA, and the State of Washington Department of Ecology) Agreement. This agreement specifies milestones and schedules for restoration of all parts of Hanford. FFTF milestones in the Tri-Party Agreement were placed in abeyance (suspension) by agreement of the three parties until a decision is made on the future of FFTF. Public meetings were held on this formal milestone change. DOE is fully committed to honoring this agreement.

A number of commentors also expressed concern that funding for Hanford cleanup would be diverted for FFTF restart and hamper the progress of cleanup activities. The U.S. Congress funds Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM). Congress also funds FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded through NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2 of Volume 2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

1.5.3 Waste Management and Spent Nuclear Fuel

A number of commentors expressed concern over the generation and disposition of waste resulting from the proposed action. In particular, commentors pointed to past DOE waste management practices and questioned whether wastes resulting from proposed NI PEIS activities would be properly managed. The NI PEIS addresses wastes produced for each alternative, as well as cumulative impacts related to waste production. Waste minimization programs at each of the alternative sites are also addressed. These programs would be implemented for the alternative selected in the Record of Decision. The waste generated from any of the alternatives considered in the NI PEIS would be managed (i.e., treated, stored, and disposed of) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

A number of commentors expressed specific concern over the generation and disposition of waste resulting from FFTF restart and operation, and how this would impact Hanford's existing waste management infrastructure. Management of wastes that would be generated under implementation of Alternative 1 (Restart FFTF) is discussed in Section 4.3 of Volume 1 (e.g., Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that the Hanford waste management infrastructure is analyzed in this NI PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, *Radioactive Waste Management*, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical, or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Sections 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in the Fuels and Materials Examination Facility (FMEF) and how this waste would be managed at the site.

A number of commentors also raised concern that processing of irradiated targets for production of plutonium-238 would generate high-level radioactive waste. DOE Manual 435.1, *Radioactive Waste Management*, defines high-level radioactive waste as "the highly radioactive waste material resulting from the reprocessing of spent nuclear fuel, including liquid waste produced directly in reprocessing and any solid material derived from such liquid waste that contains fission products in sufficient concentrations; and other highly radioactive material that is determined, consistent with existing law, to require permanent isolation." DOE has prepared an implementation guide to M 435.1 to assist in implementing the requirements contained in that manual. For this particular "requirement," the definition of high-level radioactive waste, the guide is intended to facilitate the classification of indefinite waste as to whether or not they are high-level radioactive waste. It is recognized that the definition of high-level radioactive waste is not precise and is essentially a source-based definition that also alludes to concentrations of a given waste stream. Page II-8 of the guide notes that "For the purpose of managing high-level waste under DOE M 435.1-1 [sic], spent nuclear fuel includes spent driver elements and/or irradiated target elements that contain transuranium elements." This statement was included in the guide because the concentrations of long-lived isotopes are likely to be somewhat high during reprocessing and it also meets the source-based definition. As a result of reviewing this guide and to address the comments raised, DOE is considering whether the waste from processing of irradiated neptunium-237 targets should be classified as high-level radioactive waste and not transuranic waste. As a result, the Waste Management sections (i.e., Sections 4.3.1.1.13, 4.3.2.1.13, 4.3.3.1.13, and 4.4.3.1.13) of this NI PEIS have been revised to reflect this different classification from what was assumed in the Draft NI PEIS. As discussed in these revised sections, irrespective of how the waste is classified (i.e., transuranic or high-level radioactive waste), the composition and characteristics are the same, and the waste management (i.e., treatment and onsite storage) for this NI PEIS would be the same. In addition, even if the waste were managed as high-level radioactive waste, it would have no impact on the existing high-level radioactive waste management infrastructure (e.g., high-level waste storage tanks) because the high-activity waste from processing the targets would be initially stored and vitrified within the processing facility (i.e., FMEF, the Radiochemical Engineering Development Center [REDC], or the Fluorinel Dissolution Process Facility [FDPF]).

Commentors also expressed concern over the potential impacts of spent nuclear fuel generation from FFTF restart and operation, particularly regarding human health risk. This NI PEIS estimates that about 16 metric tons of heavy metal spent nuclear fuel would be generated over 35 years of operation of FFTF. Hanford is currently managing about 2,000 metric tons of heavy metal spent nuclear fuel. As indicated in Table 4-173, the radiation risk to a maximally exposed individual from normal operational activities during management of the current stored nuclear fuel over 35 years is 1.4×10^{-8} latent cancer fatality. The risk to the maximally exposed individual that would be associated with the new nuclear infrastructure operations to restart FFTF and operate FMEF or the Radiochemical Processing Laboratory is 9.5×10^{-8} latent cancer fatality. Furthermore,

only a small fraction of this risk would be attributable to management of the additional spent nuclear fuel at FFTF. The annual dose to the maximally exposed individual from all current and reasonably foreseeable activities is less than 0.2 millirem. This dose is well within the DOE dose limits given in DOE Order 5400.5, *Radiation Protection of the Public and the Environment*. As discussed in that order, the dose limit from airborne emissions is 10 millirem per year, as required by EPA regulations under the Clean Air Act; the dose limit from drinking water is 4 millirem per year, consistent with the EPA drinking water criteria under the Safe Drinking Water Act; and the dose limit from all pathways combined is 100 millirem per year. The risk to the population from all activities at Hanford would be 0.21 latent cancer fatality over 35 years. DOE has committed to remove the spent nuclear fuel at Hanford for ultimate disposition in a geologic repository.

1.5.4 Cost of the Various Alternatives

Commentors expressed opinions about the costs related to the stated missions. Commentors stated that a cost-benefit analysis was necessary to show the value of production of medical isotopes balanced against facility costs, in particular, the restart of FFTF, and noted that perhaps facilities would be able to pay for themselves. There were concerns that FFTF restart would take funds away from the cleanup of Hanford. Commentors noted that the decommissioning costs were not included for the restart FFTF option in the *NI Cost Report*. Several commentors remarked that the expense of plutonium-238 production cannot be justified when DOE needs to clean up existing problems at its sites.

Although the costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS, DOE prepared a separate *NI Cost Report*. This report would provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in this Final NI PEIS. Pursuant to CEQ regulations (40 CFR Section 1505.1(e)), such a document comparing alternatives should be made available to the public prior to any decision being made. DOE mailed this document to more than 730 interested parties on August 24, 2000. This report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided the summary of the *NI Cost Report* in Volume 2, Appendix P, in this Final NI PEIS.

1.5.5 Nuclear Nonproliferation Policy

Commentors expressed opinions about the nuclear nonproliferation implications of the proposed action. Commentors were concerned about keeping plutonium-238 out of the hands of third parties, and it was suggested that the purchase of plutonium-238 from Russia would stop proliferation of the material and the United States would know the disposition of the quantity purchased. Several commentors raised concerns about specific facilities described in the NI PEIS, including FDPF and FFTF. The use of highly enriched uranium fuel in FFTF was questioned related to a possible violation of U.S. nuclear nonproliferation policy. Conversely, the shutdown of FFTF that occurred previously was characterized as being done to discourage proliferation of nuclear weapons worldwide, but had instead weakened the U.S. position as a world leader in nuclear technology. There were comments about the timeliness of release of the *NI Nonproliferation Impact Assessment*, that no nonproliferation information was included in the Draft NI PEIS, and that nuclear nonproliferation policy should be considered by DOE in selection of its preferred alternative.

The plutonium being considered for production in this NI PEIS is plutonium-238, which is not the same isotope of plutonium that is used in nuclear weapons. The production of plutonium-238 does not present a nonproliferation concern. DOE developed the separate *NI Nonproliferation Impact Assessment*, published in September 2000, that analyzed the nonproliferation impacts of the actions considered in this PEIS and found that there are no U.S. nonproliferation policies, laws, regulations, or international agreements that preclude the use of any of the facilities in the manner described in the Draft NI PEIS. Although this policy analysis is not required under NEPA, it is an essential element in the decision-making process for the DOE nuclear

infrastructure. A summary of the *NI Nonproliferation Impact Assessment* is included in Volume 2, Appendix Q, of this Final NI PEIS. It is also available on the DOE NE web site (<http://www.nuclear.gov>).

1.5.6 Public Involvement

Commentors expressed opinions about the length of the comment period on the Draft NI PEIS, and said they wanted additional time to obtain and review relevant documents, including the *NI Cost Report* and *NI Nonproliferation Impact Assessment*. As identified in Section 1.1, the deadline for transmittal of comments was changed from September 11, 2000, to September 18, 2000 (as stated in the transmittal letters of the Draft PEIS and the Summary). While the official comment period ended on September 18, 2000, DOE addressed late comments to the extent practicable and considered all comments received through October 31, 2000, in preparing this Final NI PEIS. Comments that were received through September 30, 2000, along with corresponding responses, have been included in Chapter 2 of this volume. Direct responses are not included to comments that were received after September 30, 2000. However, all these comments were considered and are characterized by other comments received during the comment period (for which a response has been provided).

Many commentors expressed the opinion that public input is intended for “show only,” and that DOE has already made its decisions. Commentors also stated that they had given the same comments over and over again and that DOE representatives were not listening. DOE policy encourages effective public participation in its decision-making process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered all comments received from the public.

Some commentors expressed opinions about the conduct of the hearings, both positive and negative. The public hearing format was designed to be fair. The public hearing format used was based on stakeholder input and was presented in the Notice of Availability (65 FR 46443 et seq.) for the Draft NI PEIS. This format was intended to encourage public participation, regardless of the motivation for attending the hearing. It provided an opportunity for the participants to meet one another, exchange information, and share concerns, with DOE personnel available throughout the course of each hearing to answer questions. The meetings were facilitated by an independent moderator to ensure that all persons wishing to speak had an opportunity to do so. Persons wishing to comment were selected at random from the audience rather than according to the order in which they registered. This was accomplished by a random number drawing. In addition to the comment recorder stationed at the main hearing, a second recorder was available in an adjacent room to receive comments without the need to await selection at the main proceeding. The hearing format promoted open and equal representation by all individuals and groups.

1.5.7 Environmental Impacts

A number of commentors questioned the results of the environmental impact analysis and cumulative impacts, specifically at Hanford. Many of these comments focused on concerns that the proposed action would result in negative impacts to the health of individuals residing in the Hanford region. The NI PEIS analyzes the impacts of the various alternatives, and the environmental impacts associated with all proposed nuclear infrastructure activities are addressed in detail in Chapter 4 of Volume 1. Specifically, the environmental impacts associated with operation of the Hanford facilities during normal operations and from postulated accidents are presented in Section 4.3. These assessments were made using well-established and accepted analytical methods, as described in Appendixes G through L in Volume 2. The analytical methodology is conservative by nature; the actual impacts to the environment would be expected to be less than calculated. All impacts have been shown to be small. No fatalities among workers or the general public would be

expected over the 35-year operational period. The impacts to the biosphere (air, water, and land) were also evaluated and determined to be small.

Some commentors raised specific concern over potential contamination of the Columbia River resulting from the restart of FFTF. However, FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

A number of commentors also expressed concern that DOE would expose individuals in the Pacific Northwest to risks associated with importing of weapons-grade plutonium. None of the proposed alternatives involve the shipment of any weapons-grade plutonium to any port in the United States. Alternative 1 does postulate that DOE might decide at some point to import mixed oxide fuel from Europe to fuel FFTF. At this time, however, DOE has not proposed to import this fuel through any specific port. If DOE ultimately decides to import fuel from Europe, it would perform a separate NEPA analysis to select a port. This review would address all relevant potential impacts of overseas and inland water transportation, shipboard fires, package handling, land transportation, as well as safeguards and security associated with the import of SNR-300 mixed oxide fuel through a variety of specific candidate ports on the west and east coasts. It would take into account all public comments, including local resolutions, concerning the desirability of bringing mixed oxide fuel into the proposed alternative ports.

In the event that DOE decides to enhance its nuclear infrastructure, it would not expose any population to high, unacceptable risks under any alternative. Any transportation activities that would be conducted by DOE would comply with U.S. Nuclear Regulatory Commission (NRC) and U.S. Department of Transportation regulations. Associated transatlantic shipments would comply with International Atomic Energy Agency requirements. In Section J.6.2 of Volume 2, DOE reviewed the potential maximum impacts from the marine transportation of mixed oxide fuel from Europe to a representative military port (Charleston, South Carolina), and overland transportation to Hanford. Also in that section, the results of a bounding analysis show that the maximum potential radiological risks to the surrounding public from mixed oxide fuel shipments would be extremely small (e.g., less than 1 chance in a trillion for a latent cancer fatality per shipment from severe accidents at docks and in channels and less than 1 chance in 50 billion for a latent cancer fatality per shipment from overland highway accidents).

1.6 CHANGES FROM THE DRAFT NI PEIS

In response to comments on the Draft NI PEIS and as a result of information that was unavailable at the time of its issuance, this Final NI PEIS contains revisions and new information. These revisions and new information are indicated by sidebars. A brief discussion of the most important changes included in this Final NI PEIS is provided in the following paragraphs.

Chapter 1

Purpose and Need for Agency Action

As a result of public comments, additional discussion was incorporated to address DOE's production of medical, research, and industrial isotopes relative to global isotope production and availability. In addition, the discussion of the need for plutonium-238 production for space missions was expanded and updated to reflect the most recent planning guidance provided by NASA to DOE.

Issues Raised During the Public Comment Period on the Draft NI PEIS

Section 1.5, Issues Raised During the Public Comment Period on the Draft NI PEIS, was added to this Final NI PEIS.

Related NEPA Reviews

The Final NI PEIS was revised to add descriptions of the *Final Environmental Impact Statement, Management of Spent Nuclear Fuel from the K Basins at the Hanford Site, Richland, Washington* (DOE/EIS-0245F), and the *Environmental Assessment, Management of Hanford Site Non-Defense Production Reactor Spent Nuclear Fuel* (DOE/EA-1185). The impacts of these NEPA actions were factored into the assessment of potential cumulative impacts resulting from the NI PEIS proposed action.

This Final NI PEIS was also revised to reflect recent Records of Decision that have been issued for the *Final Environmental Impact Statement on a Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel* (DOE/EIS-0218F), the *Final Environmental Impact Statement for Treating Transuranic (TRU)/Alpha Low-Level Waste at the Oak Ridge National Laboratory, Oak Ridge, Tennessee* (DOE/EIS-0305), and the *Final Environmental Impact Statement for the Treatment and Management of Sodium-Bonded Spent Nuclear Fuel* (DOE/EIS-0306).

Changes from the Draft NI PEIS

Section 1.8, Changes from the Draft NI PEIS, was added to this Final NI PEIS.

Chapter 2

Transportation Requirements

Additional U.S. ports were named as candidates for receiving mixed oxide fuel from Europe.

Alternatives Considered and Dismissed

Information was provided to explain why the Isotope Production Facility at LANL, the Brookhaven LINAC (Linear Accelerator) Isotope Producer and the Alternating Gradient Synchrotron accelerator complex at Brookhaven National Laboratory, and CLWRs were not considered reasonable alternatives for the production of medical isotopes.

Information was also provided to explain why increasing the power levels at ATR and/or HFIR or installing rapid radioisotope retrieval systems would be insufficient to meet the long-term growth projection needs and therefore were dismissed as reasonable alternatives.

Preferred Alternative

The discussion of DOE's preferred alternative for accomplishing the proposed action, that is, Alternative 2, Use Only Existing Operational Facilities, Option 7, is included in this Final NI PEIS.

Summary of Environmental Impacts

Section 2.7 was revised in response to comments that it was difficult to compare environmental impacts among alternatives. Although estimates of the environmental impacts that would result from implementation of the

alternatives are the same as those in the Draft NI PEIS, the tables and accompanying text were reformatted for ease in comparing environmental impacts among alternatives and among options within alternatives. Section 2.7 was also revised to focus on incremental impacts that would result from implementation of the alternatives. Baseline environmental impacts were removed from the comparisons among alternatives and options. This information is now presented in Chapter 3.

Chapter 3

Affected Environment

Additional information was provided on the environmental baseline at each site, including graphics to more clearly illustrate existing surface water and groundwater conditions. Estimates of existing impacts for current HFIR/REDC operations were added to Sections 3.2.3.2 (Air Quality), 3.2.9.1.2 (Radiation Exposure and Risk), and 3.2.11.1 (Waste Inventories and Activities). Similarly, estimates for current ATR operations were added to Sections 3.3.3.2 (Air Quality), 3.3.9.1.2 (Radiation Exposure and Risk), and 3.3.11.1 (Waste Inventories and Activities). Estimates of existing impacts of maintaining FFTF in standby were added to Section 3.4.3.1 (Air Quality). Information was also provided on the impacts of the range fires affecting Hanford and INEEL during the summer of 2000. In addition, site data were updated to reflect recent measurements and analyses.

In response to public comments on the Draft NI PEIS, additional information on health studies conducted in the Hanford area was also incorporated.

Chapter 4

Air Quality

Stack parameters used for the air quality modeling were added. In response to public comment, estimates of the ambient air quality concentrations from FFTF sources were added to the deactivation section.

Water Resources

New water use and sanitary wastewater generation increments for REDC and FDPF were added to reflect the revised additional workforce required at these facilities and to be consistent with FMEF. Water use and wastewater generation rates for the new accelerator(s) and new research reactor alternatives were also revised. These changes were also incorporated into the waste management analyses.

Ecological and Cultural and Paleontological Resources

These sections were updated to reflect that consultations concerning threatened and endangered species and cultural resources were conducted with appropriate Federal and state agencies. Consultations were also conducted with interested Native American tribes. No major issues were raised as a result of these consultations.

Socioeconomics

Section 4.3.1.1.8 was revised to reflect changes in the number of workers associated with FFTF operations and deactivation. The associated impacts on community services were also incorporated. In addition, the number of workers at the Oak Ridge Reservation was revised to reflect the entire site workforce rather than just the number of workers at the Oak Ridge National Laboratory.

Normal Operations

Based on more recent site data on occupational radiation exposure for workers at REDC, all worker health impacts for target processing at REDC, FMEF, and FDPF and for neptunium target storage at REDC, Chemical Processing Plant–651, and FMEF were updated. Also, low-energy accelerator source terms were modified to properly reflect normal operational emissions resulting in modifications to the population health impacts for all options of Alternative 3.

Facility Accidents

The high-energy accelerator analysis was redone to incorporate a more accurate revised source term, and the incremental risks for currently operating reactors were added to the tables. An additional analysis addressing industrial accidents was also performed and incorporated into Chapter 4.

Transportation

The neptunium inventory was revised to use the recently declassified actual inventory. The number of actual shipments from SRS to the processing facilities and the transportation risk estimates were modified accordingly.

Waste Management

The analysis for the Draft NI PEIS assumed that the waste generated from the processing of irradiated neptunium-237 targets is transuranic waste. However, as a result of comments received during the public comment period, DOE is considering whether the waste from processing of irradiated neptunium-237 targets should be classified as high-level radioactive waste and not transuranic waste. The Waste Management sections (i.e., Sections 4.3.1.1.13, 4.3.2.1.13, 4.3.3.1.13, and 4.4.3.1.13) were revised to reflect this different classification from what was assumed in the Draft NI PEIS.

Spent Nuclear Fuel Management

These sections were revised to quantify the generation of spent fuel from 35 years of operation and to state that dry spent nuclear fuel storage at the FFTF site is similar to NRC-approved methods currently being used for interim storage of commercial spent nuclear fuel. In addition, based on public comments, a reference was added about the K Basins spent fuel storage.

Cumulative Impacts

Cumulative impact tables in Section 4.8 were revised to present the contributions from each of the various site actions anticipated during the course of the operational period evaluated in this NI PEIS.

The air quality tables were also revised to incorporate the revised baseline from Chapter 3. In addition, waste management tables were revised to include the sites' treatment, storage, and disposal capacities for easier comparison of the waste generations by waste type to the waste management capacities at the sites.

Chapter 5

In response to public comments, a list of organizations that DOE contacted during the consultation process was added.

Volume 2

Summaries of the *NI Cost Report* and *NI Nonproliferation Impact Assessment* were added as Appendixes P and Q, respectively. NASA mission guidance correspondence was added as Appendix R.

Volume 3

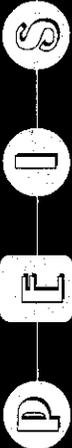

Volume 3 of the NI PEIS was added to present the comments received during the public review period for the Draft NI PEIS and DOE's responses to these comments.

Chapter 2

Written Comments and DOE Responses

Commentor No. 1154: R. T. Hirano

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

We need the FFTF, please restart it. As a taxpayer, we don't need political arguments, it might be slightly different design but in another state at billions of dollars to us. Let's get on with it!!

1154-1

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

- attending public meetings and giving your comments directly to DOE officials
returning this comment form to the registration desk at the meeting or to the address below
calling toll-free and leaving your comments: 1-877-562-4593
faxing your comments toll-free to: 1-877-562-4592
commenting via e-mail: NuclearInfrastructure-PEIS@hq.doe.gov

Response to Commentor No. 1154

1154-1: DOE notes the commentor's support for Alternative 1, Restart FFTF, and opposition to Alternative 4, Construct New Research Reactor. It should be noted that if Alternative 4 were selected in the Record of Decision, it could be built at any DOE site.

Commentor No. 1155: Duane H. Freeborn

Cellette E. Brown
NE 50 Dept. of Energy
19901 Germantown Rd.
Germantown, MD 20874

6675 SW Whistling Ct.
Benton, OR 97008
September 8, 2000

Dear Ms. Brown,

I'm writing to express my utter dismay that the question of starting FFTF is still being debated. We had papers have been posted the enormous bill to keep this aging reactor on standby status for too long already. It should be shut down permanently. What we really don't need in this area (Portland) is more nuclear waste when the job is done with existing, even more dangerous & waste-riches toward the Columbia River. (It may well already be a "hot" mine....)

I don't feel like the DOE has handled with the people about this issue. Medical isotopes can be secured from other areas; plutonium can be secured, and is already contracted for, from Russia.

Cleaning up Hanford's present waste is of the utmost importance. Living in the Portland area, this is a crucial health concern. Don't create more waste and waste-shut down FFTF.

Sincerely yours,
Duane H Freeborn

1155-1

1155-2

1155-3

1155-2

1155-1

Response to Commentor No. 1155

1155-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

1155-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1. No food or water restrictions are current in place outside the Hanford site as a result of Hanford activities.

1155-3: The United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily Molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Commentor No. 1156: Martin Wester

Draft PEIS Comment Form

I would like to see our local communities better themselves through FFE medically & business would thrive from this.

Also as a taxpayer, I understand the trade imbargo for medical cancer would improve health & economy.

The U.S.A. & Tri-city area of WA would both excel with FFE.

Thank-you for your time & sorry for my writing.

Martin Wester

1156-1

Response to Commentor No. 1156

1156-1: DOE notes the commentor's support for Alternative 1, Restart FFE.

I just wanted to make it clear that I prefer Option #5 to permanently deactivate FFTF with no new missions.

1158-1

Response to Commentor No. 1158

1158-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 1159: Anonymous (Cont'd)

Response to Commentor No. 1159

living near nuclear facilities, including the Hanford Site. Cancers are believed to be caused by a combination of hereditary and environmental factors, including radiological and chemical agents. In ongoing clinical testing, therapeutic radioisotopes have proven effective in treating cancers and other illnesses while minimizing adverse side effects, making their use an attractive alternative to traditional chemotherapy and radiation treatments.

1159-4: See response to comment 1159-1.

1159-5: DOE notes the commentor's interest in alternative energy sources, although issues of research and development of alternative energy sources are beyond the scope of this Nuclear Infrastructure PEIS.

1159-6: The commentor appears to express the concern that DOE would expose people in the Puget Sound area to risks associated with the transport of neptunium and plutonium. None of the proposed alternatives involve the shipment of any neptunium to the Puget Sound area. Alternative 1 does postulate that DOE might decide at some point to import mixed oxide fuel from Europe to fuel FFTF. At this time, however, DOE has not proposed to import this fuel through any specific port. If DOE ultimately decides to import fuel from Europe, it would perform a separate NEPA analysis to select a port. This review would address all relevant potential impacts of overseas and inland water transportation, shipboard fires, package handling, land transportation, as well as safeguards and security associated with the import of SNR-300 mixed oxide fuel through a variety of specific candidate ports on the east and west coasts. It would consider all public comments, including local resolutions, concerning the desirability of bringing mixed oxide fuel into the proposed alternative ports. In the event that DOE decides to enhance its nuclear infrastructure, it would not expose any population to high, unacceptable risks under any alternative. Any transportation activities that would be conducted by DOE would comply with U.S. Nuclear Regulatory Commission and U.S. Department of Transportation regulations. Associated transatlantic shipment would comply with International Atomic Energy Agency requirements. In Section J.6.2, DOE reviewed the potential maximum impacts from the marine transportation of mixed oxide fuel from Europe to a representative military port, Charleston, South Carolina, and overland transportation to Hanford. Also

Commentor No. 1159: Anonymous (Cont'd)

Response to Commentor No. 1159

in that section, a bounding analysis demonstrates that the maximum potential radiological risks to the surrounding public from mixed oxide fuel shipments would be extremely small (e.g., less than 1 chance in a trillion for a latent cancer fatality per shipment from severe accidents at docks and in channels and less than 1 chance in 50 billion for a latent cancer fatality per shipment from overland highway accidents).

Commentor No. 1160: Martha A. Plonk

Draft PEIS Comment Form

We need FFTE. Please restart it. The facility can produce isotopes for medical research and therapy. At present 2 universities are 90% dependent on foreign sources for these isotopes.

I repeat please help and use East Flux Test Facility we need our facility.

1160-1

Response to Commentor No. 1160

1160-1: DOE notes the commentor's support for Alternative 1, Restart FFTE. The commentor is correct in noting that the United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, supplies of many research isotopes are not readily available from existing domestic or foreign sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed. Under the NI PEIS proposed action and consistent with its mandates under the Atomic Energy Act, DOE would enhance its existing nuclear facility infrastructure to, among other things, more effectively support production of radioisotopes for medical applications and research. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

7/12/00

Commentor No. 1166: Darryl Bullington

Draft PEIS Comment Form

SEPT 7 2000

PERSONAL COMMUNICATION WITH A RESEARCHER AT ARGONNE NATIONAL LABORATORY REVEALED THAT METALLIC URANIUM FUEL IS DIMENSIONALLY UNSTABLE UNDER IRRADIATION.

IT APPEARS LITTLE HAS BEEN LEARNED FROM 50+ YEARS OF IRRADIATION STUDIES AS YOU ARE NOW BASING RESTART OF THE FFTF UPON USING HIGHLY ENRICHED URANIUM FUEL FOR FOURTEEN TO TWENTY-NINE YEARS (PAGE 9-13).

I URGE YOU TO PERMANENTLY DEACTIVATE THE FFTF (WITH NO NEW MISSIONS) AND TO PRODUCE NO MORE IRRADIATED FUELS AT THE SITE.

1166-1

1166-1: Metallic uranium nuclear fuel has been successfully used in power and research nuclear reactors worldwide for over 40 years. The nuclear fuel which would be used at FFTF is mixed oxide fuel until the available supply has been exhausted. Then, the fuel would be switched to highly enriched uranium (HEU) for years 22 to 35 (a period of 13 years). DOE has been safely using HEU in its research reactors for years; however, HEU would be used only if it is determined that low enriched uranium (LEU) is not technically feasible.

1166-2

1166-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF. The generation and disposition of spent nuclear fuel is analyzed in Section 4.3.1.1.14 of Volume 1 of the NI PEIS.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

Commentor No. 1169: Del Greenfield

495 N.W. Greenleaf Rd.
Portland OR 97109
September 6, 2000

Dear Colette Brown:

We urge the USDOE to stop the restart of FFTF and to close down the plant that is costing us citizens millions of dollars annually just to keep it open.

We don't need it. We don't want it. And it adds more nuclear waste that we can't get rid of.

Isn't it time your department started working for the people and not for the corporations that just want to make money? We don't consider these corporations to be patriotic!

Please respond.

Sincerely, Del Greenfield
Love Greenfield

Response to Commentor No. 1169

1169-1

1169-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.

1169-2

1169-2: DOE notes the commentor's concern regarding waste generation. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

1169-3

1169-3: DOE notes the commentor's viewpoint.

Commentor No. 1170: Tanja Ziegler

 Germantown,
 MD 20874-1290

Dear Colette E. Brown

7th September 2000

Re: DoE Plan for expanded production of Plu-238 for future space missions

I am writing to you to ask you to reconsider your plans for the establishment of new irradiation and processing facilities for Plu-238.

The plutonium production/fabrication process for space nuclear power missions has recently led to several worker contamination accidents. An expansion of production will only worsen the problem.

We are also concerned that increasing the number of launches of nuclear powered space devices from Cape Canaveral on rockets with a 10 % failure rate will only increase the possibility of a deadly mishap.

We believe NASA is not doing enough to develop alternative power sources. The European Space Agency (ESA) has now developed high-efficiency solar cells for deep space missions.

I am looking forward to your reply
 Yours sincerely

Tanja Ziegler

Response to Commentor No. 1170

1170-1

1170-1: DOE notes the commentor's opposition to the production of plutonium-238 concern for NASA's use of nuclear materials for space missions, and interest in the development of alternative energy sources for space missions, although issues such as NASA research priorities are beyond the scope of this PEIS. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch.

1170-2

1170-2: Plutonium-238 processing facilities can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Sections 4.2-4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from plutonium-238 processing, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that the radiological and nonradiological risks associated with plutonium-238 processing would be small.

1170-1

Commentor No. 1174: David H. Read

Response to Commentor No. 1174

- 1174-1: With respect to waste management and cleanup issues, the Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e. Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 1174-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 1174-3: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.
- 1174-4: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The schedule for vitrification of the high-level radioactive wastes currently stored in the high-level waste tanks is included in this agreement. Vitrification of these wastes is not within the scope of this NI PEIS.

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

*The value of the FFTF for
 production of medical isotopes and
 other purposes is unclear and
 its risk is quite clear.*

Sincerely,

Chris Wilson

Name *Christopher Wilson MD* Address *3832 43rd NE*

City *Seattle* State *WA* ZIP *98105*

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

Response to Commentor No. 1177

1177-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

1177-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

1177-3: DOE notes the commentor's views on restarting FFTF for expanding its existing nuclear facility infrastructure. Consistent with its mandates under the Atomic Energy Act, DOE is proposing this expansion for the purposes of addressing three primary needs:

1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;

2) to support future NASA space exploration missions by re establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long term, assured supply; and

3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2. of Volume was revised to clarify the purpose and need of the proposed action.

DOE acknowledges that the FFTF's large size and configuration is not particularly well suited for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of the FFTF for the production of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who

Commentor No. 1177: Christopher Wilson (Cont'd)

Response to Commentor No. 1177

might consider its use for isotope production”. In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates use of the FFTF when coupled with the other proposed missions.

- 1177-4:** FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

Commentor No. 1178: Will Vanatto

NI PEIS Toll_Free Telephone

9/11/00

Will Vanatto
Reality News Network
Palm Beach County, FL
561_833_7815

I am calling to voice my disgust with the notion that DOE is considering further production of plutonium_238, one of the most deadly substances known to man. There has been several accidents during the course of the last few decades with space exploration using 238; 10 percent of the launches meet with accidents.

1178-1

There has been many worker contamination incidents.

1178-2

NASA is doing next to nothing about solar exploration even though the European Space Agency has now developed high efficiency solar cells for deep space missions. NASA lied about the Galaxy probe not being able to use solar. It is unbelievable that you people can rationalize using nuclear power when we know it is going to poison the babies and future generation. It is completely disgusting, nothing is worth that. Please take off your scientist hat and put on your humanitarian hat and get with it. You people are mad scientists. You are destroying what little is left of this planet. There are more and more people finding out about it; we are educating them daily. Let's go, let's get with it, your careers are not worth the world. Thank you.

1178-1

Response to Commentor No. 1178

1178-1: DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions, although issues such as NASA research priorities are beyond the scope of this PEIS. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch.

1178-2: The commentor's concern about worker contamination is noted. Eight workers were exposed to plutonium-238 the Los Alamos National Laboratory on March 17, 2000. Their exposure to plutonium-238 was caused by a leaking pipe connection in a support system serving a glovebox. As a result of this accident, the Secretary of Energy ordered a series of actions to increase worker safety and health and to avoid further accidental exposures.

Plutonium-238 processing facilities can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Sections 4.2-4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from plutonium-238 processing, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that the radiological and nonradiological risks associated with plutonium-238 processing would be small.

Commentor No. 1179: Steve Legault

NI PEIS Toll_Free Telephone

9/11/00

Steve Legault
206_782_5639

Completely opposed to the restart of Fast Flux Test Facility in Tri_Cities, Hanford.

1179-1

Curious to know why you are having a public hearing in Arlington, Virginia, but not that curious.

1179-2

Really want to stop that thing.

I work with a number of oncologists, all of them say there is no shortage of nuclear isotopes.

1179-3

I see no need for upgrading nuclear bombs to keep them at an ever_ready hair trigger to fire against the toothless bear called Russia. My wife completely concurs with me, but I think I will have her leave her own message.

1179-4

Response to Commentor No. 1179

1179-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1179-2: It is DOE policy to hold at least one public hearing in the vicinity of the nation's capital on EISs for which contingent decisions have national implications.

1179-3: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

For nearly 50 years, DOE has actively promoted the use of radioisotopes to improve the health and well-being of U.S. citizens. DOE's use of its unique technologies and capabilities to develop isotopes for civilian purposes has enabled the widespread application of medical isotopes seen today. While its market share is a small fraction of total world isotope production, DOE remains the key provider for a large number of isotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large-enough quantities to make their production financially attractive to private industry. DOE's intent is to complement commercial sector capabilities to ensure that a reliable supply of isotopes is available in the U.S. to meet future demand, and to encourage the commercial sector to privatize the production of isotopes that have established applications to a level that would support commercial ventures. Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the

Commentor No. 1179: Steve Legault (Cont'd)

Response to Commentor No. 1179

DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions basic energy sciences or defense. DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term (less than 5 years).

- 1179-4:** DOE notes the commentor's opposition to the continuing upgrading of the nuclear arsenal, although issues related to nuclear weapons are beyond the scope of this Nuclear Infrastructure PEIS. The DOE missions to be addressed in this EIS include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development. The three missions are civilian nuclear energy missions and are not defense-related.

Commentor No. 1180: Kathy Dattle

NI PEIS Toll_Free Telephone

9/11/00

I wonder if there has been a formal request for an extension of the comment deadline on the PEIS. Basically, we feel that we are not given enough time to comment on this document.

I realize that the comment deadline is next week, the 18th. We would like to formally request that DOE grant a 30_day extension of the comment period, and if this has not already been done, I would be interested to know if it is likely.

1181-1

Response to Commentor No. 1181

1181-1: DOE notes the commentor's request for extension of the public comment period. DOE received a number of requests for extension of the public comment period. The Council on Environmental Quality's (CEQ) "Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act" (40 CFR 1506.10(c)) require that a minimum of 45 days be allowed for public comment on the Draft NI PEIS. As stated in the Notice of Availability (65 FR 46443 et seq.), the public comment period began on July 28, 2000 and continued to September 18, 2000. In preparing the Final PEIS, DOE has assessed and considered both oral and written comments received on the Draft PEIS during the public comment period and has responded to these comments in the Final PEIS. Volume 3 of the NI PEIS contains public comments received on the NI PEIS and DOE responses to those comments. Moreover, late comments were considered to the extent practicable.

Commentor No. 1182: Bob Kingsbrook

NI PEIS Toll-Free Telephone

9/11/00

Bob Kingsbrook
6777 Moore Drive
Oakland, CA 94611

It is critically important to my family, friends, every American, and world citizen that you honor the 1989 Tri-Party Agreement between the U.S., DOE, EPA, and WA Ecology a pact to keep a clear focus on cleaning up the FFTF and cease the impossibly wasteful and dangerous pursuit of so-called nuclear production. Please. Please be prudent. I want you to select Option 5 to permanently deactivate FFTF with no new missions. Please, we must shut down the Hanford FFTF immediately. Please choose Option 5 to permanently deactivate FFTF with no new missions. Thank you.

1182-1

1182-2

Response to Commentor No. 1182

1182-1: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to “ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use.” The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

DOE notes the commentor’s opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

A Tri-Party Agreement change was made to place the milestones for FFTF’s permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Public meetings were held on this formal milestone change.

1182-2: DOE notes the commentor’s support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 1183: Bill Smirnow

NI PEIS Toll_Free Telephone

9/11/00

Bill Smirnow
 169 Maple Hill Road
 Huntington, NY 11743

I express opposition to this. The use of nuclear power is both unnecessary and dangerous. And in those rare cases where it might be necessary, it is not worth the risk. The public is not being informed of this in a democratic manner. It should not be undertaken.

1183-1

1183-2

Response to Commentor No. 1183

-
- 1183-1:** The commentor's opposition to nuclear power is noted. The radiological and nonradiological risk of each alternative in the PEIS is analyzed in detail and presented in PEIS Summary Section S.6 and EIS Volume 1, Section 2.7.1. The missions to be addressed in this PEIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and nuclear research and development can currently only be met using nuclear reactor or accelerator technologies.
- 1183-2:** DOE policy encourages effective public participation in its decision making process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

Commentor No. 1184: Hanna Washerman

NI PEIS Toll-Free Telephone

9/11/00

Hanna Washerman
212_689_0048

I am totally against any increase in space nuclear power.

I think we better cleanup. I hear it costs \$300 billion, the pollution at DOE facilities now from what's been done in space already. Thank you.

1184-1

Response to Commentor No. 1184

1184-1: DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and concern over nuclear waste. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch.

As discussed in Chapter 4 of Volume 1 (e.g. sections 4.3.1.1.13, 4.3.2.1.13, 4.3.3.1.13), waste will be generated by all of the alternatives, including the No Action Alternative. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. DOE activities associated with this program would not impact the schedule or available funding for existing cleanup activities at candidate sites for implementation of the nuclear infrastructure alternatives.

Commentor No. 1185: Annie Wildwood

NI PEIS Toll_Free Telephone

9/11/00

Annie Wildwood
PO Box 133
Cotati, CA 94931

I think it is essential that certain things be considered by the Department of Energy. NASA is not doing enough to develop alternative power sources for space missions. European Space Agency has now developed high efficacy solar cells for deep space missions.

1185-1

Plutonium production fabrication process for space nuclear power missions has recently led to several worker contamination accidents. Expansion of the production will only worsen the problem.

1185-2

Point 3, the expanded nuclear, the number of launches of nuclear power space devices from Cape Canaveral on rockets with 10 percent failure rate will only increase the possibility of a deadly mishap.

1185-1

Point 4, the massive cost of expanded production of plutonium_238 cannot be justified at a time when the DOE admits it needs over \$300 billion to clean up existing problems at DOE facilities.

1185-3

Point 5, the military is promoting the use of nuclear power in space for space_based weapons technology. Using nuclear power for space war, we will have severe environmental implications for life on earth.

1185-1

It is essential that DOE considers these points and reassess the current PEIS. Please take our comments to heart and reassess the current PEIS. Please. Thank you. Thank you for allowing this number here to make my comments. I hope you deeply consider these serious matters that I have mentioned.

1185-4

Response to Commentor No. 1185

- 1185-1:** DOE notes the commentor's concern for NASA's use of nuclear materials for space missions, interest in the development of alternative energy sources for space missions, and concern for the use of nuclear power in space-based weapons. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. None of the missions stated in the NI PEIS are defense- or weapons-related.
- 1185-2:** Plutonium-238 processing facilities can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Sections 4.2-4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from plutonium-238 processing, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that the radiological and nonradiological risks associated with plutonium-238 processing would be small.
- 1185-3:** DOE notes the commentor's opinion and concern about funding available for cleanup at DOE facilities.
- 1185-4:** DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and to providing ample opportunity for public comment on those actions. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

Commentor No. 1186: Rosa Zubizarreta

RUSA ZUBIZARRETA

PAGE 02

To: Colette E. Brown
U.S. Department of Energy

Dear Ms. Brown,

I would like to offer my comments on the draft Programmatic Environmental Impact Statement re: plans to expand production of PLU-238 for future space missions.

As an individual citizen of this country, the level of risk from the production of plutonium and from the use of plutonium to power space exploration is unacceptable to me, especially given that there are safe solar alternatives for this purpose.

As you may know, scientists around the world have endorsed the program of "The Natural Step", which calls upon our industrial society to produce only substances which can be safely returned and reintegrated to the natural cycles of matter. Producing plutonium is not in alignment with the need to create a safe and sustainable world for future generation. It only makes sense as a means to increase our potential for destruction.

While I appreciate the Environmental Impact process as a potentially helpful step towards making a wise decision, I do not see enough evidence of informed public dialog on this issue, in order for there to be sufficient public education and participation in a matter of such grave import.

I thank you for your careful consideration of these issues.

With all best wishes,

Rosa Zubizarreta
707-578-6650

1186-1

1186-2

Response to Commentor No. 1186

- 1186-1:** DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions, although issues such as NASA research priorities are beyond the scope of this PEIS. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch.
- 1186-2:** DOE notes the commentor's views including the need for public dialog and education as a prerequisite for informed public participation. It is DOE policy to encourage public input on matters of regional, national and international importance. In doing so, DOE has established reading rooms near DOE sites to provide easy access to information about DOE programs and encourages the use of this source of information. Further, DOE has numerous web sites, including one for NE (<http://www.nuclear.gov>), that provide up-to-date-information complete with fact sheets, news releases, and other materials. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments.

Commentor No. 1187: Aaron A. Semer

From: Aaron Semer[SMTP:AARON@AIDSHOUSING.ORG]
 Sent: Friday, September 08, 2000 6:26:24 PM
 To: INFRASTRUCTURE_PEIS, NUCLEAR
 Subject: DO NOT RESTART THE FFTF!!
 Auto forwarded by a Rule

I absolutely believe that option 5 _ "permanently deactivate FFTF with no new missions," is the only rational and responsible choice to make. The negative effects of restarting the FFTF far outweigh the positive. It's too expensive, too contaminating, and goes directly against the current legal mission of Hanford, which is clean_up, not production. You have a responsibility to the people of Washington, and the rest of the country(even the world), to keep us free of contamination and use our tax dollars wisely. Hanford has proven to do neither of these. It is a money wasting, polluting cesspool. The sooner it is cleaned up and shut down, the better.

Sincerely,

Aaron A. Semer
 417 13th Ave. E #105
 Seattle, WA 98102

1187-1

1187-2

1187-3

1187-4

Response to Commentor No. 1187

- 1187-1:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 1187-2:** DOE notes the commentor's opinion.
- 1187-3:** Restart and operation of the FFTF would result in minimal contamination of the biosphere (air, water, land). All air emissions and wastewater discharges to the environment would be in accordance with applicable permit and regulatory requirements. The releases of air pollutants and contaminated liquids associated with FFTF operations are addressed in detail in Section 4.3 of the NI PEIS. The release of criteria air pollutants would result in concentrations well below Federal and state air standards Table 4-13); the releases of radioactivity and hazardous chemicals into the atmosphere would have a negligible effect on human health (Tables 4.17 and 4-19). No discernible impacts to groundwater or surface water quality would result from water discharges (Section 4.3.1.1.4).
- 1187-4:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Public meetings were held on this formal milestone change. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

Commentor No. 1188: Gerald Woodcock

Sent: Friday, September 08, 2000 11:10:04 PM
To: INFRASTRUCTURE_PEIS, NUCLEAR
Subject: Restart FFTF
Auto forwarded by a Rule

It is an absolute imperative that FFTF be restarted if emerging treatments for cancer using medical isotopes are to achieve their full potential. This is not an abstract intellectual exercise. The restart of FFTF has the potential to treat thousands of cancer patients, alleviate tremendous amounts of pain and suffering, prolong useful lives of patients and improve their quality of life. The potential goes far beyond the borders of our own country. While the program cannot initially be self_sustaining financially, objective analysis shows that FFTF can be financially "in the black" in as little as seven years after returning to service.

Gerald Woodcock

1188-1

1188-2

Response to Commentor No. 1188

1188-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

1188-2: DOE notes the commentor's opinion. The estimated costs of the range of reasonable alternatives are presented in the Cost Report, summarized in Appendix P of the Final NI PEIS. However, the Cost Report is not a cost-benefit analysis. While it is reasonable to believe that the benefits of medical isotopes are substantial, the purpose of this NI PEIS is to describe the nuclear infrastructure missions (Section 1.2 of Volume 1), a range of reasonable alternatives for satisfying the mission requirements (Section 2.5 of Volume 1), and the environmental impacts that would result from implementation of the alternatives. According to 40 CFR Section 1502.23, if a cost-benefit analysis exists, it must be reported and summarized in the NI PEIS.

Commentor No. 1189: Jim and Susan Wells

 Cc: Ruth Yarrow
 Subject: Shut down the Hanford FFTF now!
 Auto forwarded by a Rule

Dear Committee Members:

It's critically important to my family, friends, and every American and world citizen that you immediately honor the 1989 Tri_Party agreement between USDOE, EPA and WA Ecology, a pact to keep clear focus on cleaning up the FFTF and cease the impossibly wasteful and dangerous pursuit of so-called nuclear production.

1189-1

Those living now as well as voiceless future generations are depending on your prudent selection of Option 5: to permanently deactivate FFTF, with no new missions.

1189 -2

Please do this now.

Yours truly,

Jim and Susan Wells
 2815 10th Place West
 Seattle, WA 98119

Response to Commentor No. 1189

1189-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Public meetings were held on this formal milestone change. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "... ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

1189-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 1190: Tammy Johnson

I just wanted to let you know that I believe the medical isotopes should be used to help in any way that they can to reduce cancer. This is a disease that effects many people and their families and should be allowed to be utilized.

Tammy Johnson

1190-1

Response to Commentor No. 1190

1190-1: DOE notes the commentor's support for greater availability of medical isotopes for the treatment of cancer. For nearly 50 years, DOE has actively promoted the use of radioisotopes to improve the health and well being of U.S. citizens. DOE's use of its unique technologies and capabilities to develop isotopes for civilian purposes has enabled the widespread application of medical isotopes seen today. While its market share is a small fraction of total world isotope production, DOE remains the key provider for a large number of isotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large-enough quantities to make their production financially attractive to private industry. DOE's intent is to complement commercial sector capabilities to ensure that a reliable supply of isotopes is available in the U.S. to meet future demand, and to encourage the commercial sector to privatize the production of isotopes that have established applications to a level that would support commercial ventures.

SENT VIA EMAIL
September 9th, 2000

Dear Ms Brown et al,

One hardly has to read the approximately 1200 pages of fiction to
recognize a great lie is being perpetrated by DOE.

DOE wants radioactive material for its nuclear weapons and
nuclear_powered weapons systems. The American military is the
most powerful political organization in the world, yet its
organizational methods are utterly unobservable. It is also the
least_regulated pseudo_corporation in the galaxy, and the single
most polluting entity of all times in the universe. It gets much of its
nuclear material from DOE.

1191-1

Response to Commentor No. 1191

1191-1: DOE notes the commentor's views. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

None of the alternatives in the NI PEIS include defense missions and would not contribute to future weapons production. Also, the proposed action would not have an impact on the cleanup missions at any of the candidate sites.

1191-2: DOE notes the commentor's opposition to enhancing its existing nuclear facility infrastructure to support production of plutonium-238 for use in future NASA space exploration missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Although research to identify other potential fuel sources to support these space exploration missions has been conducted, no viable alternative to using plutonium-238 has been established. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions. NASA uses plutonium-238 sources only when they enable the mission or enhance mission capabilities. Potential environmental impacts associated with launches of spacecraft using plutonium-238 are addressed in NEPA documentation prepared by NASA

Commentor No. 1191: Russell D. Hoffman (Cont'd)

Now, in this Draft PEIS, the DOE wants to be given millions of dollars in order to procure and process millions of Curies of plutonium and other radioactive substances, supposedly for civilian purposes, but in reality, for new war toys including military satellites powered by Plutonium 238 __ satellites which could just as easily be powered by solar technologies or which should not be placed in orbit at all until or unless appropriate alternative energy technologies exist.

DOE wants to do much of the work at already_existing nuclear waste Superfund impossible_to_clean_up sites, namely, Hanford, Washington, Oak Ridge, Tennessee, Los Alamos, New Mexico, and so forth.

The DOE creates this apparent civilian "need" for plutonium RTGs (Radioactive Thermoelectric Generators), and other tools of the trade, by endorsing and arranging the funding of NASA projects which are civilian in appearance, and perhaps leading_edge in some of their other technologies, but which are positively 20th_Century (i.e. old) in their use of nuclear energy solutions, relying on dangerous and closed_market technologies of no use to the average citizen, which furthermore, are utterly wasteful of the very resource they use, since the plutonium is not recoverable after the mission, and which are old technology when compared to what is available even now on the open market __ clean solar energy systems would work perfectly well for most of the proposed missions, and in other cases, smaller missions could fulfill all the science data requirements of all the proposed civilian space missions. There is no need for the nuclear components at all. Not one watt of energy or degree of heat needs to be generated by the use of nuclear components for any vital interest, civilian or military, of any country, including the United States.

And yet NASA/DOE continues to demand more nuclear components. Why?

**1191-1
(Cont'd)**

1191-2

1191-3

Response to Commentor No. 1191

in support of each mission. Radioisotope power systems have been used for over 30 years, and have repeatedly demonstrated their performance, safety, and reliability in NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005.

NASA, not DOE, is responsible for spacecraft design and for determining what electric power source best suits the mission-specific needs. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost. Plutonium-238 produced domestically or procured from Russia as a result of the NI PEIS Record of Decision, is to be used to support NASA deep space missions and can not be used for any defense-related mission.

1191-3: DOE notes the commentor's concern for NASA's use of nuclear materials for space missions. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. None of the missions stated in the NI PEIS are defense- or weapons-related.

The use of depleted uranium, and the use of nuclear-powered ships and submarines are not within the scope of this PEIS.

Commentor No. 1191: Russell D. Hoffman (Cont'd)

Because DOE loves plutonium. So does the military. They cannot conceive of the millions of scattered deaths their poisons create, literally in their wake.

A few months before Cassini was launched, in 1997, DOE announced that future missions would use a five_times better thermoelectric generator, known as an RPS, instead of the RTGs used on Cassini. Five times better isn't nearly good enough, but nonetheless, had DOE merely implemented this new unit for Cassini's launch, that would have given them about 50 pounds of "free" plutonium __ several year's worth at the proposed rates of use by NASA!

So clearly, DOE is not properly respectful of plutonium even simply as a precious resource, one which is deadly if improperly handled at any step. This policy fact is clearly demonstrated in the physical form of the RTGs themselves. NSAA's flimsy containment system isn't even designed to be 100% secure, and NASA's expected release rates from accidents, as published for example in the Cassini space probe's EIS, prove that the RTGs are carefully designed to release their contents in a reentry accident of some sort, as a fine powder at a high altitude.

The perfect spectrum of sizes for lodging in a person's lungs, to be exact.

And the perfect spectrum of sizes to be widely dispersed by the winds before reaching the ground, so that whoever dies does not die in a herd, but by themselves, from one little speck that found its way into that person's lungs.

Cancer, leukemia, and birth defects. These are the things DOE wishes a permit to create. And the reason is for military power supplies for "Cold War" spy satellites. As far as this writer can tell, NASA's recent Cassini probe was part of a cover operation for the military.

**1191-3
(Cont'd)**

Response to Commentor No. 1191

Commentor No. 1191: Russell D. Hoffman (Cont'd)

Cassini is right now on its way towards Jupiter and Saturn. But just because the flyby of Earth and the launch have both occurred doesn't mean we are safe from that awful bird ___ far from it. And does DOE recall NASA's failure to calculate an orbital insertion ___ a very similar maneuver to a flyby ___ just one month after Cassini flew by Earth?

Right now, Cassini should be re_aimed, so that if anything goes wrong, it would be more likely to impact Jupiter rather than fly by it. And Cassini should be left in that orbital pattern.

Cassini could become a lost probe, going dead any time between now, September 9th, 2000, and when it is supposed to fall into Saturn or one of its moons about a decade from now, after all its illustrious science data is returned and it is nothing more than a flying chunk of radioactive waste (Pu 238's half life is about 87 years, Pu 239, 24,400 years). No trajectory is exact, and unmeasurable (with current technologies) gravitational combinations of forces, plus the forces from micrometeor impacts, all together mean that soon we would have no idea where Cassini might actually be. Cassini could possibly loop around one of the outer planets and be driven back towards Earth, having by the time it gets to us (unseen), possibly have experienced a decade or even a hundred years in space, during which time the containment system will probably have become brittle and useless. Cassini could be thrown back at us by the outer planets, just as Earth and Venus were used as sling_shots to get Cassini out towards Saturn in the first place.

All this risk, for what? Not to please the public! The public expressed widespread disgust with NASA for launching Cassini in the face of reason, and NASA had to put on a major publicity campaign to counteract the bad publicity it rightfully received. (Using what official or unofficial budget to counteract the actions of this and other activists, I do not know.)

1191-3
(Cont'd)

Response to Commentor No. 1191

Commentor No. 1191: Russell D. Hoffman (Cont'd)

All this mess, and trouble, for what? To cover_up what are probably dozens of military nuclear launches.

All the "civilian" missions are part of a military regime; they are cover_ups. The military thinks they need nuclear powered electrical energy generators (RTGs), and undoubtedly they think they need nuclear heaters as well (RHUs, Radioactive Heater Units, which each contain tens of millions of fatal doses worth of plutonium 238 and 239 (2.7 grams) and which each absolutely will incinerate in virtually any reentry accident (there are about 130 RHUs on board Cassini).

All of the civilian nuclear_powered and equipped probes which are right now being designed and built, could either just as easily be solar_probes or could be switched for missions which do not go quite so far out as to study Pluto, for example, this decade instead of next, or which carry a few less instruments so that the energy drain is reduced somewhat. However, NASA/DOE's goal in choosing specific missions is in fact, to reach just beyond the practical limit, not as a show of can_do or bravado (for what bravery is required to risk other people's lives?), but simply to force the use of nuclear, so that the system is in place for the military uses to go on unnoticed.

Putting one too many experiments on board the probe so that solar becomes difficult is one of DOE's goals when deciding which missions to fund!

Replacing missions with solar variants has been studied conclusively, even years ago, for Galileo __ and by JPL's own scientists. Specifically in the D. E. Rockey et al report of 1980, extracted from NASA by Karl Grossman, using the Freedom of Information Act (FOIA). There has been more than 20 years of solar development since then __ surely we could get to the next planet out past Jupiter by now (little of the solar development that has occurred in the last 20 years has been thanks to our DOE, who, having banked on nuclear power, are now making the nation morally and financially bankrupt for having let them do so).

**1191-3
(Cont'd)**

Response to Commentor No. 1191

Commentor No. 1191: Russell D. Hoffman (Cont'd)

Our DOE leaders continue choosing shortsighted nuclear "solutions". Why? There's nothing civil about it. NASA space probes are improperly insured, too ___ by the Price_Anderson act, as corrupt an act as any Americans have ever revolted against or been revolted by. And note that P_A was designed to "insure" Stationary Objects ___ nuclear power plants ___ NOT space probes! NASA is protected by use of the Price_Anderson act from financial loss caused by Cassini or by NASA's other uses of plutonium and other radioactive substances ___ protected, that is, from legal justice by the victims of NASA policy. Protected by an illegal act which NASA has no right to operate under the shield of, even if the act were legal for those stationary nuclear power plants it was originally designed to hold harmless from the financial consequences of their own actions.

I say the entire Draft PEIS is a lie. It's basic premises are lies. NASA doesn't need nuclear power for civilian probes, and the military needs to be reigned in ___ they don't need nuclear power either, for probes, subs, ships, or on the tips of missiles. Humanity demands that the U.S. Military, and all militaries all around the world, be subservient to an even higher goal than winning wars against people. Humanity demands that these wars be planned for, and even be executed if need be, while conforming to the same environmental laws the rest of society lives (and dies) under.

Otherwise, we might win all the battles, but we will lose the planet, and along with it our health, our homelands, and everything else we cherish as citizens of a growing nation and as individual souls on a planet of billions of each_precious souls.

In Kosovo, Depleted Uranium bullets fired at, among other things, chemical industrial sites have turned the Blue Danube black with death. In Iraq, children die at the rate of 10,000 a month, because sewage systems and water irrigation systems were bombed, and because millions of shells of Depleted Uranium were used to win the Gulf War so quickly and "efficiently".

**1191-3
(Cont'd)**

Response to Commentor No. 1191

Commentor No. 1191: Russell D. Hoffman (Cont'd)

The use of Depleted Uranium should be banned, and the use of plutonium_powered listening devices for the military, whether undersea or in orbit in outer space (both uses are common today) should likewise be forbidden.

Further, the use of nuclear_powered ships and submarines must be stopped. Failures such as the Thresher and the Scorpion, two American nuclear subs which were lost for uncertain reasons, and more recently Russia's flagship nuclear sub, the Kursk (the Thresher was a flagship sub, in its time) remind us all too well that accidents can and will continue to happen. Each nuclear reactor which has already been lost or dumped at sea (the U.S. Navy dumped the research reactor Sea Wolf into the ocean some years back) needs to be pulled out and recovered, for a more proper nuclear waste disposal. But getting them out of the ocean is only one of the steps in what will be a long and nightmarish waste_guarding operation.

Who will do it? Who will pay for it? DOE must do it, AND DOE must pay for it. They should not be given yet more money for creating more nuclear waste and spreading it around the environment, using false pretenses and fictitious needs. They can't even clean up for their past mistakes. DOE is bankrupt.

And DOE must, as well, shut down all civilian nuclear power plants, each of which has a spent fuel pool next to it which is more deadly and dangerous than the plant itself. The clean energy solutions are Wind, Wave, Tide, Solar, Geothermal, Biomass, Hydroelectric, Ocean Thermal Gradient, and so on. They are NOT nuclear, coal, or oil solution's to America's constant and never_ending energy shortage. The solutions only come from a wide mix of available sources, not from the closed_minded, ingrown thinking which ignores the facts about nuclear waste disposal problems and dispersal problems, and all the other problems that have attended the use of nuclear energy and weapons since Day 1.

**1191-3
(Cont'd)**

Response to Commentor No. 1191

Commentor No. 1191: Russell D. Hoffman (Cont'd)

Please acknowledge receipt of these comments, and I request to know the name of any government official who actually reads even so much as this one document in opposition to the DOE nightmare proposed in the Draft PEIS, let alone, familiarizes themselves with the full details of what crimes are going on in the lofty name of science and space exploration, giving both a bad name, and polluting the planet, and the Near Earth Orbit area terribly. For I believe there is not one properly credentialed or elected official anywhere in the whole U.S. Government who can answer the charges I have brought forth here.

To Whom it May Concern,

Hanford is the most highly contaminated nuclear site in the western world. * Restarting FFTF would produce new high level radioactive waste streams, which affect worker health and safety, public and environmental health.

*Permanently shutting down the FFTF is part of the 1989 Tri_Party Agreement between USDOE, EPA and WA Ecology.

* Keeping FFTF on hot standby for four years has cost over \$40 million per year.

* The Washington State Medical Association, WA Academy of Family Physicians and Physicians for Social Responsibility/National have all passed resolutions opposing the restart of the FFTF.

* The legal mission of Hanford is clean_up, not production.

Tobiah Israel, A concerned citizen from Washington State

1192-1

1192-2

1192-3

1192-4

1192-2

Response to Commentor No. 1192

1192-1: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. This waste would not be stored in the high-level radioactive waste tanks. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

1192-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Public meetings were held on this formal milestone change. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities. DOE is fully committed to honoring this agreement.

DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "... ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE

Commentor No. 1192: Tobiah Israel (Cont'd)

Response to Commentor No. 1192

resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

- 1192-3:** The commentor's observation is correct, as noted in the Cost Report. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.
- 1192-4:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Hi, I would like to register my support for alternative 1 for restart of FFTF, etc. for the PEIS DOE/NE_0119. I believe it is high time the U.S. got back into the business of providing for itself, and, in addition, I believe that the U.S. has lost much of it's credibility among other nations for nuclear matters. I have been told as much by people from other nations (before my retirement).

Thank you.

Response to Commentor No. 1195

1195-1: Currently, approximately 50 percent of DOE’s isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities’ primary missions basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE’s market share increases, there will be a need for expanded isotope production capacity in the short-term. The commentor is referred to Chapter 2 of Volume 1 for information about facilities considered but dismissed.

1195-2: There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Although research to identify other potential fuel sources to support these space exploration missions has been conducted, no viable alternative to using plutonium-238 has been established. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE’s preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

1195-3: The costs and nuclear nonproliferation impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such ancillary documents need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed these documents to more than 730 interested parties on August 24 and September 8, 2000, respectively. Both reports

Commentor No. 1195: Mike Conlan (Cont'd)

Response to Commentor No. 1195

were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided summaries of the Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment in Appendixes P and Q, respectively in the Final NI PEIS.

1195-4: The draft “Waste Minimization and Management Plan for the Fast Flux Test Facility” (May 2000) was referenced in the NI PEIS and was available prior to the public hearings.

Ladies and Gentlemen _

I want to go on record in support of restarting the Fast Flux Test Facility. The United States needs a reliable supply of medical isotopes, and needs to have a facility to support experiments with new, promising cancer_fighting isotopes that are not presently available. The United States should be leading the world in developing new cancer treatments, rather than depending on foreign sources for many of the isotopes we presently use in medicine.

I believe that if DOE shuts down the FFTF permanently, it would deny the Tri_Cities an entire cancer_treatment industry that would surely develop here. I would also like to see FFTF used for the types of nuclear research that were conducted there before the facility was placed on standby. A world_class research reactor operating here would be a perfect complement to our present research community that has been led and fostered by DOE.

I was disappointed when DOE passed up the opportunity to privatize the reactor a few years ago, and I will be deeply disappointed if it is permanently closed. It is a unique and valuable asset that should be put to good use, and the decision about its future should be based on sound science rather than emotion.

 To: INFRASTRUCTURE_PEIS, NUCLEAR
 Subject: hanford ffff
 Auto forwarded by a Rule

Dear Collette Brown/Secretary Richardson,

Please accept the following as public comments on the Draft Environmental Impact Statement on the Nuclear Infrastructure EIS.

As a citizen of the Pacific Northwest, I am deeply concerned about the United States Department of Energy's proposal to restart Hanford's Fast Flux Test Facility Nuclear Reactor. I wish to have my values incorporated into the formal administrative record and taken into consideration when adopting the final record of decision. I also want you to respond to my concerns before you make your record of decision.

Considering Hanford's overwhelming problems, including the crisis with tank waste treatment, as well as the damage caused by and radiation released from the Hanford wildfire, restarting FFTF is absolutely unacceptable. We must deal with the waste already at Hanford and focus on the clean_up mission. FFTF maintenance has already gobbled up \$100 million in clean_up money and distracted from desperately needed clean_up. Tank wastes are already seeping towards the Columbia River. More wastes must not be added to those tanks. Clean_up must be the only priority. We must save the Columbia River and returning salmon runs, the health vein of the Northwest.

Also, I object to the fact that you are asking citizens to comment on an incomplete study. You have not told us how you will deal with non_proliferation issues or additional waste from FFTF. Should FFTF be restarted, that decision will be illegal under Federal law and will be overturned! Do the right thing, shut down FFTF now and save the future of the Columbia River!

1197-1

1197-2

1197-3

1197-2

1197-1

1197-4

1197-1

1197-5

Response to Commentor No. 1197

1197-1: DOE notes the commentor's concerns. This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. DOE prepared a separate Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on September 8, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Nuclear Infrastructure Nonproliferation Impact Assessment in Appendix Q in the Final NI PEIS. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives. DOE's decision will be made in compliance with applicable laws and regulations, including CEQ Implementation Regulations (40 CFR 1505.1).

1197-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford and the potential risk of contamination to the Columbia River. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The

Commentor No. 1197: Mary Jean Brady (Cont'd)

I know you attempt to allow for public comment but this issue affects all of us in Washington state and not just neighboring counties and metro areas. I fear for the health of the nearby counties already and potentially all of us here in the Northwest.

Sincerely,

Mary Jean Brady

bradymj@cnw.com

1197-1

Response to Commentor No. 1197

nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

In regards to the Hanford wildfire of 2000, the DOE Richland Operations Office, the State of Washington Department of Health, and U.S. Environmental Protection Agency performed environmental monitoring on and around the Site to assess potential radiological impacts. The wildfire did not cause a release of radioactive materials from any Hanford facilities but did result in resuspension of radioactive materials which were already in the environment. The very low levels of radioactive materials that were resuspended were slightly above natural background levels and required several days of analysis to quantify. Information on this event has been made available to the public and can be accessed at <http://www.Hanford.gov/envmon/indes.html>. This site also provides a link to information on the independent offsite air monitoring that was conducted by the U.S. Environmental Protection Agency.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

None of the alternatives considered by this PEIS will add to the tank waste volume.

1197-3: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.

1197-4: Management of wastes that would be generated under implementation of Alternative 1 (Restart FFTF) is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and

Commentor No. 1197: Mary Jean Brady (Cont'd)

Response to Commentor No. 1197

operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

1197-5: See the response to comment 1197-3.

Colette Brown, U.S. DOE:

Having thought about this problem for years, and attending a public meeting in Seattle two years ago, I am very much against restarting the FFTF. The resumption of plutonium production, which has been proven unnecessary for our defense needs, will necessarily lead to more nuclear wastes in the Hanford area, and delay the already much delayed cleanup.

The argument for production of medical isotopes is obviously spurious, and only included to make the restart palatable to the public. At the public meeting at the Seattle Center, the head of the University of Washington Medical Isotope division stated clearly that this facility was not needed, that there were adequate sites for isotope production elsewhere.

I urge support for alternative #5

DO NOT RESTART THE FFTF

1199-2

1199-3

1199-4

1199-5

Response to Commentor No. 1199

1199-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.

1199-2: The purpose of the NI PEIS is to evaluate the environmental impacts of reasonable alternatives to enhancing DOE's existing nuclear facility infrastructure to support production of isotopes for medical, research, and industrial uses, production of plutonium-238 for use in future NASA space exploration missions, and U.S. nuclear research and development needs for civilian application. No component of the proposed action is for the purpose of supporting defense or weapons-related missions.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

1199-3: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The alternatives delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

1199-4: Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has

Commentor No. 1199: Alexander R. Stevens (Cont'd)

Response to Commentor No. 1199

recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term.

1199-5: See response to comment 1199-1.

Commentor No. 1200: Nancy Stiefel

From: Nancy Stiefel[SMTP:NAS5580@IRCC.NET]
 Sent: Wednesday, September 13, 2000 10:53:38 AM
 To: INFRASTRUCTURE_PEIS, NUCLEAR
 Cc: globalnet@mindspring.com%internet
 Subject: PLU_238
 Auto forwarded by a Rule

NASA is not doing enough to develop the use of solar power for its space missions. The idea of using nuclear power in space is completely objectionable. Plu_238, one of the most deadly materials known to human kind, should be completely banned from any space mission. Its use is dangerous, costly, and ludicrous in light of the advancements in alternative power sources (particularly by the European Space Agency). No expansion of production facilities for plu_238 should even be contemplated. Do not re_establish a domestic capability for producing and processing plu_238.

Your serious consideration of this viewpoint is expected and appreciated.

1200-1**1200-2*****Response to Commentor No. 1200***

- 1200-1:** DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions, although issues such as NASA research priorities are beyond the scope of this PEIS. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch.
- 1200-2:** DOE notes the commentor's opposition to establishing a domestic capability for producing plutonium-238. DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Subject: Public Comment on pursuing Pu_238 production in Idaho at INEEL Auto forwarded by a Rule

Ms. Colette Brown
DOE, Office of Space and Defense Power Systems

Dear Ms Brown:

I write as a citizen of the state of Idaho to object emphatically to DOE's plan to reprocess plutonium, possibly in Idaho. I object to it being done at Hanford, too, but I can only speak as a citizen of Idaho at this time.

Reprocessing is not acceptable and should not be considered at INEEL or any other facility

The place where you would like to pursue this effort at INEEL, Building 666, is a decrepit and highly contaminated building and should be decommissioned in a manner that is protective of human health and the environment. Decommissioned I repeat, NOT USED AGAIN.

Americans from all walks of life and locations have consistently opposed further and continued Plutonium_238 production. It is unnecessary and, worse, its use is too risky.

Using ATR at INEEL would interfere with its current mission of producing medical and industrial isotopes.

Please extend the comment deadline by 30 days. You have not allowed enough time for citizens to become informed and to form their views and communicate them to your department.

Joanna Kirkpatrick, 2005 N 17th St, Boise Id 83702

Response to Commentor No. 1201

- 1201-1:** The commentor's position concerning production of plutonium-238 at Idaho National Engineering and Environmental Laboratory and the Hanford Site is noted. The purpose of this NI PEIS is to evaluate the environmental impacts of a range of reasonable alternatives to fulfill the requirements of the missions described in Section 1.2 of Volume 1. The Record of Decision for the PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.
- 1201-2:** DOE would not conduct any reprocessing to produce weapons-grade plutonium under any of the alternatives considered under this programmatic environmental impact statement. The alternatives do include processing of target materials used to produce isotopes for medical and industrial uses, plutonium-238 for space missions, and nuclear materials research and development. Sections 4.3.1.1.13; 4.3.2.1.13; 4.3.3.1.13; and 4.4.3.1.13 were revised to clarify the waste management approach for waste resulting from processing of target materials for plutonium-238 production.
- 1201-3:** DOE notes the commentor's opposition to enhancing its existing nuclear facility infrastructure to support production of plutonium-238 for use in future NASA space exploration missions. Section 1.2.2 of Volume 1 was revised to clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.
- Potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed production of plutonium-238 are relatively low and are discussed in detail in Chapter 4 of Volume 1 and appendixes H, I, and J of Volume 2 in the Final NI PEIS. For over 30 years, radioisotope power systems have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. However, potential health and safety impacts associated with future launches of spacecraft utilizing plutonium-238 are not within the scope of the NI PEIS analysis, but would be addressed in the specific NEPA documentation prepared by NASA in support of such missions.
- 1201-4:** As stated in EIS Volume 1, Section 2.3.1.2, ATR would continue to meet its medical and industrial radioisotope production mission for the no

Commentor No. 1201: Joanna Kirkpatrick (Cont'd)

Response to Commentor No. 1201

action and most other alternatives considered where ATR is not used for the production of plutonium-238. If ATR were to be used as a production facility for plutonium-238 (options 1, 2, 3, 7, 8, and 9 under Alternative 2), it would support medical and industrial radioisotope production to the extent possible. DOE would try to minimize the impact of the new mission on current medical and industrial radioisotope production.

- 1201-5:** DOE notes the commentor's request for extension of the public comment period. The Council on Environmental Quality's (CEQ) "Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act" (40 CFR 1506.10(c)) require that a minimum of 45 days be allowed for public comment on the Draft NI PEIS. As stated in the Notice of Availability (65 FR 46443 et seq.), the public comment period began on July 28, 2000 and continued to September 18, 2000. In preparing the Final PEIS, DOE has assessed and considered both oral and written comments received on the Draft PEIS during the public comment period and has responded to these comments in the Final PEIS. Volume 3 of the NI PEIS contains public comments received on the NI PEIS and DOE responses to those comments. Moreover, late comments were considered to the extent practicable.

Auto forwarded by a Rule

Colette E. Brown, U.S. Department of Energy:

I want to register my belief that the FFTF at Hanford should not be restarted. I urge you to adopt Alternative #5. We shouldn't do anything to deter Hanford from cleaning up the waste already present at the site rather than creating more. Future demands for medical isotopes can be met using other facilities.

Thank you,

Judith Starbuck
1126 Grand Avenue
Seattle, WA 98122

1204-1

1204-2

1204-3

Response to Commentor No. 1204

- 1204-1:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 1204-2:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The alternatives delineated in the NI PEIS would not have an impact on Hanford cleanup activities.
- 1204-3:** Currently, about 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term.

**Commentor No. 1205: Ken Dobbin, Councilman,

Subject: FFTF Thanks
Auto forwarded by a Rule

Dear Ms Brown:

Thanks for a very professional public hearing in Richland on August 31. Everyone I have talked to since that meeting has commented on how well it was run and that they believe all the technical information needed to justify an FFTF restart now has been presented in public forum.

I am looking forward to the final PEIS choosing to restart the FFTF as the preferred alternative. I am also confident that the Secretary has ample justification now to make the ROD to restart the FFTF before the end of the year.

I am gaining confidence that the DOE is looking at the total nuclear infrastructure needs of our nation and will assign several of the missions to the FFTF. In the past, the FFTF was only considered for one mission at a time will all the operating costs allocated to that mission. Multi_missions is a way of distributing that cost.

I also pray that the DOE includes cost savings for our health care system, especially medicare, from the isotopes that the FFTF can generate. Even the elected officials in the Seattle area can agree with that mission that could save us Americans billions of dollars.

Thanks for your careful consideration.

Ken Dobbin, Councilman
City of West Richland, WA
email: kddnep@aol.com

1205-1

1205-1: DOE notes the commentor's remarks concerning the Richland, Washington public hearing.

1205-2: DOE notes the commentor's support for Alternative 1, Restart FFTF.

The commentor is correct in stating that FFTF would be assigned more than one mission. As stated in Section 2.5.2 of Volume 1, FFTF would be used for the three stated missions.

1205-2

1205-3: DOE notes the commentor's views on the costs and benefits of the proposed production of medical radioisotopes. The estimated costs of the range of reasonable alternatives are presented in the Cost Report, summarized in Appendix P of the Final NI PEIS. However, the Cost Report is not a cost-benefit analysis. While it is reasonable to believe that the benefits of medical isotopes are substantial, the purpose of this NI PEIS is to describe the nuclear infrastructure missions (Section 1.2 of Volume 1), a range of reasonable alternatives for satisfying the mission requirements (Section 2.5 of Volume 1), and the environmental impacts that would result from implementation of the alternatives. According to 40 CFR Section 1502.23, if a cost-benefit analysis exists, it must be reported and summarized in the NI PEIS.

1205-3

 Subject: Draft PEIS on PU_238 for space missions
 Auto forwarded by a Rule

TO: Collette E. Brown, US Department of Energy, NE_50

Dear Ms. Brown:

It is proposed to possibly re_start the Fast Flux Test Facility at Hanford, WA, to supply Plutonium_238 fuel for deep space exploration. INEL and ORNL are also under consideration for this function. Previously, NASA had announced it would rely on purchase of plutonium from from Russia pursuant to a decommissioning and disposal agreement between Russia and the United States. Now, there is evidently worry that the plutonium_containing materials from Russia might not be forthcoming.

Question: Why worry that the Russians won't deliver the plutonium? The worry seems speculative indeed. When have the Russians signaled reluctance, except to complain about the great cost of safe transport, which is more reasonably interpreted as a broad hint that the US should fork over more monetary aid than as a refusal to reward our expectations of loads of Russian plutonium arriving on US shores. The last I heard on the subject was positive. According to an Associated Press story, on September 1 Vice President Gore and Russian Prime Minister Kasyanov signed an agreement that will "gain" the United States 34 tons of the stuff, and Congress has approved \$200 million to help the Russians get it to us.

Second question: But, supposing there is Russian reluctance, what would be the motivation of it? Given that plutonium is a dire environmental liability wherever it exists, why on earth would the Russians pass up a golden opportunity to dump their liability

1206-1

1206-2

Response to Commentor No. 1206

1206-1: The 34 tons of plutonium referred to by the commentor is weapons-grade plutonium that the Russians have declared surplus and plan to disposition. The \$200 million that Congress approved will be used to assist the Russians in building a pit disassembly and conversion facility in Russia to disassemble pits (a weapons component) and convert the recovered plutonium into plutonium dioxide suitable for disposition. The purpose of the NI PEIS is to evaluate the environmental impacts of a range of reasonable alternatives to fulfill the DOE missions, one of which is the domestic production of plutonium-238. Plutonium-238, used to support NASA space missions, is not weapons-grade plutonium (i.e., plutonium-239).

1206-2: As discussed in Section 1.2 of Volume 1, plutonium-238 would be produced to support NASA's deep space missions. Plutonium-238 is not used to produce nuclear weapons. All missions considered in the NI PEIS are for civilian purposes. The Russians have not displayed any reluctance to sell plutonium-238 to the U.S. One of DOE's objectives is to develop

Commentor No. 1206: Jeanne Koster (Cont'd)

on the United States and get paid for doing so? Could our government be speculating that the Russians may become reluctant to cooperate by plutonium delivery because the Russians believe we have an ultimate goal beyond the extremely modest power needs of a handful of deep space exploration vehicles? What if the Russians should perceive our purpose in using the plutonium to be against their national interest?

Third question: How so? Well, they can log on to the US Space Command's very own website [www.peterson.af.mil/usspace] and take a gander at plans to enforce US interest against Russian or any other interest. There they will find "Vision for 2020" and other documents describing the Pentagon's ambition to absolutely control space with space_based weaponry and associated supports that can be most readily powered by plutonium. They can read plain as day that space jockeys in the Pentagon are intent on positioning the US as Master of the Universe, capable of enforcing US will. Period. They can read in these documents an upfront and unabashed imperialist and mercantilist motivation, a resolve to protect US interest quite broadly interpreted, including economic as well as strictly strategic military interest.

So, maybe its not unreasonable to speculate that a near_future nationalist government in Russia would interpret development of plutonium power for deep space exploration as merely a "Trojan horse" that will enable DOE to accomplish military aims. Contextual considerations, such as overlap in NASA and DOE aims, need to be explicitly treated in the draft PEIS. Surely, you understand how the absence of explicit treatment could skew the public comment.

On the subject of displeasing the Russians, it must be mentioned that a Hanford FFTF restart will produce isotopes usable in tactical nuclear weapons. It's no secret that the United States contemplates use of tactical nuclear weapons. Many in the community of nations, including, presumably, most of our allies, would find pursuit of such a US ambition objectionable. The PEIS

**1206-2
(Cont'd)**

1206-3

Response to Commentor No. 1206

U.S. capabilities to support NASA's future space missions - a capability that would not be subject to reliance on the goodwill of other nations. Plutonium-238, like any other resource with monetary value, is limited in supply, and the Russian's continued willingness to sell their resources is necessarily uncertain. The terms of any sales beyond the existing contract would be subject to new contractual negotiations.

1206-3: DOE notes the commentor's views. Consistent with its mandates under the Atomic Energy Act, DOE is proposing this enhancement for the purposes of addressing three primary needs:

1) to support the increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;

2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and for which the U.S. has no long-term assured supply; and

3) to support civilian nuclear energy research and development in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. No component of the proposed action is for the purpose of producing tritium, nor is it for the purpose of supporting any other defense or weapons-related mission.

Commentor No. 1206: Jeanne Koster (Cont'd)

needs to discuss the FFTF for isotope production that could eventuate in that class of weapons.

Many objections remain against use of plutonium-powered generators for space exploration. I am sure that others' comments will treat those objections well. I am confining this comment chiefly to plea for your agency to lay all the cards on the table in your PEIS, including cards about the military potential of decisions that NASA takes. Even if NASA itself disavows any intention to enable military advances, the potential for such advances inherent in a decision to develop plutonium generators for space vehicles or to re_start the Hanford FFTF must be examined. Otherwise NASA will not fully comply with the mandate of the National Environmental Policy Act.

Sincerely,
Jeanne Koster

Subject: Expanded Plutonium Production
Auto forwarded by a Rule

I am very sorry to read about further military involvement in NASA space missions. The use of space for military purposes violates international treaties. Our arming of the heavens is an unworthy direction, but of course there are profits to be made. I

1208-1

I object to expanded production of plutonium for any purposes. Monies should be redirected toward environmental and health concerns as we move from the nuclear age to the information age. Don't you agree?

1208-2

Best regards,

Sunny Miller

Response to Commentor No. 1208

1208-1: DOE notes the commentor's objection to the use of space for defense purposes. None of the DOE missions described in this PEIS is weapons- or defense-related.

1208-2: DOE notes the commentor's opposition to the production of plutonium 238 for any purpose. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

 Subject: FFTF Restart _Vital to Medical Isotopes and a wise economic move.
 Auto forwarded by a Rule

What I don't understand is why we are having to explain why FFTF should be restarted. Isn't there enough scientific information in the community of Nuclear Power, etc to understand the value of FFTF. The medical isotopes is vital, necessary and definitely non_proliferation. I would hope that alone is enough to get the decision makers "off the dime" and onto ways we can help our communities and country, rather than hinder them.

Another problem I see is the bold exaggeration and outright false and misleading information given out by the HEAL Organization and Mr. Pollet. Someone other than his "opponents" here at Hanford should soon be educated enough to sift through the jargon and explain the facts to the average "Joe Q. Public". I thought getting the facts, evaluating the information that comes in, and reaching a valid decision for the best interest of the people was the purpose of the EIS process. Why doesn't that happen? It seems to me, we have let the process deteriorate into a mail in response type of bureaucratic nightmare, hodgepodge of half_truths and innuendos (sometimes from both sides), from the "non_nukes" who seem to be anti anything nuclear.

1210-1***Response to Commentor No. 1210***

-
- 1210-1:** DOE notes the commentor's views and concerns. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.
- 1210-2:** DOE notes the commentor's support for Alternative 1, Restart FFTF.
- 1210-3:** DOE notes the commentor's support for nuclear education and materials research programs. The commentor's support for nuclear power is also noted. It is the current policy of the United States that clean, safe, reliable nuclear power continue as a viable component of the country's energy portfolio. In recognition of this need, the government has initiated nuclear energy research and development programs to address potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) and to ensure that current nuclear power plants can continue to deliver adequate and affordable energy supplies. An enhanced DOE nuclear facility infrastructure is required to support such nuclear energy research and development for civilian applications.

Commentor No. 1210: Dale McNally (Cont'd)

Please register my vote to help the people, by restarting FFTF, the very valuable piece of expensive equipment. Then register my suggestion to start evaluating the information and bring back the educational and testing programs which have provided tremendous safety information for metal brittleness, etc. from the effects of radiation. It seems to me the safety and clean air folks would eventually realize the value of the electricity produced also, from nuclear power, as compared to coal fired power plants. Enough for now,

Sincerely,
Dale McNally

 Subject: PLU_238 Production for Space Missions
 Auto forwarded by a Rule

I write in response to your Draft Programmatic Environmental Impact Statement on DoE Plans for Expanded Production of PLU_238 for Future Space Missions.

I cannot understand the proposal to increase production of plutonium when DoE is faced with the very real ___ as yet unsolved! ___ problem of nuclear waste. While the nuclear waste created by plutonium used in weapons production needs hundreds of billions of dollars more to be cleaned up ___ and while DoE has yet to uncover a plan or process that can contain nuclear waste for the thousands of years it remains active, it seems there is a moral issue that goes unaddressed in the plans to produce plutonium for space exploration.

Your PEIS does not address the fact that the European Space Agency has developed high_efficiency solar cells for deep space missions. Neither NASA nor the DoE demonstrate that enough attention has been given to develop solar power sources for deep space missions.

As a resident of Florida, I am deeply disturbed by the idea that there will be an increase in the number of launches from Cape Canaveral carrying nuclear powered batteries. It is only a matter of time before a launch accident carrying plutonium will occur, with the consequences threatening the air we breathe in Florida.

I am adamantly opposed to increasing production of Plutonium for use in space missions. It is only a matter of time before NASA's and the US Space Command's agendas meet, and this plutonium is used to support weapons in space.

1211-1

Response to Commentor No. 1211

1211-1: DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and concern over nuclear waste. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch.

As discussed in Chapter 4 of Volume 1 (e.g., 4.3.1.1.13, 4.3.2.1.13, 4.3.3.1.13), waste will be generated by all of the alternatives, including the No Action Alternative. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. DOE activities associated with this program would not impact the schedule or available funding for existing cleanup activities at candidate sites for implementation of the nuclear infrastructure alternatives.

Commentor No. 1211: Mary Beth Sullivan (Cont'd)

Halt all plutonium production. Spend the resources in solving the existing problem of nuclear waste.

Sincerely,

Mary Beth Sullivan
Gainesville, Florida.

|| 1211-2

Auto forwarded by a Rule

Ms. Brown:

Please add my comments to the ever growing list of those opposing the restart of the Fast Flux Test Facility. We all know that cleaning up Hanford is a losing proposition__I've long grown weary of the futile efforts by mismanaged firms to try and attempt the impossible. I'm not sure we'll ever see the area free from severe environmental contamination.

But to add to the amount of waste __why? I have attended hearings and am not impressed that this facility is needed. I agree with our Governor and other elected officials who feel the time for using Washington as a nuclear dumping ground has long since passed.

Please renew the commitment to clean up Hanford and stop trying to add to its nuclear burden.

Sincerely,

Bob Roseth
roseth1@juno.com

Response to Commentor No. 1212

1212-1

1212-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1212-2

1212-2: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Subject: Hanford Reactor Activation
Auto forwarded by a Rule

We are very much opposed to the recent consideration of restarting a nuclear reactor on the Hanford Nuclear Reservation. We feel that there is already too much of a risk to future generations of seepage via aquifers to the Columbia River of the nuclear waste currently stored on the site. The creation of even more risk from having an active reactor on the site is something we do not find acceptable as we live downstream from Hanford.

We ask that you abandon any consideration of such a proposal.

Sincerely;

Stan & Sun Noble

1214-1

1214-2

1214-3

1214-1

Response to Commentor No. 1214

1214-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1214-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford and the risk of contamination to the Columbia River. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

1214-3: The environmental impacts associated with operation of the FFTF are addressed in detail in Section 4.3 of the NI PEIS. The impacts are shown to be small. These impacts specifically include the risks to human health during normal operations and associated with postulated accidents. Over the 35-year operational period no fatalities would be expected among workers or in the general public in the vicinity of Hanford or at distant locations.

Commentor No. 1215: Bruce Bailey

 Auto forwarded by a Rule

Dear Sirs:

I ABSOLUTELY OPPOSE restarting any of the Hanford reactors, particularly the FFTF, for any reason. The Hanford area has been devastated by the nuclear industry. It needs to be cleaned up, then left alone to recover. It DOES NOT need the unnecessary restarting of the FFTF. Clean up Hanford, don't dirty it further.

Bruce Bailey

1215-1

1215-2

Response to Commentor No. 1215

1215-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

It should be noted that FFTF is the only reactor at Hanford under consideration for restart and is, in fact, the only reactor that could be restarted.

1215-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

The NI PEIS addresses the environmental impacts due to the treatment, storage, and disposal of the waste generated for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and appropriate DOE orders.

Public comment on Nuclear Infrastructure Draft Programmatic
Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

Nuclear chemicals cause cancer
and I do not want cancer.
Also the waste is tough to get
rid of and when released into
our environment destroy it.

Name Augusta Gordon
Address 2305 SE 37th Ave
City, state Portland OR Zip 97214

1395-1

1395-2

1395-3

Response to Commentor No. 1395

1395-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1395-2: The commentor's position on nuclear chemicals is noted. Sections 4.3 through 4.6 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of a range of reasonable alternatives, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with Hanford operations in support of the nuclear infrastructure would be small.

1395-3: DOE notes the commentor's concern regarding waste generation. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Commentor No. 1396: Bruce H. Noordhoff

Ms. Colette E. Brown
NE-50, Office of Nuclear Science
Energy and Technology
19901 Germantown Road
Germantown, MD 20874

Dear Ms. Brown:

Subject: Comments on Nuclear Infrastructure PEIS-03100

I offer the following comments on NI PEIS-03100 in support of Alternative 1, FFTF Restart.

- I strongly support the enhancement of this EIS by the inclusion of the Nuclear Energy Research and Development for Civilian Applications mission. I share NERAC's conclusion that the capabilities of currently operating DOE facilities will not support a nuclear energy option, if this option becomes necessary. Further, I believe reinvigoration of materials testing capability in support of advanced reactor development could be critical to our country, if "rate rage" from increasing electrical power shortages and price increases occurs.
- From my study of the NI PEIS, I find the FFTF Restart option to be the best of the options in every area of comparison:
 - It is the preeminent option for supporting the nuclear energy research and development mission, especially for materials and nuclear fuels research.
 - It is capable of producing a greater variety and greater volumes of medical isotopes for diagnostic and therapeutic uses.
 - It can supply the specified quantities of Pu-238.
 - The cost comparison shows FFTF Restart can be achieved most economically.
 - The non-proliferation requirements can be satisfied readily.

Therefore, I believe the selection of FFTF Restart as the Preferred Option should be a "slam-dunk" based on the EIS findings.

- It is critical that the Record of Decision on the final NI EIS be based on DOE's vision of the future energy needs of this country. This is the time for statesman-like leadership which reaches decisions through study and conviction. For this decision, it is essential that our leadership stand against the political "winds that blow" to avoid pitfalls having great programmatic and financial risks and consequences of national importance.

1396-1

1396-2

Response to Commentor No. 1396

- 1396-1:** DOE notes the commentor's support for Alternative 1, Restart FFTF. DOE also notes the commentor's statements related to NERAC's findings and agrees with those findings. Chapter 1 of the PEIS presents material related to the NERAC report.
- 1396-2:** DOE notes the commentor's views. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

Commentor No. 1396: Bruce H. Noordhoff (Cont'd)

I am reminded how unrelenting anti-nuclear activist pressures influenced the decision to prematurely shutdown the PUREX facility at Hanford in 1990, before the spent fuel in the "pipeline" to PUREX was processed. This decision is still reflected in today's storage of corroding high-level waste in the K Basins close to the Columbia River and the diversion of \$1.5 billion dollars from cleanup programs to move and store this material more safely. Additional funding will be needed in subsequent years to maintain this fuel in storage, as there is no plan to dispose of it.

I encourage the NI EIS-03100 decision-makers to not let pressures from vocal activist groups warp their decision on how best to meet projected U.S. needs for radioisotopes and nuclear research and development over the next 20 years.

FFTF IS TRULY A NATIONAL ASSET
FFTF CAN SERVICE ALL THREE NI EIS PROGRAMS.
RESTART FFTF.
JUST DO IT!

Respectfully submitted,

Bruce H. Noordhoff

Draft PEIS Comment Form

Spt 9, 00

Please restart FFTF for medical isotopes. The medical profession, as in any profession, needs as many weapons as possible to fight cancer. Demographics show us that cancer Americans will be a larger percentage of the American population. We need to give cancer fighters more tools to do their job. There are few, if any, legitimate reasons for not restarting FFTF. Thank you so so.

Thank you
Gary T. Dilweg

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Commentor No. 1398: Laurel Piippo

FFTF

September 9, 2000

Dear Collette Brown,

The clock is ticking, time is passing, and we're still talking, talking, talking. On the front page of the TRI-CITY HERALD is a story about vitrification for the disposal of nuclear waste costing so many billions of dollars. How long has this discussion gone on? Ten years? Twenty years? Seven years after FFTF was put on standby, we're still talking while cancer patients suffer and die -- just like those nuts in Hood River and Portland want them to do. Please ask, beg, plead, tell, order, demand Secy Richardson in my behalf to GET ON WITH IT -- restart FFTF.

Yesterday the daughter of one of my Senior Peer Counseling clients (a volunteer effort too long to explain) asked me to help her write about her father's death. He died of cancer and asked his daughter to write his thoughts, particularly in regard to treatment by medical isotopes. He worked here and apparently knew about their medical possibilities and told his daughter he was convinced they could have extended his life.

Attached is my evaluation sheet concerning three hearings I attended this month. The method of selecting speakers was excellent, much better than advance registration or signing up. The lottery system was very fair but tough on those who came up last, of course, and must have been tough on you, having to stay till the very end. I do not think that listening to emotional people exchange ignorances -- and that includes me -- is a good way to settle an issue requiring scientific facts and expertise. Taking a poll or majority rules when people are driven by the latest fad or hysteria is not the way to determine restarting FFTF. On the other hand the government did a rotten job of creating nuclear waste, is apparently being very slow to clean it up, and deserves to be screamed at.

The moderator did a good job of controlling the audience, insisting on courtesy, but could have been more firm about limiting us to five minutes. Except for me, of course. Why were THEIR five minutes so much longer than my five minutes?

Again, I want to apologize for whatever sweeping gestures or impassioned words I said that led you to believe I had any negative feelings toward you. You do such an impressive job and are a terrific role model as a woman in charge (even though Charles Kilbury did say, "Thank you, GENTLEMEN, for the opportunity to speak). As I watched you in action, I wished my granddaughters could have seen what you do and how well you do it. It is a pleasure to see you again.

Sincerely,

LAUREL PIIPPO
Vocal Cancer Survivor

ISOTOPES NO ANSWER TO CANCER
**Public comment on Nuclear Infrastructure Draft Programmatic
Environmental Impact Statement (NI PEIS)**

I am opposed to restart of the Fast Flux Test Facility reactor because:

IT IS TOO RISKY TO THE WILDLIFE
AND TO THE HUMAN LIVES IN THE
PACIFIC NORTHWEST. THERE IS NO JUST-
IFICATION FOR EXPANDING THE D.O.E.'S
NUCLEAR FACILITY INFRASTRUCTURE.

Name B. KINNEAR-WILLIAMS
Address 1105 NW 79TH CIRCLE
City, state VANCOUVER WA Zip 98665

Response to Commentor No. 1399

- 1399-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 1399-2:** The concerns expressed on the potential health and environmental effects of NI PEIS Alternative 1 are noted. The environmental impacts associated with operation of the FFTF and support facilities at Hanford during normal operations and from postulated accidents are presented and discussed in Section 4.3 of the NI PEIS. All impacts to human health and to ecological resources would be small in the immediate area of the Hanford site and negligible at all distant locations.
- 1399-3:** DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.
- Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted

1399-1

1399-2

1399-3

Commentor No. 1399: Barbara Kinnear-Williams (Cont'd)

Response to Commentor No. 1399

by approximately 2005. Under the No Action Alternative, DOE would continue to purchase plutonium-238 to meet the space mission needs for the 35-year evaluation period considered in the NI PEIS. However, DOE recognizes that any purchase beyond what is currently available to the United States through the existing contract would likely require negotiation of a new contract and may require additional NEPA review. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Clean, safe, reliable nuclear power has a role today and in the future for our national energy security. In recognition of this need, nuclear energy research and development programs have been initiated to address potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) and to ensure that current nuclear power plants can continue to deliver adequate and affordable energy supplies. An expanded DOE nuclear facility infrastructure is required to support such nuclear energy research and development for civilian applications.

Re: FFTF for Medical Isotopes

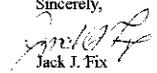

Dear Ms. Brown:

The decision should be made to maintain the Fast Flux Test Facility (FFTF) at Hanford. The FFTF represents one of the most versatile nuclear reactor facilities within DOE. It offers the capability for medical isotope production and even the potential for electrical power generation. The FFTF should be maintained based on considerations of demonstrated scientific contributions, comparative value to DOE programs, and the benefit to US citizens to have assured access to FFTF produced isotopes for medical diagnosis and treatment. Maintaining the FFTF for medical isotope production is widely supported by scientific and medical organizations.

The primary drawback appears to be the outcry of anti-nuclear organizations and politicians that demand no DOE nuclear facility be operated or even maintained at Hanford. The stated reasons are often based on unsound scientific reasons, such as the potential to vaporize Portland, Oregon during an accident or the inability of DOE to handle more than environmental cleanup at Hanford. At best the anti-nuclear organizations support the use of medical isotopes in medical diagnosis and treatment but for the US to import whatever medical isotopes are needed.

I ask that a decision be made to maintain the FFTF to produce medical isotopes based on comparative benefits that will become increasingly evident in the future. The personal testimony of oncologists and cancer patients for the advantages of this technology will continue to grow. The capability to target cancer cells while minimizing damage to healthy tissue cannot be ignored. The aging baby boomer generation will significantly increase the cancer incidence in the years to come and will greatly benefit from this treatment option.

Sincerely,

Jack J. Fix

RE: Fast Flux Test Facility Draft Environmental Impact Statement

Dear Ms. Brown:

The City of Pasco supports the use of the Fast Flux Test Facility at Hanford (FFTF) for the production of isotopes for medicine, space missions and other forms of research and development. The FFTF has the economic capability of producing the quantity, variety and the quality of medical isotopes required by the medical industry to treat cancer. In addition, the FFTF has the capability of safely producing industrial grade isotopes, space batteries and can be a world leader in nuclear research.

The final environmental impact statement should designate the FFTF as the preferred alternative for the efficient production of medical isotopes because it is the only facility that can accommodate all the demands of the medical isotope program as well as industry, space and research. The FFTF is the most cost effective means for meeting the entire range of missions proposed.

Sincerely,

Michael L. Garrison
Mayor

Dear Madam

I support the selection of Alternate 1, Restart of FFTF as the preferred alternative for DOE's Infrastructure Programmatic Environment Impact Statement.

Since FFTF is the most modern reactor facility in the DOE complex, it does not make sense to scrap the FFTF, when it can be operated economically to produce the needed medical and industrial isotopes and material to support NASA's missions.

Contrary to the FFTF's opponents' campaign of mis-information and fear, restart of FFTF would NOT threaten the health of the people or environments of Washington , Oregon and the United States. As evidence by the past operation of the FFTF, which set several world records including safe and efficient reactor operation.

Sincerely,

George T. Taylor

Portland, OR

I am calling to protest the start_up again of the FFTF at Hanford. I am very much concerned about further nuclear waste and I don't think that the start_up is necessary.

|| 1405-1

|| 1405-2

Response to Commentor No. 1405

1405-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1405-2: DOE notes the commentor's concern regarding waste generation. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. As discussed in Section 4.3.1.1.13 of the PEIS, the waste generated as a result of FFTF operations is very small compared to wastes generated by other Hanford activities. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Commentor No. 1406: Mary Siebertsen

NI PEIS Toll_Free Telephone

9/12/00

Mary Siebertsen
7705 SW Miner Way
Portland, OR 97225
503_292_1638

I would like to leave my opinion as for the opening up of the reactor in Hanford for the FFTF which you are referring to as PEIS. I am totally and completely opposed to starting up the reactor. I know you are saying you are going to develop isotopes as well but you are also producing tritium which will certainly overwhelm the cancer situation that you claim to be using the isotopes for. I want the cleanup to be done and completed. I do not want the reactor started again. My husband feels the exact same way, so please put both of us down with our opinion. Thank you very much. I do think you should extend the deadline. I think it is to short to get public input.

1406-1

1406-2

1406-3

1406-1

1406-4

Response to Commentor No. 1406

- 1406-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 1406-2:** The purpose of the NI PEIS is to evaluate the environmental impacts of a range of reasonable alternatives to expanding DOE's existing nuclear facility infrastructure to support production of isotopes for medical, research, and industrial uses; production of plutonium-238 for use in future NASA space exploration missions; and U.S. nuclear research and development needs for civilian application. No component of the proposed action is for the purpose of producing tritium, nor is it for the purpose of supporting any defense-related mission.
- 1406-3:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.
- 1406-4:** DOE notes the commentor's request for extension of the public comment period. The Council on Environmental Quality's (CEQ) "Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act" (40 CFR 1506.10(c)) require that a minimum of 45 days be allowed for public comment on the Draft NI PEIS. As stated in the Notice of Availability (65 FR 46443 et seq.), the public comment period began on July 28, 2000 and continued to September 18, 2000. In preparing the Final PEIS, DOE has assessed and considered both oral and written comments received on the Draft PEIS during the public comment period and has responded to these comments in the Final PEIS. Volume 3 of the NI PEIS contains public comments received on the NI PEIS and DOE responses to those comments. Moreover, late comments were considered to the extent practicable.

Commentor No. 1407: Sandy Mitchell

NI PEIS Toll-Free Telephone

9/11/00

Mr. Sandy Mitchell
10715 1/2 Phinney Ave, North
Seattle, WA 98133
206_440_0148

I am calling to say that I am outraged that the Department of Energy is again trying to start/restart Fast Flux, whatever. I am thoroughly sick of the games that DOE and the Defense Department have been playing with the health of the public, with myself included. I am pretty well informed about the already existing health hazards and fall out. Literally and figuratively. Already above materials already produced at Hanford and fully aware of how difficult the cleanup effort at Hanford has been. I absolutely urge the DOE and government generally to stop this bullshit. Stop lying to us, stop trying to add more contamination to an already incredibly contaminated area.

1407-1

1407-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF. It should be pointed out that the Department of Defense is not involved in any of the missions or alternatives described in the NI PEIS, nor was it involved in the preparation of the document itself.

1407-2

1407-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

Each alternative of the NI PEIS considered and evaluated potential health effects, both in terms of consequences and risks, associated with normal operations and accidental releases from a complete spectrum of accidents including severe accidents. All of the alternatives, including the restart of FFTF, are shown to pose very little risk to the health and safety of the public.

Commentor No. 1408: Lewis D. Burke

NI PEIS Toll_Free Telephone

9/13/00

Lewis D. Burke
 Box 847
 Republic, WA

This is September 13th, I received this information about these supposed meetings. I don't really realize how they're in the public's interests. I think they're in the special interests. This is government serving the worst interests in the United States.

1408-1

Response to Commentor No. 1408

1408-1: The purpose of this NI PEIS is to evaluate the environmental impacts of reasonable alternatives to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238 for NASA space missions, and nuclear research and development. Other interests are beyond the scope of this NI PEIS. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the environmental impact analysis of DOE's proposed alternatives for meeting mission requirements. In preparing the Final NI PEIS, DOE carefully considered comments received from the public. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

Commentor No. 1409: John Severson

9/13/00

John Severson
(503) 297_8572

My name is John Severson. I've been a small businessman and a resident of Oregon _ Portland, Oregon for a number of years and I do not want to see Hanford start producing Tritium, due to the fact that I don't really see the use for it, I'm not convinced of anybody's argument that it's needed and I prefer to see Hanford decommissioned as was originally scheduled years ago. Just wanted to let you know what my opinion was and if anyone needs to call me my number is (503) 297_8572.

1409-1

1409-2

Response to Commentor No. 1409

1409-1: The purpose of the NI PEIS is to evaluate the environmental impacts of a range of reasonable alternatives to expanding DOE's existing nuclear facility infrastructure to support production of isotopes for medical, research, and industrial uses; production of plutonium-238 for use in future NASA space exploration missions; and U.S. nuclear research and development needs for civilian application. No component of the proposed action is for the purpose of producing tritium, nor is it for the purpose of supporting any defense-related mission.

1409-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "...ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

RE: Restart of FFTF

I am strongly in favor of restarting the Fast Flux Test Facility for production of isotopes for medical and industrial research. As one of a large percentage of Americans who has had a bone scan I realize how useful isotopes are in diagnosing ailments. I've been appalled to read of research that has been abandoned due to problems in obtaining lab quality isotopes.

Sincerely,

Connie Estep

Department of Energy
Comments regarding restart of the FFTF

Keith C. Douka
2119 Shasta Ave.
Richland, WA 99352

I am in favor of re-starting the Fast Flux Test Facility.

It becomes tiring to continue to read article after article by concerned citizens regarding this issue, with little or no direct experience related to FFTF or the nuclear power industry as a whole.

My background includes the initial startup activities of the FFTF from 1976 to 1979. From there I supported nuclear startups and/or refueling outages for the following plants:

Tennessee Valley Authority	Sequoyah Unit 1 and 2 Watts Bar Unit 1 and 2
South Carolina Electric & Gas	V.C. Summer
Toledo Electric Co.	Davis-Besse
Florida Power Corp.	Crystal River III
Mississippi Power & Light	Grand Gulf
Georgia Power	Vogtle Unit 1 and 2
Commonwealth Edison	Braidwood Unit 1 and 2
Energy Northwest	Unit 2

The names for many of these utilities have changed over the years, in this case the listing reflects what was. It is important to spend some time qualifying an opinion.

FFTF in comparison to water-cooled power reactors for production of medical isotopes stands head and shoulders above in many areas. An important area to consider is "operating importance". Commercial power reactors in today's deregulated power market are focused on the bottom line, that is making power. Everything centers around the plant generating as much electricity as possible through the operating cycle. Medical isotopes should not take a back seat. The focus should be directly on the mission of creating the isotopes to save lives.

FFTF has a physical plant configuration that favors isotope production. It was designed for testing fuels and materials, whereas the typical power reactor was not. FFTF sits ready to handle the mission with sub-systems already in place to handle irradiated components. It's design includes the ability to load and unload test assemblies without core unloading. A power reactor has to de-couple the reactor head and remove it from the reactor vessel. Anytime you lift a 400,000 pound lid off of something it has to be considered at best "inconvenient".

FFTF has a high neutron environment. The liquid sodium coolant allows this where water is not as efficient. This again shows a broader spectrum of possibilities for isotope production.

1413-1

Response to Commentor No. 1413

1413-1: DOE notes the commentor's support for Alternative 1, Restart FFTF, and opposition to Options 4, 5, and 6 of Alternative 2, Use Only Existing Operational Facilities. However, it should be noted that a CLWR would only be used in the production of plutonium-238 and not medical isotopes.

Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

Commentor No. 1413: Keith G. Douka (Cont'd)

03/16/00 THU 09:51 FAX 5093737606

OCM

002

FFTF operates at nearly atmospheric pressure. Power reactors operate at a typical 2,000 psi. The energies contained with the systems and piping are handled with a great amount of respect. You learn this when a steam line atmospheric relief valve lifts off.

The liquid sodium coolant is contained within piping systems that are located in cells with inert atmospheres. With welded pipe joints and low line pressure there is little chance of pipe rupture or unplanned leakage.

FFTF is a simpler operation with respect to a water-cooled nuclear power reactor. It's control room is very basic in comparison. It should though be upgraded with modern controls if for no other reason than spare parts availability.

FFTF is located on a government reservation in a solitary setting removed from all other site activities. Operation of this test facility would have no impact on cleanup activities at the rest of the site.

Hanford continues to accept contaminated waste. What little waste that is generated by FFTF would be placed right along side of the rest of the inbound contamination waste.

In summary: The United States of America is the world leader in many areas. It should also be the world leader in isotope production, not for the glory but to save American lives such as yours and mine. How ironic that we argue over the most inane things while each of us know someone battling cancer or that has died from cancer. It is also likely that I will face cancer in my future. If I am affected by cancer I certainly do not want opponents to FFTF to sit there and hold my hand telling me how sorry they are that I am dying, but my life as an American citizen was not worth the effort to operate the FFTF.

Keith G. Douka

1413-1

Response to Commentor No. 1413

Commentor No. 1442: Janelle Koester

From: Janelle Koester[SMTP:JANELLE@GORGE.NET]
Sent: Thursday, September 14, 2000 3:22:34 PM
To: INFRASTRUCTURE_PEIS, NUCLEAR
Subject: against startup at hanford
Auto forwarded by a Rule

I am writing to say that I am against the The U.S. Department of Energy's plan to restart the dangerous FFTF Nuclear Reactor at Hanford to produce research medical isotopes and plutonium_238.

I believe it is dangerous and unacceptable for many reasons, some of which I list here.

1. Future demands for medical isotopes can be met using other facilities.
2. Future needs for plutonium to power NASA space missions can be met using existing supplies, supplemented by foreign sources if necessary.
3. The cost analysis, non_proliferation study and waste management study, all extremely important to measuring the impact of FFTF restart, are separated from the environmental impact study.

Finally, more wastes and contamination are not acceptable at Hanford. Restart of FFTF will add more high_level waste to Hanford. Adding new wastes would interfere with the primary mission of Hanford: to clean it up.

Please note for your records that I am STRONGLY OPPOSED TO THIS PLAN AND STARTUP AT HANFORD, as both a citizen and multi_business owner in my community.

thanks,

Janelle Koester, Koester Consulting
PO Box 1175, Hood River,OR 97031

Response to Commentor No. 1442

1442-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1442-2: Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term. The commentor is referred to the Chapter 2, Volume 1 discussion about facilities that were considered but dismissed.

1442-3: There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

1442-4: The costs and nuclear nonproliferation impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such ancillary documents need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed these documents to more than 730 interested parties on August 24 and September 8, 2000, respectively. Both reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided summaries of the Cost Report and Nuclear Infrastructure

Commentor No. 1442: Janelle Koester (Cont'd)

Response to Commentor No. 1442

Nonproliferation Impact Assessment in Appendixes P and Q, respectively in the Final NI PEIS.

The draft Waste Minimization and Management Plan for the Fast Flux Test Facility (May 2000) was referenced in the NI PEIS and made available prior to the public hearings.

1442-5: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

The draft "Waste Minimization and Management Plan for the Fast Flux Test Facility" (May 2000) was referenced in this NI PEIS and was available prior to the public hearings. The report is available on the FFTF website (www.fftf.org/reports).

Commentor No. 1442: Janelle Koester (Cont'd)

Response to Commentor No. 1442

1442-6: See response to Comment 1442-5.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Commentor No. 1443: Arlene Young

I would like to reinforce former Senator Mark Hatfield's position that the Hanford facility should not be reactivated. Radioactive waste is a serious concern to everyone caring about our future. Those of us who live near this facility have watched carefully how slowly clean up of this site has progressed and the errors that have been made in handling this facility. There is no support for any other course of action than shutting the facility down completely and cleaning up the contamination on this site.

Commentor No. 1444: Ariel Simmons

From: Ariel Savannah Simmons[SMTP:SARIEL@USWEST.NET]
Sent: Thursday, September 14, 2000 11:05:06 AM
To: INFRASTRUCTURE_PEIS, NUCLEAR
Subject: Nuclear infrastructure_PEIS c/o Colette Brow also mailed to Kempthorne, Craig, Crapo, Chenoweth, and Simpson
Auto forwarded by a Rule

Ms. Colette Brown
DOE, Office of Space and Defense Power Systems
Dear Ms. Colette Brown,

I've recently learned that the Department of Energy is considering producing Plutonium 238 (PU_238) at INEEL for use in NASA space missions or involving INEEL in the production the process, which will occur on the Hanford Reservation. To produce PU_238, the DOE will use a version of reprocessing technology, which will produce somewhere in the ballpark of 288,000 gallons of liquid waste. This is an exorbitant amount of nuclear waste and is neither acceptable nor justifiable.

As concerned citizen's, the members of the Snake River Alliance have asked you to extend the deadline for comments on the Draft Programmatic Environmental Impact Statement for Accomplishing Expanded Nuclear Energy Research and Development and Isotope Production Missions in the United States, Including the Role of the Fast Flux Test Facility (FFTF). It takes time for people to grasp the ideas and implications in a complicated and multitudinous document, such as this Draft EIS. If possible, at this time, please extend the comment period another 30 days.

Please hear my concerns and prevent the production of PU_238 through "reprocessing" at INEEL and all other DOE sights like the Hanford Reservation.

Response to Commentor No. 1444

1444-1: The use of proposed alternative facilities associated with processing of neptunium-237 targets would have no impact on schedules or available funding for high-level radioactive waste programs at either Hanford or INEEL. At INEEL, the tanks would not be used although certain facilities at the Idaho Nuclear Technology Engineering Center (INTEC) would be used to treat the wastes resulting from processing the irradiated targets. These are reliable systems that would process a maximum of 1,050 cubic meters of low-level radioactive waste over the 35-year nuclear infrastructure operational period. The higher activity waste would be treated as a solid form via a stand-alone vitrification system, separate from any tank waste treatment system. At Hanford, the existing high level radioactive waste facilities would not be used, and as analyzed in the PEIS, no existing or planned high-level radioactive waste facilities would be used to treat the wastes resulting from processing the irradiated targets.

1444-2: DOE notes the commentor's request for extension of the public comment period. The Council on Environmental Quality's (CEQ) "Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act" (40 CFR 1506.10(c)) require that a minimum of 45 days be allowed for public comment on the Draft NI PEIS. As stated in the Notice of Availability (65 FR 46443 et seq.), the public comment period began on July 28, 2000 and continued to September 18, 2000. In preparing the Final PEIS, DOE has assessed and considered both oral and written comments received on the Draft PEIS during the public comment period and has responded to these comments in the Final PEIS. Volume 3 of the NI PEIS contains public comments received on the NI PEIS and DOE responses to those comments. Moreover, late comments were considered to the extent practicable.

1444-3: The use of any of the proposed facilities would not impact the schedule, available funding, or progress of the cleanup missions at Hanford, INEEL, or ORR. This NI PEIS addressed wastes produced for each alternative, as well as cumulative impacts related to waste production. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

1444-1

1444-2

Commentor No. 1444: Ariel Simmons (Cont'd)

a.. Plutonium_238 production is entirely too risky of an endeavor. The reprocessing technology has led to the most expensive and complicated cleanup projects in the history of the United States ___ at INEEL, the Hanford Reservation in southeastern Washington, and Savannah River, South Carolina. The result of the extraction process is liquid waste that is both radioactive and hazardous. Difficult to manage and problematic to put into solid form, liquid waste poses an undue environmental risk.

1444-1

b.. As environmental groups continue to educate people with sound evidence about the waste types that DOE is generating with it's projects, people are becoming less tolerant of projects which serve no valid function, cost tremendous amounts of tax money in cleanup, and are designed solely to keep nuclear scientists in employment. I am an educated Idaho resident, and I have grave concerns about the production of plutonium_238 in my State.

1444-3

c.. "The Department's recent estimate on cleaning up our site is \$22 billion and is expected to take 50 years___longer than any other DOE facility. In addition, we have over 360 individual superfund sites within the 890 sq. mile area that comprises INEEL. With this known, the last thing we need is a plan to generate more nuclear waste at a site that needs more waste like the DOE needs security scandals. Out of concern for Idaho's environment, I strongly urge you not to pursue the plutonium_238 production mission outlined in your PEIS."_Snake River Alliance concerns, which I share.

1444-4

d.. Though this form of plutonium is not usable in nuclear bombs; the technology used to create it is nearly identical to the technology used to extract plutonium_239, the weapons_usable isotope. In 1992, the Bush Administration officially halted reprocessing. This was done to demonstrate US willingness to staunch the flow of plutonium and to persuade other countries not to engage in this threatening technology. Why, then, would the DOE attempt to reopen this threat? Using this reprocessing technology to produce PU_238 will create a real proliferation threat.

1444-5

Response to Commentor No. 1444

1444-4: The commentor's position regarding plutonium-238 production at INEEL is noted. Production of plutonium-238 at one or more of the candidate sites would be conducted in support of NASA's deep space missions Volume 1, Section 1.2.2 of the NI PEIS). As discussed in Sections 4.3.2.1.13 and 4.4.2.1.13 of the EIS, selection of the Fluorinel Dissolution Processing Facility and/or the Advanced Test Reactor to support production of plutonium-238 would have no significant impact on the waste management system at INEEL. Use of any of the facilities proposed in this PEIS for the stated missions would not impact cleanup missions at DOE sites.

1444-5: The commentor is correct in stating that the technology that would be used to separate plutonium consisting of over 80 percent plutonium-238 and neptunium from the irradiated target is similar to the technology that was used to extract plutonium-239. However, the use of this technology is not in itself inconsistent with nonproliferation policy. Unlike plutonium-239, plutonium-238 is not used in nuclear weapons, but rather it would be used as a power source for NASA space missions. The technology that is discussed in EIS Sections S.3, 2.2.3 and A.1.4 would be used to chemically separate plutonium-238 and neptunium from irradiated targets and not from irradiated or spent nuclear fuel whereas the reprocessing we wish to discourage separates weapons grade plutonium-239 from irradiated nuclear fuel. As discussed in the separate nonproliferation impacts assessment report, use of this technology to produce plutonium-238 from irradiated targets will not create a nonproliferation threat, nor will it present any significant concerns related to meeting U.S. nonproliferation goals. This assessment does provide information on proliferation concerns which might be raised related to uncertainty regarding "reduction in attractiveness of material forms," one of the evaluation criteria used in the report. The potential for concerns to be raised are not violations of nonproliferation policy, but are useful to the overall process to reach a decision on the nuclear infrastructure. Further, this potential issue is unavoidable (unless the U.S. elects to neither produce nor purchase plutonium-238), since it impacts all PEIS alternatives and options, including the No Action Alternative and Alternative 5: permanently deactivate FFTF with no new missions at U.S. facilities. The supply of plutonium-238 is needed, and, in the event that its production is resumed in the U.S., the total separated stock of weapons useable neptunium currently in existence will be reduced over

Commentor No. 1444: Ariel Simmons (Cont'd)

e.. The PU_238 isotope is 280 times more radioactive than the stuff in nuclear warheads. Its use is too risky in NASA space missions. In the case of an accident upon liftoff or an "inadvertent re_entry", the possible risk to human life is too great.

f.. Plutonium isn't even necessary. It's not part of the propulsion system; the Pu_238 is used to power instrumentation on the spacecraft. The European Space Agency has developed solar power cells advanced enough that even a California Institute of Technology study by scientists under contract to NASA itself admit that solar power could get the job done. It is true that the deeper the space exploration, the less effective are the solar cells. But it is also true that the DOE refuses to invest in solar technologies because of it's love affair (and extreme lobbying pressure) from the nuclear industry.

g.. "The (INEEL Building 666, which is a "reprocessing" facility) is currently under consideration for new missions." This building is one of the most contaminated in America. Scrap it. The problems that will arise out of trying to reuse this building for new missions pose huge financial risks. Why put a lot of money into a sinking ship? The building should be decommissioned in a manner that protects, workers, the environment, and all of human health. Sacrifice the building, not human lives and the environment. As a member of the Snake River Alliance, please hear my concerns and requests below, "Considering all these factors that could adversely affect our environment and commitment to nonproliferation, I strongly urge you to select alternative 5 in the current PEIS. This alternative would allow the Advanced Test Reactor at INEEL to continue producing medical and industrial isotopes for the commercial sector and would not lead to the production of anymore highly radioactive liquid waste at Hanford or INEEL. The main mission at these two facilities has been and should continue to be cleanup of the mess left over from previous nuclear weapons work. Additional waste production would interfere with this already difficult and expensive work. Alternative 5 also calls for the decommissioning of the FFTF reactor at Hanford. FFTF is an aging breeder reactor whose use

1444-6

1444-7

1444-8

Response to Commentor No. 1444

time in an irreversible manner since there is a moratorium on U.S. spent fuel reprocessing. This reduction, which enhances nonproliferation efforts, is also an important factor for DOE to consider in reaching a decision on managing its nuclear facility infrastructure.

1444-6: DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch.

1444-7: DOE would not conduct any reprocessing to produce weapons-grade plutonium under any of the alternatives considered under this programmatic environmental impact statement. The alternatives do include processing of target materials used to produce isotopes for medical and industrial uses, plutonium-238 for space missions, and nuclear materials research and development. Sections 4.3.1.1.13; 4.3.2.1.13; 4.3.3.1.13; and 4.4.3.1.13 were revised to clarify the waste management approach for waste resulting from processing of target materials for plutonium-238 production.

Building CPP-666 is divided into two parts, the Fuel Storage Facility and the Fluorine Dissolution Process Facility (FDPF). The FDPF is under consideration in this PEIS for storage of neptunium-237 oxide, preparation of neptunium-237 targets, and separation of plutonium-238 from irradiated targets. DOE believes that this facility will meet, with further analysis and/or minor modifications, the criteria to safely conduct these operations.

1444-8: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF. It should be noted that medical isotopes would continue to be produced at ATR regardless of which alternative is selected in the Record of Decision. The FFTF would produce spent nuclear fuel and low-level radioactive waste, and as discussed throughout Section 4.3 of Volume 1, none of the proposed alternatives would add waste to the high-level waste tanks at Hanford or INEEL. Also, it should

Commentor No. 1444: Ariel Simmons (Cont'd)

would be inconsistent with United States policy to discourage use of this technology due to the capability this class of reactors has to produce more plutonium than is consumed. "

Thank you for the opportunity to comment on this plan.

Sincerely,

Ariel Simmons (Boise, Idaho)

**1444-8
(Cont'd)**

Response to Commentor No. 1444

be pointed out that while FFTF supported the breeder reactor program, it is not itself a breeder reactor, but rather a fast flux research reactor.

Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.8.3.4 was revised to clarify that, while analysis shows that the waste management options considered in the NI PEIS would have only a small impact on the Hanford waste management infrastructure, if a decision were made to restart FFTF, DOE would seek an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to treat and dispose of waste generated from FFTF. DOE would use this approach in order to provide additional assurance that the management of wastes resulting from the restart and operation of FFTF would not impact cleanup activities at the site. In either case, whether commercial or the Hanford waste management infrastructure is used, the waste would be managed in accordance with applicable Federal and state laws and regulations and appropriate DOE orders. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

With respect to cleanup of wastes at Hanford or INEEL, the proposed action and the existing cleanup missions are independent programs and actions related to one will not impact the other. While the cleanup activities at both Hanford and INEEL are high priority to DOE, it should be noted that the cleanup of legacy wastes is beyond the scope of the NI PEIS.

Ms. Colette Brown
DOE, Office of Space and Defense Power Systems

Dear Ms. Brown,
Your Department's recent proposal to expand the civilian nuclear infrastructure, outlined in the Draft Programmatic Environmental Impact Statement for accomplishing expanded civilian nuclear energy research and development and isotope production mission in the United States, including the role of the Fast Flux Test Facility, raises significant nuclear weapons proliferation and environmental issues.

As a member of the Snake River Alliance I have become aware of the serious nuclear contamination and waste problems at INEEL. INEEL is one of the most contaminated areas in America. The Department's recent estimate on cleaning up our site is \$22 billion and is expected to take 50 years__longer than any other DOE facility. In addition, we have over 360 individual superfund sites within the 890 sq. mile area that comprises INEEL. With this known, the last thing we need is a plan to generate more nuclear waste at a site that needs more waste like the DOE needs security scandals. Out of concern for Idaho's environment, I strongly urge you not to pursue the plutonium_238 production mission outlined in your PEIS.

One of the most daunting problems confronting cleanup at major DOE facilities such as Hanford and INEEL, is the solidification of liquid high_level nuclear waste. Your current plan for plutonium_238 production entails the generation of approximately 288,000 additional gallons of this waste over the project's 35 year span. While this is a small portion of Hanford's high level waste, it is

Response to Commentor No. 1449

1449-1: The commentor's position regarding plutonium-238 production at INEEL is noted. Production of plutonium-238 at one or more of the candidate sites would be conducted in support of NASA's deep space missions Volume 1, Section 1.2.2 of the NI PEIS). As discussed in Sections 4.3.2.1.13 and 4.4.2.1.13 of the EIS, selection of the Fluorinel Dissolution Processing Facility and/or the Advanced Test Reactor to support production of plutonium-238 would have no significant impact on the waste management system at INEEL. Use of any of the facilities proposed in this PEIS for the stated missions would not impact cleanup missions at DOE sites.

1449-2: The use of proposed alternative facilities associated with processing of neptunium-237 targets would have no impact on schedules or available funding for high-level radioactive waste programs at either Hanford or INEEL. At INEEL, the tanks would not be used although certain facilities at the Idaho Nuclear Technology Engineering Center (INTEC) would be used to treat the wastes resulting from processing the irradiated targets. These are reliable systems that would process a maximum of 1,050 cubic meters of low-level radioactive waste over the 35-year nuclear infrastructure operational period. The higher activity waste would be treated as a solid form via a stand-alone vitrification system, separate from any tank waste treatment system. At Hanford, the existing high level radioactive waste facilities would not be used, and as analyzed in the PEIS, no existing or planned high-level radioactive waste facilities would be used to treat the wastes resulting from processing the irradiated targets.

1449-3: Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will

1449-1

1449-2

Commentor No. 1449: Julie Dinwiddie (Cont'd)

approximately one fifth of what we have remaining here in Idaho, which makes it a very significant amount. Previous leakage of this waste at INEEL and Hanford threatens our water supplies. What we certainly don't need is any more of this most highly problematic of waste forms.

Given the certain risks inherent in production of plutonium, the justified need for this material would have to be tremendous, and the PEIS does a poor job of providing ample justification. Beyond the risks involved in production, and the aforementioned resulting waste problem, there is also the issue of an accident occurring upon lift_off or reentry of a space probe carrying this material. The cassini probe, launched in 1997, carried 72 pounds of Pu_238. The potential for an explosion during lift_off or upon an inadvertent reentry during the fly_by phase, gave many in the scientific community pause, including scientists within NASA. According to NASA's own conservative estimate, a burn up upon reentry of the cassini probe could have caused 2,300 cancer fatalities, independent analyses ranged much higher. This potential for a catastrophic release of this extremely toxic material will remain so long as the US government remains committed to the use of plutonium_238. If DOE is to have a role in developing power systems for NASA's instrumentation, it should focus on promising solar technology, an alternative that has been promoted in the European scientific community.

There are also proliferation concerns as it pertains to this plan. A return to production of this isotope, however poorly justified, means a return to the use of aqueous reprocessing at DOE facilities where this technology has been used to extract bomb material for the weapons program. From President Carter to presidents Bush and Clinton, US policy has been to halt reprocessing in this country in order to set a global precedent to curtail the spread of nuclear weapons material_a noble effort in serious need of bolstering through action.

Indeed, an otherwise lukewarm Nuclear Infrastructure Nonproliferation Impact Assessment

1449-2
(Cont'd)

1449-3

1449-4

1449-5

Response to Commentor No. 1449

be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed production of plutonium-238 are relatively low and are discussed in detail in Chapter 4 of Volume 1, and Appendixes H, I, and J of Volume 2 in the Final NI PEIS.

- 1449-4:** DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. The Cassini fly-by occurred exactly as planned, with no release of nuclear material..
- 1449-5:** The commentor is correct in stating that the aqueous processing technology that would be used to separate plutonium consisting of over 80 percent plutonium-238 and neptunium from the irradiated target is similar to the technology that was used to extract plutonium-239. However, unlike plutonium-239, plutonium-238 is not used in nuclear weapons, but rather it would be used as a power source for NASA space missions. The technology that is discussed in EIS Sections S.3, 2.2.3 and A.1.4 would be used to chemically separate plutonium-238 and neptunium from irradiated targets and not from irradiated or spent nuclear fuel whereas reprocessing separates weapons grade plutonium-239 from irradiated nuclear fuel. As discussed in the separate nonproliferation impact assessment report, use of this technology to produce

Commentor No. 1449: Julie Dinwiddie (Cont'd)

conducted by your Office of Arms Control and Nonproliferation questions whether our commitment to nonproliferation isn't weakened by the use of the Fluorinel Dissolution Process Facility within Building 666 at INEEL. INEEL's reprocessing facility is next door to a wet storage unit for Navy spent fuel, which contains a greater than average amount of highly enriched uranium. It was reprocessed from 1953 to 1989 at INEEL for the weapons program. Use of this facility to carry out plutonium_238 extraction, especially considering the dubious need for this isotope, at the very least raises the concern that DOE is not fully committed to ending reprocessing. The international community cannot be expected to trust DOE's civilian_mission claim when an agency devoutly committed to development of weapons uses a nuclear weapons technology at a weapons facility.

**1449-5
(Cont'd)**

Considering all these factors that could adversely affect our environment and commitment to nonproliferation, I strongly urge you to select alternative 5 in the current PEIS. This alternative would allow the Advanced Test Reactor at INEEL to continue producing medical and industrial isotopes for the commercial sector and would not lead to the production of anymore highly radioactive liquid waste at Hanford or INEEL. The main mission at these two facilities has been and should continue to be cleanup of the mess left over from previous nuclear weapons work. Additional waste production would interfere with this already difficult and expensive work. Alternative 5 also calls for the decommissioning of the FFTF reactor at Hanford. FFTF is an aging breeder reactor whose use would be inconsistent with United States policy to discourage use of this technology due to the capability this class of reactors has to produce more plutonium than is consumed. Thank you for the opportunity to comment on this plan.

1449-6

Sincerely,

Julie Dinwiddie

Response to Commentor No. 1449

plutonium-238 from irradiated targets will not create a nonproliferation threat. DOE is committed to full compliance with and support of the U.S. policy prohibiting reprocessing. The juxtaposition of INEEL Building 666 to wet storage of highly enriched uranium Navy spent nuclear fuel and its previous mission of reprocessing spent nuclear fuel were considered in the separate nonproliferation impact assessment.

1449-6: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF. It should be noted that medical isotopes would continue to be produced at ATR regardless of which alternative is selected in the Record of Decision. The FFTF would produce spent nuclear fuel and low-level radioactive waste, and as discussed throughout Section 4.3 of Volume 1, none of the proposed alternatives would add waste to the high-level waste tanks at Hanford or INEEL. Also, it should be pointed out that while FFTF supported the breeder reactor program, it is not itself a breeder reactor, but rather a fast flux research reactor.

Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

With respect to cleanup of wastes at Hanford or INEEL, the proposed action and the existing cleanup missions are independent programs and actions related to one will not impact the other. While the cleanup activities at both Hanford and INEEL are high priority to DOE, it should be noted that the cleanup of legacy wastes is beyond the scope of the NI PEIS.

The cassini probe, launched in 1997, carried 72 pounds of Pu_238. The potential for an explosion during liftoff or upon an inadvertent reentry during the fly_by phase, gave many in the scientific community pause, including scientists within NASA. According to NASA's own conservative estimate, a burn up upon reentry of the cassini probe could have caused 2,300 cancer fatalities, independent analyses ranged much higher. This potential for a catastrophic release of this extremely toxic material will remain so long as the US government remains committed to the use of plutonium_238. If DOE is to have a role in developing power systems for NASA's instrumentation, it should focus on promising solar technology, an alternative that has been promoted in the European scientific community.

There are also proliferation concerns as it pertains to this plan. A return to production of this isotope, however poorly justified, means a return to the use of aqueous reprocessing at DOE facilities where this technology has been used to extract bomb material for the weapons program. From President Carter to presidents Bush and Clinton, US policy has been to halt reprocessing in this country in order to set a global precedent to curtail the spread of nuclear weapons material_a noble effort in serious need of bolstering through action.

**1453-2
(Cont'd)**

1453-3

1453-4

1453-5

Response to Commentor No. 1453

be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed production of plutonium-238 are relatively low and are discussed in detail in Chapter 4 of Volume 1, and Appendixes H, I, and J of Volume 2 in the Final NI PEIS.

1453-4: DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. The Cassini fly-by occurred exactly as planned, with no release of nuclear material.

1453-5: The commentor is correct in stating that the aqueous processing technology that would be used to separate plutonium consisting of over 80 percent plutonium-238 and neptunium from the irradiated target is similar to the technology that was used to extract plutonium-239. However, unlike plutonium-239, plutonium-238 is not used in nuclear weapons, but rather it would be used as a power source for NASA space missions. The technology that is discussed in EIS Sections S.3, 2.2.3 and A.1.4 would be used to chemically separate plutonium-238 and neptunium from irradiated targets and not from irradiated or spent nuclear fuel whereas reprocessing separates weapons grade plutonium-239 from irradiated nuclear fuel. As discussed in the separate nonproliferation impact assessment report, use of this technology to produce

Commentor No. 1453: Florence Lemle (Cont'd)

Indeed, an otherwise lukewarm Nuclear Infrastructure Nonproliferation Impact Assessment conducted by your Office of Arms Control and Nonproliferation questions whether our commitment to nonproliferation isn't weakened by the use of the Fluorinel Dissolution Process Facility within Building 666 at INEEL. INEEL's reprocessing facility is next door to a wet storage unit for Navy spent fuel, which contains a greater than average amount of highly enriched uranium. It was reprocessed from 1953 to 1989 at INEEL for the weapons program. Use of this facility to carry out plutonium_238 extraction, especially considering the dubious need for this isotope, at the very least raises the concern that DOE is not fully committed to ending reprocessing. The international community cannot be expected to trust DOE's civilian_mission claim when an agency devoutly committed to development of weapons uses a nuclear weapons technology at a weapons facility.

Considering all these factors that could adversely affect our environment and commitment to nonproliferation, I strongly urge you to select alternative 5 in the current PEIS. This alternative would allow the Advanced Test Reactor at INEEL to continue producing medical and industrial isotopes for the commercial sector and would not lead to the production of anymore highly radioactive liquid waste at Hanford or INEEL. The main mission at these two facilities has been and should continue to be cleanup of the mess left over from previous nuclear weapons work. Additional waste production would interfere with this already difficult and expensive work. Alternative 5 also calls for the decommissioning of the FFTF reactor at Hanford. FFTF is an aging breeder reactor whose use would be inconsistent with United States policy to discourage use of this technology due to the capability this class of reactors has to produce more plutonium than is consumed. Thank you for the opportunity to comment on this plan.

Sincerely,

Florence Lemle
PO Box 3575
Jackson, WY 83001
Flemle@aol.com

1453-5
(Cont'd)

1453-6

Response to Commentor No. 1453

plutonium-238 from irradiated targets will not create a nonproliferation threat. DOE is committed to full compliance with and support of the U.S. policy prohibiting reprocessing. The juxtaposition of INEEL Building 666 to wet storage of highly enriched uranium Navy spent nuclear fuel and its previous mission of reprocessing spent nuclear fuel were considered in the separate nonproliferation impact assessment.

1453-6: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF. It should be noted that medical isotopes would continue to be produced at ATR regardless of which alternative is selected in the Record of Decision. The FFTF would produce spent nuclear fuel and low-level radioactive waste, and as discussed throughout Section 4.3 of Volume 1, none of the proposed alternatives would add waste to the high-level waste tanks at Hanford or INEEL. Also, it should be pointed out that while FFTF supported the breeder reactor program, it is not itself a breeder reactor, but rather a fast flux research reactor.

Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

With respect to cleanup of wastes at Hanford or INEEL, the proposed action and the existing cleanup missions are independent programs and actions related to one will not impact the other. While the cleanup activities at both Hanford and INEEL are high priority to DOE, it should be noted that the cleanup of legacy wastes is beyond the scope of the NI PEIS.

Commentor No. 1454: James R. McGrath

From: james mcgrath

Subject: FFTF
Auto forwarded by a Rule

We want to add our voices to those opposing the restart of the Fast Flux Test Facility at Hanford, WA. To begin the production now of radioactive isotopes which competent nuclear medicine leaders have said is not needed and to begin again producing a stream of radioactive waste in the midst of a cesspool of radioactivity which the D.O.E. agreed 11 years ago to clean up and has failed it's part is almost unbelievable.

If we (as a nation) would set put our energies and resources into a genuine and full fledged cleanup action, it would provide a new economic base for the stessed tri_cities area and turn people in a direction they can feel good about. Nobody can be proud to be part of an activity which is unnecessary and destructive.

Let's shut down the FFTF permanently.

James R. McGrath, MD Charlotte B. McGrath, RN
10901 176th Circle NE #1712
Redmond, WA (*052_7248 425_881_2220

1454-1

1454-2

1454-3

1454-4

Response to Commentor No. 1454

1454-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.

1454-2: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advise regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

The NI PEIS provides an estimate of waste generation and potential human health impacts associated with each of the alternatives proposed for the production of medical isotopes. Any additional wastes generated in support of this mission would be managed in a safe an environmentally protective manner and in compliance with all applicable Federal and state laws, regulations, and applicable DOE orders. In terms of potential human health impacts, the NI PEIS analysis indicates that the most likely impacts would not result in additional cancer fatalities among the population surrounding the DOE facilities that may be selected for use.

Commentor No. 1454: James R. McGrath (Cont'd)

Response to Commentor No. 1454

In addition, the proposed action would not have an impact on the cleanup missions at any of the candidate sites.

1454-3: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "... ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

1454-4: See response to comment 1454-1.

To whom it may concern,

I am writing concerning the Draft Programmatic Environmental Impact Statement (PEIS) for supporting civilian nuclear energy research and development and isotope production missions in the United States, including the role of the Fast Flux Test Facility. I attended the meeting in Richland, Wa concerning this Statement. I think that FFTF should be used for the medical isotope production. I come from a family that has seen cancer numerous times on both sides. I have a sister who has had skin cancer. Therefore, I am looking at a good possibility of getting cancer. We need the research and development done now, with a restart of FFTF this could happen. FFTF could be on line and producing isotopes while the other options are still being engineered and attempting to go through their approval processes. I have read and listened to the opposition for FFTF and I see only scare tactics being used to attempt to sway public opinion.

I cannot believe that any sane person would consider restarting the FFTF Nuclear Reactor at Hanford. We already are having trouble dealing with the radioactive wastes that were created in the past, and we're considering a decision that would create MORE waste? This is insanity. Let's clean up or attempt to clean up the mess that has already been created.

Your own people are telling you that the medical isotopes and the Plutonium is not necessary. Listen to them. Listen to the voices of reason and not to those who would send money your way. They care not for your lives and ours.

Do not restart the FFTF at Hanford.

In the period since the initial estimates were made, the actual growth of medical isotope use

Commentor No. 1457: Carol Halvorson (Cont'd)

Response to Commentor No. 1457

has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Although research to identify other potential fuel sources to support these space exploration missions has been conducted, no viable alternative to using plutonium-238 has been established. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

1457-4: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Dear Ms Brown,

I would like to submit the following electronic newsletter I received today as a supplement to my prior letter of September 9th, 2000. Also, I would appreciate being informed of what sort of response I can expect from DoE on the matters I raised in my previous email.

The enclosed newsletter is from the "NOFLYBY" webmaster, Jonathan Haber. It suggests that all readers send their comments not only to DoE but to __ not Jonathan Haber __ but Bruce Gagnon, that is, Global Net.

In my previous email I referred to Global Net __ that is, Bruce Gagnon's group __ as the "The official organization which opposes nuclear power in space". By "official" I did not mean to imply that there was a publicly documented sanctioning (there may be, for all I know), but rather that NASA, DOE, and other government agencies,

Response to Commentor No. 1458

-
- 1458-1** **1458-1:** DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and concern over nuclear waste. The scope of this Nuclear Infrastructure PEIS is limited to analysis of alternatives to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development (see Volume 1, Section 1.2 of the NI PEIS).

Commentor No. 1458: Russell D. Hoffman (Cont'd)

and the media, and other activist groups, have all behaved *as if* that group were somehow officially sanctioned. NASA for example a few years ago held a "town meeting" about Cassini with Gagnon's group, and at that meeting Gagnon specifically excluded local (Florida) NASA sub_contractor scientist Horst Poehler from participating at a panel level. Gagnon had no comparable expert available. (Dr. Poehler is the author of the excellent Cassini Cancers article, available at my STOP CASSINI web site.)

I submit the attached newsletter as an indication that Gagnon's group is indeed considered, even by many people in the movement itself, as the "de facto" leadership organization in opposition to DOE plans.

But I also claim that Bruce Gagnon, and several others associated with his group, are both secretive, and extraordinarily unproductive, specifically because they are frauds. Such behavior is utterly UNConstitutional against a U.S. citizen, yet these "operatives" are agents of American military policy acting against American citizens (among others). At the same time, they are acting as if in utter ignorance of numerous scientific principals.

Such activities have got to stop for our democracy to solve its problems, such as the continued hazard from the growing nuclear waste piles all around our country (nearly all DOE's fault), and the growing pile of official lies being told in order to support a bankrupt national nuclear policy and its corrupt and blindfolded industry __ an industry which does not even dare to examine its own dangers.

It is very likely that if the American public understood the true dangers we are facing from the various nuclear threats our own government makes against us __ which are all cumulative in their effects on the biosphere and on our health __ we, the public, would have stopped this mad behavior long ago.

So one must ask, why haven't we?

Indeed, why have a few closed_minded scientists at NASA actually managed to convince the world to let a particularly large and

**1458-1
(Cont'd)**

Response to Commentor No. 1458

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch.

As discussed in Chapter 4 of Volume 1 (e.g. sections 4.3.1.1.13, 4.3.2.1.13, 4.3.3.1.13), waste will be generated by all of the alternatives, including the No Action Alternative. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. DOE activities associated with this program would not impact the schedule or available funding for existing cleanup activities at candidate sites for implementation of the nuclear infrastructure alternatives (see Section N.3.2).

DOE does not place operatives in environmental organizations, the news media, NASA, or any other organization. Individuals and organizations are free to make any comment on the NI PEIS. Responses to all comments received during the comment period are given in the Comment Response Document that comprises Volume 3 of this NI PEIS.

Commentor No. 1458: Russell D. Hoffman (Cont'd)

cumbersome probe be sent to Saturn, thus risking spilling 400,000 Curies of Plutonium 238 in vaporized form into our small biosphere with 6 billion human souls on board?

Why couldn't NASA have flown two non_nuclear missions to replace Cassini's ugly and dangerous nuclear solution ___ dangerous, as proven by NASA's own subsequent failures? (Titan's have failed, orbital insertions have failed, the Shuttles have been grounded for potentially catastrophic failures found by chance, etc. etc. etc.)

Why did NASA not only risk our (citizens of planet Earth's) lives, and do so for no scientific gain at all since the entire science gain could have been developed with non_nuclear electrical power sources, but why also did NASA risk its own reputation by attempting such a dangerous and foolhardy thing?

The answer is surely the military connection I discussed in my previous letter.

The fact is, I doubt the American public, if given a fair chance to look at the issues, would go along with such madness as is currently being proposed by DOE. The only explanation I can accept for my fellow Americans making such wrong decisions collectively is that they have not been given the facts.

When I became involved, in 1997, with the issue of nukes in space, it quickly became apparent that, except for the dedicated work of one investigative journalist (Karl Grossman), nukes in space was largely a forgotten issue ___ a slumbering horror which needed to be stopped.

Soon, even more appeared to be amiss than just silence from the major media and from other environmental organizations (the issue won a Project Censored award about that time).

Eventually, with careful study, I was able to identify the problem of why the public didn't understand how little we (the public) were gaining from such great dangers DOE was permitting: The real

**1458-1
(Cont'd)**

Response to Commentor No. 1458

Commentor No. 1458: Russell D. Hoffman (Cont'd)

problem?

Government is playing both sides of the issue.

I believe that our government is able to control, through carefully placed operatives both in environmental organizations and in the media __ not only everything NASA officially says to the media about what is going on, and many media outlets themselves __ but in addition, through agents and infiltrators of the various movements opposed to what the Government is doing, they control even what the media hears the opposition say.

These infiltrators are particularly potent, because they cause the wrong questions to be asked, or if anyone does ask the right questions, they are willing to accept the wrong answers. These infiltrators fight only half heartedly, except at their efforts to gain control of all phases of the movement. They commit 100s of other sins of both omission and commission to prevent other activists from becoming effective in actually changing public policy by effecting public opinion.

I would like to submit as additional suggested reading, all 253 prior issues of the Stop Cassini newsletter, and all three prior issues of the Nukes, Kooks and Spooks newsletter, all of which are available either online at my web site (for the Stop Cassini newsletters) or by request directly from me (for the Nukes, Kooks and Spooks newsletters, which I have not yet been posted).

And I again request to be informed when I can expect detailed, honest answers to my charges. The American public has a right to know the full truth. This country was founded on truth and the purpose of the Environmental Impact Statement process is to present the truth fairly and completely so that the American public can decide for themselves what they want to do.

Sincerely,

Russell D. Hoffman

Commentor No. 1459: Elizabeth N. Presley (Cont'd)

Response to Commentor No. 1459

Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

For nearly 50 years, DOE has actively promoted the use of radioisotopes to improve the health and well-being of U.S. citizens. DOE's use of its unique technologies and capabilities to develop isotopes for civilian purposes has enabled the widespread application of medical isotopes seen today. While its market share is a small fraction of total world isotope production, DOE remains the key provider for a large number of isotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large-enough quantities to make their production financially attractive to private industry. DOE's intent is to complement commercial sector capabilities to ensure that a reliable supply of isotopes is available in the U.S. to meet future demand, and to encourage the commercial sector to privatize the production of isotopes that have established applications to a level that would support commercial ventures.

Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term (less than 5 years).

1459-5: The concerns expressed on the potential health and environmental effects of NI PEIS Alternative 1 are noted. The environmental impacts associated with operation of the FFTF and support facilities at Hanford during normal operations and from postulated accidents are presented and discussed in Section 4.3 of the NI PEIS. All impacts to human health and to ecological resources would be small in the immediate area of the Hanford site and negligible at all distant locations.

1459-6: See response to comment 1459-1.

Subject: Possible restart of the FFTF facility at Hanford (Richland, Wa) Auto forwarded by a Rule

With regard to the chairman f NERAC's statement to the Energy Secretary that "There is an urgent sense that the nation must rapidly restore an adequate investment in basic & applied research in nuclear energy if it is to sustain a viable United States capability in the 21st Century"_ I'd be interested in the actual Location of that 'urgent sense.' The representation (in the NI PEIS "Summary") that NERAC provides "independent expert advice' on such matters is not a true representation; many of the 'experts' have something to gain by increased funding of 'basic & applied research in nuclear energy, which calls into question their alleged 'independent' status. Additionally, a lack of _true_ independence calls into question their determination of the parameters of "viable U.S. capability" in the future. Despite the thrust of the NI PEIS, ie that this is a process that is designed to put U.S. assets to work (& a small subset of U.S. assets located at/ near USDOE facilities, at that), & that this justifies ignoring foreign sources of supply of some products from these assets, this policy ignores that we have Partners in many of our present ventures into space exploration. To ignore their potential contributions (& cost_ effective ones, most likely) of Pu_238 is to support a 'demand' economy_ something we (ie our Nation) determined was 'The Problem' with industrial policies in the former Soviet Union, & other places as well. While I appreciate that deactivation of the FFTF facility will increase cleanup costs at Hanford in the near future, it will ultimately have to be done. I'd say, as long as our Gov't is supporting more internationally regulated global trade, it would be the height of hypocrisy to deny that, in this particular area, we must ignore our own policies in order to support a 'mission' for this facility. (While I may have qualms, personally, about support of global 'free' trade, NAFTA is presently 'the law of the land.')

1460-3

1460-4

Response to Commentor No. 1460

- 1460-1:** Clean, safe, reliable nuclear power has a role today and in the future for our national energy security. In recognition of this need, nuclear energy research and development programs have been initiated to address potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) and to ensure that current nuclear power plants can continue to deliver adequate and affordable energy supplies. An enhanced DOE nuclear facility infrastructure is required to support such nuclear energy research and development for civilian applications. Information on the need for nuclear energy research and development is provided in Section 1.2.3 of Volume 1.
- 1460-2:** The United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.
- DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.
- 1460-3:** Deactivation of FFTF would be a Hanford cleanup cost.
- 1460-4:** The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily Molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. Further, supplies of many research isotopes are not readily available from existing foreign or domestic sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed. As such, reliance on these other sources

Commentor No. 1460: J. H. Browne, Jr. (Cont'd)

I support Alternative 5, but consider that Alt 4 might be my first choice, had it been structured differently. Thanks for your consideration.

I am writing to express my desire that Hanford's FFTF be permanently shut down and deactivated. It is an irresponsible affront to the health and welfare of the citizens of eastern Washington to add more radioactive wastestreams to the nation's most polluted nuclear site. The Washington State Medical Association, Washington Academy of Family Physicians and the Physicians for Social Responsibility have all passed formal resolutions opposing the restart of Hanford's FFTF. Clean up and not restart, as outlined in the TPA, should be the future mission at Hanford.

Sincerely,

Dennis Crockett, Ph.D.

 Subject: RESTART FOR LIFE
 Auto forwarded by a Rule

To Whom It May Concern:

I strongly urge the DOE to restart FFTF and use this modern and safe reactor to make the life saving isotopes that the cancer patients of this country so desperately need!!! I am not only a cancer survivor, but also the wife of an employee at this precious facility. Please help my husband and all of the FFTF employees, to help cancer patients such as myself be able to fight this unfair killer with more authority. Let's not confuse the issue of postwar cleanup in our area with the mission of the FFTF. FFTF is a safe and efficient reactor, which can produce a very wide variety of medical isotopes with very little waste as a result. Please ignore radical environmental groups' opinions, for they speak only out of ignorance and misplaced passion. They are not a part of this community, and can only benefit from the production of the isotopes at FFTF. Please do America and all of us in Eastern Washington a favor and RESTART FFTF to embark on these new and exciting missions. Let us all make the Tri_Cities and Hanford a place to be proud of. Let's start saving lives!!!!

Sincerely,

Shayne R. Bono

1462-1

1462-2

1462-1

Response to Commentor No. 1462

1462-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

1462-2: It is DOE policy to encourage public input on matters of regional, national and international importance as part of its commitment to facilitate a public participation process that is open and unbiased. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

Commentor No. 1463: Doris Cellarius

From: Doris Cellarius[SMTP:DORIS@CELLARIUS.NET]
 Sent: Wednesday, September 13, 2000 5:25:08 PM
 To: INFRASTRUCTURE_PEIS, NUCLEAR
 Subject: DO NOT RESTART THE FFTF
 Auto forwarded by a Rule

To: Colette E. Brown
 US Department of Energy, NE_50
 19901 Germantown Road
 Germantown, MD 20874_1290

From: Doris Cellarius
 621 Park Avenue, Prescott, AZ 86303_4044

I lived in Washington State for 27 years (until last September) and was very concerned about Hanford Clean_up. I served for several years on the DOIT Mixed Waste Advisory Committee. I oppose the proposed restart of FFTF Nuclear Reactor at Hanford to produce research medical isotopes and plutonium_238.

Restart of that reactor would add more high_level waste to the cleanup problem, further complicating an already unacceptable cleanup effort by the Department of Energy.

Furthermore, the DOE has never been able to document why such a restart is needed. Many medical professionals have testified that demands for medical isotopes can be met using other facilities. Plutonium to power NASA space missions can be met using existing supplies, supplemented by foreign sources if necessary.

I am disgusted with the way the Department of Energy has attempted to manipulate politicians and the public in Washington state. Playing on the public's fears is not an honorable practice for a government agency established to serve the public good. Please give up on this faulty proposal.

Thank you.

Doris Cellarius

Response to Commentor No. 1463

1463-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1463-2: The restart of FFTF would not impact the schedule or available funding for existing cleanup activities at Hanford nor would it generate any high-level radioactive wastes. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The use of proposed alternative facilities associated with processing of neptunium-237 targets would have no impact on schedules or available funding for high-level radioactive waste programs at Hanford. The higher-activity waste would be treated as a solid form via a stand-alone vitrification system, separate from any tank waste treatment system. Therefore, the existing Hanford high-level radioactive waste facilities would not be used and, as analyzed in the PEIS, no existing or planned high-level radioactive waste facilities would be used to treat the wastes resulting from processing the irradiated targets.

1463-3: The United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements.

Although other manufacturers produce medical isotopes, DOE remains the key provider for a large number of isotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large-enough quantities to make their production financially attractive to private industry. Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of

Commentor No. 1463: Doris Cellarius (Cont'd)

Response to Commentor No. 1463

the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

1463-4: There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Although research to identify other potential fuel sources to support these space exploration missions has been conducted, no viable alternative to using plutonium-238 has been established. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

1463-5: DOE notes the commentor's views. DOE is committed to discharging its responsibilities in an open and unbiased manner and providing the public with comprehensive environmental reviews of its proposed actions. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the environmental impact analysis of DOE's proposed alternatives for meeting mission requirements, and gave equal consideration to all comments, regardless of how or where they were received. All comments received during the public comment period have been responded to in this NI PEIS.

Commentor No. 1464: Theresa Smith

PUBLIC COMMENT

NO. I do NOT want Handford restarted. NOT to make medical isotopes or for ANY reason. Until we can resolve the issues of radio active wastes, it is irresponsible to create more. We may cure some cancer but at what cost? WE DON'T KNOW THE FULL COSTS.

- || 1464-1
- || 1464-2
- || 1464-3
- || 1464-4

Response to Commentor No. 1464

- 1464-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 1464-2:** DOE notes the commentor's opposition to restarting FFTF to produce medical isotopes or for any other reason.
- 1464-3:** DOE notes the commentor's concern regarding waste generation. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.
- 1464-4:** DOE notes the commentor's concerns about the need for radioactive isotopes in medical procedures and the wastes produced in their production. Radioisotopes are used for both therapy and diagnosis. In ongoing clinical testing, therapeutic isotopes have proven effective in treating cancer and other illnesses by cell-directed localized radiation therapy (i.e., deploying antibodies or carriers of radioisotopes to seek and destroy invasive cancer cells). This directed therapy can minimize adverse side effects (e.g., healthy tissue damage, nausea, hair loss), making it an effective, attractive alternative to traditional chemotherapy or radiation treatments. In addition to therapy for cancer and other illnesses, radioisotopes are also used for diagnostic purposes, such as imaging internal organs. Unlike conventional radiology, imaging with radioisotopes reveals organ function and structure, which provides additional data for a more accurate diagnosis, and assists in the early detection of abnormalities. The generation of wastes from the production of medical isotopes, which are small in comparison to the candidate sites' current generation rates, are discussed for each alternative in Chapter 4, Volume 1 of the NI PEIS. The additional waste generated would only have a small impact on the management of wastes at the candidate sites.
- Potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the medical isotope mission are relatively low and are discussed in detail in Chapter 4 of Volume 1 and appendixes H, I, and J of Volume 2 in the Final NI PEIS. In terms of potential human health impacts, the NI PEIS analysis

Commentor No. 1464: Theresa Smith (Cont'd)

Response to Commentor No. 1464

indicates that the most likely impacts would not result in additional cancer fatalities among the population surrounding the DOE facilities that may be selected for use.

The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS.

Commentor No. 1465: Galena Kline

Subject: Hanford Reactor Re_activation
Auto forwarded by a Rule

I just received an e_mail concerning the restart of reactors at Hanford. I am writing this brief message to say that I am opposed to this restart. Hanford has caused enough trouble for the Columbia River and its residents. Please do not put us in danger any longer.

Sincerely,

Galena Kline

1465-1

1465-2

Response to Commentor No. 1465

1465-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1465-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford and the risk of contamination to the Columbia River. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is committed to honoring this agreement.

The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

 Subject: Re: No to proposal to restart Hanford
 Auto forwarded by a Rule

As a citizen of the Pacific NW, I am very concerned about the US Dept. of Energy's proposal to restart Hanford's Fast Flux Test Facility Nuclear Reactor. I wish to have my opinion incorporated into the formal administrative record and taken into consideration when adopting the final record of decision. I would also like you to respond to my concerns before you make your record of decision.

Looking at Hanford's problems, e.g., crisis with tank waste treatment and damage caused by and radiation released from the Hanford wildfire, restarting FFTF is absolutely unacceptable. We must deal with the waste already at Hanford and focus on the clean_up mission. Tank wastes are already seeping towards the Columbia River. More wastes must not be added to those tanks. Clean_up must be the only priority. We must save our Columbia River—we do not get a second chance.

You have not told us how you will deal with non_proliferation issues or additional waste from FFTF. Should FFTF be restarted, that decision will be illegal under Federal law and will be overturned! Do the right thing, shut down FFTF right now and save the future of our Columbia River!

Sincerely,
 Darlene Hickman

1466-1

1466-5

Response to Commentor No. 1466

- 1466-1:** DOE notes the commentor's concerns. This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. DOE prepared a separate Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on September 8, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Nuclear Infrastructure Nonproliferation Impact Assessment in Appendix Q in the Final NI PEIS. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.
- 1466-2:** DOE notes the commentor's concern regarding the existing cleanup mission at Hanford and the risk of contamination to the Columbia River. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Commentor No. 1466: Darlene Hickman (Cont'd)

Response to Commentor No. 1466

The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

None of the alternatives considered in this PEIS would add to the Hanford waste tanks.

In regards to the Hanford wildfire of 2000, the DOE Richland Operations Office, the State of Washington Department of Health, and U.S. Environmental Protection Agency performed environmental monitoring on and around the Site to assess potential radiological impacts. The wildfire did not cause a release of radioactive materials from any Hanford facilities but did result in resuspension of radioactive materials which were already in the environment. The very low levels of radioactive materials that were resuspended were slightly above natural background levels and required several days of analysis to quantify. Information on this event has been made available to the public and can be accessed at <http://www.Hanford.gov/envmon/indes.html>. This site also provides a link to information on the independent offsite air monitoring that was conducted by the U.S. Environmental Protection Agency.

- 1466-3:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.
- 1466-4:** Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE

Commentor No. 1466: Darlene Hickman (Cont'd)

Response to Commentor No. 1466

Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

1466-5: See response to comment 1466-3.

Reg.FFTF at Hanford

There is no reason to restart the FFTF at Hanford. There is no shortage of medical isotopes, our suppliers (mainly Canada) are very reliable. We need to clean up Hanford and not add to the pollution by restating FFTF.

Wolfgang F.Kluge MD.

1467-1

1467-2

Response to Commentor No. 1467

1467-1: The United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements.

Although other manufacturers produce medical isotopes, DOE remains the key provider for a large number of isotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large-enough quantities to make their production financially attractive to private industry. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

1467-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. The DOE

Commentor No. 1467: Wolfgang F. Kluge (Cont'd)

Response to Commentor No. 1467

missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities. DOE is fully committed to honoring this agreement.

In regards to additional pollution, the NI PEIS evaluated the maximum cumulative impacts to the public from all reasonably foreseeable Hanford Site activities over the 35 year time-frame. Table S-21 shows the maximum cumulative air pollutant concentrations for Hanford and the NI PEIS activities. As shown, Hanford is currently in compliance with all Federal and state ambient air quality standards, and would continue to remain well within the standards with the small contribution of air pollutants that would be attributable to the NI PEIS alternatives. Table S-22 shows the maximum radiological radiation exposure for Hanford and the NI PEIS activities. As shown, the dose to the maximally exposed individual would be expected to remain well within regulatory limits. Based on an exposure period of 35 years, 0.21 (<1) latent cancer fatalities would be expected to occur among the local population over the 35-year period as a result of Hanford related radiation exposure.

To Whom It May Concern.

The Fast Flux Test Facility is a resource which is completed, built with government funds and is being wasted by not being used. Our tax money built the facility and it should be used for our benefit.

Importing nuclear isotopes for cancer treatment and research is a wasteful use of our resources. With FFTF we can produce our own. The facility, which I have toured, is safe and a welcome part of our community. We're not saying "no nukes in our back yard" and those who oppose the use of any nuclear device are largely uninformed about them and live so far from them that their concern is irrelevant.

We, who live next door to FFTF, have dealt with nuclear reactors for more than 50 years, and now are tending to the nuclear cleanup. This industry has a history of such low accident rates that it could serve as a model for the nation.

We are foolish not to use the FFTF as a resource to produce isotopes for cancer treatment and research and for other types of research as well. This versatile facility does not have to have a weapons mission to be useful to mankind. Nuclear energy, per se, is a resource that can be as beneficial to mankind as we allow it to be. It is not, of itself, a menace or environmental hazard. Properly run, it is as fine an industry as we've seen _ certainly much less hazardous to the public health and the environment as the mining and burning of coal for power in the nineteenth century.

I and my neighbors heartily support the startup and use of FFTF for peaceful and healthful pursuits.

T. H. Vertrees,
 Kennewick, WA

Keep FFTF open! It is incredibly stupid to close FFTF when it can easily be used to create medical isotopes__an increasingly important part of medicine. Politics should not play a roll in something as important as the lives of our citizens!

If you would like to talk to me, I can be contacted at (503) 648_7285.

Thank you,
Kathryn Kuskie

Subject: FFTF restart
Auto forwarded by a Rule

I am opposed to the permanent shutdown of the Fast Flux Test Facility (FFTF). The draft EIS states many reasons in favor of restart but, I believe, misses an important point.

Most environmentalists are opposed to allowing a species to go extinct not because of the current contributions of the species to the ecology, but because of unknown future benefits. For example, if we allow salmon to go extinct we'll miss some good meals now, but, more importantly, we may be forever forfeiting a future cure for AIDS or cancer.

If we allow the permanent closure of FFTF now, we will forgo some immediate benefits as stated in the draft EIS. However, we need to recognize that it is highly unlikely that a future government will ever again garner the public will to build a similar machine. If we allow the permanent closure of FFTF, we may be forever forfeiting a future outcome of enormous benefit that is not now visible to us.

Please do not permanently shutdown the FFTF. Preserve yet unidentified future benefits likely to spring from this unique national resource.

Thanks for considering my comments

Ms. Colette Brown
 DOE, Office of Space and Defense Power Systems

Dear Ms. Brown:
 Your Department's recent proposal to expand the civilian nuclear infrastructure, outlined in the Draft Programmatic Environmental Impact Statement for accomplishing expanded civilian nuclear energy research and development and isotope production mission in the United States, including the role of the Fast Flux Test Facility, raises significant nuclear weapons proliferation and environmental issues.

As a member of the Snake River Alliance I have become aware of the serious nuclear contamination and waste problems at INEEL. INEEL is one of the most contaminated areas in America. The Department's recent estimate on cleaning up our site is \$22 billion and is expected to take 50 years__longer than any other DOE facility. In addition, we have over 360 individual superfund sites within the 890 sq. mile area that comprises INEEL. With this known, the last thing we need is a plan to generate more nuclear waste at a site that needs more waste like the DOE needs security scandals. Out of concern for Idaho's environment, I strongly urge you not to pursue the plutonium_238 production mission outlined in your PEIS.

One of the most daunting problems confronting cleanup at major DOE facilities such as Hanford and INEEL, is the solidification of liquid high_level nuclear waste. Your current plan for plutonium_238

1471-1

1471-2

Response to Commentor No. 1471

- 1471-1:** The commentor's position regarding plutonium-238 production at INEEL is noted. Production of plutonium-238 at one or more of the candidate sites would be conducted in support of NASA's deep space missions Volume 1, Section 1.2.2 of the NI PEIS). As discussed in Sections 4.3.2.1.13 and 4.4.2.1.13 of the EIS, selection of the Fluorinel Dissolution Processing Facility and/or the Advanced Test Reactor to support production of plutonium-238 would have no significant impact on the waste management system at INEEL. Use of any of the facilities proposed in this PEIS for the stated missions would not impact cleanup missions at DOE sites.
- 1471-2:** The use of proposed alternative facilities associated with processing of neptunium-237 targets would have no impact on schedules or available funding for high-level radioactive waste programs at either Hanford or INEEL. At INEEL, the tanks would not be used although certain facilities at the Idaho Nuclear Technology Engineering Center (INTEC) would be used to treat the wastes resulting from processing the irradiated targets. These are reliable systems that would process a maximum of 1,050 cubic meters of low-level radioactive waste over the 35-year nuclear infrastructure operational period. The higher activity waste would be treated as a solid form via a stand-alone vitrification system, separate from any tank waste treatment system. At Hanford, the existing high level radioactive waste facilities would not be used, and as analyzed in the PEIS, no existing or planned high-level radioactive waste facilities would be used to treat the wastes resulting from processing the irradiated targets.
- 1471-3:** Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic

Commentor No. 1471: Kevin Welsh (Cont'd)

production entails the generation of approximately 288,000 additional gallons of this waste over the project's 35 year span. While this is a small portion of Hanford's high level waste, it is approximately one_fifth of what we have remaining here in Idaho, which makes it a very significant amount. Previous leakage of this waste at INEEL and Hanford threatens our water supplies. What we certainly don't need is any more of this most highly problematic of waste forms.

Given the certain risks inherent in production of plutonium, the justified need for this material would have to be tremendous, and the PEIS does a poor job of providing ample justification. Beyond the risks involved in production, and the aforementioned resulting waste problem, there is also the issue of an accident occurring upon lift_off or reentry of a space probe carrying this material. The cassini probe, launched in 1997, carried 72 pounds of Pu_238. The potential for an explosion during lift_off or upon an inadvertent reentry during the fly_by phase, gave many in the scientific community pause, including scientists within NASA. According to NASA's own conservative estimate, a burn up upon reentry of the cassini probe could have caused 2,300 cancer fatalities, independent analyses ranged much higher. This potential for a catastrophic release of this extremely toxic material will remain so long as the US government remains committed to the use of plutonium_238. If DOE is to have a role in developing power systems for NASA's instrumentation, it should focus on promising solar technology, an alternative that has been promoted in the European scientific community.

There are also proliferation concerns as it pertains to this plan. A return to production of this isotope, however poorly justified, means a return to the use of aqueous reprocessing at DOE facilities where this technology has been used to extract bomb material for the weapons program. From President Carter to presidents Bush and Clinton, US policy has been to halt reprocessing in this country in order to set a global precedent to curtail the spread of nuclear weapons material_a noble effort in serious need of bolstering through_action.

**1471-2
(Cont'd)**

1471-3

1471-4

1471-5

Response to Commentor No. 1471

supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed production of plutonium-238 are relatively low and are discussed in detail in Chapter 4 of Volume 1, and Appendixes H, I, and J of Volume 2 in the Final NI PEIS.

1471-4: DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. The Cassini fly-by occurred exactly as planned, with no release of nuclear material.

1471-5: The commentor is correct in stating that the aqueous processing technology that would be used to separate plutonium consisting of over 80 percent plutonium-238 and neptunium from the irradiated target is similar to the technology that was used to extract plutonium-239. However, unlike plutonium-239, plutonium-238 is not used in nuclear weapons, but rather it would be used as a power source for NASA space missions. The technology that is discussed in EIS Sections S.3, 2.2.3 and A.1.4 would be used to chemically separate plutonium-238 and neptunium from irradiated targets and not from irradiated or spent nuclear fuel whereas reprocessing separates weapons grade plutonium-239 from irradiated nuclear fuel. As discussed in the separate nonproliferation impact assessment report, use of this technology to produce plutonium-238 from irradiated targets will not create a nonproliferation threat. DOE is committed to full compliance with and support of the U.S.

Commentor No. 1471: Kevin Welsh (Cont'd)

Indeed, an otherwise lukewarm Nuclear Infrastructure Nonproliferation Impact Assessment conducted by your Office of Arms Control and Nonproliferation questions whether our commitment to nonproliferation isn't weakened by the use of the Fluorinel Dissolution Process Facility within Building 666 at INEEL. INEEL's reprocessing facility is next door to a wet storage unit for Navy spent fuel, which contains a greater than average amount of highly enriched uranium. It was reprocessed from 1953 to 1989 at INEEL for the weapons program. Use of this facility to carry out plutonium_238 extraction, especially considering the dubious need for this isotope, at the very least raises the concern that DOE is not fully committed to ending reprocessing. The international community cannot be expected to trust DOE's civilian_mission claim when an agency devoutly committed to development of weapons uses a nuclear weapons technology at a weapons facility.

Considering all these factors that could adversely affect our environment and commitment to nonproliferation, I strongly urge you to select alternative 5 in the current PEIS. This alternative would allow the Advanced Test Reactor at INEEL to continue producing medical and industrial isotopes for the commercial sector and would not lead to the production of anymore highly radioactive liquid waste at Hanford or INEEL. The main mission at these two facilities has been and should continue to be cleanup of the mess left over from previous nuclear weapons work. Additional waste production would interfere with this already difficult and expensive work. Alternative 5 also calls for the decommissioning of the FFTF reactor at Hanford. FFTF is an aging breeder reactor whose use would be inconsistent with United States policy to discourage use of this technology due to the capability this class of reactors has to produce more plutonium than is consumed. Thank you for the opportunity to comment on this plan.

Sincerely,
Kevin Welsh

1471-5
(Cont'd)

1471-6

Response to Commentor No. 1471

policy prohibiting reprocessing. The juxtaposition of INEEL Building 666 to wet storage of highly enriched uranium Navy spent nuclear fuel and its previous mission of reprocessing spent nuclear fuel were considered in the separate nonproliferation impact assessment.

1471-6: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF. It should be noted that medical isotopes would continue to be produced at ATR regardless of which alternative is selected in the Record of Decision. The FFTF would produce spent nuclear fuel and low-level radioactive waste, and as discussed throughout Section 4.3 of Volume 1, none of the proposed alternatives would generate high-level radioactive waste or add waste to the high-level waste tanks at Hanford. Also, it should be pointed out that while FFTF supported the breeder reactor program, it is not itself a breeder reactor, but rather a fast flux research reactor.

Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

With respect to cleanup of wastes at Hanford or INEEL, the proposed action and the existing cleanup missions are independent programs and actions related to one will not impact the other. While the cleanup activities at both Hanford and INEEL are high priority to DOE, it should be noted that the cleanup of legacy wastes is beyond the scope of the NI PEIS.

Commentor No. 1472: Carol Witherell

I favor OPTION FIVE _ permanently deactivate FFTF with no new missions. Hanford is the most highly contaminated nuclear site in the western world. The mission at Handford is CLEAN_UP not productin.

Gemma Hall_Hart
 908 16th Street
 Bellingham, Wa. 98225.

1473-1**1473-2****Response to Commentor No. 1473**

1473-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

1473-2: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "... ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

This email expands comments I made at Richland on August 31st.

I recommend AGAINST the accelerator option.
Accelerators have not been of much use in producing isotopes in any appreciable quantities.

In the early '50s, a very large Linac (linear accelerator) was shut down at UCRL (the University of California Radiation Laboratory, now Lawrence Livermore National Laboratory). It had been built to produce plutonium but had been unable to compete with the production reactors at Hanford and Savannah River. At a seminar at Berkeley, it was mentioned that it was a bargain. Each proton only cost only one ten quadrillionth of a dollar (\$E_16). Unfortunately, a gram of plutonium made this way would cost 400 times more than if a reactor were used.

In the '60s, Atomic Energy of Canada Ltd. considered the ING Project (Intense Neutron Generator) which used a proton accelerator to produce neutrons by spallation. They never broke ground.

In the '70s, FMIT (Fusion Materials Investigation), a similar facility was also considered. Again, ground was not broken.

In the '80s, an accelerator was also the dark horse as a candidate for the New Production Reactor to no avail.

The problem is that Avogadro's number is just too large given the energy inefficiency of an accelerator!

An additional problem today is that by the time a accelerator system is developed, designed, and permitted, there will be, barring a sea change in policy, a major shortage of the electrical generating capacity required. Building the required capacity opens a new can of worms.

1476-1

1476-2

Response to Commentor No. 1476

1476-1: DOE notes the commentor's opposition to Alternative 3, Construct New Accelerator(s), and support for Alternative 1, Restart FFTF.

1476-2: The NIP EIS evaluates alternative ways of achieving the program objectives on a programmatic basis. Therefore both reactors and accelerators were considered in the evaluation of irradiation facilities. DOE acknowledges that all of the alternatives are not equally effective in meeting the program objectives.

DOE acknowledges that the high-energy accelerator provides a significant load on the local electrical grid. In the event that the Record of Decision selects the high-energy accelerator for further development, subsequent NEPA review will assess grid stability and other electrical load assessment criteria in the evaluation of alternative site locations.

Commentor No. 1476: Sid Altschuler (Cont'd)

There is another MAJOR RISK which has NOT been addressed in the EIS. It is the political risk which will occur if the demand for isotopes suddenly increases (due to the development of a new treatment for even a single relatively common form of cancer) and the capacity to produce them is not available. It will make the outrage which occurred when the Salk vaccine was not immediately available in sufficient quantities pale in comparison. The Washington Post's Herblock had an excellent cartoon at the time to which you may choose to refer. The activism over AIDS will be multiplied many times as will the lawsuits.

"A word to the wise is sufficient."
RESTART the FFTF!!!

1476-3**1476-4****Response to Commentor No. 1476**

1476-3: DOE notes the commentor's viewpoint. DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing dates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

1476-4: See response to comment 1476-1.

 Subject: The FFTF & Isotope Production

This text is in response to your request for input concerning the role of the FFTF in Isotope Production.

For some years the Fast Flux Test Facility has been in a standby mode and can best be described as a facility long in search of a mission. It was designed to do one thing well. But it was put in standby mode because it no longer had any programmatic support. One must ask if this reactor has the ability to be converted to isotope production without a massive infusion of dollars to retool it to do that which it was not designed to do. A second concern is the age and condition of the facility infrastructure in part due to radiation damage.

In a recent AIP mailing, the DOE is described as finding its isotope production infrastructure "diminished" because of the shutdown of the HFBR at Brookhaven & the cyclotron at Oak Ridge.

Two observations can be made. The FFTF standby mode costs have for sometime been twice what the DOE said it could not afford in the case of the HFBR being brought back on line. This attitude is unacceptable in a time of tight research dollars. I also note that the DOE must find its ability to do neutron scattering research in the US "diminished" due to a political (not environment, safety or health) decision concerning the HFBR restart.

Therefore, the solution to the issue of isotope production should not even consider the FFTF. The DOE must consider a reactor that can support a dual role. The FFTF is not a candidate.

1479-1**1479-2****Response to Commentor No. 1479**

-
- 1479-1:** As stated in EIS Section 2.3.1.1.2, several upgrades would be implemented if a decision to restart FFTF was made by DOE. These upgrades would improve efficiency and reliability, minimize waste, and conform to current industry standards. The FFTF is in excellent condition and evaluations have shown that it has sufficient life remaining to fully support the proposed 35 year mission. The age and condition of the FFTF facility infrastructure will be considered by DOE in its decision making process. The separate cost report accounts for costs associated with expected FFTF facility modifications, including those required to support the new missions.
- 1479-2:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF. It should be noted that the FFTF would not be used as a single purpose reactor under the proposed action, rather it would be used to fulfill each of the three project missions. As discussed in Volume 1, Section 2.6.1 of the NI PEIS, the HFBR was initially considered as a potential irradiation source to support the proposed action, but was subsequently dismissed from further consideration after Secretary Richardson decided the facility would be permanently shut down.

Commentor No. 1479: James J. Hurst (Cont'd)

Political consideration played an overwhelming role in Secretary Richardson's decision on the shutdown of the HFBR. There have clearly been political considerations made to keep the FFTF in its current mode. DOE must now consider that playing politics does not support good science or technology. Look for a dual use facility. A restart of the HFBR should be considered as a sensible option. The political climate seems to be changing in New York, and the current Secretary will soon leave office.

If restart is not an option, then consider a new dual use facility that serves the same function as the HFBR did (and still can do).

Subject: FFTF startup
Auto forwarded by a Rule

I am greatly saddened by the fact that for the past 7 years a facility such as FFTF has been in such down. Not only has this been a great loss of tax payer money, but it also serves as an excellent example for the waist of Government spending in its inability to make decisions. FFTF was at the top of it's class and still is. It is unfortunate that so many other possibilities of it's continuing operation have been passed by. It seems that now we are down to the final one and this happens to be one of the most important concerning humanities health today. The fact that every expert over the past seven years has given FFTF nothing but the highest regards should be proof enough that those with political pull in Seattle & Portland know nothing of the truth when they fight against the startup of FFTF. Considering the fact that it's startup to produce medical isotopes would not only be extremely beneficial to the medical community in the US but abroad as well, and the continued fight against this by some of those same politicians is further proof of their ignorance. FFTF would be beneficial to the medical community, the millions of people suffering from various cancers world wide, as well as the space exploration industry. My faith in the Government, especially DOE has been greatly damaged over the past 7 years because of its true ignorance in the benefits of such a facility as FFTF. I can only hope that DOE and the rest of the Government will finally come to their senses and give FFTF the startup notice it so rightly deserves for the facility itself & the rest of Humanity.

Shelly Wandler

Attn: Collette Brown:

I am in favor of starting the FFTF for medical and industrial research.

I have lived in the Richland area since 1983, and worked at Hanford for 14 years before retiring. I worked at the N Reactor the 300 area, K Basin and in the orth Richland area. During this time, I had the opportunity of touring the FFT area and buildings. What I saw impressed me very much, the stainless steel equipment that was installed and costing millions of dollars to sit and do nothing is appalling.

Why not take advantage of this facility. Instead of spending our tax payers money on duplicating this area, and now spending billions of dollars to do so.

It is also appalling that the Heart of American, NW can throw so much weight in an area they don't even truly know about. They don't seem to care how much money it is costing them and the tax payers to prolong the issue.

What do we have in Washington, D.C. A bunch of dummies that can't understand the more we tarry on this issue the more money it will take. Which in the long run will take away from the very thing that FFTF is trying to do, develop medical research, that some day might save a member of their family.

As I see it _ the bottom line is political and to hell with the money it will cost, or the medical research that can help to days generation and generations to come.

Mary R. Colton, mrcolton2@juno.com

Response to Commentor No. 1482

1482-1

1482-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

1482-2: DOE notes the commentor's views. Selection of facilities and site locations for accomplishing expanded civilian nuclear energy research and development and isotope production missions is not a political decision. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

 Subject: Comments from FFTF Talk to Us

1 Name = Dennis Lupkes
 2 Comments = Dear Administrator:

Considering the tremendous breakthroughs constantly being made in genetics and cancer research, the days of nuclear medicine as a standard cancer treatment are probably numbered. Shortly, the nuclear material provided by FFTF will not be needed in great enough quantity to warrant the money spent. It will be more cost effective to buy the material elsewhere.

Not knowing the current available service life of the facility, I would say run commit to operating it for five years to produce the medical isotopes and other materials and then pull the plug. JUST DO SOMETHING.

Thanks,

Dennis Lupkes
 Kennewick High School

1483-1

1483-2

Response to Commentor No. 1483

1483-1: DOE notes the commentor's concern that medical breakthroughs may reduce the need for radioisotopes. However, DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

For nearly 50 years, DOE has actively promoted the use of isotopes to improve the health and well-being of U.S. citizens. DOE's use of its unique technologies and capabilities to develop isotopes for civilian purposes has enabled the widespread application of medical isotopes seen today. While its market share is a small fraction of total world isotope production, DOE remains the key provider for a large number of radioisotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large-enough quantities to make their production financially attractive to private industry. DOE's intent is to complement commercial sector capabilities to ensure that a reliable supply of isotopes is available in the U.S. to meet future demand, and to encourage the commercial sector to privatize the production of isotopes that have established applications to a level that would support commercial ventures. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

Commentor No. 1483: Dennis Lupkes (Cont'd)

Response to Commentor No. 1483

1483-2: DOE notes the commentor's support for Alternative 1, Restart FFTF. It should be pointed out that it would not be cost effective to operate FFTF for only 5 years. Further, limiting FFTF operation to 5 years would not satisfy the long-term needs of the three DOE missions.

Subject: Re: Hood River, OR, DOE Meeting 08-29-00 relative to start up of FFTF at Hanford

Dear Secretary Richardson: I implore you to please read the following plea to shut down FFTF at Hanford, WA. We have just witnessed the information meeting relative to the EIS that was presented only last Friday to the public eye; therefore, none of us has had time to review the statements made in it. However, we do have watchdog groups here that are very "on top of" all information relative to this process. We believe that you are not receiving all of the input that various groups from the Columbia River Gorge; and that you are being "fed" only the positive side from those persons interested in keeping their DOE alive and well at Hanford. You need to investigate and be assured of the thousands of residents who are opposed to this start up; Collette Brown tonight admitted that they cannot redistribute the future waste from the plutonium - and that it would be deposited underground at the Hanford site. The citizens of this area cannot believe that this is the fact!! You have had several billions of dollars already of the taxpayers monies going out the door to contractors, who eventually throw up their hands and say that they cannot clean up the waste or even contain it properly. This site is one of the most toxic waste dumps on this planet; it is insane to produce more waste until a process to contain what is already deposited is completed. Please do not ignore these statements of the evening of 08-29-00 at Hood River, OR. These citizens are opposed to your plan to start up the FFTF OR to begin commercial processes of any nuclear waste products. We have been backed up by Senator Ron Weiden, OR, and others in the government in a statement read this evening. Thank you. If you care to respond, it would be greatly appreciated. Also, if you have an interest, there are people who would like to visit you in person to discuss this plan. Gail Hudson McCarthy, resident of WA State - John W. McCarthy, resident of WA State - our grandchildren and their future children!

1484-1

1484-2

1484-3

1484-4

1484-2

1484-1

Response to Commentor No. 1484

1484-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF. Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

1484-2: DOE notes the commentor's remarks concerning the views expressed during the Hood River, Oregon public hearing. It is DOE policy to encourage public input on matters of regional, national and international importance as part of its commitment to facilitate a public participation process that is open and unbiased. DOE is aware that there is a considerable difference of public opinion regarding the alternatives evaluated in this NI PEIS to accomplish the DOE missions, including direct support as well as opposition to Alternative 1, Restart FFTF. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the environmental impact analysis of DOE's proposed alternatives for meeting the mission requirements, and gave equal consideration to all comments, regardless of how or where they were received. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

1484-3: The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The

Commentor No. 1484: Gail Hudson McCarthy and John W. McCarthy (Cont'd)

Response to Commentor No. 1484

waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Sections 4.3.1.1.13, 4.3.2.1.13, 4.3.3.1.13, and 4.4.3.1.13 were revised to address comments received during the public comment period. This section now states that “DOE is considering whether the waste from processing of irradiated neptunium-237 targets should be classified as high-level radioactive waste and not transuranic waste. Irrespective of how the waste is classified (i.e., transuranic or high-level radioactive waste), the composition and characteristics are the same and the waste management activities (i.e., treatment and on-site storage) as described in this NI PEIS would be the same. In addition, either waste type would require disposal in a suitable repository. If it is transuranic waste, it would be nondefense waste and could not be disposed of at WIPP under current law. Because nondefense transuranic waste has no current disposal path, DOE Headquarters' approval would be necessary before a decision is made to generate such waste, as required by DOE Order 435.1. “If the waste is classified as high-level radioactive waste, it is assumed for the purposes of this analysis that Yucca Mountain, Nevada, if approved, would be the final disposal site for DOE's high-level radioactive waste.”

- 1484-4:** DOE notes the commentor’s concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

Commentor No. 1485: Daniel LaVassar**Response to Commentor No. 1485**

2000-016096 Jun 20 p 5:23

3430 26th Ave West
Seattle, WA 98199Secretary Richardson
U.S. Department of Energy, Headquarters
Forrestal Building
1000 Independence Avenue, S.W.
Washington, DC 20585
June 12, 2000

Dear Secretary Richardson:

I am writing to you in support of restarting the Fast Flux Test Facility. I believe this facility can be instrumental in increasing the United States' supply of radioactive isotopes for medical and industrial uses. This reactor is a sitting investment of one billion dollars, and would cost more than twice that to replicate. It would also be much quicker to restart than building an as-yet-unplanned facility designed to produce medical isotopes. I feel it would be criminal to shut down such a national asset.

I realize the issue is clouded in the legacy of nuclear weapon production and proposals to use the facility for tritium production, but I urge you to look at the issue from a dispassionate point of view. There is a growing need for medical isotopes, and we rely on foreign sources for ninety percent of our supply. With new applications for isotopes being developed every year, such as for treating blocked arteries to ensure they do not relog, to name just one potentially lucrative market, can we really afford to rely on uncertain supplies?

The FFTF also represents an opportunity to create a revenue stream. Some project \$88 million worth of revenues from isotope sales by 2008. Perhaps these revenues could be utilized in Hanford cleanup. This would address the concerns of critics that a restart diverts funds from cleanup.

I hope you will examine this issue, and come to the conclusion I have: a restart makes good scientific and financial sense.

Sincerely,

Daniel La Vassar

1485-1

1485-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

1485-2

1485-2: DOE notes the commentor's views regarding the use of revenues from isotope production in FFTF for Hanford cleanup. The estimated costs of the range of reasonable alternatives are presented in the Cost Report, summarized in Appendix P of the Final NI PEIS. However, the Cost Report is not a cost-benefit analysis. While it is reasonable to believe that the benefits of medical isotopes are substantial, the purpose of this NI PEIS is to describe the nuclear infrastructure missions (Section 1.2 of Volume 1), a range of reasonable alternatives for satisfying the mission requirements (Section 2.5 of Volume 1), and the environmental impacts that would result from implementation of the alternatives. According to 40 CFR Section 1502.23, if a cost-benefit analysis exists, it must be reported and summarized in the NI PEIS.

1485-1

To: Secretary, The
Subject: hanford

Dear Secretary Richardson,

I am writing you today to strongly voice my opposition to the proposed restart of the Fast Flux Test Facility nuclear reactor at Hanford. Not only has nuclear power been shown to be a dangerous and nefarious method of energy, Hanford has repeatedly been shown to be leaking toxic chemicals and destroying the environment, and human health along with it, since its construction.

Restarting the reactor would produce large amounts of nuclear waste, adding to nuclear waste that is already an overwhelming burden.

Furthermore it would take away from money that was directed for clean-up in a sight in desperate need of such a clean up. Hanfords only mission is supposed to be clean-up!! Please do not exacerbate this current problem with Hanford into a larger one.

I strongly urge you to put an end to the idea of restarting this reactor, Hanford has only caused problems for the entire region. Please fix these problems, do not cause more!

Sincerely,
Chris Fick
Portland, Oregon

1486-2

1486-3

1486-2

Response to Commentor No. 1486

1486-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1486-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

1486-3: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

Germantown, Maryland 20874-1290

*Copy for Secy of Energy
Bill Richardson*

Dear Ms. Brown,

As a three-time cancer survivor who has lived in Richland since 1951, I plan to attend public hearings in Hood River on August 28 and Portland August 29 to advocate restarting FFTF. Our children were born here, their spouses lived here, and our seven grandchildren were born and reared here. I am the only one of 13 Piippos afflicted with cancer. Never having worked at Hanford, I don't blame Hanford. Apparently I am unkillable, having lived 49 of my 73 years a few miles from the waste dump and am strong and healthy, thanks to and in spite of the brutality of traditional cancer treatment -- slash, burn, poison (surgery, radiation, chemotherapy).

Three other Tri-Cities residents are coming with me to the hearings. I especially want Betty Bergdahl to testify. She is 88 years old, moved here in the 1940's, had four children here, and has many grandchildren and great-grandchildren. She and her husband built a house on the Columbia River where the kids swam. NO ONE IN THEIR ENTIRE FAMILY had or has cancer. Anti-nuclear fanatics need to hear this, and so does DOE secretary Richardson. Diane Aungst, age 86, moved here with her husband in 1951, had a child here, and no one has cancer. Kay Hess, Kennewick, will also attend the hearings. Her daughter had surgery for a pre-cancerous condition. All of us want FFTF activated for the production of medical isotopes for a kinder gentler treatment of cancer.

I don't understand why an issue so vital to the health of the American people should be determined by showmanship at public hearings. Listen to the scientists, please! I don't know the most fair way for all points of view to be heard equally at these hearings; but if you have people sign up in advance, Pollette and his gang will be there at 3 a.m. to monopolize the time. Perhaps a roving microphone works best, but please be sure your master of ceremonies hears from Betty Bergdahl. I'll just roam around in my shirt. See above picture!

Please don't send me any more lengthy reports. The last box cost \$10 postage. I don't want tax dollars spent to mail me material I will never read. Thank you.

Sincerely,
Laurel Piippo

John A. Kitzhaber, M.D., Governor

September 13, 2000

Colette E. Brown, Document Manager
 Office of Space and Defense Power Systems (EM-50)
 Office of Nuclear Energy, Science and Technology
 U.S. Department of Energy
 19901 Germantown Road
 Germantown, MD 20874

Dear Ms. Brown:

Thank you for the opportunity to review the draft Nuclear Infrastructure Programmatic Environmental Impact Statement (PEIS).

Attached is a letter from Oregon Governor John Kitzhaber to Energy Secretary Richardson. That letter presents the State of Oregon's position on this issue: that the U.S. Department of Energy (DOE) failed to make a compelling case that the Fast Flux Test Facility (FFTF) is needed to accomplish any of the proposed missions and therefore the reactor should be permanently shut down.

In scoping comments submitted in October 1999, the Oregon Office of Energy stated it could not support any new missions for FFTF unless the following criteria were satisfied:

- There is a compelling need for any new mission
- FFTF represents the best choice for any new missions from economic, technical, public health and safety and environmental standpoints
- Operation of FFTF will not compromise Hanford cleanup funding, schedule or resources
- Operation of FFTF will not significantly increase Hanford's radioactive or hazardous waste burden

The Office of Energy also said DOE must include the following in its Nuclear Infrastructure draft PEIS:

- A detailed examination of DOE's projections for irradiation needs
- A broader selection of options...to meet the stated needs
- A complete examination of the costs of restarting (the Fast Flux Test Facility)
- A thorough examination of all potential impacts of FFTF operation on all current and projected Hanford cleanup operations.

1489-1

1489-2

1489-3

Response to Commentor No. 1489

1489-1: DOE notes the commentor's opposition to restarting FFTF for expanding its existing nuclear facility infrastructure. Consistent with its mandates under the Atomic Energy Act, DOE is proposing this expansion for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio.

DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert committees. In 1998, an Expert Panel convened to forecast future demand for medical isotopes estimated that the expected growth rate of medical isotope use during the next 20 years will range between 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by DOE's Nuclear Energy Research Advisory Committee (NERAC), established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. The growth projections were also adopted by DOE as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings.

The United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. Although other manufacturers produce medical isotopes, DOE remains the key provider for a large number of isotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large-enough quantities to make

Commentor No. 1489: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

September 13, 2000
Page 2

We believe the draft PEIS is fundamentally flawed in three ways. The chief example is DOE's artificial attempt to find one alternative that can accomplish all of the missions, rather than find the best alternative to meet each individual mission. By lumping the missions together, the number of reasonable solutions is understandably limited. If the missions are separated, and DOE addresses how best to meet each of these individual needs, there are additional, reasonable and likely less expensive alternatives to consider.

Second, much of the information and analysis we requested during the scoping process was not included in the draft PEIS released in July 2000. For example, DOE did not provide specifics about medical isotope needs. Instead, the PEIS dealt in generalities. DOE also did not provide a thorough analysis of potential impacts of an FFTF restart on Hanford cleanup.

Third, we are concerned that key information – primarily the cost analysis and the non-proliferation study (even though not required by law) – was not made available to the public in time to be thoroughly considered in this process. This is a major policy decision and DOE does a disservice to the public by proceeding without allowing sufficient time for public review. In the future DOE should ensure adequate information is provided in a timely manner for public review.

Additional technical comments are attached. If you have any questions about our comments, please contact me at 503-378-5544.

Sincerely,

Mary Lou Blazek
Administrator, Nuclear Safety Division

1489-4

1489-3

1489-5

Response to Commentor No. 1489

their production financially attractive to private industry. However, supplies of many research isotopes are not readily available from existing domestic or foreign sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed. Under the NI PEIS proposed action and consistent with its mandates under the Atomic Energy Act, DOE would enhance its existing nuclear facility infrastructure to, among other things, more effectively support production of isotopes for medical applications and research. DOE's intent is to complement commercial sector capabilities to ensure that a reliable supply of isotopes is available in the U.S. to meet future demand, and to encourage the commercial sector to privatize the production of isotopes that have established applications to a level that would support commercial ventures.

Through a Memorandum of Understanding with NASA, DOE also provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Although research to identify other potential fuel sources to support these space exploration missions has been conducted, no viable alternative to using plutonium-238 has been established. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost.

It is the policy of this Administration that clean, safe, reliable nuclear power continue as a viable component of the United States' energy portfolio. In recognition of this need, the Administration and Congress have initiated nuclear energy research and development programs to address potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) and to ensure that current nuclear power plants can continue to deliver adequate and

Additional technical comments from the Oregon Office of Energy

GENERAL COMMENTS:

- The draft PEIS does not answer many of our questions about the potential impacts of FFTF operation on Hanford cleanup. Issues involving waste generation and its disposition are not adequately answered. For example, the draft PEIS incorrectly states that transuranic waste generated from operations at FFTF would go to the Waste Isolation Pilot Plant (WIPP). WIPP is allowed to receive only waste generated in defense-related activities. Therefore, we are unable to determine what will really happen with this waste. The final PEIS should clearly explain the amount and types of waste that would be generated in the production, irradiation and processing of targets – including liquid waste – and the final disposition of all waste.
- The draft PEIS concedes that current DOE reactors – the High Flux Isotope Reactor (HFIR) and the Advanced Test Reactor (ATR) can continue their current support of the medical and industrial isotope missions, including some growth. The draft PEIS says the reactors can not meet increased isotope needs when the plutonium 238 production mission is added to these reactors. Our recommendation is not to add the plutonium 238 mission to these reactors. The final PEIS should analyze available capacities at each of these reactors for medical and industrial isotope missions, without the plutonium 238 mission added on.
- The draft EIS should address how using Hanford's 300 Area facilities for processing would impact current DOE-Richland plans to clean up and demolish these facilities prior to 2010.
- The final PEIS should not attempt to minimize the impact of adding 16 tons of spent fuel to the current spent fuel inventory at Hanford. There is currently more than 2,100 tons of corroding spent nuclear fuel stored in aging water filled basins just a quarter mile from the Columbia River. Moving this spent fuel out of the basins and away from the river is one of DOE's most urgent risk cleanup priorities nationwide and will cost more than \$1.6 billion to accomplish. The draft PEIS states that the environmental impacts from Hanford's existing spent fuel is minimal, and therefore adding another 16 tons of spent fuel from restarting the reactor would therefore be minimal as well. The final PEIS should realistically assess the impacts of managing additional spent fuel at Hanford.
- DOE should identify specific isotopes that are in short supply. The draft PEIS dealt in generalities and identified many radioisotopes which are already well supplied by commercial producers.

1489-6

1489-7

1489-8

1489-9

1489-10

Response to Commentor No. 1489

affordable energy supplies. An enhanced DOE nuclear facility infrastructure is required to support such nuclear energy research and development for civilian applications.

1489-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

1489-3: Based on the scoping comments, the scope of the NI PEIS was expanded in a number of areas as outlined in Section 1.4 of the NI PEIS. In preparing this NI PEIS, DOE carefully considered all scoping comments received for both the Plutonium-238 Production EIS and the NI PEIS from the public, and all comments received during the scoping periods are part of the Administrative Record for the NI PEIS.

DOE has sought independent analysis of trends in the use of medical radioisotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert committees. In 1998, an Expert Panel convened to forecast future demand for medical isotopes and estimated that the expected growth rate of medical isotope use during the next 20 years will range between 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by DOE's Nuclear Energy Research Advisory Committee (NERAC), established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. The growth projections were also adopted by DOE as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings.

Under the NI PEIS proposed action and consistent with its mandates under the Atomic Energy Act, DOE would enhance its existing nuclear facility infrastructure to, among other things, more effectively support production of radioisotopes for medical applications and research. DOE's intent is to complement commercial sector capabilities to ensure that a reliable supply of isotopes is available in the U.S. to meet future demand, and to encourage the commercial sector to privatize the production of isotopes that have established applications to a level that would support commercial ventures.

Commentor No. 1489: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

September 13, 2000
Page 4

- DOE's conclusions should consider that new diagnostic or therapeutic uses of radioisotopes could be answered by private industry producing the necessary isotopes. The final PEIS should consider subsidizing private industry to produce some of the isotopes which are not yet economical but which show promise in research.
- In July 2000, DOE's Office of Nuclear Technology recommended "dedicated facilities with a primary mission to produce isotopes." The Department of Energy's Nuclear Energy Research Advisory Committee subcommittee for isotope research and production planning concluded in April 2000 that "the production needs of neutron-rich isotopes for research purposes can be met by existing reactors." The report singled out the Missouri University Research reactor and the HFIR as being "better suited to meeting the demands of users who need small quantities of research isotopes at irregular intervals." DOE should reconsider use of the University of Missouri reactor for research isotopes and other viable alternatives to meet other needs.
- The draft PEIS does not make a compelling case to support an annual production rate of 5 kilograms of plutonium 238. The PEIS contains no documentation from NASA or from DOE to justify this quantity. Even if DOE's stated need is not inflated, the draft PEIS clearly indicates viable options for acquiring this amount of plutonium – options which DOE has discarded even though they could, individually or in combination, meet all of our plutonium 238 needs. The final PEIS should thoroughly analyze purchasing plutonium 238 from Russia, use of Canadian reactors and use of commercial reactors in the United States for the production of plutonium 238. These options should not be discarded simply because they may not be able to meet all of the proposed missions or because they do not result in an enhancement of the United States' nuclear infrastructure.
- The draft PEIS speaks in generalities related to the future need for nuclear power. It even makes a bold and questionable statement about renewed interest in nuclear power in the United States – despite the fact that not a single utility has ordered a new nuclear power plant in more than 20 years. The final PEIS should be specific about what new interest for nuclear power there is in the United States.
- The final PEIS should discuss the capacity to produce medical isotopes at the Isotope Production Facility, now under construction at Los Alamos. The final PEIS should consider whether this facility – combined with other existing DOE reactors and accelerators – can meet existing and projected medical isotope needs.

1489-10

1489-11

1489-12

1489-13

1489-14

Response to Commentor No. 1489

Although Hanford cleanup is not within the scope of the NI PEIS, information is included about the cleanup mission at Hanford and the land-use planning efforts. The restart of FFTF or any of the other proposed alternative facilities would not have an impact on the cleanup missions at the candidate sites.

- 1489-4:** As discussed in Section 1.3 of Volume 1, in addition to the range of reasonable programmatic alternatives evaluated in the NI PEIS, DOE could choose in the Record of Decision to combine components of several alternatives in selecting the most appropriate strategy. For example, DOE could select a low-energy accelerator to produce certain medical, research, and industrial isotopes, and an existing operating reactor to produce plutonium-238 and conduct limited nuclear energy research and development.
- 1489-5:** CEQ (40 CFR 1500 et seq.) and DOE (10 CFR Part 1021) implementation regulations do not require inclusion of cost and nonproliferation studies in an environmental impact statement. The basic purpose of the NI PEIS is to describe the alternatives under consideration for implementation (Section 2.5 of Volume 1) and the environmental impacts that would occur if these alternatives were implemented (Chapter 4 of Volume 1). Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. The associated cost report and nonproliferation report were made available to the public on August 24, 2000 and September 8, 2000, respectively. DOE mailed these documents to approximately 730 interested parties, and the reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in public reading rooms.
- 1489-6:** The restart of FFTF would not impact the schedule or available funding for existing cleanup at Hanford. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. In particular, information on waste generation by waste types and how this waste will be managed can be found in the Waste Management Sections of Chapter 4 for each of the alternatives and alternative options.

Sections 4.3.1.1.13, 4.3.2.1.13, 4.3.3.1.13, and 4.4.3.1.13 were revised to address comments received during the public comment period. This

Commentor No. 1489: Mary Lou Blazek (Cont'd)

Oregon Office of Energy

September 13, 2000
Page 5

Chapter 1

- On Page 1-3, the draft PEIS says that some research isotopes are not being explored in part because of their high price. Yet the draft PEIS does not address how FFTF or any of its other proposed options would be able to provide isotopes at a competitive price. The final PEIS should provide this information.
- On Page 1-4, the draft PEIS says DOE produces a large number of radioisotopes that are used in relatively small quantities for research and that they are not purchased in quantities that would permit private industry to take over their production. However, the draft PEIS never identifies these specific isotopes. With generalities such as this, it is difficult to ascertain the specific need which DOE purports to meet. The final PEIS should provide these specifics.
- On Page 1-7, the draft PEIS states that as far as renegotiating its agreement with Russia to purchase additional plutonium 238, "The long-term viability of pursuing additional contract extensions or entering into a new contract is unclear." It appears from that statement that DOE has not raised this issue with the Russians because DOE is pursuing its own production capability. We urge DOE to further explore the Russian option.

Chapter 2

- The term "preconceptual" design is used often in this section. This term should be defined.
- Section 2.3.1.1 – The NRC review of FFTF's Final Safety Analysis Report is not described in adequate detail.
- Section 2.3.1.1 – The draft PEIS should explain the upgrades that were done to FFTF's Final Safety Analysis Report following the accident at Three Mile Island.
- Section 2.3.1.1.3 – page 2-14 – The statement is made that impacts of using highly enriched uranium bound the use of low enriched uranium. The EIS should further explain the bounding criteria.
- The missions actually requiring fast neutrons should be explained.
- Section 2.3.1.4 – page 2-24. The description of a commercial light water reactor is incorrect. Most are not 2 loops with 2 pumps per loop. Most are 4 loops, one pump per loop. Fuel assemblies are now generally 17x17, and operating cycles in many reactors are 24 months.

1489-15

1489-16

1489-17

1489-18

1489-19

1489-20

1489-21

1489-22

1489-23

Response to Commentor No. 1489

section now states that "DOE is considering whether the waste from processing of irradiated neptunium-237 targets should be classified as high-level radioactive waste and not transuranic waste. Irrespective of how the waste is classified (i.e., transuranic or high-level radioactive waste), the composition and characteristics are the same and the waste management activities (i.e., treatment and on-site storage) as described in this NI PEIS would be the same. In addition, either waste type would require disposal in a suitable repository. If it is transuranic waste, it would be nondefense waste and could not be disposed of at WIPP under current law. Because nondefense transuranic waste has no current disposal path, DOE Headquarters' approval would be necessary before a decision is made to generate such waste, as required by DOE Order 435.1. If the waste is classified as high-level radioactive waste, it is assumed for the purposes of this analysis that Yucca Mountain, Nevada, if approved, would be the final disposal site for DOE's high level radioactive waste."

- 1489-7:** Section 2.6.1 in Volume 1 of the NI PEIS was revised. As explained in this section, medical isotope production at DOE's HFIR and ATR may be sufficient for the short term, but would not be sufficient to meet long-term growth projections forecasted by the Expert Panel.
- 1489-8:** Hanford 300 Area facilities included in options under consideration for nuclear infrastructure activities are the Radiochemical Processing Laboratory (RPL) and Building 306-E (refer to Volume 1, Section 2.3.2.4 of the NI PEIS). There are no current plans to close down the RPL. However, Building 306-E is listed in the 300 Area accelerated closure plan (300 Area Initiative), with closure activities scheduled to begin in May, 2003. If the Nuclear Infrastructure Record of Decision selects for implementation an alternative option that utilizes Building 306-E, the building would be removed from the list of facilities to be closed until its part of the mission were completed.
- 1489-9:** The discussion in the Summary and Section 4.8.3.5 of the NI PEIS on the cumulative impacts for spent nuclear fuel management at the Hanford Site have been revised to clarify that the management of the existing spent nuclear fuel at Hanford results in a dose of less than 0.1 millirem per year to the maximally exposed member of the public.

This

dose is well within the DOE limits given in DOE Order 5400.5. As

Commentor No. 1489: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

September 13, 2000
Page 6

Chapter 3, Section 3.4

- Section 3.4.4.1.1 – page 3-89 does not and should discuss the recent discoveries of elevated groundwater tritium levels associated with the 618-11 burial ground.
- Section 3.4.9.4 – page 3-113 does not provide FFTF's accident/incident history. This should be included in addition to the generic site discussion.
- Section 3.4.9.4 – page 3-113. The origin of the accident categories mentioned in this section should be stated.
- Section 3.4.9.4. The Hanford Site's Industrial Safety Accident Rate should be stated.
- Section 3.4.11.1 – page 3-115. The processing of neptunium and medical isotope targets may result in the generation of liquid radioactive waste. The disposition of this waste stream should be clearly explained.
- Section 3.4.11.2, Transuranic Waste, page 3-116. This section discusses disposal of this waste at WIPP. The TRU waste generated from these missions will not be defense waste and cannot now be accepted at WIPP.
- Section 3.5.11.1 mentions that high level waste will not be discussed further in this section. However, for a commercial light water reactor, spent nuclear fuel is defined as high level waste by the Nuclear Regulatory Commission. It is appropriate to include this in the discussion of wastes in this section.

Chapter 4

- Section 4.2.4.9 – DOE should provide the basis for assuming that doses due to storage will be 10 percent of the doses due to target fabrication. This cannot be considered a conservative assumption without providing justification.
- The section refers the reader to Section 4.4.3.1.9 and Appendix H. Section 4.4.3.1.9 contains no information germane to this assumption, and Appendix H simply reiterates the assumption.
- Option 4 impacts should include increased decontamination and decommissioning impacts due to the storage of radioactive material in a currently clean building.
- Section 4.3.1.1.10, page 4-44 – The draft EIS should explain the basis for the 1×10^{-6} accident frequency.

1489-24

1489-25

1489-26

1489-27

1489-28

1489-29

1489-30

1489-31

1489-32

1489-33

1489-34

Response to Commentor No. 1489

discussed in that Order, the dose limit from airborne emissions is 10 millirem per year, as required by the Clean Air Act; drinking water is 4 millirem per year, as required by the Safe Drinking Water Act; and the dose limit from all pathways combined is 100 millirem per year. DOE has committed to remove the spent nuclear fuel at Hanford for ultimate disposition in a geologic repository.

1489-10: Consistent with the mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure to support production of radioisotopes for medical applications and research. DOE is not proposing to restart or build any new facility for the primary mission of serving commercial medical isotope producers. DOE merely seeks to fulfill its responsibility to ensure that there is a reliable supply of isotopes in the U.S. to meet future demand. DOE does not subsidize commercial producers. DOE does encourage the commercial sector to privatize the production of medical isotopes in certain instances. DOE does this by turning over production of certain isotopes to commercial entities once DOE has established that commercial production is economically viable, i.e., still continue to produce about 90 percent of the isotopes at its facilities. Over the years, about 10 percent of the isotopes initially produced by DOE have been privatized.

1489-11: DOE acknowledges that while some existing reactors may possess the potential capability or capacity to support research isotope production as suggested in the "NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000", it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without disturbing the existing missions of these facilities. As described in Table 2-4 of the NI PEIS, the research reactor at the University of Missouri lacks sufficient neutron production capacity to support the proposed action without impacting existing missions.

1489-12: As explained in Section 1.2.2 of Volume 1 of the PEIS, the Russian purchase of plutonium-238 satisfies the near-term responsibility to supply NASA with the necessary fuel for space exploration. As discussed in Section 1.1 of Volume 1, in view of DOE's responsibilities under the Atomic Energy Act of 1954, as amended, DOE's preference is to establish a domestic plutonium-238 production capability. DOE's selection of 5 kg plutonium-238 production per year

Commentor No. 1489: Mary Lou Blazek (Cont'd) Oregon Office of Energy

September 13, 2000
Page 7

- Sections discussing Alternative 1, Options 4, 5, and 6 should contain a discussion of radiological consequences for normal operations, as well as accident consequences.

1489-35

Chapter 5

- Page 5-16, section 5.1.4. Table 5-2 should list the August 1, 1997 Memorandum of Understanding (MOU) between DOE and the State of Oregon. A January 26, 1994 MOU with the Shoshone-Bannock Tribes is listed on the table for Idaho National Engineering and Environmental Laboratory at 5-17. The table indicates that the MOU with the Shoshone-Bannock requires consultation. The MOU with the State of Oregon also requires consultation. For completeness and consistency with the INEEL section, the *Draft PEIS* should be revised to include the MOU with the State of Oregon under the Hanford section of Table 5-2.
- Table 5-2 also omits the MOU between DOE and the Confederated Tribes of the Umatilla Indian Reservation (CTUIR). The *Draft PEIS* should be revised to include the MOU with the CTUIR in the Hanford section for completeness and consistency with the INEEL section.
- The *Draft PEIS* should be revised to include information in Chapter 5 on standards for environmental management systems that will be used for each of the alternatives being considered. For example, the International Organization for Standardization (ISO) 14000 standards are widely recognized nationally and internationally as effective tools for managing day-to-day operations that impact the environment. The ISO 14000 standards address a wide range of issues including: top management commitment to continuous improvement, compliance, and pollution prevention; integrating environmental considerations into operating procedures; training employees in regard to their environmental obligations; and conducting audits of the environmental management system. Inclusion of an environmental management system standard such as ISO 14000 in the list of applicable standards will provide a framework to move beyond compliance and demonstrate the DOE's commitment to effective environmental management for any of the alternatives being considered in the *Draft PEIS*. The inclusion of information on environmental management system standards will provide a more accurate basis for assessing the environmental impacts of each of the proposed alternatives.

1489-36

1489-37

1489-38

Appendix D

- Appendix D does not discuss the disadvantages of FFTF. Some disadvantages that we noted that should be included are: its large size makes it expensive to operate;

1489-39

Response to Commentor No. 1489

is based on the uncertainties in the radioisotope power system technology development and requirements for backup units, as well as the variability in the amount needed to meet NASA's power requirements.

The continued procurement of plutonium-238 from Russia is evaluated as an element of the No Action Alternative. Use of commercial light water reactors (CLWRs) for the production of plutonium-238 is evaluated as Alternative 2, Options 4, 5, and 6. Section 2.6.1 of the PEIS discusses irradiation facilities including the Canadian reactors that were considered and dismissed.

1489-13: Nuclear energy currently provides approximately 20 percent of the United States' electricity needs. Clean, safe, reliable nuclear power has a role today and will continue as a viable component of the nation's energy portfolio. The NERAC Subcommittee on Long-Term Planning for Nuclear Energy Research has set forth a recommended 20-year research and development plan to guide DOE's nuclear energy programs in areas of material research, nuclear fuel, and reactor technology development. This plan stresses the need for DOE facilities to sustain the nuclear energy research mission in the years ahead. As discussed in Section 1.2.3 of the NI PEIS, such nuclear research and development initiatives requiring an enhanced DOE nuclear facility infrastructure fall into the three basic categories: materials research, nuclear fuel research, and advanced reactor development.

1489-14: The Isotope Production Facility (IPF) at Los Alamos National Laboratory produces radioisotopes using the Los Alamos Neutron Science Center's (LANSCE) half-mile accelerator that delivers medium energy protons. Among other isotopes, the IPF's three major products include germanium-68, strontium-82, and sodium-22. As a result of changing DOE missions, the production of radioisotopes at target area "A" of the LANSCE has been rendered inoperable. In order to replace the level of production lost due to this change, DOE is completing a new and more efficient IPF that would allow DOE to continue to produce most of these same isotopes in an effort to meet existing demand. As addressed in Section 2.6.1 of the NI PEIS, IPF at LANSCE was considered but dismissed from further evaluation because, although it can be used in tandem with the Brookhaven Linac Isotope Producer (BLIP) located at the Brookhaven National Laboratory to

Commentor No. 1489: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

September 13, 2000
Page 8

operating at reduced power; it uses MOX fuel or HEU fuel which results in supply problems and non-proliferation concerns; its protection system is 20 years old.

Appendix E

- Appendix E should discuss advantages or disadvantages associated with this new reactor. Appendix D in several places praises FFTF's advantages.

Appendix G

- Subsection G.3.1, at G-4 and G-5, discusses the Prevention of Significant Deterioration (PSD) requirements of the federal Clean Air Act. The *Draft PEIS* describes Hanford as a PSD Class II area, at G-5, and indicates that there are no PSD Class I areas within 100 kilometers of Hanford. The *Draft PEIS* further indicates that the designation of the Hanford Reach as a national monument may eventually lead to redesignation of the area as a PSD Class I area. Because the Hanford Reach is now a national monument, the *Draft PEIS* should be revised to analyze the impacts on Hanford as a PSD Class I area, not as a Class II area. This is consistent with "bounding" elsewhere in the *Draft PEIS*.
- Subsection G.4.2.2 describes the analysis of water quality impacts. Surface water and groundwater quality are described separately. However, surface water and groundwater are often connected hydraulically. The *Draft PEIS* should be revised to include an assessment of water quality and quantity impacts resulting from hydraulic connectivity between surface water and groundwater for each of the alternatives.
- Subsection G.7.2 describes impact assessment. The *Draft PEIS* indicates, at the bottom of G-12, that consultations have been initiated with state historic preservation officers and interested Native American tribes. The *Draft PEIS* should be revised to specify which tribes have been consulted. The omission of the MOU between DOE and the CTUIR from Table 5-2 suggests that DOE has not initiated consultations with the CTUIR. However, the Hanford Site contains significant CTUIR resources that may be impacted. The inclusion of a list of consultations will insure that such impacts are considered.
- G.9 Waste Management. The *Draft PEIS*, at G-16, indicates that "Hanford and the Nevada Test Site will be made available to all DOE sites for the disposal of low-level radioactive waste." This is one of a number of issues that the State of Washington has been negotiating with DOE. In accordance with "bounding" elsewhere in the *Draft PEIS*, this section should be revised to analyze how low-level waste from other DOE sites will be handled for each of the alternatives if it is not disposed at Hanford.

1489-40

1489-41

1489-42

1489-43

1489-44

Response to Commentor No. 1489

supply near-term isotope requirements, it is unlikely that these facilities could accomplish reliable, increased isotope production at the level needed to support projected needs.

- 1489-15:** DOE's production and sale of radioisotopes fall into two categories - "commercial" and "research". "Commercial" radioisotopes are those that are produced in large, bulk quantities and sold to pharmaceutical companies or distributors, or to equipment or sealed source manufacturers. DOE prices these orders at full cost-recovery, meaning all direct and indirect costs of producing these isotopes are factored into the final cost. DOE only produces commercial isotopes when there is no U.S. private sector capability or when foreign sources do not have the capacity to meet U.S. needs reliably.

In contrast, "research" radioisotopes are typically produced and sold in small quantities in response to specialty orders from researchers preparing experiments in the field of medicine, with small quantities of these radioisotopes also purchased by industrial researchers. Unlike commercial radioisotopes, DOE prices research isotopes to produce a reasonable return to the government but not discourage their use. Because small-quantity production of research isotopes is not financially attractive to private-sector producers, it is generally not undertaken. DOE attempts to provide all research radioisotopes that are requested, subject to production capability, inventory, and financial constraints. As successful application of a specific research isotope is established, the production and sales of that radioisotope may shift from research to commercial status. In recent years, over 95 percent of DOE's sales of radioisotopes by dollar volume were commercial, and 5 percent have been for research.

- 1489-16:** DOE notes the commentor's views. Examples of research isotopes currently produced by DOE include Copper-67, used for the treatment and diagnosis of cancer, and Holmium-166, used for the treatment of rheumatoid arthritis. A full listing of the radioisotopes available from DOE is provided on the NE website at <http://www.nuclear.gov>. Section 2.7.3 of Volume 3 has been expanded to include a list of research isotopes identified by the Expert Panel (Section 1.2.1).
- 1489-17:** Under the No Action Alternative, DOE would continue to purchase plutonium-238 to meet the space mission needs for the 35-year evaluation period considered in the NI PEIS. However, DOE

Appendix K

- K.3 Methodology. The *Draft PEIS* uses data from the 1990 Census as a baseline. The 2000 Census data is not due to be completed until December 31, 2000. However, some preliminary data has been released and reported in the media. DOE should include any 2000 Census data available when the final *PEIS* is issued and use such data to make its decision.

UNSOLICITED COMMENT:

Cost Analysis

The cost analysis is biased towards making FFTF look more competitive from a cost standpoint than it is. For example, the cost analysis adds \$281 million for the cost of deactivating FFTF to the options of building a new reactor or new accelerators, but doesn't add that cost to the "restart FFTF" option – even though the reactor would still have to be deactivated at some point, and future deactivation costs would be even greater. Alternatives 3 & 4 also presume new processing facilities will have to be built, even though existing facilities have already been identified in other alternatives as being available for modification at a lower cost.

Had DOE looked at separating the proposed missions, the cost analysis includes at least one alternative which is clearly far cheaper than restarting FFTF. A new low energy accelerator could support most of the medical and industrial isotope production mission and the nuclear research and development mission. Purchasing plutonium 238 from Russia would take care of that identified need. These numbers, taken from the cost analysis, provide one example of the much higher costs of restarting and operating FFTF:

Low energy accelerator/purchase Pu-238 from Russia	
Build new low energy accelerator	\$34.4 million (page 3-3)
Startup costs	\$0.79 million (page 3-3)
TOTAL CAPITOL COSTS	\$35.2 million (page 3-3)
Accelerator annual operating costs	\$ 4.5 million (page 3-3)
Purchasing plutonium from Russia	\$ 8.8 million (annually) (page S-5)
TOTAL ANNUAL COSTS	\$13.3 million
Costs after 10 years:	\$168.2 million
Costs after 35 years:	\$500.7 million
Restarting FFTF	
FFTF modification	\$37.7 million (page 3-3)
FFTF startup	\$276.3 million (page 3-3)

1489-45

1489-46

Response to Commentor No. 1489

recognizes that any purchase from Russia beyond the current contract period that ends in 2002 would require a contract extension or negotiation of a new contract and may require additional NEPA review.

- 1489-18:** Preconceptual design (or "pre-design") is a preliminary stage of design, based on knowledge of major items of equipment sufficient for approximate sizing, preliminary flow sheet specification, rough specification of utility requirements, and approximate sizing of buildings and structures.
- 1489-19:** Licensing of FFTF under the regulations for commercial reactors was not a regulatory requirement. However, the Energy Research and Development Administration (a predecessor to DOE) requested a technical review by the Nuclear Regulatory Commission. As a result, the FFTF underwent a technical safety review by the Nuclear Regulatory Commission before initial operation. The final safety analysis report (FSAR) for the FFTF, issued in 1975, was reviewed by the Nuclear Regulatory Commission and the Advisory Committee on Reactor Safeguards. The Nuclear Regulatory Commission safety evaluation report and recommendations were issued in 1979 and a 1979 amendment, and all open issues were addressed before the start of operation in 1982. One of the major issues addressed was verification of emergency decay heat removal by natural circulation of the sodium coolant. This was satisfactorily demonstrated during the extensive startup test program.
- Throughout the life of FFTF, the FSAR has been maintained via approved change control and engineering change notices. All updates and revisions have had the required reviews and approvals. No deficiencies in the FFTF design, analysis, facility condition, or operations have been identified or recognized that would prevent FFTF from meeting the safety objectives and intent of commercial nuclear safety regulations for equivalent facilities.
- 1489-20:** The FFTF was just beginning an extensive Acceptance Test Program at the time of the accident at Three Mile Island. Although a similar event could not occur at the FFTF because it is a liquid metal reactor, a detailed analysis of the causal factors was completed and a thorough review of the FFTF design, operation and emergency planning was performed, with consideration of recommendations made by the President's Commission on the accident, the Nuclear Regulatory

Commentor No. 1489: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

September 13, 2000
Page 10

TOTAL CAPITAL COSTS	\$314 million (page 3-3)
FFTF annual operating costs	\$56.2 million (lowest est) (page 3-3)
TOTAL ANNUAL COSTS	\$56.2 million
Costs after 10 years:	\$876 million
Costs after 35 years	\$2.281 billion

The above estimates presume similar costs for processing, transportation, etc, which should be the same. It does not include the costs needed to store and ultimately dispose of the additional spent nuclear fuel that would be generated by FFTF.

1489-46
(Cont'd)

Response to Commentor No. 1489

Commission and various other industry groups. As a result of this review, a number of actions were identified to strengthen the FFTF's defense against occurrence of a serious emergency event and/or to improve the ability to cope with such an event, should one occur. These actions covered various topical areas including changes to the plant design and Technical Specifications, improvements to operating and maintenance procedures, enhanced operator training, and revisions to emergency planning and response. All of these actions were completed during the Acceptance Test Program (prior to the start of routine plant operations).

- 1489-21:** As presented in PEIS Section I.1.1.4.1, FFTF core radioisotope inventories were calculated for a mixed oxide fuel core and a highly enriched uranium fuel core. The radioisotope source term for the mixed oxide core is significantly larger than that for the highly enriched uranium core. The higher source term for mixed oxide fuel is due primarily to the plutonium inventory. Use of a lower enrichment uranium fuel core in FFTF would result in a source term similar to that for the highly enriched uranium core in inventory. Therefore, the radioactive source term for the mixed oxide core is bounding for both the highly enriched uranium and lower enriched uranium fuel cores at FFTF. In any case, as shown in the PEIS, even the mixed oxide fuel source term results in very low risk under accident conditions.
- 1489-22:** The missions requiring fast neutrons include: (1) production of certain medical radioisotopes and (2) certain materials research. Six of the 30 representative medical radioisotopes listed in Table C-1 of the NI PEIS can not be produced with thermal neutrons, but instead require fast neutrons. These product medical radioisotopes are: copper-64, copper-67, phosphorus-32, phosphorus-33, scandium-47, and yttrium-91. Production of these medical radioisotopes require fast neutrons because their neutron absorption cross sections are insignificant for thermal neutrons, but are largest for fast neutrons. Table 1-1 contained in Section 1.2.2 of Volume 1 presents the important treatment and diagnostic uses for these radioisotopes. Some areas of nuclear materials research require a fast neutron flux to simulate the effects of fast neutrons on components in nuclear power plants. Although nuclear power plants are designed to operate with a larger thermal neutron flux, they do produce a significant fast neutron flux which, over time, can affect material properties.

Commentor No. 1489: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 1489

- 1489-23:** The description of a commercial light water reactor in Section 2.3.1.4 of Volume 1 is intended as an example of one of many different pressurized water commercial light water reactor designs in operation in the U.S. The three pressurized water reactor vendors which designed all the currently operating pressurized water commercial nuclear power plants in the U.S. are: Babcock & Wilcox (now known as Framatome), Combustion Engineering (now part of BNFL), and Westinghouse (now part of BNFL). Their designs include: two hot and cold loops with two pumps, two hot loops and four cold loops with four pumps, three hot loops and three cold loops with three pumps, and four hot loops and four cold loops with four pumps. In addition, currently operating pressurized water nuclear power plants use fuel assemblies that are either 14 x 14, 15 x 15, 16 x 16, or 17 x 17 arrays of fuel rods. Current operating nuclear power plants operate 12-month, 18-month, or 24 month fuel cycles. The commercial light water reactor description for a pressurized water reactor design which is presented in Section 2.3.1.4 of the NI PEIS is representative of the range of loop and fuel designs.
- 1489-24:** Section 3.4.4 of Volume 1 is intended to provide a general overview of Hanford Site water resources. Specific discussions of surface water and groundwater resources in the Hanford 300 and 400 Areas, where facilities proposed to be utilized for the proposed activities are located, are provided in Volume 1, Sections 3.4.4.1.2 and 3.4.4.2.2, respectively. DOE considers the level of detail provided to already exceed that which is commensurate with the level of expected impact, as specified by CEQ regulations (40 CFR 1502.15). However, due to the relative magnitude of the cited finding and proximity of the 618-11 burial ground to the 400 Area, a brief discussion of identified tritium levels has been added to Section 3.4.4.2.2. Also, generalized groundwater contamination maps (including for tritium) have been added under Section 3.4.4.2 as a visual aid to understanding the discussions on Hanford groundwater contamination.
- 1489-25:** A history of incidents and accidents was added to Section 3.4.9.4 of Volume 1. No worker fatalities or serious injuries occurred during previous operations of the FFTF, nor did any significant radiological or chemical releases occur.
- 1489-26:** The accident categories given in Section 3.4.9.4 of Volume 1 have been removed. They were originally included as a convenience to the reader.

Commentor No. 1489: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 1489

- 1489-27:** A discussion of Hanford Site safety has been added to Section 3.4.9.4 in Volume 1.
- 1489-28:** As stated in the Waste Management Sections of Chapter 4 for each of the alternatives and alternative options, target fabrication and processing for medical isotope production would not produce any liquid radioactive wastes. Target fabrication and processing for plutonium-238 production would generate a small amount of liquid low level radioactive wastes. The amounts that would be generated, how the waste will be managed (i.e., treated, stored, and disposed) for each of the alternatives and alternative options are discussed in the Waste Management Sections of Chapter 4.
- 1489-29:** Information on waste generation by waste types and how this waste will be managed can be found in the Waste Management Sections of Chapter 4 for each of the alternatives and alternative options. Sections 4.3.1.1.13, 4.3.2.1.13, 4.3.3.1.13, and 4.4.3.1.13 were revised to address comments received during the public comment period. This section now states that “DOE is considering whether the waste from processing of irradiated neptunium-237 targets should be classified as high-level radioactive waste and not transuranic waste. Irrespective of how the waste is classified (i.e., transuranic or high-level radioactive waste), the composition and characteristics are the same and the waste management activities (i.e., treatment and on-site storage) as described in this NI PEIS would be the same. In addition, either waste type would require disposal in a suitable repository. If it is transuranic waste, it would be nondefense waste and could not be disposed of at WIPP under current law. Because nondefense transuranic waste has no current disposal path, DOE Headquarters' approval would be necessary before a decision is made to generate such waste, as required by DOE Order 435.1. If the waste is classified as high-level radioactive waste, it is assumed for the purposes of this analysis that Yucca Mountain, Nevada, if approved, would be the final disposal site for DOE's high level radioactive waste.”
- 1489-30:** To provide consistency throughout the document, the definition of high level waste in DOE Manual 451.1 was used. Therefore, spent nuclear fuel is not provided under the Waste Management sections of the document and is discussed separately under Spent Nuclear Fuel. Clarification is provided for the reader in Section 3.5.11.1 of Volume 1.

Commentor No. 1489: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 1489

- 1489-31:** Appendix H, Section 2.3 has been revised to incorporate a more complete discussion of this assumption.
- 1489-32:** Section H.2.3 has been revised to incorporate a more complete discussion of this assumption. The reference to Section 4.3.1.1.9 of Volume 1 is intended to provide the reader with the information on processing from which the storage impacts are derived.
- 1489-33:** Decontamination and Decommissioning (D&D) of existing facilities is not within the scope of the NI PEIS. Before D&D activities were undertaken, DOE would prepare the appropriate environmental documentation to address the associated environmental impacts.
- 1489-34:** The FFTF Final Safety Analysis Report states that the unprotected loss-of-flow event, resulting in a complete core melt, represents the most severe accident analyzed for the FFTF. The frequency of this event was estimated to be 10^{-9} per year based on a sequence of internally initiated events. For the NI PEIS analysis, the frequency was increased to be 10^{-6} to incorporate non-internally initiated events such as external events and natural phenomena that could contribute to the severe core melt scenario. The main contributor to the increased frequency is a catastrophic earthquake. The magnitude of potential earthquakes with return periods greater than 10,000 years is highly uncertain. For the purposes of the NI PEIS, it was assumed that an earthquake with a return period of 1 million years would result in sufficient ground motion to cause major damage to FFTF resulting in a core melt scenario. An earthquake of this magnitude could result in severe effects to the entire region, including building collapses, power outages, and road hazards.
- 1489-35:** The sections discussing Alternative 1 Options 4, 5, and 6 do provide a discussion of the radiological consequences of normal operations. As noted in Sections 4.3.4.1.9, 4.3.5.1.9, and 4.3.6.1.9 of Volume 1, the consequences of normal operations for Alternative 1 Options 4, 5, and 6 are the same as for Alternative 1 Options 1 (discussed in Section 4.3.1.1.9), 2 (Section 4.3.2.1.9), and 3 (Section 4.3.3.1.9), respectively.
- 1489-36:** In order to provide consistency and to clarify that Table 5-2 includes only state environmental laws, regulations, and agreements (i.e., those that are a result of a statute, regulation, or court order) the reference to the January 26, 1994 Memorandum of Understanding (MOU) and the

Commentor No. 1489: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 1489

Agreement-in-Principle between DOE and the Shoshone-Bannock Tribes was deleted from Table 5-2 of the NI PEIS. The MOU between DOE and the State of Oregon was also not included in the table for the same reason.

- 1489-37:** In order to provide consistency and to clarify that Table 5-2 includes only state environmental laws, regulations, and agreements (i.e., those that are a result of a statute, regulation, or court order) the reference to the January 26, 1994 Memorandum of Understanding (MOU) and the Agreement-in-Principle between DOE and the Shoshone-Bannock Tribes was deleted from Table 5-2 of the NI PEIS. The MOU between DOE and the Confederated Tribes of the Umatilla Indian Reservation was also not included in the table for the same reason.
- 1489-38:** Chapter 5 of the NI PEIS presents the laws, regulations, and other requirements that apply to the proposed action and alternatives. Voluntary or best management practices, such as the International Organization for Standardization (ISO) 14000 standards, are not included but may be implemented on a voluntary basis.
- 1489-39:** The cost to operate FFTF is addressed in the separate Cost Report. Non-proliferation issues involving FFTF, MOX fuel, and HEU fuel are addressed in the separate Nuclear Infrastructure Nonproliferation Impact Assessment. Both the Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment have been made available to the public. DOE has provided summaries of the Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment in Appendixes P and Q, respectively, in the Final NI PEIS.
- It is true that FFTF is 20 years old, but it is DOE's newest reactor. Evaluations have shown that FFTF has sufficient life remaining to fully support the proposed 35-year mission. Section 2.3.1.1.2 in Volume 1 of the NI PEIS discusses the upgrades of the plant protection system.
- 1489-40:** Positive features of the new research reactor are presented in Sections E.1 and E.8 (Appendix E) of the NI PEIS. Neither Appendix D nor Appendix E are intended to present advantages or disadvantages of FFTF or the new research reactor, but rather to present a description of the design and operation of these two facilities and their applicability to the stated missions described in Section 1.2 of Volume 1.

Commentor No. 1489: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 1489

- 1489-41:** DOE evaluates the impacts of any proposed projects/activities against the applicability thresholds for Prevention of Significant Deterioration (PSD) air permitting. This is because the Hanford Site is designated as attainment/unclassifiable for the criteria pollutants regulated (see Section 3.4.3.1 of Volume 1). Note that nonattainment areas are subject to the Clean Air Act, as amended in 1990, Title I program instead of the PSD air permitting provisions. The Class I designations for Washington State are listed under 40 CFR 81.434. The Hanford Reach National Monument is not included in this listing. In addition, DOE has not received any preliminary announcements of EPA's intention to redesignate the Hanford Reach National Monument as a Class I area. If such an announcement was made, EPA would communicate its intent via the Federal Register to allow public comment on the proposed action prior to implementation.
- 1489-42:** Separation of the surface water and groundwater discussions in Section G.4.2.2 is a formatting convention only. The hydraulic interconnection between surface water and groundwater at the DOE sites under consideration is recognized and discussed as appropriate in the applicable affected environment and environmental consequences sections. This includes provision of a more than adequate level of detail on hydrologic and hydrogeologic systems, sources of recharge and discharge, and existing surface water and groundwater contamination. As examples, the discharge of the unconfined aquifer system at Hanford in the form of seeps or springs along the Columbia River, as well as base flow to the river, is discussed in Volume 1, Section 3.4.4.1.1. Further, the affected environment sections for Hanford and INEEL (e.g., see Sections 3.3.4.1.2, 3.4.4.1.1, and 3.4.4.1.2) discuss wastewater disposal practices to surface ponds, the potential interaction of perched groundwater, and the quality of the associated discharges to underscore the significance of such discharges to groundwater quality. This is an important consideration for both the Hanford and INEEL sites, both of which are underlain by largely unconfined aquifer systems of great lateral extent. The same consideration for these interactions is also provided in the associated discussions of the Oak Ridge Reservation, in accordance with the differences in site geology and hydrogeology relative to Hanford and INEEL. Here the emphasis is on impacts to surface water. Due to the tilted nature of the underlying geologic strata, groundwater and surface contaminants follow relatively short flow paths to surface streams, and this unique distinction has been clarified

Commentor No. 1489: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 1489

in this NI PEIS (Section 3.2.4.2). Nevertheless, commensurate with the level of potential impact, these considerations have already been included in the assessment of impacts for each of the alternatives (e.g., wastewater management and water use).

- 1489-43:** A list of organizations contacted during the consultation process, including those related to Native Americans, Cultural Resources, and Threatened and Endangered Species (both Federal and State), has been included in Chapter 5. In order to provide consistency and to clarify that Table 5-2 includes only state environmental laws, regulations, and agreements (i.e., those that are a result of a statute, regulation, or court order), Memoranda of Understanding have been omitted from the table. Therefore, the MOU between DOE and the Confederated Tribes of the Umatilla Indian Reservation was not included in the table.
- 1489-44:** The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Information on waste generation by waste types and how this waste will be managed can be found in the Waste Management Sections of Chapter 4 for each of the alternatives and alternative options.
- 1489-45:** As discussed in Sections K.3.1 and K.3.2 of Appendix K, projections of minority populations require baseline data from the decennial census and population projections for potentially affected states by race and Hispanic-origin at the census tract-level or block group-level of spatial resolution. Relevant baseline minority population data obtained from the latest decennial census are scheduled for release by the U.S. Census Bureau in late 2001 (See the U.S. Census Bureau's website at address www.census.gov/population/www/censusdata/c2kproducts.html for a description of planned release dates for year 2000 census data). Updated population projections and data required for identification of low-income populations at block group-level spatial resolution are scheduled for release in mid-2002.
- 1489-46:** See response to comment 1489-5.

The Cost Report was structured to clearly identify the implementation costs of the various alternatives. As shown in Tables S-2 and S-3 of the Cost Report, deactivation of FFTF is a proposed action under Alternatives 2, 3, 4, and 5 and which is the basis for including FFTF

Commentor No. 1489: Mary Lou Blazek (Cont'd)
Oregon Office of Energy

Response to Commentor No. 1489

deactivation costs. In the same manner that HFIR and ATR deactivation costs are not included in Alternative 2, FFTF deactivation costs are not included in Alternative 1.

**Commentor No. 1490: Gary S. Carter
Strategic Energy Resources, Inc.**

Response to Commentor No. 1490

9-12-00

**Strategic Energy Resources (SER) Comments on
The Programmatic Environmental Statement
For Accomplishing Expanded Civilian Nuclear Energy R&D and
{DOE} Isotope Production Missions in the United States (doe/eis-03100)**

Strategic Energy Resources, Inc. (SER) is a Virginia Company formed in 1997 to advance the production of nuclear isotopes in Commercial Light Water Reactors. Its president is Gary S. Carter, who is also currently a senior principal engineer at Framatome Technologies Inc. (FTI). Mr. Carter specializes in reactor vessel and internals design and repair. He works in nuclear service and nuclear electric project engineering functions. He was both a service and project engineer for the B&W TMI-2 recovery team and a submarine test engineer. Mr. J.R. Worsham is a senior principal physicist with FTI and is a partner in SER.

Points of Discussion:

1. The DOE has omitted the potential advantages of the PWR ex-core option for Pu-238 production, and discussed only the potential for in-core production. A major nuclear fuel supplier in conjunction with SER submitted proprietary information on ex-core and in-core production to the DOE in February of 1999. Now that in-core production has been discussed in the PEIS, ex-core potential should also be discussed in order to fully convey the increased economic benefits and improved safety issues. The safety issues that exist are those surrounding the higher potential environmental release of radioactive materials with in-core production. *Please note that SER requests the DOE to exclude the actual proprietary figures included in these comments from public record if possible.*
2. The ex-core option also needs to be addressed to balance the in-core discussion already offered. The in-core option requires significant fuel management change whereas the ex-core option does not. Furthermore, the ex-core option does not necessarily require any capital expenditures or hardware modifications to many of the currently operating PWRs.
3. PWR owners and operators are interested in Pu-238 given DOE discussion and mention of the ex-core option that requires no, or no significant, capital expenditures. They are not as enthusiastic regarding Pu-238 production given only in-core production options, with the corresponding licensing and required fuel management changes.
4. Since the DOE has included PWR in-core production option technical discussions in the PEIS, a fair and balanced discussion would address the ex-core option and the capability to adequately inform a broad base of the public, and the commercial nuclear utility industry. A balanced discussion of ex-core production capability would include:
 - 4.1 the increased safety potential for non-release of target and production material in any core breach or accident;

Commentor No. 1490: Gary S. Carter (Cont'd)
Strategic Energy Resources, Inc.

2

- 4.2 the more likely potential to produce the required Pu-238 purity (<2ppm of Pu-236). (due to the neutron fluence spectrum and larger target diameter);
- 4.3. the ability to avoid the need for significant operator capital expenditures and fuel management changes;

5. Additionally, the DOE has summarily dismissed the capability of PWRs to produce long-lived medical and industrial isotopes in the ex-core region. SER also believes the discussion offered in Section 2.6.1 (Irradiation Facilities Dismissed) on page 2-67 is too harsh and final in its basic assumptions and conclusions with regard to PWR production capabilities. This is especially true given ex-core production potential for certain of these isotopes.

6. **First with regard to Pu-238 ex-core production.**

6.1 Strategic Energy Resources, Inc. (SER) has provided, (conceptually summarized in *Proprietary* Figures 1,2 & 3), a method (patent pending) for producing extremely pure Pu-238 (low Pu-236 <2 ppm) directly outside the nuclear core of many existing CLWRs, **with no reactor internals modifications required.**

6.2 This concept was formally presented in February of 1999 to the DOE in a proprietary prospectus from a prominent nuclear fuel company with the teaming support of SER. The prospectus included a statement of expression of interest in production of Pu-238 for NASA space missions from two (2) suitable reactor owners and operators. Many other appropriately designed, and operating PWRs with the necessary internals structures also currently exist. **Moreover, the commercial nuclear sector interest in the production of space, industrial and medical isotopes is just beginning to awaken. SER found significant interest from a number of contacted PWR operators when it became evident that no significant capital expenditures or fuel management perturbations are required to safely produce Pu-238 for NASA space missions. Similar interest exists for production of suitable medical isotopes.**

6.3 For the DOE to exclude mention of the ex-core production potential is an oversight in such a complex and comprehensive PEIS. Hopefully, the PEIS will be amended to include consideration of a safe, efficient and cost-effective production alternative to provide support and alternatives (depth) to the DOE nuclear energy isotope production missions.

6.4 Oak Ridge National Laboratory (ORNL) has expressed interest and capability to design the Np-237 targets for ex-core production as currently envisioned by SER in the previously mentioned 1999 prospectus.

Response to Commentor No. 1490

1490-1

1490-1: DOE notes that neptunium-237 targets can be placed in numerous commercial light-water reactor (CLWR) in-core and ex-core locations for the production of plutonium-238. The center fuel assembly in-core location was selected for evaluation in the NI PEIS because it was assumed that this would be the worst case location during postulated beyond design basis accident conditions. The Final NI PEIS has been revised (Section 2.3.1.4) to reflect that neptunium-237 targets can be dispersed in other in-core locations or in ex-core locations for the production of plutonium-238. Such design and core configuration details would be analyzed if DOE decides to pursue this option for the production of plutonium-238.

Commentor No. 1490: Gary S. Carter (Cont'd)
Strategic Energy Resources, Inc.

3

6.5 Thermal neutron fluence levels have been evaluated by SER, Framatome Cogema Fuels / Framatome Technologies Inc. and found to be more than adequate for production. This production process has the added advantage of more thermalized high-energy neutrons. Thus there is less production of unwanted Pu-236. The potential for an adequate ex-core target design that meets the <2ppm Pu-236 requirement has been evaluated by competent nuclear physicists and is considered excellent. Core safety degradation and associated product release issues are essentially eliminated.

7.0 Notes: Regarding In-Core Limitations and Ex-Core Advantages

The current draft PEIS only mentions supposedly proprietary in-core PWR production potential.

7.1 In-core production target design will have to compensate for high energy neutrons (fast flux) in a very limited target diameter rod (≈ 0.430 " dia.) to gain any hope of achieving the required low levels of Pu-236. They are not yet even conceptually designed.

7.2 No matter how in-core production is viewed, even including production in the center core fuel assembly, addition of target rods to a fuel assembly will require increased power production from the remaining fuel and require significant perturbations in fuel management which are extremely troublesome and costly to reactor operators.

7.3 It will be necessary to disassemble a previously discharged fuel assembly and install the replacement target fuel rods prior to insertion in the core center position. After irradiation, the center fuel assembly will again have to be disassembled, and the target rods removed. The burned fuel rods that were removed to make room for the target rods will now have to be specially disposed and handled in a special and unusual (ie expensive) manner to permit proper storage and disposal handling.

7.4 The in-core target fuel rods are significantly limited in diameter as compared to the potential target diameter for ex-core production targets. Approximately 0.43" dia. vs. 1.32" diameter.

7.5 Furthermore, the proposed in-core control component target rods may be limited in the allowable Np-237 enrichment and quantity, and may also be limited in radial volume, or as yet undefined composite target development, to enable production with the required Pu-236 contamination levels of < 2ppm.

7.6 Conclusion: The above limitations regarding in-core production of Pu-238 are eliminated through the use of SER ex-core production methods.

8.0 Removal of the ex-core targets as proposed by SER will be accomplished during non-critical path refueling activities. Ex-core target exchange would not be as complicated or as time consuming as current removal and exchange of Reactor Vessel

1490-1
(Cont'd)

1490-2

Response to Commentor No. 1490

1490-2: The commentor is correct in stating that the use of in-core CLWR locations for the production of plutonium-238 would have a more significant effect on CLWR operations as well as the quantity and purity of plutonium-238 that is produced compared to ex-core CLWR location production. As stated in response 1490-1 and revisions in the Final NE PEIS, Section 2.3.1.4, different in-core and ex-core locations were evaluated and the center fuel assembly was selected solely for the purpose of analyzing the worst case environmental impacts of beyond design basis accidents. Specific CLWR design and core configuration details would be analyzed if DOE decides to pursue this option for the production of plutonium-238.

Commentor No. 1490: Gary S. Carter (Cont'd)
Strategic Energy Resources, Inc.

4

Material Surveillance Specimen Capsules which are being removed or exchanged in many of the nation's PWRs.

9.0 Furthermore, no facilities modifications will be required.

10.0 No modifications will be required to the reactor internals or to the reactor vessels to implement PWR ex-core production of Pu-238, or other industrial and medical isotopes.

11.0 With regard to the DOE's assessment and conclusions on PWR production of medical and industrial isotopes:

11.1 The conclusions given in paragraph 2.6.1 (page 2-67, first paragraph, lines 2 through 8) have some validity only for some short-lived isotopes. In line 9, the report states, "In the event CLWRs are used for medical isotope production {with no mention of industrial isotopes}, the selection of isotopes to be produced would be limited to those with relatively long half-lives because there are no CLWR sites with facilities for processing irradiated targets. {DOE states the obvious in that CLWR sites can't be expected to have facilities for processing irradiated targets when nothing is currently produced and the DOE has previously not been willing to consider the idea! - Can DOE consider such a possibility given the available on-site space and a willing partner?}

11.1.1 **First and foremost**, it should be stated that PWRs would be ideal for production of many medical **and** industrial isotopes. This is especially true when ex-core production methods, A) do not impact fuel management; B) do not require significant capital expenditures, and C) do not extend or impose on critical path refueling outage activities.

11.1.2 **Second**; the contention that production of all isotopes (including those with moderate and long half-lives) will require significant facility modifications into the reactor vessel and potentially the containment vessel is patently incorrect. It can be argued that production of short half-life isotopes may require such modifications. However, ex-core production of long-life isotopes (eg. tritium- 12.3 yrs; Pu-238- 87.7 yrs; strontium 89- 50.52 days; Cobalt 60- 5.27 yrs; Cesium 137- 30.07 yrs), in a batch process, would require absolutely no facilities or reactor vessel and internals modifications in many of the operating PWRs in the US and the world.

11.1.3 **Third**; not only are no facilities and vessel modifications required for ex-core production, but the DOE's contention that subsequent refueling outage duration would be extended is also totally incorrect. To accomplish the DOE's Pu-238 production goals of approximately 7 or 8 Kilos per 18 month fuel cycle, no more than two or three ex-core production targets will be required. These ex-core targets can be easily exchanged at any time during the refueling outage with normal refueling pool levels and with the plenum assembly removed as is normally required for refueling.

1490-2
(Cont'd)

1490-3

Response to Commentor No. 1490

1490-3: The commentor is correct in stating that long half-life medical and industrial radioisotopes can be produced in CLWR ex-core locations without any significant impact on CLWR operation or plant modifications. The Final NI PEIS, Section 2.6.1, has been revised to recognize this capability. However, this revised NI PEIS section also notes that only one of the isotopes delineated in the Expert Panel's Report, strontium-89, was considered in candidate for CLWR ex-core production and that approximately 10 CLWRs with scheduled reactor refueling outages every 2 to 3 months would be required to provide a continuous and reliable supply of strontium-89. Since other isotopes identified in the Expert Panel's Report could not be produced in CLWRs with 18 to 24 month refueling schedules, CLWR use for medical and industrial radioisotope production was not considered a reasonable alternative.

Commentor No. 1490: Gary S. Carter (Cont'd)
Strategic Energy Resources, Inc.

5

11.1.4 **Forth**; initial installation and subsequent exchange of only 2 or 3 ex-core target rods is not expected to either meet or exceed the effort, and planning that is normally required for a B&W reactor specimen capsule exchange. Existing underwater on-site casks, refueling pool handling methods and some tooling may be applicable in both these endeavors for certain B&W designed reactors and possibly many other Combustion and Westinghouse reactors (eg McGuire, etc).

11.1.5 **Fifth**; since there are no penetrations or modifications required for long to moderate half-life isotopes being produced in a PWR ex-core region, the DOE statement that extra nozzle penetration inspections can extend an outage and increase outage cost is in error with regard to ex-core production of the long to moderate life isotopes.

11.1.6 **Sixth**; PWRs should not be summarily dismissed as being unable to support DOE nuclear research and development missions for long and moderate life isotopes when ex-core production methods are employed.

11.1.7 **Finally**; SER maintains the DOE conclusions given in section 2.6.1 concerning PWR isotope production require significant reevaluation with regard to the production of moderate and long half-life isotopes. The DOE has focused only on in-core production methods and omitted in-core safety considerations. By totally excluding consideration for development of SER's ex-core production methods, the DOE has effectively denied the PWR owners a fair opportunity to compete in that in-core production methods may prove unacceptable or unobtainable. *Lastly, the DOE has made no serious effort to place the expanded production of nuclear isotopes needed for industry and medicine in the hands of private industry in what should eventually become an indigenous commercial endeavor in the United States.*

SER continues to offer explanations and debate the PWR ex-core production capability in greater detail, and in person, and sincerely appreciates the efforts of Ms. Colette Brown of the Office of Nuclear Energy, Science and Technology to provide a venue for this presentation within her office. SER respectfully requests the DOE now consider these formal comments in more detail and appropriately amend the PEIS Report to include the ex-core production potential. These comments are herewith formally submitted in writing to the DOE at 2:00 pm on September 12, 2000 at the Germantown office of the DOE, Room A270. Copies are also being submitted to the Office of Management and Budget, to select members of the House and Senate Armed Services Committees and to the Nuclear Regulatory Commission.

1490-3

Response to Commentor No. 1490

Commentor No. 1490: Gary S. Carter (Cont'd)
Strategic Energy Resources, Inc.

6

12.0 With regard to the DOE's COST assessment and conclusions on PWR production of Pu-238, medical and industrial isotopes:

12.1 SER believes the DOE has failed to consider significant options in their alternative 2 conclusions offered on page S-10 of the PEIS supplement "Cost Report for Alternatives". First SER and its associates have been in contact with Dr. Robert Wham at Oak Ridge regarding ex-core Pu-238 target design. Dr. Wham has been appraised of the ex-core potential and is familiar with the basic design parameters. SER's understanding of ORNL's target design capabilities and the advantages discussed with ORNL for ex-core target design do not, in SER's opinion, lend themselves to a "high risk" design. DOE is strongly recommended to discuss the PWR ex-core target design capability with Dr. Wham who continues to provide assistance to the Office of Science and Technology.

12.2 Secondly (Pg. S-10); If a development target were to experience design or operational problems in one reactor, it is a gross oversight to assume that DOE can only contract for development testing in any one reactor. Many U.S. PWRs will have the capability and will to support prototype target development given adequate compensation and design assurance for safe and unfettered plant operation with the target in place. The DOE should consider development testing contracts with more than one US PWR in any event to minimize the potential for operational problems at any one single reactor.

12.3 Third (Pg. S-10); CLWR irradiation costs are uncertain only because DOE has no known recent history of approaching the U.S. commercial nuclear power owners and operators to produce isotopes. If DOE engages more than one PWR owner/operator for isotope production, competition, American enterprise and ingenuity will prevail. The DOE should not interpret its charter, (as stated on page 1-1 under the amended Atomic Energy Act of 1954) as a license for the US government to directly produce non-defense related nuclear isotopes. However, there should be no reason that given proper safeguards, the DOE cannot sanction even the production of defense related (non-weapons) research and deep space power isotopes in commercial PWRs.

12.4 SER does not favor the option evaluated on page 2-3 whereby the US would continue the purchase of Pu-238 from Russia except as an interim measure in order to bring indigenous production capability on-line.

12.5 On page 2-9 DOE states that all alternative 2 options must be saddled with the deactivation costs for the FFTF. This can only be a fair assessment if the DOE also factors in the benefit of not operating the FFTF for all other alternatives during development of the quickest scheduled alternative. According to the OMB, FFTF operation cost may approach 30 to 40 million dollars per year. However, SER maintains the FFTF deactivation costs are inappropriately placed in relation to any cost evaluation of alternatives 2, 3 or 4. FFTF deactivation should stand alone and should have been funded under existing DOE/DOD program costs. SER notes that DOE includes FFTF deactivation costs associated with alternatives 3 and 4 (construct one or two new accelerators and construct a new research reactor- see page 3-4).

1490-4

1490-4: The CLWR target development evaluation assumed the prototype target design or multiple target designs would be irradiated in the CLWR for one fuel cycle. During the second fuel cycle the design or designs would be evaluated, the final design selected, and targets fabricated in production quantities. Production quantities of neptunium-237 targets are inserted into the CLWR for irradiation during the third fuel cycle. DOE considers the completion of all CLWR prototype target design testing in a single test cycle or fuel cycle a high risk.

1490-5

1490-5: The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS.

CLWR irradiation costs are uncertain because DOE has no recent history of contracting with CLWR owners for irradiating targets for the production of isotopes. The estimates were based on general discussions with representatives of the CLWR industry. CLWR owners have not directly contacted DOE with an expression of interest.

1490-6

1490-6: DOE would not purchase plutonium-238 as an interim measure in order to bring indigenous production capability on-line. Large quantities of plutonium-238 are not stockpiled in advance of needs due to budget constraints and the additional processing required to remove decay products that occur during extended storage. The purchase of plutonium-238 from Russia could take place under the No Action Alternative and Alternative 5, Permanently Deactivate FFTF; however, it would not occur if DOE decided in the Record of Decision to produce plutonium-238 domestically (i.e., if any other alternative were selected).

1490-7

1490-7: Deactivation of FFTF is not part of implementing Alternative 1, Restart FFTF. Deactivation of FFTF is part of implementing Alternatives 2, 3, 4, and 5 and including the cost of FFTF deactivation in the implementation costs for these alternatives is appropriate. The Cost Report was structured to identify the implementation costs of the various alternatives

Commentor No. 1490: Gary S. Carter (Cont'd)
Strategic Energy Resources, Inc.

7

12.6 Comments concerning evaluations on page 3-4; DOE may be per-supposing the PWR target design parameters without adequate consultation. Stainless steel encased Pu-238 targets may not be optimal for either PWR ex-core or in-core use. Zircaloy versus stainless tube encasements, for instance, could offer the best ex-core target design encasement material. DOE should consult with Dr. Wham (ORNL) regarding desired neutron fluence and spectra and SER regarding the available PWR ex-core and in-core neutron fluence and spectra.

12.7 On page 3-5, next to last paragraph, summary costs for alternative 2 seem to be omitted.

Respectfully,

Gary S. Carter

1490-9

Response to Commentor No. 1490

so the Secretary of Energy would have this information along with other data for consideration. The Cost Report did not identify the source of funding for implementation.

1490-8: The Draft NI PEIS, Section 2.2.2.1, Plutonium-238 Production Target Fabrication, states that CLWR targets would have stainless steel or Zircaloy cladding. The PEIS did not presuppose the CLWR target design. The target designs were postulated to a level of detail appropriate to assess the environmental impacts associated with plutonium-238 production, target fabrication and post irradiation target processing.

1490-9: The commentor is referring to page 3-5 of the Cost Report. Summary costs for Alternative 2 are presented on page 3-4 of the Cost Report.

Commentor No. 1491: Patricia L. Clark

September 13, 2000

Ms. Colette Brown
DOE
Office of Space and Defense Power Systems

Dear Ms. Brown,

Your Department's recent proposal to expand the civilian nuclear infrastructure, outlined in the *Draft Programmatic Environmental Impact Statement for accomplishing expanded civilian nuclear energy research and development and isotope production mission in the United States, including the role of the Fast Flux Test Facility*, raises significant nuclear weapons proliferation and environmental issues.

As a member of the Snake River Alliance I have become aware of the serious nuclear contamination and waste problems at INEEL. INEEL is one of the most contaminated areas in America. The Department's recent estimate on cleaning up our site is \$22 billion and is expected to take 50 years—longer than any other DOE facility. In addition, we have over 360 individual superfund sites within the 890 sq. mile area that comprises INEEL. With this known, the last thing we need is a plan to generate more nuclear waste at a site that needs more waste like the DOE needs security scandals. Out of concern for Idaho's environment, I strongly urge you not to pursue the plutonium-238 production mission outlined in your PEIS.

One of the most daunting problems confronting cleanup at major DOE facilities such as Hanford and INEEL, is the solidification of liquid high-level nuclear waste. Your current plan for plutonium-238 production entails the generation of approximately 288,000 additional gallons of this waste over the project's 35 year span. While this is a small portion of Hanford's high level waste, it is approximately one fifth of what we have remaining here in Idaho, which makes it a very significant amount. Previous leakage of this waste at INEEL and Hanford threatens our water supplies. What we certainly don't need is any more of this most highly problematic of waste forms.

Given the certain risks inherent in production of plutonium, the justified need for this material would have to be tremendous, and the PEIS does a poor job of providing ample justification. Beyond the risks involved in production, and the aforementioned resulting waste problem, there is also the issue of an accident occurring upon lift-off or reentry of a space probe carrying this material. The cassini probe, launched in 1997, carried 72 pounds of Pu-238. The potential for an explosion during lift-off or upon an inadvertent reentry during the fly-by phase, gave many in the scientific community pause, including scientists within NASA. According to NASA's own conservative estimate, a burn up upon reentry of the cassini probe could have caused 2,300 cancer fatalities, independent analyses ranged much higher. This potential for a catastrophic release of this extremely toxic material will remain so long as the US government remains committed to the use of plutonium-238. If DOE is to have a role in developing power systems for NASA's instrumentation, it should focus on promising solar technology, an alternative that has been promoted in the European scientific community.

There are also proliferation concerns as it pertains to this plan. A return to production of this isotope, however poorly justified, means a return to the use of aqueous reprocessing at DOE facilities where this technology has been used to extract bomb material for the weapons program. From President Carter to presidents Bush and Clinton, US policy has been to halt reprocessing in this country in order to set a global precedent to curtail the spread of nuclear weapons material—a noble effort in serious need of bolstering through action.

Indeed, an otherwise lukewarm *Nuclear Infrastructure Nonproliferation Impact Assessment* conducted by your Office of Arms Control and Nonproliferation questions whether our commitment to nonproliferation isn't weakened by the use of the Fluorinel Dissolution Process Facility within Building 666 at INEEL.

Response to Commentor No. 1491

- 1491-1:** The commentor's position regarding plutonium-238 production at INEEL is noted. Production of plutonium-238 at one or more of the candidate sites would be conducted in support of NASA's deep space missions (Volume 1, Section 1.2.2 of the NI PEIS). As discussed in Sections 4.3.2.1.13 and 4.4.2.1.13 of the EIS, selection of the Fluorinel Dissolution Processing Facility and/or the Advanced Test Reactor to support production of plutonium-238 would have no significant impact on the waste management system at INEEL. Use of any of the facilities proposed in this PEIS for the stated missions would not impact cleanup missions at DOE sites.
- 1491-2:** The use of proposed alternative facilities associated with processing of neptunium-237 targets would have no impact on schedules or available funding for high-level radioactive waste programs at either Hanford or INEEL. At INEEL, the tanks would not be used although certain facilities at the Idaho Nuclear Technology Engineering Center INTEC) would be used to treat the wastes resulting from processing the irradiated targets. These are reliable systems that would process a maximum of 1,050 cubic meters of low-level radioactive waste over the 35-year nuclear infrastructure operational period. The higher activity waste would be treated as a solid form via a stand-alone vitrification system, separate from any tank waste treatment system. At Hanford, the existing high-level radioactive waste facilities would not be used, and as analyzed in the PEIS, no existing or planned high-level radioactive waste facilities would be used to treat the wastes resulting from processing the irradiated targets.
- 1491-3:** Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing

Commentor No. 1491: Patricia L. Clark (Cont'd)

INEEL's reprocessing facility is next door to a wet storage unit for Navy spent fuel, which contains a greater than average amount of highly enriched uranium. It was reprocessed from 1953 to 1989 at INEEL for the weapons program. Use of this facility to carry out plutonium-238 extraction, especially considering the dubious need for this isotope, at the very least raises the concern that DOE is not fully committed to ending reprocessing. The international community cannot be expected to trust DOE's civilian-mission claim when an agency devoutly committed to development of weapons uses a nuclear weapons technology at a weapons facility.

Considering all these factors that could adversely affect our environment and commitment to nonproliferation, I strongly urge you to select alternative 5 in the current PEIS. This alternative would allow the Advanced Test Reactor at INEEL to continue producing medical and industrial isotopes for the commercial sector and would not lead to the production of anymore highly radioactive liquid waste at Hanford or INEEL. The main mission at these two facilities has been and should continue to be cleanup of the mess left over from previous nuclear weapons work. Additional waste production would interfere with this already difficult and expensive work. Alternative 5 also calls for the decommissioning of the FFTF reactor at Hanford. FFTF is an aging breeder reactor whose use would be inconsistent with United States policy to discourage use of this technology due to the capability this class of reactors has to produce more plutonium than is consumed. Thank you for the opportunity to comment on this plan.

Sincerely,

Patricia L. Clark
3120 Crescent Rim # 305
 Boise, Id. 83706

1491-5
(Cont'd)

1491-6

Response to Commentor No. 1491

plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed production of plutonium-238 are relatively low and are discussed in detail in Chapter 4 of Volume 1, and Appendixes H, I, and J of Volume 2 in the Final NI PEIS.

- 1491-4:** DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. The Cassini fly-by occurred exactly as planned, with no release of nuclear material.
- 1491-5:** The commentor is correct in stating that the aqueous processing technology that would be used to separate plutonium consisting of over 80 percent plutonium-238 and neptunium from the irradiated target is similar to the technology that was used to extract plutonium-239. However, unlike plutonium-239, plutonium-238 is not used in nuclear weapons, but rather it would be used as a power source for NASA space missions. The technology that is discussed in EIS Sections S.3, 2.2.3 and A.1.4 would be used to chemically separate plutonium-238 and neptunium from irradiated targets and not from irradiated or spent nuclear fuel whereas reprocessing separates weapons grade plutonium-239 from irradiated nuclear fuel. As discussed in the separate nonproliferation

Commentor No. 1491: Patricia L. Clark (Cont'd)

Response to Commentor No. 1491

impact assessment report, use of this technology to produce plutonium-238 from irradiated targets will not create a nonproliferation threat. DOE is committed to full compliance with and support of the U.S. policy prohibiting reprocessing. The juxtaposition of INEEL Building 666 to wet storage of highly enriched uranium Navy spent nuclear fuel and its previous mission of reprocessing spent nuclear fuel were considered in the separate nonproliferation impact assessment.

- 1491-6:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF. It should be noted that medical isotopes would continue to be produced at ATR regardless of which alternative is selected in the Record of Decision. The FFTF would produce spent nuclear fuel and low-level radioactive waste, and as discussed throughout Section 4.3 of Volume 1, none of the proposed alternatives would add waste to the high-level waste tanks at Hanford or INEEL. Also, it should be pointed out that while FFTF supported the breeder reactor program, it is not itself a breeder reactor, but rather a fast flux research reactor.

Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

With respect to cleanup of wastes at Hanford or INEEL, the proposed action and the existing cleanup missions are independent programs and actions related to one will not impact the other. While the cleanup activities at both Hanford and INEEL are high priority to DOE, it should

Commentor No. 1491: Patricia L. Clark (Cont'd)

Response to Commentor No. 1491

be noted that the cleanup of legacy wastes is beyond the scope of the NI PEIS.

Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

Colleen Brown
Office of Nuclear Energy
U.S. Department of Energy

Dear Ms. Brown,

I stand adamantly in favor of restarting
FFTF at Hanford.

This facility stands ready for re-start
and will offer the citizens of America the
radical isotopes they need instead of looking
them from other countries. America needs to be on
the leading edge of science!

Some opponents propose building a
facility in another state - that's ludicrous and
an absolute waste of taxpayer's money.

This facility has a good track record and
a team of workers already on-site.

Keep FFTF at Hanford! Help all the
people in my family with cancer - and millions more!

Evelyn Campbell
3404 Mount Laniel Drive
West Richland, WA 99353

Subject: restart if FFTF

To the Department of Energy,

I'm writing on behalf of my many friends and family members who live in the state of Oregon very near the Columbia River. Promises and mission statements by your department have been made to close down the FFTF facility at Hanford in the best interest of our environment and the health and welfare of the citizens of Oregon. Now there is the possibility of restarting it in December for no good reason known to the public. Facts known to a few who have had to "dig out" the information after much investigation show that the restart is not necessary for reasons the Dept. claims. Since an atmosphere of mistrust prevails due to unkept promises and unpublicized information I would like to voice an opinion of those people mentioned in my first sentence.

Hanford's high level nuclear waste tanks are already leaking radioactive waste into groundwater which is moving closer to the Columbia River and threatening the life of the river and people downstream. Restart of FFTF will add more waste to the nuclear waste tanks endangering our future as human beings.

What are you thinking?? Please don't tell me it is an economic necessity or an energy conservation plan or a medical research plan or a space exploration plan or any other plan that is proven to not be necessary.

Please don't do this to us.

Yours truly,

Beth J. Christiansen, citizen of OR concerned about our future

citizens!

1493-1

Response to Commentor No. 1493

1493-1: DOE notes the commentor's views regarding the potential use of FFTF for enhancing DOE's existing nuclear facility infrastructure. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

1493-2: DOE notes the commentor's concerns regarding the migration of contaminants to the Columbia River. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

More specific to the DOE missions presented in the NI PEIS, no high level waste will be added to the Hanford high-level nuclear waste tanks as a result of operating FFTF. Additionally, FFTF is located approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

No food or water restrictions are in place outside the Hanford Reservation as a result of Hanford activities.

Commentor No. 1493: Beth J. Christiansen (Cont'd)

Response to Commentor No. 1493

1493-3: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. This waste would not be stored in the high-level radioactive waste tanks. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

1493-4: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

 Subject: FFTF

hi my name is charlene I am a health physics tech at CH2M Hill I have been working on site since 1991. I think it would be a great opportunity for the people in this community and surrounding areas to have FFTF restarted and to make the isotopes needed for medical research needed for the people in this country. I don't feel that this would take away from the cleaning up of hanford as it would open up jobs for new people with the skills to operate FFTF's program. I would love to be a part of that mission someday. there would also be the opportunity for new skilled personnel to come to hanford to work from other sites and the cleanup project will still continue with the same amount of people as now. I mean what about the glassification project thats not going to take away from the cleanup so how will restarting FFTF make DOE stray away from the cleanup of hanford. there are all kinds of new projects forming out here on site and DOE is still focused on cleanup. Please think about this before turning down the FFTF restart.

- 1496-1:** DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.
- 1496-2:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF. Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.
- 1496-3:** DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and holding public hearings is an essential and required part of the NEPA process. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

Dear Secretary of Energy Richardson:

After a detailed personal and professional review of the Nuclear Infrastructure PEIS I find that it comprehensively discusses and justifies the needs to maintain and expand the nation's radioisotope production capabilities and the civilian nuclear energy infrastructure. This review included my participation in sessions aimed at searching for common ground between proponents and opponents of re-starting the Fast Flux Test Facility. It is my conclusion that the three areas covered in the PEIS: medical and industrial radioisotope production, Pu-238 production for space missions, and civilian nuclear energy research and development are all valuable roles that the U.S. government must maintain and expand if the world's future generations are to continue to move toward a higher quality of life.

I fully support Alternative 1 stated in the PEIS - Restart FFTF as the best and only option that can completely accomplish these objectives. There is absolutely no doubt in my mind that FFTF can safely provide the neutron irradiation services and nuclear energy research and development opportunities that are required to allow cancer patients to survive, humankind to reach to the stars, and scientists and engineers to further develop greenhouse gas emission free nuclear generated electricity well into the 21st century. None of the other alternatives or options included in the PEIS can accomplish these missions.

Medical revolutions must be fostered, supported and encouraged to enable new diagnostic and therapeutic techniques to improve the quality of life of the World's citizens. Radioisotopes from FFTF and nuclear research and investigations using these isotopes can and will provide enhanced quality and length of life for millions of people.

Humankind has an innate desire for exploration and discovery and nuclear power (including the use of Pu-238) is the best and often only way to accomplish robotic and human missions into space where sunlight is inadequate to provide the necessary power to sustain exploration activities. Pu-238 and it's engineered applications have a long history of providing safe and reliable power to space missions and the U.S. must maintain adequate domestic supplies if it is to continue to be the world-wide leader in space exploration and discovery.

The expansion of nuclear energy research and development is absolutely necessary if the world is to avoid the dual negative consequences of excessive dependence on fossil fuels for electricity production and global warming. The world must have a balanced energy supply and nuclear power has a well-deserved reputation for safely producing important quantities of greenhouse gas emissions free electricity.

Thus, I highly encourage you to select Alternative 1 of the Nuclear Infrastructure PEIS for implementation. It is the right decision for today and the future health and well being of the country's citizens.

If you have any questions about my comments or understanding of these issues, I would be very glad to discuss them with you or your Staff further.

Sincerely,

Andrew C. Klein

I received a draft of the summary of the draft Programmatic Environmental Impact but I got a card that says there's also a report on the cost report and the Nuclear Infrastructure Impact Assessment. I would like those two. And if they are summaries, that would be acceptable.

I really feel very badly about our government going ahead with startup of the Fast Flux at this point. There have been mistakes and we certainly should learn from the one that was in Russia. And anyway I would like the Fast Flux information that you have. I hope we don't leave a planet that is not habitable for my great_grandchildren.

Thank you.

Commentor No. 1507: Mary Hanson

NI PEIS Toll_Free Telephone

9/14/00

Mary Hanson
(206) 528_0289

Hi. I'm asking you on the PEIS to go for Option 5 at Hanford. That would be, close FFTF permanently with no new missions. There are...I went to the hearing here in Seattle on the 30th and I put my name in but my number just never came up so I was not allowed to speak.

1507-1

What I would have said if I had been allowed to speak would have been, that it is, that the search for missions seems suspect at this time, unfortunately the culture, the history at Hanford and at FFTF does not inspire confidence.

1507-2

In my view the focus has to be totally on cleanup and the whole question of bringing isotopes and fuel and all these other issues in clouds the picture and adds to the waste stream and is in, I mean, it's just over for Hanford, I mean it's done, they've had second chances, third chances, fifth chances, nineteenth chances, agreements, it's that there just isn't, that is not a solid enough outfit to trust with something as potentially dangerous as some kind of nuclear mission, other than cleanup. You know, it's going to be rough enough and tough enough for them to get cleanup right. I feel for the people, but on the other hand we're in a very strong, we're not in an economy where people are having a hard time finding work, which has been the case during sometimes this whole scenario as it has played out.

1507-3

So, there again my opinion is no new missions. Close FFTF permanently. Thank you for your time. Bye.

1507-1

Response to Commentor No. 1507

1507-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

1507-2: All members of the public that requested an opportunity to speak at the hearing were given numbers. The numbers were placed in a container and picked at random to establish the speaking order. When the container was empty, the meeting facilitator said "Are there any additional ticket holders out there who've not been called? Is there anyone who does not have a ticket who wanted to speak? If not, this concludes the meeting." (See the last page of the Seattle Hearing transcripts). In addition, several times during the meeting the facilitator announced that members of the public could provide comments to a DOE official in a room adjacent to the hearing room. It was also announced that the comments would be recorded by a court recorder and have the same status as comments made in the hearing. The commentor apparently left the hearing before her number was called and did not take advantage of the opportunity to give formal comments to a DOE official and court recorder in the adjacent room.

DOE notes the commentor's views regarding the potential use of FFTF for enhancing DOE's existing nuclear facility infrastructure. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs:

- 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;
- 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and
- 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

1507-3: Restoration of the Hanford Site and waste management activities are the primary missions at Hanford. With respect to waste management and

Commentor No. 1507: Mary Hanson (Cont'd)

Response to Commentor No. 1507

cleanup issues, the Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. FFTF restart would not impact the cleanup missions at Hanford.

Commentor No. 1508: Jonathan Mark

NI PEIS Toll-Free Telephone

9/14/00

Jonathan Mark
PO 1999, Wendell Depot, MA 01380

Hi, this is Jonathan Mark, I've sent in an e-mail comment about the expected expansion of plutonium development especially plutonium 238. I just wanted to see if the request for proposal deadline has been extended to September 18th, that's good. You can send me, just the summary to Jonathan Mark, at PO 1999, Wendell Depot, MA 01380 .

The only other comment I wanted to add is that there is about 160 species disappearing each day and the lifetime of plutonium radiation and its harmful effects lasts much longer than we have awareness of what the problems that really may arise. There's a lot of ideas that Lyme disease and other such genetic changes of deer ticks causing great problems has been due to radioactivity. Millstone and other plants in Connecticut that altered this incident that's harming many, many people's lives. The lives of workers, the lives of the instability of the political process, it would be better off committing to disarmament, and not expanding plutonium development. We don't need to understand outer space so much that we have to threaten our very home. If we can develop space programs that don't threaten our home, than it's a good use of technology and ideas and I'm all support of it. But when it threatens life, and radiation does threaten life, it only takes one decaying atom shown in a 1997 report, showing that the alpha waves of radioactivity when it's internalized inside a body can cause a cancer reaction. It's just a bad idea, so I urge all those involved at DOE and the Defense Department to reconsider the expansion of Plutonium development and transform the direction towards total disarmament of dangerous amounts of radioactivity that can harm people. Thank you for listening to this, but I would thank you much more if you would take any action in this regard.

1508-1

Response to Commentor No. 1508

1508-1: DOE notes the commentor's concern for NASA's use of nuclear materials for space missions, interest in the development of alternative energy sources for space missions, and concern for the use of nuclear power in space-based weapons, although issues such as NASA research priorities are beyond the scope of this PEIS. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. It should be noted that none of the missions stated in the NI PEIS are defense- or weapons-related.

Commentor No. 1509: Sylvia Haven

NI PEIS Toll_Free Telephone

9/14/00

Sylvia Haven
Seattle, WA

Yes, I am vehemently opposed to the restarting of the Hanford FFTF nuclear reactor, mainly because it will make more problems for our environment and it doesn't seem, by some experts I've heard speak, that it's absolutely necessary and it might even, in fact, be a problem with the negotiated treaties that we've made with other people not to Produce more plutonium and bomb material.

Thank you very much for listening. Good_bye.

1509-1

1509-2

1509-3

Response to Commentor No. 1509

- 1509-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF. As shown in Chapter 4 of the PEIS, impacts to the environment are small for all the alternatives.
- 1509-2:** DOE notes the commentor's views regarding the potential use of FFTF for expanding DOE's existing nuclear facility infrastructure. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.
- 1509-3:** The use of FFTF to produce plutonium-238 does not mean that the process would produce plutonium-239, which is a weapon useable material. Unlike plutonium-239, plutonium-238 is not used in nuclear weapons, but rather it would be used as a power and heat source for NASA space missions. The technology that is discussed in the PEIS Sections S.3, 2.2.3 and A.1.4 would be used to chemically separate plutonium-238 and neptunium from irradiated targets and not from irradiated or spent nuclear fuel, whereas reprocessing separates weapons grade plutonium-239 from irradiated nuclear fuel. As discussed in the separate nonproliferation impact assessment report, use of this technology to produce plutonium-238 from irradiated targets will not create a nonproliferation threat.

1510-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1510-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

The environmental impacts associated with operation of the FFTF are addressed in Section 4.3 of Volume 1 of the NI PEIS. The impacts are shown to be small. These impacts specifically include the risks to human health during normal operations and associated with postulated accidents. Over the 35-year operational period no fatalities would be expected among workers or in the general public in the vicinity of Hanford or at distant locations. For perspective, the radiation dose the average American receives from naturally occurring radiation sources is about 300 mrem each year. Based on the same 35-year time period used above the health risk from the natural non-Hanford related radiation exposure would be 2,600 latent cancer fatalities to the same population.

All environmental parameters (e.g., air, soil, surface water, groundwater, vegetation, animals, etc.) in and around the Hanford Site are monitored on a set frequency. The information is available to the public in annual monitoring reports. No food or water restrictions are currently in place outside the Hanford Reservation as a result of Hanford activities.

 Germantown, MD 20874_1290

Don't restart the FFTF Nuclear Reactor at Hanford . The Hanford region needs the long overdue promise of clean_up, NOT another dangerous addition to the carnage. There must be another way.

Medical isotopes is a red herring. Future demands for medical isotopes can be met using other facilities.

Future needs for plutonium to power NASA space missions can be met using existing supplies, supplemented by foreign sources if necessary.

Weigh all of the costs in making this decision _ costs which extend out to the life of the waste produced and are going to be inherited by generations unborn beyond the length of recorded history.

I encourage choosing ALTERNATIVE #5: SHUT DOWN FFTF!!

This issue is growing into one of the most important issues to me. It is the main reason I am losing support for both of our Senators. It is one of the few issues which can get me out in the street and cause me to donate money. Over 20 years ago I devoted 3 years to stopping WPPSS. We succeeded. Don't get me started again.

Paul Ballard

|| 1513-4

|| 1513-5

|| 1513-6

Response to Commentor No. 1513

1513-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.

1513-2: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "... ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

1513-3: The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements.

Although other manufacturers produce medical isotopes, DOE remains the key provider for a large number of radioisotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large-enough quantities to make their production financially attractive to private industry. However, supplies of many research isotopes are not readily available from existing domestic or foreign sources, causing a number of medical research

Commentor No. 1513: Paul Ballard (Cont'd)

Response to Commentor No. 1513

programs to be terminated, deferred, or seriously delayed. Under the NI PEIS proposed action and consistent with its mandates under the Atomic Energy Act, DOE would enhance its existing nuclear facility infrastructure to, among other things, more effectively support production of radioisotopes for medical applications and research. DOE's intent is to complement commercial sector capabilities to ensure that a reliable supply of isotopes is available in the U.S. to meet future demand, and to encourage the commercial sector to privatize the production of isotopes that have established applications to a level that would support commercial ventures. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

1513-4: There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Although research to identify other potential fuel sources to support these space exploration missions has been conducted, no viable alternative to using plutonium-238 has been established. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

1513-5: The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS.

The purpose of this NI PEIS is to evaluate the environmental impacts of a range of reasonable alternatives to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238 for NASA space missions, and nuclear research and development. DOE has made every effort to obtain and evaluate all of the information it needs to make a decision on expanding

Commentor No. 1513: Paul Ballard (Cont'd)

Response to Commentor No. 1513

civilian nuclear energy research and development and isotope production missions in the United States.

DOE's Record of Decision will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

 Auto forwarded by a Rule

Ms. Colette Brown
 DOE, Office of Space and Defense Power Systems

Dear Ms. Brown,

I wish to comment on the current plan under consideration on the INEEL laboratory here in Idaho. I support Alternative 5 in which production of plutonium would not be re_initiated. The incredible amount of waste already sitting above our primary aquifer is unacceptable. Our priority as a nation should be cleaning up this threat to our populace, rather than adding to it.

Mike Rogers
 Boise, ID

1523-1

1523-2

Response to Commentor No. 1523

1523-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

1523-2: The commentor's positions regarding waste above the Snake River Plain aquifer and cleanup as a priority at INEEL are noted. The Snake River Plain aquifer and DOE's use of the aquifer are described in Volume 1, Section 3.3.4.2.1 of the NI PEIS. Analyses of water resource impacts that would result from selection of the Fluorinel Dissolution Process Facility as a fabrication/processing facility for production of plutonium-238 are given in Section 4.3.2.1.4 of the NI PEIS. An annual increase of 23,000 liters of process wastewater would result from plutonium-238 target processing. Under normal operations, no radioactive liquid effluent discharges would occur. Selection of the Fluorinel Dissolution Process Facility as a fabrication/processing facility would have no significant effect on the Snake River Plain aquifer. As discussed in Section 4.4.1.1.4, selection of the Advanced Test Reactor for irradiation of plutonium-238 targets would not measurably alter groundwater use or effluent discharge from the reactor.

Schedules for the nuclear infrastructure alternatives given in Volume 1, Section 2.7.2 indicate the plutonium-238 production mission at INEEL, if implemented, would end well before DOE's planned completion date of 2050 for accomplishing major cleanup objectives. Selection of candidate facilities at INEEL to support plutonium-238 production would not impact existing cleanup activities at INEEL.

Att: Colette E. Brown / DOE

In the Director Magwood communication of July 21, the DOE speaks of "alternatives" for producing PU_238. Ms. Brown, THERE ARE NO ALTERNATIVES !! Of the three mentioned, only the "no action" selection is plausible and sane.

You are seeking approval from the American public to support you in the manufacture of the deadliest brew that man has ever created, and I refuse to be an accomplice. To date, the DOE has proven to be incapable of harnessing the deadly, destructive potential of PU_238.

The price you want the American public to pay for the production of medical and industrial isotopes is too high. Environmental contamination at Hanford and Savannah continues. The number of contaminated victims at Piketon and Paducah continues to grow. A Fast Flux Test Facility in the hands of the DOE has already proven to be a threat to the American public. I urge "NO ACTION" for FFTF.

S.M. Ziring
 57 Boylston St. N.
 Meriden, CT 06450

1526-1

1526-2

1526-3

1526-4

1526-1

Response to Commentor No. 1526

1526-1: DOE notes the commentor's support for the No Action Alternative, under which FFTF would continue to be maintained in standby. Included in the PEIS are the results of analyses that show that the risks associated with operating the FFTF are very small.

1526-2: The commentor's position regarding production of plutonium-238 is noted. As discussed in Volume 1, Section 1.2.2 of the NI PEIS, DOE has supplied power systems that use plutonium-238 in support of NASA's space missions for over three decades. These systems have demonstrated their reliability and safety in a variety of space missions that include Apollo, Pioneer, Viking, Voyager, Galileo, Ulysses, Mars Pathfinder, and Cassini.

1526-3: The NI PEIS addresses the environmental impacts associated with the production of various isotopes, including those for medical and industrial purposes. The impacts are shown in Chapter 4, "Environmental Consequences," to be small. All air emissions and wastewater discharges would be in accordance with applicable permit and regulatory requirements such that any environmental contamination would be negligible.

DOE remains committed to its environmental restoration and cleanup missions at Hanford, Savannah River, and other sites independent of ultimate decisions on nuclear infrastructure activities. None of the alternatives proposed in this PEIS would have any impact on DOE site cleanup schedules or activities.

1526-4: DOE notes the commentor's concern for workers and the public near other DOE sites, although these issues are beyond the scope of this Nuclear Infrastructure PEIS.

Commentor No. 1527: Lorene Lamb**Lorene S. Lamb**Lorene S. Lamb
555 10th Street, #421
Oakland, CA 94607-4037

94601

Dear Colette Brown,

U.S. is polluting our earth. First it is with nuclear waste in the bullets that we use in our wars and now to use plut 238 for powering systems in deep space missions.

Is this what you want to leave for your grand children?

Yours truly
Lorene Lamb

1527-1

Response to Commentor No. 1527

1527-1: DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and concern for the use of nuclear materials in weapons, although issues such as NASA research priorities and the use of depleted uranium in weapons are beyond the scope of this NI PEIS. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch.

**Commentor No. 1528: Thalia Syracopoulos
National Organization for Women**

4649 SUNNYSIDE AVENUE N ROOM #222
SEATTLE WASHINGTON 98103
(206) 632-8547

10 September 2000

I am writing on behalf of the Seattle Chapter of the National Organization for Women [NOW].

I have read the Summary of the Draft EIS and found almost no information about what isotopes the Fast Flux Test Facility [FFTF] at Hanford might be able to produce. I also found no information about what specific isotopes that the FFTF might produce are in short supply.

The Draft EIS went on to say that it is possible that the DOE's isotope production facilities could be fully used in 5-10 years but it was unclear as to whether or not the Hanford FFTF facility was counted in this calculation. This projection was apparently made in the context of a worldwide market for "some radioisotopes". One aspect of the argument for reopening the FFTF at Hanford seems to be that at present DOE's market share is a small fraction of the overall total worldwide market for "some radioisotopes". This leads one to wonder if the DOE is considering restarting the FFTF in order to capture a larger portion of the worldwide market rather than to produce isotopes that are truly in short supply.

The Summary of the Draft EIS discusses medical applications of isotopes and some are even listed. However, there is no information on the present availability of those listed. These isotopes were listed as a "sample of possible isotopes that could be produced and DOE expects the actual isotopes produced would vary from year to year". This appears to mean that no one really knows if the FFTF at Hanford is capable of producing needed isotopes and thus far no one has identified particular isotopes that might actually be needed. Such speculation hardly justifies the restarting of the FFTF at Hanford.

My own profession requires that I read a wide variety of medical journals published in the United States and around

Response to Commentor No. 1528

1528-1: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual rate of growth of medical isotope use is consistent with the Expert Panel findings. Section 1.2.1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes

1528-1

Commentor No. 1528: Thalia Syracopoulos (Cont'd)
National Organization for Women

the world. At no time in the last 10 years have I encountered a single article in any medical journal mentioning the need for additional sources of isotopes for medical diagnosis, treatment or research.

Prior to writing this, I took the time to run a search of the National Library of Medicine to identify any such articles published during the last 12 years.

I initially searched "cancer AND isotope AND treatment", but this brought up 7,746 articles. I narrowed the search to "isotopes AND treatment AND supply" and brought up 118 articles, 82 of which have been published since 1988. I read the abstracts of those 82 articles and found almost nothing written by a clinician or research scientist that mentioned a shortage of isotopes.

The last search I ran was for "isotopes AND cancer AND supply". This yielded 75 articles, 46 of which have been published since 1988. I took the time to read these 46 abstracts and again found almost no mention by any of the authors of a shortage of isotopes for diagnosis, treatment or research.

I have appended a copy of the 3 abstracts that did address the subject. One is an historical article discussing the discovery of iodine isotopes for the treatment of thyroid disease. The next one related some of the history of the commercial scale production of yttrium-90 for medical research.

The last article was published in 1988 and dealt with cyclotrons and radiopharmaceuticals in positron emission tomography [PET scanning]. This last article was a report of the Positron Emission Tomography Panel of the Council on Scientific Affairs.

The lack of literature on the subject of a shortage of medical isotopes raises serious concerns about the validity of the arguments about isotope shortage and people dying from cancer because radioisotopes were unavailable. Indeed, this appears to be a red herring bandied about the by DOE to scare the public. One letter from Dr. Rainer Storb [submitted with the testimony given by Senator Slade Gorton in Seattle, WA] listing an isotope that he would like to have for his research does not qualify as a serious public health threat. If it did, one would have to

1528-1
(Cont'd)

Response to Commentor No. 1528

would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

DOE has taken the Expert Panel and NERAC report recommendations under consideration in developing the range of alternatives evaluated in the NI PEIS. These reports were made available to the public at the NI PEIS public information centers and on the Internet at www.nuclear.gov.

The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. Although other manufacturers produce medical radioisotopes, DOE remains the key provider for a large number of radioisotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large-enough quantities to make their production financially attractive to private industry. However, supplies of many research isotopes are not readily available from existing domestic or foreign sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed. Under the NI PEIS proposed action and consistent with its mandates under the Atomic Energy Act, DOE would enhance its existing nuclear facility infrastructure to, among other things, more effectively support production of radioisotopes for medical applications and research. DOE's intent is to complement commercial sector capabilities to ensure that a reliable supply of isotopes is available in the U.S. to meet future demand, and to encourage the commercial sector to privatize the production of isotopes that have established applications to a level that would support commercial ventures. For the purposes of analyses in the NI PEIS, a

Commentor No. 1528: Thalia Syracopoulos (Cont'd)
National Organization for Women

question why Dr. Storb has never published anything about the shortages of this or any other isotope.

Most, if not all, isotopes are available from manufacturers in this and other countries. It may be that those isotopes produced in small quantities are extremely expensive and that NIH/NCI etc. research grants are not large enough to purchase as many as the researchers might want. If this is the case, then it is far simpler and less expensive to increase grant money for the purchasing of isotopes than it is to restart the FFTF at Hanford.

I would like to add that over the years, I have done research on the medical uses of radiation in this country. In that context, I have found that the DOE in general and Hanford in particular have an abysmal record regarding providing safe and adequate medical care for employees who are accidentally exposed to high levels of radiation.

There is no known public health reason to restart the FFTF at Hanford. There are numerous public health reasons NOT to restart the FFTF. More importantly, there is substantial medical and scientific evidence that the entire Hanford Reservation needs to be cleaned up, not perpetuated.

Thalia Syracopoulos

**1528-1
(Cont'd)**

1528-2

1528-3

1528-4

Response to Commentor No. 1528

representative set of isotopes was selected on the basis of the recommendations of the Expert Panel, medical market forecasts, reviews of medical literature, and more than 100 types of ongoing clinical trials that use radioisotopes for the treatment of cancer and other diseases. These isotopes, which are comprised of both reactor- and accelerator-produced isotopes, are listed in Chapter 1 of the NI PEIS along with a brief description of their medical and/or industrial applications. As identified in Appendix C of the NI PEIS, FFTF would be capable of producing the majority of these representative isotopes. These include research isotopes with currently limited availability, such as Copper-67, as well as commercial isotopes whose current application is inhibited by lack of availability or high cost, such as Palladium-103. However, the absence of any specific isotope from these tables should not be interpreted to mean that it could not be considered for production under the proposed action. DOE expects that the actual isotopes and specific amounts produced as a result of the proposed action would vary from year to year in response to the focus of clinical research and the specific market needs occurring at that time.

- 1528-2:** DOE notes the commentor's concern over DOE's past management and medical care practices, although these issues are beyond the scope of this NI PEIS. The health and safety of workers and the public is a DOE priority, regardless of which approach may be chosen. Operation of the facilities would comply with applicable Federal, state, and local laws and regulations governing radiological and hazardous chemical use.
- 1528-3:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 1528-4:** Restoration of the Hanford Site and waste management activities are the primary missions at Hanford. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. FFTF restart would not impact the cleanup missions at Hanford.

Radioiodine and thyroid disease: the beginning.

Becker DV, Sawin CT

Department of Radiology, New York Hospital-Cornell
 Medical Center, New York 10021, USA.

In 1936, Karl Compton, then president of the Massachusetts Institute of Technology (MIT) and the thyroid group of the Massachusetts General Hospital (MGH), undertook a joint study that led to the production of small amounts of short-lived radioiodine (iodine 128, half-life, 25 min). The original intent was to use it for diagnosis and treatment of thyroid disease, but in order to explore the underlying physiology, their first work was performed in rabbits and published in 1938. It clearly showed that the radioiodine was selectively and avidly taken up by the thyroid gland. It was immediately apparent to the MGH-MIT group and another team working at the Berkeley, CA cyclotron that longer-lasting iodine isotopes were needed, and soon both developed procedures for cyclotron-produced ¹³⁰I (half-life, 12.5 hr) and ¹³¹I (half-life, 8 d). In 1939, the Berkeley group, using ¹³¹I, was the first to show that the normal human thyroid gland accumulated radioiodine. By 1941, the MGH-MIT team, using mainly ¹³⁰I, was able to successfully treat a few patients with hyperthyroidism, and so achieved their original goal. The Berkeley group did the same a few months later, using mainly ¹³¹I. Both presented results at the same meeting of the American Society for Clinical Investigation in Atlantic City, NJ in the spring of 1942. This was in the midst of World War II and it was not easy to get much ¹³⁰I or ¹³¹I, so experience was limited. Although effective, radioiodine treatment of hyperthyroidism had not been widely adopted by the end of the war in 1945, partly because radioiodine remained in short supply and partly because another medical therapy for hyperthyroidism, antithyroid drugs, had been invented. However, by 1946, fission-derived radioiodine became readily available as a by-product of the Manhattan project in Oak Ridge, TN; hundreds of patients were treated within a few years, both for hyperthyroidism and for thyroid cancer. A new treatment, based on the

Chemistry for commercial scale production of yttrium-90
for medical research.

Wike JS, Guyer CE, Ramey DW, Phillips BP

Chemical Technology Division, Oak Ridge National
Laboratory, TN 37831-6014.

Studies were initiated at Oak Ridge National Laboratory (ORNL) in 1982 for the radiolabeling of resin microspheres with yttrium-90 (90Y) for liver cancer therapy. Yttrium-90 is the decay product of strontium-90 (90Sr). Subsequently, 90Y became a major radioisotope of choice for labeling antibodies for therapeutic trials in the treatment of other forms of cancer. A 25-Ci 90Y 90Y generator or 90Sr cow was placed in service to supply the anticipated needs of customers. In vivo use of 90Y required that the 90Sr contamination levels be kept below 10 $\mu\text{Ci/Ci}$ 90Y (corrected to preparation time). Also, it was necessary to remove trace metals that interfered in the 90Y antibody radiolabeling process, giving low radiolabeling yields. Di-(2-ethylhexyl) phosphoric acid (HDEHP) in dodecane has been used routinely at ORNL to extract 90Y and thereby give a product that meets the radiochemical purity required with respect to 90Sr. Methods were also developed to remove interfering trace elements to provide acceptable labeling yields.

Cyclotrons and radiopharmaceuticals in positron emission tomography. Council on Scientific Affairs. Report of the

Response to Commentor No. 1528

Commentor No. 1528: Thalia Syracopoulos (Cont'd)
National Organization for Women

Positron Emission Tomography Panel.

Positron emission tomography (PET) can probe biochemical pathways in vivo and can provide quantitative data; for that purpose, tracers labeled with positron-emitting radioisotopes are essential. This report describes the tracers that are being used or that may have future use, their production by cyclotrons, and other needed resources for PET imaging. Current routine and automated methods for convenient production of labeled compounds, coupled with simple computer-controlled accelerators, can support the creation of clinical PET centers in any large medical institution, obviating the need for in-depth research teams. An alternate approach involves the development of regional centers that provide in-house service and that supply fluorine 18- and carbon 11-labeled compounds to nearby hospitals with PET machines.

Commentor No. 1529: Donald A. Runciman

1315 SW 174th St.
Seattle, WA. 98166

September 9, 2000

Ms. Colette Brown
U. S. Department of Energy
Office of Space and Defense Power Systems
NE-50
19901 Germantown Road
Germantown, Maryland 20874-1290

Dear Ms. Brown:

Those who do not learn the lessons of history are bound to repeat them. As a private citizen I have learned the lessons of the Powder Plant, the local wartime name for the work going on at Hanford. This was just across the river from my uncle's ranch near West Richland.

The Department of Energy has demonstrated its inability to take care of the wastes generated by Hanford. While not all of the fault is with the Department of Energy, a part is the failure by Congress to provide funds to accomplish the necessary clean up of Hanford.

I am not about to let you generate more waste by starting up the Fast Flux Test Facility until you clean up the mess you have already have, if you can.

To repeat myself, the answer is NO! You are not to start up the FFTF.

Sincerely,

Donald A. Runciman
(206) 243-9307

1529-1

1529-2

Response to Commentor No. 1529

1529-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

1529-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Commentor No. 1530: John Browne, Jr.

Draft PEIS Comment Form

SEP 10, 2000

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

ESSENTIALLY, THIS IS THE STORY OF A REACTOR (AND EXTENDED PLANT) LOOKING FOR A PURPOSE TO EXIST. THE NI PEIS HAS BEEN DESIGNED ESSENTIALLY TO "POINT THE FINGER" AT FTFE AND SUMMON IT TO ACTION. ALL (OR NEARLY ALL) DISMISSED ALTERNATIVES HAVE BEEN PRESENTED SO AS TO MAKE FTFE STARTUP AND ISOTOPE PRODUCTION APPEAR INEVITABLE. IN DOING SO, DOE HAS SET ITSELF UP TO RUN APOUL OF OUR (NAFTA) TREATY AGREEMENTS, AS WELL AS OTHER AGREEMENTS THAT INVOLVE INTERNATIONAL TRADE (e.g. WTO). IF THE EXPENDITURES AND SUBSIDIES TO RUN FTFE FOR ISOTOPE PRODUCTION, DESPITE PRESENT RELIANCE ON CANADA FOR A GREAT MANY OF OUR ISOTOPE NEEDS (AND KNOWLEDGE THAT THE CANDU PROJECT IS EXPANDING), IS CONSIDERED AN UNFAIR RESTRAINT OF TRADE BY CANADIANS (AND/OR OTHERS WHO MAY WISH TO MARKET ISOTOPE HERE) WHAT WILL BE THE OUTCOME? ADDITIONALLY, RECOGNITION THAT A NUMBER OF HOT CELL FACILITIES COULD DO THE REQUESTED WORK BUT AREN'T BEING CONSIDERED BECAUSE THEY'RE NOT PART OF A DOE SITE IS CERTAINLY SHORT CHANGING THE (WIDELY DISPERSED) POTENTIAL CUSTOMERS OF EASIEST ACCESS TO SHORT LIVED ISOTOPES, IN FAVOR OF A FACILITY FAR OFF IN ONE CORNER OF THE COUNTRY WHERE TRANSPORT TIME (AND INFRASTRUCTURE) ARE SEVERAL WAYS TO PROVIDE COMMENTS ON THE NUCLEAR INFRASTRUCTURE PEIS. These include:

- attending public meetings and giving your comments directly to DOE officials (SEE OTHER SIDE)

Response to Commentor No. 1530

- 1530-1: DOE notes the commentor's views. DOE has sought independent analysis of trends in the use of medical radioisotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it has established two expert committees. The first, a thirteen-member Expert Panel convened in 1998 to forecast future demand for medical isotopes, included academicians from leading medical universities and schools of public health, and professional affiliations ranging from the National Cancer Institute to manufacturers of radiopharmaceuticals. The second consists of a subcommittee of DOE's Nuclear Energy Research Advisory Committee (NERAC), established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. The members of this Subcommittee were selected based upon their expertise and experience in the production, processing, distribution, and application of stable and radioactive isotopes in the biological and physical sciences, and in medicine. The members included basic and clinical scientists, administrators, and users of isotopes from academia, industry, and the federal government. The Expert Panel estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings.

The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily Molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. Further, supplies of many research isotopes are not readily available from existing foreign or domestic sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed. As such, reliance on these other sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission.

Commentor No. 1530: John Browne, Jr. (Cont'd)

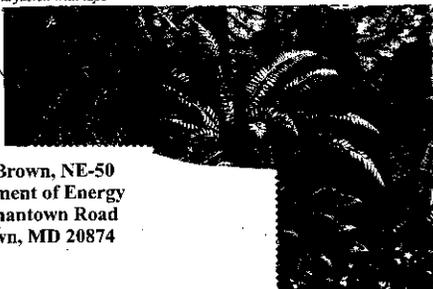

③ BOTH "THE EXPERT PANEL" AND NERAC ARE COMPOSED OF PEOPLE WITH VESTED INTERESTS IN EXPANSION AND PROMULGATION OF THE NUCLEAR INDUSTRY. WHY THEY SHOULD BE TRUSTED TO ESTIMATE "GROWTH RATE OF ISOTOPE USE" OR "FUTURE NEEDS OF THE BIOMEDICAL SCIENCES COMMUNITY" IN ANY WAY OTHER THAN "MORE IS BETTER"? THE FFTF IS LIKE A "HOT ROD" TO THESE "EXPERTS"... THEY DON'T WANT TO SEE THIS THING SHUT DOWN AND SCRAPPED, EVEN IF THAT WERE THE LOGICAL DECISION. THEIR EMOTIONAL INVESTMENT IN THIS THING IS TOO GREAT; SO THEY'LL CONTINUE TO SEARCH FOR A "PURPOSE" TO KEEP IT ALIVE, DESPITE THE POSSIBILITY OF DOING SO WILL MEAN RUNNING AFOUL OF OUR NATIONAL OBLIGATIONS AND GOALS, SUCH AS NON-PROLIFERATION. WITH THE INTRODUCTION OF STIRLING ENGINE TECHNOLOGY BY NASA, THE PU-238 PROJECTED NEEDS ARE GREATLY REDUCED; SO, IN THIS AREA, THE PRESENT NIPES IS OBSOLESCEANT, AT LEAST.

Fold on lines and fasten with tape

HEY!
DID YOU
MAKE MY LITTLE
WITH TRITIUM?
IT'S SO HEAVY THAT
I CAN HARDLY LIFT IT!
WHAT?... YOU ADDED
EXTRA HEARING??
YEAR-MAYBE
THAT'S WHY IT'S
SO HEAVY.
THANKS!

Colette E. Brown, NE-50
U.S. Department of Energy
19901 Germantown Road
Germantown, MD 20874

1530-1

ADDITIONALLY, THE CHARGE OF THE "EXPERTS" THAT RESEARCH THAT COULD BE TAKING PLACE HAS BEEN LIMITED BY THE SCARCITY AND/OR HIGH PRICE OF CERTAIN ISOTOPES MAY BE TRUE; BUT WHY SHOULD "WE" SUPPORT DABBING IN EXPENSIVE, UNPROVEN TECHNOLOGIES? BIOTECH SEEMS TO FIND SUPPORT IN "TRADITIONAL" WAYS, THESE DAYS - VIA PRIVATE RESEARCH DOLLARS, FROM PHARMACEUTICAL COMPANIES AND "VENTURE CAPITAL" SOURCES. THERE ARE ONLY SO MANY "PUBLIC DOLLARS" TO SPEND (DESPITE THE MANY PROGRAMS); DESPITE REASSURANCES TO THE CONTRARY, NUCLEAR WASTE CLEANUP PROJECTS WILL BE ADVERSELY AFFECTED BY FIRING UP THIS OLD DRAG RACING HOT ROD WHILE SEARCHING FOR A "PUBLIC TRANSPORTATION" JOB DESCRIPTION IN WHICH TO CLOTHE IT. IF FFTF IS RESTARTED AND REDEPLOYED, IT WILL NOT BE "BECAUSE IT'S ECONOMICALLY AND PRACTICALLY FEASIBLE." IT WILL BE BECAUSE OF EMOTIONAL REASONS; AND BOTH NATIONAL PRIDE AND XENOPHOBIA WILL FIGURE PROMINENTLY IN ANY RESTART, ALONG WITH THE CONSIDERABLE POWER OF AGENCY INERTIA - "THIS REACTOR IS POWERED BY BUREAUCRATS."

Response to Commentor No. 1530

requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost.

A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

1530-2: DOE notes the commentor's view. In developing a range of reasonable alternatives, DOE examined the capabilities and available capacities of existing and planned accelerators, reactors, and hot cell facilities for meeting DOE's proposed nuclear infrastructure mission requirements. The basis as

Commentor No. 1530: John Browne, Jr. (Cont'd)

Response to Commentor No. 1530

to why specific facilities were eventually dismissed as reasonable alternatives is presented in Volume 1, Section 2.6 of the NI PEIS.

1530-3: DOE notes the commentor's viewpoint.

1530-4: DOE notes the commentor's view. There are numerous DOE hot cell processing facilities located across the United States that could support the proposed nuclear infrastructure mission requirements. Given this general availability, and in order focus the analyses of alternatives on a reasonable range of processing options, DOE only analyzed the most suitable hot cell facilities at candidate DOE irradiation facility locations (i.e., the Oak Ridge Reservation, the Idaho National Engineering and Environmental Laboratory, and the Hanford Site). This range of processing options would not limit the availability or access of isotopes to potential customers.

Commentor No. 1536: Lucile Wyers

Response to Commentor No. 1536

from: Mrs Brown
Draft PEIS Comment Form

9-11-00

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

When I received the 2 vol draft PEIS, I was not first happy thinking that this was about cleaning up hazardous waste at Hanford. But then I was shocked and dismayed to see that instead of the FTF facility was being considered again.

I am protesting for more time against shutting up the FTF. I did attend the Aug 29th, 2000 hearing in Hood River but did not have a chance to speak. He have been living with this dangerous situation at Hanford for too long a time already.

I want DOE to proceed with the clean-up as fast as possible. He narrowly escaped a big disaster about month ago when a grave / spent fission came close to storage area for high level waste.

Peaceful uses for nuclear energy are important but we believe research can go on without starting up the FTF again.

Turn it up - don't make more waste!

1536-1

1536-1: DOE notes the commentor's opposition to Alternative 1, Restart FTF; however, it should be pointed out that some research cannot be done in existing operating thermal reactors (e.g., fusion research, accelerator transmutation of waste, and space reactor technology).

1536-2

1536-2: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

1536-1

Commentor No. 1537: Mary Nally

September 11, 2000

Mary Nally
417 13th Ave E. #105
Seattle, WA 98102

Colette E. Brown
NE-50, US Dept. of Energy
19901 Germantown Rd.
Germantown, MD 20874

Dear Colette Brown,

I am writing to you about Hanford, the most highly contaminated nuclear site in the western world. I prefer option 5 - "permanently deactivate FFTF with no new missions."

Restarting FFTF would produce new high level radioactive waste streams. Permanently shutting down the FFTF is part of the 1989 Tri-Party Agreement between USDOE, EPA and WA Ecology. Keeping FFTF on hot standby for four years has cost over \$40 million per year, money coming from our tax dollars, already overspent on our ever-swelling military budget.

The Washington State Medical Association, WA Academy of Family Physicians and Physicians for Social Responsibility/National have all passed resolutions opposing the restart of the FFTF. The legal mission of Hanford is clean-up, not production. Please listen to the voice of the people who have been saying over and over, shut down Hanford and clean it up, permanently!

Sincerely,

Mary Nally, registered voter

Response to Commentor No. 1537

- 1537-1:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF. DOE also notes the commentor's concerns regarding the existing contamination at Hanford and the cleanup mission. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 1537-2:** As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. High-level radioactive waste would not be generated from merely operating FFTF. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.
- The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.
- 1537-3:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Draft PEIS Comment Form

9-9-00

Dear Ms. Kincaid,

Please restart FFTF for medical isotopes! This historic capability to advance medical sciences cannot be ignored. After decades of spending hundreds of billions of dollars on weapons to destroy the world, it's about time that we use some of those cold war capabilities to improve the lot of humankind!

Sincerely,

David Wiggins

Commentor No. 1541: Thomas F. and Dixie R. Hutson

Draft PEIS Comment Form

NUCLEAR INFRASTRUCTURE EIS

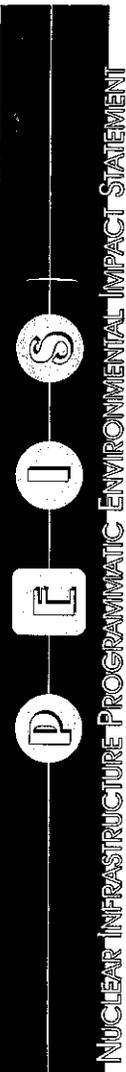

We support the restart of the FFTF Reactor Facility at Hanford to meet the national needs for medical isotopes and other peaceful nuclear materials. The FFTF is the most economical, safe, and environmental friendly method available to meet these needs.

Very truly yours, Thomas F. Hutson Dixie R. Hutson

1541-1

Response to Commentor No. 1541

1541-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Draft PEIS Comment Form

Coleette E. Brown

I am concerned about the air, water and ground environmental health hazards that have been going on since 1946. Many people I know passed away with Cancer and many problems. My Cousins husband had stomach cancer, his passed away at age 33, he worked at Oak Ridge. My Cousin had prostate cancer and his name he worked as sheet metal worker at Oak Ridge as did a lot of his friends who passed away with Cancer. My Cousin and his family I am sure they would have passed away at Oak Ridge. The whole place needs to be cleaned up. Please bring other residents that at Oak Ridge. I am enclosing a clipping from Today's paper READ IT. I am tired of hearing about all the sick people in Oak Ridge and the ground that part of the death.

1542-1

1542-1: The commentor's concern for environmental health hazards, hazardous waste incineration, and cleanup at the Oak Ridge Reservation are noted. Health effects studies of potential radiological and nonradiological impacts of the Oak Ridge Reservation are described in Section 3.2.9.3 of Volume 1. Potential health impacts on workers and the public that could result from implementation of the nuclear infrastructure alternatives are described in Chapter 4 of Volume 1. Implementation of the alternatives described in Section 2.5 would not be expected to result in significant contamination of air, water, or soil. As discussed in Section 4.3.1.1.13, hazardous waste generated under these alternatives would be shipped offsite to a commercial facility licensed to dispose of hazardous waste. Activities at the High Flux Isotope Reactor and the Radiochemical Engineering Development Facility would not affect cleanup efforts or funding at the Oak Ridge Reservation.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Commentor No. 1544: Maurita Bernet

September 11, 2000

Colette Brown
Office of Space & Defense Power Systems
US Dept of Energy
19901 Germantown Rd
Germantown MD 20874

Dear Colette,

I am writing from our small town of Omak WA where we struggle to unite three distinct cultures (white, Indian, Hispanic) and have economic challenges to go with that. So I write with awareness of the need for jobs and hopes for "security."

The main concern of this letter, though, is the possibility of reopening the Fast Flux Testing Facility at Hanford. I know there are people who need jobs, but I think it's past time to create jobs at the expense of the whole circle of Life. Don't we want to be CLEANING UP our poisonous messes rather than creating still more? I came to this area over 10 years ago & remember hearing the sad stories of cancer -- including on the Colville reservation in this area -- resulting from Hanford's activities over the past half-century plus. And even now we wait news of polluting waters heading for the Columbia river. And on and on.

Please, I beg of you, to use your wonderful human and political powers to STOP all further waste-creation at the Hanford site (or anywhere else, for that matter!) and to put all the needed energies and resources into CLEANING UP what has been and continues to be such a dangerous-to-all-Life situation.

Thank you for your attention to this urgent matter.

Sincerely,

Maurita Bernet
PO Box 3745
Omak WA 98841
509-826-7229

1544-1

Response to Commentor No. 1544

1544-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford and contamination of the Columbia River. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

The Colville Indian Reservation is approximately 320 kilometers (200 miles) north-northwest of the Hanford Site. River borne contamination from the Hanford Site would not affect the Colville Reservation because the Columbia River flows from the Colville Reservation toward the Hanford Site. As discussed in Section 3.4.9.3 of Volume 1, prevailing winds at the Hanford Site blow toward Grant County, Washington and the Colville Reservation from the south (14.2 percent of the time) and south-southwest (11.5 percent of the time) directions. Grant County is adjacent to the Hanford Site. Hence, Grant County would be expected to bear the major burden of wind borne contamination from the Hanford Site. Existing data and studies suggest that cancer mortality rates are not elevated in counties adjacent to the Hanford Site, including Grant County Volume 1, Section 3.9.4.3). If the cancer mortality risk in Grant County is elevated due to the presence of the Hanford Site, the increase in risk, if there is any, was too small to be identified by the study methodology and currently available data. Impacts of airborne contamination from the Hanford Site on the Colville Reservation would be far smaller than the impacts on Grant County. Due to the distance from

Commentor No. 1544: Maurita Bernet (Cont'd)

Response to Commentor No. 1544

the Hanford Site to the Colville Reservation, radiological impacts that would result from implementation of the nuclear infrastructure alternatives would be essentially zero.

Commentor No. 1545: R. B. Pinter

Response to Commentor No. 1545

Draft PEIS Comment Form

We wish to be on record as endorsing the no action option on restarting the FFTF at Hanford, WA. Of course, we note that testimony from the east, far removed from the Columbia river, endorses the restart, but of course these people would suffer no effects of leaks and accidents at Hanford. We are especially concerned about the contractors of atomic and nuclear processes at Hanford, who are interested only in the "bottom line", their profits. They are known, and widely reported here in the press, for their incompetence in storing nuclear waste, with such things as pressure and temperature buildup in containers which are underground for the most part. Well, if they explode, or even leak, the waste will find its way to the ground water supplies and the Columbia river, ruining the environment for all time. We pay taxes to preserve people and salmon, among other species, and have no confidence that the DOE contractors will do likewise, or even care. Do the contractors understand all the chemical, atomic and nuclear reactions involved in the mix of materials they are putting in their storage tanks? They don't, and they won't talk because they are ignorant and they assume that we are also.

Of course the good option, if there must be more plutonium here, is purchase from Russia. For many political purposes this is good. However, we don't endorse the use of nuclear plants on satellites as this creates a possibility of yet more accidents. We endorse the dismantling of US bombs and the re-use of that plutonium. We DO NOT need to make more of this terrible poison of which we have enough already.

Finally, the problem of isotope creation is important for health care and therapies, and purchased plutonium will serve this too.

We are uncertain that future politicians will not be as careful as those in recent years about escalating building of more nuclear weapons. What better tool to give the aggressive and warlike politician than more facilities for producing more plutonium !!! WE wish to see peace and no nuclear pollution, not war.

1545-1

7/12/00

1545-1: DOE notes the commentor's support for the No Action Alternative.

1545-2: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford and the risk of contamination to the Columbia River. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

1545-3: The purpose of the NI PEIS is to evaluate the environmental impacts of a range of reasonable alternatives to enhancing DOE's existing nuclear facility infrastructure to support production of isotopes for medical, research, and industrial uses; production of plutonium-238 for use in future NASA space exploration missions; and U.S. nuclear research and development needs for civilian application. The plutonium that would be produced under the proposed action would not be intended for medical applications. Plutonium-238, used to support NASA space missions, is

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Chapter 2—Written Comments and DOE Responses

Commentor No. 1545: R. B. Pinter (Cont'd)

Response to Commentor No. 1545

not weapons grade plutonium (i.e., plutonium-239). Whereas the United States is currently planning for the disposition of tons of surplus plutonium-239 that is not needed to support the U.S. nuclear weapons stockpile, there are only approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems and the plutonium-238 that fuels them for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. Based on NASA guidance to DOE on the potential use of radioisotope powersystems for upcoming space missions, DOE anticipates that the existing plutonium-238 inventory will be exhausted by approximately 2005. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Although research to identify other potential fuel sources to support these space exploration missions has been conducted, no viable alternative to using plutonium-238 has been established. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

As discussed in detail in Chapter 4 of Volume 1 and appendixes H, I, and J of Volume 2 in the Final NI PEIS, potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed action are relatively low. Potential health and safety impacts associated with future launches of spacecraft utilizing plutonium-238 are not within the scope of the NI PEIS analysis, but would be addressed in the specific NEPA documentation prepared by NASA in support of such missions.

Commentor No. 1545: R. B. Pinter (Cont'd)

Response to Commentor No. 1545

1545-4: DOE notes the commentor's interest in controlling the production of nuclear weapons, although issues of nuclear weapons production, dismantlement of weapons, and elimination of weapons systems are beyond the scope of this Nuclear Infrastructure PEIS. Unlike plutonium-239, plutonium-238, is not used in nuclear weapons. The technology that is discussed in the NI PEIS would be used to chemically separate plutonium-238 and neptunium from irradiated targets and not from irradiated or spent nuclear fuel, whereas reprocessing separates weapons grade plutonium-239 from irradiated nuclear fuel. None of the DOE missions described in this PEIS is weapons- or defense-related.

Commentor No. 1546: Claire R. Holmsham

Response to Commentor No. 1546

Draft PEIS Comment Form

I support the selection of FFTF as the preferred alternative to meet the pressing United States needs for research and medical isotopes.

 Germantown, MD 20874

Dear Ms Brown:

The mission of Hanford should be cleanup, and only cleanup. Any plan that would generate still more radioactive waste is reckless and irresponsible. I'd like to urge the DOE to adopt alternative #5: shut down the FFTF for good, and get on with cleaning up the mess we already have. We've already had too many missed deadlines and broken promises.

Sincerely,

Warren Jones

Cc: Governor Gary Locke
 Senator Patty Murray
 Senator Slade Gorton

|| 1548-1
 || 1548-2
 || 1548-3
 || 1548-1

Response to Commentor No. 1548

- 1548-1:** DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Public meetings were held on this formal milestone change. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.
- 1548-2:** DOE notes the commentor's concern regarding the generation of radioactive wastes. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.
- 1548-3:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Subject: Support restarting
FFTF for medical
Isotope production

1549-1

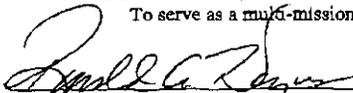

Response to Commentor No. 1549

1549-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 1549: UFCW Local No. 367 (Cont'd)**Support of Medical Isotope Production
at the Fast Flux Test Facility**

- Whereas, One in three Americans are touched by cancer, and
- Whereas, The use of medical isotopes in the treatment of cancer and heart disease is showing very encouraging and dramatic results. These new treatments use radioisotopes targeted specifically to the diseased cells and minimize the damage to healthy cells. The cost of medical isotope treatment is often much less than conventional treatments and with less debilitating results; and
- Whereas, Serious concern exists in the scientific and medical professions that the United States does not have the capability to produce enough radioisotopes to meet the rapidly increasing demand, while we depend on foreign supplies as over 90% of the isotopes currently used are imported, and
- Whereas, Private companies that develop new cancer treatments hesitate to invest millions of research dollars up front when the isotopes they want to use may not be reliably available, and
- Whereas, The existing Fast Flux Test Facility (FFTF) can reliably produce a diverse selection and large quantities of high quality isotopes; and
- Whereas, The FFTF is a significant national asset as it is the Department of Energy's newest and most sophisticated nuclear reactor with the potential to play a major role in supporting critical national missions such as medical isotope production for treatments of disease, non-proliferation fuels testing, research associated with the transmutation of nuclear waste, NASA space mission energy needs, and other scientific research; and
- Whereas, The United States has an aging and diminishing reactor inventory for scientific research and testing, while at the same time the United States is experiencing an increasing demand for the production of isotopes for medical and industrial applications; therefore

BE IT RESOLVED that UFCW Local No. 367 supports a restart of the Fast Flux Test Facility
To serve as a multi-mission research and isotope production reactor.

Subject: Draft Nuclear Infrastructure PEIS Comments

Dear Ms. Brown:

I have reviewed the Draft Nuclear Infrastructure PEIS and the corresponding cost study and have a few comments to provide that I hope you will find useful. I also attended the August 22, 2000 public hearing in Oak Ridge and appreciate your presentation and discussions.

My comments regarding the Draft PEIS are generally related to the ^{239}Pu production as this is an area that I am both interested in and have studied over the past few years. I work at Oak Ridge National Laboratory in the Nuclear Analysis and Shielding Section and have been involved extensively in design and analysis in the former Advanced Neutron Source project and for the High Flux Isotope Reactor. Recently, I have been studying the use of commercial light-water reactors (CLWR) for the production of ^{239}Pu . I am making these comments on my own behalf but much of my experience is from work performed at ORNL.

First, I would like to provide some general comments about the Draft PEIS and then make a few, more detailed comments on the use of CLWRs for the production of ^{239}Pu . My overall impression of the report is that it is relatively broad and does not provide many details or reference any supporting documents that may provide more details regarding the design decisions presented. However, I do believe that in evaluating the environmental impacts, that precise designs are generally not required. I am a bit surprised that DOE did not rely more on its technical experts in its National Laboratories to provide more input. There are no contributors from any National Laboratories listed in the Chapter 6 List of Preparers.

Now on to some more technical comments. Generally the quality of ^{239}Pu is determined by its contamination with ^{240}Pu . I suspect that there is some requirement on the maximum ^{240}Pu level that is acceptable for use by NASA (^{240}Pu produced at SRS had levels around a few parts per million ^{240}Pu , perhaps after a significant decay time). There is no discussion of the acceptable level of ^{240}Pu and if all of the proposed options would meet this requirement. This potentially could favor options that have the capability to produce large amounts of ^{239}Pu which would allow time for the ^{240}Pu to decay away.

The specifications given for the accelerator designs are not complete. The draft report indicates proton energy levels but does not give either a power level (MW) and/or a beam current. These parameters are what determine the size of the system, and therefore the cost and environmental impacts. These values

Response to Commentor No. 1550

1550-1: DOE notes the commentor's views and observations including those relating to new facility designs. Detailed facility designs are generally not required to support the analysis of environmental impacts in an EIS, as conceded by the commentor, particularly at the programmatic level. The preconceptual design descriptions contained in this NI PEIS are intended to address only such data that is necessary to assess the facility design as to its ability to accomplish the missions and for evaluating the associated environmental impacts. This information includes major design and structural elements, critical operating features and constraints, and projected construction and operation resource requirements. These preconceptual designs draw heavily both from off-the-shelf design configurations obtained from prospective vendors (i.e., for the new research reactor) as well as from design projects that are under development (i.e., the Oak Ridge Spallation Neutron Source for the high energy accelerator). See Appendix E and F for details. Contributors listed in Section 6 (List of Preparers) do include individuals knowledgeable in both the design and operation of the facilities under consideration to include the new research reactor and high- and low energy accelerators. This list of preparers includes individuals who were formally on the staff of the national laboratories and continue to support work at the national laboratories as contractors. In addition the list also includes individuals with extensive backgrounds in the commercial nuclear industry.

1550-2: In irradiating neptunium-237 target material to produce plutonium-238, other plutonium isotopes are also produced as impurities within the target material. These include plutonium-236 and plutonium-239. Of these impurities, plutonium-236 is important because daughter products resulting from radioactive decay of the plutonium-236 give off high-energy gamma rays which are difficult to shield. Plutonium-236 has a half-life of 2.85 years and the decay chain includes daughter products with gamma energies up to 2.6 MeV. Because of this gamma activity, target fabrication and handling can be more difficult and interaction and interference problems may arise with spacecraft electronics and instrumentation over a long time period unless this impurity level is kept quite low. The goal for the plutonium-236 impurity level in the past has been a value less than 2 parts per million. The plutonium-236 impurity level can be minimized through optimal target designs and core location placement.

The plutonium-236 level present at the end of irradiation can be reduced by allowing it to decay over a period of time prior to processing or prior

should be added to both the Draft PEIS and the Cost Report.

Based on what is in the report, I do not understand the logic behind the choice of a TRIGA reactor for the new research reactor concept. There is no information whether the design presented is optimal for the required uses of the reactor. I suspect that it is not. Furthermore, the power level of the reactor is much higher than any existing reactor of its type, and therefore represents a technical risk. On page 2-30 it does state that "Reactor core physics calculations were performed to evaluate three different nuclear fuel designs (described in Appendix E)." Appendix E, however, only discusses the TRIGA design. It seems that the TRIGA reactor was chosen purely on the inherent safety of its zirconium-hydride fuel and the wide-spread use of TRIGAs throughout the world. A better technical justification for the choice of a TRIGA reactor should be given, particularly since three different designs were evaluated.

I have several comments regarding the CLWR production of ^{239}Pu presented in the report. First, the chosen assembly design (15x15) is an old design and has been mostly replaced by 17x17 designs for 18-month cycles. The Draft PEIS claims to have drawn on the tritium production in CLWRs which is being performed in reactors which use a 17x17 assembly design. The production of tritium is based upon placing targets in the burnable absorber rod locations using Tritium Producing Burnable Absorber Rods (TPBARS). This also seems like a logical choice for the production of ^{239}Pu , but the concept presented in the Draft PEIS is much different. In the report it is proposed that fuel pins will be removed from an irradiated assembly and will be replaced with target rods. This is a very difficult and expensive procedure. In my opinion, a better approach would be to use the target rods as burnable absorbers during the first cycle of the assembly, similar to the TPBARS. These burnable absorber rods can be easily withdrawn from the assembly during refueling (much like the standard burnable absorber rods) and there would be very little impact on the reactor operation.

In reading Appendix B.3, I found almost no information on the proposed target design. There are no dimensions, materials, or other specifications. The material requirements for targets in a CLWR are much different than that for the research reactors. Under a program¹ to investigate the production of ^{239}Pu in CLWRs in the 1970's a few test rods were irradiated in the Connecticut Yankee reactor. In this case the target rods consisted of neptunia (NpO_2) dispersed in zirconia (ZrO_2). The chemical process requirements for such a target are much different than the standard targets of Al-NpO₂. The impact of these different processing requirements was not addressed in the report.

Furthermore, the report seems to indicate that five kilograms of ^{239}Pu can be produced per year using only one assembly at the center of the core. I do not believe that you can produce the required amount of ^{239}Pu with only one targeted assembly. Based on the experimental results from the above mentioned program and on the burnable-absorber target designs, about one kilogram can be produced per assembly per year while maintaining reasonably low levels of ^{239}Pu . Therefore, a minimum of five targeted assemblies would be required. Even five assemblies is a relatively small number and therefore CLWRs

¹ M. Boberski, et al., *Final Report on Production of Pu-238 in Commercial Power Reactors: Target Fabricating, Postirradiation Examination, and Plutonium and Neptunium Recovery*, BMI-X-646, Battelle Columbus Laboratories (1975).

Response to Commentor No. 1550

to use in fabricating heat sources. Plutonium-238 can also be blended with existing plutonium-238 stock that has less than 1 part per million plutonium-236 to lower the plutonium-236 concentration. The combination of plutonium-236 decay with blending as necessary would result in a plutonium-238 product that would meet NASA's needs, provided the plutonium-236 level is relatively low at the end of irradiation. The alternative selected to produce plutonium-238 will be required to ensure this impurity requirement is met. As detailed planning for a selected alternative progresses, this could result in the need for target design or facility modifications. Contingencies were added to the cost estimates provided in the Cost Report to cover the cost effects of unforeseen design changes, altered performance requirements, or major schedule delays due to developmental problems.

1550-3: The maximum beam current for the low-energy accelerator (2 milliamperes) is defined in the System Design Basis writeup on page F-8 of the Draft NI PEIS.

The maximum beam current for the high-energy accelerator (72 milliamperes) is defined in Table F-1, Linac Parameters, on page F-17 of the Draft NI PEIS.

The accelerator costs presented in the Cost Report are based on accelerator designs provided in Appendix F.

1550-4: As stated in the EIS Volume 1, Section 2.3.1.6, a preconceptual design of a new research reactor was developed based on the criteria that meets 1) current research reactor designs acceptable to NRC and IAEA, 2) nonproliferation policy (i.e., using low enriched uranium fuel), and 3) DOE missions in producing a) medical and industrial isotopes, and b) plutonium-238 while supporting nuclear energy research and development EIS Section E.2 describes the three fuel designs which were evaluated for the scoping reactor physics calculations and the basis for selecting TRIGA fuel. The TRIGA fuel core provided the largest irradiation volume and highest thermal neutron flux for low enriched uranium-235 in a research reactor. The high thermal neutron flux is desirable for plutonium-238 production and for producing most of the medical and industrial radioisotopes. Although the 50 megawatt power level of the new TRIGA research reactor is larger than the largest currently operating TRIGA reactor power of 16 megawatts, the fuel design is almost identical to the current TRIGA 10 megawatt high power

Commentor No. 1550: Jess C. Gehin (Cont'd)

Page 3 / 3

can provide plenty of production capacity. In fact, a large number of targets could be simultaneously irradiated to produce all of the ^{239}Pu to meet future requirements. The material could be stored and the ^{239}Pu would decay away thereby producing very high quality ^{241}Pu . The CLWR concept (and perhaps the FFTF) can provide surplus capacity should future needs require more ^{239}Pu than current plans. The other concepts (HFIR, ATR, new research reactor, and accelerators) would not be able to provide such surge capacity. This additional flexibility should be factored into the decision process.

From the above discussion, it's obvious that I believe that CLWR production of ^{239}Pu is both technically feasible and cost effective. In addition, using CLWRs for ^{239}Pu production allows HFIR and ATR to provide plenty of capacity for medical isotope production. Both of these reactors currently are under-utilized for isotope production. Alternatively, a smaller and less expensive research reactor could be constructed for the sole purpose of medical isotope production. One such example is a Canadian MAPLE design.

My final comment is in regards to the cost analysis report. Unfortunately this report was not available at the time of the public meeting and therefore could not be discussed. The costs presented are not complete and therefore do not provide a fair comparison of the alternatives. The cost analysis does not have any decommissioning costs for any of the alternatives other than for the FFTF, and then only if the FFTF is not chosen for the mission. In many cases, the deactivation costs dominate the overall costs. If the FFTF is chosen, decommissioning costs similar to the \$281 million will be incurred upon shutdown increasing it's total cost significantly over the value given in the Cost Analysis Report. The end result is that the use of FFTF will cost nearly twice as much as utilizing existing reactors, which already have their decommissioning costs covered by other means. Shutdown and decommissioning costs should also be included for the new research reactor and accelerators.

I hope that you find these comments constructive and useful in your revision of the Draft PEIS and in your decision process. If you need further information please do not hesitate to contact me. My work phone number is (865) 576-5093 and e-mail address is gehinc@ornl.gov. I would also like to be added to your mailing list and would like a CR-ROM copy of the Final Nuclear Infrastructure PEIS when it available.

Sincerely,

Jess C. Gehin

Response to Commentor No. 1550

design and the system thermal-hydraulic performance represents a linear extrapolation of existing designs. The power density of the 50 megawatt design is less than or equal to that for existing TRIGA reactor designs. The 50 megawatt TRIGA reactor design has been discussed with General Atomics, the TRIGA reactor design corporation. Appendix E will be modified to incorporate the aforementioned additional technical justification for selecting a TRIGA reactor.

- 1550-5:** Currently operating pressurized water reactor (PWR) commercial light water reactors (CLWR) in the U.S. operate with four different fuel assembly geometries denoted as 14 x 14, 15 x 15, 16 x 16, and 17 x 17. While the newer designs use 16 x 16 and 17 x 17 fuel assemblies, there are 14 operating PWRs in the U.S. that use 15 x 15 fuel assemblies in their core. The CLWR described in the EIS and used for the purpose of evaluating environmental impacts is representative of currently operating PWR CLWRs. Due to its bounding uranium mass, the 15 x 15 fuel assembly has the highest radioisotope source term of all commercial PWR fuel assembly designs. EIS Section 2.2.2.1, Plutonium-238 Production Target Fabrication, states that CLWR targets would have stainless steel or Zircaloy cladding. The PEIS did not presuppose the CLWR target design. The target designs were postulated to a level of detail appropriate to assess the environmental impacts associated with plutonium-238 production, target fabrication and post irradiation target processing. The CLWR target development evaluation assumed the prototype target design or multiple target designs would be irradiated in the CLWR for one fuel cycle. During the second fuel cycle the design or designs would be evaluated, the final design selected, and targets fabricated in production quantities. Production quantities of neptunium-237 targets are inserted into the CLWR for irradiation during the third fuel cycle. Neptunium-237 targets can be placed in numerous CLWR in-core and ex-core locations for the production of plutonium-238. The center fuel assembly in-core location was selected for evaluation in the NI PEIS because it was assumed that this would be the worst case location during postulated beyond design basis accident conditions. Such design and core configuration details would be analyzed if DOE decides to pursue this option for the production of plutonium-238. DOE considers the completion of all CLWR prototype target design testing in a single test cycle or fuel cycle a high risk. The commentor's support of CLWR plutonium-238 production, HFIR and ATR medical isotope production, and the use of a smaller less expensive research reactor such as the Canadian MAPLE design for medical isotope production is noted.

**1550-5
(Cont'd)****1550-6**

Commentor No. 1550: Jess C. Gehin (Cont'd)

Response to Commentor No. 1550

1550-6: The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS.

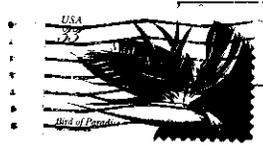

Deactivation of FFTF is not part of implementing Alternative 1, Restart FFTF. Deactivation of FFTF is part of implementing Alternatives 2, 3, 4, and 5 and including the cost of FFTF deactivation in the implementation costs for these alternatives is appropriate. The Cost Report was structured to identify the implementation costs of the various alternatives so the Secretary of Energy would have this information along with other data for consideration.

Decommissioning FFTF, including associated costs and cleanup, is not within the scope of the NI PEIS. Before decommission activities were undertaken, DOE would prepare the appropriate environmental reviews to address the associated environmental impacts. Cost assessments would also be prepared.

DOE remains committed to cleaning up the Hanford Site independent of an ultimate decision on FFTF. The amounts of wastes associated with decommissioning FFTF would be small. The schedule for cleaning up these other wastes would not be affected if FFTF were restarted.

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

Hanford still has to clean up the huge mess and contamination it already has created. It still is endangering the Columbia River & the FFTF, thru its process, would be creating more deadly contamination.

Name Marian Grebauier

Address 4579 NE 20 AVE

City, state PORTLAND OR Zip 97211

1551-1
1551-2
1551-3

Response to Commentor No. 1551

1551-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1551-2: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford and the risk of contamination to the Columbia River. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

1551-3: As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected. Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

|| 1552-1
|| 1552-2
|| 1552-3

Response to Commentor No. 1552

- 1552-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 1552-2: DOE notes the commentor's concern regarding waste storage. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.
- 1552-3: DOE notes the concerns for potential ecological and human health impacts expressed in this comment. The impacts on ecological resources and human health have been assessed for each alternative in Chapter 4 of the NI PEIS. Specifically for the FFTF Restart Alternative, the impacts on ecological resources are addressed in Section 4.3.1.1.6; human health impacts are addressed in Section 4.3.1.1.9 for normal operations and in Section 4.3.1.1.10 for postulated accidents. All of these impacts are shown to be small. Ecological resources would not be adversely affected and no fatalities would be expected among the general public or Hanford workers.

PLEASE respond

Address 345 NE 22 AV

City, state PORTLAND, OREGON Zip 97212-2432

1553-1

1553-2

Response to Commentor No. 1553

1553-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, although it should be pointed out that FFTF will not supply fuel to any reactor, either foreign or domestic.

DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings.

The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily Molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. Further, supplies of many research isotopes are not readily available from existing foreign or domestic sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed. As such, reliance on these other sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

1553-2: DOE notes the commentor's interest in controlling the production of nuclear weapons, although issues of nuclear weapons production, dismantlement of weapons, and elimination of weapons systems are beyond the scope of this NI PEIS. The scope of this NI PEIS is limited to analysis of alternatives to fulfill the requirements of the missions

Commentor No. 1553: Everett Antila (Cont'd)

Response to Commentor No. 1553

addressed, which include the production of medical and industrial isotopes, the production of plutonium-238, and nuclear research and development.

The three missions are civilian nuclear energy missions and are not defense-related. Section 1.2. of Volume 1 was revised to clarify the purpose and need of the proposed action.

Commentor No. 1554: Allan Stockman

Hanford Watch

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

*THE FEDERAL GOVERNMENT SHOULD FOCUS ITS ATTENTION
AND LIMITED FUNDS AT CLEANING UP HANFORD
AND NOT CREATING MORE DANGEROUS
NUCLEAR PRODUCTS THAT ARE NOT
NEEDED*

Name Allan Stockman
Address 7079 NE FARWELL AVE
City, state VANCOUVER, WA Zip 98662

1554-1
1554-2
1554-3

Response to Commentor No. 1554

1554-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1554-2: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

1554-3: DOE notes the views expressed regarding the potential use of FFTF for expanding DOE's existing nuclear facility infrastructure. However, the proposed action in the NI PEIS is necessary to meet the Nation's needs; it will not detract from critical Hanford cleanup efforts. As discussed in detail in Chapter 4 of Volume 1 and appendixes H, I, and J of Volume 2 in the Final NI PEIS, potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed action are relatively low. Again, the proposed action would not have an impact on the cleanup missions at the candidate sites.

 To: INFRASTRUCTURE_PEIS, NUCLEAR
 Subject: FFTF, A National/International Asset The World Needs
 Auto forwarded by a Rule

Cancer has divestated the lives of many of our friends and loved ones in our generation. The FFTF has the proven, demonstrated, technological ability to produce a vass array of medical isotopes that can change the quality of life for 100's of 1000's of people around the world. It is a unique facility that can produce the largest volume and the purest forms of medical isotopes of any facility on the face of the planet! The United States has an incredible window of opportunity to be the world leader in helping to alleviating the ravages of cancer and its harsh treatments. There is promising new research that will allow medical isotopes to zero_in on the cancerous tumor and destroy it without the extensive damage to surrounding tissue and organs that is part of conventional treatment.

The USA has the opportunity and moral obligation to improve the quality of life worldwide by supplying desparately needed medical isotopes. Currently, many of the potential uses of these isotopes will never be realized without a facility such as FFTF. We, the most powerful nation on earth, can either stick our heads in the sand or rise to the occasion and take the higher moral ground for the better good. What kind a nation/people do we want to be?

The primary pieces are in place to justify the mission for FFTF to begin producing medical isotopes. The facility exists (which includes an outstanding operating record), the technology is proven, and the need is both desparate and immediate.

Please take advantage of this once_in_a_lifetime opportunity, and restart the FFTF for the production of medical isotopes.

Sincerely,

Eddie U. McPherson

Ms. Colette Brown
DOE, Office of Space and Defense Power Systems

Dear Ms. Brown,
Your Department's recent proposal to expand the civilian nuclear infrastructure, outlined in the Draft Programmatic Environmental Impact Statement for accomplishing expanded civilian nuclear energy research and development and isotope production mission in the United States, including the role of the Fast Flux Test Facility, raises significant nuclear weapons proliferation and environmental issues.

As a member of the Snake River Alliance I have become aware of the serious nuclear contamination and waste problems at INEEL. INEEL is one of the most contaminated areas in America. The Department's recent estimate on cleaning up our site is \$22 billion and is expected to take 50 years__longer than any other DOE facility. In addition, we have over 360 individual superfund sites within the 890 sq. mile area that comprises INEEL. With this known, the last thing we need is a plan to generate more nuclear waste at a site that needs more waste like the DOE needs security scandals. Out of concern for Idaho's environment, I strongly urge you not to pursue the plutonium_238 production mission outlined in your PEIS.

Response to Commentor No. 1632

1632-1: The commentor's position regarding plutonium-238 production at INEEL is noted. Production of plutonium-238 at one or more of the candidate sites would be conducted in support of NASA's deep space missions (Volume 1, Section 1.2.2, of the NI PEIS). As discussed in Sections 4.3.2.1.13 and 4.4.2.1.13 of the PEIS, selection of the Fluorinel Dissolution Processing Facility and/or the Advanced Test Reactor to support production of plutonium-238 would have no significant impact on the waste management system at INEEL. Use of any of the facilities proposed in this PEIS for the stated missions would not impact cleanup missions at DOE sites.

1632-2: The use of proposed alternative facilities associated with processing of neptunium-237 targets would have no impact on schedules or available funding for high-level radioactive waste programs at either Hanford or INEEL. At INEEL, the tanks would not be used although certain facilities at the Idaho Nuclear Technology Engineering Center (INTEC) would be used to treat the wastes resulting from processing the irradiated targets. These are reliable systems that would process a maximum of 1,050 cubic meters of low-level radioactive waste over the 35-year nuclear infrastructure operational period. The higher activity waste would be treated as a solid form via a stand-alone vitrification system, separate from any tank waste treatment system. At Hanford, the existing high-level radioactive waste facilities would not be used, and as analyzed in the PEIS, no existing or planned high-level radioactive waste facilities would be used to treat the wastes resulting from processing the irradiated targets.

1632-3: Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic

1632-1

Commentor No. 1632: Nancy W. Fenn (Cont'd)

One of the most daunting problems confronting cleanup at major DOE facilities such as Hanford and INEEL, is the solidification of liquid high_level nuclear waste. Your current plan for plutonium_238 production entails the generation of approximately 288,000 additional gallons of this waste over the project's 35 year span. While this is a small portion of Hanford's high level waste, it is approximately one fifth of what we have remaining here in Idaho, which makes it a very significant amount. Previous leakage of this waste at INEEL and Hanford threatens our water supplies. What we certainly don't need is any more of this most highly problematic of waste forms.

Given the certain risks inherent in production of plutonium, the justified need for this material would have to be tremendous, and the PEIS does a poor job of providing ample justification. Beyond the risks involved in production, and the aforementioned resulting waste problem, there is also the issue of an accident occurring upon lift_off or reentry of a space probe carrying this material. The cassini probe, launched in 1997, carried 72 pounds of Pu_238. The potential for an explosion during lift_off or upon an inadvertent reentry during the fly_by phase, gave many in the scientific community pause, including scientists within NASA. According to NASA's own conservative estimate, a burn up upon reentry of the cassini probe could have caused 2,300 cancer fatalities, independent analyses ranged much higher. This potential for a catastrophic release of this extremely toxic material will remain so long as the US government remains committed to the use of plutonium_238. If DOE is to have a role in developing power systems for NASA's instrumentation, it should focus on promising solar technology, an alternative that has been promoted in the European scientific community.

There are also proliferation concerns as it pertains to this plan. A return to production of this isotope, however poorly justified, means a return to the use of aqueous reprocessing at DOE facilities where this technology has been used to extract bomb material for the weapons program. From President Carter to presidents Bush and Clinton, US policy has been to halt reprocessing in this country in order to set a global precedent to curtail the spread of nuclear weapons material_a noble effort in serious need of bolstering through action.

1632-2

1632-3

1632-4

1632-5

Response to Commentor No. 1632

supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed production of plutonium-238 are relatively low and are discussed in detail in Chapter 4 of Volume 1, and Appendixes H, I, and J of Volume 2 in the Final NI PEIS.

1632-4: DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions, although issues such as NASA research priorities are beyond the scope of this PEIS. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. The Cassini fly-by occurred exactly as planned, with no release of nuclear material.

1632-5: It is not true that resumption of plutonium-238 production constitutes a return to reprocessing. The aqueous technique that would be used to separate plutonium consisting of over 80 percent plutonium-238 and neptunium from the irradiated target is similar to the technology that was used in portions of the complex process to extract plutonium-239. However, as discussed in PEIS Sections S.3, 2.2.3 and A.1.4, this technology would be used to chemically separate plutonium-238 and neptunium from irradiated targets and not from irradiated or spent nuclear fuel, whereas reprocessing separates weapons grade plutonium-239 from irradiated nuclear fuel. Plutonium-238 extraction is not reprocessing. Unlike plutonium-239, plutonium-238 is not used in nuclear weapons,

Commentor No. 1632: Nancy W. Fenn (Cont'd)

Indeed, an otherwise lukewarm Nuclear Infrastructure Nonproliferation Impact Assessment conducted by your Office of Arms Control and Nonproliferation questions whether our commitment to nonproliferation isn't weakened by the use of the Fluorinel Dissolution Process Facility within Building 666 at INEEL. INEEL's reprocessing facility is next door to a wet storage unit for Navy spent fuel, which contains a greater than average amount of highly enriched uranium. It was reprocessed from 1953 to 1989 at INEEL for the weapons program. Use of this facility to carry out plutonium-238 extraction, especially considering the dubious need for this isotope, at the very least raises the concern that DOE is not fully committed to ending reprocessing. The international community cannot be expected to trust DOE's civilian mission claim when an agency devoutly committed to development of weapons uses a nuclear weapons technology at a weapons facility.

1632-5
(Cont'd)

Considering all these factors that could adversely affect our environment and commitment to nonproliferation, I strongly urge you to select alternative 5 in the current PEIS. This alternative would allow the Advanced Test Reactor at INEEL to continue producing medical and industrial isotopes for the commercial sector and would not lead to the production of anymore highly radioactive liquid waste at Hanford or INEEL. The main mission at these two facilities has been and should continue to be cleanup of the mess left over from previous nuclear weapons work. Additional waste production would interfere with this already difficult and expensive work. Alternative 5 also calls for the decommissioning of the FFTF reactor at Hanford. FFTF is an aging breeder reactor whose use would be inconsistent with United States policy to discourage use of this technology due to the capability this class of reactors has to produce more plutonium than is consumed. Thank you for the opportunity to comment on this plan.

1632-6

Sincerely,
Nancy W. Fenn

Response to Commentor No. 1632

but rather it would be used as a power and heat source for NASA space missions.

The Nuclear Infrastructure Nonproliferation Impact Assessment, published in September 2000, confirms that extracting plutonium-238 from irradiated targets would not undermine nonproliferation goals. In this report, DOE recognizes that proliferation concerns might be raised related to one of the technical assessment factors, "reduction in attractiveness of material forms," due to the fact that, in the extraction of plutonium-238, the remaining unconverted neptunium, a weapons-useable fissile material used as target material for conversion into plutonium-238, must also be recovered (not produced), purified, and recycled. This is unavoidable (unless the United States elects to neither produce or purchase plutonium-238), and it impacts all PEIS alternatives and options, including the No Action Alternative and Alternative 5: permanently deactivate FFTF with no new missions at U.S. facilities. However, while the fact that concerns might be raised is a valuable input to the record of decision process, it does not constitute an inconsistency with or departure from nonproliferation policy, and plutonium-238 is needed to fulfill our missions. Further, in the event that plutonium-238 production is resumed in the United States, the total separated stocks of neptunium would be reduced over time in an irreversible manner since there is a moratorium on U.S. spent fuel reprocessing. This overall reduction in a weapons-useable material would mitigate the potential concerns related to material attractiveness, and offer an additional method to pursue U.S. nonproliferation goals. DOE's proposed approach in this mission, and its rigorous nonproliferation impact assessment, demonstrate its commitment to nonproliferation policy, domestically and in the international community.

The juxtaposition of Fluorinel Dissolution Process Facility (FDPF) in INEEL Building 666 to wet storage of highly enriched uranium Navy spent nuclear fuel, and its previous mission of reprocessing spent nuclear fuel, were rigorously and objectively evaluated in the Nuclear Infrastructure Nonproliferation Impact Assessment published in September 2000. In no uncertain terms, this report discusses the proliferation concerns raised in the areas of facilitating cost-effective international monitoring and supporting negotiation of a verifiable Fissile Material Cutoff Treaty (FMCT), and outlines what is needed to mitigate these concerns. This is a valuable input to the record of decision process.

Commentor No. 1632: Nancy W. Fenn (Cont'd)

Response to Commentor No. 1632

Most of the concerns and uncertainties surrounding the use of FDPF are associated with its history as a defense programs facility and the resulting lack of transparency that could be afforded in the event that international monitoring becomes desirable under an FMCT. This is a different set of concerns than those expressed in the comment. The fact is, that since it is well known that FDPF has a long history of Navy defense missions, and since the described mission (plutonium-238 extraction) in the PEIS does not involve the production of special fissile material, sufficient transparency could possibly be provided by a managed access regime that would meet the requirements of FMCT verification. If this could be done, the aforementioned concerns would be mitigated.

- 1632-6:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF. It should be noted that medical isotopes would continue to be produced at ATR regardless of which alternative is selected in the Record of Decision. The FFTF would produce spent nuclear fuel and low-level radioactive waste, and as discussed throughout Section 4.3 of Volume 1, none of the proposed alternatives would add waste to the high-level waste tanks at Hanford or INEEL. Also, it should be pointed out that while FFTF supported the breeder reactor program, it is not itself a breeder reactor, but rather a fast flux research reactor.

Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Sections 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

Commentor No. 1632: Nancy W. Fenn (Cont'd)

Response to Commentor No. 1632

With respect to cleanup of wastes at Hanford or INEEL, the proposed action and the existing cleanup missions are independent programs and actions related to one will not impact the other. While the cleanup activities at both Hanford and INEEL are high priority to DOE, it should be noted that the cleanup of legacy wastes is beyond the scope of the NI PEIS.

 Auto forwarded by a Rule

Dear Collette Brown/Secretary Richardson,

Please accept the following as public comments on the Draft Environmental Impact Statement on the Nuclear Infrastructure EIS.

As a citizen of the Pacific Northwest, I am deeply concerned about the United States Department of Energy's proposal to restart Hanford's Fast Flux Test Facility Nuclear Reactor. I wish to have my values incorporated into the formal administrative record and taken into consideration when adopting the final record of decision. I also want you to respond to my concerns before you make your record of decision.

Considering Hanford's overwhelming problems, including the crisis with tank waste treatment, as well as the damage caused by and radiation released from the Hanford wildfire, restarting FFTF is absolutely unacceptable. We must deal with the waste already at Hanford and focus on the clean_up mission. FFTF maintenance has already gobbled up \$100 million in clean_up money and distracted from desperately needed clean_up. Tank wastes are already seeping towards the Columbia River. More wastes must not be added to those tanks. Clean_up must be the only priority. We must save the Columbia River. Also, I object to the fact that you are asking citizens to comment on an incomplete study. You have not told us how you will deal with non_proliferation issues or additional waste from FFTF. Should FFTF be restarted, that decision will be illegal under Federal law and will be overturned! Do the right thing, shut down FFTF now and save the future of the Columbia River!

Sincerely,
 Chris Fuess
 1126 State Ave NE, Olympia, WA, 98506

1634-2

1634-1

1634-4

1634-1

1634-5

Response to Commentor No. 1634

1634-1: DOE notes the commentor's concerns. This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. DOE prepared a separate Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on September 8, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Nuclear Infrastructure Nonproliferation Impact Assessment in Appendix Q in the Final NI PEIS. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

1634-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Hanford cleanup is funded by DOE's Office of the Assistant Secretary for Environmental Management (EM). FFTF funding is currently provided through the Office of Nuclear Energy, Science & Technology (NE). The DOE missions considered in this PEIS would also be funded by the DOE Office of NE, which has no funding connection to Hanford cleanup activities. Therefore, restart of FFTF would not impact current cleanup schedules.

Commentor No. 1634: Chris Fuess (Cont'd)

Response to Commentor No. 1634

The restart of FFTF or any of the other proposed alternative facilities would not have an impact on the cleanup missions at Hanford, INEEL, or ORR . The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and appropriate DOE orders.

In regards to the Hanford wildfire of 2000, the DOE Richland Operations Office, the State of Washington Department of Health, and U.S. Environmental Protection Agency performed environmental monitoring on and around the Site to assess potential radiological impacts. The wildfire did not cause a release of radioactive materials from any Hanford facilities but did result in resuspension of radioactive materials which were already in the environment. The very low levels of radioactive materials that were resuspended were slightly above natural background levels and required several days of analysis to quantify. Information on this event has been made available to the public and can be accessed at <http://www.Hanford.gov/envmon/indes.html>. This site also provides a link to information on the independent offsite air monitoring that was conducted by the U.S. Environmental Protection Agency.

1634-3: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.

1634-4: Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities)

Commentor No. 1634: Chris Fuess (Cont'd)

Response to Commentor No. 1634

to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

1634-5: See response to comment 1634-3.

 RE: Plutonium transmutation via the Roy Process.

Dear Sir,
 All high level nuclear waste, including plutonium, can be totally transmuted into non radioactive elements using the Roy Process invention. See web site: <http://members.home.net/theroyprocess>

Plutonium can be transmuted into non radioactive lead producing heat which can be used to make steam and power existing generators at each nuclear power plant were nuclear waste is now stored in cooling ponds. The Roy Process Patent Application contains completed electrodynamic calculations for three isotopes: Pu239, Sr90 and Cs137. All other isotopes treated by the same method.

Dr. Roy estimated cost in 1979 at \$80 Million dollars and take three years to construct the Roy Process pilot treatment plant. Portable units can also be built for on site transmutation.

The Roy Process is available to a company capable of realization who contracts with us.

Sincerely,
 Dennis F. Nester,
 Agent for the Roy Process, theroyprocess@home.com

Subject: Use of depleted plutonium
Auto forwarded by a Rule

Dear Ms. Brown,

Please count me an American Citizen who is opposed to the use of depleted uranium. From what I understand it is radioactive and in the area's where it has already been highly used there are serious health related concerns.

Thank you,
Andrea Hornbein

1636-1

Response to Commentor No. 1636

1636-1: The commentor's concerns about depleted uranium are noted. Missions described in Section 1.2 of Volume 1 and alternatives described in Section 2.5 do not involve depleted uranium. This NI PEIS provides estimates of human health impacts associated with a range of reasonable alternatives (including restart of FFTF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. Plutonium is one of many substances that have been considered in the analysis of health and safety impacts for this PEIS. Both radiological and chemical impacts were addressed. (See Appendixes H and I of the PEIS.) Plutonium has been identified as the primary contributor to the health impacts associated with the processing of irradiated neptunium targets at any of the proposed processing facilities. The analysis shows that no public or worker latent cancer fatalities would be expected to result from implementation of the alternatives. See, for example, Sections 4.3.1.1.9, 4.3.2.1.9, and 4.3.3.1.9 in Chapter 4 and the Summary Tables in Chapter 2 of Volume 1 of the NI PEIS.

 Ms. Colette Brown
 DOE, Office of Space and Defense Power Systems

Dear Ms. Brown,
 Your Department's recent proposal to expand the civilian nuclear infrastructure, outlined in the Draft Programmatic Environmental Impact Statement for accomplishing expanded civilian nuclear energy research and development and isotope production mission in the United States, including the role of the Fast Flux Test Facility, raises significant nuclear weapons proliferation and environmental issues.

As a member of the Snake River Alliance I have become aware of the serious nuclear contamination and waste problems at INEEL. INEEL is one of the most contaminated areas in America. The Department's recent estimate on cleaning up our site is \$22 billion and is expected to take 50 years__longer than any other DOE facility. In addition, we have over 360 individual superfund sites within the 890 sq. mile area that comprises INEEL. With this known, the last thing we need is a plan to generate more nuclear waste at a site that needs more waste like the DOE needs security scandals. Out of concern for Idaho's environment, I strongly urge you not to pursue the plutonium_238 production mission outlined in your PEIS.

One of the most daunting problems confronting cleanup at major DOE facilities such as Hanford and INEEL, is the solidification of liquid high_level nuclear waste. Your current plan for plutonium_238 production entails the generation of approximately 288,000 additional gallons of this waste over the project's 35 year span. While this is a small portion of Hanford's high level waste, it is

Response to Commentor No. 1637

- 1637-1:** The commentor's position regarding plutonium-238 production at INEEL is noted. Production of plutonium-238 at one or more of the candidate sites would be conducted in support of NASA's deep space missions Volume 1, Section 1.2.2 of the NI PEIS). As discussed in Sections 4.3.2.1.13 and 4.4.2.1.13 of the EIS, selection of the Fluorinel Dissolution Processing Facility and/or the Advanced Test Reactor to support production of plutonium-238 would have little impact on the waste management system at INEEL. Use of any of the facilities proposed in this PEIS for the stated missions would not impact cleanup missions at DOE sites.
- 1637-2:** The use of proposed alternative facilities associated with processing of neptunium-237 targets would have no impact on schedules or available funding for high-level radioactive waste programs at either Hanford or INEEL. At INEEL, the tanks would not be used although certain facilities at the Idaho Nuclear Technology Engineering Center (INTEC) would be used to treat the wastes resulting from processing the irradiated targets. These are reliable systems that would process a maximum of 1,050 cubic meters of low-level radioactive waste over the 35-year nuclear infrastructure operational period. The higher activity waste would be treated as a solid form via a stand-alone vitrification system, separate from any tank waste treatment system. At Hanford, the existing high level radioactive waste facilities would not be used, and as analyzed in the PEIS, no existing or planned high-level radioactive waste facilities would be used to treat the wastes resulting from processing the irradiated targets.
- 1637-3:** Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic

1637-1

1637-2

Commentor No. 1637: Ann Tesoro (Cont'd)

approximately one fifth of what we have remaining here in Idaho, which makes it a very significant amount. Previous leakage of this waste at INEEL and Hanford threatens our water supplies. What we certainly don't need is any more of this most highly problematic of waste forms.

Given the certain risks inherent in production of plutonium, the justified need for this material would have to be tremendous, and the PEIS does a poor job of providing ample justification. Beyond the risks involved in production, and the aforementioned resulting waste problem, there is also the issue of an accident occurring upon lift_off or reentry of a space probe carrying this material. The cassini probe, launched in 1997, carried 72 pounds of Pu_238. The potential for an explosion during lift_off or upon an inadvertent reentry during the fly_by phase, gave many in the scientific community pause, including scientists within NASA. According to NASA's own conservative estimate, a burn up upon reentry of the cassini probe could have caused 2,300 cancer fatalities, independent analyses ranged much higher. This potential for a catastrophic release of this extremely toxic material will remain so long as the US government remains committed to the use of plutonium_238. If DOE is to have a role in developing power systems for NASA's instrumentation, it should focus on promising solar technology, an alternative that has been promoted in the European scientific community.

There are also proliferation concerns as it pertains to this plan. A return to production of this isotope, however poorly justified, means a return to the use of aqueous reprocessing at DOE facilities where this technology has been used to extract bomb material for the weapons program. From President Carter to presidents Bush and Clinton, US policy has been to halt reprocessing in this country in order to set a global precedent to curtail the spread of nuclear weapons material_a noble effort in serious need of bolstering through action.

Indeed, an otherwise lukewarm Nuclear Infrastructure Nonproliferation Impact Assessment

(Cont'd)

1637-3

1637-4

1637-5

Response to Commentor No. 1637

supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed production of plutonium-238 are relatively low and are discussed in detail in Chapter 4 of Volume 1, and Appendixes H, I, and J of Volume 2 in the Final NI PEIS.

1637-4: DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions, although issues such as NASA research priorities are beyond the scope of this PEIS. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. The Cassini fly-by occurred exactly as planned, with no release of nuclear material.

1637-5: It is not true that resumption of plutonium-238 production constitutes a return to reprocessing. The aqueous technique that would be used to separate plutonium consisting of over 80 percent plutonium-238 and neptunium from the irradiated target is similar to the technology that was used in portions of the complex process to extract plutonium-239. However, as discussed in PEIS Sections S.3, 2.2.3 and A.1.4, this technology would be used to chemically separate plutonium-238 and neptunium from irradiated targets and not from irradiated or spent nuclear fuel, whereas reprocessing separates weapons grade plutonium-239 from irradiated nuclear fuel. Plutonium-238 extraction is not reprocessing. Unlike plutonium-239, plutonium-238 is not used in nuclear weapons, but rather it would be used as a power and heat source for NASA space missions.

Commentor No. 1637: Ann Tesoro (Cont'd)

conducted by your Office of Arms Control and Nonproliferation questions whether our commitment to nonproliferation isn't weakened by the use of the Fluorinel Dissolution Process Facility within Building 666 at INEEL. INEEL's reprocessing facility is next door to a wet storage unit for Navy spent fuel, which contains a greater than average amount of highly enriched uranium. It was reprocessed from 1953 to 1989 at INEEL for the weapons program. Use of this facility to carry out plutonium_238 extraction, especially considering the dubious need for this isotope, at the very least raises the concern that DOE is not fully committed to ending reprocessing. The international community cannot be expected to trust DOE's civilian_mission claim when an agency devoutly committed to development of weapons uses a nuclear weapons technology at a weapons facility.

Considering all these factors that could adversely affect our environment and commitment to nonproliferation, I strongly urge you to select alternative 5 in the current PEIS. This alternative would allow the Advanced Test Reactor at INEEL to continue producing medical and industrial isotopes for the commercial sector and would not lead to the production of anymore highly radioactive liquid waste at Hanford or INEEL. The main mission at these two facilities has been and should continue to be cleanup of the mess left over from previous nuclear weapons work. Additional waste production would interfere with this already difficult and expensive work. Alternative 5 also calls for the decommissioning of the FFTF reactor at Hanford. FFTF is an aging breeder reactor whose use would be inconsistent with United States policy to discourage use of this technology due to the capability this class of reactors has to produce more plutonium than is consumed. Thank you for the opportunity to comment on this plan.

Sincerely,

**1637-5
(Cont'd)**

1637-6

Response to Commentor No. 1637

The Nuclear Infrastructure Nonproliferation Impact Assessment, published in September 2000, confirms that extracting plutonium-238 from irradiated targets would not undermine nonproliferation goals. In this report, DOE recognizes that proliferation concerns might be raised related to one of the technical assessment factors, "reduction in attractiveness of material forms," due to the fact that, in the extraction of plutonium-238, the remaining unconverted neptunium, a weapons-useable fissile material used as target material for conversion into plutonium-238, must also be recovered (not produced), purified, and recycled. This is unavoidable (unless the United States elects to neither produce or purchase plutonium-238), and it impacts all PEIS alternatives and options, including the No Action Alternative and Alternative 5: permanently deactivate FFTF with no new missions at U.S. facilities. However, while the fact that concerns might be raised is a valuable input to the record of decision process, it does not constitute an inconsistency with or departure from nonproliferation policy, and plutonium-238 is needed to fulfill our missions. Further, in the event that plutonium-238 production is resumed in the United States, the total separated stocks of neptunium would be reduced over time in an irreversible manner since there is a moratorium on U.S. spent fuel reprocessing. This overall reduction in a weapons useable material would mitigate the potential concerns related to material attractiveness, and offer an additional method to pursue U.S. nonproliferation goals. DOE's proposed approach in this mission, and its rigorous nonproliferation impact assessment, demonstrate its commitment to nonproliferation policy, domestically and in the international community.

The juxtaposition of Fluorinel Dissolution Process Facility (FDPF) in INEEL Building 666 to wet storage of highly enriched uranium Navy spent nuclear fuel, and its previous mission of reprocessing spent nuclear fuel, were rigorously and objectively evaluated in the Nuclear Infrastructure Nonproliferation Impact Assessment published in September 2000. In no uncertain terms, this report discusses the proliferation concerns raised in the areas of facilitating cost-effective international monitoring and supporting negotiation of a verifiable Fissile Material Cutoff Treaty (FMCT), and outlines what is needed to mitigate these concerns. This is a valuable input to the record of decision process.

Most of the concerns and uncertainties surrounding the use of FDPF are associated with its history as a defense programs facility and the resulting lack of transparency that could be afforded in the event that international monitoring becomes desirable under an Fissile Material Cutoff Treaty

Commentor No. 1637: Ann Tesoro (Cont'd)

Response to Commentor No. 1637

(FMCT). This is a different set of concerns than those expressed in the comment. The fact is, that since it is well known that FDPF has a long history of Navy defense missions, and since the described mission (plutonium-238 extraction) in the PEIS does not involve the production of special fissile material, sufficient transparency could possibly be provided by a managed access regime that would meet the requirements of FMCT verification. If this could be done, the aforementioned concerns would be mitigated.

- 1637-6:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF. It should be noted that medical isotopes would continue to be produced at ATR regardless of which alternative is selected in the Record of Decision. The FFTF would produce spent nuclear fuel and low-level radioactive waste, and as discussed throughout Section 4.3 of Volume 1, none of the proposed alternatives would add waste to the high-level waste tanks at Hanford or INEEL. Also, it should be pointed out that while FFTF supported the breeder reactor program, it is not itself a breeder reactor, but rather a fast flux research reactor.

Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Sections 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

With respect to cleanup of wastes at Hanford or INEEL, the proposed action and the existing cleanup missions are independent programs and actions related to one will not impact the other. While the cleanup activities

Commentor No. 1637: Ann Tesoro (Cont'd)

Response to Commentor No. 1637

at both Hanford and INEEL are high priority to DOE, it should be noted that the cleanup of legacy wastes is beyond the scope of the NI PEIS.

Ms. Colette Brown
 DOE, Office of Space and Defense Power Systems

Dear Ms. Brown,
 Your Department's recent proposal to expand the civilian nuclear infrastructure, outlined in the Draft Programmatic Environmental Impact Statement for accomplishing expanded civilian nuclear energy research and development and isotope production mission in the United States, including the role of the Fast Flux Test Facility, raises significant nuclear weapons proliferation and environmental issues.

As a member of the Snake River Alliance I have become aware of the serious nuclear contamination and waste problems at INEEL. INEEL is one of the most contaminated areas in America. The Department's recent estimate on cleaning up our site is \$22 billion and is expected to take 50 years__longer than any other DOE facility. In addition, we have over 360 individual superfund sites within the 890 sq. mile area that comprises INEEL. With this known, the last thing we need is a plan to generate more nuclear waste at a site that needs more waste like the DOE needs security scandals. Out of concern for Idaho's environment, I strongly urge you not to pursue the plutonium_238 production mission outlined in your PEIS.

One of the most daunting problems confronting cleanup at major DOE facilities such as Hanford and INEEL, is the solidification of liquid high_level nuclear waste. Your current plan for plutonium_238 production entails the generation of approximately 288,000 additional gallons of this waste over the project's 35 year span. While this is a small portion of Hanford's high level

Response to Commentor No. 1638

1638-1: The commentor's position regarding plutonium-238 production at INEEL is noted. Production of plutonium-238 at one or more of the candidate sites would be conducted in support of NASA's deep space missions Volume 1, Section 1.2.2 of the NI PEIS). As discussed in Sections 4.3.2.1.13 and 4.4.2.1.13 of the EIS, selection of the Fluorinel Dissolution Processing Facility and/or the Advanced Test Reactor to support production of plutonium-238 would have no significant impact on the waste management system at INEEL. Use of any of the facilities proposed in this PEIS for the stated missions would not impact cleanup missions at DOE sites.

1638-2: The use of proposed alternative facilities associated with processing of neptunium-237 targets would have no impact on schedules or available funding for high-level radioactive waste programs at either Hanford or INEEL. At INEEL, the tanks would not be used although certain facilities at the Idaho Nuclear Technology Engineering Center (INTEC) would be used to treat the wastes resulting from processing the irradiated targets. These are reliable systems that would process a maximum of 1 050 cubic meters of low-level radioactive waste over the 35-year nuclear infrastructure operational period. The higher activity waste would be treated as a solid form via a stand-alone vitrification system, separate from any tank waste treatment system. At Hanford, the existing high level radioactive waste facilities would not be used, and as analyzed in the PEIS, no existing or planned high-level radioactive waste facilities would be used to treat the wastes resulting from processing the irradiated targets.

1638-3: Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic

1638-1

1638-2

Commentor No. 1638: Carolyn Hondo (Cont'd)

waste, it is approximately one fifth of what we have remaining here in Idaho, which makes it a very significant amount. Previous leakage of this waste at INEEL and Hanford threatens our water supplies. What we certainly don't need is any more of this most highly problematic of waste forms.

Given the certain risks inherent in production of plutonium, the justified need for this material would have to be tremendous, and the PEIS does a poor job of providing ample justification. Beyond the risks involved in production, and the aforementioned resulting waste problem, there is also the issue of an accident occurring upon lift_off or reentry of a space probe carrying this material. The cassini probe, launched in 1997, carried 72 pounds of Pu_238. The potential for an explosion during lift_off or upon an inadvertent reentry during the fly_by phase, gave many in the scientific community pause, including scientists within NASA. According to NASA's own conservative estimate, a burn up upon reentry of the cassini probe could have caused 2,300 cancer fatalities, independent analyses ranged much higher. This potential for a catastrophic release of this extremely toxic material will remain so long as the US government remains committed to the use of plutonium_238. If DOE is to have a role in developing power systems for NASA's instrumentation, it should focus on promising solar technology, an alternative that has been promoted in the European scientific community.

There are also proliferation concerns as it pertains to this plan. A return to production of this isotope, however poorly justified, means a return to the use of aqueous reprocessing at DOE facilities where this technology has been used to extract bomb material for the weapons program. From President Carter to presidents Bush and Clinton, US policy has been to halt reprocessing in this country in order to set a global precedent to curtail the spread of nuclear weapons material_a noble effort in serious need of bolstering through action.

supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed production of plutonium-238 are relatively low and are discussed in detail in Chapter 4 of Volume 1, and Appendixes H, I, and J of Volume 2 in the Final NI PEIS.

1638-4: DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. The Cassini fly-by occurred exactly as planned, with no release of nuclear material.

1638-5: The commentor is correct in stating that the aqueous processing technology that would be used to separate plutonium consisting of over 80 percent plutonium-238 and neptunium from the irradiated target is similar to the technology that was used to extract plutonium-239. However, unlike plutonium-239, plutonium-238 is not used in nuclear weapons, but rather it would be used as a power source for NASA space missions. The technology that is discussed in EIS Sections S.3, 2.2.3 and A.1.4 would be used to chemically separate plutonium-238 and neptunium from irradiated targets and not from irradiated or spent nuclear fuel whereas reprocessing separates weapons grade plutonium-239 from irradiated nuclear fuel. As discussed in the separate nonproliferation impact assessment report, use of this technology to produce plutonium-238 from irradiated targets will not create a nonproliferation threat. DOE is committed to full compliance

Commentor No. 1638: Carolyn Hondo (Cont'd)

Indeed, an otherwise lukewarm Nuclear Infrastructure Nonproliferation Impact Assessment conducted by your Office of Arms Control and Nonproliferation questions whether our commitment to nonproliferation isn't weakened by the use of the Fluorinel Dissolution Process Facility within Building 666 at INEEL. INEEL's reprocessing facility is next door to a wet storage unit for Navy spent fuel, which contains a greater than average amount of highly enriched uranium. It was reprocessed from 1953 to 1989 at INEEL for the weapons program. Use of this facility to carry out plutonium_238 extraction, especially considering the dubious need for this isotope, at the very least raises the concern that DOE is not fully committed to ending reprocessing. The international community cannot be expected to trust DOE's civilian_mission claim when an agency devoutly committed to development of weapons uses a nuclear weapons technology at a weapons facility.

Considering all these factors that could adversely affect our environment and commitment to nonproliferation, I strongly urge you to select alternative 5 in the current PEIS. This alternative would allow the Advanced Test Reactor at INEEL to continue producing medical and industrial isotopes for the commercial sector and would not lead to the production of anymore highly radioactive liquid waste at Hanford or INEEL. The main mission at these two facilities has been and should continue to be cleanup of the mess left over from previous nuclear weapons work. Additional waste production would interfere with this already difficult and expensive work. Alternative 5 also calls for the decommissioning of the FFTF reactor at Hanford. FFTF is an aging breeder reactor whose use would be inconsistent with United States policy to discourage use of this technology due to the capability this class of reactors has to produce more plutonium than is consumed. Thank you for the opportunity to comment on this plan.

 Subject: P_238
 Auto forwarded by a Rule

Dear DOE,

It has come to my attention that your agency is considering reprocessing technologies to produce P_238 for NASA at INEEL. Consider that NASA has made public that it has plutonium sufficient for its space probes. Consider also that reprocessing is a dirty process, which is known to lead to weapons proliferation. The safest, most cost_ effective way to clean_up hazardous waste is to stop producing it. I want to be able to say that the government of my country leads the world in a common_sense approach to stopping nuclear proliferation. Drop this bad idea. Here in southeastern Idaho, we don't want the jobs this idea will create. Thank you.

Sincerely,
 Barbara Agnew, 289 West 400 North, Teton, ID 83452

1639-1**1639-2****1639-3****Response to Commentor No. 1639**

1639-1: The technology that is discussed in the NI PEIS would be used to chemically separate plutonium-238 and neptunium from irradiated targets and not from irradiated or spent nuclear fuel, whereas reprocessing separates weapons grade plutonium-239 from irradiated nuclear fuel. As discussed in the separate nonproliferation impact assessment report, use of this technology to produce plutonium-238 from irradiated targets will not create a nonproliferation threat. DOE is committed to full compliance with and support of the U.S. policy prohibiting reprocessing.

A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

1639-2: The technology that is discussed in Sections S.3, 2.2.3 and A.1.4 of the NI PEIS would be used to chemically separate plutonium-238 and neptunium from irradiated targets and not from irradiated or spent nuclear fuel whereas reprocessing separates weapons grade plutonium-239 from irradiated nuclear fuel. As discussed in the separate Nuclear Infrastructure Nonproliferation Impact Assessment, published in September, 2000, use of this technology to produce plutonium-238 from irradiated targets will not create a nonproliferation threat. DOE is committed to full compliance with and support of the U.S. policy prohibiting reprocessing.

1639-3: DOE notes the commentor's opposition to those alternatives that would involve INEEL.

supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed production of plutonium-238 are relatively low and are discussed in detail in Chapter 4 of Volume 1, and Appendixes H, I, and J of Volume 2 in the Final NI PEIS.

1640-4: DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. The Cassini fly-by occurred exactly as planned, with no release of nuclear material.

1640-5: It is not true that resumption of plutonium-238 production constitutes a return to reprocessing. The aqueous technique that would be used to separate plutonium consisting of over 80 percent plutonium-238 and neptunium from the irradiated target is similar to the technology that was used in portions of the complex process to extract plutonium-239. However, as discussed in PEIS Sections S.3, 2.2.3 and A.1.4, this technology would be used to chemically separate plutonium-238 and neptunium from irradiated targets and not from irradiated or spent nuclear fuel, whereas reprocessing separates weapons grade plutonium-239 from irradiated nuclear fuel. Plutonium-238 extraction is not reprocessing. Unlike plutonium-239, plutonium-238 is not used in nuclear weapons, but rather it would be used as a power and heat source for NASA space missions. The Nuclear Infrastructure Nonproliferation Impact Assessment, published in September 2000, confirms that extracting

Commentor No. 1640: Maurice Horn (Cont'd)

Indeed, an otherwise lukewarm Nuclear Infrastructure Nonproliferation Impact Assessment conducted by your Office of Arms Control and Nonproliferation questions whether our commitment to nonproliferation isn't weakened by the use of the Fluorinel Dissolution Process Facility within Building 666 at INEEL. INEEL's reprocessing facility is next door to a wet storage unit for Navy spent fuel, which contains a greater than average amount of highly enriched uranium. It was reprocessed from 1953 to 1989 at INEEL for the weapons program. Use of this facility to carry out plutonium-238 extraction, especially considering the dubious need for this isotope, at the very least raises the concern that DOE is not fully committed to ending reprocessing. The international community cannot be expected to trust DOE's civilian_mission claim when an agency devoutly committed to development of weapons uses a nuclear weapons technology at a weapons facility.

**1640-5
(Cont'd)**

Considering all these factors that could adversely affect our environment and commitment to nonproliferation, I strongly urge you to select alternative 5 in the current PEIS. This alternative would allow the Advanced Test Reactor at INEEL to continue producing medical and industrial isotopes for the commercial sector and would not lead to the production of anymore highly radioactive liquid waste at Hanford or INEEL. The main mission at these two facilities has been and should continue to be cleanup of the mess left over from previous nuclear weapons work. Additional waste production would interfere with this already difficult and expensive work. Alternative 5 also calls for the decommissioning of the FFTF reactor at Hanford. FFTF is an aging breeder reactor whose use would be inconsistent with United States policy to discourage use of this technology due to the capability this class of reactors has to produce more plutonium than is consumed. Thank you for the opportunity to comment on this plan.

1640-6

Sincerely,

Maurice E. Horn

Phone: 406_586_0886 Email: <mhornrentalres@mcn.net>

Response to Commentor No. 1640

plutonium-238 from irradiated targets would not undermine nonproliferation goals. In this report, DOE recognizes that proliferation concerns might be raised related to one of the technical assessment factors, "reduction in attractiveness of material forms," due to the fact that, in the extraction of plutonium-238, the remaining unconverted neptunium, a weapons-useable fissile material used as target material for conversion into plutonium-238, must also be recovered (not produced), purified, and recycled. This is unavoidable (unless the United States elects to neither produce or purchase plutonium-238), and it impacts all PEIS alternatives and options, including the No Action Alternative and Alternative 5: permanently deactivate FFTF with no new missions at U.S. facilities. However, while the fact that concerns might be raised is a valuable input to the record of decision process, it does not constitute an inconsistency with or departure from nonproliferation policy, and plutonium-238 is needed to fulfill our missions. Further, in the event that plutonium-238 production is resumed in the United States, the total separated stocks of neptunium would be reduced over time in an irreversible manner since there is a moratorium on U.S. spent fuel reprocessing. This overall reduction in a weapons useable material would mitigate the potential concerns related to material attractiveness, and offer an additional method to pursue U.S. nonproliferation goals. DOE's proposed approach in this mission, and its rigorous nonproliferation impact assessment, demonstrate its commitment to nonproliferation policy, domestically and in the international community.

The juxtaposition of Fluorinel Dissolution Process Facility (FDPF) in INEEL Building 666 to wet storage of highly enriched uranium Navy spent nuclear fuel, and its previous mission of reprocessing spent nuclear fuel, were rigorously and objectively evaluated in the Nuclear Infrastructure Nonproliferation Impact Assessment published in September 2000. In no uncertain terms, this report discusses the proliferation concerns raised in the areas of facilitating cost-effective international monitoring and supporting negotiation of a verifiable Fissile Material Cutoff Treaty (FMCT), and outlines what is needed to mitigate these concerns. This is a valuable input to the record of decision process.

Most of the concerns and uncertainties surrounding the use of FDPF are associated with its history as a defense programs facility and the resulting lack of transparency that could be afforded in the event that international monitoring becomes desirable under an FMCT. This is a different set of concerns than those expressed in the comment. The fact is, that since it is

Commentor No. 1640: Maurice Horn (Cont'd)

Response to Commentor No. 1640

well known that FDPF has a long history of Navy defense missions, and since the described mission (plutonium-238 extraction) in the PEIS does not involve the production of special fissile material, sufficient transparency could possibly be provided by a managed access regime that would meet the requirements of FMCT verification. If this could be done, the aforementioned concerns would be mitigated.

- 1640-6:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF. It should be noted that medical isotopes would continue to be produced at ATR regardless of which alternative is selected in the Record of Decision. The FFTF would produce spent nuclear fuel and low-level radioactive waste, and as discussed throughout Section 4.3 of Volume 1, none of the proposed alternatives would add waste to the high-level waste tanks at Hanford or INEEL. Also, it should be pointed out that while FFTF supported the breeder reactor program, it is not itself a breeder reactor, but rather a fast flux research reactor.

Management of waste that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1 that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Sections 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

With respect to cleanup of waste at Hanford or INEEL, the proposed action and the existing cleanup missions are independent programs and actions related to one will not impact the other. While the cleanup activities at both Hanford and INEEL are a high priority to DOE, it should be noted that the cleanup of legacy waste is beyond the scope of the NI PEIS.

|| 1641-1

Response to Commentor No. 1641

1641-1: DOE notes the commentor's concerns regarding the migration of contaminants to the Columbia River. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE and are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

All environmental parameters (e.g., air, soil, surface water, groundwater, vegetation, animals, etc.) in and around the Hanford Site are monitored on a set frequency. The information is available to the public in annual monitoring reports. No food or water restrictions are currently in place outside the Hanford Reservation as a result of Hanford activities.

The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Ms.Brown...I am opposed to the doe proposal to produce plutonium at the INEEL site in Idaho. I am infavor of the alternative which would end the production program entirely at the site. I think that is alternative # 5. As you are aware the INEEI is a listed superfund site. There are presently four plumes of contaminated ground water, improperly stored liquid and solid waste, leaking pools of contaminated liquid and many more known and unknown polluting sources at the site. The DOE and the EPA should focus all efforts into cleaning up the site and eliminating further contamination of the aquifer or the site. To allow further activities which will produce more waste before cleanup of the site is irresponsible. The contamination of the aquifer cannot be cleaned up..the damage will be irreparable. Please act responsibly!!!

Max Eiden

1642-1

1642-2

Response to Commentor No. 1642

- 1642-1:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Options 1, 2, 3, 5, 7, 8, and 9 of Alternatives 2, Use Only Existing Operational Facilities, which would involve the production of plutonium-238 at INEEL.
- 1642-2:** The commentor's position regarding cleanup and additional activities at INEEL are noted. Section 3.3.11.1 of Volume 1 discusses the superfund status of INEEL. Implementation of the nuclear infrastructure alternatives at INEEL would not alter DOE's goal to complete remediation of contaminated sites in time to achieve de-listing from the National Priorities List by 2019. DOE's use of and impact on the Snake River Plain aquifer are discussed in Section 3.3.4.2.1.

DoE PLANS FOR EXPANDED PRODUCTION OF PLU_238 FOR FUTURE SPACE MISSIONS

Dear Colette E. Brown,

People in the UK are very concerned that the US seems to be increasing the amount of PU238 in the world. It is not in the interests of the world's people, only of a few scientists, and should therefore not be allowed to go ahead.

Please confirm that you will not be risking our lives, those of the rest of this world's creatures, and of our future generations. You have no right to do this, other than through the abuse of the power given to you by your transient position as the most powerful nation on earth.

This power is yours largely because of your image in the world as the home of freedom and promise, but should people's impression change to seeing you as a threat to their existence, or the well_being of their children, you will not be able to maintain your superiority.

Thanks

Andy Savage.

1647-1

Response to Commentor No. 1647

1647-1: DOE notes the commentor's opposition to enhancing its existing nuclear facility infrastructure to support production of plutonium-238 for use in future NASA space exploration missions.

**Commentor No. 1648: John A. Kitzhaber, Governor,
State of Oregon**

JOHN A. KITZHABER, M.D.
GOVERNOR

August 29, 2000

The Honorable Bill Richardson
Secretary of Energy
Forrestal Building
1000 Independence Avenue SW
Washington D.C. 20585

Dear Secretary Richardson:

The Department of Energy recently issued a draft Environmental Impact Statement that considers restart of Hanford's Fast Flux Test Facility (FFTF) to meet expanded isotope production and nuclear energy research missions. I urge you to reject consideration of the FFTF for these missions and permanently shut down the reactor.

In December 1997, I wrote to Secretary Peña, urging him not to restart the FFTF to produce tritium for the nation's nuclear weapons program. One of my concerns then, as it is now, is that restart of the reactor would complicate the formidable and essential task of cleaning up Hanford's waste. I was pleased when you announced in December 1998 that FFTF would not be restarted to produce tritium.

When I expressed my opposition to use of the FFTF for tritium production, I also indicated I would be willing to consider restart of the reactor to produce medical isotopes if DOE could demonstrate a compelling need for FFTF's use to ensure sufficient supplies of these isotopes. As a physician, I do not want a shortage of isotopes to jeopardize medical research, diagnosis or treatment. If I believed the FFTF were crucial to ensuring a sufficient supply of these isotopes, I would support its restart. However, I am not convinced that is the case.

A subcommittee of DOE's Nuclear Energy Research Advisory Committee says the FFTF would not be an economically viable or dependable source of isotopes for research purposes and that existing reactors in Missouri and Tennessee are better suited for this mission. The draft EIS identifies the same reactor in Tennessee and another in Idaho as having additional capacity available to produce medical isotopes used in diagnosis and treatment. The draft EIS did not consider Canadian sources -- one of America's largest suppliers of isotopes -- where two new reactors are scheduled to go on-line this year solely for the purpose of producing isotopes. It is clear there are sufficient sources available -- without FFTF -- to produce needed medical isotopes.

STATE CAPITOL, SALEM 97310-0370 (503) 378-3111 FAX (503) 378-4863 TTY (503) 378-4859

1648-1

1648-2

1648-3

Response to Commentor No. 1648

- 1648-1:** The commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF With No New Missions, are noted.
- 1648-2:** The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.
- 1648-3:** Section 1.2 of Volume 1 of the Final NI PEIS has been revised to provide additional information on the need to expand domestic medical and plutonium-238 isotope production capabilities. DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual rate of growth of medical isotope use is consistent with the Expert Panel findings.

The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting

**Commentor No. 1648: John A. Kitzhaber, Governor,
State of Oregon (Cont'd)**

The Hon Bill Richardson
August 29, 2000
Page 2

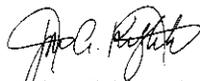

The DOE similarly limited its look at alternatives for producing plutonium 238 for space travel. The draft EIS disregards all international sources and eliminates some domestic alternatives because they would not be able to meet the combined needs of all the proposed missions. Removing these artificial constraints would favor many alternatives better suited than FFTF to meet even the most optimistic projected needs for plutonium 238.

The stated need for advanced nuclear energy research and development – beyond our existing programs – is questionable. New nuclear power plants are not competitive in today's energy market and have little public support. Further, the draft EIS ignores the main obstacle to reinvigorating the U.S. nuclear industry: the lack of institutional capacity to deal with the waste stream.

It is disturbing to me that viable alternatives to the proposed uses for FFTF were disregarded in the draft EIS. The final EIS should be more of an honest assessment of legitimate nuclear-related needs and a comprehensive look at the best methods to meet those needs.

For the past eight years, the consideration of potential new missions for the FFTF has diverted a substantial amount of time and energy from Hanford cleanup and caused a significant drain on DOE's budget. Efforts to justify a new mission for this reactor have all failed. I believe that the FFTF does not have – and will never have – a mission and should be permanently shut down.

Sincerely,

John A. Kitzhaber, M.D.

JAK/NR/sm

**1648-3
(Cont'd)**

1648-4

1648-5

1648-6

Response to Commentor No. 1648

nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other missions.

DOE acknowledges that there are other manufacturers of medical radioisotopes, including the University of Missouri and International Isotopes Incorporated (which has constructed a linear accelerator from assets purchased from the former Superconducting Super Collider Project), and the domestic production capabilities of these facilities have been considered in the development of the NI PEIS. While some existing facilities may possess the capacity to support production of small quantities of research isotopes, NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000, recommends that:

"Plans for acquiring a dedicated radioisotope production reactor should be initiated so that both the cyclotron and reactor radioisotope production facilities will meet the radioisotope needs of the U.S. research community by 2010." The report further states:

"It is important that contingency planning be performed and implemented by Isotope Programs that act to guarantee isotope supplies in the long term. This must include consideration of facility retirement and/or redirection, potentially major changes in the agreements underlying parasitic production, successful consolidation of processing capabilities, and the timing and uncertainties of bringing new, dedicated facilities online." Further, as explained in Section 2.6.1 in Volume 1 of the PEIS, medical isotope production at DOE Facilities in Idaho and Tennessee may be sufficient for short term, but will not be sufficient to meet long term growth projections forecasted by the Expert Panel. Canada supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99). Canada does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. Because of the short half lives of most medical isotopes, purchase from other countries would not be feasible.

***Commentor No. 1648: John A. Kitzhaber, Governor,
State of Oregon (Cont'd)***

Response to Commentor No. 1648

As explained in Section 1.2.2 of Volume 1 of the PEIS, the Russian purchase of plutonium-238 satisfies the near-term responsibility to supply NASA with the necessary fuel for space exploration. However, due to the political and economic climate in Russia and concerns of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. DOE's selection of 5 kg plutonium-238 production per year is based on the uncertainties in the radioisotope power system technology development and requirements for backup units, as well as the variability in the amount needed to meet NASA's power requirements.

1648-4: In January 1997, President Clinton tasked his Committee of Advisors on Science and Technology (PCAST) to evaluate the current national energy research and development portfolio and to provide a strategy that ensures the United States has a program to address the Nation's energy and environmental needs for the next century. In its November 1997 report responding to this request, the PCAST Energy Research and Development Panel determined that restoring a viable nuclear energy option to help meet our future energy needs is important and that a properly focused research and development effort to address the potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) was appropriate. The PCAST panel further recommended that DOE reinvigorate its nuclear energy research and development activities to address these potential barriers. Further information on the need for nuclear energy research and development is provided in Section 1.2.3 of Volume 1.

It is assumed that the commentor is talking about high-level radioactive waste and spent fuel when referring to the lack of institutional capacity to deal with the waste stream from nuclear power plants. The NI PEIS assumes, for the purpose of analysis, that Yucca Mountain, Nevada, would be the final disposal site for DOE's high-level radioactive waste and spent nuclear fuel. DOE has prepared a separate EIS, "Draft Environmental Impact Statement for a Geologic Repository for the Disposal of Spent Nuclear Fuel and High-Level Radioactive Waste at Yucca Mountain, Nye County, Nevada" (DOE/EIS-0250D, July 1999), which analyzes the environmental impacts from construction, operation and monitoring, related transportation, and eventual closure of a potential geological repository.

***Commentor No. 1648: John A. Kitzhaber, Governor,
State of Oregon (Cont'd)***

Response to Commentor No. 1648

1648-5: The NI PEIS evaluates the environmental impacts of a range of reasonable alternatives for enhancing DOE's existing nuclear facility infrastructure to support the proposed action. In addition to restarting the FFTF, the NI PEIS also evaluates alternatives that would either employ the use of other existing facilities or rely on the construction of new facilities. Alternative 2, Options 4 and 5, considers the use of commercial light water reactors (CLWRs) as irradiation facilities for plutonium-238 production.

A number of facilities, including those already producing isotopes, were considered but were dismissed from further consideration (see Section 2.6). Among the reasons that some were dismissed was the fact that they lacked sufficient neutron production capacity, were fully dedicated to existing missions, were not capable of steady-state neutron production, had insufficient power to sustain adequate steady-state neutron production, were unable to produce a constant, reliable source of neutrons due to dependency on operating schedules of their primary missions, are under construction with capacity fully dedicated to other planned missions, or have been permanently shut down.

MICHAEL J. CONTINI, COMMENTS MADE AT THE PEIS SCOPE HEARING.
RESIDENCE: 120 Tree Farm Road, Pasco, WA 99301
Mailing: 302 Torbett PMB 243, Richland, WA 99352

Good evening. I am a resident of Franklin County. I am an electrical engineer employed at FFTF. I would like to thank the Department of Energy for having this meeting in the Tri_Cities. We, the residents of Benton and Franklin Counties, are the most immediate down streamers or down winders from Hanford and the FFTF. I have a daughter and son_in_law who reside in Portland. In 1983, I WAS a cancer patient. It goes with out saying that my family has a lot at stake here. I favor the alternative, which makes use of the FFTF because it can safely supply the most diverse number and quantity of medical isotopes.

The Programmatic EIS needs include the following:

- 1) A complete and categorical lifetime exclusion of any future mission for FFTF involving the production of any WEAPONS MATERIALS such as Plutonium or Tritium. If the DOD wants them, they can go somewhere else.

1652-1

1652-2

Response to Commentor No. 1652

- 1652-1:** DOE notes the commentor's support for Alternative 1, Restart FFTF.
- 1652-2:** DOE notes the commentor's objections to restarting FFTF if it were going to be used for the production of nuclear weapons materials. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

No component of the proposed action is for the purpose of supporting any defense or weapons-related mission. While no defense missions are planned for the FFTF, DOE cannot categorically exclude the possibility of the facility supporting a currently unforeseen future defense need. However, any such support would only occur at the direction of the Secretary of Energy, and would require the preparation of additional NEPA assessment.

Commentor No. 1652: Michael J. Contini (Cont'd)

2) For all alternatives, a section must be included which identifies the plans and activities, which will be put in place to minimize isotope production waste and reactor core waste, therefore minimizing the impact to the environment. A commitment must be made, if the particular alternative is chosen, to include the detailed plans and programs in the authorization basis. For the alternative including FFTF, I suggest that a criterion for authorization must be the creation of a Waste Board. The charter of this board would be to research and supervise the implementation of methods to minimize final quantities of waste to be stored. These would include process improvements, recycling, and finding external uses for the waste products.

1652-3

3) All alternatives must include the impact on the local electrical distribution system. The PEIS must answer the question: Is the infrastructure in place that could supply the necessary electrical power or would it have to be constructed. A further useful comparison would consider the amount of electrical energy required for operation of each facility at full capacity.

1652-4

4) The PEIS does not appear to consider the potential for Actinide or Waste Transmutation for each of the alternatives. How much long_lived waste can be converted to short_lived waste?

1652-5

The Final PEIS must include and address the concerns of all. Those that I have heard can be lumped into the categories of Safety, Waste, and Need. The DOE must not just dismiss any recommendations made by any individual or group.

1652-6

Humans are part of the environment. Therefore, it is right and just to consider the impacts of medical isotope supply limitations to the humans with cancer. Some contend this is a regional issue. WRONG, cancer is a national and international issue, with the availability of treatments being a supply and demand issue. Remember, in a limited supply environment, those who can pay for the travel and the treatment (foreign dictators, social elite, political

Response to Commentor No. 1652

1652-3: DOE notes the commentor's suggestion for a "Waste Board." The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

1652-4: Under both "No Action" and Alternative 5, "Permanently Deactivate FFTF," additional electrical power would not be required or would be very small. Under Alternative 2, "Use Only Existing Operational Facilities," the bounding additional electricity needs at Oak Ridge, INEEL and Hanford are presented in Tables 4-163, 4-167, and 4-171 of the NI PEIS. At ORR and INEEL, the additional electrical consumption would be negligible. At Hanford, the additional electrical consumption would be 55,000 megawatt-hours per year, which represents only 2.2 percent of the total site's electrical capacity. Because of the relatively small electricity needs, a breakdown of need by facility is not warranted.

Under Alternative 3, "Construct New Accelerator(s)," the additional electrical consumption would be approximately 250,000 megawatt-hours per year and under Alternative 4, "Construct New Research Reactor" the additional electrical consumption would be approximately 25,000 megawatt-hours per year. For the accelerator alternative DOE acknowledges that a significant load would be added to the local electrical grid. In the event the Record of Decision selects the accelerator alternative for implementation, subsequent NEPA documentation would assess grid stability and other electrical load assessment criteria in the evaluation of alternative site locations. Included, as necessary, would be detailed electricity needs for each facility. Although implementation of the reactor alternative would require a much smaller amount of additional electricity, similar NEPA documentation would assess electrical grid capabilities for the various alternative sites.

1652-5: Transmutation of transuranic waste and spent nuclear fuel is hypothetically possible, but the technology for accomplishing such transmutation is unproven. If transmutation should be demonstrated as a

Commentor No. 1652: Michael J. Contini (Cont'd)

elite, Hollywood elite, the rich) get the treatments. The rest of us will be left with surgery, chemotherapy and beam radiation treatments, and the well-known consequences of them. Thank you.

08/30/00 Revised Comments at Seattle and Tri Cities

Thank you for this opportunity. My name is Michael Contini. I am a resident of the Tri_Cities area, specifically, Franklin County. I am speaking tonight as a private citizen. I support alternative one, restart of the FFTF for the production of Medical and Commercial Isotopes, Pu 238, and for nuclear research. However, I want a statement in the PEIS that provides a categorical exclusion of using FFTF at anytime for the production of nuclear weapons materials of any kind. It is also my opinion that deferring the EIS for the new reactor or new accelerators is irresponsible. You can define the impacts of the facilities to any environment with the proviso that the specific details would be covered in a subsequent site specific EIS.

I want to now turn my attention to accountability. There is a sign here concerning "2 FFTF employees fired for falsifying work done." I am familiar with this event since I work at FFTF. This event happened and the employees paid the price, they were fired. They were held accountable.

Can we say this about Heart of America NW (HOANW), the Government Accountability Project (GAP), and Columbia River United (CRU)? What accountability exists for them? They can distort, misquote, and take out of context items of great concern. Again, what accountability exists for the watchdogs of Hanford? "Who will watch the watchman" is a quote I have often heard. (Julius Ceaser ??) The above methods used by these organizations to foster public support both verbal and financial are RADICAL and EXTREME.

I now refer to the publication The Environmentalist's Little Green Book. If you want to refer to it, it is available at

1652-1

1652-2

1652-7

1652-8

Response to Commentor No. 1652

viable waste or spent nuclear fuel treatment technology in the future, it could be applied to transuranic waste and spent nuclear fuel generated under the nuclear infrastructure alternatives described in Section 2.5 of Volume 1. Transmutation of nuclear waste and spent nuclear fuel is one example of the type of civilian research that could be conducted with accelerators or nuclear reactors under the mission described in Section 1.2.3 of Volume 1.

- 1652-6: DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and to providing ample opportunity for public comment on those actions. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the environmental impact analysis of DOE's proposed alternatives for meeting mission requirements. In preparing the Final NI PEIS, DOE carefully considered comments received from the public. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.
- 1652-7: DOE notes the commentor's views and concerns regarding the need to prepare subsequent NEPA documentation should either Alternative 3 Construct New Accelerator[s] or Alternative 4 (Construct New Research Reactor) be selected. As a programmatic document, this NI PEIS has a rather broad scope associated with the selection of facilities and site locations for accomplishing expanded civilian nuclear energy research and development and the identified isotope production missions. The CEQ regulations for implementing NEPA (40 CFR 1502.20) encourage agencies to 'tier' their NEPA documentation down from those having a program- or policy-level focus to subsequent and more-detailed documents as a means of eliminating repetitiveness and to provide for a level of analysis appropriate to each level of decisionmaking. This is the approach being employed by DOE herein as a detailed, site-specific analysis of environmental impacts of the accelerator(s) and research reactor options is not necessary at this stage of DOE's decisionmaking process for expanding civilian nuclear infrastructure.
- 1652-8: DOE notes the commentor's views and observations.

Commentor No. 1652: Michael J. Contini (Cont'd)

www.uschamber.com from the US Chamber of Commerce. I quote some of the heroes of the environmental movement.

"We in the Green movement aspire to a cultural model in which the killing of a forest will be considered more contemptible and more criminal than the sale of 6_year_old children to Asian brothels."
Carl Amery, Green Party of West Germany

"To feed a starving child is to exacerbate the world population problem." Lamont Cole, former Yale University professor

"...The only hope for the world is to make sure there is not another United States. We can't let other countries have the same number of cars, the amount of industrialization, we have in the U.S. We have to stop these Third World countries right where they are."
Michael Oppenheimer, senior scientist for the Environmental Defense Fund

"Complex technology of any sort is an assault on human dignity. It would be little short of disastrous for us to discover the source of clean, cheap, abundant energy, because of what we might do with it."
Amory Lovins, Rocky Mountain Institute

"Let's face it. We don't want safe nuclear power plants. We want NO nuclear power plants."
A spokesperson for the Government Accountability Project, The American Spectator, Vol. 18, No. 11, November '85

"Giving society cheap, abundant energy would be the equivalent of giving an idiot child a machine gun."
Dr. Paul Ehrlich, Stanford professor of biology

"The right to have children should be a marketable commodity, bought and traded by individuals but absolutely limited by the state."
Kenneth Boulding, originator of the "Spaceship Earth" concept

"I do not believe that a human being has a right to life...I would rather have medical experiments done on our children than on animals."
PETA (People for the Ethical Treatment of Animals)

Response to Commentor No. 1652

Commentor No. 1652: Michael J. Contini (Cont'd)

"We are not interested in the utility of a particular species, of a free flowing river or ecosystem to mankind. They have intrinsic value, more value _ to me _ than another human being or a billion of them."
David Graber, Biologist with the U.S. National Park Service

"Human beings, as a species, have no more value than slugs."
John Davis, Editor of Earth First! Journal

"The world has cancer, and the cancer is man."
Alan Gregg, former longtime official of the Rockefeller Foundation

These views would be considered RADICAL and EXTREME by most people, who support environmental cleanup and responsibility. Are these the views of HOANW, the GAP and CRU? The methods they use (distortion, misquoting, taking out of context, propagation of unfounded fear) would point to a RADICAL and EXTREME agenda. Will these activists be held accountable for the results and intended consequences of their activities? Who will hold them accountable? Will cancer patients? Will the Department of Energy? Will the Washington State Department of Ecology? Will the residents of Washington and Oregon?

Finally, I am concerned with the environment. I want Hanford cleaned up as safe as possible. However, the small quantity of waste (in comparison to the huge quantities already there) which FFTF will produce (and NOT introduce into the existing mess) for the missions of the PEIS is a small price to pay for the benefits gained. Further, I want the Willamette River cleaned up, thus helping to keep the Columbia River clean. (Refer to the AP article, TriCity Herald August 22, 00) I want the true cause of the high rate of cancer in Hood River County Oregon determined and the causing factors eliminated or at least minimized. I want Puget Sound and Elliot Bay cleaned up. However, I do not support the RADICAL and EXTREME views quoted above, nor the RADICAL, EXTREME and DECEITFUL methods used by HOANW, the GAP, and CRU, all of which lead me to question their agenda and their integrity. Thank you.

Commentor No. 1653: David Kipping (Cont'd)

Comment on the Infrastructure EIS
by David Kipping

I have studied the draft EIS Summary (July 2000) and the Cost Summary (August 2000) in considerable detail. I have not looked at the supplementary and backup material that accompanies the EIS. This statement represents my personal opinions and not that of any organizations with which I am affiliated.

This public comment highlights the points that I consider the most critical. There are many other items of lesser importance that should be mentioned, but I do not have the time to research and document them fully. My conclusion is that this draft EIS is severely flawed and should be rewritten and re_issued as a second draft EIS.

1) The overall purpose of this EIS is very unclear. Is the overall goal to enhance nuclear infrastructure as a fundamentally good thing, or to meet specific production requirements (Pu_238, isotopes, etc.)?

The EIS specifically rejected Canada as a source of isotopes (S_19) because it did not build up infrastructure and, for the same reason, was negative about Russia as a source of Pu_238 (S_6). In other words, the goal seems to be to build up infrastructure, no matter what the cost or need.

On the other hand, allowing Russia to provide Pu_238 (in one of the alternatives) implies that meeting national requirements for critical items is the goal of the EIS. If so, meeting those needs should be done at the minimum cost, even if it means relying on foreign sources. Both Canada and Russia have proven to be reliable sources for over 10 years.

2) This EIS does not adequately substantiate the need for infrastructure expansion.

1653-1

1653-2

Response to Commentor No. 1653

1653-1: DOE notes the commentor's views. Consistent with its mandates under the Atomic Energy Act, DOE is proposing to enhance its nuclear facility infrastructure for the purposes of addressing three primary needs:

1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;

2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and

3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio.

The NI PEIS acknowledges that the United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. As discussed in Section 1.2.1, DOE's intent is to complement commercial sector capabilities to ensure that a reliable supply of isotopes is available in the U.S. to meet future demand, and to encourage the commercial sector to privatize the production of isotopes that have established applications to a level that would support commercial ventures. The NI PEIS also considers the possible purchase of plutonium-238 within the terms of the current contract with Russia to support U.S. needs. To address long-term plutonium-238 needs, a production goal of 2 to 5 kilograms (4.4 to 11 pounds) per year has been analyzed.

1653-2: DOE notes the commentor's views. The NI PEIS evaluates the environmental impacts of a range of reasonable alternatives for enhancing DOE's existing nuclear facility infrastructure to support production of isotopes for medical, research, and industrial uses, production of plutonium-238 for use in future NASA space exploration missions, and U.S. nuclear research and development needs for civilian application.

Commentor No. 1653: David Kipping (Cont'd)

There appear to be four separate objectives that form the basis of DOE's assertion that infrastructure must be expanded:

1. To ensure a supply of medical isotopes to support medical needs,
2. To ensure a supply of isotopes to support various research and development initiatives,
3. To ensure an adequate supply of Pu_238 to support NASA's needs, and
4. To expand the civilian nuclear research capacity and infrastructure.

However, this document does not adequately substantiate the purpose and need for taking action within each of those four objectives. Explanations of current and existing capability and capacity leave the reader with the impression that some or all of the objectives could be achieved through continued operation of existing facilities. For example, it appears that R&D isotope production could be met through continued operation of ATR, HFIR, and commercial reactors, that continued purchases of medical isotopes from Canadian sources would fulfill needs for medical isotopes, and that the U.S. could continue to purchase Pu_238 from the Russians. Because those actions would fall within the intended mission of existing facilities, I am left wondering why NEPA documentation is required.

3) This document presents some alternatives, but not others.

The document presents a mind_boggling array of alternatives with at least 26 permutations of alternatives. The approach seems to be to select parts of several alternatives when the final decision is made (S_11), hence none of the alternatives are necessarily what the final decision will represent.

Unfortunately, it is unclear how these alternatives address DOE's four basic objectives under its purpose and need for action. It

**1653-2
(Cont'd)**

1653-3

Response to Commentor No. 1653

DOE is proposing to enhance its nuclear facility infrastructure because existing sources that provide these capabilities are not expected to reliably meet the projected long-term U.S. needs for expanded nuclear materials production and testing or research and development. Each of the alternatives in the NI PEIS would contribute to fulfilling some of the DOE missions. While HFIR, ATR, and commercial reactors are considered for production of plutonium-238, it is unlikely that reliable, increased production of medical, industrial, and research isotopes to support projected needs could be accomplished at these facilities without disturbing their existing missions. Section 1.2 of Volume 1 has been revised to clarify the purpose and need of the proposed action.

1653-3: Section 2.7.1.2.3 of Volume 1 of the Draft NI PEIS presents a comparison of mission effectiveness among alternatives. This section has been revised in the Final NI PEIS (see Section 2.7.3, Comparison of Mission Effectiveness Among Alternatives) to provide the reader a better understanding of the medical isotopes that can be produced using accelerator technology (Alternative 3) and reactor technology alternatives (Alternatives 1 and 4).

1653-4: The alternatives proposed by the commentor each involve the use of foreign sources of either plutonium-238 or medical isotopes. While the acquisition of plutonium-238 is a possibility under the No Action Alternative, it is the intent of the NI PEIS to analyze the impacts of accomplishing expanded civilian nuclear energy research and development and isotope production missions in the United States. This is consistent with the Nuclear Energy Research Advisory Committee report that found that "There is an urgent sense that the nation must rapidly restore an adequate investment in basic and applied research in nuclear energy if it is to sustain a viable United States capability in the 21st Century."

As noted above, DOE could purchase plutonium-238 from Russia to satisfy its near-term responsibility to supply NASA with the necessary fuel to support future space exploration missions. However, as discussed in Section 1.3.3 of the NI PEIS, the long-term viability of the U.S. maintaining its plutonium-238 inventory through continued purchase of this material beyond the existing contract terms is uncertain.

The United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. See the response to 1653-1, above.

Commentor No. 1653: David Kipping (Cont'd)

appears that some of the alternatives only address a portion of the four objectives. I understand that the "no action" alternative inadequately addresses the four objectives, but I question why other alternatives were considered if they do not meet all four of the objectives. The EIS should more clearly demonstrate how each alternative considered would address the four objectives or offer an explanation as to which of the four objectives would be achieved by each of the alternatives, and which would not.

**1653-3
(Cont'd)**

In addition, it is not clear why the alternatives described were considered and other apparently viable alternatives were not. For example, it seems that one reasonable alternative would be to use HFIR and ATR to produce medical and R&D isotopes and to continue current reliance on Russian sources for PU_238. Another possibility would be to use HFIR and ATR to produce PU_238 and R&D isotopes and to rely on Canadian sources for medical isotopes; this alternative was not evaluated. A third option is to rely on the Russians for Pu_238 and to use HFIR and ATR to do R&D isotopes and rely on Canadians for medical isotopes; this approach was not evaluated either. ATR & HFIR are fully operational; why not use them for production of isotopes? The EIS does not provide clear explanations for why some alternatives were considered and others were not.

1653-4

4) It is unclear whether there is a real need for production of Pu_238

It is not clear whether any Pu_238 will be required in the future. NASA wrote a letter to DOE, dated 22 May 2000, regarding production of Thermoelectric Generators (powered by Pu_238). The letter is a modification to a Memorandum of Understanding from 1991. The key part of the NASA letter is:

1653-5

"As a result of the proposed DSS program changes, NASA Headquarters no longer has an identifiable planned requirement for Small Radioisotope Thermoelectric Generator (SRTG) power

Response to Commentor No. 1653

It should be noted that the first alternative proposed by the commentor is essentially the No Action Alternative (i.e., purchase plutonium-238 from Russia and continue medical and industrial isotope production and nuclear research and development activities at the current operating levels of existing facilities). Other alternatives, in addition to proposing the use of foreign sources of both plutonium-238 and research isotopes, suggest using HFIR and ATR to support research isotope production. However, while these reactors may possess the potential capability or capacity to support research isotope production, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without disturbing the existing missions of these facilities.

1653-5: Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Under the No Action Alternative, DOE would continue to purchase plutonium-238 to meet the space mission needs for the 35-year evaluation period considered in the NI PEIS. However, DOE recognizes that any purchase beyond what is currently available to the United States through the existing contract would likely require negotiation of a new contract and may require additional NEPA review.

The May 22, 2000, correspondence from NASA to DOE identifies that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, SRTG development efforts were stopped in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires one-third less

Commentor No. 1653: David Kipping (Cont'd)

systems. Therefore NASA Headquarters requests that all SRTG development efforts for DSS spacecraft missions be halted. In addition, investigation into the utilization of the ES and Multi_Hundred Watt systems for DSS applications should be stopped."

This letter implies that there is no future need for Pu_238 by NASA beyond current missions for which they already have Pu_238 power supplies. This view is shared by 15 elected officials who publicly stated their opposition to startup of the FFTF. All 15 elected officials may be wrong, but this is a key point.

Public concern for the possibility of re_entry into the atmosphere of a Pu_238 power supply is providing impetus to develop alternative power supplies. The numbers in the EIS for Pu_238 needs appear to be based on historical trends, and not on what NASA really needs. It is essential that the EIS provide incontrovertible proof that, in fact, NASA has a need for Pu_238 for the next 35 years.

5) The need for new infrastructure for production of isotopes has not been demonstrated.

The only justification for new infrastructure is a vague "need" of 7 to 14% a year stated by an unnamed panel convened by DOE (S_3). There does not appear to be any independent assessment by the medical or research community. In order remedy this inadequate explanation of need, the EIS must: include a full explanation of all current and viable sources of each desired medical isotope and R&D isotope. Include clear estimates of the projected demand for and projected shortfall of each isotope over a specified timeframe. Projections should be based on clearly stated assumptions. Demonstrate how each estimate of projected demands, shortfalls, and timeframes has been independently verified. Provide a clear justification for expansion of civilian isotope production capacity and infrastructure and demonstrate how that need has been verified.

**1653-5
(Cont'd)**

1653-6

Response to Commentor No. 1653

plutonium-238 as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000, letter to DOE that large RTGs be maintained as backup. Section 1.2.2 of Volume 1 was revised to clarify plutonium-238 mission needs.

For analysis purposes, the NI PEIS evaluates impacts from facility construction, modification, startup, and 35 years of operation, followed by decommissioning when applicable. The 35-year operating period is based upon the estimated length of time existing DOE irradiation facilities would continue operating if used for accommodating the stated missions. Although future space mission schedules over a long-term planning horizon of 20 to 35 years cannot be specified at this time, DOE anticipates that NASA space exploration missions conducted during this period will continue to require plutonium-238-fueled power systems.

Potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed production of plutonium-238 are relatively low and are discussed in detail in Chapter 4 and appendixes H, I, and J in the Final NI PEIS. Potential health and safety impacts associated with future launches of spacecraft utilizing plutonium-238 are not within the scope of the NI PEIS analysis, but would be addressed in the specific NEPA documentation prepared by NASA in support of such missions.

1653-6: DOE notes the commentor's views. DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was

Commentor No. 1653: David Kipping (Cont'd)

6) There is no real justification for new or improved facilities for nuclear research. The EIS does not discuss current deficiencies in research facilities and does not project future requirements. The document conflates production needs (Pu_238, isotopes) with more generalized research needs. See Point 1 above.

1653-7

7) Why were not the Office of Science and Technology's needs factored in? The title of the document implies that it covers all possible future needs, yet it states that it does not address any Office of Science and Technology needs (S_1). It makes no sense to exclude OST's needs. The National Environmental Policy Act requires consideration and public disclosure of the full impacts of all related actions during decision making. DOE should make every effort to consider all impacts of related decisions to ensure full compliance with NEPA and to avoid vulnerability to being challenged for segmentation of decision_making.

1653-8

8) The need for new infrastructure for production of Pu_238 has not been demonstrated.

Given that there is a need for Pu_238, the Russians are a reliable and cost_effective source. They have been providing Pu_238 for about 10 years on very favorable cost and delivery terms. Although, it was not mentioned in the EIS, there is no doubt that the Russian Pu_238 will be much less expensive than the costs of restarting and operating irradiation and reprocessing facilities in the US. As mentioned in Point 1 (above), utilizing Russian supplies seems to be discounted.

1653-9

Finally, one of the alternatives for production of Pu_238 (actually Np_237) is to use commercial reactors rather than building or restarting DOE facilities. Reprocessing would still have to be done by DOE to recover the Pu_238.

One of the main arguments for restarting the FFTF is for production of Pu_238. With two other possible sources, both of which are likely to be less expensive, restart of FFTF does not seem like

Response to Commentor No. 1653

revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

For the purposes of analyses in the NI PEIS, a representative set of isotopes was selected on the basis of the recommendations of the Expert Panel, medical market forecasts, reviews of medical literature, and more than 100 types of ongoing clinical trials that use radioisotopes for the treatment of cancer and other diseases. These isotopes, which are comprised of both reactor- and accelerator-produced isotopes, are listed in Chapter 1 of the NI PEIS along with a brief description of their medical and/or industrial applications. These include research isotopes with currently limited availability, such as copper-67, as well as commercial isotopes whose current application is inhibited by lack of availability or high cost, such as palladium-103. However, the absence of any specific isotope from these tables should not be interpreted to mean that it could not be considered for production under the proposed action. DOE expects that the actual isotopes and specific amounts produced as a result of the proposed action would vary from year to year in response to the focus of clinical research and the specific market needs occurring at that time.

1653-7: DOE notes the commentor's views. Clean, safe, reliable nuclear power has a role today and in the future for our national energy security. In recognition of this need, nuclear energy research and development programs have been initiated to address potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) and to ensure that current nuclear power plants can continue to deliver adequate and affordable energy supplies. Because it is unlikely that existing facilities could fully and effectively support these nuclear energy research and development initiatives without disturbing their existing missions, DOE is proposing to enhance its nuclear facility infrastructure to also support these activities. Information on the need for nuclear energy research and development is provided in Section 1.2.3 of Volume 1.

1653-8: The PEIS does not contemplate actions to meet the needs of all future missions of DOE, including those assigned to the Office of Science, which has its own particular set of needs to carry out its important missions. This programmatic EIS will not preclude the Office of Science from making decisions regarding its future activities.

Commentor No. 1653: David Kipping (Cont'd)

a reasonable alternative. Another argument for restarting the FFTF is to produce isotopes, since the current operational facilities (ATF and HFIR) will be very busy producing Pu_238. However, if DOE does not need to produce Pu_238 in any of its facilities, then there is enough capacity in existing operational facilities to produce isotopes. Hence, there is no viable mission for FFTF and it should be shut down (Alternative 5).

9) The need for new infrastructure for production of isotopes has not been demonstrated.

Even if there is a need for increased amounts of medical and research isotopes, this document does not present an adequate rationale for developing additional infrastructure. It appears that commercial facilities (existing or projected), Canadian sources, and existing DOE facilities (ATR and HFIR) can meet these needs.

10) No cost information was included in the EIS.

I realize that NEPA does not require inclusion of cost information, however DOE must have thought it was important. The cost information was eventually published a month after the EIS was issued, and obviously had no effect on the EIS. If cost information is to be taken into account, it should be part of the EIS. As a minimum, the comment period should have been extended to allow careful consideration of the cost information supplement.

The cost information states that all of the alternatives except Alternative 5 and "no action" would deactivate the FFTF (the main EIS summary is unclear on this point). The cost estimates for Alternatives 2, 3, 4, and 5 include \$281 million for deactivation of the FFTF. By comparison, restart of the FFTF (Alternative 1) appears to only require \$341 million, thus making restart look more favorable as it is only \$60 million more than deactivation. If deactivation of FFTF at the end of its life is included the comparable cost becomes \$595 million, thus making restart a

**1653-9
(Cont'd)**

1653-2

1653-10

1653-11

Response to Commentor No. 1653

1653-9: DOE notes the commentor's opposition to restarting FFTF for expanding its nuclear facility infrastructure. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost.

The potential production of plutonium-238 using ATR, HFIR, or a commercial reactor was evaluated in the NI PEIS because it would be compatible with the operating requirements of these facilities' existing missions. However, different irradiation requirements are associated with the production of medical, industrial, and research isotopes. While ATR, HFIR, or a commercial reactor may possess the potential capability or capacity to support isotope production, it is unlikely that reliable, increased isotope production to support projected needs could be accomplished without disturbing the existing missions of these facilities.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

1653-10: DOE agrees with the commentor's statement that NEPA does not require the cost of alternatives to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary

Commentor No. 1653: David Kipping (Cont'd)

much more expensive alternative. DOE should make sure that the two sets of analyses are consistent so the public can make meaningful comparisons based on consideration of both environmental impacts and costs.

I found Figure S_1 on page S_4, very helpful. It allows the reader to understand the very complex decision process. It should be included in the EIS. Similarly Tables S_2 and S_3, summarizing costs should be included in the EIS.

11) No non_proliferation impact information was included in the EIS.

There are two aspects of this EIS that affect the US position on non_proliferation. If the FFTF is restarted, the preferred fuel is highly enriched uranium (HEU) and mixed (plutonium) oxide fuel (MOX). It is against US policy to use HEU (S_13) and the use of MOX fuel is still being debated. I am concerned that the use of HEU as fuel may violate non_proliferation policy and agreements with international governments. If Pu_238 is to be produced, then the Np_237 targets will have to be processed. The technique for doing this is essentially the same as is used for recovering weapons_grade Pu_239 and U_235. In 1992, the Bush administration specifically terminated reprocessing of materials for weapons production. Extracting Pu_238 flies in the face of this national policy.

DOE should provide a clear explanation of how HEU could be used without violation of non_proliferation policy. DOE should consider impacts on non_proliferation policy in the selection of its preferred alternative.

The non_proliferation impact information was eventually published two months after the EIS was issued, and obviously had no effect on the document. Non_proliferation impact information must be taken into account and it must be part of the EIS. As a minimum,

**1653-11
(Cont'd)**

1653-12

1653-13

Response to Commentor No. 1653

document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS.

DOE also notes the commentor's request for extension of the public comment period. The Council on Environmental Quality's (CEQ) "Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act" (40 CFR 1506.10(c)) require that a minimum of 45 days be allowed for public comment on the Draft NI PEIS. As stated in the Notice of Availability (65 FR 46443 et seq.), the public comment period began on July 28, 2000 and continued to September 18, 2000. In preparing the Final PEIS, DOE has assessed and considered both oral and written comments received on the Draft PEIS during the public comment period and has responded to these comments in the Final PEIS. Volume 3 of the NI PEIS contains public comments received on the NI PEIS and DOE responses to those comments. Moreover, late comments were considered to the extent practicable.

1653-11: Deactivation of FFTF is not part of implementing Alternative 1, Restart FFTF. Deactivation of FFTF is part of implementing Alternatives 2, 3, 4, and 5 and including the cost of FFTF deactivation in the implementation costs for these alternatives is appropriate. The Cost Report was structured to identify the implementation costs of the various alternatives so the Secretary of Energy would have this information along with other data for consideration.

DOE has provided a summary of the Cost Report in Appendix P in the Final NI PEIS. The summary includes the figure and tables referenced by the commentor.

1653-12: This commentor addresses two primary areas of concern related to proliferation policy: the use of mixed oxide and highly enriched uranium to fuel the FFTF; and, extraction of plutonium-238 which requires separation of neptunium. Regarding proposed FFTF fuels: the use of mixed oxide or highly enriched uranium to fuel the FFTF has been rigorously evaluated in the Nuclear Infrastructure Nonproliferation

Commentor No. 1653: David Kipping (Cont'd)

the comment period should have been extended to allow careful consideration of the non_proliferation impact information supplement.

12) The EIS does not deal with High_Level Waste.

In the alternatives that involve processing Np_237 targets to extract Pu_238, there is no mention of the generation of High_Level Waste (HLW). It seems quite unlikely that the wastes that will be generated would not include HLW. If HLW will not be produced, there should be an explanation as to how it will be avoided. The semantic argument that HLW is the product of reprocessing and the we are merely processing Np_237 (and producing low level waste) is unacceptable.

Reprocessing of weapons grade material produces a large quantity of liquid radioactive HLW, and the Pu_238 extraction process is essentially the same. It is estimated that approximately 288,000 gallons of HLW would be generated over 35 years if processing is done at INEEL.

If processing of Np_237 is done at INEEL (CPP_651 & CPP_666) there are many problems:

The facility was shut down in 1989 because it could not meet environmental regulations in place at that time. The costs, timelines, and implications of meeting the current environmental regulations must be documented in the EIS. When the facility was permanently shut down as a result of the ban on reprocessing, it was not fully cleaned up and there are still intermediate products in storage and many contaminated areas. The facility must be cleaned up before it could be used again. The costs, timelines, and implications of this necessary cleanup must be documented in the EIS. There is no place to store the HLW that will be produced. The current INEEL tank farm is aging, leaking, and in the process of being closed. The tanks are well beyond their design life and

1653-13
(Cont'd)

1653-14

1653-15

1653-14

Response to Commentor No. 1653

Impact Assessment. This report, published in September, 2000, confirms that the manner in which these fuels would be used, as described in the PEIS, is consistent with nonproliferation policy. In the event that a decision is made to restart FFTF, the first six years of operation would use existing onsite mixed oxide (MOX) fuel. DOE expects that an additional 15-year supply of mixed oxide fuel in Europe, owned by Germany, could be available for FFTF. MOX fuel does not use highly enriched uranium. Further, use of the Hanford MOX fuel would dispose of a significant U.S. stockpile of highly attractive fresh plutonium fuel by conversion to spent fuel through irradiation in FFTF. This represents a safe, low cost, high benefit opportunity to reduce U.S. civilian plutonium without chemical or bulk processing. Use of the German MOX represents a similar advantage with respect to the German stockpile of separated civilian plutonium. During the period of MOX fuel use, in support of U.S. nonproliferation policy directives, DOE's Office of Nonproliferation and National Security would undertake a study under RERTR to consider the technical feasibility of using low enriched uranium to fuel the FFTF. Under this nonproliferation protocol, if use of low enriched uranium fuel is found infeasible in FFTF for meeting assigned missions, policy would allow DOE to subsequently procure highly enriched uranium fuel for use in FFTF. Again, this approach is consistent with U.S. nonproliferation policy. Regarding plutonium-238 extraction: the aqueous processing technology that would be used to separate plutonium consisting of over 80 percent plutonium-238 and neptunium from the irradiated target is similar to the technology that was used in portions of the complex process to extract plutonium-239. However, as discussed in EIS Sections S.3, 2.2.3 and A.1.4, this technology would be used to chemically separate plutonium-238 and neptunium from irradiated targets and not from irradiated or spent nuclear fuel, whereas reprocessing separates weapons-grade plutonium-239 from irradiated nuclear fuel. Plutonium-238 extraction is not reprocessing. Unlike plutonium-239, plutonium-238 is not used in nuclear weapons, but rather it would be used as a power source for NASA space missions.

The Nuclear Infrastructure Nonproliferation Impact Assessment confirms that extracting plutonium-238 from irradiated targets would not create a nonproliferation threat. In this report, DOE recognizes that proliferation concerns might be raised related to one of the technical assessment factors, "reduction in attractiveness of material forms," due to the fact that, in the extraction of plutonium-238, neptunium, a weapons-useable fissile

Commentor No. 1653: David Kipping (Cont'd)

are not suitable for storage of new HLW. In all probability, a new sets of tanks will have to be built for the Pu_238 extraction. The EIS must consider the costs, timelines, and implications of constructing new HLW storage facilities at INEEL. There is no method for treating the new HLW that will be produced. The current INEEL tank farm has been emptied of all reprocessing HLW. That HLW was converted to solid form in the New Calciner. The Calciner has been shut down and is in the process of being closed. The EIS must deal with how the new HLW will be processed and where the solid form will be stored.

I do not have enough knowledge to address the problems if processing is done at other facilities, but I am sure that the problems will be similar, if not more severe.

13) The hidden agenda seems to be restart of the FFTF.

Although no preferred alternative was given, it appears that restarting the FFTF is high on the priority list. Aside from the lack of need for producing Pu_238 and isotopes in this reactor, there are other concerns associated with restart:

- Public acceptance and safety concerns.
- Non_proliferation concerns (see Point 11).
- The high cost of restart (see Point 10).
- Jeopardizing the cleanup effort at Hanford.

I cannot produce details on these concerns, but they must be dealt with in the EIS. I am sure that people in Washington state and near Hanford will produce comments on this topic.

An April 2000 report by the Nuclear Energy Research Advisory Committee, an advisory panel created by the Department of Energy, says that the reactor "will not be a viable source of [medical] research radioisotopes" and that production would not be cost effective. Why was this not mentioned in the EIS?

**1653-14
(Cont'd)**

1653-16

1653-17

Response to Commentor No. 1653

material, must also be recovered, purified, and recycled. This is unavoidable (unless the United States elects to neither produce or purchase plutonium-238), and it impacts all NI PEIS alternatives and options, including the No Action Alternative and Alternative 5: permanently deactivate FFTF with no new missions at U.S. facilities. However, while the fact that concerns might be raised is valuable to the Record of Decision process, it does not constitute an inconsistency with or departure from nonproliferation policy, and plutonium-238 is needed to fulfill our missions. Further, in the event that plutonium-238 production is resumed in the United States, the total separated stocks of neptunium would be reduced over time in an irreversible manner since there is a moratorium on U.S. spent fuel reprocessing. This overall reduction in a weapons-useable material would mitigate the potential concerns related to material attractiveness, and offer an additional method to pursue U.S. nonproliferation goals.

DOE is committed to full compliance with and support of the U.S. policy prohibiting reprocessing.

1653-13: The nuclear nonproliferation impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Nuclear Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document needs only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this documents to more than 730 interested parties on September 8, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Nuclear Nonproliferation Impact Assessment in Appendix Q in the Final NI PEIS.

Also see response 1653-10.

1653-14: The DOE Manual 435.1. Radioactive Waste Management defines high level radioactive waste as the highly radioactive waste material resulting from the reprocessing of spent nuclear fuel, including liquid waste produced directly in reprocessing and any solid material derived from such liquid waste that contains fission products in sufficient concentrations; and other highly radioactive material that is determined,

Commentor No. 1653: David Kipping (Cont'd)

14) This EIS is inadequate in responding to the stated needs.

For all of the reasons given above, I conclude that DOE's analysis is inadequate to support rational decision_making. In addition, the document is too flawed for meaningful public review. I understand there is a great rush to issue a Record of Decision before the current administration leaves office. While there may be some political or even technical advantages to this approach and time schedule, this decision is too important to be rushed without considering of all relevant facts and alternatives. Compliance with NEPA must not be jeopardized.

15) This EIS must be completely re_written to address the current deficiencies.

The EIS should be reissued as a revised draft EIS. DOE should add missing information, develop a solid approach to evaluating and comparing the alternatives, and enhance its analysis to support comparison among the myriad alternatives. This second draft must present all the facts and credible alternatives in a fashion that can be digested and understood by the public. It should substantiate the purpose and need for action, describe all impacts that would result from the comparable alternatives, and evaluate the alternatives using consistent criteria. The public should be afforded an opportunity to review a draft EIS that is not severely flawed in order to participate in a meaningful manner in DOE's decision_making process, as intended under NEPA.

1653-18

1653-19

Response to Commentor No. 1653

consistent with existing law, to require permanent isolation. DOE has prepared an implementation guide to DOE M 435.1 to assist in implementing the requirements contained in that manual. For this particular requirement, the definition of high-level radioactive waste, the guide is intended to facilitate the classification of indefinite waste as to whether or not they are high-level radioactive waste. It is recognized that the definition of high-level radioactive waste is not precise and is essentially a source-based definition that also alludes to concentrations of a given waste stream. Page II-8 of this guide notes that for the purpose of managing high-level waste under DOE M 435.1-1 [sic], spent nuclear fuel includes spent driver elements and/or irradiated target elements that contain transuranium elements. This statement was included in the guide because the concentrations of long-lived isotopes are likely to be somewhat high during reprocessing and it also meets the source-based definition. As a result of reviewing this guide and to address the comments raised, DOE is considering whether the waste from processing of irradiated neptunium-237 targets should be classified as high-level radioactive waste and not transuranic waste. As a result, the Waste Management sections (i.e., Sections 4.3.1.1.13; 4.3.2.1.13; 4.3.3.1.13; and 4.4.3.1.13) of this NI PEIS have been revised to reflect this different classification from what was assumed in the draft NI PEIS. As discussed in these revised sections, irrespective of how the waste is classified (i.e., transuranic or high-level radioactive waste), the composition and characteristics are the same and the waste management (i.e., treatment and onsite storage) for this NI PEIS would be the same. In addition, even if the waste is managed as high-level radioactive waste it would have no impact on the existing high-level radioactive waste management infrastructure (e.g., high-level waste storage tanks), since the high-activity waste from processing of the targets would be initially stored and vitrified within the processing facility (i.e., FMEF, REDC, or FDPF).

1653-15: The commentor's positions regarding the use of Building CPP-651 and the Fluorinel Dissolution Process Facility to support production of plutonium-238 are noted. If facilities at INEEL were selected for production of plutonium-238, the facilities would not be operated until compliant with DOE's health and safety standards. This PEIS evaluates the environmental effects that would result from implementation of all of the six nuclear infrastructure alternatives. Program schedules are described in Volume 1, Section 2.7.2. Environmental impacts that would result from the use of Building CPP-651 and the Fluorinel Dissolution

Response to Commentor No. 1653

Process Facility are discussed in Chapter 4. Costs of startup and facility modifications for the Fluorinel Dissolution Process Facility are included in the Cost Report.

The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS.

1653-16: DOE notes the commentor's concerns regarding Alternative 1, Restart FFTF, including public acceptance, safety, nonproliferation, cost of restart, and Hanford cleanup. The NEPA process provides DOE with an opportunity to fully analyze the potential impacts of its actions on human health and the environment, and all such relevant impacts have been evaluated in compliance with NEPA. Cost and nonproliferation concerns have been addressed above.

DOE policy encourages effective public participation in its decision making process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

Facility safety is of the utmost concern to DOE and is convinced that FFTF is safe to accomplish the stated missions. In the event that FFTF restart is selected in the Record of Decision, complete safety and operational readiness reviews will be performed prior to the restart. The FFTF Safety Analysis Report is routinely reassessed and updated when required to address any changes in plant configuration due to physical modifications or changes in plant operation procedures. The operational readiness review would assess the current updated Safety Analysis

Commentor No. 1653: David Kipping (Cont'd)

Response to Commentor No. 1653

Report to ensure that the analyses bound the reactor operating envelope for the stated missions. The analyses presented in this NI PEIS reflect the proposed changes to the reactor core (including fuel and irradiation targets) to perform the stated missions.

DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

FFTF restart would not impact the schedule or available funding for existing cleanup activities. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

1653-17: The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost-efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these

Commentor No. 1653: David Kipping (Cont'd)

Response to Commentor No. 1653

constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

DOE has taken the Expert Panel and NERAC report recommendations under consideration in developing the range of alternatives evaluated in the NI PEIS. These reports were made available to the public at the NI PEIS public information centers and on the Internet at www.nuclear.gov.

1653-18: DOE disagrees with the commentor's characterization of the NI PEIS as flawed. This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR 1500 through 1508 and 10 CFR 1021), respectively. DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow for a fair comparison among the various alternatives and among the candidate sites for the facilities. This was accomplished through review and analysis of site-specific information on the environmental conditions prevailing at ORR, INEEL, and Hanford to include a comprehensive analysis of the associated environmental and health risks of each alternative.

1653-19: The changes which have been made to the NI PEIS in response to public and agency comments as well as a result of DOE's own internal reviews do not warrant reissuance of the NI PEIS as a revised draft. No fundamental factors relating to purpose and need, the alternatives under consideration, or the associated environmental impact evaluations have changed since the Draft NI PEIS was published. As stated in the responses to the commentor's specific concerns, this NI PEIS presents a substantiated purpose and need for agency action, a range of reasonable alternatives for accomplishing the stated missions, as well as an unbiased and thorough analysis of the associated environmental impacts of each alternative.

The "Draft Programmatic Environmental Impact Statement for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the United States, Including the Role of the Fast Flux Test Facility," DOE/EIS_03100, July 2000 needs to address several issues in more detail as follows:

1. You identify four alternatives and the no action alternative, which address the Department's objectives. It was noted in the public briefing in Richland, Washington that these alternatives are not equal in their capability to satisfy the Department's objectives. Some description of relative capabilities is provided, but it is very limited in nature. Relative production capacity is not addressed. If, for example, two high_energy accelerators are required, rather than one, in order to produce a comparable quantity of isotopes, this needs to be identified in the PEIS and/or cost study.

Recommendation #1: The PEIS should describe the relative capabilities and the relative production capacities of the alternatives to inform not only the decision_makers, but also the public.

2. In the summary you describe a mission to produce isotopes for medical diagnostic and therapeutic purposes. You quote a report from the NERAC Subcommittee for Isotope Research and Production Planning stating that "It is now widely conceded that limited availability of specific radionuclides is a constraint on the progress of research."

1654-1**1654-2****Response to Commentor No. 1654**

1654-1: A comparison of mission effectiveness among alternatives is presented in Volume 1, Section 2.7.1.2.3 of the Draft NI PEIS presents This section has been revised in the Final NI PEIS (see Section 2.7.1.8, "Comparison of Mission Effectiveness Among Alternatives") to provide the reader a better understanding of the medical isotopes that can be produced using accelerator technology (Alternative 3) and reactor technology alternatives (Alternatives 1 and 4). It should be noted that in addition to the No Action alternative, the NI PEIS presents 5 (not 4) alternatives.

1654-2: The purpose of the NI PEIS is to determine the environmental impacts associated with each of the reasonable alternatives identified by DOE. The scope of the PEIS does not include evaluations of potential socioeconomic and public health impacts that would result from a possible shortfall in the supply of isotopes for the research community.

Commentor No. 1654: Douglas A. Gantt (Cont'd)

Recommendation #2: The PEIS must address, in at least qualitative terms, the socioeconomic impacts and the public health impacts of not providing "an adequate supply of isotopes to keep pace with the growing and changing needs of the research community." There is clearly an adverse impact in these areas under the "no action" alternative and under alternatives 2 and 5. This impact is at least national, if not international in scope.

**1654-2
(Cont'd)**

I strongly urge that the DOE move forward to enhance the nuclear research infrastructure and to maintain the U.S. role as a leader in nuclear science. I believe that the FFTF can be safely operated and would provide the greatest flexibility in meeting all mission objectives. Furthermore, the Department would be retaining up to four times the capability described in the current PEIS, in that the FFTF is proposed to only operate at one fourth of its original design power.

1654-3

Response to Commentor No. 1654

1654-3: DOE notes the commentor's support for Alternative 1, Restart FFTF, however, increasing operating power by a factor of four does not increase infrastructure capability by the same factor due to limitations related to core volume.

**Commentor No. 1655: John Commander

Auto forwarded by a Rule

Coalition 21 Comments 09/17/2000

We support all three missions with in the PEIS scope which include:

- * Medical and Industrial Isotope Production
- * Plutonium 238 Production for Space Missions
- * Nuclear Energy Research and Development for Civilian Applications

We support Alternative 2 Option 2 which would provide for the entire scope of work to be accomplished at INEEL.

1655-1

This requires the use of existing infrastructure for the near term, the next ten years.

For the long term, we also support construction of a new Research Reactor. DOE needs to start the planning phase for a new reactor as soon as possible, since the project planning to actual operation will take at least 15 years in todays environment.

1655-2

We agree with the Cost Report for Alternatives which indicates Alternative 2 Option 2 is the most cost effective approach for near term support of the three missions.

1655-1

We disagree with including D&D of FFTF costs as part of this project cost, since that inflates the project cost. D&D costs for FFTF should not be charged to the project, they should be properly charged to the DOE D&D Account.

1655-3

Response to Commentor No. 1655

1655-1: DOE notes the commentor's support for Alternative 2, Use Only Existing Operational Facilities, Option 2, Irradiate at ATR and Process/Store at FDPF/CPP-651.

1655-2: DOE notes the commentor's support for Alternative 4, Construct New Research Reactor.

1655-3: FFTF would be permanently deactivated should a decision be made to select any alternative other than Alternative 1, Restart FFTF. Therefore the Cost Report correctly assigns these costs in the alternative evaluations.

1655-4: CEQ (40 CFR 1500 et seq.) and DOE (10 CFR Part 1021) implementation regulations do not require inclusion of nonproliferation studies in an environmental impact statement. The basic purpose of the NI PEIS is to describe the alternatives under consideration for implementation (Section 2.5 of Volume 1) and the environmental impacts that would occur if these alternatives were implemented (Chapter 4 of Volume 1). Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. The associated nonproliferation report was made available to the public on September 8, 2000. DOE mailed this document to about 730 interested parties, and the report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in public reading rooms.

DOE also notes the commentor's request for extension of the public comment period. The Council on Environmental Quality's (CEQ) "Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act" (40 CFR 1506.10(c)) require that a minimum of 45 days be allowed for public comment on the Draft NI PEIS. As stated in the Notice of Availability (65 FR 46443 et seq.), the public comment period began on July 28, 2000 and continued to September 18, 2000. In

Commentor No. 1655: John Commander (Cont'd)

We received the Nuclear Infrastructure Nonproliferation Impact Assessment too late for review and comment. We therefore request an extension in the comment period to allow for our review of that document.

1655-4

In summary, we wish to express our support for the project; and backing for the short term implementation of the ATR and FDPF/ CPP651 facilities. This fits well with the DOE designation of INEEL as the Lead Laboratory for Nuclear Energy Research and Development.

1655-1

Response to Commentor No. 1655

preparing the Final PEIS, DOE has assessed and considered both oral and written comments received on the Draft PEIS during the public comment period and has responded to these comments in the Final PEIS. Volume 3 of the NI PEIS contains public comments received on the NI PEIS and DOE responses to those comments. Moreover, late comments were considered to the extent practicable.

NACP DOE NI PEIS Statement and NACP Information Request
September 15, 2000

The National Association of Cancer Patients, La Jolla, California, represents over eight million cancer patients in America, one million in California alone. We strongly support the restart of FFTF because it is a unique source of isotopes for the diagnosis and treatment of many kinds of cancer, and in research to discover new, more effective treatments.

The information below is referenced in studies published in medical journals and given at medical conferences, by the National Institutes of Health, the National Cancer Institute, the Centers for Disease Control in Atlanta, Medicare, the Health Care Finance Administration, the American Cancer Society, and by physicians and patients who have written about medical isotope treatments.

Over 1500 cancer patients die daily in this country, equivalent to three fully loaded Boeing 747s crashing to the earth, killing everyone on board. Under age 65, cancer is the leading cause of death. One child is diagnosed with cancer each hour. Nearly one in two males and one in three females will get cancer. "Smart bullet" medical isotope treatments just target cancer cells and are very effective in treating many types of cancers. For example, after other treatments fail, 70% of dying blood cancer patients remain CANCER_FREE five or more years later. Physicians call these results "spectacular." Cancer patient Laura said, "No previous treatment had done

1657-1

Response to Commentor No. 1657

1657-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 1657: National Association of Cancer Patients (Cont'd)

anything to reduce my tumors. What I love about this treatment is that it works, it takes the pain away and there?s no side effects."

The NACP asks the DOE to consider medical isotopes availability a national public health issue and include the following in the NI PEIS. Where will these isotopes be produced? Alpha emitters are best to treat blood and other diffuse cancers. Jacqueline Kennedy Onassis and King Hussein of Jordan had non_Hodgkins lymphoma. An NACP member tried but failed to get isotope information to the King. If treated, he had a better than 90% chance at life and remaining America?s staunch ally in the Middle East. He died of multiple organ failure after his second bone marrow transplant. Twenty percent of cancer patients die from treatment complications, not directly from their cancer.

Cancer does not wait. These isotopes have half_lives measured in MINUTES and REQUIRE a domestic supply. Also consider in the PEIS that patients wish to be treated near their homes, and that additional nuclear facilities will be required to supply these short_lived alpha emitters in the quantities necessary to more effectively treat their disease at sites across the country. There will be over 50,000 new non_Hodgkins lymphoma diagnoses this year. The incidence of this disease is increasing. FFTF could efficiently produce alpha emitters. John Stanford, the much loved Seattle School Superintendent, died last year of acute myeloid leukemia. An NACP member informed him of a study at Memorial Sloan Kettering Cancer Center in New York. It took the DOE three years to supply enough alpha emitters to treat eighteen patients there. There was an insufficient supply and John Stanford was not treated. Had there been enough alpha emitters to treat Mr. Stanford, he would have had a 70% chance of being at his desk today helping the children of Seattle. This year, 9,700 patients will be diagnosed with AML. The DOE has agreed to supply enough alpha emitters by 2002 to treat 36 patients in three years, double the previous amount. What will happen to the over 29,000 patients denied this treatment for a lack of isotope supply? This disease is 75% fatal without isotope treatment. This is unacceptable to

1657-2

1657-3

Response to Commentor No. 1657

1657-2: DOE notes the commentor's support for restarting FFTF in order to increase availability of medical isotopes.

1657-3: DOE notes the commentor's viewpoint. A forecast for future demand for medical isotopes and the expected growth rate of medical isotope use during the next 20 years is provided in Section 1.2 of the NI PEIS. The growth projections were adopted by DOE as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual rate of growth of medical isotope use is consistent with the Expert Panel findings.

Commentor No. 1657: National Association of Cancer Patients (Cont'd)

the NACP and cancer patients. The DOE is RESPONSIBLE to produce and deliver isotopes researchers request, yet its budget request for the isotope program in FY2001 is LESS than for FY2000. Dr. Robert Schenter testified on August 31, 2000 that the FFTF efficiently produced research isotopes, in direct contrast to NERAC's statement that the FFTF is not a research production candidate. One of our members spoke with a woman whose father was treated with high specific activity I_131 produced from FFTF. Given less than three months to live with his non_Hodgkins lymphoma, he remains cancer_free and healthy eleven years after his single treatment. When high_specific activity I_131 becomes available, should FFTF be restarted, Dr. Darrell Fisher, a renowned medical physicist, stated that this would be the isotope of choice, as I_131 from Canada currently being used is only about seven percent pure. The DOE should consult with those in the know instead of rely on uninformed statements from others. The NACP asks Secretary Richardson, prior to making his decision on the NI PEIS, to listen to informed proponents of FFTF, including DOE's own employees and especially those working at FFTF, and give them time equal to that he gave Mr. Pollet of Heart of America. This man is an avowed enemy of FFTF restart, and not an informed scientist.

**1657-3
(Cont'd)**

1657-4

1657-5

1657-6

Efficient new medical isotope production facilities for AT LEAST 37 medical isotopes must be considered. The NI PEIS should also consider a public_private partnership possibility when considering how these isotopes might best be produced and distributed. Please note the following. A recent study showed equally effective prostate cancer control from surgery OR Palladium (Pd) seed implants after twelve years. Pd is backordered up to one year. As a result, men are being FORCED into surgery. A retrospective study showed that over half of prostate surgery patients become impotent, must wear a DIAPER for the rest of their lives or BOTH.

Jerry Petasnick, MD, president of the National Society of Radiologists, said, "Our organization represents over 30,000 practicing radiologists? it is difficult to conduct clinical studies with

Response to Commentor No. 1657

- 1657-4:** DOE notes the commentor's views. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.
- 1657-5:** For the purposes of analyses in the NI PEIS, a representative set of isotopes was selected on the basis of the recommendations of the Expert Panel, medical market forecasts, reviews of medical literature, and more than 100 types of ongoing clinical trials that use radioisotopes for the treatment of cancer and other diseases. These 37 isotopes, which are comprised of both reactor- and accelerator- produced isotopes, are listed in Chapter 1, Volume 1 of the NI PEIS along with a brief description of their medical and/or industrial applications. These include research isotopes with currently limited availability, such as copper-67, as well as commercial isotopes whose current application is inhibited by lack of availability or high cost, such as palladium-103. However, the absence of any specific isotope from these tables does not mean that it could not be considered for production under the proposed action. DOE expects that the actual isotopes and specific amounts produced as a result of the proposed action would vary from year to year in response to the focus of clinical research and the specific market needs occurring at that time.
- 1657-6:** DOE currently has business relationships with private companies related to the production of radioisotopes. If FFTF would be restarted, DOE would pursue business arrangements with private companies in order to offset the cost of isotope production.

Commentor No. 1657: National Association of Cancer Patients (Cont'd)

even very small numbers of patients. Research is being hampered or removed from consideration by a lack of these isotopes. Medical isotopes are often the only effective way to properly diagnose and treat serious disease. It is crucial that we have access to a wide variety of isotopes, including those with high specific activity, appropriate to diagnose, prevent and treat heart disease, cancer, arthritis, and, more recently, infectious disease."

Please listen to physicians who are asking the DOE to supply the isotopes they need to treat their patients. Dr. Carl Mansfield, Thomas Jefferson University Hospital, Philadelphia after a ten year palladium implant BREAST cancer study said, "These implants mean that a patient can KEEP a breast and still have the SAME chances of survival?" President Clinton's mother died of breast cancer.

A reactor, the FFTF is necessary to produce the quantity and quality of isotopes needed to treat patients and save lives. S. De Nardo, MD, at the University of California at Davis, was provided a cyclotron to produce Cu_67. This cyclotron is so inefficient at producing this isotope that even small numbers of study patients are not being accommodated. This isotope has a natural affinity for both prostate and breast cancer, just as iodine has a natural affinity for the thyroid. FFTF could produce large quantities of this isotope and many others. Nearly 360,000 Americans will be diagnosed in 2000 with breast and prostate cancer. Isotope backorders and inadequate supplies of isotopes for study protocols are killing cancer patients. Again, please listen to physicians who are telling the DOE that they do not have the isotopes they need to treat even small numbers of study patients. The NACP predicts a public outcry once these facts become known.

The NACP asks the DOE to consider the Balanced Budget Act of 1997 and include WITHIN in the PEIS a cost_benefit analysis of radioisotope therapy versus older, often less_effective treatments, based on published study statistics. The NACP vigorously disagrees with the DOE statement given at the recent scoping hearings in

1657-7

Response to Commentor No. 1657

- 1657-7:** DOE notes the commentor's views on the costs and benefits of the proposed production of medical radioisotopes. The estimated costs of the range of reasonable alternatives are presented in the Cost Report, summarized in Appendix P of the Final NI PEIS. However, the Cost Report is not a cost-benefit analysis. While it is reasonable to believe that the benefits of medical isotopes are substantial, the purpose of this NI PEIS is to describe the nuclear infrastructure missions (Section 1.2 of Volume 1), a range of reasonable alternatives for satisfying the mission requirements (Section 2.5 of Volume 1), and the environmental impacts that would result from implementation of the alternatives. According to 40 CFR Section 1502.23, if a cost-benefit analysis exists, it must be reported and summarized in the NI PEIS.

Commentor No. 1657: National Association of Cancer Patients (Cont'd)

Washington that there is insufficient data to perform this analysis. This data absolutely exists ? no one from the DOE has made an effort to seek out these figures. The NACP also disagrees with the Frost and Sullivan report that the yearly projected increase in demand for medical isotopes will range between 7 and 14%. The volume increase for 1999 was actually 19%. And it is impossible to predict the huge demand that will result from research breakthroughs in the future. Remember, there was no demand for computers until the computer chip was invented, no demand for antibiotics until penicillin was discovered! The demand came after the discovery!

Eighty percent of cancer patients should benefit from isotope therapy. Over six million cancer patients alive today might benefit from isotope treatments. Over half might be saved. Isotopes given to cancer patients either alone or with other treatments enhance their effectiveness, avoid repeat surgery, chemotherapy and other treatment and followup ? related costs. A six year study showed the death rate from ovarian cancer is 10% with smart bullets, 86% without this treatment. Comedienne Gilda Radner and, more recently, Academy_Award winning actress Madeline Kahn both died of ovarian cancer. It cost an average of \$15,000 in 1993 to care for one dying cancer patient. Over 550,000 Americans will die of cancer this year. It cost over \$600,000 to treat King Hussein. The typical cost for more effectively treating blood cancer with "smart bullets" is less than \$10,000 per patient. Cost savings from treating blood cancer patients alone could easily exceed TEN BILLION dollars per year. Projected savings to Medicare and Medicaid might more than pay for hundreds of DOE programs, with money left over to supply the elderly prescription drugs and health insurance for over 40 million Americans who have none. Include in the NI PEIS a projected estimate of increased tax revenues to the U.S. Treasury as patients like Laura return to work.

Waste minimization. Consider waste minimization in the NI PEIS from the medical community's point of view. Cancer patients produce an enormous volume of hazardous waste that requires

1657-7
(Cont'd)

1657-8

1657-9

1657-10

Response to Commentor No. 1657

1657-8: DOE notes the commentor's concerns. DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

1657-9: See response to Comment 1657-7.

1657-10: Medical wastes are regulated by the U.S. Environmental Protection Agency and authorized State agencies. DOE does not have purview over these wastes or the waste generators. The analysis requested by the commentor is out of scope of the NI PEIS.

Commentor No. 1657: National Association of Cancer Patients (Cont'd)

special handling at high cost. Estimate sharply reduced waste volumes with more efficient medical isotope therapy. There are over 14 million diagnostic tests per year performed in this country that require medical isotopes. Patients are being spared from more costly invasive procedures with this expanding technology for both diagnosis and treatment of disease. In many states, this waste is now being stored in 55 gallon barrels in medical facilities and medical companies under stairwells, in hallways, on loading bays, and in parking lots. This is a health hazard. The DOE should acknowledge this very real situation in the NI PEIS, and work with Congress to address this serious public health issue post haste. Nationally, current hazardous cancer waste volumes are MUCH higher than those generated from the operation of the DOE facilities of Alternate 1 listed in the PEIS.

**1657-10
(Cont'd)**

The NACP asks the DOE to address ALL these points in the PEIS. The NACP asks everyone _ PLEASE, do not play politics on the backs of cancer patients.

Ms. Colette Brown
 DOE, Office of Space and Defense Power Systems

Dear Ms. Brown,
 Your Department's recent proposal to expand the civilian nuclear infrastructure, outlined in the Draft Programmatic Environmental Impact Statement for accomplishing expanded civilian nuclear energy research and development and isotope production mission in the United States, including the role of the Fast Flux Test Facility, raises significant nuclear weapons proliferation and environmental issues.

As a member of the Snake River Alliance I have become aware of the serious nuclear contamination and waste problems at INEEL. INEEL is one of the most contaminated areas in America. The Department's recent estimate on cleaning up our site is \$22 billion and is expected to take 50 years__longer than any other DOE facility. In addition, we have over 360 individual superfund sites within the 890 sq. mile area that comprises INEEL. With this known, the last thing we need is a plan to generate more nuclear waste at a site that needs more waste like the DOE needs security scandals. Out of concern for Idaho's environment, I strongly urge you not to pursue the plutonium_238 production mission outlined in your PEIS.

One of the most daunting problems confronting cleanup at major DOE facilities such as Hanford and INEEL, is the solidification of liquid high_level nuclear waste. Your current plan for plutonium_238 production entails the generation of approximately 288,000 additional gallons of this waste over the project's 35 year span.

1659-1

1659-2

Response to Commentor No. 1659

- 1659-1:** The commentor's position regarding plutonium-238 production at INEEL is noted. Production of plutonium-238 at one or more of the candidate sites would be conducted in support of NASA's deep space missions Volume 1, Section 1.2.2 of the NI PEIS). As discussed in Sections 4.3.2.1.13 and 4.4.2.1.13 of the PEIS, selection of the Fluorinel Dissolution Processing Facility and/or the Advanced Test Reactor to support production of plutonium-238 would have no significant impact on the waste management system at INEEL. Use of any of the facilities proposed in this PEIS for the stated missions would not impact cleanup missions at DOE sites.
- 1659-2:** The use of proposed alternative facilities associated with processing of neptunium-237 targets would have no impact on schedules or available funding for high-level radioactive waste programs at either Hanford or INEEL. At INEEL, the tanks would not be used although certain facilities at the Idaho Nuclear Technology Engineering Center (INTEC) would be used to treat the wastes resulting from processing the irradiated targets. These are reliable systems that would process a maximum of 1,050 cubic meters of low-level radioactive waste over the 35-year nuclear infrastructure operational period. The higher activity waste would be treated as a solid form via a stand-alone vitrification system, separate from any tank waste treatment system. At Hanford, the existing high level radioactive waste facilities would not be used, and as analyzed in the PEIS, no existing or planned high-level radioactive waste facilities would be used to treat the wastes resulting from processing the irradiated targets.
- 1659-3:** Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic

**Commentor No. 1659: Reverend Merepeace-MsMere
(Cont'd)**

While this is a small portion of Hanford's high level waste, it is approximately one fifth of what we have remaining here in Idaho, which makes it a very significant amount. Previous leakage of this waste at INEEL and Hanford threatens our water supplies. What we certainly don't need is any more of this most highly problematic of waste forms.

1659-2

Given the certain risks inherent in production of plutonium, the justified need for this material would have to be tremendous, and the PEIS does a poor job of providing ample justification. Beyond the risks involved in production, and the aforementioned resulting waste problem, there is also the issue of an accident occurring upon lift_off or reentry of a space probe carrying this material. The cassini probe, launched in 1997, carried 72 pounds of Pu_238. The potential for an explosion during lift_off or upon an inadvertent reentry during the fly_by phase, gave many in the scientific community pause, including scientists within NASA. According to NASA's own conservative estimate, a burn up upon reentry of the cassini probe could have caused 2,300 cancer fatalities, independent analyses ranged much higher. This potential for a catastrophic release of this extremely toxic material will remain so long as the US government remains committed to the use of plutonium_238. If DOE is to have a role in developing power systems for NASA's instrumentation, it should focus on promising solar technology, an alternative that has been promoted in the European scientific community.

1659-3

There are also proliferation concerns as it pertains to this plan. A return to production of this isotope, however poorly justified, means a return to the use of aqueous reprocessing at DOE facilities where this technology has been used to extract bomb material for the weapons program. From President Carter to presidents Bush and Clinton, US policy has been to halt reprocessing in this country in order to set a global precedent to curtail the spread of nuclear weapons material? a noble effort in serious need of bolstering through action.

1659-4

1659-5

Response to Commentor No. 1659

supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed production of plutonium-238 are relatively low and are discussed in detail in Chapter 4 of Volume 1, and Appendixes H, I, and J of Volume 2 in the Final NI PEIS.

1659-4: DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. The Cassini fly-by occurred exactly as planned, with no release of nuclear material.

1659-5: It is not true that resumption of plutonium-238 production constitutes a return to reprocessing. The aqueous technique that would be used to separate plutonium consisting of over 80 percent plutonium-238 and neptunium from the irradiated target is similar to the technology that was used in portions of the complex process to extract plutonium-239. However, as discussed in PEIS Sections S.3, 2.2.3 and A.1.4, this technology would be used to chemically separate plutonium-238 and neptunium from irradiated targets and not from irradiated or spent nuclear fuel, whereas reprocessing separates weapons grade plutonium-239 from irradiated nuclear fuel. Plutonium-238 extraction is not reprocessing. Unlike plutonium-239, plutonium-238 is not used in nuclear weapons, but rather it would be used as a power and heat source for NASA space missions.

**Commentor No. 1659: Reverend Merepeace-MsMere
(Cont'd)**

Indeed, an otherwise lukewarm Nuclear Infrastructure Nonproliferation Impact Assessment conducted by your Office of Arms Control and Nonproliferation questions whether our commitment to nonproliferation isn't weakened by the use of the Fluorinel Dissolution Process Facility within Building 666 at INEEL. INEEL's reprocessing facility is next door to a wet storage unit for Navy spent fuel, which contains a greater than average amount of highly enriched uranium. It was reprocessed from 1953 to 1989 at INEEL for the weapons program. Use of this facility to carry out plutonium_238 extraction, especially considering the dubious need for this isotope, at the very least raises the concern that DOE is not fully committed to ending reprocessing. The international community cannot be expected to trust DOE's civilian_mission claim when an agency devoutly committed to development of weapons uses a nuclear weapons technology at a weapons facility.

Considering all these factors that could adversely affect our environment and commitment to nonproliferation, I strongly urge you to select alternative 5 in the current PEIS. This alternative would allow the Advanced Test Reactor at INEEL to continue producing medical and industrial isotopes for the commercial sector and would not lead to the production of anymore highly radioactive liquid waste at Hanford or INEEL. The main mission at these two facilities has been and should continue to be cleanup of the mess left over from previous nuclear weapons work. Additional waste production would interfere with this already difficult and expensive work. Alternative 5 also calls for the decommissioning of the FFTF reactor at Hanford. FFTF is an aging breeder reactor whose use would be inconsistent with United States policy to discourage use of this technology due to the capability this class of reactors has to produce more plutonium than is consumed. Thank you for the opportunity to comment on this plan.

Sincerely,

Reverend Merepeace_MsMere

1659-6

Response to Commentor No. 1659

The Nuclear Infrastructure Nonproliferation Impact Assessment, published in September 2000, confirms that extracting plutonium-238 from irradiated targets would not undermine nonproliferation goals. In this report, DOE recognizes that proliferation concerns might be raised related to one of the technical assessment factors, "reduction in attractiveness of material forms," due to the fact that, in the extraction of plutonium-238, the remaining unconverted neptunium, a weapons-useable fissile material used as target material for conversion into plutonium-238, must also be recovered (not produced), purified, and recycled. This is unavoidable (unless the United States elects to neither produce or purchase plutonium-238), and it impacts all PEIS alternatives and options, including the No Action Alternative and Alternative 5: permanently deactivate FFTF with no new missions at U.S. facilities. However, while the fact that concerns might be raised is a valuable input to the record of decision process, it does not constitute an inconsistency with or departure from nonproliferation policy, and plutonium-238 is needed to fulfill our missions. Further, in the event that plutonium-238 production is resumed in the United States, the total separated stocks of neptunium would be reduced over time in an irreversible manner since there is a moratorium on U.S. spent fuel reprocessing. This overall reduction in a weapons useable material would mitigate the potential concerns related to material attractiveness, and offer an additional method to pursue U.S. nonproliferation goals. DOE's proposed approach in this mission, and its rigorous nonproliferation impact assessment, demonstrate its commitment to nonproliferation policy, domestically and in the international community.

The juxtaposition of Fluorinel Dissolution Process Facility (FDPF) in INEEL Building 666 to wet storage of highly enriched uranium Navy spent nuclear fuel, and its previous mission of reprocessing spent nuclear fuel, were rigorously and objectively evaluated in the Nuclear Infrastructure Nonproliferation Impact Assessment published in September 2000. In no uncertain terms, this report discusses the proliferation concerns raised in the areas of facilitating cost-effective international monitoring and supporting negotiation of a verifiable FMCT, and outlines what is needed to mitigate these concerns. This is a valuable input to the record of decision process.

Most of the concerns and uncertainties surrounding the use of FDPF are associated with its history as a defense programs facility and the resulting lack of transparency that could be afforded in the event that international monitoring becomes desirable under an FMCT. This is a different set of concerns than those expressed in the comment. The fact is, that since it is

***Commentor No. 1659: Reverend Merepeace-MsMere
(Cont'd)***

Response to Commentor No. 1659

well known that FDFP has a long history of Navy defense missions, and since the described mission (plutonium-238 extraction) in the PEIS does not involve the production of special fissile material, sufficient transparency could possibly be provided by a managed access regime that would meet the requirements of FMCT verification. If this could be done, the aforementioned concerns would be mitigated.

1659-6: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF. It should be noted that medical isotopes would continue to be produced at ATR regardless of which alternative is selected in the Record of Decision. The FFTF would produce spent nuclear fuel and low-level radioactive waste, and as discussed throughout Section 4.3 of Volume 1, none of the proposed alternatives would add waste to the high-level waste tanks at Hanford or INEEL. Also, it should be pointed out that while FFTF supported the breeder reactor program, it is not itself a breeder reactor, but rather a fast flux research reactor.

Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

With respect to cleanup of wastes at Hanford or INEEL, the proposed action and the existing cleanup missions are independent programs and actions related to one will not impact the other. While the cleanup activities at both Hanford and INEEL are high priority to DOE, it should be noted that the cleanup of legacy wastes is beyond the scope of the NI PEIS.

 Subject: FFTF EIS Comments
 Auto forwarded by a Rule

Dear DOE,

The following are my comments concerning the proposed restart of Hanford's Fast Flux Test Facility (FFTF). I have been involved in many aspects of Hanford issues since 1984. Based upon this experience and my study of FFTF, I can only conclude that the only option for FFTF should be Option 5: "permanently deactivate FFTF with no new missions."

My reasons for permanently shutting down FFTF are as follows:

1. FFTF is dangerous to operate.
2. FFTF is wasteful. There is no place to permanently dispose of its waste and its operation is not cost effective.
3. The isotopes FFTF would produce are not needed and would be too expensive. Because of this, the Washington State Medical Association, WA Academy of Family Physicians and Physicians for Social Responsibility/National have all passed resolutions opposing the restart of the FFTF.
4. Closure of FFTF is part of the 1989 Tri_Party Agreement.

In short, shut FFTF down and get on with Hanford cleanup. The money saved by shutting down FFTF should be transferred to placing the K Basins fuel into dry cask storage.

Sincerely,
 Jim Thomas

 Seattle, WA 98116

1662-1

1662-2

1662-3

1662-4

1662-5

1662-1

1662-6

Response to Commentor No. 1662

- 1662-1:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 1662-2:** FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.
- 1662-3:** As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.
- The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.
- While cost could be an important factor in the ultimate Record of Decision, the purpose of this and other EISs is to address the environmental consequences of the alternatives for the proposed action. Cost issues associated with the restart of FFTF are beyond the scope of the NI PEIS.
- 1662-4:** DOE notes the commentor's opposition to the restart of FFTF and the concern that additional medical isotopes that would be produced by FFTF are not needed. DOE acknowledges the difficulty in reliably predicting isotopic needs for future uses in research and medicine. Therefore, DOE has sought independent analysis of trends in the use of medical radioisotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it has established

Commentor No. 1662: James Thomas (Cont'd)

Response to Commentor No. 1662

two expert committees. The first, a thirteen-member Expert Panel convened in 1998 to forecast future demand for medical isotopes, included academicians from leading medical universities and schools of public health, and professional affiliations ranging from the National Cancer Institute to manufacturers of radiopharmaceuticals. The second consists of a subcommittee of DOE's Nuclear Energy Research Advisory Committee (NERAC), established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. The members of this Subcommittee were selected based upon their expertise and experience in the production, processing, distribution, and application of stable and radioactive isotopes in the biological and physical sciences, and in medicine. The members included basic and clinical scientists, administrators, and users of isotopes from academia, industry, and the federal government.

In 1998, the Expert Panel estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

1662-5: DOE notes the commentor's opposition to Alternative 1, FFTF Restart, and concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site.

DOE-RL, EPA, and Ecology agreed to a change in this agreement to place the milestones for FFTF's permanent deactivation in abeyance until the

Commentor No. 1662: James Thomas (Cont'd)

Response to Commentor No. 1662

DOE reaches a decision on FFTF's future. Public meetings were held on this formal milestone change. The NI PEIS missions would not have an impact on Hanford cleanup activities.

1662-6: The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As described in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Hanford K Basin issues are not within the scope of this PEIS, as none of the alternatives considered would add to these waste volumes. However, removal of K Basin spent fuel is scheduled to begin prior to the end of 2000.

A well_organized group of anti_nuclear activists shouldn't be dictating Department of Energy policy. You know what's right for our country _ we need to restart the Fast Flux Test Facility, not only for valuable medical isotopes, but also for research on new technologies in nuclear power. More and more people in this country are becoming aware of the medical isotope issues and in the coming months and years they will cry out that a travesty has occurred if DOE does not fulfill its responsibility to the American people in this area.

I don't think you should count input on the PEIS that is based on false information. I've seen groups like Heart of America get their people to respond to this issue based on complete untruths. Why should you consider a request to shut down FFTF because it will add to high_level waste in leaking tanks or take away from clean_up? It's not true, and in fact if those people were given the facts they might even be for FFTF. These groups should not "get their way" with the government by spreading lies. Stand up to them.

Re: Comments on the Nuclear Infrastructure PEIS

I urge the DOE to adopt Alternative 5 to permanently deactivate the Fast Flux Test Facility (FFTF). The DOE has demonstrated no compelling reason to justify restart of this antiquated facility. Restart of the FFTF would be too expensive economically and ecologically. The U.S. already has established sources for medical isotopes and Plutonium 238. Medical isotopes for diagnosis and treatment can be produced at existing facilities in Tennessee and Idaho, as well as two new reactors in Canada. NASA has not projected a demand for Plutonium 238 beyond what it is already acquiring. Furthermore, considering the current state of Russia's economy, it seems to be in the United States' defense interest to purchase as much of Russia's Plutonium as possible to avoid its sale to unstable political powers.

No one has ever determined a safe way to dispose of nuclear waste. Nuclear plants cause more problems than they solve. The DOE must stop searching for a mission for this outdated facility and focus on the cleanup of Hanford. The Columbia River area is a unique and ecologically sensitive area. The lives and livelihoods of many depend on a rapid and thorough cleanup. Stop wasting time and money __ permanently deactivate the FFTF.

Roxanna Nematollahi
 PO Box 80131, Portland, OR 97280

Response to Commentor No. 1666

- 1666-1:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 1666-2:** The United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. Further, supplies of many research isotopes are not readily available from existing foreign or domestic sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed. While some existing DOE reactors may possess the potential capability or capacity to support research isotope production, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without disturbing the existing missions of these facilities. As such, reliance on these other sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Although research to identify other potential fuel sources to support these space exploration missions has been conducted, no viable alternative to using plutonium-238 has been established. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's

Commentor No. 1666: Roxanna Nematollahi (Cont'd)

Response to Commentor No. 1666

preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

1666-3: DOE notes the commentor's concern regarding waste disposal. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

1666-4: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford and the risk of contamination to the Columbia River. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Subject: PLEASE SHUT DOWN THE FFTF
Auto forwarded by a Rule

I understand we have until September 8th to submit our opinions on the Fast Flux Test Reactor In Hanford.

I am a "Downwinder" who was raised in Eastern Washington for the first years of my life, and I have registered with the State of Washington.

The Cold War is over in the rest of the world, it is time we ended it here too. For over 55 years we have been messing with nuclear energy at Hanford Washington, and for much of that time, we have not known what we were doing. It has only been afterward that we have found that we made a lot of mistakes. I believe that continuing to make nuclear waste while it leaks into the Columbia River and is incredibly irresponsible. We should shut down the FFTF and start a clean up of Hanford now. It may be too late, but that is no excuse to keep putting it off. We can get a better handle on damage control if we start now and stop making it worse.

I understand that there are claims that they make Medical Isotopes there, but I have heard nothing about where or how or IF they are used. I know though that the Physicians for Social Responsibility, the Washington State Medical Association, Washington Academy of Family Physicians have all passed resolutions opposing the restart of this reactor. I learned a long time ago that Doctors orders are not to be trifled with. When will our country stop and listen to what's best for us, and listen?

The Chernobyl reactor is going to be shut down soon. Is it our goal to surpass that disaster with one right in our back yard? The stories I hear about tanks with chemicals that nobody can identify and the

Response to Commentor No. 1668

1668-1: DOE notes the commentor's concerns regarding the high level waste tanks and migration of contaminants to the Columbia River. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE and are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

In regards to the commentor's concern with Columbia River, all environmental parameters (e.g., air, soil, surface water, groundwater, vegetation, animals, etc.) in and around the Hanford Site are monitored on a set frequency. The information is available to the public in annual monitoring reports. No food or water restrictions are currently in place outside the Hanford Reservation as a result of Hanford activities.

More specific to the DOE missions in this NI PEIS, DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

The environmental impacts associated with operation of the FFTF are addressed in Section 4.3 of Volume 1 of the NI PEIS. The impacts are shown to be small. These impacts specifically include the risks to human health during normal operations and associated with postulated accidents. Over the 35-year operational period no fatalities would be expected among workers or in the general public in the vicinity of Hanford or at distant locations. For perspective, the radiation dose the average American receives from natural sources is about 300 mrem each year. Based on the same 35 year time period used above, approximately 2,600 latent cancer fatalities would be expected among the same population as a result of this natural (non-Hanford related) radiation exposure. Additionally, FFTF is approximately 4.5 miles from the Columbia River.

1668-1

1668-2

1668-1

1668-3

1668-1

Commentor No. 1668: Cliff Wells (Cont'd)

leaks slowly going to our Columbia River sound like the makings of a disaster to top all disasters. Do we have to have an explosion or loss of life before we take this disaster seriously? I hope we can get some people with common sense involved here and start cleaning up after our last 55 years before we make another 55 years of mess for our Great Grandchildren to worry about.

I know there have been law suits over the safety of employees at Hanford. Is that still part of the operating expenses? Is it acceptable if a few Washingtonians are exposed to this so we can provide isotopes for people elsewhere? How long is it going to be before we can produce medical isotopes safely, and without risking the health of the people who live down wind and down stream from our old fashioned factories?

I hope you will consider the volume of letters and emails you get, and give me the the consideration I gave in writing this letter. If you can justify starting the FFTF, maybe you could try to convince me. If you can't, maybe you should reconsider what the citizens of this country really want, and not what you can push on them. Maybe cleanup is in the future of Hanford, THEN we can consider new projects. Maybe if it is not so dangerous to work there, we will be able to attract workers who can do a better job. I think we are probably drawing a lot of people who don't appreciate the danger and they are only making it worse.

Thank you for your consideration.

Response to Commentor No. 1668

There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

1668-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

1668-3: For nearly 50 years, DOE's use of its unique technologies and capabilities to develop isotopes for civilian purposes has enabled the widespread application of medical isotopes seen today. While its market share is a small fraction of total world isotope production, DOE remains the key provider for a large number of isotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large-enough quantities to make their production financially attractive to private industry. When in operation, FFTF participated in supporting DOE's medical isotope production program. Table C-1 of Volume 2 presents a list of isotopes that could be produced at FFTF. FFTF has produced some of these isotopes in the past and a brief

Commentor No. 1668: Cliff Wells (Cont'd)

Response to Commentor No. 1668

description of the isotope medical and/or industrial application is presented in Table 1-1 of Volume 1.

1668-4: Consistent with its mandates under the Atomic Energy Act, DOE is proposing enhancement of its nuclear facility infrastructure for the purposes of addressing three primary needs:

1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;

2) to support future NASA space exploration missions by reestablishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long term, assured supply; and

3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Purpose and need are discussed in Chapter 1 of Volume 1.

DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and to providing ample opportunity for public comment on those actions. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

Hmmm. I've come to the conclusion that there is no planning other than "the immediate"0, at the cost of future generations that you will not be part our own. But, one that we will provide insurmountable challenges in ability to try to contain the additional waste that will come from the restart of FFTF. Incredible!!!

Lenny Trapp.

In Reference to:

Department of Energy consideration to approve the restart of the FFTF (Fast Flux Testing Facility) Nuclear Reactor at Hanford .. Primary reason: to produce Plutonium 238 for the space program but NASA has stated that this is not necessary. Secondary purpose: necessary to create medical isotopes, but Department of Energy has stated this is not necessary.

1669-1

1669-2

1669-3

Response to Commentor No. 1669

- 1669-1:** Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.
- 1669-2:** DOE notes the commentor's concern about NASA's need for plutonium-238 for space missions. A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.
- 1669-3:** DOE has sought independent analysis of trends in the use of medical radioisotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it has established two expert committees. The first, a thirteen-member Expert Panel

Commentor No. 1669: The Trapp Family (Cont'd)

Response to Commentor No. 1669

convened in 1998 to forecast future demand for medical isotopes, included academicians from leading medical universities and schools of public health, and professional affiliations ranging from the National Cancer Institute to manufacturers of radiopharmaceuticals. The second consists of a subcommittee of DOE's Nuclear Energy Research Advisory Committee (NERAC), established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. The members of this Subcommittee were selected based upon their expertise and experience in the production, processing, distribution, and application of stable and radioactive isotopes in the biological and physical sciences, and in medicine. The members included basic and clinical scientists, administrators, and users of isotopes from academia, industry, and the federal government.

In 1998, the Expert Panel estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the

Commentor No. 1669: The Trapp Family (Cont'd)

Response to Commentor No. 1669

DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

To: Ms. Colette E. Brown, NE_50
U.S. Department of Energy, 19901 Germantown Road
Germantown, MD_ 20874.

Dear Miss Brown,

I am firmly opposed to the restart of FFTF, that is proposed in the recent Nuclear Infrastructure Programmatic Environmental Impact Statement (NI_PEIS). I would like to clearly explain why and how I reached this conclusion. I would also like to thank the DOE for giving me the opportunity to comment on this important matter.

After reading the NI_PEIS, one can reasonably infer that the DOE appears to be leaning illogically towards Action Alternative 1(AA1) ie the "Restart FFTF" alternative over all other alternatives. This is extremely disturbing, because of the fact that, this choice would pose the highest public health risks according to your NI_PEIS. I am basing my conclusions on the bar graphs of the NI_PEIS in pages S_48, S_49, S_51 and S_52. The diagrams in S_48 & 49 that summarize "Expected Latent Cancer Fatalities" due to (a) radiological accidents at sites (b) radiological transportation accidents and (c) risks due to incident free transportation, clearly display the high level of risk to public health, involved in proceeding with AA1 . From the bar graphs in page S_51 & 52 similar conclusions can be reached regarding collision and emission fatalities from the various transportation parameters. The choice is inescapable. Only AA5, that "Permanently deactivates the FFTF

1670-1

1670-2

1670-3

1670-4

1670-5

Response to Commentor No. 1670

1670-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.

1670-2: In accordance with NEPA and CEQ regulations, this NI PEIS analyzes a range of reasonable alternatives for accomplishing the DOE missions which include the production of medical and industrial isotopes, the production of plutonium-238 for NASA space missions, and nuclear research and development. Alternatives 1, 2, 3, and 4 are reasonable alternatives for accomplishing these missions. Each of the four alternatives mentioned can meet either parts or all of the requirements of the DOE missions and, therefore, each is worthy of consideration. No final decisions have been made with regard to the facilities and locations evaluated to fulfill the requirements of these missions. However, in accordance with Council on Environmental Quality regulations (40 CFR 1502.14(e)), DOE has identified its preferred alternative in Volume 1, Section 2.8 of the Final NI PEIS and included a discussion of DOE's reasons for selecting it. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

1670-3: The facilities considered in the NI PEIS can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Sections 4.2-4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from implementation of the alternatives, including normal operations and a spectrum of accidents that include severe accidents. The environmental analysis showed that while there are differences in risks among the alternatives, the radiological and nonradiological risks are small for all the alternatives.

1670-4: While there are differences in risks among the alternatives, risks that would result from radiological accidents and transportation are small for all the nuclear infrastructure alternatives. Figures shown in the Summary and in Section 2.7.1 of Volume 1 show that the risk of an additional fatality as a result of implementing any alternative is small.

Transportation impacts are not the only factor considered in the selection of an alternative. Accordingly, DOE has identified its preferred alternative in Section 2.8 of Volume 1 and includes a discussion of DOE's reasons for selecting it. DOE's Record of Decision for the NI PEIS will be based on a

Commentor No. 1670: G. Parameswaran (Cont'd)

with no new missions" seems to provide the safest and cleanest route to travel from a public health standpoint. This would help the DOE reorient itself firmly in the direction of its core mission in Hanford, which is one of cleanup of all the nuclear wastes in the site. Moreover, the AA5 would help the DOE recover around \$30 million per annum, which is currently used to keep the FFTF in a "hot standby".

I would like to add further that the primary goals of the DOE ie the (1) production of isotopes for medical and industrial uses (2) the production of Plutonium_238 for NASA and (3) other nuclear research for civilian uses are in no way jeopardized in abandoning the "Restart FFTF" alternative.

In April of 2000, the DOE's chosen panel of experts the " Nuclear Energy Research Advisory Committee" or NERAC, recommended that "the FFTF will not be a viable source of research isotopes". These research isotopes can be generated in a cost effective manner in the accelerators of various universities and research institutions. The added benefit would be one of less nuclear waste in the production process. This committee further states that DOE should not be in the business of producing either medical or industrial isotopes(violation of their mandate), that can and are currently produced by the commercial industry, at great benefit to the US taxpayer. Moreover, the Washington State Medical Association and Physicians for Social Responsibility have stated that medical isotopes are readily available from Canada and other non_DOE sources. How can DOE justify the cost of restarting the FFTF at a cost of over \$423 million, when research isotopes can be produced using accelerators at \$106 million?

The second major reason in proposing "Restart FFTF" in this NI_PEIS is to supply the National Aeronautics and Space Administration (NASA) with Ptutonium_238 for power generation in space reactors. Whereas NASA has unequivocally stated on May 22nd of 2000 that : "NASA has no longer an identifiable planned requirement for Small Radioisotope Thermoelectric

1670-5
(Cont'd)

1670-6

1670-7

1670-8

Response to Commentor No. 1670

number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

1670-5: See response to comment 1670-1.

1670-6: The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

DOE's production and sale of isotopes fall into two categories – "commercial" and "research". "Commercial" isotopes are those that are produced in large, bulk quantities and sold to pharmaceutical companies or distributors, or to equipment or sealed source manufacturers. Examples of commercial radioisotopes produced by DOE include strontium-82 and germanium-68 for medical applications, and iridium-192 and californium-252 for industrial applications. DOE only produces commercial isotopes when there is no U.S. private sector capability or when foreign sources do not have the capacity to meet U.S. needs reliably. In contrast, "research" radioisotopes are typically produced and sold in small quantities in response to specialty orders from researchers preparing experiments in the field of medicine, with small quantities of these radioisotopes also purchased by industrial researchers. Small quantity production of research

Commentor No. 1670: G. Parameswaran (Cont'd)

Generator(STRG) power systems.", the DOE manages to insist to the contrary. Notwithstanding the fact, that there is always a significant risk to the entire global populace in sending nuclear powered space probes ; these stated goals by the DOE makes no sense either scientifically or economically.

**1670-8
(Cont'd)**

These significant findings seems to have mysteriously eluded the DOE in their compilation of the preferred alternatives in the NI_PEIS. I would like to add further, that AA2, AA3 & AA4 are ugly alternatives merely added to beautify AA1 the "Restart FFTF" alternative and merit no serious consideration. The inescapable conclusion is that, to propose restarting of the FFTF, just for civilian nuclear research no longer holds any validity .

1670-2

This letter cannot finish without mentioning the negative impacts to the environment that would result in the "Restart FFTF" alternative. Hanford by all independent estimates has a rather poor record of confining the nuclear wastes it already possesses. There are credible reports that indicate 68 of the 177 High_Level Nuclear Waste tanks are leaking. These wastes might have already polluted the ground water and may be proceeding towards the Columbia river. The untold damages that could accrue to the recently declared "Hanford Reach National Monument" are staggering. This 195,000 acre shrub_steppe ecosystem is the last free flowing non tidal stretch of the Columbia river, that is home to the spawning of at least 80% of fall Chinook Salmon. The "Hanford Reach" is one of the keystones to recovery Salmonid species in the recently declared Endangered Species Act listing. To add more nuclear waste to the Hanford complex , as the "Restart FFTF" would do would be clearly counter productive.

1670-9

1670-10

1670-9

I would like to conclude this letter by stating that "Restart FFTF" AA1 option is a Pandora's box, that must not be opened, because it would have extremely negative impacts on public health and environment of the Pacific NW. I hope the DOE would give thoughtful consideration to my comments.

1670-11

Yours truly,
G.Parameswaran.

Response to Commentor No. 1670

isotopes is not financially attractive to private-sector producers and is generally not undertaken. DOE attempts to provide all research radioisotopes that are requested, subject to production capability, inventory, and financial constraints. As successful application of a specific research isotope is established, the production and sales of that radioisotope may shift from research to commercial status. In recent years, over 95 percent of DOE's sales of radioisotopes by dollar volume were commercial, and 5 percent have been for research.

The United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

The generation of wastes from the production of medical isotopes, which are small in comparison to the candidate sites' current generation rates, are discussed for each alternative in Chapter 4, Volume 1 of the NI PEIS. The additional waste generated would only have a small impact on the management of wastes at the candidate sites.

1670-7: The commentor is comparing the cost of the low-energy accelerator, a element of Alternative 3, Construct New Accelerator(s), with the FFTF. The low-energy accelerator's only mission is to produce a select set of medical isotopes. The FFTF can produce a diverse set of medical and industrial isotopes, plus meet the requirements of the plutonium-238 production mission, and the nuclear energy research and development mission. DOE considers all three missions of equal importance.

1670-8: DOE notes the commentor's concern about NASA's need for plutonium 238 for space missions. The May 22, 2000, correspondence from NASA to DOE identifies that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the

Commentor No. 1670: G. Parameswaran (Cont'd)

Response to Commentor No. 1670

suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

The risk of space missions is out of the scope of the NI PEIS. NASA, however, undergoes a National Environmental Policy Act (NEPA) process for each launch. This includes public participation during which the public may participate in NASA decisions concerning space missions.

1670-9: Evaluations performed in Chapter 4 of the PEIS demonstrate that the restart and operation of FFTF would have a very small impact on public safety and the environment. FFTF restart would not impact the schedule or available funding for existing cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram funds designated for Hanford cleanup, regardless of the alternative(s) selected. As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

Commentor No. 1670: G. Parameswaran (Cont'd)

Response to Commentor No. 1670

1670-10: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

Hanford tank waste issues are not within the scope of this PEIS, as none of the alternatives considered would add to these waste volumes. Nearly all of the lands included within the proposed Hanford Reach National Monument have been remediated and turned over to the U.S. Fish and Wildlife Service by DOE. DOE has every intention of protecting this area.

1670-11: DOE notes the concern expressed in the comment on potential health and environmental impacts of restarting FFTF. The environmental impacts associated with operation of the FFTF and support facilities at Hanford during normal operations and from postulated accidents are presented and discussed in Section 4.3 of the NI PEIS. All impacts to human health and to ecological resources would be small in the immediate area of the Hanford site and negligible at all distant locations.

Commentor No. 1672: R. K. Greenwell

From: R. K. (Ken) Greenwell[SMTP:KNJGREEN@OWT.COM]
Sent: Monday, September 18, 2000 1:46:53 AM
To: INFRASTRUCTURE_PEIS, NUCLEAR
Subject: Comments on NI PEIS (DOE / EIS_ 0310D)
Auto forwarded by a Rule
September 17, 2000

The purpose of this message is to provide comments on the Nuclear Infrastructure Programmatic Environmental Impact Statement (NI PEIS) which includes the role of the Fast Flux Test Facility (DOE / EIS _0310D).

1) First, I support the expanded DOE nuclear missions as I believe these are very important to the U.S. and it's credibility in dealing with peaceful nuclear issues in the world, and in maintaining a leadership role.

1672-1

1672-1: DOE notes the commentor's support of DOE's proposed expanded nuclear infrastructure to meet the missions addressed in the NI PEIS.

2) I have reviewed the NI PEIS quite extensively. Although I know there is some discussion in various sections of the document that specifies limitations for some of the alternatives in meeting all of the expanded mission requirements, the document still gives an overall impression that Alternatives 1 through 4 could all equally meet all expanded mission requirements. I believe that the public needs to fully and clearly understand that all alternatives are not meeting the same requirements. Those that are performing less of the total mission would be expected to have less environmental impact as they are delivering less. I believe that, as a minimum, a section needs to be added to the document to provide a clear comparison of what is being provided and, equally important, what is not being provided by each alternative regarding the enhanced DOE missions. This should be provided in it's entirety in at least one place to provide a clear, easy to read basis for comparison. It is desirable that this be included both in the Summary and in the main text of the document.

1672-2

1672-2: A comparison of mission effectiveness among alternatives is presented in Volume 1, Section 2.7.1.2.3 of the Draft NI PEIS. This section has been revised in the Final NI PEIS (see Section 2.7.1.8, "Comparison of Mission Effectiveness Among Alternatives") to provide the reader a better understanding of the medical isotopes that can be produced using accelerator technology (Alternative 3) and reactor technology alternatives (Alternatives 1 and 4).

Commentor No. 1672: R. K. Greenwell (Cont'd)

3) Based on a detailed review of the descriptions for Alternatives 3 and 4 (New Accelerators and New Research Reactor), it appears that much more work is needed to define these alternatives before they could meet any significant portion of the expanded missions. For example, a proton accelerating cyclotron is not practical for efficiently producing therapeutic isotopes that require neutron irradiation. Such a cyclotron, while useful and needed for many research activities, is not used to produce much neutron irradiation damage data in materials for use in future reactor applications. It appears that no consideration is given to medical isotope production, nor provisions for any significant nuclear research and development with the high energy accelerator. Similarly, there is no evidence , based on the description given for the new research reactor, that any significant provisions have been made for performing any advanced nuclear research and development activities much beyond what could be performed on existing university reactors. Finally, based on detailed technical considerations, it does not appear that either the high energy accelerator nor the new reactor , as currently described in the NI PEIS document, could produce Plutonium_238 at the purity level required for NASA applications. Based on these technical considerations, it does not seem that Alternatives 3 and 4 could meet much of the expanded mission requirements without major additional study, cost, and increased potential for delay. It does not seem wise to abandon existing, operable facilities such as the Fast Flux Test Facility to pursue somewhat developmental projects outlined in Alternatives 3 and 4 which appear to need so much additional work.

4) For a number of years now, there have been many new energy research and development projects that have been started, have proceeded either into the design stage or, in many cases, well along into the construction stage, only to be canceled. Projects have ranged from the Clinch River Breeder Reactor Program to the Superconducting Super Collider, to the Fusion Materials Irradiation Test Facility, to the Advanced Neutron Source (most recent

1672-3**1672-4****Response to Commentor No. 1672**

1672-3: The commentor is correct in his observation that the high-energy accelerator was designed for the production of plutonium-238 and that the low-energy accelerator can not perform neutron irradiation. However as stated in Volume 1, Section 2.3.1.5.2, the design of the high-energy accelerator presented in the PEIS focused on supporting the plutonium 238 production mission, but the design could be refined and expanded to perform additional missions such as the production of a select set of medical and industrial isotopes. The low-energy accelerator was configured primarily for the production of a spectrum of proton enriched medical and industrial isotopes. The modified high-energy accelerator and low-energy accelerator could jointly produce a broad spectrum of medical and industrial isotopes.

DOE acknowledges that the flexibility of the new research reactor to meet the diverse nuclear research and development mission requirement is limited by the low-enriched uranium core and the low operating temperature of the reactor. The cost and schedule estimates for Alternative 3 and 4, presented in the Cost Report, reflect the uncertainties and risks due to the design maturity of these alternatives. Alternatives 3 and 4 reference designs presented in the NI PEIS were developed in sufficient detail to enable an analysis of environmental impacts associated with their construction and operation. If DOE selected either of these alternatives, it would prepare conceptual, preliminary, and detailed designs and optimize the facility design to accomplish the stated missions.

1672-4: DOE notes the commentor's support for Alternative 2, Use Only Existing Operational Facilities) and Alternative 1, Restart FFTF.

1672-5: See response to comment 1672-4.

Commentor No. 1672: R. K. Greenwell (Cont'd)

research reactor facility proposed to be built only to be canceled after significant study and expense), along with numerous other large and small projects. This process continues today with threats of cancellation of projects such as the multi-billion dollar National Ignition Facility. Such a record of experience, regardless of the reasons for cancellation, does not provide confidence that proposed replacement facilities to enhance the nuclear infrastructure will actually be completed in a timely manner. This is a particularly important issue when there is a possibility that existing infrastructure will be irreversibly destroyed before new facilities, such as the proposed new accelerators or a new research reactor, are developed, proven and available. For this reason, I believe that the U.S. should continue to use what is available and paid for, including the FFTF, to perform the enhanced missions until there is certainty that better alternatives are available, or until it is demonstrated that anything else is even needed.

**1672-4
(Cont'd)**

Based on the above items, I urge the Department of Energy to restart the FFTF and use it to produce medical and industrial isotopes, to produce Plutonium ₂₃₈ for the space program, and to perform needed nuclear research and development work in many areas. The FFTF has either done these type things in the past or it has clearly been demonstrated that it could do most of these missions based on numerous, documented studies and tests. This valuable national asset should not be allowed to remain in standby any longer with a growing need for additional high quality irradiation and test services.

1672-5

Sincerely,

R.K. Greenwell

The government should support cancer research. Isotopes are extremely useful and research is just in its infancy. I have read the PEIS and other documents. FFTF is the only logical choice for isotope research and production. If it is not used for any other mission, FFTF use is still justified. The other options don't come close. The only reason I can see that FFTF is not producing isotopes right now is partison politics. Make the correct technical and humanitariun decision. Restart FFTF for medical isotopes.

I have read the PEIS and other documents. The government should support cancer research. Isotopes are extremely useful. Research is just in its infancy. The savings in lives and quality of life can be phenominal. FFTF is the only logical choice for isotope research and production. If it is not used for any other mission, FFTF use is still justified. The other options don't come close. The only reason I can see that FFTF is not producing isotopes right now is partison politics. It is absurd to ask that it be self supporting. No other government facilities or programs are, most of which have little real benefit for the taxpayers. If it must be shown self supporting, show the profit that will be made by reductions in the costs of medical treatment and thus Medicare. Make the correct technical and humanitariun decision. Restart FFTF for medical isotopes.

1674-1

 Subject: PEIS comments
 Auto forwarded by a Rule

Dear Sirs:

I would like to submit my comments on the draft programmatic environmental impact statement for accomplishing expanded civilian nuclear energy research and development and isotope production missions. I would like to express my firm opposition to restarting the Fast Flux Test Facility on the Hanford Nuclear Reservation. A restart of the FFTF, which has already siphoned hundreds of millions of dollars away from the clean_up effort, would create more waste, much of which, regardless of the Department of Energy's protestations, would be added to the present waste burden at Hanford. I would like to remind the Department of Energy that THERE IS NO PERMANENT SOLUTION TO HIGH_LEVEL RADIOACTIVE WASTES. We cannot just assume that we'll bury it in the desert and forget about it. I'm not sure there will ever be a satisfactory solution to the problem of nuclear waste, but I do know that the first step in dealing with the problem is simple: don't create any more waste! This obvious fact alone should persuade anyone of sound mind that restarting the FFTF is out of the question. In addition, restarting the FFTF would create unnecessary hazards associated with importing MOX fuel from Germany. Furthermore, the FMEF, presently a clean facility, would be contaminated, adding to the already onerous clean_up burden at Hanford.

I believe the EIS is biased and should be completely rewritten. Plutonium production should be totally severed from isotope production in the environmental impact statement and cost estimate. They are two separate issues. FFTF decommissioning costs should be subtracted from all of the alternatives. It will have to be decommissioned someday regardless of which alternative is chosen,

1675-1

1675-2

1675-3

1675-4

1675-5

1675-6

Response to Commentor No. 1675

1675-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1675-2: As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected. As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. High-level radioactive waste would not be generated from merely operating FFTF. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

1675-3: Alternative 1 does postulate that DOE might decide at some point to import mixed oxide fuel from Europe to fuel FFTF. At this time, however, DOE has not proposed to import this fuel through any specific port. If DOE ultimately decides to import fuel from Europe, it would perform a separate NEPA analysis to select a port. This review would address all relevant potential impacts of overseas and inland water transportation, shipboard fires, package handling, land transportation, as well as safeguards and security associated with the import of SNR-300 mixed oxide fuel through a variety of specific candidate ports on the east and west coasts. It would consider all public comments, including local resolutions, concerning the desirability of bringing mixed oxide fuel into the proposed alternative ports.

In the event that DOE decides to enhance its nuclear infrastructure, it would not expose any population to high, unacceptable risks under any alternative. Any transportation activities that would be conducted by DOE would comply with U.S. Nuclear Regulatory Commission and U.S. Department of Transportation regulations. Associated transatlantic

Commentor No. 1675: Cain Allen (Cont'd)

but the bias of the EIS is made clear by the fact that it includes decommissioning costs in all of the alternatives EXCEPT FFTF restart! Furthermore, the FFTF cost estimate does not include waste management costs, a serious and highly suspect oversight. The benefits estimations are also shaky at best, based as they are on suspect market predictions.

**1675-6
(Cont'd)**

Medical isotopes can be obtained from presently existing facilities. There is no reason whatsoever to restart the FFTF to produce them. As for NASA, they have no business launching plutonium into our atmosphere. Restarting a nuclear reactor at a site that is already the most contaminated in the Western Hemisphere to provide NASA with plutonium borders on insanity.

1675-7

The mission at Hanford is clean_up, plain and simple. The Department of Energy needs to understand that. The glory days are over_it's time to pick up the pieces. Don't even think about restarting the FFTF!

1675-8

1675-9

1675-1

I appreciate this chance to comment.

Yours sincerely,

Cain Allen
Portland, OR

Response to Commentor No. 1675

shipment would comply with International Atomic Energy Agency requirements. In Section J.6.2, DOE reviewed the potential maximum impacts from the marine transportation of mixed oxide fuel from Europe to a representative military port, Charleston, South Carolina, and overland transportation to Hanford. Also in that section, a bounding analysis demonstrates that the maximum potential radiological risks to the surrounding public from mixed oxide fuel shipments would be extremely small (e.g., less than 1 chance in a trillion for a latent cancer fatality per shipment from severe accidents at docks and in channels and less than 1 chance in 50 billion for a latent cancer fatality per shipment from overland highway accidents).

1675-4: The commentor's position on the impact of FMEF operations on the Hanford cleanup is noted. Implementation of nuclear infrastructure alternatives (described in Section 2.5 of Volume 1) that would use FMEF for target fabrication/processing would not be expected to significantly affect cleanup efforts at the Hanford Site. Implementation of the Alternatives 1 through 4 would impact the schedule or available funding for Hanford cleanup (See Section N.3.2 of Appendix N).

1675-5: This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS. Further, DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives. DOE made every effort to obtain, analyze, and disclose all required information to make a decision on expanding nuclear infrastructure. As a programmatic document, this NI PEIS has a rather broad scope associated with the selection of facilities and site locations for accomplishing expanded civilian nuclear energy research and development and the identified isotope production missions. Based on the alternatives presented in this NI PEIS, the Record of Decision can implement one or more alternatives, or a combination of elements from one or more alternatives. For example, the Record of Decision could elect to meet the needs of the isotope production missions with a combination of reactors and accelerators. Each of the facilities discussed in the NI PEIS will be evaluated and judged on a case- by-case as to its ability to meet one or more of the stated mission requirements.

Commentor No. 1675: Cain Allen (Cont'd)

Response to Commentor No. 1675

The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS.

- 1675-6:** DOE assumes that the commentor is referring to deactivation, not decommission. Decommission costs were not included for any alternative. Deactivation of FFTF is not part of implementing Alternative 1, Restart FFTF. Deactivation of FFTF is part of implementing Alternatives 2, 3, 4, and 5 and including the cost of FFTF deactivation in the implementation costs for these alternatives is appropriate. The Cost Report was structured to identify the implementation costs of the various alternatives so the Secretary of Energy would have this information along with other data for consideration.

As noted by the commentor, waste management costs were not presented in the Cost Report. Wastes would be generated by all alternatives including Alternative 1, Restart FFTF, which makes these costs not a particularly useful discriminator among the alternatives considered. Also, the ultimate disposition of some of these wastes in terms of acceptable waste form, disposal site (onsite or offsite commercial), etc. have yet to be determined. This adds an additional uncertainty to any attempt to quantify waste costs, thus, making any estimates highly presumptive and speculative at best.

DOE has sought independent analysis of trends in the use of medical radioisotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert committees. In 1998, an Expert Panel convened to forecast future demand for medical isotopes estimated that the expected growth rate of medical isotope use during the next 20 years will range between 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by DOE's Nuclear Energy Research Advisory Committee (NERAC), established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. The growth projections were also adopted by DOE as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings.

Commentor No. 1675: Cain Allen (Cont'd)

Response to Commentor No. 1675

- 1675-7:** While some existing DOE facilities may possess the potential capability or capacity to support research isotope production, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without disturbing the existing missions of these facilities. Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term (less than 5 years).
- 1675-8:** DOE notes the commentor's concern for NASA's use of nuclear materials for space missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. DOE also notes the commentor's opposition to the restart of FFTF. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram funds designated for Hanford cleanup, regardless of the alternative(s) selected.
- 1675-9:** DOE notes the commentor's concerns regarding the existing cleanup mission. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Colette E. Brown, NE_50
 U.S. Department of Energy
 Office of Nuclear Energy, Science and Technology
 19901 Germantown Road, Room A_270
 Germantown, MD 20874

After reviewing the "Nuclear Infrastructure Programmatic Environmental Impact Statement" and related DOE documents, I urge you to adopt Alternative 5 to permanently deactivate FFTF. The DOE's own NERAC Subcommittee for Isotope Research and Production Planning concluded in its Final Report (April 2000) that "the FFTF will not be a viable source of research radioisotopes." Furthermore, NASA has indicated to the DOE that it no longer needs plutonium for planned space missions. Finally, the DOE has thus far failed to clean up the nuclear waste that is already leaking from the Hanford nuclear facility.

The creation of nuclear waste is in itself unconscionably irresponsible, since it remains extremely dangerous to all life forms for millennia. To resume production of nuclear waste at the Hanford facility which is currently leaking nuclear waste into groundwater is unthinkable.

Therefore, the responsible course of action is to permanently shut down Hanford and clean up the nuclear waste at Hanford which the DOE agreed to do in the Hanford Clean_Up agreement.

Regards,
 Jonathan Lahr
 P.O.B. 80131, Portland, Oregon 97280

1676-1**1676-2****1676-3****1676-4****1676-1****1676-4****Response to Commentor No. 1676**

- 1676-1:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 1676-2:** The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.
- 1676-3:** DOE notes the commentor's concern about NASA's need for plutonium-238 for space missions. The May 22, 2000, correspondence from NASA to DOE identifies that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further

Commentor No. 1676: Jonathan Lahr (Cont'd)

Response to Commentor No. 1676

clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

- 1676-4:** DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

Commentor No. 1677: Lynn Sims

Comment DPEIS for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the US, Including the Role of the Fast Flux Test Facility

Thank you for the opportunity to comment.

The FFTF is a reactor in search of a mission. For years we have had hearing and from the first ominous rumblings of the idea of restarting FFTF, the project has been plagued with controversy and unsavory manipulations, first by Advanced Nuclear and Medical Systems. These folks wanted to "focus all immediate planning and PR efforts on 'humanitarian mission' of FFTF, DO NOT MENTION ANY PROPOSALS FOR INCREASING REACTOR ACTIVITY OR FUTURE BREEDER REACTOR, etc. The undeniable worthiness of the humanitarian mission must be highlighted and exploited to the maximum sensitivity of our society." It is not yet proven essential that we need these isotopes from FFTF rather than buying them from Canada or using other facilities. However the proponents have succeeded in embroiling everyone in an emotional debate over cancer treatment. I am not opposed to medical isotopes, but I am opposed to using FFTF.

Pu 238 can be purchased now from Russia to supply adequate amounts,.

The third mission to support civilian nuclear energy research and development activities, new nuclear fuel forms and new reactor designs seems to be the crux of the matter and most disturbing. Nuclear energy is expensive and risky and produces long lived radioactive waste. We have no satisfactory plan for the waste we already have. To promote producing more is unacceptable.

1677-1

1677-2

1677-3

1677-4

Response to Commentor No. 1677

1677-1: DOE notes the commentor's views. The United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs. While some existing DOE facilities may possess the potential capability or capacity to support research isotope production, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without disturbing the existing missions of these facilities. Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term (less than 5 years).

FFTF is not a breeder reactor.

1677-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.

1677-3: DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

1677-4: DOE notes the commentor's opposition to nuclear energy and the expansion of nuclear research. Clean, safe, reliable nuclear power has a role

Commentor No. 1677: Lynn Sims (Cont'd)

The waste disposal issue for FFTF is not adequately addressed and the waste which would be produced by any "advanced fuels" is not addressed AT ALL. We propose burdening future generations with lethal waste, and that is WRONG. Instead of expanding nuclear research, it should be alternate energies that are researched and expanded. Contrary to the NERAC chairman's opinion, THERE IS NO urgent sense that the nation must rapidly restore investment ...if it is to sustain a viable US capability in the 21st century. We do NOT need to invest more (too much has been spent already and too much damage already done!), we have to choose a better path altogether!! The premise for this mission for the FFTF is built upon sand and not reality.

1677-5

We will tolerate NO MORE waste producing operations at Hanford. Our city councils have said so, our State Legislators have said so, our Governor has said so, the people have said so. We are adamantly and unalterably OPPOSED to more waste production at Hanford. We are even more so opposed to the use of HEU or MOX fuels.

1677-5

1677-6

The EIS is inadequate in addressing the need for isotope, Pu 238 or research missions, the waste disposal issue, the fuel transport issues, the condition of the fuel stored to use, the real long term cost issues, the risks of not meeting current earthquake requirements and the costs of upgrades, the proliferation issues of promoting more nuclear commerce, or the values of the people in the region.

1677-7
1677-8

1677-9 1677-10

1677-11

1677-10 1677-12

We want all attention to focus on the major dilemmas of the tank wastes and K Basins and the mission of clean up. We do not want more bad decisionmaking, like those that led us to this terrible situation at Hanford. The only choice is Alternative # 5. Shut down FFTF.

1677-13

1677-14

Lynn Sims
3959 NE 42
Portland OR 97213

Response to Commentor No. 1677

today and in the future for our national energy security. In recognition of this need, nuclear energy research and development programs have been initiated to address potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) and to ensure that current nuclear power plants can continue to deliver adequate and affordable energy supplies. Because it is unlikely that existing facilities could fully and effectively support these nuclear energy research and development initiatives without disturbing their existing missions, DOE is proposing to enhance its nuclear facility infrastructure to also support these activities. Information on the need for nuclear energy research and development is provided in Section 1.2.3 of Volume 1.

1677-5: FFTF restart would not impact the schedule or available funding for existing cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram funds designated for Hanford cleanup, regardless of the alternative(s) selected. As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

As stated in Section 4.3.4.1.14 of the NI PEIS, "...the waste generation would not be affected by the type of fuel used (i.e., mixed oxide or highly enriched uranium)..."

1677-6: The commentor's opposition to the use of MOX and HEU fuels is noted. As stated in section 4.3.1.1.4 of the NI PEIS, "the spent [FFTF] nuclear fuel would be packaged in acceptable containers and shipped to a geologic repository for ultimate disposal." The NI PEIS assumes, for the

Commentor No. 1677: Lynn Sims (Cont'd)

Response to Commentor No. 1677

purposes of analysis, that Yucca Mountain, Nevada, would be the final disposal site for DOE's high-level radioactive waste and spent nuclear fuel. As directed by the U.S. Congress through the Nuclear Waste Policy Act, as amended, Yucca Mountain is designated, and is currently being characterized, as the candidate site for constructing a geologic repository for disposal of high-level radioactive waste and spent nuclear fuel. DOE has prepared a separate EIS, "Draft Environmental Impact Statement for a Geologic Repository for the Disposal of Spent Nuclear Fuel and High-Level Radioactive Waste at Yucca Mountain, Nye County, Nevada" (DOE/EIS-0250D, July 1999), which analyzes the environmental impacts from construction, operation and monitoring, related transportation, and eventual closure of a potential geological repository. Based on the categorization of DOE fuel types provided in Appendix A of the EIS, the spent oxide based fuels from FFTF are expected to be disposable in their current form.

1677-7: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining

Commentor No. 1677: Lynn Sims (Cont'd)

Response to Commentor No. 1677

the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Although research to identify other potential fuel sources to support these space exploration missions has been conducted, no viable alternative to using plutonium-238 has been established. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

In January 1997, President Clinton tasked his Committee of Advisors on Science and Technology (PCAST) to evaluate the current national energy research and development portfolio and to provide a strategy that ensures the United States has a program to address the Nation's energy and environmental needs for the next century. In its November 1997 report responding to this request, the PCAST Energy Research and Development Panel determined that restoring a viable nuclear energy option to help meet our future energy needs is important and that a properly focused research and development effort to address the potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) was appropriate. The PCAST panel further recommended that DOE reinvigorate its nuclear energy research and development activities to address these potential barriers. Section 1.2.3 provides information on the nuclear energy research and development mission.

1677-8: Alternative 1 does postulate that DOE might decide at some point to import mixed oxide fuel from Europe to fuel FFTF. At this time, however, DOE has not proposed to import this fuel through any specific port. If DOE ultimately decides to import fuel from Europe, it would perform a separate NEPA analysis to select a port. This review would address all relevant potential impacts of overseas and inland water transportation, shipboard fires, package handling, land transportation, as well as safeguards and security associated with the import of SNR-300 mixed oxide fuel through a variety of specific candidate ports on the east and west coasts. It would consider all public comments, including local

Commentor No. 1677: Lynn Sims (Cont'd)

Response to Commentor No. 1677

resolutions, concerning the desirability of bringing mixed oxide fuel into the proposed alternative ports.

In the event that DOE decides to enhance its nuclear infrastructure, it would not expose any population to high, unacceptable risks under any alternative. Any transportation activities that would be conducted by DOE would comply with U.S. Nuclear Regulatory Commission and U.S. Department of Transportation regulations. Associated transatlantic shipment would comply with International Atomic Energy Agency requirements. In Section J.6.2, DOE reviewed the potential maximum impacts from the marine transportation of mixed oxide fuel from Europe to a representative military port, Charleston, South Carolina, and overland transportation to Hanford. Also in that section, a bounding analysis demonstrates that the maximum potential radiological risks to the surrounding public from mixed oxide fuel shipments would be extremely small (e.g., less than 1 chance in a trillion for a latent cancer fatality per shipment from severe accidents at docks and in channels and less than 1 chance in 50 billion for a latent cancer fatality per shipment from overland highway accidents).

- 1677-9:** As stated in Section D.5 of Appendix D of the NI PEIS, “the FFTF core configuration would have to meet the nuclear safety requirements and limitations defined in the Final Safety Analysis Report and the Technical Specifications.” This applies to both irradiated reactor fuel that is being retained in sodium storage vessels and any new reactor fuel that would be used at FFTF. All nuclear fuel is subject to rigorous quality control and inspections prior to its use in the FFTF reactor core.
- 1677-10:** The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS.

Commentor No. 1677: Lynn Sims (Cont'd)

Response to Commentor No. 1677

- 1677-11:** FFTF and fabrication/processing facilities at the Hanford Site can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.2-4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from implementation of the alternatives, including normal operations and a spectrum of accidents that included severe accidents. The spectrum of accidents reviewed included both design basis and beyond-design basis seismic events. The environmental analysis showed that radiological and nonradiological risks associated with each of the alternatives is small. In addition, prior to restarting FFTF, a revised safety analysis report and probabilistic risk assessment which address the potential consequences of a variety of events, including earthquakes would be prepared.
- 1677-12:** The technology that is discussed in Sections S.3, 2.2.3 and A.1.4 of the NI PEIS would be used to chemically separate plutonium-238 and neptunium from irradiated targets and not from irradiated or spent nuclear fuel whereas reprocessing separates weapons grade plutonium 239 from irradiated nuclear fuel. As discussed in the separate Nuclear Infrastructure Nonproliferation Impact Assessment, published in September, 2000, use of this technology to produce plutonium-238 from irradiated targets will not create a nonproliferation threat. DOE is committed to full compliance with and support of the U.S. policy prohibiting reprocessing.
- 1677-13:** DOE notes the commentor's concerns regarding tank wastes and storage of defense mission (non-FFTF) spent nuclear fuel in K Basins. Although not within the scope of this NI PEIS, these activities are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As discussed in Appendix N, section N.3.2 of the NI PEIS, the DOE missions in this NI PEIS would not be in conflict with the land use plan or the Tri-Party Agreement. Additionally, DOE will not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.
- 1677-14:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Dear Ms Brown,

Attached are two items I wish to add to my submission regarding
 Draft PEIS , which also includes two prior emails, one on
 September 9th, 2000, and one on September 15th, 2000. Please
 contact me if you have not received both of those submissions,
 and/or to acknowledge receipt of this additional material. Thank
 you in advance.

1678-1

Response to Commentor No. 1678

1678-1: DOE notes the commentor's objection to the production of plutonium-238. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. None of the DOE missions stated in the NI PEIS are defense- or weapons-related.

DOE also notes the commentor's concern about safe operations at nuclear sites. The health and safety of workers and the public is a priority of the nuclear infrastructure program. The three DOE reactors considered for the program; FFTF, HFIR, and ATR; have operated safely and successfully for many years. (ATR has been in operation since 1967, HFIR since 1966, and FFTF operated from 1980 until it was shutdown for refueling in 1992. FFTF has been in standby status since then.) Safety analyses for HFIR and ATR have recently been revised, in 1998 and 1999 respectively, to reflect operational changes and to upgrade the facility accident analysis. Should a decision be made to restart FFTF, the status and condition of all safety systems will be assessed and appropriate actions taken, as necessary, prior to startup to assure safe operation. Commercial nuclear power reactors have also been considered as an alternative for target irradiation. Every commercial reactor is subject to oversight by the Nuclear Regulatory Commission, which uses a combination of safety standards, licensing, and inspection to insure that power plants are built and operated within acceptable safety limits. In the United States, commercial nuclear power plants have operated successfully since 1959 without having adversely affected the health and safety of the public.

Commentor No. 1678: Russell D. Hoffman (Cont'd)

The first item you should have already received from the original author, a gentleman from England whom I have communicated often with, about these matters.

The second item I have included is a news report about an incident at a Russian nuclear facility. It was sent to me by another person with whom I have exchanged many emails about these subjects, an American living in Japan.

The relevance of the second attachment should be obvious to you, but to make it clear, let me first say that I do realize that our technology is ever so slightly different from Russian technology ___ in fact, for all I know righty isn't tighty and lefty isn't loosy in Russia ___ but the fact is, they are undoubtedly trying just as hard as our own fellows are, NOT to have a meltdown. But they've already had at least one (Chernobyl) and it appears they came mighty close to having one last week. (And they lost an nuclear sub last month, too). Sure, their "professionalism" might have saved the day this time, but the incident is clearly being described as a seriously close call.

We should take the Russian's misfortune to heart. Our nuclear industry may be very good at "spin" and propaganda, but they are also human just like the Russians, and they have made mistakes and will continue to make mistakes. Some of the mistakes will be catastrophic unless we shut down and clean up NOW. I'm not saying there are no benefits to nuclear technology, but 99.9% of the nuclear technology we have is useless and all of it is dangerous.

The reasons presented by DOE in the Draft PEIS for wanting to expand their plutonium RTG production facilities are not the real reasons the Government wants the technology, and the dangers are far greater than the United States Government is willing to admit.

Sincerely,

Russell D. Hoffman
Concerned Citizen/Activist, Carlsbad, CA

 ENVIRONMENTAL IMPACT STATEMENT (PEIS)

DoE PLANS FOR EXPANDED PRODUCTION OF
 PLU_238 FOR FUTURE SPACE MISSIONS

Dear Colette E. Brown,

People in the UK are very concerned that the US seems to be increasing the amount of PU238 in the world. It is not in the interests of the world's people, only of a few scientists, and should therefore not be allowed to go ahead.

Please confirm that you will not be risking our lives, those of the rest of this world's creatures, and of our future generations. You have no right to do this, other than through the abuse of the power given to you by your transient position as the most powerful nation on earth.

This power is yours largely because of your image in the world as the home of freedom and promise, but should people's impression change to seeing you as a threat to their existence, or the well_being of their children, you will not be able to maintain your superiority.

Thanks

Andy Savage.

Subject: nuke news
Published on Sunday, September 17, 2000 in the Observer of
London Nuclear Disaster Averted
Russian power plant workers praised for 'heroic' operation to cool
reactors by Amelia Gentleman in Moscow

A nuclear catastrophe _ triggered by a fault in Russia's ageing
electrical grid _ was averted last week thanks to a 'heroic'
emergency operation by power station workers.

Details of how one of Russia's main nuclear plants and the
country's largest plutonium_processing centre came close to
disaster emerged slowly, prompting new alarm in a country still
reeling from a string of disasters.

Nuclear experts said 'courageous' workers at the Beloyarsk power
station and the Mayak reprocessing plant had managed to prevent
a Chernobyl_style accident. Environmental campaigners warned
that the crumbling state of Russia's infrastructure meant such close
escapes could be expected with growing frequency.

Preliminary investigations showed that a short circuit in the
regional electricity system caused a sudden blackout in three
nuclear reactors in the Urals. Its cause remains unclear, although
it has been widely attributed to a fault in the poorly maintained
network.

Unexpected power cuts at nuclear plants, which are designed to
work ceaselessly, pose a severe risk. There was controversy
yesterday over whether built_in emergency electricity systems took

Response to Commentor No. 1678

Commentor No. 1678: Russell D. Hoffman (Cont'd)

manually. Residents may have heard steam spurting suddenly from the cooling plant, as pressure in the system mounted.

One of the immediate results of the shutdown at Beloyarsk was a power failure at the nearby Mayak processing plant in the Chelyabinsk region, where two reactors were in operation.

The potential consequences of malfunction at the vast, high_security Mayak plant are no less alarming. Scientists there take spent nuclear fuel from all over the former Soviet Union and convert it into weapons_grade plutonium and high_level waste. The site is estimated to contain 120 million curies of radioactive waste _ much of it held in liquid form in vast tanks _ including seven times the amount of strontium_90 and caesium_137 that was released in Chernobyl.

Mayak was without power for 45 minutes and the reactors were automatically shut down. The head of the plant, Vitaliy Sadovnikov, told a local newspaper that this was the worst blackout the station had faced and it was only his staff's 'near_military discipline' which prevented a serious accident.

He said the back_up electricity provider, designed to cool down the reactors in the event of such an emergency, had only been started up 30 minutes after the plant was brought to a halt.

But yesterday Bulat Nigmatulin, a Deputy Minister at Minatom, said these reports were lies. 'This unpleasant situation came about because for the first time there was a breakdown in the local energy system,' he said.

'The atomic installations at Beloyarsk and Mayak are protected against this kind of accident, and on this occasion everything went exactly according to plan, with on_site emergency electricity sources starting up immediately.'

Response to Commentor No. 1678

Commentor No. 1678: Russell D. Hoffman (Cont'd)

He said 30-minute delays would have led to explosions in the reactors.

Officials at both plants report there was no radiation contamination as a result of the emergency shutdowns. Environmental activists in the region continue to test the site, but are so far satisfied that this is the case.

Although a crisis was averted, analysts agree that both mishaps are sobering examples of the ease with which a disaster could be sparked.

'The fact that the grid was down for 45 minutes is extremely alarming, because it means that control was temporarily lost in these crucial nuclear installations,' said Tobias Muenchmeyer, atomic energy expert with Greenpeace.

Some commentators linked the initial power cut to the campaign by Russia's electricity monopoly to cut off those customers with outstanding debts. They speculated that by suddenly switching off one area of the grid, Unified Energy Systems might have precipitated the short circuit. UES officials deny this, and a government commission has been set up to investigate.

State officials are eager to promote atomic energy as a means of heating and powering their vast country. A strategy document published by Minatom in May advocated that Russia should radically increase its nuclear capacity over the next 20 years, building up to 24 new reactors.

Independent experts affirm that over the past five years the number of emergency shutdowns in Russian reactors has dropped fourfold, and over the past two years financing of safety monitoring has increased. But the memory of the Chernobyl disaster 14 years ago remains uncomfortably fresh.

 Subject: NIPEIS

Dear Mr. Secretary,
 Dear Ms. Brown,

I am writing to you Mr. Secretary to express my dismay that the people that work for you never seem to tell you what the people have to say.

I attended the meeting here in Richland on the Nuclear Infrastructure PEIS. It was well attended and here in my home town a lot of people _ the usual crowd _ turned out to yell and holler for their share of the pork. But many more like me ain't willing to say nothin for fear we would be run out a town.

They say they are for isotopes. But I gotta tell ya _they aren't. Sure they believe they are. But that don't mean nothin. If they was really for isotopes to cure cancer, they would run screaming from the reactor here.

It was born in a nuclear wet dream and cost more money than I care to think about. Sure, it has done some good _ when it was running. But not very much.

And if they get their way, it will cost us a bucket load more. I am afraid it will cost so much that it will price us right out of the isotope business.

If you want to do some good _ its time to say enough. Shut down the Fast Flux Test Facility forever.

But what really made me made was when Ms. Brown came and told us that we got to comment on the EIS _ but that we don't git to

1679-1

1679-2

1679-3

1679-4

Response to Commentor No. 1679

- 1679-1:** DOE notes the commentor's views regarding the Richland, Washington public hearing. It is DOE policy to encourage public input on matters of regional, national and international importance as part of its commitment to facilitate a public participation process that is open and unbiased. DOE is aware that there is a considerable difference of public opinion regarding the alternatives evaluated in this NI PEIS to accomplish the DOE missions, including direct support as well as opposition to Alternative 1, Restart FFTF. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the environmental impact analysis of DOE's proposed alternatives for meeting the mission requirements, and gave equal consideration to all comments, regardless of how or where they were received. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.
- 1679-2:** DOE notes the commentor's concern about the cost of operating FFTF. This concern, and other issues are addressed in a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Volume 2, Appendix P.
- 1679-3:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 1679-4:** In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the environmental impact analysis of DOE's proposed alternatives for meeting mission requirements. In preparing the Final NI PEIS, DOE carefully considered comments received from the public. The costs and nuclear nonproliferation impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such ancillary documents need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE

Commentor No. 1679: Bette Simpson (Cont'd)

comment on nothing else. Just who does she think she is? Where does she think she gets her paycheck from anyway?

1679-4 (Cont'd)

Near as I could tell, Ms. Brown tried to sell us a bill a goods. The EIS don't say squat about how much plutonium NASA needs. It just claims they need a lot and goes on from there. And she don't say nothin about what the infernal CIA and them other spies want. If you ask me its a coverup.

1679-5

They don't want the reactor to save people from cancer. They want it for spy stuff. That's the truth of it.

1679-4

And then to tell us we can't comment on the costs or the nonproliferation things. Lady where do you get off? If they made mistakes in there, it could mean doing things that cause huge damage to the environment. But no _ we don't get no say in that.

1679-5

Well I gonna make my say. We got enough bombs and we got enough reactors. Use what you got until you show you need more instead a just makin excuses to run more reactors. We don't need em.

1679-3

Mr. Secretary, I hope you shut this thing down for good. And thats all I gots to say.

Bette

Response to Commentor No. 1679

mailed these documents to more than 730 interested parties on August 24 and September 8, 2000, respectively. Both reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided summaries of the Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment in Appendixes P and Q, respectively, in the Final NI PEIS.

1679-5: DOE has no hidden agenda for weapons research or use of FFTF for classified missions. The only missions being considered are those analyzed in the NI PEIS, which are the production of isotopes for medical research, and industrial uses; plutonium production for future NASA space exploration missions; and U.S. nuclear research and development needs for civilian application.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Although research to identify other potential fuel sources to support these space exploration missions has been conducted, no viable alternative to using plutonium-238 has been established. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions be lost. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Commentor No. 1680: Elan Banehama

Colette E. Brown
 U.S. Department of Energy

Dear Colette E. Brown,

I would like to offer these comments, concerns, objections to the
 DOE's PLANS FOR EXPANDED PRODUCTION OF PLU_238
 FOR FUTURE SPACE MISSIONS

__NASA is not doing enough to develop environmentally benign
 power sources for space missions. European Space Agency (ESA)
 has now developed high_efficiency solar cells for deep space
 missions.

1680-1

__The plutonium production/fabrication process for space nuclear
 power missions has recently led to several worker contamination
 accidents. An expansion of production will only worsen this
 problem.

1680-2

__Expanding the number of launches of nuclear powered space
 devices from Cape Canaveral on rockets with 10% failure rates will
 only increase the possibility of a deadly mishap.

1680-3

__The massive cost of expanded production of plu_238 can not be
 justified at a time when DOE admits it needs over \$300 billion to
 clean_up existing problems at DOE facilities.

1680-4

Thank you,

Elan Banehama
 77 Grove Ave., Leeds, MA 01053, 413.586.7701 voice

Response to Commentor No. 1680

- 1680-1:** DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions, although issues such as NASA research priorities are beyond the scope of this PEIS. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch.
- 1680-2:** Plutonium-238 processing facilities can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Sections 4.2-4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from plutonium-238 processing, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that the radiological and nonradiological risks associated with plutonium-238 processing would be small.
- 1680-3:** DOE notes the commentor's concern for NASA's use of nuclear materials for space missions, although issues such as NASA research priorities are beyond the scope of this PEIS. issues such as NASA research priorities are beyond the scope of this PEIS. Auto forwarded by a Rule

The restart of the Fast Flux Test Facility for the medical isotope mission and to support the PU 238 mission is vitally important to the United States. The medical isotope production process will allow further development of isotopes for medical and research needs. Let us not be dependant on foreign sources for our medical isotope needs.

Put FFTF back in to production of isotopes.

1686-1

Response to Commentor No. 1686

1686-1: The commentor's position regarding creation of nuclear waste at INEEL is noted.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. The waste minimization program for INEEL is described in Section 3.3.11.8 of Volume 1. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and appropriate DOE orders.

Re: Use of Pu_238 for space based power supplies:

I am totally against this for many reasons:

Considering what happened to the Mars Polar Lander it is obvious that NASA's "one in a million" chance of the spacecraft impacting earth was grossly overstated. What if the day after Cassini crashed into the earth, impacting Manhattan, we all got to read in the papers the next day: "OOPS, the contractor was working in Lbs. and JPL was using Kilos". Prior to the Polar Lander, I'm sure no one would have believed such a inconceivably silly mistake could occur.

Since NASA must agree that the odds were really not one in a million but with just one more data point added by the ill fated Polar Lander more like one in a thousand then one must also agree that NASA's extrapolation of potential risk which was partly based on this estimate was also understated and that at least some of the concerns of those opposed to the launch/flyby turned out to be well founded.

I do not believe that anyone, including NASA or DOE, could or has accurately simulated the forces exerted on a non_aerodynamic 6 ton spacecraft entering the atmosphere at 42,500 MPH. I don't believe we have the technical ability to accelerate an object even a fraction of the size and shape of Cassini to over 62,000 feet/sec. on the earth's surface! As far as the forces involved, to put it in perspective, Casinni's weight is almost the same as our Apollo Command module. Apollo's re_entry speed was only about 1/2 of Casinni's potential re_entry speed. The Apollo re_entry had to

1687-1

Response to Commentor No. 1687

1687-1: DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternatives energy sources for space missions, although issues such as NASA's research priorities are outside the scope of this NI PEIS. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. The Cassini fly-by occurred as planned with no release of nuclear materials.

Plutonium-238, plutonium-239, and plutonium-240 decay with emission of an alpha-particle to uranium-234, uranium-235, and uranium-236, respectively. Plutonium-241 decays with emission of an electron to americium-241. The half-lives of plutonium-238 and americium-241 are approximately 88 years and 432 years, respectively. Plutonium-238 has a much higher specific activity (number of curies per gram) than americium-241. The specific activity of plutonium-238 is approximately 5 times larger than the specific activity of americium-241. Inhalation and ingestion dose coefficients for plutonium-238 and americium-241 differ by ten percent or less.

Commentor No. 1687: Arthur Doucette (Cont'd)

be precisely flown to within a degree or so in order to keep the approach angle shallow enough that the energy of re_entry was dissipated over sufficient time to keep the shield temperatures down to a manageable 5,000 degrees F. Apollo gave up over 86,000 KiloWatts of energy during it's controlled approach, Casinni could have easily arrived at the earth's surface with that much energy or more still left. On a perpendicular trajectory it would traverse the atmosphere in a little over 10 seconds and hardly slow down at all. Does the DOE realize the destructive force of a 6 ton object moving at this speed impacting almost anywhere? What about in a densely populated area? To claim that the RTG's could withstand an impact into the earth's surface at these speeds and potential temperatures and remain intact was and is preposterous.

Given that NASA agrees that there was a risk and that the argument is really about the level of risk, where is the justification that there is anything we will learn from Saturn or the other outer planets that warrants taking this risk? Is NASA just assuming it is worth the risk when they support these deep space probes using plutonium? We have sent many deep space probes with RTG's, can NASA name just one life which has been saved or even extended a short while because of what we have learned? Could NASA list just one improvement to mankind that has come from what we have learned from ANY of our deep space probes? Can NASA point to any potential improvement to mankind that couldn't be achieved without a RTG powered space probe?

NASA believes that "Other than plutonium generators, there is no practical source of electrical power for spacecraft that go to the outer planets." Has NASA considered that maybe we shouldn't explore them until we can develop a SAFE and practical source of electrical power for deep space travel? Is it not possible that if we spent the same 3 Billion in research to develop such a safe and practical source of power that the research could also have many practical benefits to those of us back on earth? In the article by Dick Thompson (Time) he writes on this issue: "What will be lost if Cassini is canceled? As Galileo's spectacular images of Jupiter and

1687-1
(Cont'd)

Response to Commentor No. 1687

Commentor No. 1687: Arthur Doucette (Cont'd)

its moons showed last spring, an extended visit is really the only way to study a distant planet. Saturn's rings are perhaps the most mysterious and magnificent objects in the solar system. Its moon Titan has its own atmosphere, filled with organic chemicals; scientists suspect it's just the sort of place life could have gained a foothold. Pulling the plug on Cassini now, when we're on the verge of exploring such a place, would be a missed opportunity of astronomical proportions." While this is stirring prose there is really nothing of substance alluded to, no actual benefits to be gained. The fact is Space exploration is direct science not applied science. Any benefit we get from this is coincidental and with Space Science, any coincidental benefits are most likely to be gained only after extremely long spans of time. Therefor delaying the probes for a decade or so, until they can be made safely has no negative impact on anyone and the chance of discovering something coincidentally valuable while developing the required safe power systems is equally great so in reality, nothing is lost. Any money spent on Direct Science is a gamble and we never know the odds.

I'm particularly not in favor of using the earth for gravity assists to the outer planets and certainly not when they are carry plutonium 238 power supplies. Several key issues are risk Vs reward and potential terminal damage to public support for space exploration. I'm sure that if Cassini had hit the earth or atmosphere, that future use of RTG's on space probes would become problematic and that deep space research in general might be significantly curtailed. I believe this would be true regardless of the measured health impact of the plutonium on board. What was the probability of Cassini hitting the earth? Certainly not high, but then not as low as NASA was saying either. The final trajectory towards the earth was planned such that in almost every failure mode of the final course correction, the failure would result in Cassini missing the earth by a wider margin then planned. The danger was in navigation errors prior to the final burn which is exactly what caused MPL to impact on Mars. When they did the final burn for the MPL it was not where they thought it was because of previous navigation errors caused by

**1687-1
(Cont'd)**

Response to Commentor No. 1687

Commentor No. 1687: Arthur Doucette (Cont'd)

improper calculation of the spacecraft's weight. The other dangers include loss of communication with the spacecraft due to mechanical damage: antenna not unfolding, micrometer impact or the not uncommon unexplained failure. Because of the path the spacecraft needed in order to use Earth as a gravity assist then failures of this type could leave Cassini in a near Earth orbit, i.e. if it didn't get all of the three specific gravity assists it needed it would never get the energy needed to accelerate to Jupiter for its final assist to Saturn. If it got stuck in a near Earth orbit then given time its likely hood of impacting the Earth go way above the likelihood of the final course correction causing a problem. The plutonium on board would remain a problem for thousands of years.

The second area I am in disagreement with NASA is on the toxicity of plutonium. Specifically plutonium 238 which comprised 71% of the plutonium on Cassini. (13% P239, 2% P240) _ an important point is that plutonium decays into americium and it has its own set of problems, in fact decayed plutonium is considered more dangerous then the starting material. I have included several references from respected sources, none from fringe scientists or others with their own agendas.

The first is from the Univ. of Penn. on the health risk of Plutonium based on its form:

On the other hand, plutonium inside the body is highly toxic. Solid plutonium metal is neither easily dispersed nor easily inhaled or absorbed into the body. But if plutonium metal is exposed to air to any degree, it slowly oxidizes to plutonium oxide (PuO₂), which is a powdery, much more ispersible substance. Depending on the particle size, plutonium_239 oxide may lodge deep in the alveoli of the lung where it has a biological half_life of 500 days, and alpha particles from the oxide can cause cancer. Also, fractions of the inhaled plutonium oxide can slowly dissolve, enter the bloodstream, and end up primarily in bone or liver.

**1687-1
(Cont'd)**

Response to Commentor No. 1687

Commentor No. 1687: Arthur Doucette (Cont'd)

Plutonium oxide is weakly soluble in water. If it is ingested in food or water, only a small fraction (4 parts per 10,000) is absorbed into the gastrointestinal tract. However, it may take just a few millionths of a gram to cause cancer over time. In animals, small doses induce cancer, especially in lung and bone.

Plutonium's Risk to Human Health Depends On Its Form

Last Revision Date: Thursday, 26_Aug_1999 23:27:58 EDT

Copyright 1 1994, The Trustees of the University of Pennsylvania

The point of this article is that the most dangerous form of Pu is the oxide which is what Cassini's fuel consisted of.

The next is from the DOE funded Amarillo Natl. Research Center (ANRC) which basically says extremely small particles of Pu inhaled will cause cancer:

The main danger from plutonium comes from inhalation. If inhaled, plutonium can become stuck in the tissues of the lungs (if the particles are smaller than one micron _ .00004 inches _ in diameter). Although the radioactivity of plutonium is not high, the radiation would be concentrated in a single place, and because the plutonium would be in direct contact with sensitive tissue, the alpha particles could damage the lungs, this damage would typically show up as cancer after a period of years.

ANRC The U.S. Department of Energy and the State of Texas formed the Amarillo National Research Center (ANRC) to conduct scientific and technical research, advise decision makers, and provide information on nuclear weapons materials and related environment, safety, health and non_proliferation issues.

The next is from the Lawrence Livermore National Laboratory in a very well written study on the toxicity of plutonium. This section deals with determining the risk factors, the appendix is the supporting calculations:

Response to Commentor No. 1687

Commentor No. 1687: Arthur Doucette (Cont'd)

The total effective dose equivalent defined in Limits for the Intake of Radionuclides by Workers, International Commission on Radiological Protection (ICRP) Publication 30 (Pergamon Press, Cambridge, UK, 1979), is a weighted sum of organ dose equivalents multiplied by appropriate risk weighting factors. [10] These values are based on effects observed at relatively high exposures. The usual (and conservative) assumption is that the risk of getting cancer at lower exposures is linearly related to the exposure. This risk would be in addition to the natural incidence rate of fatal cancer, which is approximately 20% for the United States population. Thus, if an individual inhaled 0.0008 milligrams of plutonium, that individual's risk of developing fatal cancer as a result of this exposure would be increased from 20% to 21%. If each of 10 individuals inhaled 0.0008 milligrams of plutonium, the probability that one of them would get cancer would be 10%, since each individual has a 1% risk. That is, the probability of a cancer appearing in an exposed population depends simply on the amount of plutonium collectively inhaled. For each 0.08 milligrams of plutonium inhaled by the exposed population (regardless of the size of the population), one additional fatal cancer would be expected to occur.

Appendix A. Risk and Dose Vs Plutonium Intake

The cancer risk associated with the inhalation or ingestion of a given amount of plutonium can be determined as the product of three quantities: (1) the activity (activity is measured in curies) of plutonium per milligram, (2) the dose (measured in rem) delivered per unit of plutonium activity taken in, and (3) the risk of cancer per unit dose of radiation delivered to the body by that plutonium. The calculations below follow that pattern.

For inhalation, we have $.08 \text{ millicurie/mg} \times 3.1 \times 10^5 \text{ rem/millicurie} \times 5 \times 10^{-4} \text{ Cancer/rem} = 12 \text{ cancer/mg}$ which corresponds to 0.08 mg/cancer.

For ingestion, we have $.08 \text{ millicurie/mg} \times 52 \text{ rem/millicurie} \times 5 \times 10^{-4} \text{ Cancer/rem} = .0021 \text{ cancer/mg}$ which corresponds to 480 mg/cancer.

Response to Commentor No. 1687

Commentor No. 1687: Arthur Doucette (Cont'd)

A Perspective on the Dangers of Plutonium W. G. Sutcliffe, R. H. Condit, W. G. Mansfield, D. S. Myers, D. W. Layton, and P. W. Murphy. Lawrence Livermore National Laboratory, April 14, 1995

The problem with the previous article is it dealt with P239 in it's calculation. As it turns out P238 is far more dangerous, in fact as the following excerpt from the ATSDR shows the radiation per gram of P238 is 260 times as great as P239:

Plutonium has been released to the environment primarily by atmospheric testing of nuclear weapons and by accidents at weapons production and utilization facilities. In addition, accidents involving weapons transport, satellite reentry, and nuclear reactors have also released smaller amounts of plutonium into the atmosphere. When plutonium was released to the atmosphere, it returned to the earth's surface as fallout. Average fallout levels in soils in the United States are about 2 millicuries (mCi)/square kilometer (about 0.4 square miles) for plutonium_239 and 0.05 mCi/square kilometer for plutonium_238. A millicurie is a unit used to measure the amount of radioactivity; 1 mCi of plutonium_239

Response to Commentor No. 1687

Commentor No. 1687: Arthur Doucette (Cont'd)

weighs 0.016 gm, while 1 mCi of plutonium_238 weighs 0.00006 gm.

Agency for Toxic Substances and Disease Registry
ATSDR Public Health Statement, December 1990

If you review the formulas presented in the preceding paper you will see that there is a direct correlation of mCi/g to the toxicity. Thus where the previous formula suggests .08mg per cancer for inhaled Pu239, substituting the mCi rate of Pu238 yields .0003 mg/cancer. Thus making Pu238 260 times more lethal per gram!

I would agree that even in most re_entry scenarios, the likelihood of a catastrophe is very small, but there do exist plausible scenarios that could result in massive deaths and illness. This is the risk Vs reward issue. I've followed NASA since before the first Redstone took Carpenter on his suborbital flight. Never before, even considering the Apollo pad fire and Challenger, have I ever read or seen so many people and groups bashing NASA consistently and with such anger as over Cassini and launches containing RTG's. Simply from a public relations point of view Cassini will likely remain a net loss to NASA even if it succeeds in its planetary exploration mission. Future launches of Pu238 will continue to result in a ever growing part of the public which opposes their mission.

Sincerely,
Arthur Doucette

|| 1688-2

Response to Commentor No. 1688

1688-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1688-2: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Ms. Colette Brown
 DOE, Office of Space and Defense Power Systems

Dear Ms. Brown,
 Your Department's recent proposal to expand the civilian nuclear infrastructure, outlined in the Draft Programmatic Environmental Impact Statement for accomplishing expanded civilian nuclear energy research and development and isotope production mission in the United States, including the role of the Fast Flux Test Facility, raises significant nuclear weapons proliferation and environmental issues.

As a member of the Snake River Alliance I have become aware of the serious nuclear contamination and waste problems at INEEL. INEEL is one of the most contaminated areas in America. The Department's recent estimate on cleaning up our site is \$22 billion and is expected to take 50 years__longer than any other DOE facility. In addition, we have over 360 individual superfund sites within the 890 sq. mile area that comprises INEEL. With this known, the last thing we need is a plan to generate more nuclear waste at a site that needs more waste like the DOE needs security scandals. Out of concern for Idaho's environment, I strongly urge you not to pursue the plutonium_238 production mission outlined in your PEIS.

One of the most daunting problems confronting cleanup at major DOE facilities such as Hanford and INEEL, is the solidification of liquid high_level nuclear waste. Your current plan for plutonium_238 production entails the generation of approximately 288,000 additional gallons of this waste over the project's 35 year span. While this is a small portion of Hanford's high level waste, it

1689-1**1689-2****Response to Commentor No. 1689**

1689-1: The commentor's position regarding plutonium-238 production at INEEL is noted. Production of plutonium-238 at one or more of the candidate sites would be conducted in support of NASA's deep space missions Volume 1, Section 1.2.2 of the NI PEIS). As discussed in Sections 4.3.2.1.13 and 4.4.2.1.13 of the EIS, selection of the Fluorinel Dissolution Processing Facility and/or the Advanced Test Reactor to support production of plutonium-238 would have no significant impact on the waste management system at INEEL. Use of any of the facilities proposed in this PEIS for the stated missions would not impact cleanup missions at DOE sites.

Grand Teton National Park and Yellowstone National Park are approximately 139 kilometers (80 miles) and 112 kilometers (70 miles), respectively, from the boundary of INEEL. Airborne radioactive and nonradioactive pollutants that could result from implementation of the nuclear infrastructure alternatives would not contaminate Grand Teton National Park or Yellowstone National Park. As discussed in Chapter 4, Appendix H and Appendix I, for both normal operations and accidents, no significant environmental impacts are expected at distances in excess of 80 kilometers (50 miles) from the INEEL.

Waste management and cleanup efforts at INEEL are discussed in Section 3.3.11. Selection of candidate facilities at INEEL for support of DOE's nuclear infrastructure missions would not impact the cleanup missions at INEEL.

1689-2: The use of proposed alternative facilities associated with processing of neptunium-237 targets would have no impact on schedules or available funding for high-level radioactive waste programs at either Hanford or INEEL. At INEEL, the tanks would not be used although certain facilities at the Idaho Nuclear Technology Engineering Center (INTEC) would be used to treat the wastes resulting from processing the irradiated targets. These are reliable systems that would process a maximum of 1,050 cubic meters of low-level radioactive waste over the 35-year nuclear infrastructure operational period. The higher activity waste would be treated as a solid form via a stand-alone vitrification system, separate from any tank waste treatment system. At Hanford, the existing high-level radioactive waste facilities would not be used, and as analyzed in the PEIS, no existing or planned high-level radioactive waste facilities would be used to treat the wastes resulting from processing the irradiated targets.

Commentor No. 1689: Suzanne C. Kneeland (Cont'd)

is approximately one fifth of what we have remaining here in Idaho, which makes it a very significant amount. Previous leakage of this waste at INEEL and Hanford threatens our water supplies. What we certainly don't need is any more of this most highly problematic of waste forms.

**1689-2
(Cont'd)**

Given the certain risks inherent in production of plutonium, the justified need for this material would have to be tremendous, and the PEIS does a poor job of providing ample justification. Beyond the risks involved in production, and the aforementioned resulting waste problem, there is also the issue of an accident occurring upon lift_off or reentry of a space probe carrying this material. The cassini probe, launched in 1997, carried 72 pounds of Pu_238. The potential for an explosion during lift_off or upon an inadvertent reentry during the fly_by phase, gave many in the scientific community pause, including scientists within NASA. According to NASA's own conservative estimate, a burn up upon reentry of the cassini probe could have caused 2,300 cancer fatalities, independent analyses ranged much higher. This potential for a catastrophic release of this extremely toxic material will remain so long as the US government remains committed to the use of plutonium_238. If DOE is to have a role in developing power systems for NASA's instrumentation, it should focus on promising solar technology, an alternative that has been promoted in the European scientific community.

1689-3

There are also proliferation concerns as it pertains to this plan. A return to production of this isotope, however poorly justified, means a return to the use of aqueous reprocessing at DOE facilities where this technology has been used to extract bomb material for the weapons program. From President Carter to presidents Bush and Clinton, US policy has been to halt reprocessing in this country in order to set a global precedent to curtail the spread of nuclear weapons material_a noble effort in serious need of bolstering through action.

1689-4

Indeed, an otherwise lukewarm Nuclear Infrastructure

1689-5

Response to Commentor No. 1689

1689-3: Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed production of plutonium-238 are relatively low and are discussed in detail in Chapter 4 of Volume 1, and Appendixes H, I, and J of Volume 2 in the Final NI PEIS.

1689-4: DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions, although issues such as NASA research priorities are beyond the scope of this PEIS. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch.

Commentor No. 1689: Suzanne C. Kneeland (Cont'd)

Nonproliferation Impact Assessment conducted by your Office of Arms Control and Nonproliferation questions whether our commitment to nonproliferation isn't weakened by the use of the Fluorinel Dissolution Process Facility within Building 666 at INEEL. INEEL's reprocessing facility is next door to a wet storage unit for Navy spent fuel, which contains a greater than average amount of highly enriched uranium. It was reprocessed from 1953 to 1989 at INEEL for the weapons program. Use of this facility to carry out plutonium_238 extraction, especially considering the dubious need for this isotope, at the very least raises the concern that DOE is not fully committed to ending reprocessing. The international community cannot be expected to trust DOE's civilian_mission claim when an agency devoutly committed to development of weapons uses a nuclear weapons technology at a weapons facility.

Considering all these factors that could adversely affect our environment and commitment to nonproliferation, I strongly urge you to select alternative 5 in the current PEIS. This alternative would allow the Advanced Test Reactor at INEEL to continue producing medical and industrial isotopes for the commercial sector and would not lead to the production of anymore highly radioactive liquid waste at Hanford or INEEL. The main mission at these two facilities has been and should continue to be cleanup of the mess left over from previous nuclear weapons work. Additional waste production would interfere with this already difficult and expensive work. Alternative 5 also calls for the decommissioning of the FFTF reactor at Hanford. FFTF is an aging breeder reactor whose use would be inconsistent with United States policy to discourage use of this technology due to the capability this class of reactors has to produce more plutonium than is consumed. Thank you for the opportunity to comment on this plan. As a downwinder of the INEEL site, I fear Yellowstone and Grand Teton National Parks are also unprotected from harmful airborne pollutants from INEEL. We find out more and more each day about INEEL's toxicity and lies and cover_up. I feel our community has learned a lot recently in a short amount of time, and citizens are deeply concerned about the

1689-1

Response to Commentor No. 1689

1689-5: It is not true that resumption of plutonium-238 production constitutes a return to reprocessing. The aqueous technique that would be used to separate plutonium consisting of over 80 percent plutonium-238 and neptunium from the irradiated target is similar to the technology that was used in portions of the complex process to extract plutonium-239. However, as discussed in PEIS Sections S.3, 2.2.3 and A.1.4, this technology would be used to chemically separate plutonium-238 and neptunium from irradiated targets and not from irradiated or spent nuclear fuel, whereas reprocessing separates weapons grade plutonium-239 from irradiated nuclear fuel. Plutonium-238 extraction is not reprocessing. Unlike plutonium-239, plutonium-238 is not used in nuclear weapons, but rather it would be used as a power and heat source for NASA space missions.

The Nuclear Infrastructure Nonproliferation Impact Assessment, published in September 2000, confirms that extracting plutonium-238 from irradiated targets would not undermine nonproliferation goals. In this report, DOE recognizes that proliferation concerns might be raised related to one of the technical assessment factors, "reduction in attractiveness of material forms," due to the fact that, in the extraction of plutonium-238, the remaining unconverted neptunium, a weapons useable fissile material used as target material for conversion into plutonium-238, must also be recovered (not produced), purified, and recycled. This is unavoidable (unless the United States elects to neither produce or purchase plutonium-238), and it impacts all PEIS alternatives and options, including the No Action Alternative and Alternative 5: permanently deactivate FFTF with no new missions at U.S. facilities. However, while the fact that concerns might be raised is a valuable input to the record of decision process, it does not constitute an inconsistency with or departure from nonproliferation policy, and plutonium-238 is needed to fulfill our missions. Further, in the event that plutonium-238 production is resumed in the United States, the total separated stocks of neptunium would be reduced over time in an irreversible manner since there is a moratorium on U.S. spent fuel reprocessing. This overall reduction in a weapons-useable material would mitigate the potential concerns related to material attractiveness, and offer an additional method to pursue U.S. nonproliferation goals. DOE's proposed approach in this mission, and its rigorous nonproliferation impact assessment, demonstrate its commitment to nonproliferation policy, domestically and in the international community.

Commentor No. 1689: Suzanne C. Kneeland (Cont'd)

mess being created over there each day. This plutonium plan is only one in a long list of foolish ideas from the DOE and INEEL. It's always so easy to say, "We didn't know that much back then...we know a lot more now," while explaining away past mistakes. Then we line up more foolish ideas that we do not know the consequences of until generations later. Everyone's always looking for the "cure" for cancer or AIDS...let's now look at the causes of these diseases which can be the direct result of living too close to a Nuclear Reactor Test Site or DOE facility. I am outraged at the poisoning of children and adults in Oak Ridge, Tennessee and the children in Winona, TX. People are dying every day because we are poisoning ourselves and our children in this mad race to produce bombs that will surely kill us all accidentally or on purpose. As a teacher and caretaker of children, I implore you to stop the madness of plutonium production. Give those INEEL folks jobs cleaning up the huge messes safely.

Thank you for your time.
Sincerely,
Suzanne C. Kneeland

**1689-1
(Cont'd)**

1689-7

1689-1

Response to Commentor No. 1689

The juxtaposition of Fluorinel Dissolution Process Facility (FDPF) in INEEL Building 666 to wet storage of highly enriched uranium Navy spent nuclear fuel, and its previous mission of reprocessing spent nuclear fuel, were rigorously and objectively evaluated in the Nuclear Infrastructure Nonproliferation Impact Assessment published in September 2000. In no uncertain terms, this report discusses the proliferation concerns raised in the areas of facilitating cost-effective international monitoring and supporting negotiation of a verifiable Fissile Material Cutoff Treaty (FMCT), and outlines what is needed to mitigate these concerns. This is a valuable input to the record of decision process.

Most of the concerns and uncertainties surrounding the use of FDPF are associated with its history as a defense programs facility and the resulting lack of transparency that could be afforded in the event that international monitoring becomes desirable under an FMCT. This is a different set of concerns than those expressed in the comment. The fact is, that since it is well known that FDPF has a long history of Navy defense missions, and since the described mission (plutonium-238 extraction) in the PEIS does not involve the production of special fissile material, sufficient transparency could possibly be provided by a managed access regime that would meet the requirements of FMCT verification. If this could be done, the aforementioned concerns would be mitigated.

1689-6: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF. It should be noted that medical isotopes would continue to be produced at ATR regardless of which alternative is selected in the Record of Decision. The FFTF would produce spent nuclear fuel and low-level radioactive waste, and as discussed throughout Section 4.3 of Volume 1, none of the proposed alternatives would add waste to the high-level waste tanks at Hanford or INEEL. Also, it should be pointed out that while FFTF supported the breeder reactor program, it is not itself a breeder reactor, but rather a fast flux research reactor.

Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the

Commentor No. 1689: Suzanne C. Kneeland (Cont'd)

Response to Commentor No. 1689

Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

With respect to cleanup of wastes at Hanford or INEEL, the proposed action and the existing cleanup missions are independent programs and actions related to one will not impact the other. While the cleanup activities at both Hanford and INEEL are high priority to DOE, it should be noted that the cleanup of legacy wastes is beyond the scope of the NI PEIS.

1689-7: The commentor's positions on plutonium production and health impacts of nuclear reactors are noted. As discussed in Section 1.2.2 of Volume 1, under the nuclear infrastructure alternatives, plutonium-238 would be produced to support NASA's deep space probes. Plutonium-238 is not used to make nuclear weapons.

Impacts on public health in the Oak Ridge Area that would occur under implementation of the nuclear infrastructure alternatives are discussed in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.9, 4.4.1.1.9) and Appendixes H through J of Volume 2. Implementation of the alternatives would not be expected to result in latent cancer fatalities among populations residing in the potentially affected area surrounding the Oak Ridge Reservation.

Ms. Colette Brown
DOE, Office of Space and Defense Power Systems

Dear Ms. Brown,

I support Alternative 5 in which production of plutonium would not be re_initiated. We need to focus on cleaning up our past mistakes, rather than creating new ones.

Chip Ruberry
Boise, ID

1690-1

Response to Commentor No. 1690

1690-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF. DOE also notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations. Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

Sent: Monday, September 18, 2000 3:47:28 PM
To: INFRASTRUCTURE_PEIS, NUCLEAR
Subject: Citizen comment
Auto forwarded by a Rule

I'm writing to voice my opposition to restarting the FFTF reactor at Hanford.

I live in Portland, Oregon with my family, friends and neighbors and am particularly concerned about adding more nuclear waste and pollution to what is arguably the nation's most polluted place.

Restarting the FFTF will add more waste to Hanford's leaking and explosive waste holding tanks.

In 1995 the Department of Energy promised (in the Hanford Clean_up Agreement) to shut down FFTF and use the money saved for higher priority Clean_Up. Instead, USDOE has spent more than \$100 million of clean_up money keeping FFTF on hot standby.

The purported reason for restarting FFTF is to obtain Plutonium_238 yet NASA has stated they have no need to purchase Plutonium_238 for the specific space mission used to justify FFTF restart. How can it be economically viable to operate FFTF for Pu_238 if there are no buyers? And besides, we haven't even been told the cost of the restart. How can the public make an informed decision without knowing the cost? And why was NASA's decision not included in the PEIS study?

Finally, Northwest citizens have repeatedly voiced their concerns over FFTF _ telling USDOE to shut it down and get Hanford cleaned up. Why does the USDOE continue to ignore Northwest citizens? Honor your commitment to clean_up and shut down FFTF!

1696-1

1696-2

1696-3

1696-4

1696-5

1696-4

1696-3

Response to Commentor No. 1696

1696-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1696-2: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. This waste would not be stored in the high-level radioactive waste tanks. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

1696-3: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

All environmental parameters (e.g., air, soil, surface water, groundwater, vegetation, animals, etc.) in and around the Hanford Site are monitored on a set frequency. The information is available to the public in annual monitoring reports. No food or water restrictions are currently in place outside the Hanford Reservation as a result of Hanford activities.

Commentor No. 1696: Brian Setzler (Cont'd)

Hanford's high_level nuclear waste tanks are already leaking radioactive waste into the groundwater, which is moving closer to the Columbia River and threatening the life of the river and the people downstream. With this real and imminent danger, how can anyone reasonably propose restarting a reactor that will add more waste to this ecosystem?

40 years of history have established that USDOE cannot be trusted to disclose the truth. In June, during the Hanford fire, USDOE lied about Plutonium releases. For years ago, USDOE promised independent regulation of reactors, including FFTF. USDOE has lied and broken its promises. How can we trust you to run an unsafe, unregulated reactor?

Do not restart the FFTF!!!!!!

Brian Setzler

Portland, OR 97213
503_287_1798

1696-3
(Cont'd)

1696-2

1696-3

1696-1

Response to Commentor No. 1696

In regards to the Hanford wildfire of 2000, the DOE Richland Operations Office, the State of Washington Department of Health, and U.S. Environmental Protection Agency performed environmental monitoring on and around the Site to assess potential radiological impacts. The wildfire did not cause a release of radioactive materials from any Hanford facilities but did result in resuspension of radioactive materials which were already in the environment. The very low levels of radioactive materials that were resuspended were slightly above natural background levels and required several days of analysis to quantify. Information on this event has been made available to the public and can be accessed at <http://www.Hanford.gov/envmon/index.html>. This site also provides a link to information on the independent offsite air monitoring That was conducted by the U.S. Environmental Protection Agency.

As discussed in Appendix N, section N.3.2, implementation of any of the DOE missions at Hanford would not be in conflict with the land use plan or the Tri-Party Agreement. Additionally, DOE has made a commitment that implementation of the Record of Decision will not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

As identified in Section N.4.2 of the NI PEIS, the subject of independent regulation is not within the scope of the NI PEIS but is an operational issue to be considered only if FFTF restart is selected in the Record of Decision.

1696-4: The May 22, 2000, correspondence from NASA to DOE identifies that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be

Commentor No. 1696: Brian Setzler (Cont'd)

Response to Commentor No. 1696

maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

- 1696-5:** The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS.

Re: Draft Programmatic Environmental Impact Statement for accomplishing expanded civilian nuclear energy research and development and isotope production mission in the United States, including the role of the Fast Flux Test Facility

Dear Ms. Brown,

The following comments are submitted on behalf of the 1,300 members of the Snake River Alliance_an Idaho_based, grassroots group working for peace and justice, the end of nuclear weapons production and responsible solutions to nuclear waste and

Response to Commentor No. 1697

Commentor No. 1697: Gary E. Richardson (Cont'd)
Snake River Alliance

contamination. We have acted as the citizen watchdog of activities at the Idaho National Engineering and Environmental Laboratory for 21 years.

Your department's proposal to expand the civilian nuclear infrastructure raises significant nuclear weapons proliferation and environmental issues. INEEL is already one of the most contaminated areas in America. The Department's recent estimate on cleaning up our site is \$22 billion over 50 years. In addition, we have approximately 400 individual Superfund sites within the 890_square_mile area that comprises INEEL. With this known, the last thing we need is a plan to generate more nuclear waste at a site that needs more waste like the DOE needs more security scandals.

One of the most daunting problems confronting cleanup at major DOE facilities, such as Hanford and INEEL, is the solidification of liquid high_level nuclear waste. Your current plan for plutonium_238 production entails the generation of approximately 288,000 additional gallons of this waste over the project's 35_year span. While this is a small portion of Hanford's high_level waste, it is approximately one fifth of what we have remaining here in Idaho, which makes it a very significant amount. Previous leakage of this waste at INEEL and Hanford threatens our water supplies. What we certainly don't need is any more of this highly dangerous waste form.

Overall, the current PEIS is seriously flawed: It fails to justify the need for expanding the civilian nuclear infrastructure when balanced against the additional waste that would be generated at major DOE facilities and against this nation's non_proliferation policy. Many of the alternatives analyzed are simply unreasonable. The DOE has looked at many alternatives in place of a wide range of alternatives.

Unreasonable alternatives and analysis

This PEIS, while analyzing many alternatives when all the permutations of the various alternatives are factored, does not necessarily analyze a wide range of alternatives as required under the National Environmental Policy Act. It is clear, especially when

1697-1

1697-2

1697-3

1697-4

Response to Commentor No. 1697

1697-1: The commentor's position on generation of nuclear waste at INEEL is noted. Use of facilities considered in the NI PEIS would not impact the cleanup missions at their respective sites.

1697-2: The use of proposed alternative facilities associated with processing of neptunium-237 targets would have no impact on schedules or available funding for high-level radioactive waste programs at either Hanford or INEEL. At INEEL, the tanks would not be used although certain facilities at the Idaho Nuclear Technology Engineering Center (INTEC) would be used to treat the wastes resulting from processing the irradiated targets. These are reliable systems that would process a maximum of 1050 cubic meters of low-level radioactive waste over the 35-year nuclear infrastructure operational period. The higher activity waste would be treated as a solid form via a stand-alone vitrification system, separate from any tank waste treatment system. At Hanford, the existing high level radioactive waste facilities would not be used, and as analyzed in the PEIS, no existing or planned high-level radioactive waste facilities would be used to treat the wastes resulting from processing the irradiated targets.

1697-3: DOE notes the commentor's opinion concerning the justification of the purpose and need for the DOE missions. DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

Commentor No. 1697: Gary E. Richardson (Cont'd)
Snake River Alliance

examining alternative 2, that an attempt was made to throw in as many alternatives as possible, even if they contradict the overall stated intent of expanding the nuclear infrastructure. Alternative 2 involves using existing DOE research reactors to accomplish the stated mission to the extent possible, even if the change in course over the current mission of these reactors as outlined in the PEIS diminishes the overall civilian nuclear infrastructure. For instance, use of INEEL's ATR under alternative 2 would involve plutonium_238 production, but would strip ATR of its current medical and industrial isotope production. Production of these isotopes under current operation represents two-thirds of the isotopes the DOE expects an increased need for as outlined in the PEIS. Because alternative 2, particularly as it concerns the use of ATR, would diminish the DOE's current civilian nuclear infrastructure mission, it cannot be said to be a reasonable alternative and therefore should be dropped from consideration in the final EIS. Including this alternative in the PEIS is an admission that the plutonium production mission is really your only concern and that the supposed justification for other isotope production is simply intended to make this civilian infrastructure PEIS appear more appealing and important to the public.

Furthermore, all alternatives involve breaking up the missions: target fabrication, storage, irradiation, and (to a degree) target processing. This also is unreasonable as it involves transport of nuclear materials. For instance, under alternative 1, option 2, the neptunium oxide would be shipped for SRS to INEEL for target fabrication; the targets would then be shipped to Hanford for irradiation; and then returned to INEEL for separation. Why break up the missions to this extent other than to spread the mess around? If the mess can be spread out around DOE facilities, then it is possible for the additional waste to be considered insignificant (especially considering the amount already stored and generated at facilities like Hanford and INEEL) by site while the overall amount of generated waste is far from insignificant. Unless a clear rationale for breaking up the missions can be provided in the revised draft PEIS, then these options should also be dropped from consideration. This also is an

1697-4
(Cont'd)

Response to Commentor No. 1697

DOE has taken the Expert Panel and NERAC report recommendations under consideration in developing the range of alternatives evaluated in the NI PEIS. These reports were made available to the public at the NI PEIS public information centers and on the Internet at <http://www.nuclear.gov>.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Under the No Action Alternative, DOE would continue to purchase plutonium-238 to meet the space mission needs for the 35-year evaluation period considered in the NI PEIS. However, DOE recognizes that any purchase beyond what is currently available to the United States through the existing contract would likely require negotiation of a new contract and may require additional NEPA review.

The May 22, 2000, correspondence from NASA to DOE identifies that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, SRTG development efforts were stopped in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires one-third less plutonium-238 as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000, letter to DOE that large RTGs be maintained as backup. Section 1.2.2 of Volume 1 was revised to clarify plutonium-238 mission needs.

Commentor No. 1697: Gary E. Richardson (Cont'd)
Snake River Alliance

instance of throwing in many options to attempt to satisfy a wide range of alternatives when it is instead many alternatives within a narrow context.

In addition, it is possible that a hybrid of various alternatives would end up being selected as the preferred alternative. This selection method was recently criticized by the National Academy of Sciences. Because the preferred alternative could end up looking nothing like any one of the individual alternatives analyzed, it becomes difficult for the public to be confident of the analyses.

Waste generation and management at INEEL (4.3.2.1.13)
First and foremost, the term "high_level waste" is not used to describe the liquid waste stream resulting from processing the irradiated targets. How is this possible? High_level waste is a product of the operation (aqueous reprocessing) described in the PEIS for extracting the plutonium. Previous use of this technology at INEEL's FDPF facility resulted in approximately 8 million gallons of liquid high_level waste that has since been converted to calcine. The production of this waste stream at INEEL raises serious environmental management concerns.

Furthermore, the DOE has previously inventoried liquid waste in gallons. By using cubic meters by year (table 4_35) to represent the amount of liquid waste generated, the DOE is attempting to portray the amount generated as relatively small. If a conversion is done to gallons, the measure normally used by the DOE, approximately 288,000 gallons of high_level liquid waste will be generated at INEEL over the 35_year life of the project. If the current PEIS were to accurately classify newly generated liquid waste as high_level, it would of course be enormously significant.

There is no place to store the HLW that will be produced. The current INEEL tank farm is aging, leaking, and will eventually be closed. The tanks are well beyond their design life and are not suitable for storage of new HLW. In all probability, new sets of tanks would have to be built for the Pu_238 extraction. The PEIS must

(Cont'd)

1697-5

Response to Commentor No. 1697

It is the current United States policy that clean, safe, reliable nuclear power continue as a viable component of the United States' energy portfolio. In recognition of this need, the United States has initiated nuclear energy research and development programs to address potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) and to ensure that current nuclear power plants can continue to deliver adequate and affordable energy supplies. An enhanced DOE nuclear facility infrastructure is required to support such nuclear energy research and development for civilian applications.

The NI PEIS provides an estimate of waste generation impacts associated with each of the alternatives proposed for the production of medical, industrial and research isotopes, plutonium-238, and nuclear research and development. Any additional wastes generated in support of these missions would be managed in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations, and applicable DOE orders.

Nonproliferation is not included in the NI PEIS, but is discussed in a separate nonproliferation impact assessment report. The technology that is discussed in the NI PEIS would be used to chemically separate plutonium-238 and neptunium from irradiated targets and not from irradiated or spent nuclear fuel, whereas reprocessing separates weapons grade plutonium-239 from irradiated nuclear fuel. As discussed in the separate nonproliferation impact assessment report, use of this technology to produce plutonium-238 from irradiated targets will not create a nonproliferation threat. DOE is committed to full compliance with and support of the U.S. policy prohibiting reprocessing.

1697-4: DOE has undertaken to analyze a range of reasonable alternatives in the NI PEIS as required by NEPA (40 CFR 1502). Alternative 2, Use Only Existing Operational Facilities, represents a reasonable alternative that is keyed to the plutonium-238 mission. Under this alternative production of medical and industrial isotopes and support of nuclear research and development in DOE reactors and accelerators would continue at No Action Alternative levels, although near term growth could be limited under some options. It should be noted that variation in the consequences of an alternative does not make an alternative unreasonable, rather it provides an additional basis for selection of one alternative over another by the decision-maker.

Commentor No. 1697: Gary E. Richardson (Cont'd)
Snake River Alliance

consider the costs, timelines, and implications of constructing new HLW storage facilities at INEEL.

The PEIS and US non-proliferation policy
 A return to production of plutonium_238, however poorly justified, means a return to the use of aqueous reprocessing at DOE facilities where this technology has been used to extract bomb material for the weapons program. From President Carter to presidents Bush and Clinton, US policy has been to halt reprocessing in this country in order to set a global precedent to curtail the spread of nuclear weapons material_a noble effort in serious need of bolstering through action.

Indeed, an otherwise lukewarm Nuclear Infrastructure Nonproliferation Impact Assessment conducted by your Office of Arms Control and Nonproliferation questions whether our commitment to nonproliferation isn't weakened by the use of the Fluorinel Dissolution Process Facility within Building 666 at INEEL. INEEL's reprocessing facility is next door to a wet storage unit for Navy spent fuel, which contains a greater than average amount of highly enriched uranium. It was reprocessed from 1953 to 1989 at INEEL for the weapons program. Use of this facility to carry out plutonium_238 extraction, especially considering the dubious need for this isotope, at the very least raises the concern that the DOE is not fully committed to ending reprocessing. The international community cannot be expected to trust the DOE's civilian_mission claim when an agency devoutly committed to development of weapons uses a nuclear weapons technology at a weapons facility.

If the FFTF is restarted, the preferred fuel is highly enriched uranium (HEU) and mixed (plutonium) oxide fuel (MOX). It is against US policy to use HEU and the use of MOX fuel is still being debated. Use of HEU as fuel violates non-proliferation policy and agreements with international governments. HEU (enriched to 93%) is currently being used at the ATR. Efforts must be taken to abandon that use in order to conform to US non-proliferation policy. In addition, FFTF is an aging breeder reactor and use of this facility is inconsistent with

1697-5
(Cont'd)

1697-6

Response to Commentor No. 1697

The various alternatives and options have different transportation requirements. These differing requirements resulted from DOE's desire to evaluate those irradiation, processing, and storage facilities that are reasonably able to accomplish the nuclear infrastructure missions as set forth in the NI PEIS. This was not done in order to minimize the impact of waste generation and disposal. If fact, the cumulative impact of waste generation and disposal are specifically addressed in Sections 4.8.1.4, 4.8.2.4, and 4.8.3.5 for ORR, INEEL and Hanford, respectively.

Section 1.3 of Volume 1 states that in addition to the range of reasonable programmatic alternatives evaluated in the NI PEIS, DOE could choose to combine components of several alternatives in selecting the most appropriate strategy. It should be noted, however, that if such an alternative were selected, it would be bounded by the range of reasonable alternatives analyzed in the NI PEIS.

1697-5: The DOE Manual 435.1. Radioactive Waste Management defines high level radioactive waste as the highly radioactive waste material resulting from the reprocessing of spent nuclear fuel, including liquid waste produced directly in reprocessing and any solid material derived from such liquid waste that contains fission products in sufficient concentrations; and other highly radioactive material that is determined, consistent with existing law, to require permanent isolation. DOE has prepared an implementation guide to DOE M 435.1 to assist in implementing the requirements contained in that manual. For this particular requirement, the definition of high-level radioactive waste, the guide is intended to facilitate the classification of indefinite waste as to whether or not they are high-level radioactive waste. It is recognized that the definition of high-level radioactive waste is not precise and is essentially a source-based definition that also alludes to concentrations of a given waste stream. Page II-8 of this guide notes that for the purpose of managing high-level waste under DOE M 435.1-1 [sic], spent nuclear fuel includes spent driver elements and/or irradiated target elements that contain transuranium elements. This statement was included in the guide because the concentrations of long-lived isotopes are likely to be somewhat high during reprocessing and it also meets the source-based definition. As a result of reviewing this guide and to address the comments raised, DOE is considering whether the waste from processing of irradiated neptunium-237 targets should be classified as high-level radioactive waste and not transuranic waste. As a result, the Waste Management sections (i.e., Sections 4.3.1.1.13; 4.3.2.1.13; 4.3.3.1.13;

***Commentor No. 1697: Gary E. Richardson (Cont'd)
Snake River Alliance***

US policy to discourage use of this special class of reactors capable of producing more plutonium than is consumed. The only legitimate course for FFTF is deactivation, similar to EBR-II only with a firm schedule and serious effort.

The fact that certain alternatives raise significant non-proliferation issues, especially the restart of FDPF involved in several options within alternatives 1 through 4, is more than reason enough to drop these alternatives from consideration in a revised Draft PEIS.

Resource Conservation and Recovery Act issues involved in restarting FDPF

INEEL's reprocessing operation at FDPF was shut down in 1989 due to environmental noncompliance (see enclosed newspaper clippings). The piping associated with the operation was not double contained and therefore operation of the reprocessor violated the Resource Conservation and Recovery Act. Leaky piping is an issue of concern at INEEL, considering that past leaky piping at the high-level waste tank farm has led to the release of approximately 38,000 gallons of high-level waste into our environment. This cleanup effort involving several hundred thousand cubic meters of contaminated soil at INEEL has been delayed due to the complexity of integrating cleanup of this contamination with treatment of the high-level waste tanks.

Are we now to assume that this problem has been resolved? It was surprising to read in the cost estimate for the various alternatives that use of FDPF would be significantly cheaper than use of the other reprocessing facilities analyzed in the PEIS. The DOE was still working on bringing this facility up to code when President Bush officially halted reprocessing on non-proliferation grounds in 1992. A Resource Conservation and Recovery Act permit would be necessary to operate this facility as outlined in the PEIS. What are the plans for obtaining this permit? Because of the danger involved in extraction of plutonium through aqueous reprocessing and the difficulty of managing liquid radioactive waste as mentioned above, it would also be necessary to conduct a separate Environmental

**1697-6

1697-7

Response to Commentor No. 1697

and 4.4.3.1.13) of this NI PEIS have been revised to reflect this different classification from what was assumed in the draft NI PEIS. As discussed in these revised sections, irrespective of how the waste is classified (i.e., transuranic or high-level radioactive waste), the composition and characteristics are the same and the waste management (i.e., treatment and on-site storage) for this NI PEIS would be the same. In addition, even if the waste is managed as high-level radioactive waste it would have no impact on the existing high-level radioactive waste management infrastructure (e.g., high-level waste storage tanks), since the high activity waste from processing of the targets would be initially stored and vitrified within the processing facility (i.e., FMEF, REDC, or FDPF).

1697-6: The commentor is correct in stating that the aqueous processing technology that would be used to separate plutonium consisting of over 80 percent plutonium-238 and neptunium from the irradiated target is similar to the technology that was used to extract plutonium-239. However, unlike plutonium-239, plutonium-238 is not used in nuclear weapons, but rather it would be used as a power and heat source for NASA space missions. The technology that is discussed in Sections S.3, 2.2.3 and A.1.4 of the NI PEIS would be used to chemically separate plutonium-238 and neptunium from irradiated targets and not from irradiated or spent nuclear fuel whereas reprocessing separates weapons grade plutonium-239 from irradiated nuclear fuel. As discussed in the separate Nuclear Infrastructure Nonproliferation Impact Assessment, published in September, 2000, use of this technology to produce plutonium-238 from irradiated targets will not create a nonproliferation threat. DOE is committed to full compliance with and support of the U.S. policy prohibiting reprocessing. The juxtaposition of INEEL Building 666 to wet storage of highly enriched uranium Navy spent nuclear fuel and its previous mission of reprocessing spent nuclear fuel were considered in the separate nonproliferation impact assessment.

The use of mixed oxide or highly enriched uranium to fuel the FFTF has been rigorously evaluated in the Nuclear Infrastructure Nonproliferation Impact Assessment. This report confirms that the manner in which these fuels would be used, as described in the PEIS, is consistent with nonproliferation policy. In the event that a decision is made to restart FFTF, the first six years of operation would use existing onsite mixed oxide (MOX) fuel. DOE expects that an additional 15-year supply of mixed oxide fuel in Germany could be available for FFTF. MOX fuel

Impact Statement on restart of this facility.

A questionable need for Pu_238

It is not clear whether any Pu_238 will be required in the future. NASA wrote a letter to the DOE, dated 22 May 2000, regarding production of Thermoelectric Generators (powered by Pu_238). The letter is a modification to a Memorandum of Understanding from 1991. The key part of the NASA letter is:

"As a result of the proposed DSS program changes, NASA Headquarters no longer has an identifiable planned requirement for Small Radioisotope Thermoelectric Generator (SRTG) power systems. Therefore NASA Headquarters requests that all SRTG development efforts for DSS spacecraft missions be halted. In addition, investigation into the utilization of the ES and Multi_Hundred Watt systems for DSS applications should be stopped."

This letter implies that there is no future need for Pu_238 by NASA beyond current missions for which they already have Pu_238 power supplies. This view is shared by 15 elected officials who publicly stated their opposition to startup of the FFTF in a 1997 letter to President Clinton (enclosed).

Public concern for the possibility of re_entry into the atmosphere of a Pu_238 power supply is providing impetus to develop alternative power supplies. The numbers in the draft PEIS for Pu_238 needs appear to be based on historical trends and not on what NASA really needs. It is essential that the PEIS provide incontrovertible proof that, in fact, NASA has a need for Pu_238 for the next 35 years.

Inadequate comment period

The non_proliferation assessment was originally due to be released at the time of the PEIS. We did not receive it until one week prior (9/11/2000) to the end of the comment period. This is an indication of how little serious attention the DOE currently pays non_proliferation_it is given less consideration than socio_economic impacts analyzed in the PEIS.

1697-8

1697-9

Response to Commentor No. 1697

does not use highly enriched uranium. Further, use of the Hanford MOX fuel would dispose of a significant U.S. stockpile of highly attractive fresh plutonium fuel by conversion to spent fuel through irradiation in FFTF. This represents a safe, low-cost, high benefit opportunity to reduce U.S. civilian plutonium without chemical or bulk processing. Use of the German MOX represents a similar advantage with respect to the German stockpile of separated civilian plutonium. During the period of MOX fuel use, in support of U.S. nonproliferation policy directives, DOE's Office of Nonproliferation and National Security would undertake a study under RERTR to consider the technical feasibility of using low enriched uranium to fuel the FFTF. Under this nonproliferation protocol, if use of low enriched uranium fuel is found infeasible in FFTF for meeting assigned missions, policy would allow DOE to subsequently procure highly enriched uranium fuel for use in FFTF. Again, this approach is consistent with U.S. nonproliferation policy.

1697-7: The FDPF was closed because it no longer had a mission (i.e., reprocessing spent nuclear fuel). At the same time when FDPF was operational, it was just one of several INTEC facilities that sent waste to the INTEC liquid waste handling system. The INTEC liquid waste handling system did have hazardous waste compliance issues associated with it. However, because the INTEC waste handling system was and is used by other INTEC processes, it was necessary for DOE to complete extensive upgrades to that system to meet state and Federal hazardous waste requirements even though the FDPF was shut down for other reasons. In addition, several of the individual systems are currently in the process of being permitted in accordance with the Resource Conservation and Recovery Act (RCRA). Other portions of the system e.g., the INTEC Tank Farm) will not be permitted and will be closed in accordance with RCRA requirements.

If chosen for target storage and processing operations, DOE believes that this facility will meet the criteria to safely conduct these processes without impact to the environment. The FDPF would be upgraded, as necessary, and associated waste handling system would comply with RCRA. This NI PEIS provides the NEPA coverage for the FDPF for activities described.

1697-8: The May 22, 2000, correspondence from NASA to DOE identifies that NASA no longer has a planned requirement for small radioisotope

Commentor No. 1697: Gary E. Richardson (Cont'd)
Snake River Alliance

Considering all the problems inherent in the restart of FFTF and the DOE's reprocessing facilities, we urge you to either address these problems more adequately in a revised draft PEIS or choose alternative 5 in the current PEIS and commence shutdown of the FFTF. Thank you for the opportunity to comment on this proposed plan.

Respectfully submitted,

Steve Hopkins
Program Associate

Response to Commentor No. 1697

thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, SRTG development efforts were stopped in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires one-third less plutonium-238 as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000, letter to DOE that large RTGs be maintained as backup. Section 1.2.2 of Volume 1 was revised to clarify plutonium-238 mission needs.

1697-9: The nuclear nonproliferation impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on September 8, 2000. The report was made available immediately upon release on the NE web site <http://www.nuclear.gov> and in the public reading rooms. DOE has also provided a summary of the Nuclear Infrastructure Nonproliferation Impact Assessment in Appendix Q in the Final NI PEIS.

The Council on Environmental Quality's (CEQ) "Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act" (40 CFR 1506.10(c)) require that a minimum of 45 days be allowed for public comment on the Draft NI PEIS. As stated in the Notice of Availability (65 FR 46443 et seq.), the public comment period began on July 28, 2000 and continued to September 18, 2000. In preparing the Final PEIS, DOE has assessed and considered both oral and written comments received on the Draft PEIS during the public comment period and has responded to these comments in the Final PEIS. Volume 3 of the NI PEIS contains public comments received on the NI PEIS and DOE responses to those comments. Moreover, late comments were considered to the extent practicable.

1697-10: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

**PETITION in opposition to
 Plutonium production**

PROPOSED AT THE IDAHO NATIONAL ENGINEERING AND ENVIRONMENTAL LABORATORY

The use of building '666' to produce plutonium at the Department of Energy's Idaho National Engineering and Environmental Laboratory poses unacceptable hazards to human health and the environment. Plutonium is one of the most toxic substances known to man, and the current plan to produce more is unjustifiable.

Restarting this highly contaminated facility at INEEL would produce a large quantity of dangerous and difficult to contain liquid radioactive waste. Past leakage of this type of waste currently threatens the Snake River Aquifer beneath the site. The Snake River Aquifer is Southern Idaho's number one source of water and must be protected. INEEL already has a tremendous nuclear waste problem, and production of more would make an already difficult cleanup job more difficult.

We, the undersigned, demand that you abandon the plutonium production mission at INEEL as outlined in your recent environmental assessment on expanding the nuclear infrastructure in the United States. Here in Idaho we are proud of our world famous potatoes and would prefer to remain known for an agricultural rather than a plutonium economy. Produce potatoes not plutonium.

Response to Commentor No. 1697

1697-11: DOE notes the concern expressed in the comment on the potential environmental and health impacts of INEEL Building-666 use in NI PEIS alternatives. Building-666 at INEEL is divided into two parts, the fuel storage facility and FDPF. The FDPF is a candidate storage and processing facility for plutonium-238 production. The impacts to human health and the environment from storage and processing activities are presented in Section 4.4.2 of the NI PEIS. All impacts on human health to workers and the general public, both during normal operations and from postulated accidents, are shown to be small. Impacts to all other environmental resources are also shown to be small.

Chapter 2—Written Comments and DOE Responses

**Commentor No. 1697: Gary E. Richardson (Cont'd)
Snake River Alliance**

**PETITION in opposition to
Plutonium production**

PROPOSED AT THE IDAHO NATIONAL ENGINEERING AND ENVIRONMENTAL LABORATORY

The use of building '666' to produce plutonium at the Department of Energy's Idaho National Engineering and Environmental Laboratory poses unacceptable hazards to human health and the environment. Plutonium is one of the most toxic substances known to man, and the current plan to produce more is unjustifiable.

Restarting this highly contaminated facility at INEEL would produce a large quantity of dangerous and difficult to contain liquid radioactive waste. Past leakage of this type of waste currently threatens the Snake River Aquifer beneath the site. The Snake River Aquifer is Southern Idaho's number one source of water and must be protected. INEEL already has a tremendous nuclear waste problem, and production of more would make an already difficult cleanup job more difficult.

We, the undersigned, demand that you abandon the plutonium production mission at INEEL as outlined in your recent environmental assessment on expanding the nuclear infrastructure in the United States. Here in Idaho we are proud of our world famous potatoes and would prefer to remain known for an agricultural rather than a plutonium economy. Produce potatoes not plutonium.

Sincerely

Past leakage of this type of waste currently threatens the Snake River Aquifer beneath the site. The Snake River Aquifer is Southern Idaho's number one source of water and must be protected. INEEL already has a tremendous nuclear waste problem, and production of more would make an already difficult cleanup job more difficult.

We, the undersigned, demand that you abandon the plutonium production mission at INEEL as outlined in your recent environmental assessment on expanding the nuclear infrastructure in the United States. Here in Idaho we are proud of our world famous potatoes and would prefer to remain known for an agricultural rather than a plutonium economy. Produce potatoes not plutonium.

Sincerely,

X Alicia Flinn Alicia Flinn 1415 N. 14th St.

**PETITION in opposition to
 Plutonium production**

PROPOSED AT THE IDAHO NATIONAL ENGINEERING AND ENVIRONMENTAL LABORATORY

The use of building '666' to produce plutonium at the Department of Energy's Idaho National Engineering and Environmental Laboratory poses unacceptable hazards to human health and the environment. Plutonium is one of the most toxic substances known to man, and the current plan to produce more is unjustifiable.

Restarting this highly contaminated facility at INEEL would produce a large quantity of dangerous and difficult to contain liquid radioactive waste. Past leakage of this type of waste currently threatens the Snake River Aquifer beneath the site. The Snake River Aquifer is Southern Idaho's number one source of water and must be protected. INEEL already has a tremendous nuclear waste problem, and production of more would make an already difficult cleanup job more difficult.

We, the undersigned, demand that you abandon the plutonium production mission at INEEL as outlined in your recent environmental assessment on expanding the nuclear infrastructure in the United States. Here in Idaho we are proud of our world famous potatoes and would prefer to remain known for an agricultural rather than a plutonium economy. Produce potatoes not plutonium.

**PETITION in opposition to
 Plutonium production**

PROPOSED AT THE IDAHO NATIONAL ENGINEERING AND ENVIRONMENTAL LABORATORY

The use of building '666' to produce plutonium at the Department of Energy's Idaho National Engineering and Environmental Laboratory poses unacceptable hazards to human health and the environment. Plutonium is one of the most toxic substances known to man, and the current plan to produce more is unjustifiable.

Restarting this highly contaminated facility at INEEL would produce a large quantity of dangerous and difficult to contain liquid radioactive waste. Past leakage of this type of waste currently threatens the Snake River Aquifer beneath the site. The Snake River Aquifer is Southern Idaho's number one source of water and must be protected. INEEL already has a tremendous nuclear waste problem, and production of more would make an already difficult cleanup job more difficult.

We, the undersigned, demand that you abandon the plutonium production mission at INEEL as outlined in your recent environmental assessment on expanding the nuclear infrastructure in the United States. Here in Idaho we are proud of our world famous potatoes and would prefer to remain known for an agricultural rather than a plutonium economy. Produce potatoes not plutonium.

Sincerely,
 X  Kelt J. Laverty 10492 Summerwind

Commentor No. 1698: Richard C. Geary

From: ReCarDeaux@aol.com%internet
[SMTP:RECARDEAUX@AOL.COM]
Sent: Sunday, September 17, 2000 4:54:59 PM
To: INFRASTRUCTURE_PEIS, NUCLEAR
Subject: D.O.E. Comments on expansion of plutonium 238
Auto forwarded by a Rule

To: Colette E. Brown,
U.S. Department of Energy, NE_50,
19901 Germantown Road, Germantown, MD 20874_1290
Nuclear.Infrastructure_PEIS@hq.doe.gov

From: Richard C. Geary
520 NW 44th Street
Oklahoma City, OK 73118
ReCarDeaux@aol.com

Dear Ms Brown:

After reading considerably on the subject, I have come to some conclusions about plutonium and its problems.

Babysitting plutonium 238 for 240,000 years until it becomes non-radioactive is NOT INEXPENSIVE OR SAFE. Cleaning up the existing Hanford site (\$300 Billion) is NOT INEXPENSIVE. Waiting for radioactive waste to leak into the groundwater or into the food_chain is NOT SAFE. Dispersing plutonium into the upper atmosphere to be inhaled by the inhabitants of Earth, producing cancer, below (at a 10% rocket_failure rate) is NOT ADVISABLE.

Therefore, I respectfully urge D.O.E. NOT TO WORSEN THE PROBLEM by producing more, unnecessary (when Europe has developed solar alternatives) plutonium for launches which NASA thinks it needs for its purposes.

Richard C. Geary

Response to Commentor No. 1698

1698-1: DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions, although issues such as NASA research priorities are beyond the scope of this PEIS. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch.

Under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately only 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005.

DOE also notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

1698-1

Re: Draft Programmatic Environmental Impact Statement for Accomplishing
Expanded Civilian Nuclear Energy Research and Development and
Isotope Production Missions in the United States, Including the Role of
the Fast Flux Test Facility

Dear Ms. Brown:

This memorandum supplements our previous comments of September 5, 2000, on the subject document. We appreciate the consideration being given to commercial light water reactors (CLWRs) as an option for producing Pu-238. We also strongly suggest that CLWRs be more thoroughly evaluated for their suitability for producing medical isotopes.

Further, as we mentioned in earlier telephone conversations, we were surprised to see one figure from the proprietary material we shared with you last year incorporated in the draft PEIS. While we are not asking that this figure be deleted from the final EIS, we would like to maintain the proprietary status of the remaining material and hope that our proprietary material will be treated appropriately in the future.

Very truly yours,

Thomas A. Coleman
Vice President
Government Relations

Telephone: 804-832-3000 Fax: 804-832-3653

Response to Commentor No. 1699

1699-1

1699-1: DOE notes the commentor's suggestion to consider CLWRs for the production of plutonium-238 and medical isotopes. CLWRs were evaluated to the extent necessary for the purpose of supporting the PEIS in a similar manner as other alternatives such as the new research reactor new accelerator, ATR, HFIR, and FFTF. However, modification of CLWRs to enable online insertion and retrieval of targets for the medical and industrial isotope production missions was evaluated and dismissed as a reasonable alternative because the required facility modifications would be significant, would include penetrations into the reactor vessel, and, possibly, the containment vessel, and would require additional facility modifications to enable loading of targets into a shielded cask for transport to a processing facility, and would require an extended refueling outage for performing the facility modifications, which would result in a loss of power generation revenue to the CLWR owner.

DOE N1 PEIS Statement
September 18, 2000

As a consultant, I introduce physicians and their support staff to emerging medical technologies. I was trained as a research biologist. The information that follows comes from the National Institutes of Health, the National Cancer Institute, the Centers for Disease Control in Atlanta, Medicare, the Health Care Finance Administration, studies published in medical journals, studies presented at medical conferences, physicians, medical companies and the American Cancer Society. References are available.

Over 1500 cancer patients die daily in this country. This is equivalent to three fully loaded Boeing 747s crashing to the earth and killing everyone on board, every day. This is a national public health issue, a national outrage, and an urgent national health care emergency. Nearly one in two males and one in three females will develop cancer. Cancer is the leading cause of death for Americans under the age of 65. It will soon overtake heart disease as the number one killer in America. Every hour in this country, a child is diagnosed with cancer. Cancer is an equal opportunity disease. Radiation kills cancer cells. Radiation administered internally, in as little as a 30 second injection, may be directed just to cancer cells as "smart bullets". With alpha emitters, radiation penetrates no more than three cells thick, sparing healthy surrounding tissue. Boredom is the most common study side effect of these isotope treatments. Early study patients are given less than six months to live and have failed at least two other treatments such as often debilitating chemotherapy. Many patients refuse therapy as they are more afraid of the treatment than the disease. Now, five and more years later,

Response to Commentor No. 1700

Commentor No. 1700: Marlene G. Oliver (Cont'd)
New Medical Technology

many of these patients treated with isotopes who faced death remain cancer_free. Laura from Alabama said "No other previous treatment had done anything to reduce my tumors. What I love about this treatment is that it works, it takes the pain away, and there's no side effects." This is a quality of life issue, a humanitarian issue. I ask that the DOE please consider these facts in its decision making process. DOE requests are given in bold face type.

In the NI PEIS the I ask the DOE to include the following information.

Isotope quantity, quality and availability, particularly for research Isotopes and isotopes with high specific activity. Over 90% of Isotopes are imported. In Canada, where most isotopes used in America are produced, nuclear workers threatened to go on strike the last two times their contract came up for renewal. They have a four year contract. The situation was so dire that the last renewal, the University of Virginia Medical Center, as an example, sent a letter to its staff suspending all but emergency tests requiring isotopes as of Monday morning. Canadian nuclear workers signed at the eleventh hour. This foreign isotope dependency, no matter how friendly the source, is not acceptable to health care providers or for patients in this country. Over 14 million isotope_dependent diagnostic tests are performed yearly, 36,000 procedures daily in this country. One in three hospital patients are diagnosed with tests that require medical isotopes.

Many of the isotopes required to best treat diff use cancers are alpha emitters. Half_lives of short_lived, powerful alpha_emitting isotopes, measured in minutes, REQUIRE a domestic supply. Isotope production sources should be Identified in the NI PEIS considering current DOE nuclear facilities, including reactors, cyclotrons, and accelerators, and address which Isotopes, both for diagnosis AND treatment, are best produced in which facilities and will come from which specifically identified DOE nuclear facility sources. A list of the isotopes that are best or only produced In cyclotrons, reactors, and/or accelerators is attached, based on

1700-1

1700-1

Response to Commentor No. 1700

1700-1: DOE notes the commentor's support for restarting FFTF to enhance availability of medical isotopes. DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

For the purposes of analyses in the NI PEIS, a representative set of isotopes was selected on the basis of the recommendations of the Expert Panel, medical market forecasts, reviews of medical literature, and more than 100 types of ongoing clinical trials that use radioisotopes for the treatment of cancer and other diseases. These isotopes, which are comprised of both reactor- and accelerator- produced isotopes, are listed in Section 1.2, Volume 1 of the NI PEIS along with a brief description of their medical and/or industrial applications. As identified in Appendix C, Volume 2 of the NI PEIS, FFTF would be capable of producing the majority of these representative isotopes. These include research isotopes with currently limited availability, such as copper-67, as well as commercial isotopes whose current application is inhibited by lack of availability or high cost, such as palladium-103. However, the absence of any specific isotope from these tables should not be interpreted to mean that it could not be considered for production under the proposed action. DOE expects that the actual isotopes and specific amounts produced as a result of the proposed action would vary from year to year in response to the focus of clinical research and the specific market needs occurring at that time.

Commentor No. 1700: Marlene G. Oliver (Cont'd)
New Medical Technology

calculations performed by experts. This information should be included in the NI PEIS and the DOE should consult this list prior to deciding its course of action in its nuclear Infrastructure mapping plan. Current committed facility missions should be accounted for, as medical isotope production cannot occur if other missions are given priority, as at present. Cancer does not wait. Again, the DOE should consider and identify which facilities realistically might most efficiently produce which of the over 40 different isotopes that have been identified as having medical application to treat over 200 identified cancers and other diseases, given that many treatment isotopes are best produced in reactors that require a high neutron flux, such as the FFTF. Please also recall that the FFTF produced approximately 60 different research isotopes during its operation. Consider the volumes of treatment isotopes that will be required, and that presently the private sector is not equipped to meet this demand. It is estimated that over one million cancer patients diagnosed per year, over three million currently living with cancer, might be Isotope treatment candidates. Please note that Frost and Sullivan, in their 2000 report, revised the estimated medical isotope growth rate upward, to between 12 and 25 percent per year. Last year, this growth rate was 19 percent. Recognize that FFTF is well suited to produce small quantities of research and large quantities of treatment isotopes. At the Seattle NI PEIS meeting, I spoke with a woman whose father was treated with high specific activity ^{131}I produced at FFTF for his non-Hodgkins lymphoma, generally a fatal disease. Without this treatment, he was given less than three months to live. His good health was restored after one "smart bullet" injection, and he remains cancer-free eleven years later. She stated that his restored health and life is priceless to his family. She also stated that his physician was dismayed when he could no longer obtain this purified isotope when FFTF was put on standby. Louisiana State Medical University, among others, has asked the DOE to please supply this isotope for their studies. Their request is attached. The DOE should be aware that ^{131}I currently obtained from Canada is only about seven percent pure, and that a domestic supply of purified, high specific activity ^{131}I will be substituted for the Canadian version should the FFTF be restarted. Physicians are

1700-1

1700-1

Response to Commentor No. 1700

Commentor No. 1700: Marlene G. Oliver (Cont'd)
New Medical Technology

using this inferior isotope because it is readily available. It is probably not the isotope of choice to treat other than thyroid cancer. Again, cancer is a collection of over 200 different diseases. Just as different antibiotics are required to treat different infections, various isotopes are required to treat a variety of cancers. The DOE should consider requests from physicians who have been unable to obtain the isotopes they need and have asked for to treat even small numbers of study patients. Approximately seventy-five percent of physician/researchers polled who attended the DOE _ sponsored Medical Isotope conference in Washington, D.C. in March, 1999, stated that their research isotope needs are not being met. The DOE should consider its policy commitment to supply research isotopes to these and other physicians conducting clinical trials, and logistically explain how these orders will be filled, and in a timely fashion. Dr. Robert Schenter testified August 31, 2000 in Richland that the IFFTF successfully produced research isotopes during its operation, in contrast to the DOE statement that the FFTIF is not a research isotope production candidate. The DOE should reverse this statement. This expert nuclear physicist told me that FFTF produced sixty research isotopes "efficiently and cost-effectively." Isotopes were sent to, among others, Children's Hospital in Boston, who received them at no charge after production piggybacked onto another program. This successful research Isotope production program should be outlined in the NI PEIS and considered and continued in a restarted FFTIF. Dr. Schenter was the Hanford Isotopes Program manager for IFFTF from 1985 _ 1996. The DOE should reexamine FFTF for research isotope production and consult with those who worked to produce these research isotopes and obtain relevant facts from experts who were involved in this effort. "Junk science" should have no part in the NI PEIS nor in any decision making related to this document. Please seek out the truth from recognized experts in their fields for topics listed throughout the N1 PEIS. Please especially consider physician requests such as "Our organization represents over 30,000 practicing radiologists... it is difficult to conduct clinical studies with even very small numbers of patients. Research is being hampered or removed from consideration by a lack of these isotopes. Medical isotopes are often

1700-1

Response to Commentor No. 1700

Commentor No. 1700: Marlene G. Oliver (Cont'd)
New Medical Technology

the only effective way to properly diagnose and treat serious disease. It is crucial that we ... have access to a wide variety of isotopes, including those with high specific activity, appropriate to diagnose, prevent and treat heart disease, cancer, arthritis, and, more recently, infectious disease." Signed, Jerry P. Petasnick, MD, Chairman of the Board, Radiological Society of North America. As examples, please see attached letters requesting research isotopes from the Radiological Society of North America and the American Society of Nuclear Cardiology, as well as the LSMU request. Patients do drive markets. Patients want their disease gone, as quickly and easily as possible. The DOE should recognize this fact and give physicians the tools they will need to satisfy patient demand. The DOE should also recognize that the 1997 _ Frost & Sullivan report was too conservative in its original report. It stated _that the expected growth in medical isotopes should be between seven and fourteen percent per year. The DOE should recognize that isotope demand should approach exponential growth initially, as study isotope therapies begin clearing the FDA and these treatments become available to the general patient population. Last year, again, the isotope growth rate was actually nineteen percent, yet not one isotope treatment was FDA approved. At least one and possibly more isotope treatments are projected to be approved within the next year. As disease is characterized more accurately, noninvasive isotope diagnostic tests that avoid more costly treatment procedures will continue_to increase in number. The DOE requested LESS Isotope production funding for FY 2001 than In FY 2000. This does not make sense. There may be a typographical error. The request should have been \$170 million instead of \$17 million for this program? Please send the corrected sum to Congress post haste. Further examples of shortages follow. Early stage prostate cancer patients may be treated with either surgery or tiny radioactive seed implants. Long term, twelve year survival results are the same for both procedures. With a new seed implant design on the horizon, results should become better with seeds than with surgery. Prostate surgery requires a painful six week recovery and a better than fifty percent chance that the patient will become impotent, incontinent, or both. Many men are thus forced into

1700-1

1700-2

Response to Commentor No. 1700

1700-2: The amount requested by DOE for isotope support in FY 2001 was approximately 17 million dollars. The reduction of approximately 3 million dollars from the previous fiscal year is a result of the near completion the new Beam Spur at the Los Alamos Isotope Production Facility, which required DOE to request less for capital cost associated with the construction of the Beam Spur.

***Commentor No. 1700: Marlene G. Oliver (Cont'd)
New Medical Technology***

surgery and many must wear a diaper for the rest of their lives as a consequence of this backorder situation. This is but one example of many. Quality of life issues should be addressed In the NJ PEIS. Seed implants are done as an outpatient procedure that takes about an hour at half the cost of surgery, typically with a one or two day recovery, and less than a ten percent incidence of complications. Patients in San Francisco and Los Angeles have faced up to a one year backorder for seed implants due to a shortage of isotopes ¹²⁵I and ¹⁰³Pd. Apparently Johnson and Johnson, the largest medical company in the country, is Using 16 new cyclotrons that cost millions of dollars in an effort to alleviate ¹⁰³Pd backorders for their seeds. Cyclotrons (and accelerators) are inefficient producers of ¹⁰³Pd and other treatment isotopes. J & J still faces a backorder situation. J & J has recently contracted with the DOE's HFIR reactor to obtain additional quantities of ¹⁰³Pd in a manner identical to that proposed for the use of FFTF, yet HIFR is scheduled to close for four months beginning in October, With a fraction of a target, the FFTF could produce enough ¹⁰³Pd to fill over 100% of projected treatment needs in 2003 in a market that is expected to grow 20% per year for prostate seeds alone. When I spoke with a high_ranking J & J employee about FFTFS capability for ¹⁰³Pd production, he was speechless. Attached please find a letter from Johnson and Johnson expressing an interest in FFTF to produce this and other isotopes. This J and J employee _has requested more information. If you contact me, I will give you his name, address, telephone number and email address. Cancer does not wait. After a ten year breast cancer study with palladium implants, Carl Mansfield, MD, Thomas Jefferson University Hospital, Philadelphia, said, "these implants mean that a patient can keep a breast and still have the same chances of survival..." Mastectomy is where the surgeons remove the whole breast in an effort to take the cancer with it. The National Association of Cancer Patients and Citizens for Medical Isotopes presented information on breast cancer diagnosis and treatment with medical isotopes September 15 and 16, 2000 at the Susan G. Komen Breast Cancer Foundation's "Race for the Cure" Health Expo in Portland with its projected 50,000 runners, minimum. We

|| 1700-3

Response to Commentor No. 1700

1700-3: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

Quality of life issues are addressed in the PEIS as they relate to persons potentially affected by the environmental impacts of implementation of the alternatives. Quality of life as regards medical patients are benefits resulting from the availability of medical isotopes from all sources and is not within the scope of this PEIS. The scope of the PEIS is limited to the evaluation of alternatives to accomplish three missions, medical and industrial isotope production, plutonium-238 production for NASA missions, and nuclear research and development for civilian purposes.

Commentor No. 1700: Marlene G. Oliver (Cont'd)
New Medical Technology

were told that this event should have national media coverage. This raised awareness among cancer and arthritis patients of improved isotope diagnoses and treatment regimens to an organization that provides hundreds of millions of dollars annually for breast cancer research, both through fundraising and via its influence with Congress. We hope that the DOE will be contacted. Signed petitions are being entered in the N1 PEIS. Cancer patients are also suffering from a lack of other isotopes. A promising study at the University of California at Davis with advanced breast cancer patients responding to Cu_67 isotope treatment was suspended when the DOE shut down the reactor producing this isotope. Cu_67 has a natural affinity for breast tissue as well as prostate tissue. A cyclotron supplied by the DOE for this facility is unable to produce enough Cu_67 for even small numbers of study patients. At the Memorial Sloan_Keffering Cancer Center in New York, it took three years to obtain enough alphaemitters to treat 18 study patients with acute myeloid leukemia. Last year John Stanford, the much_loved Seattle superintendent of schools who was stricken with this disease, was made aware of this study. He was ready for the treatment. The study results were published this summer. Had there been an adequate supply of alpha emitters to treat John Stanford, he would have had a 70% chance of being at his desk today, helping the children of Seattle. Study results showed 13 of the 18 patients responded to this therapy. Each had been given less than six months to live after other treatments failed. The DOE has graciously agreed to double the amount of alpha emitters to this facility for the next study phase by the year 2002. This is unacceptable. Please consider that this year, it is estimated that 9,700 patients will be diagnosed with this disease, and 7,100 will die. One of our state legislators included in her August 31, 2000 Richland testimony that a boy died of this disease one week earlier, one month before his fourteenth birthday. Cancer is largely an equal opportunity disease. Most of these deaths could have been prevented if patients had been treated with isotopes. The media has begun to present isotope treatment information to the public. The DOE should be prepared to meet a growing isotope demand. The NI PEIS should serve as the basis for a nuclear infrastructure to accommodate patient needs.

1700-3

Response to Commentor No. 1700

***Commentor No. 1700: Marlene G. Oliver (Cont'd)
New Medical Technology***

The DOE should consider in the NI PEIS a public-private partnership in compliance with its own stated policy to spin off government enterprise to the commercial sector. The private sector should be more suited to coordinate production of medical isotopes such that they may be delivered in a timely fashion for processing and thence to medical facilities where patients await diagnosis and treatment. Please also realize that patients prefer to be treated near their homes. The DOE should consider in its NI PEIS placing mini high neutron flux reactors and accelerators with a primary medical isotope production mission at sites around the country so that all Americans have access to these diagnostic capabilities and life-giving treatments with short-lived and other medical isotopes. Thus, alternatives 1, 3 and 4 should be included in the nation's nuclear infrastructure plan. Again, the isotope production situation in this country is unacceptable to many in the medical community, must be addressed in the NI PEIS, and rectified post haste. My number one rule to manufacturers I work with who produce life support products is "You can't tell a patient you're backordered." Coupled with this is a requirement for redundancy of supply. It is recommended that the DOE not only restart FFTF, but add the alternatives listed in the NI PEIS to construct additional nuclear facilities to produce medical isotopes to meet the needs of Americans in their fight against serious disease.

The NACP asks the DOE to consider the Balanced Budget Act of 1997 and to include within the NI PEIS a cost-benefit analysis of radioisotope therapy, alone or in combination with other, older treatments such as surgery, chemotherapy and external beam radiation. I strongly disagree with the DOE statement at the PEIS hearing that these numbers are not readily available. DRGs and treatment expenses are easily obtainable from the Health Care Finance Administration and others. Figures for isotope-based diagnostic tests and therapeutic treatments should be addressed and are available through the HCFA and hospital billing records, among others. Please include in the NI PEIS cost estimates of how medical isotopes used to diagnose disease avoid unnecessary

1700-4

1700-4: DOE currently has business relationships with private companies related to the production of radioisotopes. DOE will continue to pursue business arrangements with private companies in order to offset the cost of isotope production.

1700-5

1700-5: DOE notes the commentor's support for the use of multiple reactors and accelerators around the country to provide patients with access to short-lived medical isotopes. However, the half-life of the isotopes to be produced within the context of the NI PEIS are sufficiently long to provide ample time for them to be processed and shipped to their end point without losing their effectiveness. Thus, DOE does not feel that it is necessary or cost-effective to build multiple reactors and accelerators to provide patients with an adequate supply of medical isotopes.

1700-6

1700-6: The estimated costs of the range of reasonable alternatives are presented in the Cost Report, summarized in Appendix P of the Final NI PEIS. However, the Cost Report is not a cost-benefit analysis. While it is reasonable to believe that the benefits of medical isotopes are substantial, the purpose of this NI PEIS is to describe the nuclear infrastructure missions (Section 1.2 of Volume 1), a range of reasonable alternatives for satisfying the mission requirements (Section 2.5 of Volume 1), and the environmental impacts that would result from implementation of the alternatives. According to 40 CFR Section 1502.23, if a cost-benefit analysis exists, it must be reported and summarized in the NI PEIS.

Response to Commentor No. 1700

Commentor No. 1700: Marlene G. Oliver (Cont'd)
New Medical Technology

invasive procedures, as the mother of a teenager testified in Richland. After his eye was removed due to trauma, the noninvasive isotope diagnosis showed that her son did not require further surgery. Many exploratory surgeries and other procedures are avoided after a diagnosis based on isotope testing. A new technique used in the emergency room separates patients complaining of chest pain into two categories: those who really are having a heart attack and should be referred for further treatment, and those who are just having severe indigestion and could be sent home instead of being admitted for further costly tests. Another isotope test distinguishes between patients who might benefit from open heart surgery and those who would not, saving the latter from unnecessary trauma. This cost study should be based on the top ten cancers, rheumatoid arthritis, and heart disease, comparing older treatments with medical isotope treatment cost savings. Statistics presented for diagnoses, the few FDA approved cancer radioisotope treatments, and for clinical study, results published in the medical literature should naturally be included. Again, these figures are readily available. Please keep in mind that, in 1993, it cost an average of \$15,000 to care for each dying cancer patient, and that over 550,000 cancer deaths are expected in 2000. Medical isotope treatment could cut that figure in half. The goal of cancer treatments is to rid the patient of cancer cells during the first treatment regimen. For example, sixty percent of cancer patients undergo surgery, at a cost of from \$10,000 to \$200,000 for more involved brain and lung cancer procedures. Surgeons only remove the cancer that they can see. Sixty percent of these patients undergo at least one more surgery when small pockets of cancer cells that are too small to see are left behind to proliferate. Radioimmunoguided surgery is successfully treating study patients. Isotopes are placed where the tumor was removed. Given in small amounts, these isotopes guide the surgeon to remove pockets of cancer cells that would otherwise be missed. These isotopes may also be given as treatment smart bulletSTM to "zap" remaining cancer cells. Similarly, seed implants are also being used to irradiate the area surrounding the removed tumor, as in costly brain cancer, to eradicate missed, remaining cancer cells.

1700-6

Response to Commentor No. 1700

***Commentor No. 1700: Marlene G. Oliver (Cont'd)
New Medical Technology***

Seed implants have been approved for use in the general liver cancer population in Australia, New Zealand, Hong Kong, and, more recently, Canada. Many cancer patients, especially prostate and breast, develop liver cancer when their cancer migrates, or metastasizes, away from its original site. Liver cancer is basically a fatal disease. Up to forty percent of liver cancer patients survive after isotope seed implant therapy. An absolute minimum two billion dollars might be saved annually after these intraoperative isotope treatments are approved in this country and become a part of the surgical armamentarium. In one recent study, it cost \$1500 per day, or about \$60,000 per patient in direct medical costs to treat leukemia, patients with the first round of chemotherapy for the first six weeks in a series of treatments. These patients normally continue with external beam radiation, followed by a second regimen of another six to eight week chemotherapy session, at a cost of well over \$100,000 per patient. Many patients endure this regimen multiple times. Seventy percent of adult leukemia patients die in spite of this effort. Over 100,000 Americans are diagnosed each year with blood cancers. Over 70% of isotope study patients with advanced blood cancer see their disease disappear and remain in remission five years later., and over 90% of such cancers shrink significantly, with a single "smart bullets" intravenous administration or needle injection at a cost of less than \$10,000 per patient, typically without the debilitating side effects of chemotherapy. Melody, a non-Hodgkins lymphoma patient, described her 30 second isotope injection as "wham, bam, thank you maam". Three chemotherapy treatments failed Melody. Over 50,000 cancer patients will contract NHL in 2000. Jacqueline Kennedy Onassis and, more recently, King Hussein, were NHL patients. Melody's "smart bullet" injection at NeoRx company in Seattle put her cancer into remission. Please note that this company has asked the DOE to supply the isotope Holmium-166 for study patients with multiple myeloma, another blood cancer. NeoRx waits for this isotope as the incidence of this cancer rises in this country. Recognize in the NIPERIS such realistic estimates as over 10 billion dollars per year in health care cost savings when isotope treatment becomes mainstream for blood cancer patients alone. Study data for the most

1700-6

Response to Commentor No. 1700

***Commentor No. 1700: Marlene G. Oliver (Cont'd)
New Medical Technology***

common type of non_Hodgkins lymphoma, is complete and before the FDA for final approval to sell in this country. Additionally, it costs thousands of dollars per gram of protein or peptide, the biological component of "smart bullets". Should purified high specific activity ¹¹³In become available, the cost to treat patients with "smart bullets" with this isotope, instead of the impure, less desirable Canadian ¹¹³In, will shrink substantially, further reducing treatment costs. Consider that the six year death rate from ovarian cancer, the disease that claimed comedienne Gilda Radner, and, more recently, Academy_Award winning actress Madeline Kahn, was 86% in a recent study. Only 10% of ovarian cancer study patients died of this disease within six years after 'smart bullet' treatment. The last phase of this study prior to seeking FDA approval is underway.

Patients restored to good health after their isotope treatment return to the workforce, as did Melody. Include in the NI PEIS cost_benefit analysis a projected realistic estimate of increased tax revenues to the U.S. Treasury.

1700-6

Heart disease is the number one killer in this country. Medical isotopes in late _ stage studies in this country are working to keep coronary arteries open, avoiding costly repeat angioplasty and open heart surgery for potentially 50,000 patients per year. Some patients undergo six angioplasties, after their arteries repeatedly close. Medicare paid \$10,666 for each stented procedure in 1999. Studies show that half of these repeats might be avoided by adding an isotope during the initial procedure that interferes with the primary complication, excess scar tissue formation. This would also help avoid costly open heart surgery for these patients.

Also be aware that isotope treatment is routine in Western Europe for intractable rheumatoid arthritis, a disease that currently affects about eight million Americans. This number expected to grow to a minimum of 12 million patients over the next 20 years. This therapy involves a thirty second isotope injection per joint treated, commonly in the knee and small joints of the hand. The isotope works to clear inflammatory cells clogging the joint. The European cost: about \$500 per injected

Commentor No. 1700: Marlene G. Oliver (Cont'd)
New Medical Technology

knee. This treatment replaces a surgery referral for a majority of these patients. In this country, these patients are referred for total knee replacement. Their diseased knee joint is removed and an artificial metal joint inserted in its place. Medicare pays about \$15,000 per knee joint replacement surgery. Hand surgery is even more costly. The European isotope of choice for the hand is Er_169. When Oak Ridge was contacted last summer, I was told Er_169 is not available. FFTF is an ideal production candidate for this isotope. Arthritis is the number one reason that Medicare patients visit their physicians. Again, projected cost savings with isotope treatment is in the billions of dollars annually.

The first studies are being conducted using "smart bullets" to target infectious disease such as the AIDS virus.. Include in the N1 PEIS an estimated cost savings of approximately \$40,000 per AIDS patient per year for medications alone should this study prove successful. We are also but one antibiotic away from other infectious disease epidemics as pathogens mutate and become resistant to antibiotics. One example is tuberculosis. Isotope treatments may keep these diseases from becoming widespread.

One of the best ways to increase the bottom line in business is to reduce costs. Cost savings for the above treatments should be estimated in the N1 PUS. Venture capitalists are generally happy to receive a five to one return on investment. They are extremely happy to see a ten to one ROL Recognize that restarting the IFFTF should produce at least a 25 to 1 R01 In cost savings, over 100 to one for some diseases treated with medical isotopes, even without including revenues from isotope sales. Recognize that the projected cost savings to Medicare and Medicaid alone, as these therapies become more mainstream, should more than pay for this isotope production program, including construction of accelerators and mini high flux reactors across the country. Recognize that the cost savings from restarting FFTF might also pay for over one hundred of Mr._ Magwood's existing programs, with money left over to supply prescription drugs at no charge to the elderly and health insurance to the over 40 million Americans who have no coverage. Recognize that

1700-6

Response to Commentor No. 1700

Commentor No. 1700: Marlene G. Oliver (Cont'd)
New Medical Technology

It is the lack of health insurance coverage for these individuals that pose the greatest health threat to this country. This potential human, economic, and environmental impact to this country is severe. In addition, as taxpayers, we have already paid for the FFTF As stakeholders, Americans would want to see and expect a return on this investment. Restarting FFTF is the single most cost effective alternative in the N11 PEIS given the facts as listed above, and should be so recognized.

3., Waste minimization. The DOE is always questioned about the waste generated from the operation of its nuclear facilities. The NI PEIS question is "How much waste is generated?" Another question should be "How much waste could be eliminated?" The DOE should consider waste minimization from the medical community's point of view, from a national level and from the health perspective of the increasing use of medical isotopes. Compared with the numbers shown in the NI PEIS, the volume of infectious and toxic waste that is generated with current, less effective cancer treatment methods is enormous. These numbers would be sharply reduced from the more efficient use of medical isotopes for diagnosis and therapy. Cancer patients produce a lot of waste. Surgery waste is infectious; chemotherapy waste is both poisonous and infectious. Witness Ms. Piippo's Richland testimony that the vomitus after her chemotherapy treatments ate away the insides of the Rubbermaid™ type container provided to collect her discharge. Recognize that these wastes are toxic, infectious hazardous wastes and require special handling at high cost. A single cancer surgery produces a minimum of two to over twenty large 33 gallon garbage bags of hazardous waste. A realistic estimate should be made to determine how much of this waste would be eliminated by the use of medical isotope therapy. The cost savings to the medical community would be substantial, and should be factored into any cost-benefit analysis that the DOE should conduct. These waste disposal cost savings might mean the difference between hospitals closing and remaining solvent. The DOE should also take the lead to assure that proper facilities and methods are available to handle medical isotope wastes from each state and explain how this will be done in the NI PEIS. Nonagreement states pose a serious public health hazard as their facilities have no

1700-6
(Cont'd)

1700-7

Response to Commentor No. 1700

1700-7: Medical wastes are regulated by the U.S. Environmental Protection Agency and authorized State agencies. Commercial generation of radioactive waste are regulated by the Nuclear Regulatory Commission or Agreement State. DOE does not have purview over these wastes or the waste generators. This type of analysis requested by the commentor is out of scope of the NI PEIS. DOE's policy prohibits reprocessing of spent nuclear fuel.

Commentor No. 1700: Marlene G. Oliver (Cont'd)
New Medical Technology

legal waste repository. Visits to medical facilities in these areas will show 55 gallon drums containing radioactive waste being stored in hallways, under stairwells, on loading bays, and even in parking lots. Once again, from a national standpoint, the hazardous medical waste volumes are much higher than those generated from the operation of the DOE facilities of Alternate I listed in the PEIS. The DOE should consider enlisting the FFTF in research to determine the best ways to reduce or eliminate the various categories of nuclear waste, including, but not limited to, medical waste. Although this might be the realm of the NRC and other agencies, the government, including the DOE, should support the best medical diagnosis and treatment options and evaluate all of our needs for the best waste treatment methods implementation with the smallest waste disposal cost and minimum environmental impact. The compartmentalizing that has occurred in the Federal government is preventing the proper evaluation of the benefits from the use of medical isotopes, and inhibiting a fairer and more coordinated plan necessary to effectively pursue this very promising option. It is crucial that the foregoing be addressed in the N1 PEIS. In France, where over 70% of their electricity comes from nuclear reactors and where nuclear power is pretty much a non-issue, there is a nuclear waste reprocessing facility adjacent to a nuclear reactor in Normandy, across the channel from England. In June of 1999, the British government announced that anti-nuclear forces would no longer prevent the United Kingdom from proceeding with its nuclear waste recycling program. The government and DOE should recognize in the N1 PEIS that this waste recycling policy makes sense~ for this country as well, and that the FFTF could play a significant research role in this waste minimization and recycling effort. Please keep "junk science" separate from the N1 PEIS and the realm of public health. The DOE should consider working with Congress and the appropriate federal agencies to address nuclear waste storage and recycling options. This would do much to allay the public's fear about ever-increasing amounts of nuclear waste.

I ask the DOE to fairly address all of the above points in the N1 PEIS. With this document, the DOE has the opportunity to take the lead in this endeavor. I ask the DOE _ PLEASE, do not play politics on the backs of patients.

Thank you.

 MISN: K1-46
 Richland, WA 99352

Dear Dr. Madia:

Our organization represents over 30,000 practicing radiologists. We are writing to you to express our strong support for a full and open consideration of the restart of the Fast Flux Test Facility (FFTF) and its renewed operation as a user facility to provide irradiation services for the nation's medical, science, and engineering communities.

With its restart, FFTF would provide an extremely valuable resource for the nation's faculty and students by supplying research and educational opportunities related to nuclear medicine, engineering, and nuclear science. The availability of FFTF's proven research capabilities would enhance and extend those efforts, especially in the areas of medical isotope development, production and applications, and materials processing.

The FFTF has the ability to produce large quantities of a variety of medical isotopes. Many of these promising isotopes are currently either unavailable or available in such small quantities from other production facilities that it is difficult to conduct clinical studies with even very small numbers of patients. Research is being hampered or removed from consideration by a lack of these isotopes. Medical isotopes are often the only effective way to properly diagnose and treat serious disease. It is crucial that we, as radiologists, have access to a wide variety of isotopes, including those with high specific activity, appropriate to diagnose, prevent and treat heart disease, cancer, arthritis, and more recently, infectious disease.

The FFTF is a unique facility with capabilities that no other device in the world can match. It also has an outstanding record of research, operational excellence, and environmental stewardship. A restart like FFTF might never be built again. Thus, I hope that the decision on its future will fully weigh its considerable merits and many prospective contributions to the nation's health and welfare.

Sincerely,

Jerry P. Petusnick, MD
 Chairman of the Board

Dr. William J. Madia
 Pacific Northwest National Laboratory
 902 Battelle Blvd.
 PO Box 99
 MISN: K1-46
 Richland WA 99352

Dear Dr. Madia:

I am writing to you to express our strong support for a full and open consideration of the restart of the Fast Flux Test Facility (FFTF) and its renewed operation as a user facility to provide irradiation services for the nation's medical community.

With its restart, FFTF could provide an extremely valuable resource for the nation's medical faculty and students by providing both research and educational opportunities related to nuclear science and especially nuclear medicine. The availability of FFTF's proven research capabilities would enhance and extend those efforts, especially in the areas of medical isotope development, production and applications for heart patients.

The FFTF has the ability to produce large quantities of a variety of medical isotopes. Many of these promising isotopes are currently either unavailable or available in such small quantities from other sometimes unreliable production facilities that it is difficult to conduct cardiac studies with even very small numbers of patients. Research is being hampered or removed from consideration by a lack of these isotopes. Medical isotope therapy is generally more effective against disease such as coronary revascularization, at lower cost. It is crucial that we receive a wide variety of isotopes, including those with high specific activity, appropriate to diagnose and treat heart disease.

It is vital that an adequate supply of medical isotopes be available to our members for research, diagnosis and treatment of coronary disease. We fully support the effort behind the FFTF restart.

Sincerely,

Timothy M. Bateman, MD

Department of Surgery

March 5, 1999

The Honorable Bill Richardson
 Secretary of Energy
 U.S. Department of Energy
 1000 Independence Avenue SW
 Washington, DC 20583

Dear Secretary Richardson,

**SHORTAGE OF CERTAIN MEDICAL ISOTOPES AND OUR NEED
 FOR THE FAST FLUX TEST FACILITY**

In March of 1996, I wrote to Senator John Breaux and Senator Patty Murray about our need for high-specific-activity iodine-131. This high-purity radioisotope is *not currently* available from any source anywhere in the world. We understand that it could be produced under a high neutron flux with the high neutron energies available in the core of the Fast Flux Test Facility, near Richland, Washington.

We need high specific activity iodine-131 because we are developing a cancer-targeting peptide that has four binding sites for radiolodine. The standard iodine-131 from Canada is mostly stable (non-radioactive) iodine-127, and these "cold" and useless atoms tend to occupy the binding sites on the targeting protein that we need for radioactive iodine-131. Our new approach will be able to treat patients with cancer cells that express the receptors that bind somatostatin. These cancers include certain lung, brain, colon, neuroendocrine, and pancreatic cancers.

As I previously wrote to Senators Breaux and Murray, one of our greatest challenges in developing new cancer treatments is the acute shortage of the necessary type, quality, and activity of radioisotopes for special applications. We believe that our approach will offer significant new hope to cancer patients who have no other resources for successful treatment.

For these reasons, I encourage you to support the restart of the Fast Flux Test Facility.

Sincerely yours,

EUGENE A. WOLTERING, M.D., F.A.C.S.

 P.O. Box 1970
 Westinghouse Hanford
 Richland, WA 99352

Dear Dr. Schenter:

I would like to thank you for the ^{131}I that you provided us last year for use in our ^{131}I - ^{125}I generator research program. This material was used in our N.I.H. project to investigate new chemistry related to the basic chemical processes involved in radionuclide generators used in medical applications.

As we discussed, the F.D.A. has given us permission to resume our clinical studies with the ^{131}I - ^{125}I generator. These studies (funded by the F.D.A. Orphan Drug program) involve injection of the generator eluate directly into the patient and allow measurement of various aspects of cardiac function without the trauma associated with catheterization and with a lower radiation dose than that incurred with currently available radiopharmaceuticals. Additional advantages resulting from the very short half-life of ^{125}I include the ability to perform repeated studies to measure the effects of exercise or pharmaceutical intervention and better imaging statistics because of the higher photon flux that results from the larger administered dose of ^{125}I .

In order to resume these studies, we will require a dependable supply of ^{131}I that is of high radionuclidic purity. A reasonable estimate for the quantity required is on the order of 2-3 Ci/month. This will allow us to prepare 1-2 generators a month so that we can complete the Phase II clinical studies referred to above. When the Phase II studies are completed, we hope to be able to begin Phase III studies. This will involve a larger number of clinical sites and hence require the production of 3-5 generators/month. At this stage, we will require 3-5 Ci of ^{131}I per month for a period of 1-2 years.

Once again, thank you for your assistance in establishing a dependable source of this radionuclide.

Sincerely,

Alan B. Packard, Ph.D.
 Senior Research Associate

Os-191 APPLICATION

March 12, 1990

A better way of diagnosing heart function in premature babies could spare those infants from unnecessary open heart surgery. Physicians currently have few options when it comes to diagnosis -- and those options aren't without risk, either.

Using a catheter can cause trauma to the infant's fragile circulatory system, while the use of currently available radiopharmaceuticals means giving the premature baby a dose of radiation.

But researchers at the Children's Hospital in Boston have found that using a radioisotope of osmium, a metallic element similar to platinum, not only gives better diagnostic information but results in a lower radiation dose. Used like a bone X-ray, it allows the imaging of softer tissues, such as the heart and blood vessels.

The osmium-191 used in the initial Food and Drug Administration study was made at the Department of Energy's most advanced research reactor, the Fast Flux Test Facility at the Hanford Site in southeastern Washington. As the study is stepped up, researchers say they will need a dependable and greater supply of osmium-191.

Ms. Colette Brown
Department of Energy
Office of Space and Defense Power Systems

Re: Draft Programmatic Environmental Impact Statement for accomplishing expanded civilian nuclear energy research and development and isotope production mission in the United States, including the role of the Fast Flux Test Facility.

Dear Ms. Brown,

I am concerned about the proposal to expand the civilian nuclear infrastructure contained in the above referenced document. As a member of the Snake River Alliance I am concerned about the existing waste at the INEEL, and its potential contamination of the Snake River Aquifer. The last thing we in Idaho need is a plan to generate more nuclear waste at the INEEL - a site that urgently needs to be cleaned up already. Therefore, I strongly urge you not to pursue the plutonium-238 production mission outlined in your PEIS.

My specific concerns about the consequences of the proposed activities include:

- Increasing the amount of liquid high level waste at the INEEL
- the inherent risks in plutonium production at INEEL or any other site
- the potential for a catastrophic release of plutonium during lift-off or re-entry of a space probe carrying this material
- the precedent that would be set if our country re-starts its plutonium re-processing activities and the resulting negative impact upon nuclear non-proliferation efforts.

Considering the factors I've mentioned above, I strongly urge you to select alternative 5 in the current PEIS. Doing so would allow the INEEL facilities concerned to continue their focus on cleaning up the existing mess left over from past nuclear weapons work, and would not make worse an already difficult task of limiting the proliferation of nuclear weapons. Thank you for the opportunity to comment on this plan.

Respectfully Yours,

J. Christopher Hormel

1702-1

1702-2

1702-3

1702-4

1702-5

1702-6

1702-7

1702-1

Response to Commentor No. 1702

- 1702-1:** The commentor's concerns regarding existing waste at INEEL and contamination of the Snake River Plain aquifer are noted. Contamination of the Snake River Plain aquifer is discussed in Sections 3.3.4.2.1 and 3.4.2.2. As discussed in Section 4.3.2.1.13, implementation of nuclear infrastructure alternatives that would involve the Fluorinel Dissolution Process Facility would generate additional waste at INEEL. This section also describes the disposition of waste that would be generated under the nuclear infrastructure alternatives. Implementation of the nuclear infrastructure alternatives would not affect funding or cleanup schedules at INEEL.
- 1702-2:** DOE notes the commentor's opposition to the plutonium-238 mission.
- 1702-3:** The use of proposed alternative facilities associated with processing of neptunium-237 targets would have no impact on schedules or available funding for high-level radioactive waste programs at either Hanford or INEEL. At INEEL, the tanks would not be used although certain facilities at the Idaho Nuclear Technology Engineering Center (INTEC) would be used to treat the wastes resulting from processing the irradiated targets. These are reliable systems that would process a maximum of 1,050 cubic meters of low-level radioactive waste over

Commentor No. 1702: J. Christopher Hormel (Cont'd)

Response to Commentor No. 1702

the 35-year nuclear infrastructure operational period. The higher activity waste would be treated as a solid form via a stand-alone vitrification system, separate from any tank waste treatment system. At Hanford, the existing high-level radioactive waste facilities would not be used, and as analyzed in the PEIS, no existing or planned high level radioactive waste facilities would be used to treat the wastes resulting from processing the irradiated targets.

- 1702-4:** The facilities evaluated in the NI PEIS can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Sections 4.2-4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from implementation of the alternatives, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that the radiological and nonradiological risks associated with each of the alternatives would be small.
- 1702-5:** DOE notes the commentor's concern for NASA's use of nuclear materials for space missions, although this issue is beyond the scope of this PEIS. Through a Memorandum of Understanding with NASA DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch.
- 1702-6:** It is not true that resumption of plutonium-238 production constitutes a return to reprocessing. The aqueous technique that would be used to separate plutonium consisting of over 80 percent plutonium-238 and neptunium from the irradiated target is similar to the technology that was used in portions of the complex process to extract plutonium-239. However, as discussed in PEIS Sections S.3, 2.2.3 and A.1.4, this technology would be used to chemically separate plutonium-238 and neptunium from irradiated targets and not from irradiated or spent nuclear fuel, whereas reprocessing separates weapons grade plutonium-239 from irradiated nuclear fuel. Plutonium-238 extraction is not reprocessing. Unlike plutonium-239, plutonium-238 is not used

Commentor No. 1702: J. Christopher Hormel (Cont'd)

Response to Commentor No. 1702

in nuclear weapons, but rather it would be used as a power and heat source for NASA space missions.

The Nuclear Infrastructure Nonproliferation Impact Assessment, published in September 2000, confirms that extracting plutonium-238 from irradiated targets would not undermine nonproliferation goals. In this report, DOE recognizes that proliferation concerns might be raised related to one of the technical assessment factors, "reduction in attractiveness of material forms," due to the fact that, in the extraction of plutonium-238, the remaining unconverted neptunium a weapons-useable fissile material used as target material for conversion into plutonium-238, must also be recovered (not produced) purified, and recycled. This is unavoidable (unless the United States elects to neither produce or purchase plutonium-238), and it impacts all PEIS alternatives and options, including the No Action Alternative and Alternative 5: permanently deactivate FFTF with no new missions at U.S. facilities. However, while the fact that concerns might be raised is valuable to the record of decision process, it does not constitute an inconsistency with or departure from nonproliferation policy, and plutonium-238 is needed to fulfill our missions. Further, in the event that plutonium-238 production is resumed in the United States, the total separated stocks of neptunium would be reduced over time in an irreversible manner since there is a moratorium on U.S. spent fuel reprocessing. This overall reduction in a weapons-useable material would mitigate the potential concerns related to material attractiveness, and offer an additional method to pursue U.S. nonproliferation goals. DOE's proposed approach in this mission, and its rigorous nonproliferation impact assessment, demonstrate its commitment to nonproliferation policy, domestically and in the international community.

1702-7: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 1703: Tatiana Maxwell

September 18, 2000

Ms. Colette Brown
DOE
Office of Space and Defense Power Systems

Dear Ms. Brown,

Your Department's recent proposal to expand the civilian nuclear infrastructure, outlined in the *Draft Programmatic Environmental Impact Statement for accomplishing expanded civilian nuclear energy research and development and isotope production mission in the United States, including the role of the Fast Flux Test Facility*, raises significant nuclear weapons proliferation and environmental issues.

As a member of the Snake River Alliance I have become aware of the serious nuclear contamination and waste problems at INEEL. INEEL is one of the most contaminated areas in America. The Department's recent estimate on cleaning up our site is \$22 billion and is expected to take 50 years—longer than any other DOE facility. In addition, we have over 360 individual superfund sites within the 890 sq. mile area that comprises INEEL. With this known, the last thing we need is a plan to generate more nuclear waste at a site that needs more waste like the DOE needs security scandals. Out of concern for Idaho's environment, I strongly urge you not to pursue the plutonium-238 production mission outlined in your PEIS.

One of the most daunting problems confronting cleanup at major DOE facilities such as Hanford and INEEL, is the solidification of liquid high-level nuclear waste. Your current plan for plutonium-238 production entails the generation of approximately 288,000 additional gallons of this waste over the project's 35 year span. While this is a small portion of Hanford's high level waste, it is approximately one fifth of what we have remaining here in Idaho, which makes it a very significant amount. Previous leakage of this waste at INEEL and Hanford threatens our water supplies. What we certainly don't need is any more of this most highly problematic of waste forms.

Given the certain risks inherent in production of plutonium, the justified need for this material would have to be tremendous, and the PEIS does a poor job of providing ample justification. Beyond the risks involved in production, and the aforementioned resulting waste problem, there is also the issue of an accident occurring upon lift-off or reentry of a space probe carrying this material. The cassini probe, launched in 1997, carried 72 pounds of Pu-238. The potential for an explosion during lift-off or upon an inadvertent reentry during the fly-by phase, gave many in the scientific community pause, including scientists within NASA. According to NASA's own conservative estimate, a burn up upon reentry of the cassini probe could have caused 2,300 cancer fatalities, independent analyses ranged much higher. This potential for a catastrophic release of this extremely toxic material will remain so long as the US government remains committed to

Response to Commentor No. 1703

1703-1: The commentor's position regarding plutonium-238 production at INEEL is noted. Production of plutonium-238 at one or more of the candidate sites would be conducted in support of NASA's deep space missions (Volume 1, Section 1.2.2 of the NI PEIS). As discussed in Sections 4.3.2.1.13 and 4.4.2.1.13 of the EIS, selection of the Fluorinel Dissolution Processing Facility and/or the Advanced Test Reactor to support production of plutonium-238 would have no significant impact on the waste management system at INEEL. Use of any of the facilities proposed in this PEIS for the stated missions would not impact cleanup missions at DOE sites.

1703-2: The use of proposed alternative facilities associated with processing of neptunium-237 targets would have no impact on schedules or available funding for high-level radioactive waste programs at either Hanford or INEEL. At INEEL, the tanks would not be used although certain facilities at the Idaho Nuclear Technology Engineering Center (INTEC) would be used to treat the wastes resulting from processing the irradiated targets. These are reliable systems that would process a maximum of 1,050 cubic meters of low-level radioactive waste over the 35-year nuclear infrastructure operational period. The higher activity waste would be treated as a solid form via a stand-alone vitrification system, separate from any tank waste treatment system. At Hanford, the existing high-level radioactive waste facilities would not be used, and as analyzed in the PEIS, no existing or planned high level radioactive waste facilities would be used to treat the wastes resulting from processing the irradiated targets.

1703-3: Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is

1703-1

1703-2

1703-3

1703-4

Commentor No. 1703: Tatiana Maxwell (Cont'd)

the use of plutonium-238. If DOE is to have a role in developing power systems for NASA's instrumentation, it should focus on promising solar technology, an alternative that has been promoted in the European scientific community.

There are also proliferation concerns as it pertains to this plan. A return to production of this isotope, however poorly justified, means a return to the use of aqueous reprocessing at DOE facilities where this technology has been used to extract bomb material for the weapons program. From President Carter to presidents Bush and Clinton, US policy has been to halt reprocessing in this country in order to set a global precedent to curtail the spread of nuclear weapons material—a noble effort in serious need of bolstering through action.

Indeed, an otherwise lukewarm *Nuclear Infrastructure Nonproliferation Impact Assessment* conducted by your Office of Arms Control and Nonproliferation questions whether our commitment to nonproliferation isn't weakened by the use of the Fluorine Dissolution Process Facility within Building 666 at INEEL. INEEL's reprocessing facility is next door to a wet storage unit for Navy spent fuel, which contains a greater than average amount of highly enriched uranium. It was reprocessed from 1953 to 1989 at INEEL for the weapons program. Use of this facility to carry out plutonium-238 extraction, especially considering the dubious need for this isotope, at the very least raises the concern that DOE is not fully committed to ending reprocessing. The international community cannot be expected to trust DOE's civilian-mission claim when an agency devoutly committed to development of weapons uses a nuclear weapons technology at a weapons facility.

Considering all these factors that could adversely affect our environment and commitment to nonproliferation, I strongly urge you to select alternative 5 in the current PEIS. This alternative would allow the Advanced Test Reactor at INEEL to continue producing medical and industrial isotopes for the commercial sector and would not lead to the production of anymore highly radioactive liquid waste at Hanford or INEEL. The main mission at these two facilities has been and should continue to be cleanup of the mess left over from previous nuclear weapons work. Additional waste production would interfere with this already difficult and expensive work. Alternative 5 also calls for the decommissioning of the FFTF reactor at Hanford. FFTF is an aging breeder reactor whose use would be inconsistent with United States policy to discourage use of this technology due to the capability this class of reactors has to produce more plutonium than is consumed. Thank you for the opportunity to comment on this plan.

Sincerely,

Tatiana Maxwell

1703-4
(Cont'd)

1703-5

1703-6

Response to Commentor No. 1703

anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed production of plutonium-238 are relatively low and are discussed in detail in Chapter 4 of Volume 1, and Appendixes H, I, and J of Volume 2 in the Final NI PEIS.

1703-4: DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. The Cassini fly-by occurred exactly as planned, with no release of nuclear material.

1703-5: The commentor is correct in stating that the aqueous processing technology that would be used to separate plutonium consisting of over 80 percent plutonium-238 and neptunium from the irradiated target is similar to the technology that was used to extract plutonium-239. However, unlike plutonium-239, plutonium-238 is not used in nuclear weapons, but rather it would be used as a power source for NASA space missions. The technology that is discussed in EIS Sections S.3, 2.2.3 and A.1.4 would be used to chemically separate plutonium-238 and neptunium from irradiated targets and not from irradiated or spent

Commentor No. 1703: Tatiana Maxwell (Cont'd)

Response to Commentor No. 1703

nuclear fuel whereas reprocessing separates weapons grade plutonium-239 from irradiated nuclear fuel. As discussed in the separate nonproliferation impact assessment report, use of this technology to produce plutonium-238 from irradiated targets will not create a nonproliferation threat. DOE is committed to full compliance with and support of the U.S. policy prohibiting reprocessing. The juxtaposition of INEEL Building 666 to wet storage of highly enriched uranium Navy spent nuclear fuel and its previous mission of reprocessing spent nuclear fuel were considered in the separate nonproliferation impact assessment.

1703-6: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF. It should be noted that medical isotopes would continue to be produced at ATR regardless of which alternative is selected in the Record of Decision. The FFTF would produce spent nuclear fuel and low-level radioactive waste, and as discussed throughout Section 4.3 of Volume 1, none of the proposed alternatives would add waste to the high-level waste tanks at Hanford or INEEL. Also, it should be pointed out that while FFTF supported the breeder reactor program, it is not itself a breeder reactor, but rather a fast flux research reactor.

With respect to cleanup of wastes at Hanford or INEEL, the proposed action and the existing cleanup missions are independent programs and actions related to one will not impact the other. While the cleanup activities at both Hanford and INEEL are high priority to DOE, it should be noted that the cleanup of legacy wastes is beyond the scope of the NI PEIS.

Commentor No. 1704: Lois R. Spinrad

Draft PEIS Comment Form

I would urge that the Fast Flux Test Facility (FFTF) be brought into operation again as soon as is possible. Our existing nuclear reactors are used in various fields of medicine to benefit many patients without turning to foreign sources.

Our space research can benefit from it without turning to other countries for energy sources.

My husband, Bernie Spinrad, now deceased, passed on to me his admiration and respect for the potential of these facilities. His history and expertise made his decision of great value.

Thank you,
Lois Spinrad

1704-1

1704-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Draft PEIS Comment Form

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

I am opposed to expanding civilian nuclear energy research and development and isotope production (including plutonium-238) missions in the United States, including the role of the Fast Flux Test Facility (64 FR 50064). We must fund our research towards safer and cleaner alternatives (that already exist) We must put our emphasis on preventative medicine, and the well-being of the relationship between humanity and the environment. Space missions should not be funded above the importance of people. Take care of the waste we have already made - JUST CLEAN UP HANFORD!!

7/12/00

09/18/00 MON 17:00 FAX

1705-1

1705-1: DOE notes the commentor's opposition to expanding DOE's nuclear infrastructure to meet the three missions addressed in the NI PEIS and to the restart of FFTF.

1705-2

1705-2: DOE notes the commentor's interest in alternative energy sources and preventative medicine, although issues of research and development of alternative energy sources and preventative medicine are beyond the scope of this Nuclear Infrastructure PEIS. Consistent with its mandates under the Atomic Energy Act, DOE is proposing this enhancement for the purposes of addressing three primary needs: 1) to support the increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and for which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear energy research and development in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio.

1705-3

1705-3: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

REGULATORY UNIT

001

Draft PEIS Comment Form

Dear Ms. Brown:

I am for the restart of the FFTF facility to produce the needed radioisotopes. As stated in the PEIS, these isotopes are needed to provide researchers with the isotopes to do their work (e.g., improve the standard of living of people in the area of medicine, power production, development of new technologies). I feel it is short-sighted to not use a facility that the American taxpayer has already paid for. In addition, the ability to obtain Congressional monies for long-term tasks appears to be not a sure thing and becomes even more at risk since it does not appear that Congress is able or willing to fund such projects. Also, use of FFTF will allow a more immediate production of radioisotopes where the alternative approaches are likely to result in extensive delays of radioisotope production.

Thank you for the opportunity to comment on this PEIS.

Sincerely,

J. L. Polehn

To whom it may concern,

Attached is Heart of America Northwest and Legal Advocates for Washington's comments on the Draft PEIS on Restarting the FFTF reactor at Hanford. If you have problems with the document, please write or call us at (206) 382_1014. Thanks

Hyun Lee

Response to Commentor No. 1707

- 1707-1:** Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.
- 1707-2:** Regarding nonproliferation policy, PEIS Alternative 1, which included the restart of FFTF, was evaluated along with a range of reasonable alternatives and options, in the Nuclear Infrastructure Nonproliferation Impact Assessment, published in September, 2000, and placed on the DOE web site (<http://www.nuclear.gov>) for public dissemination. The restart of the FFTF reactor would not violate U.S. nuclear nonproliferation policies. As stated in Appendix Q of the PEIS, "FFTF restart would fully meet nonproliferation objectives." This means that there are no significant identified concerns contrary to U.S. nonproliferation objectives.
- 1707-3:** DOE has evaluated the environmental impacts of a range of reasonable alternatives to fulfill the requirements of the proposed action. The commentor is referred to Volume 1, Section 2.5 of the PEIS for specific details.
- 1707-4:** The commentor outlines a number of issues to be addressed within Comment 1 (including Comment d in the Overview) in the submittal. To ensure that each issue is addressed, the responses have been organized to match the numerical subheadings in the submittal.

Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest

Comments of Heart of America Northwest And Legal Advocates for Washington On the US Department of Energy's Programmatic Environmental Impact Statement On Restart of the FFTF Nuclear Reactor at Hanford (Nuclear Infrastructure PEIS) September 2000 (Supplementing comments given orally, and materials turned in, at hearings)

Overview:

USDOE issued its Draft Programmatic Environmental Impact Statement (Expanded Nuclear Infrastructure PEIS, called "PEIS" herein) on Restarting the FFTF Nuclear Reactor at the end of July, 2000. The EIS illegally failed to disclose:

- a) what would be done with the wastes from restart of the FFTF reactor and the proposed resumption of Plutonium processing at Hanford;
- b) whether restart of the FFTF reactor violated U.S. nuclear non_proliferation policies;
- c) reasonable alternatives (including some recommended by the USDOE's own blue ribbon medical advisory committee on isotope production) for producing research medical isotopes and assisting commercial isotope providers in producing isotopes for commercial markets;
- d) that the same blue ribbon medical advisory committee concluded in a report provided to USDOE's Office of Nuclear Energy (the author of the PEIS) in April "that the FFTF will not be a viable source of research radioisotopes", and, that the USDOE has a sound policy against investing in restart or new construction to serve commercial isotope producers; and,
- e) the costs of restarting the FFTF reactor and costs of alternatives _ along with the impact on USDOE's ability to meet its nuclear waste cleanup obligations if it prioritizes funding for restart ahead of funding its cleanup program.

For each of these areas, USDOE published separate reports _ which were not available to the public for comment at the time of the public hearings. The National Environmental Policy Act (NEPA)

1707-1

1707-2

1707-3

1707-4

1707-5

Response to Commentor No. 1707

Overview Comment d: The issues with respect to the NERAC Subcommittee recommendations and DOE's policy against investing in restart or new construction are addressed in the response for 1.0 provided below.

1.0 DOE's production and sale of radioisotopes fall into two categories, commercial and research, and both types of isotope production are considered under the proposed actions. Commercial radioisotopes are those that are produced in large, bulk quantities and sold to pharmaceutical companies or distributors, or to equipment or sealed source manufacturers. Examples of commercial radioisotopes produced by DOE include strontium-82 and germanium-68 for medical applications, and iridium-192 and californium-252 for industrial applications. DOE only produces commercial isotopes when there is no U.S. private sector capability or when foreign sources do not have the capacity to meet U.S. needs reliably. In contrast, research radioisotopes are typically produced and sold in small quantities in response to specialty orders from researchers preparing experiments in the field of medicine, with small quantities of these radioisotopes also purchased by industrial researchers. Because small-quantity production of research isotopes is not financially attractive to private-sector producers and is generally not undertaken, DOE attempts to provide all research radioisotopes that are requested, subject to production capability, inventory, and financial constraints. As successful application of a specific research isotope is established, the production and sales of that radioisotope may shift from research to commercial status. In recent years, over 95 percent of DOE's sales of radioisotopes by dollar volume were commercial and 5 percent have been for research. Additional discussion of how DOE's isotope program fits into the overall U.S. and foreign isotope production capabilities was incorporated into Section 1.2.1 of Volume 1.

The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, (April 2000) regarding the suitability of FFTF to produce research isotopes in a timely and cost-efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of

Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest

requires that the agency disclose in one report (the EIS) all reasonably foreseeable impacts from proposed actions and interrelated decisions and all reasonable alternatives. Even where the reports were published long in advance of the publication of the PEIS, USDOE failed to disclose in the PEIS those reports' conclusions and suggested alternatives. Nor was the public reasonably notified of the existence of those reports and their relevance to the PEIS (i.e., they were not on the PEIS website). Other reports were deliberately made available only after the public hearings had ended.

Process Was Legally Inadequate: The PEIS fails to meet the substantive requirements of Washington's State Environmental Policy Act as well as NEPA. Site specific impacts (i.e., impacts from specific waste dumps or treatments) are not disclosed. USDOE refused to provide legally adequate notice and to follow the requirements of the Hanford Clean_Up Agreement Community Relations Plan for notice and conduct of the hearings. USDOE will not legally be able to utilize this PEIS for amending the Agreement or obtaining State hazardous waste (RCRA) permits. Our specific numbered comments begin on the next page.

1. The PEIS fails to disclose that the FFTF nuclear reactor is not suited for a research medical isotope production mission, and falsely implies that production of research isotopes is a mission for which the Department is considering restart of the reactor. The PEIS fails to disclose and discuss the policy of the Department against making major capital investment decisions (i.e., restart of a reactor or new construction) to serve a commercial isotope production mission (i.e., making space available in a reactor core or accelerator for production of commercial isotopes on a marginal cost reimbursed basis is considered only a "piggyback" mission). The PEIS and Record of Decision must fully disclose and discuss the difference between research isotope production missions and commercial isotope production, along with the full disclosure and consideration of the Department's own blue ribbon medical advisory committee (NERAC Subcommittee for Isotope Research and

1707-5
(Cont'd)

1707-6

1707-4

Response to Commentor No. 1707

producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates use of FFTF when coupled with the other DOE missions.

Under the NI PEIS proposed action and consistent with its mandates under the Atomic Energy Act, DOE would enhance its existing nuclear facility infrastructure to, among other things, more effectively support the production of radioisotopes for medical applications and research. However, DOE is not proposing to restart or build any new facility for the primary mission of serving the commercial medical isotope market. DOE's intent is to complement commercial sector capabilities to ensure that a reliable supply of isotopes is available in the United States to meet future demand, and to encourage the commercial sector to privatize the production of isotopes that have established applications to a level that would support commercial ventures.

1.1 The referenced joint congressional letter has been logged in as Commentor No. 158 and the responses are included therein.

1.2 The references to research isotope production are not misleading. The NERAC Subcommittee concludes the following, "Implement a contingency plan to guarantee an uninterrupted radioisotope and stable isotope supply for the country's research needs." The conclusions are addressed in more detail in Paragraph 2 of Response 1.0 and in Section 1.2 of Volume 1 of the PEIS. Further, as discussed in Paragraph 1 of Response 1.0, the proposed action includes both research- and commercial-scale isotope production.

1.2.1 DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent

Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest

Production Planning, Final Report, April, 2000): "The Subcommittee concludes that the FFTF will not be a viable source of research radioisotopes.":

1.1. As stated in the submitted joint Congressional letter (by Senator Wyden, Representatives Baird, McDermott, Smith, Blumenauer, DeFazio, Hooley and Wu), FFTF is not suited for production of medical isotopes for research (i.e., small quantities, quick turnarounds, for use in research or clinical trials as opposed to large scale batches for commercial markets produced on behalf of private pharmaceutical companies on a marginal cost basis).

1.2. The conclusion of the NERAC Subcommittee for Isotope Research and Production Planning should be clearly stated in the PEIS, and misleading references to research medical isotope production missions for the FFTF alternative (or all alternatives for the PEIS) must be removed:

1.2.1. In "Purpose and Need for Agency Action" (Section 1.2 of the PEIS), USDOE falsely presents the need for, and primary missions of, expanded infrastructure considered in the PEIS, including for the FFTF reactor restart, as: "DOE must provide an adequate supply of isotopes to keep pace with the growing and changing needs of the research community if it is to serve this key role." (referring to role of DOE to "develop isotopes"). Page 1_3.

1.2.2. There are numerous other misleading references throughout the PEIS to research isotope production missions as providing the justification or primary missions under consideration for restart of the FFTF reactor.

1.2.2.1. I.e.: The only quote from the Subcommittee on Isotope Research and Production Planning in the PEIS refers to the need to provide capability to produce isotopes for research: "It is now widely conceded that limited availability of specific radionuclides is a constraint on the progress of research." PEIS at 1_3.

1.2.2.2. I.e.: "Research isotopes that have shown promise... are not being explored because of their lack of availability or high price." Id.

1.2.3. The Office of Nuclear Energy uses this PEIS as an advocacy document, selectively quoting its NERAC Subcommittee to make it appear that the Subcommittee supports the need for investment in the FFTF restart alternative or other alternatives in this PEIS,

1707-4
(Cont'd)

Response to Commentor No. 1707

with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth rate of medical isotope use is consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

1.2.2 The commentor's contention that numerous references to research isotope production are misleading is not true. This issue is addressed in Paragraph 1 of Response 1.0 and in Response 1.2.1.

1.2.3a The issue regarding the NERAC Subcommittee recommendations concerning the suitability of the FFTF to produce research isotopes is addressed in Paragraph 2 of Response 1.0.

1.2.3b The mission under consideration is for the production of both research- and commercial-scale isotopes. This issue regarding the production of both isotope types is addressed in Paragraph 1 of Response 1.0.

1.2.3.c The issues with regard to DOE policy precluding the restart or building new infrastructure for commercial interests are addressed in Paragraph 3 of Response 1.0.

1.2.5 The issues with respect to the research- and commercial-scale isotope production as well as the associated restart or building new infrastructure are addressed in Paragraphs 1 and 3, respectively, of

Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest

without disclosing that:

a) "The Subcommittee concludes that the FFTF will not be a viable source of research radioisotopes." (NERAC Subcommittee Report at 31, April, 2000);

b) the mission under consideration for isotopes in this PEIS (at least for Alternative 1, restart of FFTF) is for support of commercial production, not for research purposes; and,

c) USDOE has a sound policy that precludes the investment in restart or building new infrastructure for the purpose of a primary mission of serving commercial isotope production (as opposed to research).

1.2.4. The PEIS fails to disclose that serving a commercial isotope production mission involves subsidizing the production of isotopes for commercial interests, who pay only the marginal cost of reactor or accelerator time and none of the infrastructure investment costs or waste costs.

1.2.5. The PEIS and Battelle's 1999 business plan place heavy emphasis on FFTF making research isotopes. Furthermore, most of the pro_FFTF statements by elected officials (E.g: Senator Gorton's statement) and from proponents at the hearings focused on production for research, rather than to serve commercial customers. This was encouraged by the FFTF Project and Office of Nuclear Energy, and demonstrates the need for the PEIS and Record of Decision to clearly state that FFTF is not under consideration for a research production mission, and that the USDOE will not make restart or construction of new facilities decisions based on consideration of serving commercial isotope producers as a primary mission.

1.2.6. The only logical conclusion is that the Department should eliminate the alternative of restart of the FFTF reactor from consideration because it is not a viable means to meet the research isotope production mission and the Department will not (and should not) consider restart for purposes of serving a commercial isotope production mission.

1.2.6.1. USDOE has a policy against restarting any facility or building a new facility for a primary mission of serving the commercial medical isotope market. This means that USDOE

1707-4
(Cont'd)

1707-5

1707-4

Response to Commentor No. 1707

Response 1.0. The Record of Decision for the NI PEIS will be based on a number of factors, including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

1.2.6 DOE notes the commentor's opposition to the restart of FFTF.

1.2.6.1 This issue with regard to DOE policy precluding the restart or building new infrastructure for commercial interests is addressed in Paragraph 3 of Response 1.0.

1.2.6.2 DOE's isotope production mission is discussed in the NI PEIS and includes both research- and commercial-scale isotope production. Specific details with regard to these issues are addressed in Paragraphs 1 and 2 of Response 1.0.

1.2.7 The commentor refers to the Secretarial sponsored dialogue on FFTF (September 5 and 6, 2000). The participants in that meeting, including the "Heart of America Northwest," signed a confidentiality agreement pledging not to discuss the meeting details in public. Referring to discussions that occurred in that meeting in this letter is a violation of that confidentiality agreement.

The NERAC Subcommittee for Isotope Research and Production Planning did not conclude that the decision on FFTF should not be based on using FFTF for medical isotopes. The Subcommittee said that because of its size the FFTF was more suited to producing commercial quantities of medical isotopes needed for diagnosis and treatment, and not the much smaller research quantities needed for testing and trials. The Program Scoping Plan for the Fast Flux Test Facility (August 1999) essentially concurred with that recommendation, stating that only \$1.5M of the projected \$31M per year revenue (2005-2010) and \$1.0M of the projected \$61M per year revenue (2010-2020) was expected to come from producing clinical trial quantities of targeted isotopes. And even that assumption for FFTF producing clinical quantities was based on that fact that if operating for other missions, producing clinical quantities of specialized isotopes for which FFTF was especially qualified would have a small impact on other plant operations. The comments about the Program Scoping Plan

Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest

should NOT make a decision to restart FFTF based on consideration of whether it will serve the commercial medical isotope market. Commercial isotope production (where the companies pay what DOE calls the full cost, but which is just the marginal cost for the irradiation time in the reactor or accelerator) is supposed to be a "piggyback" only mission. Research isotope production, on the other hand, may be a primary mission for determining if a facility is built or restarted. This policy, has very sound underpinnings. USDOE should not be in the business of building or restarting facilities to serve commercial customers _ especially since this provides them access to subsidized facilities that their competitors do not have access to, and Congress has not told DOE to construct and operate facilities for the benefit of private companies.

1.2.6.1.1. The Cost report _ which must be incorporated into the PEIS and reissued for public comment _ and PEIS must be modified to disclose the cost subsidies that the Department of Energy would incur to provide new infrastructure for meeting commercial isotope producers' market requests.

1.2.6.2. Nowhere in the PEIS does USDOE disclose that FFTF is not suited, nor under consideration for, research medical isotope production as a major mission. This must be prominently disclosed.

1.2.7. The Chair of USDOE's NERAC Subcommittee on Isotopes, Dr. Richard Reba (Chair, University of Chicago Radiology Dept.) spoke to the Secretarial sponsored dialogue on FFTF (September 5 and 6, 2000). The following points need to be addressed in the PEIS and Record of Decision:

* subcommittee felt that the decision on FFTF should not be based at all on using FFTF for medical isotopes. He reiterated that the committee concluded that FFTF should not have a mission of making research isotopes.

* the "business plan" prepared by Battelle last year, and on which Secretary Richardson based his decision to go ahead with considering to restart FFTF, was entirely suspect in the eyes of the blue ribbon medical committee. It seemed to rely heavily on research medical isotopes, which the panel found FFTF not to be suited to produce. The committee encouraged Battelle to seek

1707-4
(Cont'd)

1707-5

1707-4

Response to Commentor No. 1707

underestimating or overestimating production rates, costs, or markets between now and 2045 are very subjective. The plan was a projection, but the production rates were all based on validated technical models (proven through actual previous isotope production runs at the FFTF), and the economics were based on a business model that was independently reviewed by Dr. Howard Kaufold of the Wharton Business School and using financial information from previous expert reports, as well as multiple surveyed government and private industry companies.

1707-5: The commentor raises a number of cost issues. To assure each issue is addressed, the responses have been organized to match the numerical sub-headings in the submittal.

Overview Comment e: The NI PEIS discloses and analyzes all pertinent report information needed to evaluate the environmental impacts of reasonable alternatives to fulfill the requirements of the DOE missions. The costs and nuclear nonproliferation impacts of alternatives are not required by NEPA and CEQ regulations to be included in an EIS. DOE prepared a separate Cost Report and Nuclear Infrastructure Nonproliferation Impacts Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such ancillary documents need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR 1505.1(e)). Nevertheless, DOE mailed these documents to more than 730 interested parties on August 24 and September 8, 2000, respectively. Both reports were made available immediately upon release on the NE website (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided summaries of the Cost Report and Nuclear Infrastructure Nonproliferation Impacts Assessment in this Final NI PEIS.

DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and

Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest

commercial customers for isotope production at FFTF _ only if the reactor was restarted for other purposes;
* the business plan was never peer reviewed;
* the plan underestimated the cost of preparing the reactor and infrastructure to make isotopes at FFTF and Hanford facilities;
* the plan overestimated the market share for FFTF and the revenue isotopes would bring in;
* the plan underestimated the cost of making isotopes at FFTF;
* the plan overestimated the rate at which FFTF could produce isotopes;
* the projections for isotope need and FFTF market share, the projected costs and the rate of production should all be peer reviewed _ or a new, independent study done with peer review _ before money is invested to make the changes needed to produce isotopes in FFTF.

Each of these points must be fully reconsidered in the PEIS.

2. The PEIS must consider availability of other sources of research and commercial production of medical isotopes from Canadian reactors, universities and hospitals, commercial reactors, and private isotope production facilities in the US and abroad.

2.2. The PEIS fails to consider all reasonable alternatives, and does not even disclose the existence of alternatives recommended by the Department's own NERAC Subcommittee on Isotope Research and Production Planning; i.e., the availability of investment or subsidy to the University of Missouri facilities, the capacity of private companies in Texas (including the company that purchased the accelerator from the Super Conducting Super Collider).

2.3. These facilities can clearly meet both research and commercial production demands.

2.4. The PEIS must fully disclose and consider the availability of USDOE's own facilities to meet all or portions of reasonable forecasts for research medical isotopes, and to use unused capacity for commercial isotope production consistent with Departmental policy.

2.5. The PEIS fails to disclose the new construction of an accelerator at Los Alamos for isotope production, and whether similar additions can be made for additional capacity.

1707-4
(Cont'd)

1707-7

1707-8

1707-9

Response to Commentor No. 1707

schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The draft Waste Minimization and Management Plan for the Fast Flux Test Facility (May 2000) and the NERAC Isotope Subcommittee Report (April 2000) were referenced in the NI PEIS and were available prior to the public hearings.

As detailed in Section 4.3.1.1.13 and 4.3.3.1.13 of the NI PEIS and elsewhere, DOE has developed the draft Waste Minimization and Management Plan to incorporate pollution prevention and waste minimization practices in its consideration of the future of FFTF. This plan identifies DOE's preferred options for management, treatment, and/or disposition of all waste streams related to the restart and operation of FFTF. The Waste Minimization and Management Plan for the Fast Flux Test Facility is in preparation. A draft of this plan was submitted to the States of Washington and Oregon for review and comment. The draft plan is available on the FFTF website (<http://fftf.org/reports>) and in the DOE public reading rooms.

Section 1.2 of Volume 1 of the PEIS discusses the recommendations and findings of the Nuclear Energy Research Advisory Committee (NERAC) contained in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, as addressed in the response to Comment 1707-4. The commentor's claim that DOE failed to make the whole of this report available for public review is false. The NERAC report and the earlier Expert Panel report entitled Expert Panel: Forecast Future Demand for Medical Isotopes, were made available to the public in the public reading rooms and on the NE web site (<http://www.nuclear.gov>).

1.2.4 and 1.2.6.1.1: Consistent with the mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure to support production of radioisotopes for medical applications and research. DOE is not proposing to restart or build any new facility for the primary mission of serving commercial medical isotope producers. DOE merely seeks to fulfill its responsibility to ensure that there is a reliable supply of isotopes in the U.S. to meet future demand. DOE does not subsidize commercial producers. DOE

Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest

2.6. The PEIS mentions only in passing that 50% of current USDOE capacity at reactors and accelerators is utilized, and the additional 50% could be utilized to meet all or a significant portion of USDOE's claimed demand for isotopes. This is a reasonable alternative to all proposed actions in the PEIS.

2.7. If less than 5 kilograms per year of Plutonium 238 production was necessary, the Department fails to disclose in the PEIS that the Advanced Test Reactor (ATR) would have adequate capacity to produce isotopes that it is claimed FFTF is the only option for.

2.8. The PEIS fails to disclose that NASA does not have a need for 5 kilograms of Plutonium 238 per year, and falsely asserts that the current Radioisotope Thermoelectric Generators are the only technology that NASA can utilize for planned space missions.

2.9. The PEIS fails to disclose that on May 22, 2000 _ two months before the release of the Draft PEIS _ NASA informed USDOE that it intended to utilize the Sterling generator technology, which reduces the demand for Pu238 dramatically.

2.10. The PEIS fails to disclose that production of 5 kilograms of Pu238 per year would be a rate supporting an incredible space mission once every eight months _ which is far in excess of any reasonable forecast of Congressional approval of future space missions.

2.11. If the demand for Pu238 is greatly reduced, it can be met with a reasonable alternative of purchases from Russia, and a second reasonable alternative of purchases combined with production of smaller quantities (and not necessarily in every year) at USDOE facilities. These alternatives are reasonable and must be fully considered in the PEIS.

2.12. The justification for the consideration of the restart of the FFTF reactor is eliminated, and the alternative must be dropped, if the reactor is not under consideration for a primary mission of research medical isotopes; production capacity exists at ATR and other USDOE facilities and in the private sector (nationally and internationally) for commercial isotopes; ATR has capacity to produce medical isotopes if it is either not producing Pu238 or is producing much less than 5 kilograms per year; and, if NASA's actual reasonably forecast requirement is much less than five kilograms of Pu238 per year.

1707-9
(Cont'd)

1707-10

Response to Commentor No. 1707

does encourage the commercial sector to privatize the production of medical isotopes in certain instances. DOE does this by turning over production of certain isotopes to commercial entities once DOE has established that commercial production is economically viable. Even so, DOE continues to produce about 90 percent of the isotopes at its facilities.

6.0: This issue is addressed in the response to Overview Comment e.

11.5, paragraph 7, sentence 3: For Alternative 1 options, the PEIS assumes that the operational facilities referenced by the commentor (i.e., Radiochemical Processing Laboratory ([Building 325] and Building 306-E) are adequate to support material storage, target fabrication, and medical isotope processing activities. The alternative does not consider construction of new facilities and such costs are therefore not included under Alternative 1 in the Cost Report.

1707-6: This PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR 1500 through 1508 and 10 CFR 1021, respectively). While it is true that Washington State agencies are governed by SEPA in making decisions regarding issuance of environmental permits for activities at Hanford, DOE's responsibilities with regard to environmental impact analysis are dictated by NEPA and not SEPA. DOE will comply with State regulations, including SEPA, as appropriate.

In accordance with NEPA and the cited regulations for implementation, DOE provided legally adequate notice for the public hearings and conducted the public hearings in accordance with established procedures. Specifically, notice of scheduled public hearings was provided via the means and in the timeframe outlined in governing CEQ and DOE regulations (i.e., 40 CFR 1503.1, 1506.6, and 10 CFR 1021.313, respectively). Based on the feedback from participants in previous public hearings, DOE used a public hearing format according to established procedures in order to facilitate equal participation and representation. The format for the hearings was presented in the Notice of Availability (65 FR 46443 et seq.) for the Draft NI PEIS. As a federal NEPA action, this PEIS is not subject to the Tri-Party Agreement Community Relations Plan (CRP) which

Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest

3. The Advanced Test Reactor (ATR) at Idaho National Engineering and Environmental Laboratory (INEEL) could meet projected medical isotope demands, including the same kind of isotopes that FFTF backers claim FFTF would produce for 5 to 10 years even under USDOE's wildly overoptimistic forecasts of medical isotope demand growth.

4. Using the Advanced Test Reactor to make Plutonium 238 has total startup costs of just \$50 million. FFTF startup costs with processing facility start up is \$430 million.

* USDOE is only supposed to be basing the decision for restart on Plutonium 238 and nuclear energy research missions _ not commercial medical isotope production.

* USDOE can extend its contract to buy Pu238 from Russian and meet demand from NASA for at least seven years. This is far cheaper than other alternatives for Pu238, but Office of Nuclear Energy made clear they want an American source.

* The PEIS must disclose the technology differences for Pu238 requirements in NASA missions, and what the need would be with currently Congressionally approved and reasonably foreseen missions utilizing the new Sterling space generator after 2004.

* At the 5 kg per year production need claimed in the PEIS and by Office of Nuclear Energy _ which drives the size of their facilities and their claim for using FFTF _ Office of Nuclear Energy officials have stated would provide enough Pu238 for NASA to send a new mission into space every 8 months!!! This has never been authorized by Congress and is extremely unlikely _ yet, USDOE is proposing to make a massive capital investment based on meeting this unapproved level of space missions.

* If NASA does not need 5 kg, but only 1 to 3 kg per year, then the Advanced Test Reactor could make both Pu238 and some medical isotopes.

5. The PEIS has two accelerators lumped together in its "accelerator alternative". One is a low energy accelerator, which could make both research and commercial isotopes (but not the neutron rich isotopes that FFTF, or ATR or a high energy accelerator would make). The cost of the low energy accelerator is just \$35 million ___ less than one year's cost of keeping FFTF on standby!!!

1707-11

1707-12

1707-13

Response to Commentor No. 1707

primarily has as its focus cleanup decisions under the Tri-Party Agreement. Nevertheless, the public participation process implemented for the PEIS meets or exceeds procedures outlined in the CRP to include provision of a public comment period on the Draft NI PEIS in excess of 45 days.

The PEIS does consider site specific impacts on waste management and treatment facilities. For example, Sections 4.3.1.1.13 and 4.3.3.1.13 of the PEIS assess the impacts of FFTF restart coupled with target fabrication and processing in the 300 Area and in FMEF, respectively. The analysis includes quantification of the impacts of projected waste generation on treatment, storage, and disposal facilities.

1707-7: Current domestic and global producers of radioisotopes include governments that operate reactors and accelerators at national laboratories or institutes, and private sector companies that own and operate accelerators. There are also many partnership arrangements wherein companies lease irradiation space in government reactors or operate processing facilities in coordination with the government. A few universities also produce radioisotopes, but their ability to provide reliable and diverse supplies are generally limited by the small-scale capabilities or operating schedules of their facilities.

The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum 99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

Although other manufacturers produce medical radioisotopes, DOE remains the key provider for a large number of radioisotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially

Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest

5.2. The cost of USDOE's high energy accelerator in the PEIS is \$700 million. USDOE presents the accelerator option as being \$1 billion by lumping the two accelerators together and then adding to this another \$218 million, which they claim is the cost of shutting down FFTF. Essentially USDOE claims that the cost of shutting down FFTF is a cost of every alternative except for the alternative of restarting FFTF. Under the restart alternative, the cost of shutting down FFTF is never incurred.

5.3. The USDOE proposed high energy accelerator was sized just to make at least 5kg of Plutonium per year. It could be greatly reduced in size and cost if it was built just for nuclear research and medical isotopes. Under this reasonable alternative, which USDOE must consider, USDOE could buy the Pu238 from Russia or use the ATR reactor for Plutonium 238, while still having a nuclear energy research accelerator. Experts agree that it could do everything for nuclear research that FFTF could do, and do more.

5.4. The PEIS must be changed to include a reasonable range of accelerator alternatives that are not solely sized to produce 5 kilograms of Pu238 per year. A steady neutron source accelerator in the Northwest, for example, with reduced size would also have greatly reduced operating costs than those presented in the Cost Report, because accelerator operating costs are largely determined by electricity costs. Another reasonable alternative that the Department must discuss and consider are variations on the Department's own proposed Advanced Neutron Source accelerator proposed for Oak Ridge.

6. USDOE improperly and illegally excluded from the PEIS consideration of costs and impacts on its clean_up (Environmental Management) budget from disclosed proposed and related actions. By publishing a separate report on costs _ which was not disseminated for public review until after the public hearings were over in the Northwest, USDOE illegally and improperly prevented the public from reviewing and commenting on these issues. The sole cure for this will be disclosure and consideration in one document (the PEIS) of costs and budgetary impacts on the cleanup program, and holding an additional round of hearings and comment opportunities.

1707-13
(Cont'd)

1707-14

1707-5

Response to Commentor No. 1707

experimental, these isotopes are not generally purchased in large enough quantities to make their production financially attractive to private industry. However, supplies of many research isotopes are not readily available from existing domestic or foreign sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed. See Section 1.2.1 of Volume 1 for more detail.

1707-8: The NI PEIS evaluates the environmental impacts of a range of reasonable alternatives to fulfill the requirements of the proposed action, which includes the production of medical and industrial isotopes, the production of plutonium-238 for future NASA missions, and civilian nuclear research and development. DOE acknowledges that there are other manufacturers of medical radioisotopes, including the University of Missouri and International Isotopes Incorporated (which has constructed a linear accelerator from assets purchased from the former Superconducting Super Collider Project), and the domestic production capabilities of these facilities have been considered in the development of the NI PEIS. While some existing facilities may possess the capacity to support production of small quantities of research isotopes, NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000, recommends that:

“Plans for acquiring a dedicated radioisotope production reactor should be initiated so that both the cyclotron and reactor radioisotope production facilities will meet the radioisotope needs of the U.S. research community by 2010.” The report further states:

“It is important that contingency planning be performed and implemented by Isotope Programs that act to guarantee isotope supplies in the long term. This must include consideration of facility retirement and/or redirection, potentially major changes in the agreements underlying parasitic production, successful consolidation of processing capabilities, and the timing and uncertainties of bringing new, dedicated facilities online.”

1707-9: The PEIS fully considers the availability of DOE facilities to meet the proposed action. As stated in Section 1.2.1 of Volume 1, currently, approximately 50 percent of DOE's isotope production capability is

Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest

6.2. In the context of this PEIS and the related decisions that the PEIS considers, costs of alternative actions involve the irretrievable commitment of resources, and certain aspects of what USDOE calls "cost" (which are really budget considerations involving tradeoffs in intradepartmental budgets) considerations have direct environmental impacts (including impacts on Hanford Clean_Up and the national Environmental Management Program).

6.3. "irreversible commitment of resources" includes the impacts of using USDOE's limited funding for new production missions on the USDOE's legal obligations to cleanup contamination at Hanford and other facilities. USDOE has officially stated that its limited budget requires it to cap "target" cleanup (Environmental Management, "EM") budgets through 2006, including Hanford's cleanup budget. USDOE has officially forecast that it will fall over \$200 million short in 2002 of the funding required for essential safety work and cleanup under the Hanford Clean_Up Agreement and applicable environmental laws.

6.4. Use of USDOE's limited funding for FFTF startup and use of future Hanford EM budgets for such related actions as storing, treating or disposing of wastes from FFTF and Plutonium processing startup, therefore, has a direct environmental impact on Hanford Clean_Up.

6.5. USDOE has made this a direct impact by agreeing in the 1995 amendments to the Hanford Clean_Up Agreement to shutdown the reactor and use the funds saved from shutdown for cleanup and reducing the so-called cleanup funding "compliance gap". USDOE's own words in 1995 committed the Department to use the funds saved for higher priority environmental management activities. At that time, it was costing the Hanford EM budget \$30 million a year to maintain the reactor. USDOE is legally required to consider in the PEIS the environmental benefits from meeting its 1995 commitment to shutdown the FFTF reactor and to use the funds saved for cleanup.

6.6. The PEIS is legally required to consider how the maintenance of the reactor on hot standby for the new proposed missions cost the Hanford cleanup budget at least \$30 million a year from fiscal years 1996 through 1998, and the related USDOE decision to ask

1707-15

Response to Commentor No. 1707

being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions basic energy sciences or defense). Section 2.6.1 has been expanded to included a discussion on the capacity at ATR and HFIR.

The Isotope Production Facility (IPF) at Los Alamos National Laboratory produces radioisotopes using the Los Alamos Neutron Science Center's (LANSCE) half-mile accelerator that delivers medium-energy protons. Among other isotopes, the IPF's three major products include germanium-68, strontium-82, and sodium-22. As a result of changing DOE missions, the production of radioisotopes at target area "A" of the LANSCE has been rendered inoperable. In order to replace the level of production lost due to this change, DOE is completing a new and more efficient IPF that would allow DOE to continue to produce most of these same isotopes in an effort to meet existing demand. As addressed in Section 2.6.1 of the NI PEIS, IPF at LANSCE was considered but dismissed from further evaluation because, although it can be used in tandem with the Brookhaven Linac Isotope Producer (BLIP) located at the Brookhaven National Laboratory to supply near-term isotope requirements, it is not certain that these facilities could accomplish reliable, increased isotope production at the level needed to support projected needs.

1707-10: There currently is little room for growth of medical isotope production at ATR. The neptunium-237 targets for plutonium-238 production will compete for space in the reactor. There are potential negative impacts to the private company that leases reactor space for the production of radioisotopes due to being assigned less desirable irradiation space. If less than 5 kilograms of plutonium-238 production per year are required, the potential for negative impacts to the private company is reduced.

DOE estimates (Section 1.2.2 of Volume 1) that NASA will require between 2 to 5 kilograms of plutonium-238 per year. In response to comments 2.8, 2.9, and 2.11, DOE recognizes that a 5 kilogram per year production rate for plutonium-238 could theoretically yield an SRPS every eight months. However, DOE chose a 5-kilogram per year production rate as an upper bound due to uncertainties in the SRPS

Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest

Congress to directly move \$30 million out of the Environmental Management budget and into the Nuclear Energy budget to continue to fund hot standby for the current proposed missions. Enough money was wasted on hot standby of FFTF to pay the full costs of the two years of retrieval of liquid High_Level Nuclear Wastes from Single Shell Tanks that USDOE illegally suspended due to a lack of funding during this same period. This is an example of the direct environmental and health impact of related funding and cost decisions that must be examined in the PEIS.

6.7. The presentation of costs in the Cost Report is biased and ludicrous, as described below.

6.8. In the report, every alternative is assigned the cost of shutdown and cleanup of the FFTF reactor _ inflating each of the other alternatives by \$218 million. This is nothing more than a transparent attempt to bias the report in favor of FFTF restart. This cost must be removed from those alternatives, since USDOE has a preexisting legal commitment in the Hanford Clean_Up Agreement to shutdown the reactor and use the funds saved (compared to continued standby) for cleanup. If the decision is made to shut FFTF, that legal commitment will automatically effective in the Agreement. The cost of shutdown is not a cost of other alternatives.

6.9. The cost of eventually shutting and decommissioning the FFTF must be added to the cost presented for the FFTF restart alternative. The PEIS must disclose the full life cycle cost of the proposal to restart the reactor _ including the cost to deactivate and clean it up.

6.10. The cost of cleaning up currently uncontaminated facilities (and the environmental impacts from contaminating them), such as FMEF, must be fully disclosed and considered.

6.11. The impact on USDOE's current proposals for accelerated cleanup of Hanford's 300 Area from the proposed operation of the 325, 306 and other contaminated facilities in the 300 must be fully disclosed and considered _ including the additional cost likely to be incurred from continuing to operate these facilities while attempting to cleanup the surrounding area (especially given the fact that these facilities have contributed to, and continue to contribute to, the contamination of the soil, air, sewer lines, and

1707-15
(Cont'd)

1707-16

1707-17

Response to Commentor No. 1707

technology development requirements for backup units, and variability in the amount that may be needed for each of the units to meet NASA's power requirements.

While DOE can select a combination of alternatives, it does not prevent it from selecting FFTF for restart.

- 1707-11:** A forecast for future demand for medical isotopes and the expected growth rate of medical isotope use during the next 20 years is provided in Section 1.2 of Volume 1. The growth projections were adopted by DOE as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. DOE does agree that ATR could meet some selected medical isotope demands for the next 6 to 10 years as described in Section 2.5.3 of the Final PEIS.
- 1707-12:** DOE notes the commentor's comments regarding relative startup costs of the alternatives and the assertion that a decision regarding the restart of FFTF should only be based on plutonium-238 production and nuclear energy research missions. However, the purpose of the NI PEIS is to evaluate the environmental impacts of reasonable alternatives to enhancing DOE's existing nuclear facility infrastructure to support production of isotopes for medical, research, and industrial uses, production of plutonium-238 for use in future NASA space exploration missions, and U.S. nuclear research and development needs for civilian application. The Record of Decision for the PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

DOE agrees that it could purchase plutonium-238 from Russia to satisfy its responsibility to supply NASA with the necessary fuel to support future space exploration missions. Under the current contract set to expire in 2002, the United States is authorized to purchase up to 40 kilograms of plutonium-238, with the total available for purchase in any one year limited to 10 kilograms. Any purchase

Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest

groundwater in the surrounding 300 Area). The impact on the ability to cleanup the 300 Area must be fully disclosed.

6.12. USDOE's proposed "Done in A Decade" Plan for accelerated cleanup of the 300 Area explicitly calls for the cleanup to result in unrestricted public access to the 300 Area _ which would be a high environmental benefit. However, if there are continuing nuclear operations _ as proposed for FFTF restart support missions for buildings such as the 325 and 306 facilities _ then this entire Area can not be released for public access, even if it is successfully remediated. This is unacceptable. USDOE must commit now to close these facilities and clean them up. It is also unacceptable that the Office of Nuclear Energy ignored the USDOE's proposal for cleanup of the 300 Area in this PEIS, and failed to disclose the adverse impact the proposed operations in the 325 and 306 buildings would have on both the goal of unrestricted public access and the cost of cleanup.

6.13. The cost report and PEIS clearly assume that the operation of the 325 and 306 buildings will be subsidized by the Hanford landlord budget _ which is the cleanup (Environmental Management) budget _ at a cost of \$11 million per year. This subsidy will harm cleanup, and its impacts must be disclosed or eliminated by adding the full cost of maintaining the facility into the operating costs disclosed for FFTF related operations.

6.14. The Hanford Clean_Up budget already subsidizes the FFTF standby _ documents show that Battelle / Pacific Northwest National Lab agreed to take over the standby at the urging of the Director of the Office of Nuclear Energy, and that Battelle clearly pitched that a benefit would be its ability to use its administrative and overhead accounts to improperly subsidize FFTF standby. We urge the Secretary to have the Inspector General review this and the propriety of other contract related decisions for FFTF standby and proposed operation.

6.15. USDOE's cost report _ even with its overt bias in favor of FFTF restart _ puts the total construction and startup costs for meeting USDOE's claimed demand for research medical isotopes, and some commercial isotope production, with an accelerator at \$106.3 million.

1707-17

1707-18

1707-19

1707-20

Response to Commentor No. 1707

beyond what is currently available to the United States would likely require renegotiation of a new contract (including purchase price), and may require additional NEPA review. In addition, for supply reliability reasons and concerns about nuclear nonproliferation, see Section 1.2 of Volume 1 of the PEIS. DOE's preference is to establish a domestic plutonium-238 production capability.

The PEIS states (Section 1.2.2 of Volume 1) that NASA will require between 2 to 5 kilograms of plutonium-238 per year. DOE recognizes that a 5-kilogram per year production rate for plutonium-238 could theoretically yield an SRPS every eight months. However, DOE chose a 5-kilogram per year production rate as an upper bound due to uncertainties in the SRPS technology development requirements for backup units, and variability in the amount that may be needed for each of the units to meet NASA's power requirements. Section 1.2.2 has been revised to reflect these technology differences.

DOE agrees with the comment that the ATR could make both plutonium-238 and some medical isotopes.

1707-13: DOE notes the commentor's observations regarding costs associated with Alternative 3 (Construct New Accelerator[s]). The commentor's observations regarding the costs associated with permanent deactivation of FFTF are correct. FFTF would be permanently deactivated should a decision be made to select any alternative other than Alternative 1, Restart FFTF. The Cost Report is not biased in favor of FFTF. The Cost Report was structured to clearly identify the implementation costs of the various alternatives so the Secretary of Energy would have this information along with other data for consideration. For Alternatives 2 through 5, deactivation of FFTF is part of the implementation cost for these alternatives. In the same manner that HFIR and ATR deactivation costs are not included for Alternative 2, the FFTF deactivation costs are not included in Alternative 1. The Cost Report correctly assigns costs in the alternative evaluations.

1707-14: The commentor is correct in his observation that the proposed high energy accelerator was sized to make at least 5kg of plutonium-238 per year and that it could be greatly reduced in size, cost of construction, and operating costs if the plutonium-238 production mission were not

***Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest***

Whereas, restarting FFTF and construction and startup of the ancillary mission facilities at Hanford are estimated in the report to cost \$423 million (not even adding in shutdown costs for FFTF and cleanup of the FMEF). Operating costs for the accelerator and its processing support would cost \$10 million a year less than USDOE wastes on FFTF standby annually now _ and, \$2.4 billion less than FFTF over 30 years. (USDOE costs) 6.16. USDOE previously estimated the cost to startup FFTF at \$554 million. SEE 4/17/97 Unified Field Budget Request. The difference is inexplicable, although this figure included mission related restart costs, which may have changed slightly with the dropping of the Tritium proposal. USDOE must use its own prior approved budget baselines for this PEIS disclosure of costs.

6.17. The claimed cost of shutdown of FFTF is artificially inflated _ the validated and USDOE approved budget baseline from 4/7/99 reveals a cost of just \$152 million to shutdown, and even this must be considered a high estimate that failed to consider the proposal to accelerate shutdown. The 1996 approved baseline budget for shutdown _ before Hanford began jockeying the figures to justify restart _ was just \$89 million. SEE RDS No. R95T006 at 7.

6.18. USDOE failed to disclose that it was building a new accelerator at the time this PEIS was released, and its cost was half that disclosed in the cost report. USDOE fails to disclose how this would affect need for other facilities.

6.19. Not one cent is assigned to the costs of storing, treating and disposing of the wastes from FFTF and related mission proposed operations at Hanford, like Plutonium processing.

6.20. In its Tank Waste EIS, USDOE assigned a huge cost for evaporation services, vitrification and ultimate disposal of vitrified waste in Yucca Mountain. NEPA requires disclosure and consistency in the use of costs.

7. The total cost to the Hanford Clean_Up Budget from the proposed restart and actions at Hanford is likely to exceed \$1 billion _ the impacts of adding these costs to the already inadequate Hanford Clean_Up budget must be fully disclosed, along with the cumulative impacts of the costs of Hanford storing, treating, disposing and monitoring wastes from other pending

**1707-20
(Cont'd)**

1707-15

Response to Commentor No. 1707

pursued and the accelerator were designed and constructed only to support the nuclear research and development and medical and industrial isotope production missions.

The commentor also proposed that DOE consider alternatives in the PEIS combining elements of two or more alternatives. As stated in Volume 1, Section 2.5.4 of the PEIS, DOE can select any alternative or combination of alternatives or elements of alternatives in the Record of Decision associated with this NI PEIS. Alternative 3 is a prime example of an alternative that could be split and combined with an other alternative. The evaluations presented in the NI PEIS are structured to enable the Secretary of Energy to make these types of tradeoffs during the decision process.

The commentor proposed that DOE consider variations to the Advanced Neutron Source at the Oak Ridge National Laboratory (ORNL). The commentor is referring to the Spallation Neutron Source (SNS) facility accelerator presently under construction at ORNL. The SNS is a spallation neutron source facility designed to provide a high-flux, short pulsed neutron source that would give the United States' scientific and industrial research communities a much more intense source of pulsed neutrons than is currently available. As indicated in Table 2-4, SNS was considered and dismissed as a candidate irradiation source to support the NI PEIS missions because the facility's full capacity has been dedicated to support planned mission by the primary user of the facility. Modification of the SNS to accommodate the NI PEIS missions would compromise the ability of the facility to meet the requirements of the SNS planned missions.

1707-15: The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected. FFTF restart would not impact the schedule or available funding for existing cleanup activities.

Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest

USDOE decisions, including related decisions by the Office of Nuclear Energy that would add wastes to Hanford's existing burdens.

7.2. The Hanford site currently charges less than 50% of the marginal cost of disposal for newly generated wastes or offsite wastes shipped for disposal, and the Hanford Clean_Up budget picks up all the remaining costs (i.e., the already inadequate Hanford Clean_Up budget pays at least half of the marginal cost of \$1046 per cubic meter of Category 1 Low_Level Waste buried in Hanford's Low_Level Burial Grounds). The direct impact of waste additions from non_cleanup work must be fully disclosed, along with the life cycle costs and cumulative impacts from other USDOE proposed waste additions to Hanford.

7.3. Of course, the environmental impacts (including cumulative risk increase from transport due to related decisions that are pending _ not just the transport increment of actions in covered in this PEIS) of waste additions to Hanford's soil column / vadose zone must be analyzed and disclosed. At this time, because USDOE has refused to follow the advice of its own Hanford Advisory Board to stop the addition of non_cleanup wastes to Hanford's Low_Level Burial Grounds and to investigate the vadose zone and groundwater for potential releases, USDOE can not adequately analyze and disclose the impacts of adding additional Low_Level radioactive wastes to these burial grounds. The same is true for the proposal that the wastes from FFTF and related operations would be disposed at the commercial Low_Level Waste Dump operated on the Hanford Nuclear Reservation pursuant to the Northwest Low_Level Waste Compact. That site is subject to a RCRA release investigation, which is pending and a separate EIS on its continued operation _ a fact that the PEIS and Waste Minimization Plan failed to disclose. The cumulative impacts of all waste additions to Hanford's soil column / vadose zone and total potential load of contaminants reaching groundwater _ whether from the commercial site or the USDOE operated site _ must be considered in this PEIS. The Office of Nuclear Energy illegally attempts to avoid this analysis by claiming a preference (illegal and violative of USDOE policy, including the Department's Offsite Commercial Disposal

**1707-15
(Cont'd)**

1707-21

Response to Commentor No. 1707

DOE assessed the cumulative impacts of the proposed Hanford alternatives in Section 4.8 by combining the impacts of other present, and reasonably foreseeable Hanford Site activities, including the impacts of waste management.

DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are a high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This Agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Public meetings were held on this formal milestone change. The proposed actions delineated in the PEIS would not have an impact on Hanford cleanup activities. DOE remains committed to the cleanup mission at Hanford.

The Hanford Site funding maintains the burial grounds in a ready to serve configuration. Emplacement costs are borne by the generator. Any waste received in the execution year from offsite generators reduces the Hanford Site allocation to disposal.

Closure costs for the burial grounds are borne by Hanford. As it is unknown what sort of cap will be placed on the burial grounds, there is no detailed estimate to provide.

Forecasted volumes of wastes planned to be received are on the internet at http://www.hanford.gov/docs/ep0918/sw_navil.htm

1707-16: The Cost Report is not biased in favor of FFTF. The Cost Report was structured to clearly identify the implementation costs of the various alternatives so the Secretary of Energy would have this information along with other data for consideration. For Alternatives 2 through 5, deactivation of FFTF is part of the implementation cost for these alternatives. In the same manner that HFIR and ATR

Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest

Policy) for using an undisclosed commercial site for burial. However, the only theoretically legally available site would be right back on the Hanford Nuclear Reservation.

7.4. Pending related decisions that would result in additional burial of wastes in Hanford's soils must be disclosed and the cumulative impacts considered, including long_term impacts on groundwater and the Columbia River. It is not legally adequate to state that Hanford has capacity (as in land area available for disposal) for the wastes that are proposed to be generated by this action(s). The Low_Level Burial Grounds have operated in violation of Washington State's Dangerous Waste laws, illegally burying hazardous wastes barred from land disposal within the past five years. There has been no investigation of the Burial Grounds, which are formally considered to be illegal dangerous waste soil disposal sites that lack liners, vadose zone monitoring, leachate collection systems, etc...

7.5. The PEIS fails to consider cumulative impacts across the board, but especially in regard to related pending actions to import more waste to Hanford and bury or store more wastes at Hanford. The PEIS is required to consider impacts from "actions which have relevant similarities, such as common timing, impacts...media...in the same general location." 40CFR1502.4 (c). All proposals to add non_ Hanford cleanup wastes to Hanford's soil or storage facilities fall into this category of cumulative impacts of related decisions.

7.6. USDOE claims that it has all the money it needs for funding the restart of the FFTF reactor on a fast track, so it does not include continued costs for standby and maintenance (at \$40 million per year) over any stretched out period in the costs for restart. However, USDOE claims that because it lacks the money to meet its legal obligation to shutdown FFTF, it will add \$80 million to the deactivation costs over two years for continued maintenance _ artificially inflating the cost of shutdown to \$218 million.

7.7. The PEIS fails to even disclose chemical or radioactive hazards of projected waste streams. E.g: Not all "Low_Level" wastes are low radioactivity. Many "mixed wastes" are barred from disposal in landfills in Washington (or elsewhere if generated in Washington). The PEIS and Waste Minimization Report fail to disclose how they

1707-21
(Cont'd)

1707-22

1707-23

Response to Commentor No. 1707

deactivation costs are not included for Alternative 2, the FFTF deactivation costs are not included in Alternative 1. The Cost Report correctly assigns costs in the alternative evaluations.

The commentor's reference to DOE's standing obligations under the Tri-Party Agreement (TPA) is not correct. In October 1997, a tentative agreement was reached among the U.S. EPA, Washington State Department of Ecology, and DOE Richland Operations (DOE RL) to delete the FFTF's M-81 milestones (for both standby and transition activities) from the TPA. This followed the January 1997 decision to place FFTF in standby. This Class I TPA modification was the specific focus of the TPA-required public review and comment period, which ran from November 24, 1997, to February 20, 1998. As a result of comments from the public, the milestones were placed in abeyance (temporary suspension), as opposed to being deleted, until such time as a decision is made by DOE regarding the future of FFTF. In August 1999, DOE-RL, Washington State Department of Ecology, and the U.S. EPA signed Tri-Party Agreement Change No. M-81-98-01 agreeing to the abeyance of FFTF's M-81-00 series milestones. Should the Secretary of Energy decide to return FFTF to operation, the TPA signatories have agreed that the aforementioned milestones will be considered deleted. Should the Secretary of Energy decide to permanently shut down FFTF, the signatories have agreed to either negotiate a new FFTF TPA transition milestone series within 120 days of receipt of DOE RL's proposed changes or allow reinstatement of the M-81 milestones if the 120-day timeframe is not met.

Clean-up cost allocation is addressed in the response to 1707-15.

1707-17: The 300 Area Revitalization Plan provides for continued multi program R&D operations in the 300 Area, including operation of various laboratories, office facilities, and services. It also provides for consolidation (but not complete elimination) of radiological operations, with support for Hanford Site facility transition and environmental restoration efforts. The plan does not require closure of the 325 and 306-E buildings as long as they are needed for active research projects. Operation of these facilities would not violate any existing agreements between DOE and stakeholders or other legal obligations,

Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest

would be treated, and where. A site specific EIS will legally be required to follow this PEIS to disclose and consider these types of impacts _ after disclosing the nature of the wastes. In regard to costs, USDOE has totally failed to disclose the waste, required treatments, and disposal sites _ much less disclose in the cost estimate for restarting FFTF what the costs will be from storing, treating and disposing of the wastes from startup of FFTF and Plutonium / isotope processing at Hanford.

8. Processing Plutonium 238 at Hanford (whether at FMEF or elsewhere) does create liquid "high activity waste" that has to be stored in a tank and vitrified _ just like liquid High_Level Nuclear Waste!!! The Office of Nuclear Energy is just calling it something different to try to escape our criticism. The PEIS must fully disclose where, how and when these wastes will be stored, treated and disposed. Incredibly, the PEIS fails to disclose any of this. Nor is it legally adequate to claim it is disclosed in a separate "Waste Minimization Report", which was not available for public review. (in any event it is legally required to disclose this in the one document, the PEIS). The PEIS fails to disclose the following:

8.2. The cumulative impacts from adding any additional high activity or liquid High_Level Nuclear Wastes to Hanford's existing non_compliant tank farm system (including the cumulative risks of waste transfers) must be disclosed 8.3. The cumulative impacts of adding additional high activity or High_Level Nuclear Wastes to the total amount of waste requiring vitrification and long term storage at Hanford (including disclosure of the storage costs, and, if the waste were to be sent to the proposed and inadequately sized Yucca Mountain Repository, the full costs of disposal).

8.4. The illegality of the proposed long_term storage of newly created wastes in tanks in FMEF (see Waste Minimization Plan) with no treatment path, and the improbability of having such storage permitted.

8.5. The environmental impacts of displacing existing wastes in Hanford's High_Level Nuclear Waste tanks from treatment in the vitrification plant, if the newly created wastes are to be treated there.

1707-23
(Cont'd)

Response to Commentor No. 1707

nor would it affect ongoing or planned environmental restoration and facility transition activities.

The "Done in a Decade" (<http://www.bhi-erc.com/library/doerl/r19922.pdf>) plan addresses the shoreline and 300 Area and is consistent with the 300 Area Revitalization Plan (<http://www.hanford.gov/docs/rl-2000-62/>).

1707-18: The comment is incorrect. If DOE decides to use buildings 325 and 306 for the missions stated in the PEIS, the Office of Nuclear Energy, Science and Technology (NE) would fund the annual operational cost of those facilities, thereby having no impacts on funding for Hanford cleanup.

1707-19: DOE notes with the commentor's view. However, the existing Pacific Northwest National Laboratory (PNNL) contract (DE-AC06-76RL01830, Modification M255) with DOE has a provision C-3.h which states that if the decision is made to restart the FFTF for production and/or testing mission, then startup and future operational responsibilities may be assigned to the Contractor by the DOE, including the direct incorporation of the FFTF facility activities and staff as part of the Laboratory under this Contract. That provision is solely at the discretion of the DOE. At no time did, as the commentor states, Battelle as the operator of PNNL propose or "pitch" "that a benefit would be its ability to use its administrative and overhead accounts to improperly subsidize FFTF standby."

1707-20: The Cost Report is not biased in favor of FFTF. A separate Cost Report was prepared to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the range of alternatives presented in the NI PEIS. The information provided in the report is not required by NEPA and CEQ regulations to be included in the NI PEIS. The Cost Report was mailed to interested parties on August 24, 2000 and made available on the NE website (<http://www.nuclear.gov>) and in the public reading rooms. For information purposes, about 730 people were mailed the Cost Report. DOE has provided a summary of the Cost Report in this Final NI PEIS. These cost estimates are accurate based on currently envisioned needs and contingencies, as appropriate, including those for Alternative 1 options and permanent deactivation of FFTF.

Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest

8.6. The environmental impacts from creation of the new high level nuclear wastes / high activity wastes if Hanford does not have a vitrification plant built and operating within a decade or 15 years, or even a lifetime.

8.7. The PEIS (and cost report) fail to disclose the cost of disposal of the vitrified waste produced from the operations proposed for FMEF or elsewhere at Hanford which create liquid High_Level Nuclear Wastes / high activity wastes. That cost should be consistent with USDOE's costs used in prior Hanford High_Level Nuclear Waste Tank Waste Remediation System EIS. The prorata cost of building the vitrification capacity and long term storage and monitoring costs must also be disclosed. These add millions of dollars to the cost estimate for FFTF and must be disclosed.

9. To avoid our criticism that FFTF and Plutonium and medical isotope production wastes would be harmful to Hanford Clean_Up efforts, Office of Nuclear Energy claims that they will send the wastes to commercial disposal sites, instead of to Hanford. They claimed to be unaware of the DOE's Commercial Waste Disposal Policy, which Senator Wyden, Congressman Smith and the States of Oregon and Washington worked so hard to protect two years ago. That policy says USDOE should not send waste to commercial disposal sites except under the most unusual circumstances. The Energy Secretary made strong commitments to Congress regarding this policy being preserved.

* USDOE personnel have also claimed that they could say the wastes would not be stored "at Hanford" because FFTF would not be "at Hanford" any longer if it is restarted. We doubt that this claim will pass the laugh test for the Secretary or for a federal court.

10. The PEIS fails to analyze safety in event of accidents or chemical/radiation releases based on actual likely public exposure and actual current conditions, including public access to the areas proposed for nuclear operations.

10.2. E.g: in calculating whether ERPG (emergency guidelines for acceptable levels of public or worker exposure in event of accident) limits will be violated for chemical releases at FMEF, the PEIS assumes that the nearest member of the public is either 4.4 miles or 4.5 miles distant. In fact, USDOE has relaxed access restrictions

1707-23
(Cont'd)

1707-20

1707-24

1702-25

Response to Commentor No. 1707

DOE assumes that the commentor's reference to new accelerator construction concerns the Isotope Production Facility (IPF) at Los Alamos National Laboratory. This facility produces radioisotopes using the Los Alamos Neutron Science Center's (LANSCE) half-mile accelerator that delivers medium-energy protons. Among other isotopes, the IPF's three major products include germanium-68, strontium-82, and sodium-22. As a result of changing DOE missions, the production of radioisotopes at target area "A" of the LANSCE has been rendered inoperable. In order to replace the level of production lost due to this change, DOE is completing a new and more efficient IPF that would allow DOE to continue to produce most of these same isotopes in an effort to meet existing demand. As addressed in Section 2.6.1 of the NI PEIS, IPF at LANSCE was considered but dismissed from further evaluation because, although it can be used in tandem with the Brookhaven Linac Isotope Producer (BLIP) located at the Brookhaven National Laboratory to supply near term isotope requirements, it is unlikely that these facilities could accomplish reliable, increased isotope production at the level needed to support projected needs. Therefore, this facility was considered but dismissed from further evaluation as shown in Table 2-4 of the Draft NI PEIS.

As noted by the commentor, waste management costs were not presented in the Cost Report. Neither NEPA nor the CEQ regulations for implementing NEPA require the inclusion of a cost analysis, including for waste generation. Wastes would be generated by all alternatives and all sites including for the implementation of Alternative 1, Restart FFTF at Hanford, which makes these costs not a particularly useful discriminator among the alternatives considered. Also, the ultimate disposition of some of these wastes in terms of acceptable waste form, disposal site (onsite or offsite commercial, etc.), etc. have yet to be determined. This adds an additional uncertainty to any attempt to quantify waste costs, thus, making any estimates highly presumptive and speculative at best.

The use of proposed alternative facilities associated with reprocessing of neptunium-237 targets would have no impact on schedules or available funding for high-level radioactive waste programs at either Hanford or the INEEL sites. At INEEL the tanks would not be used

Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest

and even invites the public to come to the gate of the FFTF reactor, and has even staged bicycle races and public events from the FFTF reactor parking lot. The PEIS fails to disclose and consider the impacts of restricting access back to the site boundary (and the costs of controlling such access now that the site has allowed open, unescorted public access for several years). The public is currently allowed closer than the 500 meters or 2000 meters, at which distance the public would be exposed to chemical releases above what USDOE considers acceptable. However, the PEIS fails to disclose either current actual conditions allowing public access and, therefore, exposure, or disclose that DOE's own risk guidelines would be violated for chemical release accidents deemed to be quite possible.

10.3. Unacceptable levels of public health PEIS at 4_148, 149 and 4_83 harm occur from a postulated nitric oxide release which "reach(es) the level of concern" at 500 meters and 2000 meters, depending on weather.

10.4. The proposed operations in the 300 Area (for 325 and 306) can not meet ERPG guidelines under current or USDOE's officially proposed public access conditions.

10.5. USDOE's calculations for dose are based on unsupportable (and nonexistent plans for) claims that the public will be evacuated and crops interdicted in order to keep doses from drops of FFTF spent fuel assemblies and casks, Plutonium 238 targets or medical isotope targets within USDOE's own overly weak and unprotective guidelines. SEE: "Evaluation of Selected Ex_Reactor Accidents Related to The Tritium and Medical Isotope Production Missions at the Fast Flux Test Facility". The PEIS failed to use available data on frequency of postulated accidents and potential impacts. The PEIS fails to consider the potential for drop or releases from medical isotope targets transported to the 300 Area, where there would be unlimited public access in the Area and along the River.

10.6. Accidents with a likelihood of occurrence as high as one in one hundred per operational year, and a potential for a probability of occurrence as high as 30% over 35 years of operations, include Iodine 125 Target damage, solid waste cask drop, etc.... Neither the consequences for the exposed individuals, or the

1707-25
(Cont'd)

Response to Commentor No. 1707

although certain facilities at the Idaho Nuclear Technology Engineering Center (INTEC) would be used to treat the wastes resulting from processing the irradiated targets. These are reliable systems that would process a maximum of 1,050 cubic meters of low level radioactive waste over the 35-year nuclear infrastructure operational period. The higher activity waste would be treated as a solid form via a stand-alone vitrification system, separate from any tank waste treatment system. The costs for this vitrification facility was included in the cost analysis for this NI PEIS. At Hanford, the existing high-level radioactive waste facilities would also not be used, and as analyzed in the PEIS, no existing or planned high-level radioactive waste facilities would be used to treat the wastes resulting from processing the irradiated targets.

1707-21: Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

DOE Order 435.1 "Waste Management" gives responsibility to the DOE Field Element Managers to approve exemptions for use of non DOE facilities for the storage, treatment or disposal of DOE radioactive waste based on certain requirements. One of these requirements is that the facility must have the necessary permits, licenses, and approvals for the specific waste.

Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest

frequency, are disclosed in the PEIS. Other potentially devastating accidents include a large sodium spill and burn.

10.7. For many of these accidents, USDOE makes the ridiculous assumption that the "receptor is assumed to be evacuated after 2 hours" _ despite the lack of a track record of notification of accidents by Hanford management, the lack of an evacuation plan adequate to meet the assumption, and the failure to consider that the public includes people far closer than the postulated site boundary. Id at 50.

10.8. The PEIS fails to disclose the extensive accident history at FFTF and the growth in frequency of events caused by unanticipated problems, or "The Procedure was intentionally not used." SEE WHC_SP_0432.

10.9. The PEIS fails to consider and disclose that "severe accidents in FFTF have not been assessed using state of the art methods developed since the reactor began operation. ... (E.g.): uncertainties in post_accident heat removal, in the evolution of fission products from the molten core debris..." National Research Council. National Academy Press, "Safety Issues at the DOE Test and Research Reactors", 1988 at 67. The FSAR, on which PEIS claims are based, was based on oxide fuel, not a metal fuel as used. A hydrogen explosion or long term pressurization "might result in containment rupture" concluded the National Research Council in 1988. As a result, modifications theoretically will vent radioactive gases building up in the reactor _ which is not disclosed.

11. The proposal for FFTF restart, and alternative one in the PEIS, unconscionably and illegally rely on use of contaminated buildings in Hanford's 300 Area for isotope processing.

11.2. Both the 325 and 306 Buildings are contaminated with Beryllium _ which the PEIS fails to disclose.

11.3. The PEIS must disclose the risks to worker health and safety from starting new, long_term operations in the 325 and 306 buildings.

11.4. The PEIS fails to disclose that use of the 306 and 325 buildings for commercial isotope vendor support will violate CERCLA requirements that forbid the reuse or lease of facilities to

1707-27

Response to Commentor No. 1707

As discussed in DOE's "Commercial Disposal Policy Analysis for Low-Level and Mixed Low-Level Wastes" dated March 9, 1999, there are three commercial low-level radioactive waste disposal facilities (i.e., Envirocare of Utah; Barnwell, South Carolina; and US Ecology, Richland, Washington) which are currently operating and licensed to received low-level radioactive waste. Envirocare of Utah also has a permit to receive RCRA hazardous wastes. DOE has and is currently disposing of low-level radioactive waste and mixed low level radioactive waste at Envirocare of Utah and has sent low-level radioactive waste to Barnwell, South Carolina. In June 1995, US Ecology submitted an unsolicited proposal to DOE for the disposal of DOE waste at the US Ecology facility. In November 1995, the State of Washington informed US Ecology and DOE that the State would allow the disposal of DOE waste at the facility subject to certain conditions.

The trenches (i.e., Hanford Site's 200 Area's Low-Level Waste Burial Ground) are regulated by DOE under the Atomic Energy Act of 1954, as amended, and under DOE Order 435.1, Radioactive Waste Management. The 200 Area's Low-Level Burial Ground also contain the following three active permitted mixed waste trenches whereby mixed low-level waste is both stored and disposed of: (1) Trench 31 is a permitted, lined Subtitle C disposal trench that is currently utilized for greater than 90-day storage of mixed low-level radioactive waste; (2) Trench 34 is permitted, lined Subtitle C disposal trench currently utilized for the disposal of mixed low-level radioactive waste that has been treated and is compliant with Land Disposal restrictions; and (3) Trench 94 is a permitted, unlined disposal trench utilized for the disposal of decommissioned naval reactor components. Use of Trench 94 for naval reactor compartments is authorized under a special exemption from the State of Washington Department of Ecology (Ecology). Currently, the Low-Level Burial Ground has a Part A Permit approved by Ecology under the State of Washington Dangerous Waste Regulations, State of Washington Administrative Code (WAC) 173-303, and, as such, is an interim status treatment, storage, and disposal (TSD) unit under the Resource Conservation and Recovery Act (RCRA). The permitted active and future mixed waste units of the Low-Level Burial Ground meet all regulatory requirements of WAC 173-303 and RCRA and will be incorporated into the Hanford Site RCRA Facility

Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest

private entities while the facility and area are still contaminated. Pursuant to CERCLA, EPA has a duty to preclude the proposed uses due to their interference with pending CERCLA cleanup of the 300 Area.

11.5. The contamination in the 325 and 306 Buildings, and their contribution to surrounding contamination, is not disclosed:

* As early as 1979, USDOE documents reveal that USDOE knew that all sewer lines from the 306 building are likely to be contaminated and sources of release to the environment. Continued use of these sewers is not legal or conscionable. The PEIS fails to disclose this contamination.

* Multiple fires and leaks throughout 306 caused contamination levels at 20,000 to 80,000 cpm;

* In 1987, contamination was spread up to 100,000 disintegrations per minute throughout the building;

* There have been repeated instances of windblown contamination outside 306 from unknown sources;

* Sanitary drains and sewers from 325 are suspected to be contaminated with radioactive Mercury and Uranium 235;

* In 1977, Plutonium 238, 239 and 240 were spread outside a glovebox at up to 120,000 dpm;

* Plutonium "inadvertently left in a low level waste collection area" resulted in Plutonium spread of 5 million disintegrations per minute (dpm). Not only does the PEIS fail to disclose this, it fails to analyze the health threats from 35 years of work in these facilities, and the harm to cleanup efforts from continued operations. The PEIS and costs for Alternative one must reveal the costs of this alternative to include new facilities, and reveal their impacts. The PEIS fails to reveal known fire risks, risks of chemical usage, and the fact that if similar accidents have happened before from handling Plutonium or similar chemicals, they must be considered as "likely" to recur.

The PEIS fails to disclose that other USDOE documents reveal a catastrophic radiation dose from very real risks of fires in the 325 building. USDOE's budget and risk data sheets reveal risks of 91 Rem to onsite persons (which could be the public and children, under USDOE's current 300 Area proposal). This is 670 times

1707-29

Response to Commentor No. 1707

Part B Permit and will operate under final status regulations. In early June 2000, a working draft of the Hanford Site RCRA Facility Part B Permit application was submitted to Ecology.

Cumulative impacts, including waste impacts, are addressed in Section 4.8 of the NI PEIS.

1707-22: The estimates in the Cost Report assume that a decision is made at the end of calendar year 2000 and include the total costs required to restart the FFTF (Alternative 1) and the total costs to permanently deactivate FFTF (Alternatives 2-5). In both cases, implementation of the Record of Decision (ROD) commences immediately after the ROD announcement and continues until the respective objectives are achieved.

1707-23: Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

Costs are not within the scope of the PEIS. However, costs are considered for the Record of Decision.

The DOE Manual 435.1. Radioactive Waste Management defines high-level radioactive waste as "the highly radioactive waste material resulting from the reprocessing of spent nuclear fuel, including liquid waste produced directly in reprocessing and any solid material

Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest

higher than the dose to the public claimed in the PEIS as a maximum for the public from a fire. See Tables 4_28 and 31. Under NRC rules, and even under USDOE's weak guidelines, the calculated dose to onsite persons _ which will include the public (although the PEIS fails to disclose this) _ exceeds allowable limits and the nuclear processing operations proposed for the 306 and 325 buildings would not be allowable.

12. Plutonium 238 processing will involve the same chemical processes _ with an undisclosed risk of explosion and releases _ as the chemical process used previously for Pu239 in Hanford's Plutonium Finishing Plant (PFP) and elsewhere in the USDOE complex and other locations throughout the world.

12.2. This risk includes the risk of explosion (in DOE parlance, self_sustaining exothermic reaction) from chemicals similar to "red oils"; i.e., heating of Plutonium Nitrate solutions mixed with Tri_Butyl Phosphphate, solvents and with impurities present which may serve as an oxidizer. When the risk of such an explosion was first disclosed by Heart of America NW to USDOE regarding the proposed restart of the PFP, USDOE claimed it did not exist _ but later instituted administrative controls, declared an unresolved safety question and admitted the issue had to be fully disclosed and considered in an EIS.

12.3. Pu238 operations will also utilize the chemical hydroxylamine nitrate _ the same chemical that exploded inside PFP in 1997, and blew holes in the roof and caused a relase to the environment which harmed the health of workers. The PEIS fails to disclose this and consider the likelihood of similar future explosions _ including from Hanford workers' repeated failure to follow safety rules and _ at PFP _ a history of deliberately violating procedures. The likelihood that procedures will be violated at Hanford _ especially so long as USDOE claims FFTF and related processing operations are exempt from external nuclear safety regulation _ must be fully considered. So must the cumulative risks and impacts of ongoing chemical processing and nuclear operations given the site's history and existing problems (i.e._ lack of a sitewide chemical management plan that includes wastes; history of violating Emergency Planning and Community Right to Know requirements).

1707-29
(Cont'd)

Response to Commentor No. 1707

derived from such liquid waste that contains fission products in sufficient concentrations; and other highly radioactive material that is determined, consistent with existing law, to require permanent isolation.” DOE has prepared an implementation guide to DOE M 435.1 to assist in implementing the requirements contained in that manual. For this particular “requirement,” the definition of high-level radioactive waste, the guide is intended to facilitate the classification of indefinite waste as to whether or not they are high-level radioactive waste. It is recognized that the definition of high-level radioactive waste is not precise and is essentially a source-based definition that also alludes to concentrations of a given waste stream. Page II-8 of this guide notes that “For the purpose of managing high level waste under DOE M 435.1-1 [sic], spent nuclear fuel includes spent driver elements and/or irradiated target elements that contain transuranium elements.” This statement was included in the guide because the concentrations of long-lived isotopes are likely to be somewhat high during reprocessing and it also meets the source based definition. As a result of reviewing this guide and to address the comments raised, DOE is considering whether the waste from processing of irradiated neptunium-237 targets should be classified as high-level radioactive waste and not transuranic waste. As a result, the Waste Management sections (i.e., Sections 4.3.1.1.13; 4.3.2.1.13; 4.3.3.1.13; and 4.4.3.1.13) of this NI PEIS have been revised to reflect this different classification from what was assumed in the draft NI PEIS. As discussed in these revised sections, irrespective of how the waste is classified (i.e., transuranic or high-level radioactive waste), the composition and characteristics are the same and the waste management (i.e., treatment and onsite storage) for this NI PEIS would be the same. In addition, even if the waste is managed as high-level radioactive waste it would have no impact on the existing high-level radioactive waste management infrastructure (e.g., high-level waste storage tanks), since the high-activity waste from processing of the targets would be initially stored and vitrified within the processing facility (i.e., FMEF, REDC, or FDPF).

1707-24: In accordance with DOE Order 435.1, “Waste Management,” radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. If DOE capabilities are not practical or cost effective, exemptions may be approved to allow use

Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest

13. USDOE has failed to consider the reasonable alternative of honoring its own commitment to have operation of the FFTF reactor and related nuclear processing operations subject to independent, external nuclear safety regulation and licensing by the Nuclear Regulatory Commission. In 1996, the Secretary of Energy committed to Congress, in a highly publicized statement, that within five years all nuclear energy research facilities of the Department would be fully subject to such regulation. She used the word "commit".

1707-30

13.2. The PEIS must disclose the difference in standards that would be applied, and processes used, if USDOE honored its commitment to have FFTF and related processing operations subject to external regulation. The environmental benefits of external regulation were noted by the Secretary, and USDOE can not claim now that this is either an unreasonable alternative or that there are no significant differences between its continued use of its own standards and self_oversight and the standards and regulatory oversight of the NRC.

Failure to cure these massive deficiencies will inevitably result in legal action if the Department chooses to pursue restart of the FFTF reactor.

1707-31

The deficiencies in disclosure in this PEIS will require a site specific EIS to be conducted, if USDOE pursues restart of FFTF and Plutonium / isotope processing at Hanford. A site specific EIS will be needed to disclose where USDOE _ and how _ plans to treat, store and dispose of wastes. Similarly, a site specific EIS is necessary to disclose the risks from using the proposed contaminated facilities, and the cumulative impacts on the region and on Hanford Clean_Up from FFTF restart. Of course the claims for costs and timeline of restart fail to include the \$40 million per year from additional years of study (and from a successful challenge of this PEIS as well). USDOE should close FFTF and honor its commitment to use the funds saved from shutdown of FFTF for Hanford Celan_Up.

1707-32

1707-33

1707-15

Response to Commentor No. 1707

of non-DOE facilities for the storage, treatment, or disposal of DOE radioactive waste. DOE Order 435.1 gives responsibility to the DOE Field Element Managers to approve exemptions for use of non-DOE facilities for the storage, treatment or disposal of DOE radioactive waste based on certain requirements. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. DOE has no plans to disassociate the FFTF from the Hanford Site.

1707-25: The accident analysis presented in the NI PEIS provides a basis for making comparisons between the consequences and risks of accidents associated with facilities identified in each of the alternatives and options presented in the NI PEIS. The accident analysis evaluated the consequences and risks to maximally exposed individuals, both workers and members of the public, during postulated accident scenarios. It would not be necessary to conduct further analyses to determine the specific consequences and risks to an individual member of the public located closer to the source of an accident than that already evaluated in the NI PEIS. Any individual member of the public located in close proximity, regardless of distance, would be expected to experience consequences of a postulated accident that are more severe than the consequences to the general public. In fact, the closer an individual gets to the accident the more severe the consequence. However, the probability that a member of the public would be in close proximity to the facility would be relatively low and the associated risk to that individual would be bounded by the MEI risk.

The NI PEIS evaluates potential health effects, in terms of risks and consequences, resulting from a complete spectrum of accidents for FFTF, RPL/306E, and FMEF. The spectrum of radiological and hazardous accidents considered for the NI PEIS includes irradiation and processing facility related accidents, including accidents related to medical isotope target damage, cask drops, and processing accidents. Accident frequencies were derived from current sources, including the current FFTF Final Safety Analysis Report and RPL Safety Analysis Report. The consequences and risks to the maximally

Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest

Notes: a)Proposals referenced orally or in the Waste Minimization Plan to utilize commercial disposal sites (sites which were, improperly, not disclosed) for disposal of FFTF and Plutonium / Isotope processing wastes generated at Hanford violate USDOE's own "Requirement on Use of Non_DOE Facilities for Low_Level Waste and Mixed Low_Level Waste"; 64 FR 12161. "DOE will continue its policy of disposing its LLW and MLLW at the site at which it is generated... or...at another DOE disposal facility." None of the impacts of violating this policy were considered in the Draft PEIS _ nor was the existence of the Policy revealed. Impacts of violating the policy. The cumulative impact of the equivalent of two additional years of operation of either the USDOE Low_Level Burial Grounds or the commercial site at Hanford is significant and must be fully disclosed and analyzed. The 5,000 cubic meters of additional Low_Level Waste that the proposals would generate at Hanford are roughly equivalent to the full continued operation of either of these two dumpsites for an additional two years. b) Safety: PEIS repeatedly references GENII, 1988, for source of dose calculations. However, USDOE declared Unusual Occurrence in 1989 when it was discovered that the software had wind directions off by 180 degrees _resulting in dose calculations off by a factor of two. If 1988 version was relied upon, all dose calculations must be redone. In any event, they must be redone with appropriate exposure scenarios for public.

Note to USDOE for the official record: This version of our comments replaces the version mailed by USPO on September 15, 2000. Please utilize the attachments that were mailed with that set of comments.

1707-34

1707-35

Response to Commentor No. 1707

exposed individual, surrounding population, non-involved worker, and involved worker are presented in Sections 4.3.1.1.10 and I.1.7 of the NI PEIS.

All of the proposed medical isotope targets were screened for each postulated accident to determine which isotope would result in the highest consequences. The I-125 target resulted in the highest consequences during a postulated fire accident at a processing facility. The I-125 fire analysis is presented in Section I.

The FFTF, RPL/306E, and FMEF accident analyses in the NI PEIS conservatively assumed no evacuation of the surrounding population. Individual members of the public located onsite concurrent with a postulated accident were assumed to be exposed to the hazardous release for up to two hours. The analyses did assume that crops and foods would be condemned or interdicted in accordance with EPA Protective Action Guides. The potential for drops or releases from spent fuel assemblies, plutonium-238 targets, and medical isotope targets transported within the Hanford Site are addressed in Section J 5.3 of the NI PEIS.

The FFTF operated safely from 1982 until 1990 when it was placed in standby. There have been no serious nuclear-related accidents or accidental releases of hazardous or radioactive materials at FFTF during its lifetime. Section 3.4.9.4 of the NI PEIS has been updated to provide information specific to FFTF's accident history.

The methodologies used for the respective accident analyses were developed to model the radiological consequences of nuclear facility accidents and are considered applicable to the analysis of accidents associated with the production of plutonium-238 and other proposed isotopes. The severe reactor accident in the NI PEIS is based on the most current available information. The reactor fuels (MOX and HEU) proposed for the FFTF are oxide forms. If a decision is made to restart FFTF, the status and condition of all safety systems will be assessed and appropriate actions taken, as necessary, prior to startup. This includes updating the Final Safety Analysis Report and completing a Probabilistic Risk Analysis using state-of-the art methodologies.

Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest

Response to Commentor No. 1707

1707-26: There was no proposal to restart FFTF in the Draft NI PEIS. Alternative 1, Restart FFTF, is one of a range of reasonable alternatives evaluated for environmental impacts and for accomplishing the objectives described in Section 1.2 of Volume 1. At the time that the Draft NI PEIS was published, no preferred alternative had been selected. None of the alternatives examined in the NI PEIS is illegal or would require illegal activities.

Use of the 306 and 325 facilities for the PEIS missions would be consistent with their historical and planned uses at Hanford. The facilities were designed and constructed for the types of activities that would be conducted there if they were chosen to implement the PEIS missions. Buildings 325 and 306-E are currently used for activities that are not associated with the nuclear infrastructure alternatives described in Section 2.5 of Volume 1. According to the Hanford Beryllium Fact Sheet (www.hanford.gov/safety/beryllium/fctsheet306-e.htm) Building 306-E contains beryllium in Rooms 165 and 180 including the interior of the exhaust ducts that service these rooms, and the interior of the beryllium wire/component storage cabinet in Bay 2. But surveys conducted in 1999 showed levels were below method detection limits. In Building 325, the risk of beryllium exposure has been identified as low. Small risks are associated with work activities that would expose interior areas of older ductwork that may have residual beryllium contamination (Hanford Beryllium Fact Sheet -www.hanford.gov/safety/beryllium/fctsheet/325.htm). The PEIS missions would not be expected to result in worker exposures to beryllium, although some areas of the facilities contain residual beryllium contamination. If work in contaminated areas of the facilities were necessary, appropriate protective measures would be used to prevent worker exposures.

Worker safety (radiological protection) is a key element of the DOE's Radiological Health and Safety Policy (DOE P 441.1, April 26 1996) This policy states in part that DOE facilities must "conduct radiological operations in a manner that controls the spread of radioactive materials and reduces exposure to the workforce and the general public and that utilizes a process that seeks exposure levels as low as reasonably achievable." Each DOE site, including Hanford, is required to implement a radiological control program with the intent to

Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest

Response to Commentor No. 1707

meet this policy goal. Based on the assessment of worker health impacts for all of the alternatives and options presented in the NI PEIS that make use of facilities in the 300 Area at Hanford, the most likely impact of the use of these facilities is no increase in cancer fatalities among the facility workers. This assessment is based on operational data collected at the facilities during recent operation. For example in Alternative 1, Option 1, target irradiation and processing occur FFTF and the RPL. As shown in Section 4.3.1.19 of the PEIS, no fatal cancers would be expected to result from implementation of the alternative.

- 1707-27:** The 300 Area Revitalization Plan, which can be found at <http://www.bhi-erc.com/library/doerl/r199-22.pdf>, provides for continued multi program R&D operations in the 300 Area, including operation of various laboratories, office facilities, and services. It also provides for consolidation (but not complete elimination) of radiological operations, with support for Hanford Site facility transition and environmental restoration efforts. The plan does not require closure of the 325 and 306-E buildings as long as they are needed for active research projects. Operation of these facilities would not violate any existing agreements between DOE and stakeholders or other legal obligations, nor would it affect ongoing or planned environmental restoration and facility transition activities.

If work is planned for any of the contaminated areas (chemical or radiological) in these facilities, the area would be cleaned up or work would be conducted with appropriate protective measures in place (e.g., protective clothing, respiratory protection, administrative controls). In any case, the planned activities would comply with all regulatory standards for exposure of workers to hazardous or radioactive materials.

The NI PEIS evaluates occupational and public health and safety for the proposed activities during routine operations, accidents, and transportation for each of the alternatives (e.g., Sections 4.3.1.1.9, 4.3.1.1.10, and 4.3.1.1.11 for the FFTF restart alternative, Option 1).

- 1707-28:** It is difficult to address the commentor's concerns as no specific citations were provided. Volume 1, Chapter 3 (Section 3.4.9.4) provides information regarding the accident history at Hanford. This

Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest

Response to Commentor No. 1707

discussion specifically identifies events that have occurred more recently than those brought forth in this comment. Specific documentation of the alleged contamination events could not be found after a review of DOE records dating back to 1973. However, records of similar events were reviewed and, in all cases, the contaminated areas were cleaned and there was no indication of significant contamination of staff working in or near these areas. The current impact of these earlier events would be seen in the site data collected for the site environmental reports, both for exposure to the public and for worker exposure. Information from the Hanford Site Environmental Report for 1998 and the Occupational Radiation Exposure, 1998 Report (DOE/EH-0608) has been presented in Chapter 3 for the Hanford site.

This PEIS has provided an estimate of the incremental potential human health impacts associated with each of the alternatives proposed (including the use of Area 300 facilities) for the production of isotopes for medical uses and research and development. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. In all cases, the analysis shows that the most likely impacts from the use of the Area 300 facilities are no additional cancer fatalities among the population surrounding the Hanford facilities. [See for example Section 4.3.1.1.9 and 4.3.2.1.9 and the summary Tables in chapter 2 of Volume 1 of the NI PEIS.]

Worker safety (radiological protection) is a key element of the DOE's Radiological Health and Safety Policy (DOE P 441.1, April 26, 1996) This policy states in part that DOE facilities must "conduct radiological operations in a manner that controls the spread of radioactive materials and reduces exposure to the workforce and the general public and that utilizes a process that seeks exposure levels as low as reasonably achievable." Each DOE site, including Hanford, is required to implement a radiological control program with the intent to meet this policy goal. Based on the assessment of worker health impacts for all of the alternatives and options that make use of Hanford facilities, the most likely impact of the use of these facilities is no increase in cancer fatalities among the facility workers. For example in Alternative 1 option 1, all of the activities (target irradiation and

Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest

Response to Commentor No. 1707

processing) occur at Hanford facilities, including Area 300 facilities. As shown in Sections 4.3.1.1.9 and 4.3.2.1.9, the expected consequences are less than one additional fatal cancer among the workforce; that is, no additional fatal cancers are expected.

The NI PEIS also provides information regarding 300 Area (and Hanford) water resources (i.e., surface water, process sewer system, groundwater) and the potential impacts from the proposed activities in sections 3.4.4. and 4.3.1.1.4, respectively. As discussed, there would be little or no measurable increase in water use to support target fabrication and processing in 300 Area, negligible changes in the quantity or quality of process and sanitary wastewater, and no radiological liquid effluent to the environment under normal operations. More specifically, operations at RPL would result in an increase of less than 1 percent in process waste water discharge and this would be from equipment washing of nonradiological target materials. Additionally, building 306-E would not provide support to NI PEIS activities involving radiological materials.

DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

1707-29: The NI PEIS considered plutonium-238, neptunium-237, medical isotopes, and all hazardous chemicals during processing and irradiation to arrive at a set of accidents whose risks and consequences bound the potential public and worker health and safety impacts of all potential accidents. The resulting risks and consequences for a currently operating processing facility, such as RPL, pertain to the proposed action and do not include the risks and consequences from non-infrastructure missions. Section I.1.4.2.1 specifically addresses previous fires at the Hanford Site.

Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest

Response to Commentor No. 1707

DOE notes the commentor's concern for potential explosions and release of materials. The solvent extraction process involving the use of tributyl phosphate in hydrocarbon to separate and produce plutonium nitrate solution has been used extensively for years in the United States as well as in Japan, England, Germany, etc. Under a combination of off-normal conditions, there can be a reaction between nitric acid or nitrates and tributyl phosphate degradation products at higher than normal operating temperatures. Such a reaction could only occur in a heated evaporator or concentrator if there is excess tributyl phosphate impurity or residual in the plutonium nitrate liquid. This scenario will be analyzed as a potential design basis accident in developing the safety authorization basis and associated technical safety requirements for the chemical processing option chosen by DOE.

- 1707-30:** On February 19, 1999, Secretary Bill Richardson sent a letter to the Senator John Warner, Chairman of the Committee on Armed Services to inform him of DOE's efforts in exploring a potential move toward the external regulation of DOE's nuclear facilities. Secretary Richardson reported that, based on DOE's analysis, many of the potential benefits that were expected from external regulation had not been demonstrated, and appear to be outweighed by associated costs and difficulties raised in the pilot projects. As a result, DOE had determined that submittal of legislation to exempt certain facilities from Departmental regulations was premature. It should be noted that FFTF meets all safety requirements established by DOE and that the DOE requirements are consistent with those established and applied by other regulatory agencies such as the Nuclear Regulatory Commission.
- 1707-31:** DOE notes the commentor's opposition to the restart of FFTF. DOE, as required by NEPA, CEQ and DOE Regulations, has fully described the environmental impacts associated with the alternatives described in Section 2.5 of Volume 1.
- 1707-32:** A site-specific EIS would not be required should Alternative 1 (Restart FFTF) be selected in the Record of Decision. This NI PEIS presents a thorough analysis of site-specific information on the environmental conditions prevailing at Hanford, that could potentially

Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest

Response to Commentor No. 1707

affect or be affected by the proposed actions, to include a comprehensive analysis of the associated environmental and health risks of implementing the proposed actions. Specifically, Chapter 4 of the NI PEIS discusses the proposed treatment, storage, and disposal of all wastes generated from the use of proposed Hanford facilities including FFTF (Sections 4.3.1.1.13 and 4.3.3.1.13); the public and occupational health risks from normal operations and postulated accidents associated with use of Hanford facilities (4.3.1.1.9, 4.3.1.1.10, 4.3.3.1.9, 4.3.3.1.10); and the cumulative impacts of waste management activities at the Hanford Site (Section 4.8.3.4). In compliance with NEPA, DOE analyzed each environmental resource area in a consistent, unbiased manner across all the alternatives to allow for a fair comparison among the various alternatives and among the candidate sites. The NI PEIS also considers previous NEPA analyses that bear on the decisions to be made including the Environmental Assessment for FFTF shutdown. No fundamental factors relating to purpose and need, the alternatives under consideration, or the associated environmental impact analyses have changed relative to the decisions to be made since the Draft NI PEIS was published. Therefore, all of the environmental information relevant to expanding civilian nuclear energy research and development and isotope production missions in the United States has been acquired and analyzed in the NI PEIS. The Cost Report did not include \$40 million per year for additional years of study because if FFTF restart is selected, implementation would be immediate.

- 1707-33:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 1707-34:** On March 11, 1999 (64 FR 12161), DOE announced its decision to continue "its current policy of relying on DOE waste disposal facilities and of using commercial (non-DOE) facilities by exemption when DOE disposal is not practical."

In accordance with DOE Order 435.1, "Waste Management," radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. If DOE capabilities are not practical or cost effective, exemptions may be approved to allow use of non-DOE facilities for the storage, treatment, or disposal of DOE radioactive waste. DOE Order 435.1 gives responsibility to the DOE

Commentor No. 1707: Hyun Lee (Cont'd)
Heart of America Northwest

Response to Commentor No. 1707

Field Element Managers to approve exemptions for use of non-DOE facilities for the storage, treatment or disposal of DOE radioactive waste based on certain requirements. Section 4.3 of Volume 1 has been revised to clarify DOE's position on waste disposal.

Section 4.8 of the NI PEIS provides information on the cumulative impacts, including the cumulative amounts of waste generated at Hanford. This information has been revised from the draft to include capacities for the treatment, storage and disposal facilities at the Hanford Site. In reviewing this information, the cumulative waste generation for low-level radioactive waste is (existing site activities plus nuclear infrastructure) about 100,681 cubic meters over the 35 year nuclear infrastructure operations and low-level radioactive waste disposal capacity at Hanford is about 1,970,000 cubic meters.

1707-35: The 1988 reference to the GENII code is a reference to the documentation associated with the code, i.e., the code description and user's manual. The version of the code used in the analysis is Version 1.485 dated December 1990.

The appropriate exposure scenarios were used in the analysis of normal operation impacts. As stated in Appendix H, the plume exposure data is that recommended by the NRC in Reg Guide 1.109.

Commentor No. 1708: Margaret Macdonald Stewart

Ms. Colette Brown
DOE
Office of Space and Defense Power Systems (NE-50)
19901 German town Road,
Germantown, MD 20874-1290

18 September 2000

Dear Ms. Colette,

My name is Margaret Macdonald Stewart and the following are my comments on the Department of Energy's *Draft Programmatic Environmental Impact Statement for Accomplishing Expanded Nuclear Energy Research and Development and Isotope Production Missions in the United States, Including the role of the Fast Flux Test Facility (FFTF)* – otherwise known as the Infrastructure PEIS.

I find this document completely inadequate for its lack of substantiating evidence for the need for any additional infrastructure for the production of PU-238 for medical or research programs. And I am outraged about the total lack of cost and proliferation assessments in the EIS, which I understand is a violation of the National Environmental Policy Act (NEPA). The fact that both cost and proliferation documents were finally published and made available to the public *AFTER* public hearings clearly shows the DOE's "high regard" for both public comment and for non-proliferation issues. NOT.

Why is there no mention of what to do with the high-level waste that will be the end result of the PU-238 production process? Call it processing or reprocessing, or anything you choose, there will still be approximately 288,000 gallons of liquid high-level waste with no place to go in your EIS. Regardless of its name, it is still liquid and dangerously radioactive and is the most difficult of all nuclear waste to confine and isolate from the environment. Monstrous volumes of like liquids are the most serious and massive environmental problem in the DOE complex today, and yet this plan calls for even greater volumes to be added to at least one of the planet's most contaminated places. I am confused about priorities. Perhaps cleanup should be the plan.

I will not go into the cost analysis problem except to say that it should have been an integral part of the EIS, not an add-on. And it should have been publicly available *before* public hearings. Way to go, DOE, always thinking about the input from your # One business partner, the public. Again, I am confused about priorities.

The non-proliferation analysis should absolutely have been an integral part of the EIS and available with the EIS, not *after* public hearings were held. What is the problem here?? The administration in 1992 declared that the United States would no longer engage in reprocessing nuclear materials because of the proliferation risk and the wrong message it sends to other countries. Did I miss something here? Do we no longer care

Response to Commentor No. 1708

1708-1: DOE notes the commentor's opposition to expanding DOE's existing nuclear facility infrastructure. Consistent with its mandates under the Atomic Energy Act, DOE is proposing this expansion for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Plutonium-238 would not be used for medical or research programs; it would be used for NASA space exploration missions.

The NI PEIS provides an estimate of waste generation impacts associated with each of the alternatives proposed for the production of medical, industrial and research isotopes, plutonium-238, and nuclear research and development. Any additional wastes generated in support of these missions would be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. The proposed action would not have an impact on the cleanup missions at the candidate sites.

A separate Nuclear Infrastructure Nonproliferation Impacts Assessment was prepared to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. The information provided in the report is not required by NEPA and CEQ regulations to be included in the NI PEIS. For information purposes, the Nuclear Infrastructure Nonproliferation Impacts Assessment was mailed to approximately 730 interested parties on September 8, 2000 and made available on the NE website (<http://www.nuclear.gov>) and in the public reading rooms. DOE has provided a summary of the Nuclear Nonproliferation Impacts Assessment in the Final NI PEIS.

(Cont'd)**

about the security of the world by increasing the proliferation risks? And do we no longer care about sending that same message around the world – in an age when EVERYONE watches and listens to what the United States does and says? I've already mentioned the incredible environmental risks involved with this entire process. I am confused about the priorities.

The need for more PU-238 is never justified in this draft PEIS. We have been receiving PU-238 from Russia for 10 years or so at quite a good price, and they have plenty to sell. Canada is an excellent source of medical isotopes. Why does the United States suddenly need more than these two countries can offer? And NASA has said it does not need – emphasis on 'DOES NOT NEED' – additional PU-238 for its space needs. Is anyone out there listening? Again, I am confused about priorities.

Concerning the restart of the Fast Flux Test Facility at the Hanford Nuclear Reservation for this entire proposal is never justified. It is, however, quite blatantly the reason for this whole scheme. Interesting that DOE's own advisory panel said in an April 2000 report that the "FFTF will not be a viable source of [medical] research radioisotopes," and that production would not be cost effective. Yet this report is not included in the draft EIS. WHY? Confusing priorities, again.

There are many more issues I have with this draft EIS, but these are among the most serious. The glaring environmental and proliferation risks of this proposal to produce more PU-238 are enough to stop it dead right now. I say, cancel the project, we're doing a miserable job as it is, trying to clean up the mess already created for us by the past production of nuclear materials. The last thing we need is a bigger mess – one created by a process that has no scientific, medical, social, or environmental justification at all. If you must flog this deadly proposal, then rewrite the draft PEIS and answer the questions raised – honestly.

Sincerely,

Margaret Macdonald Stewart
Box 2404, Ketchum, ID 83340

I reject this Draft PEIS
as inadequate.

1708-4

1708-5

1708-6

1708-1

Response to Commentor No. 1708

- 1708-2:** The costs and nuclear nonproliferation impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such ancillary documents need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed these documents to more than 730 interested parties on August 24 and September 8, 2000, respectively. Both reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided summaries of the Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment in Appendixes P and Q, respectively, in the Final NI PEIS.
- 1708-3:** Sections 4.3.1.1.13; 4.3.2.1.13; 4.3.3.1.13; and 4.4.3.1.13 were revised to clarify the waste management approach for waste resulting from processing of target materials for plutonium-238 production. The use of proposed alternative facilities associated with processing of neptunium-237 targets would have no impact on schedules or available funding for high-level radioactive waste programs at either Hanford or INEEL. At INEEL, the tanks would not be used although certain facilities at the Idaho Nuclear Technology Engineering Center (INTEC) would be used to treat the wastes resulting from processing the irradiated targets. These are reliable systems that would process a maximum of 1,050 cubic meters of low-level radioactive waste over the 35-year nuclear infrastructure operational period. The higher activity waste would be treated as a solid form via a stand-alone vitrification system, separate from any tank waste treatment system. At Hanford, the existing high-level radioactive waste facilities would not be used, and as analyzed in the PEIS, no existing or planned high level radioactive waste facilities would be used to treat the wastes resulting from processing the irradiated targets.
- 1708-4:** The technology that would be used to produce plutonium-238, medical and industrial radioisotopes uses chemical separation from targets whereas reprocessing chemically separates weapons grade plutonium-239 from spent nuclear fuel. As discussed in the Nuclear

***Commentor No. 1708: Margaret Macdonald Stewart
(Cont'd)***

Response to Commentor No. 1708

Infrastructure Nonproliferation Impact Assessment (September 2000) use of this technology to produce plutonium-238 from irradiated targets will not create a nonproliferation threat. DOE is committed to full compliance with and support of the U.S. policy prohibiting reprocessing. The proposed action in this EIS represents an example to the world of the U.S. supporting and enhancing civilian use of nuclear energy such as: medical radioisotopes, industrial radioisotopes, and radioisotopes for deep space exploration.

1708-5: A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

The United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

***Commentor No. 1708: Margaret Macdonald Stewart
(Cont'd)***

Response to Commentor No. 1708

1708-6: The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost-efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

DOE has taken the Expert Panel and NERAC report recommendations under consideration in developing the range of alternatives evaluated in the NI PEIS. These reports were made available to the public at the NI PEIS public information centers and on the Internet at www.nuclear.gov.

Dear Ms. Brown,

I am writing to support the re-start of the Fast Flux Test Facility (FFTF) in Washington state, specifically based on the benefits it offers to cancer patients.

As you know, research using medical isotopes is showing great promise in developing treatments for childhood cancers. In fact, my daughter, Caroline, who was diagnosed with neuroblastoma in 1998, participated in a clinical trial at Memorial Sloan Kettering Cancer Center in which medical isotopes were used. Unfortunately, my daughter succumbed to her disease just more than one year ago, but we simply must do all we can to ensure that the cutting edge research underway to help children like Caroline continues. More than 12,000 children are diagnosed with cancer annually, and some 2,300 will lose their lives to this disease in the year 2000. This is unacceptable. The key to survival for these innocent victims is research. The demand for medical isotopes is increasing. It is my understanding that the FFTF has the capacity to produce two to three times more medical isotopes than all other reactors in the nation combined. Re-starting the FFTF would stabilize the supply of medical isotopes to help ensure continued progress toward successful treatment of cancer and other diseases.

I hope the Department of Energy will consider the great potential to be found in medical isotopes for the thousands of children and their families who are in the fight for their lives. Thank you for your consideration of my views. If I can provide additional information regarding my comments, please do not hesitate to let me know.

Sincerely,

DEBORAH PRYCE

Response to Commentor No. 1709

1709-1

1709-1:

DOE notes the commentor's support for Alternative 1, Restart FFTF. Under the proposed action and consistent with its mandates under the Atomic Energy Act, DOE would enhance its existing nuclear facility infrastructure to, among other things, more effectively support production of radioisotopes for medical applications and research. While restarting FFTF would result in greater availability of medical isotopes, it would not produce two to three times more medical isotopes than all other reactors in the nation combined, as stated by the commentor. For nearly 50 years, DOE's use of its unique technologies and capabilities to develop isotopes for civilian purposes has enabled the widespread application of medical isotopes seen today.

1709-1

Secretary Bill Richardson
Department of Energy
1000 Independence Avenue, SW
Room 7A-257
Washington, DC 20585-0117

Subject: Fast Flux Test Facility

Dear Secretary Richardson:

We have reviewed the Draft Programmatic Environmental Impact Statement for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the United States, including the Role of the Fast Flux Test Facility. Based on this review and in consideration of the NERAC Long Term Research and Development Plan and the Corradini Report entitled, "The Future of University Nuclear Engineering Programs and University Research & Training Reactors", we conclude that the FFTF should be restarted as soon as possible.

In our letter of August 18, 1999, the American Nuclear Society's position on the restart of FFTF was conditional on the basis that the funding not affect other future-looking nuclear energy programs. We also questioned the restart of FFTF since there was not an integrated national research and development strategy in which its mission could be defined. Additionally, we had concerns that the apparent justification for restart, as identified in the PNNL report, was the production of isotopes for which the economic basis was questionable.

In the intervening year several important events took place. The United States has lost another major research reactor facility due to the untimely shutdown of the Brookhaven High Flux Beam Reactor. It is also expected that DOE will shutdown the Brookhaven medical research reactor. This continual erosion of the U.S. research reactor capability severely damages our ability to develop technologies of the future and maintain the infrastructure necessary for U.S. leadership in nuclear science and technology. The NERAC long term R&D plan has been issued as has the Corradini Report which identifies the important research work that needs to be done and how the national laboratories can interface with universities to renew the interest of students in this field.

Based on the draft EIS, the Fast Flux Test Facility is the single facility that already can meet the needs of PU238 production for the space program, provide many isotopes for medical and industrial application, and be used for basic research for both fast and thermal flux applications. Although facility modifications would be required to perform these new tasks, the facility has unique attributes that allow such modifications without significant impact in performance. The other attraction of the utilization of the FFTF is that it already exists and therefore will not negatively impact the research missions of other facilities that are identified in the EIS.

Leaders in the development, dissemination and application of nuclear science and technology to benefit humanity

Response to Commentor No. 1710

|| 1710-1

1710-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

|| 1710-1

Commentor No. 1710: James A. Lake/Andrew C. Kadak American Nuclear Society (Cont'd)

Although costs were not identified in the EIS for the FFTF or other alternatives, the previous PNL report identifies costs for restoring the FFTF to service. DOE has promised that these funds will not be diverted from other DOE missions, which is an important concern of ANS and other commentors regarding restart. ANS believes the restart of the FFTF, when compared to other options for satisfying the many missions defined, will be the low cost alternative. This is based on the assumption that building any new facility is, in general, more expensive than modifying an existing facility for specific purposes.

ANS also believes the Hanford reservation has other unique assets that could be used in support of the DOE mission of research and development and isotope production which provides an added incentive to restart. As the DOE begins to look to the long term future, nuclear technologies for sustainable energy production will undoubtedly focus on fast spectrum reactors. The FFTF is the only U.S. facility that has the capability to perform such large scale research should the national political and technical consensus conclude that the future sustainable technology require such reactors.

For all these reasons, the American Nuclear Society supports restart of the Fast Flux Test Facility.

Sincerely yours,

**City of Oak Ridge Environmental Quality Advisory Board (EQAB) Comments on
DOE Comments on DOE Draft Programmatic Environmental Impact Statement (PEIS) for
Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production
Missions in the United States, Including the Role of the Fast Flux Test Facility (FFTF) [DOE/EIS-
0310D, July 2000]**

Due to the length and complexity of the PEIS, EQAB was unable to complete a detailed review of the technical merits of this EIS and the proposed action. Instead, EQAB has chosen to offer only general comments.

EQAB is aware that several other organizations have publicly alleged inaccuracies in the stated *Purpose and Need for Agency Action*. These issues are not addressed in this review.

1. This PEIS appears to be unnecessarily lengthy and complex. Many tables, charts, and much information is many-times redundant. This makes the document overly large and difficult to read. Additionally, a large amount of irrelevant, albeit interesting, information has been included. For instance, the specific location of a target in a reactor is not information germane to the topic of the EIS.
2. The complexity could also be decreased by characterizing some of the options listed under different alternatives that are essentially the same. Addressing the common issues – transportation, irradiation, processing – individually instead of including them in each of the potential combinations would have saved the reader time and effort. The time to assess the options in combination is in the epidemiological charts and comparative discussion.
3. The epidemiological assumptions and assertions are not always clear, nor are they concisely stated. Often, these assumptions were in a different location in the document. There was not always a clear association between the area demographics and the accident risk analyses. The epidemiological summaries do not appear to be consistent with some of the individual analyses.
4. Cost is a major factor in a program of this scope. It is recommended that estimated cost be presented in the PEIS rather than in an ancillary document.

EQAB appreciates the opportunity to comment on this document. However, we recommend that a longer comment period be automatically provided for any document that is longer than a pre-determined number of pages (for example, 500 pages).

These concerns notwithstanding, EQAB feels that the work described in the PEIS can be safely performed on the ORR.

1711-1

1711-2

1711-3

1711-4

1711-5

Response to Commentor No. 1711

1711-1:

The size and complexity of the NI PEIS is attributable to the complexity of the proposed action and the range of reasonable alternatives. DOE included illustrative material, such as target locations within reactors, to help readers visualize and understand the text. Although some options within an alternative are similar, they are not identical and would result in different environmental impacts. Options under the alternatives are required to present the full range of environmental impacts for each alternative. Redundancy was reduced by referencing earlier sections of the NI PEIS where the environmental evaluation yielded similar results. In addition, extraneous information has been eliminated and some sections of the PEIS have been reorganized to improve readability.

1711-2:

Epidemiological assumptions are stated in Appendixes H and I of Volume 2. As a convenience for the reader, shorter versions of these assumptions are stated in Sections 4.2-4.6 of Volume 1. In the Final NI PEIS, text was added to Appendix I describing the meteorological data, population data, and evacuation information used for each facility evaluation.

1711-3:

DOE provided a summary of the Cost Report in Appendix P of the Final NI PEIS.

1711-4:

DOE notes the commentor's suggestion.

1711-5:

DOE notes the commentor's support for those alternatives and options that involve the use of facilities on the ORR.

Dear Secretary Richardson:

I have talked at length with hundreds of cancer survivors and families of cancer victims, too many who were friends or members of my own or my spouse's family.

My company, RKKL, has discussed the medical isotopes situation with senior executives and technology managers of over forty (virtually all) major radiopharmaceutical and medical isotopes companies in the United States.

I have met with and discussed the medical isotopes situation with over 20 of the 54 senior staffers and members of the appropriation committees in the House and Senate responsible for funding the National Institutes of Health and the Department of Energy and with OMB.

I have discussed the medical isotopes situation with dozens of the leading physicians and scientists in the world who are at the cutting edge of medical science's interface with terminal diseases.

One of our medical isotopes non-profits teamed with the prestigious Society of Nuclear Medicine and its thousands of board-certified nuclear medicine physicians and technologists seeking more federal support for nuclear medicine/medical isotopes R&D.

I have given countless talks and seminars to U.S. citizens who are concerned about how medical isotopes might help them, their families and their friends deal with dreaded diseases such as cancer, rheumatoid arthritis and coronary artery disease. The most recent of these talks was to a large group living and working in our state's capitol.

2/3 9/18/2000

Based on the above interactions and inputs, I request that you consider the following in your decision making process:

1) The promise and potential of medical isotopes, and the positive impacts they can have on the quality, effectiveness and cost of health care in the U.S., are rapidly becoming more apparent and better understood by patients, practitioners and politicians across the U.S. The problems associated with the lack of a reliable U.S. supply of medical isotopes are becoming more apparent to these same groups. Support for restarting FFTF is widespread and increasing.

2) A critical need exists now for a highly reliable U.S. source of reactor-produced medical isotopes with the capability to produce large, pharmaceutical-quantity amounts of many different types of high specific activity medical isotopes. This large production-volume capability must be a U.S. government source and is vital now for the following reasons:

- The early and high-risk R&D investments necessary for major health breakthroughs involving medical isotopes will not be made without an assured domestic supply of large quantities of the same isotopes proven effective in clinical research. Both private sector and government R&D and clinical trial programs are and will continue to be severely constrained without an assured, highly reliable, large U.S. reactor capable of producing large amounts of many varieties of high-quality medical isotopes.
 - The private sector is constrained without a predictable path and assured capability to transition from R&D to full-scale production of radiopharmaceuticals. Without an assured supply, the substantial costs, time and other risks inherent in bringing a radiopharmaceutical to market are unacceptable.
 - Government R&D is constrained because the research community's motivation/capability is frequently stifled by the high cost and/or unavailability of medical isotopes or the concern that there is no path forward to market even if their research is promising.
- The private radiopharmaceutical sector in the U.S. will buy irradiation time and space in a government-owned/operated reactor but they will not own/operate reactors themselves. They believe that the supply of reactor-produced medical isotopes, especially for the large quantities needed for therapy, is a critical role that the U.S. government must fulfill, a role mandated by the U.S. Atomic Energy Act. Note there is not a government-competition-with-private-sector issue here. The issue is just the opposite. The need is for a reliable government capability to produce for a fee the large quantities of medical isotopes that the private sector will then convert into commercial radiopharmaceuticals.

1712-1

1712-2

Response to Commentor No. 1712

1712-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

1712-2: DOE notes the commentor's support for U.S. reactor-produced medical isotopes.

Commentor No. 1712: Ray K. Robinson (Cont'd)

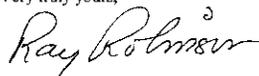

Sep 18 00 01:23p Ray K. Robinson, Inc. 509-627-6141 P.3

3/3 9/18/2006

3) FFTF is the newest, largest and best reactor the U.S. government has in its infrastructure for long-term production of large quantities of medical isotopes. In addition, FFTF can make high specific-activity isotopes and has the flexibility to tailor its irradiation characteristics to produce the wide variety of isotopes needed. Its unique characteristics make it the ideal candidate to produce some research isotopes. In conjunction with other federal civilian missions, FFTF can be cost-competitive in producing small amounts of many different research isotopes.

It is essential that FFTF be restarted. Please do not let the U.S. lose this tremendously valuable asset. Many of us believe FFTF's actual and potential benefits far outweigh its costs and potential risks. In light of our aging U.S. population and rising health care costs, and our aging nuclear infrastructure, FFTF could well be one of the U.S.'s best health insurance policies.

Very truly yours,

Ray K. Robinson, Co-Founder and
Volunteer Board Member (Co-Chair)

Subject: Citizens' Advisory Panel Comments on the Draft Programmatic Environmental Impact Statement (PEIS) for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the United States, Including the Role of the Fast Flux Test Facility (FFTF) [DOE/EIS-0310D, July 2000]

Dear Ms. Brown:

The Citizens' Advisory Panel (CAP) of the Oak Ridge Reservation (ORR) Local Oversight Committee, Inc., (LOC) is pleased to submit comments on the subject draft PEIS. However, we were hampered in evaluating the PEIS due to the non-simultaneous release of the related documents, *Nuclear Infrastructure Nonproliferation Impact Assessment (DOE/NE-0119)* and *Cost Report for Alternatives*.

The need for the federal action(s) covered by this PEIS is weak. The Office of Nuclear Energy, Science and Technology (NE) seems to be paving the way to restart the FFTF through the use of overly optimistic assumptions for growth in demand for medical isotopes and dismissal of realistic alternatives for their production. The projections of isotope demand should include bounding high and low estimates. The other two purposes in the PEIS, plutonium-238 production for space missions and nuclear energy research and development for civilian applications, can be easily accomplished through the use of existing facilities. Additionally, recent decisions by NE are inconsistent with the stated concerns about regarding isotope and Pu-238 production (see Comment 2 in attached detailed comments).

The CAP opposes the No Action Alternative based on the non-proliferation issues that the current course of action raises. Additionally, the cost for indefinitely maintaining FFTF in standby mode is unacceptable. Neither the No Action Alternative nor Alternative 5 address the national needs laid out in the PEIS.

Response to Commentor No. 1713

1713-1: CEQ (40 CFR 1500 et seq.) and DOE (10 CFR Part 1021) implementation regulations do not require inclusion of cost and nonproliferation studies in an environmental impact statement. The basic purpose of the NI PEIS is to describe the alternatives under consideration for implementation (Section 2.5 of Volume 1) and the environmental impacts that would occur if these alternatives were implemented (Chapter 4 of Volume 1). Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. The associated cost report and nonproliferation report were made available to the public on August 24, 2000, and September 8, 2000, respectively. DOE mailed this document to approximately 730 interested parties, and these reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in public reading rooms.

1713-2: DOE notes the commentor's views. Consistent with its mandates under the Atomic Energy Act, DOE is proposing this expansion for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. As opposed to the commentor's assertion, these objectives are in no way inconsistent with recent decisions by DOE's Office of Nuclear Energy, Science, and Technology (NE).

DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert committees. In 1998, an Expert Panel convened to forecast future demand for medical isotopes estimated that the expected growth rate of medical isotope use during the next 20 years will range between 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by DOE's Nuclear

Commentor No. 1713: Norman A. Mulvenon (Cont'd)
Local Oversight Committee, Inc.

SEP-18-2000 11:03 FROM LOCAL OVERSIGHT COMMITTEE TO 13014280145 P.03

C. Brown
09/18/00
Page 2 of 3

The CAP opposes the restart of FFTF (Alternative 1) on the basis of the huge cost likely to be incurred, when significantly less funding would be required to upgrade existing facilities at Oak Ridge National Laboratory (ORNL) and Idaho National Engineering and Environmental Laboratory. These upgraded facilities could then easily fulfill realistic projections of national demand for medical isotopes. A major deficiency of the PEIS is that existing facilities at INEEL and ORNL are not considered for the medical isotope production mission; these options should be considered in the final PEIS.

1713-6

As noted in the Summary document, stakeholders in Tennessee and Idaho are supportive of bringing the proposed work to their respective facilities, while many stakeholders in the Pacific Northwest are opposed to restarting the FFTF. From an equity standpoint, DOE should seriously consider upgrading facilities at ORNL and INEEL in lieu of the FFTF restart at Hanford.

1713-7

Of the alternatives presented, the CAP prefers Alternative 2, Options 1 and 7, and recommends that this alternative be expanded to include upgrading ATR and/or HFIR for isotope production. This alternative is to use only existing operational facilities, and these options are for use of ATR and/or HFIR for the irradiation facility and REDC for the Pu-238 storage and target fabrication and processing facilities. These are also advantageous with respect to non-proliferation issues as well as the cost.

1713-8

The CAP notes that several options involve restart of currently non-operational facilities for target fabrication and processing. Restart of either the Fluorine Dissolution Process Facility (FDPF) or Fuels and Materials Examination Facility (FMEF) would involve a significant degree of technical risk, unlike utilization of the currently operational facilities.

The CAP would support Alternative 4, Construct New Research Reactor, as a long-term solution, should projections of medical isotope demand be met. However, Alternative 3, Construct New Accelerator(s), is unacceptable due to the huge expense and relatively limited types of isotopes that an accelerator is capable of producing.

1713-9

The CAP is supportive of expanding ORNL's mission, consistent with sound scientific and policy decisions. ORNL has had long historical involvement in the production and distribution of medical isotopes, a mission that was cut back due to concerns about competing with the private sector. Now ORNL's historic strength has enabled Oak Ridge to leverage such production into related industrial development. The first tenant of Horizon Center, the new industrial park on DOE land leased to the Community Reuse Organization of East Tennessee, is Theragenics, a company that formulates medical isotope implants. Additionally, the CAP supports bringing a new mission, that of Pu-238 production, to ORNL.

The LOC is a non-profit regional organization funded by the State of Tennessee and established to provide local government and citizen input into the environmental management and operation of the DOE's ORR. The Board of Directors of the LOC is composed of the elected and appointed officials of the seven surrounding counties and the City of Oak Ridge, and the Chair of the CAP. The CAP has up to 20 members with

Response to Commentor No. 1713

Energy Research Advisory Committee (NERAC), established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. The growth projections were also adopted by DOE as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. The NI PEIS analyses assume growth at the high-end of this range in order to bound the potential environmental impacts that could result from implementing the proposed action. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings.

For nearly 50 years, DOE's use of its unique technologies and capabilities to develop isotopes for civilian purposes has enabled the widespread application of medical isotopes seen today. While its market share is a small fraction of total world radioisotope production, DOE remains the key provider for a large number of isotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large enough quantities to make their production financially attractive to private industry.

The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum 99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. Further, supplies of many research isotopes are not readily available from existing foreign or domestic sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed. As such, reliance on these other sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their

Response to Commentor No. 1713

use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Although research to identify other potential fuel sources to support these space exploration missions has been conducted, no viable alternative to using plutonium-238 has been established. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost.

Clean, safe, reliable nuclear power continue as a viable component of the United States' energy portfolio. In recognition of this need, the Administration and Congress have initiated nuclear energy research and development programs to address potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) and to ensure that current nuclear power plants can continue to deliver adequate and affordable energy supplies. An enhanced DOE nuclear facility infrastructure is required to support such nuclear energy research and development for civilian applications. The Nuclear Energy Research Advisory Committee (NERAC) Subcommittee on Long-term Planning for Nuclear Energy Research, an independent expert panel established by DOE, has set forth a recommended 20-year research and development plan to guide DOE's nuclear energy programs in areas of material research, nuclear fuel, and reactor technology development. This plan stresses the need for DOE facilities to sustain the nuclear energy research mission in the years ahead. Such nuclear research and development initiatives requiring an enhanced DOE nuclear facility infrastructure fall into the three basic categories of materials research, nuclear fuel research, and advanced reactor development.

1713-3: The commentor's opposition to the no action alternative based on nonproliferation issues is noted.

Local Oversight Committee, Inc.**

SEP-18-2000 11:04 FROM LOCAL OVERSIGHT COMMITTEE TO 13014280145 P.05

Citizens' Advisory Panel (CAP) Comments on the *Draft Programmatic Environmental Impact Statement (PEIS) for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the United States, Including the Role of the Fast Flux Test Facility (FFTF)* [DOE/EIS-0310D, July 2000]

1. The PEIS uses as part of the justification for need for agency action the shutdown of the High Flux Beam Reactor at Brookhaven National Laboratory and the Cyclotron Facility at Oak Ridge National Laboratory (ORNL). The former facility was shut down due to political pressure over tritium contamination of groundwater, an issue unrelated to the age or safety of the reactor. ORNL's Isochronous Cyclotron was shut down due to mission changes for the Hollifield Radioactive Ion Beam Facility that made it unnecessary. Neither of the facilities produced isotopes in any significant quantity, nor were they used for nuclear energy research. It is unclear why they are mentioned in this document.
2. The PEIS assumes a projected large increase in demand for medical isotopes, which effectively forces the decision to restart the FFTF. This assumption is not supported by the following information obtained from senior personnel in the Research Reactors Division at ORNL:
 - The High Flux Isotope Reactor (HFIR) at ORNL projects isotope usage to plan its own medical isotope production schedule. HFIR's projections do not anticipate significant growth in demand.
 - Other professional nuclear-related organizations such as the American Nuclear Society don't project a growth rate for medical isotope demand nearly as large as DOE has suggested.
 - The United States currently subsidizes the cost of isotope production.
 - Russia produces and sells many isotopes much cheaper than the United States can. The availability of cheap Russian isotopes has significantly reduced current demand for U.S.-produced isotopes. Indeed, during the same period of time when NE was planning and preparing this PEIS for expansion of U.S. isotope production capacity, NE decided to end production of stable isotopes at the Beta 3 calutron facility at Oak Ridge's Y-12 plant due to low demand, and scheduled the facility for transfer to Environmental Management for decontamination and decommissioning. The stable isotopes produced by the Beta 3 facility are used as sources for other medical and industrial isotopes; there is no guarantee that Russia will keep prices low or even continue to produce them.
 - DOE refused a request by the Advanced Test Reactor (ATR) at Idaho National Engineering and Environmental Laboratory (INEEL) for funding to upgrade the facility for medical isotope production by adding a "rabbit" system that would allow samples to be inserted and retrieved while the reactor is running.
3. The alternatives under consideration reject the obvious and most cost-effective option, that of upgrading existing facilities such as HFIR in Oak Ridge and ATR at INEEL. As mentioned under comment 2 above, ATR can be modified to produce short-lived medical isotopes by addition of a rabbit system. HFIR can be upgraded to

1713-10

1713-11

1713-7

Response to Commentor No. 1713

- 1713-4:** DOE notes the commentor's opinion. As stated in the Notice of Intent (64 FR 50064), one of the purposes of the proposed action is to determine the future role of FFTF.
- 1713-5:** DOE notes the commentor's statement. The No Action Alternative is required by CEQ regulations (40 CFR Section 1502.14 (d)). The No Action Alternative is intended to provide a benchmark that enables the decision-maker to better evaluate the environmental impacts of the action alternatives; it need not meet the stated purpose and need of the PEIS. Alternative 5 was added to the analysis as a result of scoping comments provided by the public.
- 1713-6:** As stated in Section 2.5.3 of Volume 1 of the NI PEIS, the currently operating DOE reactors, HFIR and ATR, cannot fully meet the projected long-term need for medical isotope production and nuclear research and development, with or without the plutonium-238 production mission. The Final NI PEIS, Section 2.6.1, has been revised to discuss upgrades at HFIR and ATR that would increase their isotope production capability. Facility modifications such as the installation of rapid radioisotope retrieval systems and power upgrades at both HFIR and ATR would enhance their ability to produce isotopes. This enhancement, however, would only delay the point in time at which the United States' reactor isotope production capacity is reached.
- 1713-7:** DOE acknowledges the commentor's view that the stakeholders in Tennessee and Idaho are supportive of bringing the medical isotope production work to their facilities (ORNL and INEEL) and that many stakeholders in the Pacific Northwest are opposed to the restart of FFTF. As discussed in the Final NI PEIS, Section 2.6.1, facility modifications such as the installation of rapid radioisotope retrieval systems and power upgrades at both HFIR, located at ORNL, and ATR, located at INEEL, would enhance their ability to produce isotopes within the limitations imposed by other missions such as those of the DOE Office of Naval Reactors at ATR. This enhancement at both HFIR and ATR, however, would not be adequate to meet the future demand for isotope production.
- 1713-8:** DOE notes the comment. DOE considered and dismissed upgrading ATR and HFIR for isotope production. Refer to discussions in Volume 1, Section 2.6.1. The technical risks for restart of FDPF and FMEF are not evaluated in the NI PEIS. DOE has determined the technical risks for the restart of these facilities are acceptable. The

Commentor No. 1713: Norman A. Mulvenon (Cont'd)
Local Oversight Committee, Inc.

SEP-18-2000 11:05 FROM LOCAL OVERSIGHT COMMITTEE TO 13014280145 P.06

its full design power of 100 megawatts more easily and quickly than stated in the PEIS. The primary requirements for upgrading HFIR involve paperwork changes to procedures and safety documentation. HFIR management estimates the upgrade could be accomplished with less than a month's downtime, comparable to current 7 to 10 day outages, which would have a minimal impact on its science mission.

4. The cost of restarting the FTFF is likely to be far in excess of that projected. The FTFF was built for a single mission and is costing about \$50 million per year to keep in standby. Its reactors have been in standby mode for ten years and will cost a great deal to bring up to current standards. Experts in the Research Reactors Division at ORNL estimate that \$250 million to \$300 million will be required to upgrade the equipment and safety documentation at FTFF.
5. A technical problem that has not been adequately considered is that although the MOX fuel required by the FTFF can be obtained free from Germany, there is no U.S. plant that can refabricate this fuel into elements that fit FTFF.
6. Regarding the Neptunium-237 processing to create Plutonium-238 for space mission fuel—ORNL has an appropriate technology to accomplish this and would be a logical location for this mission. HFIR can irradiate sufficient Np-237 to produce 40% of the amount needed annually, and the adjoining facility at Radiochemical Engineering Development Center is capable of both the target fabrication and chemical processing required for separation of the Pu-238. ATR is capable of producing up to 5 kg of Pu-238 annually. A combined alternative with both locations irradiating Np-237 would satisfy projected national needs.
7. With respect to the materials irradiation mission, the following comments apply:
 - There are currently eight sites available for this purpose at the HFIR and several more at the ATR. Currently most of these irradiation sites are not utilized at all or are only partially utilized.
 - Since almost all current and future power reactors being discussed for use in the United States have a thermal spectrum, the Fast Flux Test Facility, which uses a fast neutron spectrum, is not a suitable facility for testing materials for use in these reactors.

Response to Commentor No. 1713

risks of restarting non-operational facilities are addressed as cost, schedule, and technical assurance uncertainties during the Record of Decision process.

1713-9: DOE notes the comment.

1713-10: DOE notes the commentor's concern, and has modified Section 1.1 of Volume 1. The High Flux Beam Reactor at BNL and the Cyclotron Facility at ORNL are identified in this section to simply highlight recent examples of lost DOE infrastructure, as both facilities had produced some isotopes in the past.

1713-11: The NI PEIS is a programmatic document that looks at the nuclear infrastructure across the DOE complex and addresses national needs for medical isotope production. DOE realizes that the prediction of precise future needs of particular isotopes is very difficult. Because of this difficulty, DOE has sought independent analysis of trends in the use of medical radioisotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it has established two expert committees. The first, a thirteen-member Expert Panel convened in 1998 to forecast future demand for medical isotopes, included academicians from leading medical universities and schools of public health, and professional affiliations ranging from the National Cancer Institute to manufacturers of radiopharmaceuticals. The second consists of a subcommittee of DOE's Nuclear Energy Research Advisory Committee (NERAC), established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. The members of this Subcommittee were selected based upon their expertise and experience in the production, processing, distribution, and application of stable and radioactive isotopes in the biological and physical sciences, and in medicine. The members included basic and clinical scientists, administrators, and users of isotopes from academia, industry, and the federal government.

The Expert Panel estimated that the expected growth rate of medical isotope use during the next 20 years will range between 7 to 14 percent per year for therapeutic applications and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by the NERAC Subcommittee, and adopted by DOE as a planning tool for evaluating the potential capability of the existing

Commentor No. 1713: Norman A. Mulvenon (Cont'd)
Local Oversight Committee, Inc.

Response to Commentor No. 1713

nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings.

For nearly 50 years, DOE's use of its unique technologies and capabilities to develop isotopes for civilian purposes has enabled the widespread application of medical isotopes seen today. While its market share is a small fraction of total world radioisotope production, DOE remains the key provider for a large number of radioisotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large enough quantities to make their production financially attractive to private industry.

The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, supplies of many research isotopes are not readily available from existing domestic or foreign sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed. Under the NI PEIS proposed action and consistent with its mandates under the Atomic Energy Act, DOE would enhance its existing nuclear facility infrastructure to, among other things, more effectively support production of radioisotopes for medical applications and research.

The commentor stated that the Beta 3 calutron facility at Oak Ridge's Y-12 plant is being transferred to Environmental Management because there is a low demand for stable isotopes. It is true that NE decided to end production of stable isotopes at the Beta calutron facility. However, the calutron facility does not produce radioisotopes which is the mission that is addressed in the NI PEIS. Stable isotope production is not included in the NI PEIS.

The commentor's concerns about upgrading the Advanced Test Reactor (ATR) by adding a "rabbit" system are currently being addressed at INEEL. INEEL has privatized the production of medical and industrial isotopes through contracting with a commercial entity. International Isotopes Idaho, Inc. (I4) was selected in October 1996 as the commercial business for conducting these business

Commentor No. 1713: Norman A. Mulvenon (Cont'd)
Local Oversight Committee, Inc.

Response to Commentor No. 1713

operations. I4 specializes in producing isotope targets for irradiation in ATR and processing and distributing commercial-grade isotopes to its customers. Incremental investments have been identified for ATR that would make it a more versatile and capable reactor for isotope production. I4 and another commercial company are in the discussion phase of investing in ATR to install an isotope shuttle (rabbit) system for the production of short-lived radioisotopes. Although INEEL cannot justify this upgrade with government funds, it supports the commercial investment and venture. Many of the short-lived radioisotopes that would be produced by this system are expected to be in growing demand for various cancer therapies.

In response to the commentor's statement that HFIR's projections do not anticipate significant growth, HFIR's main mission is neutron scattering research, not radioisotope production. However, a "rabbit system" is being installed at HFIR, but is privately funded.

- 1713-12:** The cost of maintaining FFTF in standby was estimated in the cost report to be \$40 million per year in 1999 dollars. Total modification/construction and startup costs for restarting FFTF were estimated to be \$314 million in 1999 dollars. See also Response to Comment Number 1713-1 above.
- 1713-13:** As stated in Section 2.3.1.1.3 of Volume 1 of the PEIS, the German MOX fuel would be reconfigured into assemblies suitable for irradiation at FFTF before shipment to the United States.
- 1713-14:** DOE notes the commentor's support for the use of facilities at ORNL (HFIR and REDC) and INEEL (ATR) for the production of plutonium-238, that is, Option 7 of Alternative 2, Use Only Existing Operational Facilities.
- 1713-15:** The available irradiation sites in ATR and HFIR are factors that will be considered in the DOE decision making process. It should be noted that ATR and HFIR have limited available capacity due to their current mission commitments. For this reason, they were limited to plutonium-238 production. While it is true that current and future power reactors in the United States have a core thermal neutron spectrum, a significant fast neutron flux is also generated in these reactors. Over time, this fast neutron flux affects the material properties of reactor vessel internal components and the reactor

Commentor No. 1713: Norman A. Mulvenon (Cont'd)
Local Oversight Committee, Inc.

Response to Commentor No. 1713

vessel itself. A fast flux nuclear reactor like FFTF can simulate the equivalent fast neutron fluence in a nuclear power plant from 40 to 60 years of operation in a much shorter time period of FFTF operation.

Ms. Colette E. Brown
NE-50, Office of Nuclear Science
Energy and Technology
19901 Germantown Road
Germantown, MD 20874

Dear Ms. Brown:

This letter is in response to a request for input regarding the restart of the Fast Flux Test Facility (FFTF) located at Hanford in southeastern Washington.

We strongly advocate the restart of FFTF. There are many arguments in favor of this, among them being the ability of the reactor to produce plutonium 238 for use as an electrical power source in the NASA deep space program and the use of FFTF for important nuclear fuels and materials research programs which will advance civilian power generation and other applications. We could also mention the jobs FFTF operation will generate in the Tri-Cities economy. FFTF has also been used to study breeder reactor technology. Breeder reactors make their own fuel and that is a technology we may eventually need very badly in the coming years of fossil fuel shortages, etc.

But by far and away, the most important reason to restart FFTF is its capability of making 60 or more different medical isotopes which are absolutely crucial for stopping or slowing the progress of many important types of cancer, for diagnosing and detecting heart disease and blood flow problems (especially in premature infants), for detecting osteoporosis, for brain imaging and treatment of schizophrenia and dementia, and for relieving pain and even some kinds of arthritis. There is a national urgency involved because specific isotopes are used as "magic bullets" to target very specific types of illness and the supply of these isotopes doesn't come close to meeting the need. Treatment with these isotopes is called "radioimmunotherapy". A monoclonal antibody is attached to the radioisotope and the combination is then directed at a particular antigen or cancer cell. This is much easier on the patient because the cancer cells are selectively destroyed without causing the damage to healthy surrounding tissue that is usually seen with conventional radiation therapy. There are fewer side effects and cancers, which do not lend themselves to a surgical solution (like cancers of the liver and pancreas), can be treated in this manner.

The National Association of Cancer Patients has said "One thousand five hundred cancer patients die EVERY DAY in this country. This is the equivalent of three fully loaded Boeing 747s crashing to the earth every single day, killing every one on board." "Medical isotopes could be a therapy for an estimated one million of the 1.3 million Americans who will be diagnosed with cancer this year, and who could benefit from this kinder, gentler treatment." Cancer patients everywhere are being refused treatment because the isotopes are back-ordered. As Geral De Nardo, M.D., Professor, University of California at Davis School of Medicine, has said, "It becomes impossible to look a patient in the eye when unsure whether the isotope would arrive and in sufficient amount."

PAPER

Response to Commentor No. 1714

1714-1

1714-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

**Commentor No. 1714: Lee Thornton and Karen Grant
Columbia Basin College (Cont'd)**

Last year there was an American Chemical Society Speaker Meeting in which Dr. Robert Schenter from PNNL gave a talk on medical isotopes and radiopharmaceutical applications. While we were not naive about some of these applications, we were astounded to see how many isotopes have been discovered and the diversity of illnesses for which they have been found to be effective. More are being discovered every day. But there are not enough available. FFTF is a unique facility which can generate many of these isotopes, some of which are not available from any other source. For this reason, Boston Children's Hospital, The National Association of Cancer Patients, and many other organizations and companies have called for the restart to FFTF. The operation of the reactor will not result in the generation of any significant amount of high-level waste. Only very small amounts of low-level waste that is easily treated will be generated. Beyond that, the reactor has been very carefully monitored according to strict NRC regulations and environmental standards.

In conclusion, we hope we have convinced you that FFTF should definitely be restarted as soon as possible and we appreciate your consideration of our input on this very important matter.

Sincerely,

Lee Thornton
President

Karen Grant
Interim Dean

Response to Commentor No. 1716

Draft PEIS Comment Form

The potential for a new and bright future is at hand for the Tri-City community and our United States if we focus on the FFTF and the distinct infrastructure of people, educational attainment, and direct benefits of Nuclear Medicine.

The Hanford Site is being cleaned up & the need for skilled workers will migrate to other regions within our country as in the past years of this project.

But the focus of a win-win can be obtained by re-deploying our area resources that in turn, make good business sense in utilizing this incredible National Asset.

Mike Steckline

dianaf@micron.net

September 4 2000.

Dear Ms. Brown,

Though I suspect that the voices of ordinary citizens go unheard and ignored in today's 'democracy', conscience obliges some of us continue to write our letters and voice our views in the faint hope that enough of us might one day make a tiny, miraculous difference.

My letter today concerns grave concern over the proposed use of Building 666 at the INEEL to produce unnecessary and highly dangerous Plutonium-238. Building 666 should be decommissioned in the least hazardous way possible and this plan should be abandoned.

Please use your influence to discourage this dangerous idea.

Yours sincerely,

Diana Fassino.

Response to Commentor No. 1717

1717-1

1717-1: DOE policy encourages effective public participation in its decision making process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

1717-2

1717-2: Building CPP-666 is divided into two parts, the Fuel Storage Facility and the Fluorinel Dissolution Process Facility (FDPF). The FDPF is under consideration in this PEIS for storage of neptunium-237 oxide, preparation of neptunium-237 targets, and separation of plutonium-238 from irradiated targets. DOE believes that this facility will meet, with further analysis and/or minor modifications, the criteria to safely conduct these processes.

Commentor No. 1718: Helen Wheeler Hastay

 Seattle WA 98101-9409

Att: Pamela Taylor

One bit of scientific information that I find unforgettable is, "like the fresh water Earth will soon have, it no longer!"

So why are the people and agencies who have the means to control the purity of our water so intent on depleting it the Columbia, one of the great rivers of the world?

The British company hired to clean up the mess left by the manipulation of plutonium during World War II, has polluted up and down river. Now billions of dollars poured and another waste disposal site. The Russians proposed to dump on more polluted materials will start up the first few months. It compounds the degradation already inflicted on this once beautiful land, its resources.

When our shore and waters were on the banks of the Columbia, pure water was there for drinking, swimming and boating. Freshwater shapies beach have been seen. To what cause? All the pure water flows into the ocean, never? The stunning water we find out where you consider that even when natural water is 19 ft. all day in sandy ocean.

North Washington's clean shoreline almost was once known to the best fruit orchards and vineyards in the state. They grew the golden apples, the big apples, pears, plums, cherries, apricots and grapes - many a variety of such. For them they were approved. But, still of which went to the banger, and that too against the law.

When ten people were swimming, the river, Newport, the 10th and the 11th, walked the river. God forbid, they were every products. I went to look at the destruction.

Sincerely yours
Helen Wheeler Hastay

1718-1

Response to Commentor No. 1718

1718-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford and the risk of contamination to the Columbia River. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. DOE intends to meet its tank waste cleanup commitments despite the departure of one contractor. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

No food or water restrictions are currently in place outside the Hanford Reservation as a result of Hanford activities.

Draft PEIS Comment Form

I support the selection of the FFTF as the preferred alternative to meet the pressing United States needs for research and medical isotopes.

1719-1

1719-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 1720: Jean MacGregor

Jean MacGregor
533 Olmstead Lane SW
Olympia, WA 98512

September 11, 2000

Colette E. Brown, NE-50,
US Dept. of Energy
19901 Germantown Rd.
Germantown, MD 20874

Dear Ms. Brown,

I am writing regarding the proposed restart of the Fast Flux Test Facility at the Hanford Nuclear Reservation. I would like to go on record supporting Option 5, "to permanently deactivate the FFTF with no new missions."

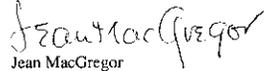

It strikes me that the financial investment by the federal government in this unneeded facility amounts to little more than a "jobs bill." If the federal government wants to pump more money into the Tri-Cities area of Washington State, it should fund additional clean-up, not another dangerous reactor of highly questionable need. It is widely known that Hanford is the most highly contaminated nuclear site in the western world – why not clean it up?!

Restarting FFTF would produce new high level radioactive waste streams. Permanently shutting down the FFTF is part of the 1989 Tri-Party Agreement between USDOE, EPA and WA Ecology – why go back on that to restart the FFTF? Just keeping the FFTF on hot standby for four years has cost over \$40 million per year, money deeply needed for clean-up.

Knowledgeable groups such as The Washington State Medical Association, WA Academy of Family Physicians and the Physicians for Social Responsibility/National have all passed resolutions opposing the restart of the FFTF. Who is the constituency who wants this FFTF and why? No compelling case can be made for the need for it, other than "jobs." Surely, the federal government can find pork barrel projects that are safer than the FFTF.

The legal mission of Hanford is and should continue be environmental clean-up. Any option besides Option 5 would represent a HUGE step backward.

Sincerely,

Jean MacGregor

1720-1

1720-2

1720-3

1720-2

1720-4

1720-2

Response to Commentor No. 1720

1720-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

1720-2: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in

Commentor No. 1720: Jean MacGregor (Cont'd)

Response to Commentor No. 1720

abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Public meetings were held on this formal milestone change.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

1720-3: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35 year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. High-level radioactive waste would not be generated from merely operating FFTF. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

1720-4: DOE notes the commentor's opinion that there is no need to restart FFTF. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research,

Commentor No. 1720: Jean MacGregor (Cont'd)

Response to Commentor No. 1720

and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action. Socioeconomic impacts associated with the restart of FFTF, including those related to jobs, are discussed in Section 4.3 of Volume 1.

Commentor No. 1721: Mary Susan Zotter

Response to Commentor No. 1721

Draft PEIS Comment Form

I am opposed to restart of the FFTF at Hanford because Hanford is a mess already & the worst toxic waste site in the Western Hemisphere. The US DOE must live up to its promise to shut FFTF for good and use funds saved on cleanup.

FFTF is not considered a viable, long-term source for medical research, radioisotopes, according to the Department's own medical advisory committee. There are other sources available. And NASA has no need to purchase Plutonium 238 for space missions, used to justify restarting FFTF.

Citizens of the Northwest have voiced their concerns about FFTF over & over and have made it clear that Hanford must be shut down and cleaned up!

1721-1

1721-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1721-2

1721-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

1721-3

1721-4

1721-2

1721-3: The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost-efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Commentor No. 1721: Mary Susan Zotter (Cont'd)

Response to Commentor No. 1721

1721-4: The May 22, 2000, correspondence from NASA to DOE identifies that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium 238 needed for large RTG may be maintained as a backup.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Commentor No. 1722: K. K. S. Pillay

Dr. Colette E. Brown
NE-50
Office of Nuclear Energy, Science and Technology
U.S. Department of Energy
19901 Germantown Road
Germantown, MD 20874

September 12, 2000

Dear Dr. Brown:

Subject: Draft NI PEIS

The Draft Programmatic Impact Statement for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production in the United States is a welcome sign. The issues discussed in this document have been the topics of public discussion for the past two decades and various Departments of DOE have conducted numerous studies that are collecting dust. Among the most recent are a report prepared by DOE/EM in 1999 (Nuclear Material Integration - Master Materials Management Plan) and another report to the U.S. Congress in June 2000 by the Secretary of Energy ("A Strategic Approach to Integrating the Long-Term Management of Nuclear Materials.") It is the ardent hope of many in the technical community that this PEIS does not suffer the indignities of all previous efforts to get DOE to move forward on issues identified in the title to the PEIS.

The DOE has rightly addressed in detail the need for isotopes for medical applications, which is most popular among the public and the problem that needs immediate attention. A judicious combination of alternatives 1 and 4 are sensible choices and are in the best interests of the nation. The restart of FFTF has significant importance to the future of nuclear science and technology in the U.S. and it would be the proper use of investments already made in FFTF and the adjacent "Secure Automated Fuel Fabrication Facility.. The construction of new accelerator facilities dedicated for isotope production at Los Alamos and Brookhaven National Laboratories are also appropriate measures to meet the demands of some special isotopes. However, reactor-produced isotopes are the bulk of isotopes used in the U.S. and immediate remedies are necessary to fill the growing needs in this area. This is where a proper combination of alternatives 1 and 4 becomes most desirable.

In addition to these facilities required for isotope production, the DOE should simultaneously initiate an effort to identify and preserve a number of valuable nuclear materials within the weapons complex that are identified as excess to national security. These include certain medical isotopes, a variety of sealed sources (used in metrology,) and high curie-content separated fission product sources. Specifically, it is essential to identify and store the following materials for future use: (1) aged purified natural thorium, (2) aged purified ²³³U, (3) aged highly enriched ²³⁵U, (4) ²²⁹Ra, (5) certain sealed sources and standards, (6) most of the high curie-content ¹³⁷Cs and ⁹⁰Sr.

Response to Commentor No. 1722

1722-1

1722-1: DOE notes the commentor's support for a combination of Alternative 1, Restart FFTF and Alternative 4, Construct New Research Reactor. As noted in Section 1.3 of Volume 1, DOE could choose to combine components of different alternatives in selecting the most appropriate strategy. The commentor should also note that if the Alternative 1 is selected in the Record of Decision, the Fuels and Materials Examination Facility (i.e., Secure Automated Fuel Fabrication Facility could also be used, depending on which option is selected. The FMEF could also be utilized for a number of other alternatives/options (see Table 2-3).

1722-2

1722-2: DOE notes the commentor's concern for identifying and preserving valuable nuclear materials for future use, although this issue is beyond the scope of this Nuclear Infrastructure PEIS. DOE recently made a decision to use a facility at ORNL to retain the uranium-233 inventory to be used for extraction of useful isotopes.

Commentor No. 1722: K. K. S. Pillay (Cont'd)

Dr. Colette E. Brown
NE-50

September 12, 2000

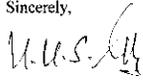

Page-2

Office of Nuclear Energy, Science and Technology

Another unmet need addressed in the PEIS is the need for a reliable source of ^{238}Pu . The need for ^{238}Pu as a reliable source of thermoelectric power for extended space missions and a variety of terrestrial applications are mentioned in the PEIS. This problem can be solved by creatively using two other isotopes available within the DOE complex— ^{237}Np and ^{241}Am —that are considered excess to national security. Both these isotopes can be readily converted into ^{238}Pu via neutron irradiation. FFTF or a new high-flux reactor facility are the ideal choices for meeting this national need. Relying on potential supplies from outside the U.S. is certainly not a good alternative or a defensible national strategy.

The Draft PEIS contains several references to opposition from the Hanford Community to reopen FFTF and other communities for establishing new facilities and operations. This is solely due to the past record of DOE in not being a responsible environmental steward. It is also true that during the late 80's DOE made many negotiated agreements with the States and they are considered obstacles to restarting or using facilities. Recognizing the past performance of DOE, it is essential to develop a new strategy to take the community into confidence and make them an integral part of decision making. This strategy, combined with open discussions of the benefits of nuclear technologies can go a long way in achieving the goals of the NI PEIS.

Sincerely,

(K. K. S. Pillay)
369 Cheryl Avenue
Los Alamos, NM 87544

1722-3

1722-4

Response to Commentor No. 1722

1722-3: DOE notes the commentor's support of creating a U.S. capability to produce plutonium-238 and not relying on foreign sources. DOE prefers the use of neptunium-237 for conversion into plutonium-238 for technical and cost reasons.

1722-4: DOE notes the commentor's views and observations. DOE is committed to discharging its responsibilities in an open and unbiased manner and providing the public with comprehensive environmental reviews of its proposed actions. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

Commentor No. 1724: May Hays

Response to Commentor No. 1724

Draft PEIS Comment Form

Dear Sir,

Please restart
FFTE for medical isotopes.
We need this for our
country. Sincerely,
May Hays

September 9, 2000

Colette E. Brown, NE_50 U.S. Department of Energy Office of Nuclear Energy, Science and Technology 19901 Germantown Road, Room A_270 Germantown, MI) 20874

To Ms. Brown, Sec. Richardson, and members of the Nuclear Infrastructure PEIS Team:
Comments on the draft NI PEIS:

I support Alternative 5, the complete and permanent deactivation of the FFTF, for the following reasons:

The Hanford Nuclear Reservation is already a site highly contaminated with nuclear waste. The only mission for Hanford should be the cleanup of the existing nuclear contamination. No new production of nuclear materials at Hanford should be considered in light of the past history of problems with leakage of waste at that site; some experts have stated that Hanford can never be completely cleaned up. Plutonium has been accidentally released into the air twice since 1997 at Hanford; tests have confirmed this, even though the DOE initially denied it. This poses an unacceptable risk, especially in light of the fact that there are major population centers downwind of Hanford.

Restarting the FFTF will undoubtedly involve draining funds from the cleanup budget, even though some DOE officials have said that this won't happen. The reality is that the DOE does not have an unlimited budget, so the funds have to come from someplace. Restarting the FFTF is by itself a violation of the Tri-Party Agreement to deactivate, decommission, and clean up Hanford, but if cleanup funds were used to finance the restart that would constitute an additional violation of the agreement.

Owing to its proximity to the Columbia River and the Hanford Reach National Monument with its rich biological diversity, including important salmon spawning grounds, Hanford is an extremely poor location for a nuclear facility. There are other DOE nuclear facilities

1725-1

1725-2

Response to Commentor No. 1725

1725-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

1725-2: The commentor's concerns regarding the existing cleanup mission at Hanford are noted. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

DOE does not conceal releases of radioactive or hazardous materials at the Hanford Site or any other site under DOE's authority. No radioactive materials were "released" in the Hanford Wildfires of 2000. Wildfires did resuspend some materials already in the environment. The amount of resuspended materials were slightly above natural background levels. Because the amount of suspended material was so small, several days of analysis to required to quantify the amount. As discussed in Chapter 4 of Volume 1, implementation of the alternatives described in Section 2.5 of Volume 1 would pose no significant risk to human health or the environment.

Hanford Site cleanup is funded through the Environmental Management Program Office. The stated missions considered in this PEIS would be funded through the Office of Nuclear Energy, Science and Technology, which has no funding connection to cleanup activities. Implementation of Alternative 1, Restart FFTF, would have no effect on funding for the Hanford Site cleanup.

A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Prior public meetings were held on this formal milestone change. FFTF restart would not impact ongoing cleanup missions at Hanford.

The commentor's concerns about the Columbia River and the Hanford Reach National Monument are noted. As discussed in

Commentor No. 1725: Carl M. Clemons (Cont'd)

that are much better situated and far safer, and are therefore much better choices for the production of nuclear materials.

**1725-2
(Cont'd)**

Many other DOE facilities are only running at 50% capacity, so arguments that the FFTF at Hanford is needed to fill any present or projected demand for medical isotopes, Plutonium_238 for space missions, or any other nuclear materials, simply do not hold up.

1725-3

I support NASA and the exploration of space, but not at the expense of the environment here on Earth. If NASA had to scrap space missions because Hanford was not producing Plutonium_238, then so be it; however, that scenario is highly unlikely since other DOE facilities or foreign sources can fill the need.

1725-4

Medical isotopes are commercially available and are being produced at medical facilities and universities that have such production capability, including many in Canada. The DOE's projected demand for such isotopes is highly inflated, especially considering that non_nuclear alternatives to cancer treatment are being developed and are expected to become available very soon.

1725-5

The FFTF at Hanford is poorly suited for the production of research radioisotopes. Such isotopes are typically produced in small quantities at irregular intervals; the FFTF cannot do this cost effectively, since it was not designed for that type of production, but rather for large_scale, continuous production.

Thank you for the opportunity to comment on the draft NI PEIS.

Sincerely,

Carl M. Clemons
47100 SE Pheasant Meadow Rd.
Sandy, OR_97055

Response to Commentor No. 1725

Chapter 4 of Volume 1 and Appendixes H and I, implementation of the Alternatives would pose no significant threat to the Columbia River or the Hanford Reach National Monument.

The commentor's position on using sites other than Hanford for the production of plutonium-238 and other isotopes is noted.

1725-3: Currently, approximately 50 percent of DOE's medical isotope production capacity is being used. Much of the remaining medical isotope production capacity is dispersed throughout the DOE complex. This capacity supports secondary missions, but cannot be effectively used for medical isotope production due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense). The 50 percent capacity does not refer to plutonium-238 production or nuclear research and development needs.

1725-4: DOE notes the commentor's opposition to the production of plutonium-238 at Hanford for use in NASA space missions. As observed by the commentor, DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

1725-5: DOE acknowledges the difficulty in reliably predicting isotopic needs for future uses in research and medicine. DOE has sought independent analysis of trends in the use of medical radioisotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it has established two expert committees. The first, a thirteen-member Expert Panel convened in 1998 to forecast future demand for medical isotopes, included academicians from leading medical universities and schools of public health, and professional affiliations ranging from the National Cancer Institute to manufacturers of radiopharmaceuticals. The second consists of a subcommittee of DOE's Nuclear Energy Research Advisory Committee (NERAC), established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. The members of this

Commentor No. 1725: Carl M. Clemons (Cont'd)

Response to Commentor No. 1725

Subcommittee were selected based upon their expertise and experience in the production, processing, distribution, and application of stable and radioactive isotopes in the biological and physical sciences, and in medicine. The members included basic and clinical scientists, administrators, and users of isotopes from academia, industry, and the federal government.

In 1998, the Expert Panel estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

In ongoing clinical testing, therapeutic isotopes have proven effective in treating cancer and other illnesses by cell-directed localized radiation therapy (i.e., deploying antibodies or carriers of radioisotopes to seek and destroy invasive cancer cells). This directed therapy can minimize adverse side effects (e.g., healthy tissue damage, nausea, hair loss), making it an effective, attractive alternative to traditional chemotherapy or radiation treatments.

The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum 99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements.

Commentor No. 1725: Carl M. Clemons (Cont'd)

Response to Commentor No. 1725

Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost-efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

Commentor No. 1726: Gene and Marilyn Derig

Dear Ms Brown: 9/13/00
 5:11 PM

It seems that every few months we have to write our Senators or Representatives or the Head of a Department and ask that FFTF be shut down.

The arguments for restarting FFTF don't stand up at all against contrary evidence.

Rather than write down the reasons for not starting FFTF again, we will just say our position is: "Close It Down". You know the reasons, we know the reasons.

Thank you for your time.

Sincerely,

 GENE and MARILYN DERIG
 P.O. Box 341
 Anacortes, WA 98221

1726-1

Response to Commentor No. 1726

1726-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 1728: Heather Hopkins

Response to Commentor No. 1728

Draft PEIS Comment Form

Doing anything at the Hanford site besides the clean-up that was agreed to is a crazy idea.

Everything that you propose is frivolous, unnecessary and serves only your interests. We the people DEMAND that you choose:

Alternative #5
 SHUT DOWN FFTF

Thank you,
 Heather Hopkins

1728-1

1728-1: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

1728-2

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Although research to identify other potential fuel sources to support these space exploration missions has been conducted, no viable alternative to using plutonium-238 has been established. Based on NASA guidance

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Commentor No. 1728: Heather Hopkins (Cont'd)

Response to Commentor No. 1728

to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

In January 1997, President Clinton tasked his Committee of Advisors on Science and Technology (PCAST) to evaluate the current national energy research and development portfolio and to provide a strategy that ensures the United States has a program to address the Nation's energy and environmental needs for the next century. In its November 1997 report responding to this request, the PCAST Energy Research and Development Panel determined that restoring a viable nuclear energy option to help meet our future energy needs is important and that a properly focused research and development effort to address the potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) was appropriate. The PCAST panel further recommended that DOE reinvigorate its nuclear energy research and development activities to address these potential barriers. Section 1.2.3 provides information on the nuclear energy research and development mission.

1728-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 1729: Dorothy Perry

Dear MS Brown.

I am a long time resident of the City of Richland, WA. I am totally in favor of restarting the FFTF reactor. It would be a total waste of government funds not to use this reactor for what ever purposes that it can be used for. To make Medical Isotops to fight cancer would be wonderful. Cancer is such a dreadful disease. Chemo Threapy is almost as bad as the disease.

Sincerely,,

1729-1

Response to Commentor No. 1729

1729-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 1730: Andrea Faste

Andrea M. Faste
7713 11th Ave. NW

19901 Germantown Road
Germantown, MD 20874-1290

Dear Ms. Brown:

Please listen to the many citizens of Washington State who are appalled at the idea of restarting the Fast Flux Reactor at Hanford. We are very frustrated that the clean-up effort so necessary at the existing plants keeps getting side-tracked as plans are put forth to bring yet more high level waste to the Hanford reservation. We are concerned that the EIS for the restart fails to take into account the availability of nuclear isotopes from other sources for medical research, and that we have plenty of plutonium already. What worries us is the inability of the DOE to get on with the clean-up, which was promised, even signed into agreement with the State of Washington, years ago. Now there are reports that leaks from the old Hanford are creeping into the ground water and heading toward the Columbia River.

Let us turn from the false hope of good jobs if the region is put in environmental jeopardy. Noone wants to see the future of central Washington turn as bleak as that of the fields surrounding Chernobyl.

Sincerely,

Andrea Faste
(a concerned citizen west of the Cascades)

|| 1730-4
|| 1730-2

Response to Commentor No. 1730

1730-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1730-2: The commentor's concerns regarding the existing cleanup mission at Hanford are noted. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site.

A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Prior public meetings were held on this formal milestone change. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

As discussed in Chapter 4 of Volume 1, implementation of the alternatives described in Section 2.5 of Volume 1 would have no significant effect on groundwater at candidate sites or the Columbia River.

1730-3: Sections 4.3.1.1.13; 4.3.2.1.13; 4.3.3.1.13; and 4.4.2.1.13 were revised to clarify the waste management approach for waste resulting from processing target materials for plutonium-238 production.

1730-4: The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably

Commentor No. 1730: Andrea Faste (Cont'd)

Response to Commentor No. 1730

Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. Further, supplies of many research isotopes are not readily available from existing foreign or domestic sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed. As such, reliance on these other sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Ms. Colette Brown
DOE Office of Space and Defense Power Systems
19801 Germantown Road
Germantown, MD 20874-1290

Dear Ms. Brown:

Re: FFTF EIS

I strongly support the restart of the FFTF reactor facility, both for the production of medical and space mission isotopes, and for whatever other research missions might be suitable for this, our newest and most advanced nuclear reactor. It greatly distresses me that we are spending so much time and money in dealing with the latter-day Luddites who are opposing this.

I am a 79-year-old retired Certified Health Physicist who worked at Hanford from 1947 until 1986. That's 39 years, all of it in operational health physics. I was one of the original members of the Health Physics Society. I am profoundly disturbed by the sad disuse of nuclear technology in this country, while we still have the knowledge and a few outstanding facilities, like the FFTF, which can bring us enormous benefits, at moderate cost. The situation completely baffles me!

As I look at the technical situations around the world, I see other countries busily putting into practice technology which we invented. The vitrification and disposal of high-level nuclear waste readily comes to mind. We developed the technology thirty years ago, and it has been in use in France and Sweden since the mid-1970s. In the meantime, we sit on our National thumb, debating what to do with ours!

It's hard to believe that this is the same country that developed most nuclear technology, that went to the Moon a dozen times, that conceived and implemented the Internet, and that is now engaged (with Russia) in building an International Space Station.

That's how it looks from here, in the real world, not Foggy Bottom, Ms. Brown. I hope that you and your colleagues can help to bring the vision of the people in Foggy Bottom somewhat nearer to that of the real world, and help to get us back into real accomplishment in the nuclear field.

Yours Truly,

Wallace P. Howell, CHP

Response to Commentor No. 1731

1731-1

1731-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

1731-2

1731-2: DOE notes the commentor's concerns. It is DOE policy to encourage public input on matters of regional, national and international importance as part of its commitment to facilitate a public participation process that is open and unbiased.

Commentor No. 1732: Carol Sinclair

Heart of America Northwest

From: Carol Sinclair <carolsin@kcls.org>
To: <office@heartofamericanorthwest.org>
Sent: Thursday, August 24, 2000 4:23 PM
Subject: Attn: Danielle

I want to add my voice to those at the hearing on August 30 calling for the Department of Energy to abandon its latest plans in regard to the Hanford nuclear facility.

1) There is not a need to restart the FFTF. There is danger in the plutonium already found in the soil, and in trace amounts found in firefighters after the recent wildfire.

2) It is too risky to transport large amounts of nuclear waste by truck through the densely-populated urban area around Seattle. Do you know how impossible our traffic congestion is right now?

Please do the right thing, which is to put the safety concerns of our citizens first.

Sincerely,
Carol Sinclair
Seattle, WA

1732-1

1732-2

1732-3

Response to Commentor No. 1732

1732-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF. The need for the proposed action is addressed in Section 1.2 of Volume 1 of the PEIS. The role of FFTF in fulfilling that need is addressed in Section 2.5.2 of Volume 1.

1732-2: No radioactive materials were "released" in the Hanford Wildfires of 2000. Wildfires did resuspend some materials already in the environment. The resuspended materials were low, slightly above natural background levels. The low levels required several days of analysis to quantify.

No firefighters working the Hanford wildfires of 2000 tested positive for radioactive material uptakes.

1732-3: It is not anticipated that wastes from the proposed facilities would be transported through the Seattle area. However, any waste transported from candidate sites would be subject to regulation by the U.S. Department of Transportation (DOT) and the U.S. Nuclear Regulatory Commission (NRC). Population densities and traffic congestion are factors that were considered during the development of the DOT and NRC regulations that apply to transportation of radioactive and hazardous materials.

Commentor No. 1733: Jean T. Carpenter

September 12, 2000

Colette Brown
Office of Space & Defense Power Systems
US Dept of Energy
19901 Germantown Rd
Germantown MD 20874

Dear Colette Brown,

I realize that there have been hearings about the possibility of restarting the FFTF in Hanford, WA.

I realize, too, that there is a great need for jobs, the economic situation in Central Wa is perhaps far from great -- we're certainly struggling greatly with lack of work & business opportunities here in Okanogan Cty -- but the LAST way I see as doing anything positive is creating still more poisonous wastes in a place that is already so polluted that it seems no one has the knowledge or the will or whatever it takes to really take hold and do something about it.

I ask that you use your position for the well-being of not only this entire area, but of the whole community of life, to prevent the FFTF from being restarted, to keep any kind of polluting wastes from being stored and Hanford, and to put whatever resources are needed to clean up once and for all a place that threatens the health of us all.

Thank you for doing your best to act on this urgent issue.

Sincerely,

Jean T Carpenter
514 S Ash
Omak WA 98841
509-826-6742

1733-1

1733-2

Response to Commentor No. 1733

- 1733-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 1733-2:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

More specific to the DOE missions in the NI PEIS, the environmental impacts associated with operation of the FFTF and support facilities at Hanford during normal operations and from postulated accidents are presented and discussed in Section 4.3 of Volume 1 of the NI PEIS. All impacts to human health and to ecological resources would be small in the immediate area of the Hanford Site and negligible at all distant locations.

In regards to waste, the NI PEIS addresses the environmental impacts due to the treatment, storage, and disposal of the waste generated for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and appropriate DOE orders.

Commentor No. 1734: Catherine Pearsall

September 9, 2000

Ms. Colette Brown
Department of Energy
19901 Germantown Road
Washington DC 20874

Dear Ms. Brown,

RESTART OF FAST FLUX TEST FACILITY (FFTF) FOR PRODUCTION OF MEDICAL ISOTOPES

I am a constituent in Eastern Washington State. I truly believe the Fast Flux Test Facility (FFTF) should be restarted by the Department of Energy (DOE) for production of medical isotopes. It can uniquely provide a wide variety of high-grade isotopes, some of which cannot currently be produced in the U.S. In addition, FFTF has the capacity to produce 2-3 times more medical isotopes than all other reactors in the nation combined. We need to be ready to supply large quantities of medical isotopes to cancer centers around the nation. At a minimum many of our fellow citizens are suffering with cancer and doctors need these products to help in curing or developing a cure for cancer.

So, lets use this operational facility, not throw it away as we have done so many others (i.e. the Supercollider) just for the sake of political capital. I know there is much opposition from Western Washington State, however, I believe much of what they don't want has to do with the fact they are making judgements based on inaccurate publicity and not sound science.

Please restart the FFTF. It would be a great tragedy if we allowed this resource to be permanently shutdown.

Sincerely,

Catherine Pearsall
Richland, WA

Response to Commentor No. 1734

1734-1

1734-1: DOE notes the commentor's support for Alternative 1, Restart FFTF. The commentor should note that while the FFTF has a large volume available for the production of isotopes, it cannot produce 2 to 3 times more medical isotopes than all other reactors in the nation combined.

1734-1

Commentor No. 1735: Anonymous

September 15, 2000

Ms. Colette Brown,
PEIS Document Manager,
Office of Nuclear Energy, Science and Technology,
U.S. Department of Energy
NE-50
19901 Germantown Road
Germantown, Maryland 20874-1290

Please accept the attached document for the record of the PEIS on isotope production. Canadian production of isotopes and the ability of Canadian sources to meet U.S. needs should be fully discussed in the final PEIS and should bear on any decision to restart the FFTF, a reactor not designed for efficient production of medical isotopes.

As the U.S. Department of Energy, via Argonne National Laboratory, is working with MDS Nordion to convert its medical production reactors at Chalk River, Canada from highly enriched uranium (HEU) to low-enriched uranium (LEU), the role of Argonne in isotope production worldwide should be included in the final PEIS. Argonne's work with Nordion and Atomic Energy of Canada Ltd. has a direct bearing on U.S. isotope use and should be fully discussed in the final PEIS.

For further information on MDS Nordion, go to <http://www.nordion.com>.

1735-1

Response to Commentor No. 1735

1735-1: The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirement. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs. DOE's assistance to Canada in reactor conversions is not within the scope of the NI PEIS.

DOE acknowledges that the FFTF's large size and configuration are not particularly well suited for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of the FFTF for the production of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report, "NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000," states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production". In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates use of the FFTF when coupled with the other proposed missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without disturbing the existing missions of these facilities.

Colette E. Brown, NE-50
U.S. Department of Energy
19901 Germantown Road
Germantown, MD 20874

Dear Ms. Brown:

We have reviewed the draft programmatic Environmental Impact Statement (EIS) for *Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the United States, Including the Role of the Fast Flux Test Facility* (CEQ# 000258) in accordance with our responsibilities under the National Environmental Policy Act and §309 of the Clean Air Act. The draft EIS addresses a mission to increase the availability of medical and industrial isotopes to accommodate future projected needs in diagnostic and therapeutic medicine, the space program, and civilian energy research and development. Alternatives presented in the draft EIS include the no action, restarting the Fast Flux Test Facility (FFTF) at Hanford, using existing DOE facilities, constructing new accelerator(s), constructing a new research reactor, and permanently deactivating the FFTF.

We have rated the draft EIS, EC-2 (Environmental Concerns-Insufficient Information) We have attempted to weigh the benefits that would arise from adopting action alternatives against the environmental consequences occurring with their adoption when assigning our rating. To a large extent, a lack of information in the draft EIS was the basis for our environmental concerns.

Information we found lacking in the EIS includes

- a compelling case that a need will arise in the future for plutonium-238 and medical and industrial isotopes;
- site-specific impacts from proposals to construct and operate accelerator(s) or a research reactor (the absence of this information prevents us and other readers from judging the environmental acceptability of these proposals);
- a demonstration that proposed action would be consistent with achieving the future land use designations that are directing Superfund clean-up efforts, especially in the 300 area in Hanford;
- assurances that funding for these proposals would not be from monies presently earmarked for clean-up; and
- the rationale for including an alternative for decommissioning the FFTF since it does not appear to address the stated purpose and need.

We are also concerned that the cost and non-proliferation reports were not made available to the public until well into the comment period on the draft EIS. We believe that the Department of Energy (DOE) should have released this information as part of the draft EIS and that its late release limits the ability of the public to comment on elements important to this decision. Moreover, we are concerned that DOE released cost and non-proliferation reports late in the draft EIS process on its

Printed on Recycled Paper

Response to Commentor No. 1737

1737-1: The commentor's views are noted. Sections 1.2.1 and 1.2.2 of Volume 1 provide a description of the need for production of medical and industrial isotopes and plutonium-238, respectively. DOE could purchase plutonium-238 from Russia to satisfy its near-term responsibility to supply NASA with plutonium-238 to support future space exploration missions. Under the current contract set to expire in 2002, the United States is authorized to purchase up to 40 kilograms of plutonium-238, with the total available for purchase in any one year limited to 10 kilograms. However, DOE does not stockpile large quantities of Russian plutonium-238 long in advance of needs due to budget constraints and the additional processing required to remove decay products that occur following extended storage of the material. To date, DOE has purchased approximately 9 kilograms of plutonium-238 under this contract. The environmental impacts associated with procurement of plutonium-238 from Russia are evaluated as an element of the No Action Alternative. Nonproliferation issues are addressed in a separate report, "Nuclear Infrastructure Nonproliferation Impact Assessment," September 2000.

Through a Memorandum of Understanding with NASA, DOE provides isotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions would be in jeopardy.

DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its

2

last EIS, *The Treatment and Management of Sodium-Bonded Spent Nuclear Fuels*. We recommend that this information accompany the release of the draft EIS for future DOE projects.

Our rating and a summary of our comments will be published in the Federal Register. I have enclosed a copy of the rating system used in our review for your reference. I have enclosed a copy of the rating system used in our review for your reference and our detailed comments. I encourage you to contact Chris Gebhardt of my staff at (206) 553-0253 if you have any questions. Thank you for the opportunity to review this draft EIS.

Sincerely,

Richard B. Parkin, Manager
 Geographic Implementation Unit

enclosures

1737-6
(Cont'd)

Response to Commentor No. 1737

mandates under the Atomic Energy Act. In doing so, it established two expert committees. In 1998, an Expert Panel convened to forecast future demand for medical isotopes estimated that the expected growth rate of medical isotope use during the next 20 years will range between 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by DOE's Nuclear Energy Research Advisory Committee (NERAC), established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. The growth projections were also adopted by DOE as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings.

The United States currently purchases approximately 90% of its medical isotopes from foreign producers, most notably Canada. Although other manufacturers produce medical isotopes, DOE remains the key provider for a large number of isotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large-enough quantities to make their production financially attractive to private industry. However, supplies of many research isotopes are not readily available from existing domestic or foreign sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed. Under the NI PEIS proposed action and consistent with its mandates under the Atomic Energy Act, DOE would enhance its existing nuclear facility infrastructure to, among other things, more effectively support production of isotopes for medical applications and research. DOE's intent is to complement commercial sector capabilities to ensure that a reliable supply of isotopes is available in the U.S. to meet future demand, and to encourage the commercial sector to privatize the production of isotopes that have established applications to a level that would support commercial ventures.

1737-2: DOE notes EPA's concerns. DOE used the generic site approach for Alternatives 3 and 4 in the absence of specific siting alternatives. This level of analysis is appropriate for a PEIS. Projected

Commentor No. 1737: Richard B. Parkin (Cont'd)
U.S. EPA

EPA's Detailed Comments on the Draft Programmatic Environmental Impact Statement for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the U.S., Including the Role of the Fast Flux Test Facility

Consistency of Alternatives with Land Use Designations

We understand that the Hanford 300 area and the majority of potential sites for the proposed accelerator(s) and research reactor are on Superfund's National Priority List (NPL) and are undergoing clean-up. Clean-up activities are oriented toward meeting future land use designations. EPA, as overseer of Superfund activities on these sites, is concerned that proposals may inhibit efforts to clean-up Hanford's 300 area or other sites on the NPL to standards consistent with their designated future land uses. We strongly recommend that the EIS state whether alternatives occur in sites on the NPL, describe future use designations directing clean-up activities, and demonstrate that action alternatives are consistent with existing Superfund efforts to meet future land uses.

1737-3

Budget Concerns

EPA is concerned about restarting the FFTF and building and operating an accelerator(s) or a research reactor because funds used for these new activities could potentially reduce the level of funding for clean-up at DOE sites. EPA fears that funding to operate the FFTF, and to an even greater extent, to construct and operate a new accelerator(s) or research reactor could divert clean-up funds from DOE's limited funding base. EPA, therefore, recommends that the EIS demonstrate that sufficient funding exists outside the clean-up budget to fund action alternatives one through four and that the Record of Decision commit to not using funds allocated for clean-up to implement action alternatives one through four.

1737-4

Not Siting Proposed Accelerator and Research Reactor Prevents Assessing Impacts

The draft EIS does not specify where the proposed accelerator(s) and research reactor in alternatives three and four, respectively, would be located and the document consequently lacks an assessment of impacts to ground water, surface water, and air resources, among others. We believe that the absence of site specific information for these two alternatives prevents DOE from considering them as viable options when the type and extent of environmental and health impacts is unknown. We therefore recommend that the final EIS drop alternatives three and four or specify a location for siting the proposed accelerator(s) and research reactor and include a full discussion of impacts with their adoption.

1737-2

No Compelling Demonstration of the Need for the Project

The EIS does not present a compelling case that a need exists to ensure the production of plutonium-238 for space missions, and to a lesser extent, the isotopes for medical and industrial purposes in 5-10 years. Currently, DOE is purchasing needed plutonium-238 from Russia and isotopes for medical and industrial purposes from other sources, including Canada. The EIS does not demonstrate that DOE cannot continue to meet the demand for these materials in the future.

1737-1

Response to Commentor No. 1737

construction and operational data on nonradiological air emissions, water use, radiological and chemical releases, and waste generation are provided at a level of detail commensurate with that provided for the existing facilities under consideration. Should one of these alternatives ultimately be selected on the basis of its technical merit for accomplishing the stated missions and the assessment of environmental impacts, subsequent NEPA reviews would be conducted to include an analysis of siting alternatives and associated site-specific impacts.

1737-3: Information on the NPL status is provided in the NI PEIS Waste Management sections of Chapter 3 (i.e., Sections 3.2.11.1, 3.3.11.1, and 3.4.11.1). In addition, as noted in the Land Use sections in Chapter 4 for each of the proposed alternatives, the proposed activities are consistent with the current land use plans for those facilities under consideration in this NI PEIS.

1737-4: DOE shares the EPA's concern about adequate funds for the cleanup of Hanford and other DOE sites. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2 of Volume 2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

1737-5: DOE acknowledges that Alternative 5, Permanently Deactivate FFTF with No New Missions, does not meet the purpose and need of the proposed action. This alternative was added to the analysis as a result of stakeholder input, and specifically focuses on the permanent deactivation of FFTF coupled with no new missions.

1737-6: CEQ (40 CFR 1500 et seq.) and DOE (10 CFR Part 1021) implementation regulations do not require inclusion of cost and nonproliferation studies in an environmental impact statement. A basic purpose of the NI PEIS is to describe the alternatives under consideration for implementation (Section 2.5 of Volume 1) and the

Commentor No. 1737: Richard B. Parkin (Cont'd)
U.S. EPA

Moreover, the current practice of purchasing plutonium-238 from Russia is not only more cost effective than restarting the FFTF or constructing and operating new accelerator(s) or a research reactor, it also appears to address nonproliferation concerns. This practice places Russian-produced nuclear material in U.S. hands which, in light of the political scene in Russia, is currently a more secure option and it gives Russia much needed funding to manage the nuclear stockpiles that exist there.

Decommissioning the FFTF Appears to be Outside the Purpose and Need

Although we support decommissioning the FFTF and recognize it as consistent with the Hanford Agreement, we question how this alternative meets the purpose and need included in the EIS of producing plutonium-238 and isotopes for medical and industrial purposes. This alternative does, however, address the question of what DOE should do with inactive reactors and accelerators (especially the FFTF) at its sites. We recommend that the EIS rewrite the purpose and need statement to reflect the larger question of what to do with inactive reactors and accelerators if this is the case.

More Detailed Comments

1. In Table S-10, impacts are described by comparison with applicable air environmental standards. We recommend a similar approach be used in Table S-11 to describe radiological impacts (dose) by comparison with the applicable Clean Air Act standard (10 mrem/year). Separate comparisons should be made with Safe Drinking Water Act criteria. This would help in providing a more consistent basis for comparing radiological to nonradiological impacts and would also make clear what (if any) of the radiological impact is due to releases to groundwater.

2. We recommend that the EIS present cancer risks from chemical, radiologic, and the combination of both on the same page and in the same format. For example, readers of the EIS could more easily detect that the chemical cancer risk in Table 4-76 is much greater than the associated radiological risk. More direct comparison would add clarity to this useful information.

3. On Page 4-274, Table 4-140 is explained with "Hazard indexes for the toxic chemicals were all far below one, and cancer risk values are well below acceptable risk values. Thus, there would be no hazardous chemical impacts from the operation of the new reactor". It is not clearly stated what "acceptable risk values" are. The hazardous chemical cancer risk in Table 4-140 is approximately 0.000000001 which is a small number but is not zero. The basis for dismissing this level of risk is not stated. If the same logic were applied to the radiological risks in Table 4-138, the radiological risks might also be "no impact". Nonradiological cancer risks should be carried through the analysis in the same way as radiological risks including, where appropriate, the calculation of population-scale "Latent Cancer Fatalities".

4. In Appendix I, hazardous chemical risks are not evaluated where quantities do not exceed Threshold Planning Quantities, or where quantities are bounded by the quantities currently stored in the facility. As a consequence, hazardous materials risks from serious accidents such as Ion Exchange Explosion or Dissolver Tank Failure are evaluated for radiological consequences, but

1737-1

1737-7

1737-8

1737-9

1737-10

Response to Commentor No. 1737

environmental impacts that would occur if these alternatives were implemented (Chapter 4 of Volume 1). Pursuant to CEQ regulations 40 CFR 1505.1(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. The associated cost report and nonproliferation report were made available to the public on August 24, 2000 and September 8, 2000, respectively. Both reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided summaries of the Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment in Appendixes P and Q, respectively, in the Final NI PEIS.

1737-7: The text associated with Table S-11 in the Draft NI PEIS (Table S-15 in the Final PEIS) provides the Clean Air Act and Safe Drinking Water Act standards for radiological impacts.

1737-8: Cancer incidence risks from chemical and radiological agents are presented separately in Chapter 4 of Volume 1. However, Table 2-6 of Section 2.7.1.1 provides side-by-side comparisons of radiological and chemical risks. In general, combining the population radiological latent cancer fatality risk with the chemical cancer incidence risk is not appropriate. Section H.3 (Assumptions) has been revised to provide a discussion of the differences in the risk measures for radiological and chemical risk.

1737-9: The reference to acceptable risk values for the carcinogenic chemicals has been removed from the text in the Final NI PEIS. The cancer risk listed for Propylene in Table 4-140 of the Draft NI PEIS Table 4.147 of the Final PEIS means that the likelihood of an individual contracting cancer from exposure to 0.000173 micrograms per cubic meter of propylene over 35 years would be less than approximately 1 in 1.5 billion. For perspective, that risk is approximately six orders of magnitude less than the risk of the individual contracting a fatal cancer from 35-years of exposure to cosmic radiation. Nevertheless, since "acceptable risk values" is open to interpretation, the phrase "acceptable risk values" will be removed.

The radiological risk to the maximally exposed offsite individual shown in Section 4.6.1.2.9 means that the likelihood of the individual

Commentor No. 1737: Richard B. Parkin (Cont'd)
U.S. EPA

not for associated chemical risks. This approach limits comparisons of alternatives and also of radiological to nonradiological risks. From the standpoint of providing an equitable basis for comparison, Threshold Planning Quantities and quantities on hand are not pertinent. The important consideration is to compare impacts (including both chemical and radiological ones) among alternatives.

1737-10

5. In summary tables of risks, both radiological and nonradiological risks should be included for comparison.

1737-11

Response to Commentor No. 1737

becoming a latent cancer fatality due to the radiation exposure that would result from implementation of this alternative is less than approximately 1 in 22 million. That risk is approximately four orders of magnitude less than the risk of the individual contracting a fatal cancer from 35-years of exposure to cosmic radiation. Neither risk is voluntary, and the radiological risk to the maximally exposed offsite individual due to the former radiation source is essentially zero.

Some care should be exercised in comparing the cancer risk from hazardous chemicals with the latent cancer fatalities used to quantify radiological risk to populations because the two risks have different physical interpretations. The cancer risk from hazardous chemicals shown in tables throughout Chapter 4 of Volume 1 is a probability of cancer incidence (not fatality) for an individual that is continuously exposed to the specified concentration of the chemical over the 35 year program duration. The U.S. Environmental Protection Agency (EPA) has not developed cancer mortality risk factors for carcinogenic chemicals. Therefore, it is not possible to provide a latent cancer fatality estimate for exposure to these chemicals. Additionally, the impacts from exposure to multiple carcinogens are not necessarily additive. Exposure to multiple carcinogens may result in either synergistic or antagonistic effects. The expected number of latent cancer fatalities, from a radiological exposure, among the population is a statistical average that considers the variability in radiological exposure that arises from the geographical distribution of the population and prevailing weather conditions. Based on wind direction, wind speed, atmospheric stability and distance from the radiation source, some persons in the area at risk are exposed to more radiation than others. While it is possible to develop population cancer incidence figures using similar modeling techniques to those used in the radiological assessment; that has not been done in this analysis. The EPA recommends using an iterative approach when performing risk analysis for chemical exposures, progressing from the simple to the more complex analysis depending upon the perceived need for more detail in the analysis. Based upon the information available and the results of the chemical risk analysis, it was determined that the analysis provided in the PEIS provides an appropriate measure of the chemical risks. Care is also required in comparing the cancer risk from hazardous chemicals to the

Commentor No. 1737: Richard B. Parkin (Cont'd)
U.S. EPA

**U.S. Environmental Protection Agency Rating System for
 Draft Environmental Impact Statements
 Definitions and Follow-Up Action***

Environmental Impact of the Action

LO -- Lack of Objections

The Environmental Protection Agency (EPA) review has not identified any potential environmental impacts requiring substantive changes to the proposal. The review may have disclosed opportunities for application of mitigation measures that could be accomplished with no more than minor changes to the proposal.

EC -- Environmental Concerns

The EPA review has identified environmental impacts that should be avoided in order to fully protect the environment. Corrective measures may require changes to the preferred alternative or application of mitigation measures that can reduce these impacts.

EO -- Environmental Objections

The EPA review has identified significant environmental impacts that should be avoided in order to provide adequate protection for the environment. Corrective measures may require substantial changes to the preferred alternative or consideration of some other project alternative (including the no-action alternative or a new alternative). EPA intends to work with the lead agency to reduce these impacts.

EU -- Environmentally Unsatisfactory

The EPA review has identified adverse environmental impacts that are of sufficient magnitude that they are unsatisfactory from the standpoint of public health or welfare or environmental quality. EPA intends to work with the lead agency to reduce these impacts. If the potential unsatisfactory impacts are not corrected at the final EIS stage, this proposal will be recommended for referral to the Council on Environmental Quality (CEQ).

Adequacy of the Impact Statement

Category I -- Adequate

EPA believes the draft EIS adequately sets forth the environmental impact(s) of the preferred alternative and those of the alternatives reasonably available to the project or action. No further analysis of data collection is necessary, but the reviewer may suggest the addition of clarifying language or information.

Response to Commentor No. 1737

radiological risk to the maximally exposed offsite individual. The cancer risk for hazardous chemicals is a probability of cancer incidence, while the radiological risk to the maximally exposed offsite individual is a risk of cancer mortality.

- 1737-10:** The NI PEIS analyses included the determination of the incremental hazardous chemical accident risks for the proposed actions under each alternative. Therefore, hazardous chemical accident risks were not evaluated at facilities that would not be altered by the proposed action. This allows an equal comparison of the proposed action among alternatives.
- 1737-11:** Section 2.7 of Volume 1 contains a summary table that includes both the radiological and nonradiological risks from normal operations and radiological risks from accidents for use in making comparisons among alternatives. The nonradiological hazardous chemical accidents evaluated in the NI PEIS resulted in no risk to health and safety at distances well within the site boundaries of each facility. Therefore, the nonradiological accident risks were not included in the summary table.

Commentor No. 1737: Richard B. Parkin (Cont'd)
U.S. EPA

Category 2 - - Insufficient Information

The draft EIS does not contain sufficient information for EPA to fully assess environmental impacts that should be avoided in order to fully protect the environment, or the EPA reviewer has identified new reasonably available alternatives that are within the spectrum of alternatives analyzed in the draft EIS, which could reduce the environmental impacts of the action. The identified additional information, data, analyses or discussion should be included in the final EIS.

Category 3 - - Inadequate

EPA does not believe that the draft EIS adequately assesses potentially significant environmental impacts of the action, or the EPA reviewer has identified new, reasonably available alternatives that are outside of the spectrum of alternatives analyzed in the draft EIS, which should be analyzed in order to reduce the potentially significant environmental impacts. EPA believes that the identified additional information, data, analyses, or discussions are of such a magnitude that they should have full public review at a draft stage. EPA does not believe that the draft EIS is adequate for the purposes of the National Environmental Policy Act and or Section 309 review, and thus should be formally revised and made available for public comment in a supplemental or revised draft EIS. On the basis of the potential significant impacts involved, this proposal could be a candidate for referral to the CEQ.

Commentor No. 1740: Martin Lewis

NI PEIS Toll_Free Telephone

9/15/00

Martin Lewis
3133 Fairfield Street
Philadelphia, PA 19136
215_676_1291

My name is Martin Lewis. I'm sending this to Colette Brown concerning the DOE plans to expand production of plutonium 238 for future space missions. Please do not send me the draft PEIS. Keep it. There's no need to expand the existing nuclear infrastructure. Space nuclear power is a good way to destroy this earth. Every entry accident of some kind, on the path accidents for that matter, and we could wind up with plutonium 238 in Philadelphia, which I'm strongly against as I live in Philadelphia, my name is Martin Lewis, 3133 Fairfield Street, Philadelphia, PA 19136, 215_676_1291. I don't know if I'm being recorded. I hope I am. It's just ridiculous that we are still pushing for more plutonium 238. We've been lucky so far. Although our children may not be lucky the way we're poisoning the earth. I don't have any children but I still do not want the effects of my being on this earth poisoning future generations. Please do not promote in any way the use plutonium 238 into space business and please stop promoting the use of nuclear power in space. Thank you.

1740-1

1740-2

Response to Commentor No. 1740

1740-1: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Although research to identify other potential fuel sources to support these space exploration missions has been conducted, no viable alternative to using plutonium-238 has been established. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost. Section 1.2.2 of Volume 1 was revised to further clarify the purpose

Commentor No. 1740: Martin Lewis (Cont'd)

Response to Commentor No. 1740

and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

In January 1997, President Clinton tasked his Committee of Advisors on Science and Technology (PCAST) to evaluate the current national energy research and development portfolio and to provide a strategy that ensures the United States has a program to address the Nation's energy and environmental needs for the next century. In its November 1997 report responding to this request, the PCAST Energy Research and Development Panel determined that restoring a viable nuclear energy option to help meet our future energy needs is important and that a properly focused research and development effort to address the potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) was appropriate. The PCAST panel further recommended that DOE reinvigorate its nuclear energy research and development activities to address these potential barriers. Section 1.2.3 provides information on the nuclear energy research and development mission.

1740-2: DOE notes the commentor's concern for NASA's use of nuclear materials for space missions, although this issue is beyond the scope of this PEIS. Through a Memorandum of Understanding with NASA DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch.

Commentor No. 1741: Angel Kelly

NI PEIS Toll_Free Telephone

Angel Kelly
Portland, OR

Hi. My name is Angel Kelly. I live in Portland, Oregon. I'm calling to say that I disagree with the restart of the Fast Flux Facility at Hanford. I think that the priority of the Department of Energy should be to clean up existing nuclear messes which they're not currently doing adequately and to not do anymore creation of radioactive waste until there is proper way to deal with the waste that's already created and any future waste that is generated. The Environmental Impact Statement doesn't take into account that this waste will last for hundreds of years and that it will contaminate the water and the land. Thank you.

1741-1

1741-2

Response to Commentor No. 1741

-
- 1741-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 1741-2:** The restart of FFTF or any of the other proposed alternative facilities would not impact the schedule or available funding for existing cleanup activities at Hanford, INEEL, or ORR. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Sonia Wilson
9505 NE Campaign
Portland, OR 97220
503_253_0191

Hi. I would like to call to state my opinion. I'm opposed to the restart of the FFTF nuclear reactor at Hanford. If you have any questions, or you need to make sure that I'm a voter or whatever, my name is Sonia Wilson and I live at 9505 NE Campaign in Portland, 97220. My phone is 503_253_0191. Thank you. Bye_bye.

|| 1742-1

Response to Commentor No. 1742

1742-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Commentor No. 1743: Mrs. Birdwell

NI PEIS Toll_Free Telephone

9/15/00

Mrs. Birdwell
White Salmon, WA

You're wrong to restart any nuclear reactors near Hanford or any other place near the Columbia or any waterway flowing into it. Now you've got to clean up that mess at Hanford and refrain from this happening there again. Keep it away from the country. Put it away from here. Put it out in the middle of the desert where there's no water to flow into it. You have to figure out something better. I'm Mrs. Birdwell at White Salmon, right on that Columbia. I don't like it. Don't like to have that beautiful, beautiful river spoiled. It's the second largest river in the United States and look what you're doing to it.

1743-1

1743-2

Response to Commentor No. 1743

1743-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1743-2: Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are a high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Commentor No. 1744: John Shumacher

NI PEIS Toll_Free Telephone

9/15/00

John Shumacher
503_408_2651

I oppose the restart of the nuclear reactor at Hanford.
Please don't do it. My name is John Shumacher, area code
503_408_2651, if you want to get a hold of me, but do not
start the reactor again. Thank you.

|| 1744-1

Response to Commentor No. 1744

1744-1: DOE notes the commentor's opposition to Alternative 1, Restart
FFTF.

Commentor No. 1745: John McCarthy

NI PEIS Toll_Free Telephone

9/15/00

John McCarthy
White Salmon, WA

Hi, my name is John McCarthy. I'm a resident of White Salmon, Washington and I just want to voice my opposition to the startup of the reactor at Hanford in the state of Washington.

1745-1

I've been to all the Department of Energy meetings out here and the message from the people that live here is very clear. Please clean up the mess that is out there before you start adding to it. It is just beyond belief that you want to add to this cesspool that by your own admission you cannot clean up.

1745-2

So this is another citizen voicing very, very strong opposition to the startup of the nuclear reactor at Hanford.

1745-1

Thank you.

Response to Commentor No. 1745

1745-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1745-2: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The stated missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

Commentor No. 1746: Cal Roberts

NI PEIS Toll_Free Telephone

Vancouver, Washington 98684
360_892_1985

My name is Cal Roberts I live at 504 Northeast 139th Avenue, Vancouver, Washington 98684. My telephone number is 360_892_1985. I am totally opposed to the restart of the nuclear reactor at Hanford. Things need to be cleaned up before you even think about doing this kind of stuff. You've already got enough problems over there which means I have enough problems over there and since all stuff comes down_river, guess what? So, I would love to be able to talk with somebody about this if you think this is something you need to do. I just oppose it so much and I really would like to have somebody contact me. All right, thank you very much.

1746-1

1746-2

1746-1

Response to Commentor No. 1746

1746-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1746-2: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to “ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use.” The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Commentor No. 1747: Anonymous

NI PEIS Toll_Free Telephone

9/15/00

Anonymous

Good afternoon. I would just like to go on record as saying that I'm opposed to the restart of the FFTF nuclear reactor at Hanford. It's my understanding that the waste generated by this plant will take somewhere in the neighborhood of hundreds of thousands of years to become non_toxic. I just don't see anyway that the planet can afford nor needs to spend what is required to generate electricity through nuclear energy. Thank you very much.

1747-1

1747-2

1747-3

Response to Commentor No. 1747

- 1747-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 1747-2:** DOE notes the commentor's concern regarding the long-term storage requirements for the waste generated by the proposed action. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.
- 1747-3:** DOE notes the commentor's opposition to nuclear power generation. It is the current United States policy that clean, safe, reliable nuclear power continue as a viable component of the United States' energy portfolio. In recognition of this need, the government has initiated nuclear energy research and development programs to address potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) and to ensure that current nuclear power plants can continue to deliver adequate and affordable energy supplies. An enhanced DOE nuclear facility infrastructure is required to support such nuclear energy research and development for civilian applications.

Commentor No. 1748: Anonymous

NI PEIS Toll_Free Telephone

9/15/00

Anonymous

Don't start any nuclear reactors near Hanford or any other place on the mainland of America. Stop all waste being delivered at Hanford or any other place that is on our mainland. Build it someplace out on an island, and where it won't hurt the people, and prove to us that it is safe.

|| 1748-1

|| 1748-2

|| 1748-1

Response to Commentor No. 1748

1748-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, as well as Alternative 4, Construct New Research Reactor, unless it were built on an island.

1748-2: DOE notes the commentor's concern regarding waste generation and the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

Both government and commercial waste disposal sites are operated within the Hanford site. These are permitted by the State of Washington.

Commentor No. 1749: Anonymous

NI PEIS Toll_Free Telephone

9/16/00

Anonymous

Yes, DOE claims that it does have a preferred alternative among the five proposals in the PEIS released on July 21, 2000 but will identify one in the final PEIS. This creates a big credibility gap for those of us who have found that because of the failures of the DOE to identify, to include in the PEIS facts such as:

1. The DOE's own Blue Ribbon Medical Advisory Committee recommended last April that the FFTF not be considered as a viable long_term source of research radioisotopes.

1749-1

Also, the claim that it's needed for NASA research. NASA informed the DOE on May 22nd 2000 that missions can utilize alternative technologies with lower cost, potentially much lower environmental impact than start up of FFTF for production of Plutonium 238.

1749-2

And another thing that was missing from the PEIS was the cost report for alternatives. Also the Nuclear Infrastructure Nonproliferation Impact Assessment was not included. So I would say that this PEIS is a completely faulty matter and that there must be some hidden agenda. We in the Pacific Northwest want to have you fulfill commitment to close down FFTF and clean up Hanford, the most polluted place in the United States. Thank you.

1749-3

1749-4

1749-5

Response to Commentor No. 1749

- 1749-1:** The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost-efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.
- 1749-2:** DOE notes the commentor's views about FFTF and the production of plutonium-238 for use in future NASA space exploration missions. The May 22, 2000, correspondence from NASA to DOE identifies that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and

Commentor No. 1749: Anonymous (Cont'd)

Response to Commentor No. 1749

need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

- 1749-3:** The costs and nuclear nonproliferation impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such ancillary documents need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed these documents to more than 730 interested parties on August 24 and September 8, 2000, respectively. Both reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided summaries of the Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment in Appendixes P and Q, respectively, in the Final NI PEIS.
- 1749-4:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. With respect to previous commitments to deactivate FFTF, a change to the Tri-Party Agreement (TPA) removed the planned milestone for total deactivation of the FFTF until its ultimate fate was assessed. That proposed TPA milestone change was the subject of previous public meetings.
- 1749-5:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This

Commentor No. 1749: Anonymous (Cont'd)

Response to Commentor No. 1749

agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities. A previous change to the Tri-Party Agreement (TPA) removed the planned milestone for total deactivation of the FFTF until its ultimate fate was assessed. That proposed TPA milestone change was the subject of previous public meetings.

Commentor No. 1753: Janelle Spain

NI PEIS Toll_Free Telephone

9/17/00

Janelle Spain
509_722_3046

I have comments. My name is Janelle Spain and telephone number 509_722_3046. And this is my comment:

The Department of Energy Nuclear Infrastructure should by no means be expanded for future research and development. Research and production. This is about the stupidest idea I've ever heard. Already we have a nuclear contamination crisis in our backyard. Already the Hanford nuclear reservation is filled with leaking tanks of toxic nuclear waste. Already taxpayers are spending billions in an attempt to clean up the mess and there exist no credible solution for rendering the materials harmless. When is enough, enough? The uranium is best left underground and Hanford is best left in a purely clean up mode. It would be a grave error to expand production at Hanford and produce more plutonium regardless of any perceived need to meet future demands of nuclear products. It's simply not worth it because workers and civilians are exposed to harmful ionizing radiation at every stage of the nuclear fuel cycle. From mining the uranium, to operating the reactors, to storing and transporting the end product and waste. Plutonium is perhaps the most toxic substance on the planet. It has a half life of 24,400 years. Once created it remains dangerous in human terms forever and leaves a poisonous legacy to future generations. Atomic radiation is an invisible killer that causes cancers and birth defects. Every dose is an overdose. We must not allow any expansion or new production at Hanford. We must not allow the Department of Energy to further pollute our state.

1753-1

1753-2

1753-3

1753-4

1753-5

Response to Commentor No. 1753

- 1753-1:** DOE notes the commentor's opinion that there is no need to expand its nuclear infrastructure for nuclear research and development missions. Clean, safe, reliable nuclear power has a role today and in the future for our national energy security. In recognition of this need, nuclear energy research and development programs have been initiated to address potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) and to ensure that current nuclear power plants can continue to deliver adequate and affordable energy supplies. Because it is unlikely that existing facilities could fully and effectively support these nuclear energy research and development initiatives without disturbing their existing missions, DOE is proposing to enhance its nuclear facility infrastructure to also support these activities. Information on the need for nuclear energy research and development is provided in Section 1.2.3 of Volume 1.
- 1753-2:** DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.
- 1753-3:** DOE notes the commentor's views about FFTF and the production of plutonium-238. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Although research to identify other potential fuel sources to support these space exploration missions has been conducted, no viable alternative to using plutonium-238 has been established. Based on NASA guidance to DOE on the potential use of

Commentor No. 1753: Janelle Spain (Cont'd)

Response to Commentor No. 1753

radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

1753-4: The commentor's positions concerning exposure to ionizing radiation, the nuclear fuel cycle, plutonium, and radiation dose are noted. Risks due to uranium mining are outside the scope of this PEIS. Chapter 4 of Volume 1 and Appendixes H through J discuss the radiological risks and waste generation that would result a range of reasonable alternatives and includes the impacts from operation of reactors and fabrication processing facilities, target storage, transportation activities, waste generation, and waste management. Radiological risks that would result from production of plutonium-238 and medical/industrial isotopes were found to be small. Waste that would be generated under each of the nuclear infrastructure alternatives would place no significant burden on existing waste management systems at the candidate sites.

1753-5: DOE notes the commentor's concerns regarding environmental impacts associated with potential expansion or new production at Hanford. The environmental impacts associated with nuclear infrastructure operations at Hanford are addressed in detail in Section 4.3 of the NI PEIS. All air emissions and wastewater discharges would be in accordance with applicable permit and regulatory requirements. The release of criteria air pollutants would result in concentrations well below Federal and state air standards (Table 4-13). The release of radioactivity and hazardous chemicals into the atmosphere would have a negligible effect on human health (Tables 4-17 and 4-19). There would be no discernible impacts to groundwater or surface water quality (Section 4.3.1.1.4). It is concluded that nuclear infrastructure operations would result in small impacts to the biosphere and would not contribute to polluting Washington or any other state.

Hi, I'm calling from Tulsa, Oklahoma. I'm terribly concerned, terribly opposed, concerned about, opposed to, what is it? Fabricating more plutonium 238? Are you talking about making more of it on purpose? I thought we were killing ourselves trying to get rid of it. I understand that they're planning to make more of it for the space program. We don't want that. We don't want to be sending plutonium into space and we certainly don't want to be making more of the damn stuff. Somebody up there is crazy to come up with this idea. Well we don't want it.

1757-1

Response to Commentor No. 1757

1757-1: Plutonium-238, used to support NASA space missions, is not weapons grade plutonium (i.e., plutonium-239). Whereas the United States is currently planning for the disposition of tons of surplus plutonium-239 that is not needed to support the U.S. nuclear weapons stockpile, there are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems and the plutonium-238 that fuels them for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, DOE anticipates that the existing plutonium-238 inventory will be exhausted by approximately 2005. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Commentor No. 1758: Nicki Stash

NI PEIS Toll_Free Telephone

9/18/00

Nicki Stash
360_733_6121

Hi. I would to leave a comment. My name is Nicki Stash. My number is 360_733_6121. I would like you to shut down the FFTF reactor and I would prefer that you please focus on cleanup. OK,
Thanks, Bye.

1758-1

1758-2

Response to Commentor No. 1758

-
- 1758-1:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 1758-2:** Restoration of the Hanford Site and waste management activities are the primary missions at Hanford. FFTF restart would not impact the cleanup missions at Hanford.

Commentor No. 1759: Maureen Dorney

NI PEIS Toll_Free Telephone

9/18/00

Maureen Dorney
Boynton Beach, FL

Good Morning. I am calling to register my comments about the Department's plan to expand their plutonium development. I am strongly opposed to developing any further use of plutonium because it's so extremely toxic and I am sure that the department could find alternative sources of power for the space exploration, as the Europeans have been doing, particularly using solar panels. I do know from personal experience about the contamination, accidents, and as I look at today's date, September 18th, I'm reminded that this would be my oldest brother's birthday, he, sad to say died of a result of a nuclear accident at the age of 29. He was working on development of nuclear energy for the Baney Corporation under contract to Atomic Energy Commission. So I know of the hazards of some of this. And I've been following some of the other more recent very tragic accidents. We cannot afford to take this risk and to expose our people on this planet to the deadly hazards of plutonium. It is one of the most toxic elements known. Please reconsider. My name is Maureen Dorney and I live in Boynton Beach, Florida. Thank you.

1759-1

1759-2

Response to Commentor No. 1759

1759-1: DOE notes the commentor's views about the production of plutonium-238. Potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed production of plutonium-238 are relatively low and are discussed in detail in Chapter 4 of Volume 1 and appendixes H, I, and J of Volume 2 in the Final NI PEIS.

Potential health and safety impacts associated with future launches of spacecraft utilizing plutonium-238 are not within the scope of the NI PEIS analysis, but would be addressed in the specific NEPA documentation prepared by NASA in support of such missions. Issues of research and development of alternative energy sources are beyond the scope of this NI PEIS. The stated missions to be addressed in this PEIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and nuclear research and development, can currently only be met using nuclear reactor or accelerator technologies.

1759-2: The commentor's concerns about plutonium are noted. Radiological risks that would result from production of radioisotopes, including plutonium-238, are described in Chapter 4 of Volume 1 and Appendixes H and I. The evaluation showed that plutonium would be the primary contributor to health impacts associated with processing of irradiated neptunium targets at candidate processing facilities. However, the analysis showed that no radiological or chemical fatalities would be expected to result from implementation of the nuclear infrastructure alternatives. See, for example, Sections 4.3.1.1.9, 4.3.2.1.9, and 4.3.3.1.9 in Chapter 4 and the Summary Tables in Chapter 2 of Volume 1 of the NI PEIS.

Commentor No. 1760: Mildred McElhaney

NI PEIS Toll_Free Telephone

9/18/00

Mildred McElhaney
5806 247th Street, SW
Mount Lake Terrace, WA 98043

I would like to express my opinion about the Hanford cleanup. I think that we should go ahead with the Hanford cleanup with all due speed and do not start some new production. I feel that starting up the FFTF would produce a radioactive waste and I don't want anymore workers' health and safety put into jeopardy. So that's my opinion and I am a voter and my name is Mildred McElhaney and my address is 5806 247th Street SW, Mount Lake Terrace, WA 98043.

Thank you.

1760-1

1760-2

1760-3

1760-4

Response to Commentor No. 1760

1760-1: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

1760-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1760-3: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

1760-4: Worker safety (radiological protection) is a key element of DOE's Radiological Health and Safety Policy (DOE P 441.1, April 26 1996). This policy states in part that DOE facilities must "conduct radiological operations in a manner that controls the spread of radioactive materials and reduces exposure to the workforce and the general public and that utilizes a process that seeks exposure levels as low as reasonably achievable." Each DOE site, including Hanford, is required to implement a radiological control program with the intent to meet this policy goal. Based on the assessment of worker health impacts for all of the alternatives and options that make use of Hanford facilities, the most likely impact of the use of these facilities is no increase in cancer fatalities

Commentor No. 1760: Mildred McElhaney (Cont'd)

Response to Commentor No. 1760

among the facility workers. For example in Alternative 1 option 3, all of the activities (target irradiation and processing) occur at Hanford facilities. As shown in Section 4.3.3.1.9, the expected consequences are less than one additional fatal cancer among the workforce; that is, no additional fatal cancers are expected.

Commentor No. 1761: Harvey G. Spencer

NI PEIS Toll_Free Telephone

9/18/00

Harvey G. Spencer
143 Emerald Drive
Quinn, WA 98382

I received a card postmarked September 7th from Germantown about two reports related to the Draft NI PEIS. Now I've had the summary of the NI PEIS but I wanted to review the cost report on the alternatives as well as the Nonproliferation Assessment before making a comment. I hardly had time to make a comment by the 18th, by the way which is today, without reviewing these reports. After all the summary doesn't say very much except that various things will work. It doesn't give you the basis for making any kind of a comment.

I tried to review those on the Internet several times and I was not able to make your search engine work. Your card that you sent out should indicate the links to use on the Internet with which to locate those reports. I couldn't even locate the base Draft Programmatic Impact Statement itself on the Internet. I think you better work on your search engine and your identification of these reports. I protest not being able to make a comment on this PEIS by virtue of the unavailability of the important reports on it and I suggest you that you should extend the comment period. Thank you. This Harvey G. Spencer at 143 Emerald Drive, Quinn, Washington 98382, phone number 360_681_2338. Thank you very much.

1761-1

Response to Commentor No. 1761

1761-1: DOE regrets the difficulties encountered by the commentor in obtaining copies of the Cost Report, Nuclear Infrastructure Nonproliferation Impact Assessment, and the Draft NI PEIS from the Internet and inability to fully comment on the NI PEIS. The NI PEIS could be directly accessed from a hyperlink at the bottom of the DOE's Office of Nuclear Energy, Science and Technology homepage (<http://www.nuclear.gov>) that provides linked access to the Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment. DOE concedes that access through the DOE home page (<http://www.doe.gov>) may have been more problematic. In the future, DOE will endeavour to make electronic access via the Internet to posted documents on its servers as efficient and direct as possible.

Commentor No. 1762: Marjorie Westman

NI PEIS Toll_Free Telephone

9/22/00

Marjorie Westman
123 McKinley
Burleith, WA 98233

My name is Marjorie Westman. I live at 123 McKinley in Burleith, Washington 98233, and I'm deeply perturbed about the idea of starting up that facility. I remember Einstein's comment many years ago that we were asking for it not keeping up with our technology. We're pressed for that now. We know we have not solved the nuclear waste problem. Please, please do not consider starting this thing up again. Thank you.

|| 1762-1

|| 1762-2

Response to Commentor No. 1762

1762-1: DOE notes the commentor's concern regarding waste management. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

1762-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Commentor No. 1763: Laura Houston

NI PEIS_Toll Free Telephone

9/18/00

Laura Houston
4031 SE Madison
Portland, OR 97214
503_232_7117

I was just calling in response to saying no on reactivation of the Hanford site. I personally have thyroid cancer and I know that people living in that area were definitely impacted by thyroid cancer and other cancers. So it is very much a hazard to people, and our water, and our animals. So absolutely not. My name is Laura Houston. My address is 4031 SE Madison, Portland, Oregon 97214. I can be reached at 503_232_7117. Again, no reactivation. Thanks, bye.

1763-1

1763-2

Response to Commentor No. 1763

1763-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1763-2: The commentor's concern about the Hanford Site as a potential hazard to people, water, and animals in the Portland area is noted.

As discussed in Section 3.4.9.3 of Volume 1, the question of whether the population surrounding the Hanford Site is subject elevated rates of cancer incidence or cancer mortality is unresolved. Existing studies and data suggest that cancer mortality and cancer incidence rates in counties adjacent to the Hanford Site are not elevated. Radiological impacts of the Hanford Site on the Portland area would be much smaller than the impacts on counties adjacent to the site.

Chapter 4 of Volume 1 presents the analysis of impacts to human health and water resources that would be expected under implementation of Alternative 1, Restart FFTF. Radiological risks to human health for people residing within 80 kilometers (50 miles) of the Hanford Site were found to be small. Because Portland is further than 80 kilometers (50 miles) from the site, radiological impacts to persons in Portland would be smaller than those listed in Chapter 4. There are no radiological liquid effluent pathways to the environment from FFTF, so that implementation of Alternative 1 would not be expected to contaminate the Columbia River. Prevailing winds at Hanford blow toward Grant County, Washington from the south to south-southwest directions. Grant County would be expected to bear the major burden of wind borne contamination from the Hanford Site. Environmental impacts on the Portland area that would result from implementation of the nuclear infrastructure alternatives described in Section 2.5 of Volume 1 would be essentially zero.

Implementation of the alternatives described in Section 2.5 of Volume 1 would not be expected to adversely impact wildlife in areas surrounding the Hanford Site or Portland. According to an International Atomic Energy Agency (IAEA) publication (IAEA Technical Report Series No. 332, Effects of Ionizing Radiation on Plants and Animals at Levels Implied by Current Radiation Protection Standards), a dose rate of 100 millirem per year to the most exposed human will lead to dose rates to plants and animals of less than 0.1 rad per day. The IAEA concluded that a dose rate of 0.1 rad per day or less for animals and 1 rad per day or less for plants would not affect these populations. The largest individual dose for any of the nuclear infrastructures alternatives under normal operations

Commentor No. 1763: Laura Houston

Response to Commentor No. 1763

would be less than 0.1 millirem, which is three orders of magnitude less than the IAEA threshold for adverse effects. Therefore, as a result of implementation of the nuclear infrastructure alternatives, all impacts to ecological resources would be small in the immediate area of the Hanford Site and negligible at all distant locations.

Commentor No. 1764: Rosemary Sirellia

NI PEIS Toll_Free Telephone

9/18/00

Rosemary Sirellia
206_522_7075

This is message is directed to Colette Brown. I would like the FFTF nuclear reactor shut down and the focus back to the clean up at Hanford. My name is Rosemary Sirellia and the telephone is 206_522_7075. Thank you. Good_bye.

|| 1764-1

|| 1764-2

Response to Commentor No. 1764

-
- 1764-1:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 1764-2:** Restoration of the Hanford Site and waste management activities are the primary missions at Hanford. FFTF restart would not impact the cleanup missions at Hanford.

Commentor No. 1765: Mary Sanderford

NI PEIS Toll_Free Telephone

9/18/00

Mary Sanderford

Hello. This is Mary Sanderford. I'm calling with regard to the restart of the FFTF. I certainly am against it and I hope that along with the others, calling that will have some effect. Please take note of it and not have that reactor start at Hanford.

1765-1

Response to Commentor No. 1765

1765-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Commentor No. 1766: Thomas Wright

NI PEIS Toll_Free Telephone

9/18/00

Dr. Thomas Wright
Portland, OR 97213

I'm calling. My name is Dr. Thomas Wright. Again, Dr. Thomas Wright and I'm from Portland, Oregon, my zip code is 97213. I am calling to oppose the restart of the FFTF nuclear power plant at Hanford. So along with the other thinking individuals, I oppose that. OK, again my name is Dr. Thomas J. Wright, Portland, Oregon 97213. I opposed to the restart of the FFTF nuclear power plant at Hanford. Bye.

1766-1

Response to Commentor No. 1766

1766-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Commentor No. 1767: Aniska Kaus

NI PEIS Toll Free Telephone

9/18/00

Aniska Kaus

Yes my name Aniska Kaus, and I'm an Oregon voter and I'm worried about the Hanford nuclear reactor whose waste products seep into the Columbia River and I want the Tri_Party Agreement to be upheld. Please clean the Hanford up and get the nuclear reactor shut down. Thank you.

1767-1

1767-2

Response to Commentor No. 1767

1767-1: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford and the risk of contamination to the Columbia River. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

1767-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 1768: James Granland

NI PEIS_Toll Free Telephone

9/18/00

James Granland
206_282_9472

Hello my is James Grandland. My telephone number is 206_282_9472. I'm calling just to get my comment in at the very end of the comment period concerning the restart of the Fast Flux reactor at Hanford. I want to voice my opinion, as a citizen, that I prefer that this reactor not be restarted. I think the reasons that are being put forth for the medical isotopes, I believe it's economically not viable to produce them that way and that's just a smoke screen. By the way, these comments are directed to Colette Brown, if that's applicable, and I'm happy to receive a phone call back along regarding that. But I think the government or the management of the Hanford facility has not proven that they're capable of maintaining the facility in a safe matter and producing more radioactivity there is not a wise move until we're better able to deal with what we've got. Please call me back at 206_286_9166 if you have any further questions about how I feel about this.

1768-1

1768-2

Response to Commentor No. 1768

1768-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1768-2: FFTF operated safely for more than 10 years with no impact to health or safety of onsite workers or the public and no discernible impact to the environment. FFTF meets all safety requirements established by DOE and the DOE requirements are consistent with those established and applied by other regulatory agencies such as the Nuclear Regulatory Agency. Analyses presented in the PEIS show that the risks associated with operation of the FFTF are extremely small.

Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. Wastes are safely managed in accordance with applicable federal and state regulations and appropriate DOE Orders.

Joan Chantler
509_748_2551

Hi. My name is Joan Chantler. My daytime number is 509_748_2551. I'd like to register opposition to the idea of reactivating Hanford. I just think we haven't got the first mess cleaned up. Let's not work on making another one. So thank you very much. I appreciate the opportunity to state my opinion. Bye.

|| 1769-1

|| 1769-2

Response to Commentor No. 1769

1769-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1769-2: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

Commentor No. 1770: Marlyee

NI PEIS Toll_Free Telephone

9/18/00

Marlyee

Hi my name is Marlyee my number is 503_872_8747 and I'm just calling to let you know that I completely disagree with the restart of the Fast Flux Testing Facility. It's sounds like it's going to be extremely harmful to the environment as well as the people of the Northwest. So I my vote is to not start it. I feel passionate about it and I hope you guys think twice about it. It's my understanding that it is an unnecessary step, for apparently NASA is needing it and it's completely unnecessary. So they're saying this as well. So please take my comments into consideration and do the right thing.

1770-1

1770-2

1770-3

Response to Commentor No. 1770

1770-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1770-2: DOE notes the concern expressed in the comment on the potential impacts of FFTF and support facility operations described in the NI PEIS. The environmental impacts associated with operation of the FFTF and support facilities at Hanford during normal operations and from postulated accidents are presented and discussed in Section 4.3 of the NI PEIS. All impacts to human health and to ecological resources would be small in the immediate area of the Hanford site and negligible at all distant locations.

1770-3: A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Commentor No. 1771: Anderson Marie

Anderson Marie

I'm worried about the Columbia River and I want the Tri_Party agreement to be upheld. My name is Anderson Marie and please shut the Hanford reactor down. Thank you.

|| 1771-1

|| 1771-2

Response to Commentor No. 1771

1771-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Public meetings were held on this formal milestone change.

The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

1771-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 1772: Sasha Seyavitz

NI PEIS Toll_Free Telephone

9/18/00

Sasha Seyavitz

Hi. I'm calling with my public comments for the EIS. My name is Sasha Seyavitz. I'm calling to ask you to shut down the FFTF reactor and focus on cleanup at Hanford. Thank you very much. Bye.

|| 1772-1
|| 1772-2

Response to Commentor No. 1772

- 1772-1:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 1772-2:** Restoration of the Hanford Site and waste management activities are the primary missions at Hanford. FFTF restart would not impact the cleanup missions at Hanford.

Commentor No. 1773: Anonymous

NI PEIS Toll_Free Telephone

9/14/00

Anonymous

I'm calling to dissuade the powers that be to close the Hanford nuclear facility. It is a matter of environment and health for the whole region. Thank you very much.

1773-1

Response to Commentor No. 1773

1773-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 1774: William Stratton

NI PEIS Toll_Free Telephone

9/15/00

William Stratton
2 Akima Lane
Los Alamos, NM 87544
505 (672)_3706

My name is William Stratton, 2 Akima Lane, Los Alamos, NM 87544. My telephone 505 (672)_3706. I would like to receive the summary of the Programmatic Nuclear Infrastructure Environmental Impact Statement (NIPEIS). I just learned that there's now another scheme to shut down the Fast Flux Test Facility. The Fast Flux Test Facility is the only sodium cooled reactor operating in the United States. For the future it is certainly vital to keep this going. In the mean time it is useful in producing isotopes for medical applications and probably for industrial applications. I think it should be considered more widely, more broadly than the small number of hearings that you've outlined to me. There is no hearing in the Southwest where we at Los Alamos might have commented or people from Sandia or Albuquerque. We are a rather significant part of the nuclear family in this country. So please send me the summary volume and record the fact that I object to shutting down the FFTF. I think we need to have all the isotope production in this country that we can obtain. We've been dependent upon Canada for a long time. I think we should have our own sources. We should have our own long range development program for future electric power reactors. Please send this summary as soon as possible. My letter will follow shortly. Certainly for something of this magnitude, the comment period should be longer. Thank you.

1774-1

1774-2

1774-3

1774-4

1774-1

Response to Commentor No. 1774

1774-1: DOE notes the commentor's support for Alternative 1, Restart FFTF, and opposition to Alternative 5, Permanently Deactivate FFTF.

1774-2: DOE notes the commentor's request for an additional public hearing in the Southwest United States and extension of the public comment period. During the public comment period, July 28 through September 18, 2000, DOE hosted seven public hearings. In accordance with NEPA, hearings were held in appropriate localities including near the locations potentially affected by the proposed actions as well as in locations where the public had expressed a substantial interest in the decisions to be made. These locations included Oak Ridge, Tennessee; Idaho Falls, Idaho; Hood River, Oregon; Portland, Oregon; Seattle, Washington; Richland, Washington; and Crystal City, Virginia (outside Washington, D.C.). For persons unable to attend these hearings or living outside of the areas, the public also had the opportunity to comment on the Draft NI PEIS through the U.S. mail, e-mail, a toll-free fax number, and a toll-free phone number.

The Council on Environmental Quality's (CEQ) "Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act" (40 CFR 1506.10(c)) require that a minimum of 45 days be allowed for public comment on the Draft NI PEIS. As stated in the Notice of Availability (65 FR 46443 et seq.), the public comment period began on July 28, 2000 and continued to September 18, 2000. In preparing the Final PEIS, DOE has assessed and considered both oral and written comments received on the Draft PEIS during the public comment period and has responded to these comments in the Final PEIS. Volume 3 of the NI PEIS contains public comments received on the NI PEIS and DOE responses to those comments. Moreover, late comments were considered to the extent practicable.

1774-3: DOE notes the commentor's opposition to Alternative 5, Permanently Deactivate FFTF, and support for isotope production in the United States. The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. Under the NI PEIS proposed action and consistent with its mandates under the Atomic Energy Act, DOE would enhance its existing nuclear facility infrastructure to, among other things, more effectively support production of radioisotopes for medical applications and research. DOE's intent is to complement commercial sector capabilities to ensure that a reliable supply of isotopes is available in the U.S. to meet future demand, and to encourage the commercial sector to privatize the production of

Commentor No. 1774: William Stratton (Cont'd)

Response to Commentor No. 1774

isotopes that have established applications to a level that would support commercial ventures. FFTF operation would not eliminate the need to acquire isotopes from foreign sources, including Canada.

1774-4: DOE notes the commentor's opinion about the need for development of future electric power reactors. As discussed in Section 1.2.3 of the NI PEIS, the Nuclear Energy Research Advisory Committee (NERAC) Subcommittee on Long-Term Planning for Nuclear Energy Research has set forth a recommended 20-year research and development plan to guide DOE's nuclear energy programs in areas of material research, nuclear fuel, and reactor technology development. This plan stresses the need for DOE facilities to sustain the nuclear energy research mission in the years ahead. Such nuclear research and development initiatives requiring an enhanced DOE nuclear facility infrastructure fall into three basic categories: materials research, nuclear fuel research, and advanced reactor development. Further information on the need for nuclear energy research and development is provided in Section 1.2.3 of Volume 1.

Commentor No. 1775: P. F. Shaw

From: Pete Shaw[SMTP:PETESHAW@JUNO.COM]
 Sent: Monday, September 18, 2000 4:01:47 PM
 To: INFRASTRUCTURE_PEIS, NUCLEAR
 Subject: Restart and Operation of the FFTF
 Auto forwarded by a Rule

I support restart and operation of the FFTF for the following reasons:

Production of medical isotopes for cancer research and treatment

Domestic production of radiation sources for use in irradiation of food and sterilization of medical/surgical supplies

Materials and source research and development

The reason given for the shutdown of the fast reactor programs in the United States _ which included the FFTF _ was to discourage the proliferation of nuclear weapons worldwide. That was a total failure. We pretty much destroyed our position as world leader in nuclear technology without gaining any benefit whatsoever by that sacrifice.

In response to the often heard statement that restart of the FFTF would detract money and attention from cleanup of the Hanford reservation, it's much more likely that shutdown of the facility would have that effect. Restart and operation would be funded from different sources and be done by different staff.

A excellent job was done on the PEIS. The people responsible can take pride in accomplishing that, and under pressures that must have been obscene.

Thank you for the opportunity to comment on the program.

Yours truly,
 P.F. Shaw
 2217 Camas Ave, Richland, WA 99352_1905 17

1775-1

1775-2

Response to Commentor No. 1775

- 1775-1:** DOE notes the commentor's support for Alternative 1, Restart FFTF. It should be pointed out that food irradiation is not in scope of the PEIS.
- 1775-2:** FFTF was closed due to cost considerations arising from cancellation of liquid metal fast reactor programs (which were key elements in closed fuel cycle and actinide waste disposal technology development), and the projected availability of other irradiation facilities to meet DOE's mission requirements. DOE does not agree that the shutdown of these programs was a failure and destroyed the U.S. world leadership position in nuclear technology. The programs were successfully shutdown, and the associated facilities now are either being shutdown or considered for potential use (as in the case of FFTF) in programs that meet DOE mission needs and are compliant with U.S. nonproliferation policy.

 Subject: SHUT DOWN HANFORD'S FFTF REACTOR!
 Auto forwarded by a Rule

To: Colette E. Brown, US Department of Energy

WE have heard that the Department of Energy is considering restarting the FFTF Nuclear Reactor at Hanford, Washington, to produce research medical isotopes and plutonium_238.

WE ARE COMPLETELY OPPOSED TO THIS PLAN !!!

***Currently Hanford is one of THE MOST CONTAMINATED SITES in this country. There is already a plume of highly toxic substances leaking from this site threatening pollution of the entire Columbia River system. The efforts to clean up Hanford have been costly and ineffective. WE DO NOT NEED TO ADD TO THE WASTES ALREADY THERE!!!

***Restarting the FFTF Nuclear Reactor would delay already tardy clean_up efforts!!!

***Demand for medical isotopes can be met using currently operating facilities in other regions.

***The Department of Energy has NOT fulfilled its responsibility to protect the populace, wildlife, and water resources of Washington State from the dangers of Hanford Nuclear operations in the past; there is no reason to believe they will do so for future operations.

We want the FFTF to be completely shut down, and Hanford and its plume contained/cleaned_up FIRST, before any consideration can be given to future use. CLEAN UP YOUR MESS!!!

Marilee Henry and Jeffrey Thorson
 14042 _ 97th Ave. N.E., Bothell, Wa. 98011

1778-1

1778-2

1778-3

1778-2

1778-4

1778-2

Response to Commentor No. 1778

1778-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.

1778-2: Restoration of the Hanford Site and waste management activities are the primary missions at Hanford.

Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

1778-3: The United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements.

***Commentor No. 1778: Marilee Henry and Jeffrey Thorson
(Cont'd)***

Response to Commentor No. 1778

Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term (less than 5 years). Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

1778-4: See response to comment 1778-1.

Commentor No. 1779: Norm Buske

From: Norm Buske[SMTP:SEARCH@IGC.ORG]
 Sent: Monday, September 18, 2000 6:56:57 PM
 To: INFRASTRUCTURE_PEIS, NUCLEAR
 Subject: Comment: NI PEIS
 Auto forwarded by a Rule

To: Colette Brown 9/18/00
 Fm: Norm Buske, Nuclear_weapons_free America
 Subj: Comment: NI PEIS

Dear Ms Brown:

At the PEIS Scoping Hearings, you asked what the public wanted included in the PEIS. I asked for the impact of the products of FFTF if the reactor undertook modern nuclear weapons material production on an "activity" rather than a "mission" basis.

You failed to provide that likely activity impact in the PEIS.

I asked again for that impact at your Seattle hearing on August 30, 2000. Although you might not have heard, because you walked away as I was commenting...

Anyway, the first two sentences of Sec. 2.3.1.1.3 of the NI PEIS (p.2.13) state that FFTF would only use "one quarter of reactor design power level to meet the irradiation requirements of the proposed missions. Periodic increases in power level between 100 and 400 megawatts may be required to support nuclear research and development activities."

Neutrons produced by a reactor at quarter power level are expensive. So there is economic virtue in having other "required activities" that would use up to three times the power of the stated mission activities for FFTF.

But that implies FFTF is really being restarted on pretext missions while it's "required activities" are clandestine.

1779-1

Response to Commentor No. 1779

1779-1: DOE notes the commentor's views. The NI PEIS evaluates a range of reasonable alternatives for expanding DOE's existing nuclear facility infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by reestablishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and that the United States has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the U.S. energy portfolio. No component of the proposed action is for the purpose of supporting any defense or weapons-related missions or activities. The environmental impacts examined in this NI PEIS are those related to the stated missions/activities.

Commentor No. 1779: Norm Buske (Cont'd)

This concern has come up increasingly during the EIS hearings. To many people, it is now clear that DOE seeks to restart FFTF on any civilian mission mix it can pretend is viable, and then to go into clandestine production of special nuclear weapons materials.

The FFTF reactor is the only reactor in the DOE complex presently suitable for clandestine weapons material production in significant quantities for deployment and use on the nuclear battlefield.

I request once again that the Final EIS include a range of likely environmental impacts from the use of such generic, "necessary activities" products of FFTF operation.

As deployment of a new generation of American nuclear weapons can be expected to have proliferation and other de_stabilizing consequences. Thus, I also request you include in the Final EIS, environmental impact scenarios in which weapons comparable to those from FFTF_produced, special nuclear materials are used against a range of American cities and other targets.

With my thanks again for your consideration,
Norm Buske
Nuclear_Weapons_Free America

 Sept. 18, 2000
 Ms. Colette Brown
 DOE, Office of Space and Defense Power Systems

Re: Draft Programmatic Environmental Impact Statement for accomplishing expanded civilian nuclear energy research and development and isotope production mission in the United States, including the role of the Fast Flux Test Facility

Dear Ms. Brown:

How is it that the federal agency that employs some of the best minds on the planet consistently come up with the most hair_brained schemes to try to justify continuing the production and proliferation of some of the most deadly, dangerous and unnecessary substances known to man?

Instead of trying to come up with new missions for obsolete, discredited and environmentally problematic facilities like the FFTF at Hanford and Building 666 at INEEL, shut them down and get on with the only jobs left for the DOE that make common sense: Clean up the mess left from half a century of playing with nuclear "fire" and develop clean alternative energy resources for the future.

I favor Alternative 5 of the PEIS and shut down of the FFTF. Please, do not create another project that will add to the already overwhelming amount of nuclear waste sitting above and leaching into the Snake River Aquifer at INEEL. Thank you for the opportunity to comment on this proposed plan.

Sincerely,
 Gary E Richardson
 746 Santa Paula Ct., Boise, ID 83712

1781-1

1781-2

1781-1

1781-3

Response to Commentor No. 1781

1781-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF. The FFTF reactor was constructed and initiated operation in the mid 1980s, making it DOE's newest reactor. It has no structural flaws that would prevent safe operations. As stated in Volume 1, Section 2.3.1.1.2, several upgrades would be implemented if a decision to restart FFTF was made by DOE. These upgrades would improve efficiency and reliability, minimize waste, and conform to current industry standards. Throughout the life of FFTF, the FSAR has been maintained via approved change control and engineering change notices. All updates and revisions have had the required reviews and approvals. No deficiencies in the FFTF design, analysis, facility condition, or operations have been identified or recognized that would prevent FFTF from meeting the safety objectives and intent of commercial nuclear safety regulations for equivalent facilities. If the Record of Decision concludes that FFTF should be restarted, a Probabilistic Risk Assessment would be completed and a new FSAR would be prepared in accordance with applicable regulations.

Building CPP-666 is divided into two parts, the Fuel Storage Facility and the Fluorinel Dissolution Process Facility (FDPF). The FDPF is under consideration in this PEIS for storage of neptunium-237 oxide, preparation of neptunium-237 targets, and separation of plutonium-238 from irradiated targets.

DOE believes that FFTF and FDPF will meet, with further analysis and/or minor modifications, the criteria to safely conduct these operations for the 35 year time period being considered in the NI PEIS.

1781-2: DOE notes the commentor's interest in alternative energy sources and concern over nuclear waste, although the issue of the cleanup of existing nuclear waste sites is beyond the scope of this Nuclear Infrastructure PEIS. The DOE missions to be addressed in this EIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development, can currently only be met using nuclear reactor or accelerator technologies.

As discussed in Chapter 4 of Volume 1 (e.g. sections 4.3.1.1.13, 4.3.2.1.13, 4.3.3.1.13), waste will be generated by all of the proposed alternatives including the No Action Alternative. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and

Commentor No. 1781: Gary E. Richardson (Cont'd)

Response to Commentor No. 1781

alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. DOE activities associated with this program would not impact schedule or available funding for existing cleanup activities at candidate sites for implementation of the nuclear infrastructure alternatives.

1781-3: The commentor's position on generation of additional waste at INEEL is noted. Waste generation that would result from implementation of nuclear infrastructure alternatives concerned with the Fluorinel Dissolution Process Facility and/or the Advanced Test Reactor are discussed in Sections 4.3.2.1.13 and 4.4.1.1.13. Localized radiochemical and chemical plumes in the Snake River Plain Aquifer at INEEL are described in Volume 1, Section 3.3.4.2.2. Tritium and strontium-90 plumes in the aquifer are the result of historical waste disposal practices at INEEL. Waste that would result from implementation of the nuclear infrastructure alternatives would be dispositioned in compliance with current waste management procedures at INEEL, and would not be expected to contaminate the Snake River Plain aquifer.

Commentor No. 1782: Mary and Gregory Dyson

From: Dyson[SMTP:DYSE@TELEPORT.COM]

 To: INFRASTRUCTURE_PEIS, NUCLEAR
 Subject: Nuclear Infrastructure PEIS
 Auto forwarded by a Rule

Dear Ms. Brown,

We, like many other residents of the Northwest, oppose the proposed restart of the FFTF Nuclear reactor. Not only do a large number of residents oppose this proposal, but our elected officials do as well.

Hanford already has billions of gallons of high_level radioactive waste that DOE has not dealt with. Hanford is th emost polluted site in the Western Hemisphere. Hanford needs to be cleaned up now, prior to any talks of starting new activity. Where will new waste go if the FFTF reactor is restarted? The DOE needs to clean_up the site to gain the trust of Northwest residents. Why is the DOE continually ignoring our wishes?

The DOE has failed to demonstrate a need for the production of plutonium. We know there are a few, vocal people who think medical isotopes will save their loved ones suffering from cancer. What they fail to understand is that the polluted mess that is Hanford is causing cancer in many more people than medical isotopes can ever save. While we sympathize with the pain and suffering that cancer causes, we cannot advocate for a treatment that poses countless risks. In addition, NASA's current demandfor plutonium is much lower than you project and can easily be met with current contracts. If the demand can not be met, NASA needs to re_evaluate their space program that places citizens at risk of cancer from polluted nuclear sites.

We want the DOE to release the numerical breakdown of the comments you have received _ both for and against _ so that Secretary Richardson is clear where residents of the Northwest

1782-1

1782-2

1782-3

1782-2

1782-4

1782-5

1782-4

1782-6

1782-7

Response to Commentor No. 1782

1782-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.

1782-2: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

There are currently 53 million gallons of waste stored in underground storage tanks on the Hanford Site. Treatment of this waste has already been determined. None of the DOE missions considered by this PEIS will add to this volume of waste.

DOE is using this opportunity to solicit public comment on this NI PEIS.

1782-3: Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

1782-4: DOE notes the commentor's views. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems,

Commentor No. 1782: Mary and Gregory Dyson (Cont'd)

stand. You need to also include in your numbers, the City Councils that have passed resolutions against FFTF restart.

|| 1782-7
|| (Cont'd)

The No Action Alternative must include the shutdown of FFTF instead of maintaining it on a stand_by basis. USDOE should chose alternative 5 _ shut down FFTF.

|| 1782-8
|| 1782-9

Thank you,

Mary and Gregory Dyson
232 NE Stanton St.
Portland, OR 97212

Response to Commentor No. 1782

and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup.

1782-5: DOE notes the commentor's concerns regarding ongoing activities to remediate the existing contamination at Hanford. The Hanford Site environmental restoration activities are high priority to DOE and are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The NI program would not impact the schedule or available funding for existing cleanup activities.

The NI PEIS evaluated the maximum cumulative radiation exposure to the public from all reasonably foreseeable Hanford Site activities, including

Commentor No. 1782: Mary and Gregory Dyson (Cont'd)

Response to Commentor No. 1782

future waste management and remediation activities (see section 4.8.3.3), over the 35-year time-frame of NI-related activities. As shown in Table 4-173, the dose to the maximally exposed individual would be expected to remain well within regulatory limits. Based on an exposure period of 35 years, 0.21 (<1) latent cancer fatalities would be expected to occur among the local population over the 35-year period as a result of Hanford related radiation exposure.

The annual doses to the public from the Hanford site and proposed NI PEIS activities above are insignificant. For perspective, the radiation dose the average American receives from natural sources is about 300 mrem each year. Based on the same 35 year time period used above, approximately 2,000 latent cancer fatalities would be expected among the same population as a result of natural (non-Hanford related) radiation exposure. In that same 35 years, about 19,000 cancer fatalities from all causes would be expected in the same population.

- 1782-6:** DOE notes the commentor's concern for NASA's use of nuclear materials for space missions, although this issue is beyond the scope of this PEIS. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch.
- 1782-7:** In preparing the Final PEIS, DOE has assessed and considered both oral and written comments received on the Draft PEIS during the public comment period and has responded to these comments in the Final PEIS. Volume 3 of the NI PEIS contains public comments received on the NI PEIS and DOE responses to those comments. These comments are summarized, tabulated, and cross-referenced by commentor, category, and method of submission. A summary discussion is also provided of the overall prevailing issues raised during the public comment period.
- 1782-8:** The No Action alternative is required under Council on Environmental Quality regulations (40 CFR 1502.14(d)). It provides a point of comparison for the action alternatives. The No Action Alternative generally represents the status quo; that is, it includes those actions that

Commentor No. 1782: Mary and Gregory Dyson (Cont'd)

Response to Commentor No. 1782

would normally take place without the proposed action. Since the status quo involves maintaining FFTF in standby and not its deactivation, it is not appropriate to include its deactivation as part of the No Action Alternative. Deactivation of FFTF is included as Alternative 5, Permanently Deactivate FFTF, and as part of Alternative 2, Use Only Existing Operational Facilities, Alternative 3, Construct New Accelerator(s), and Alternative 4, Construct New Research Reactor.

1782-9: See response to comment 1782-1

Commentor No. 1783: Barbara Lyons

 Subject: FFTF Reactor
 Auto forwarded by a Rule

Hello: thank you for taking public comment on the plan to restart the FFTF reactor at Hanford. It sounded like a humanitarian idea, to make plutonium for medical purposes. However, we already know that the DOE is capable of concealing the truth when it comes to pollution. For example, you said that there was no pollution after the recent wildfires, and then you had to admit that it was 1000 times higher than normal. At least, someone said it was that high. I don't really trust your statements, because you seem to want to always reassure people instead of telling the truth. I'm opposed to starting this reactor again. The reactor would not produce the right kind of isotopes, is inefficient, and creates more pollution. There isn't a scientific basis for establishing a crying need for these isotopes at the present time, either. I suppose you want to keep the reactor going, just in case, because you think it is a shame to get rid of something that works. However, this reactor should be scrapped and the whole area should be cleaned up before we have more disasters. Public safety should be more important right now. Thank you for your time.

Sincerely,
 Barbara Lyons 614 North 100th, Seattle, Washington 98133.

1783-1

1783-2

1783-3 | 1783-4

1783-3

1783-1

Response to Commentor No. 1783

1783-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. FFTF restart would not impact the cleanup missions at Hanford.

No radioactive materials were "released" in the Hanford Wildfires of 2000. Wildfires did resuspend some materials already in the environment. The resuspended materials were low, slightly above natural background levels. Real-time monitoring instruments cannot detect environmental levels of contaminants. The low levels required several days of analysis to quantify. DOE publicly reported monitoring results as they became available.

1783-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1783-3: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

Commentor No. 1783: Barbara Lyons (Cont'd)

Response to Commentor No. 1783

The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

- 1783-4:** Potential environment impacts associated with FFTF operations are addressed in detail in Section 4.3 of the NI PEIS. All air emissions and wastewater discharges would be in accordance with applicable permit and regulatory requirements. The release of criteria air pollutants would result in concentrations well below Federal and state air standards (Table 4-13). The release of radioactivity hazardous chemicals into the atmosphere would have a negligible effect on human health (Tables 4-17 and 4-19). There would be no discernible impacts to groundwater or surface water quality (Section 4.3.1.1.4). It is concluded that operation of FFTF would result in small impacts to the biosphere and not contribute to pollution of the environment.

 Subject: keep Hanford shut down!
 Auto forwarded by a Rule

To Whom it may concern:

I agree with Senator Hatfield's position on the FFTF. Also, NASA doesn't reports it has no use for Plutonium 238 at this time, and the DOE's own blue ribbon commission dismisses the usefulness of the FFTF for producing medical isotopes. Why, then, is it still being considered??

Where is the DOE's accountability on this issue? Either a full accounting of FFTF stakeholder interests must be provided the American public, or Hanford, a source of significant anxiety for anyone who knows anything about it, must remain shut down.

Respectfully,

Matthew Witt

 Portland, OR 97210

1784-1

1784-2

Response to Commentor No. 1784

1784-1: DOE notes the commentor's views about FFTF and its use for the production of both medical isotopes and plutonium-238 for use in future NASA space exploration missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Although research to identify other potential fuel sources to support these space exploration missions has been conducted, no viable alternative to using plutonium-238 has been established. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires one-third less plutonium-238 as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000, letter to DOE that large RTGs be maintained as backup. Section 1.2.2 was revised to clarify plutonium-238 mission needs.

DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert

Commentor No. 1784: Matthew Witt (Cont'd)

Comments on the Programmatic Environmental Impact Statement on Nuclear Infrastructure

I support all three missions contemplated in the PEIS. These missions are vital for continued progress in the fields of nuclear energy and nuclear medicine. However, I feel that the PEIS does not make a fair comparison among the options for the following reasons:

1. The EIS appears to be very comprehensive in identifying the various contributors to public and worker risk. However the costs of the different alternatives all contain the cost of decommissioning FFTF buried within the total costs. It would be much clearer to the public and the decision makers if the costs of decommissioning were separated from the overall cost of the Pu_238 and medical isotope production missions. It seems strange that the costs of decommissioning are NOT included in option 2, alternative 1 which presumes the use of FFTF for the production of Pu_238, but that the costs of decommissioning FFTF ARE included in the options that use other facilities. FFTF and ATR and HFIR will all have to be decommissioned some day, so saddling the other options with FFTF decommissioning costs does not seem any more equitable than including the ATR decommissioning costs in the FFTF option..

2. The Nuclear Infrastructure Nonproliferation Impact Assessment arrived much too late (Sept. 15) for a reasonable review. However, the conclusion that option 2, alternative 2 is the worst from a proliferation prevention standpoint is very puzzling. All of the options will require the separation of neptunium and/or plutonium from spent fuel and targets for the production of Pu_238. Furthermore, the production of medical isotopes will generally

1786-1

1786-2

Response to Commentor No. 1786

1786-1: DOE assumes that the commentor is referring to deactivation, not decommission. Decommission costs were not included for any alternative. Deactivation of FFTF is not part of implementing Alternative 1, Restart FFTF. Deactivation of FFTF is part of implementing Alternatives 2, 3, 4, and 5 and including the cost of FFTF deactivation in the implementation costs for these alternatives is appropriate. The Cost Report was structured to identify the implementation costs of the various alternatives so the Secretary of Energy would have this information along with other data for consideration.

1786-2: While it is true that all alternatives, except for no action, require the separation of neptunium, plutonium, medical, and industrial isotopes, the separate nonproliferation impact assessment report identifies two specific factors which are the major contributors to raise a significant nonproliferation concern for Alternative 2, Option 2. Option 2 uses the FDPF/PPP-651 for plutonium-238 production and storage. Nuclear Infrastructure Nonproliferation Impact Assessment, Section 6.2.2.2, states that FDPF/PPP-651 is currently excluded from international monitoring and may not qualify for an exemption under the Fissile Material Cutoff Treaty. These two factors are the basis for identifying Alternative 2, Option 2 as least favorable from a nonproliferation impact standpoint. The commentor's support of U.S. production of plutonium-238 and medical isotopes as a means to reduce the potential for proliferation is noted.

Commentor No. 1786: Steve Herring (Cont'd)

require the chemical processing of targets. Both represent some proliferation risk. However, the goal of nonproliferation policy is to prevent the spread of weapons' technology to current non_weapons' states. The use of separations technologies in the US (i.e. at the Chem Plant at the INEEL or at Hanford) does not present the transfer of that technology to non_weapons' states. Indeed, if the production of medical isotopes and Pu_238 in the US avoids the need to purchase those isotopes from other, non_weapons', countries, such domestic production would serve to reduce the potential for proliferation.

3. The choice of alternative reactors focuses on future needs for steady_state irradiation facilities, such as FFTF and ATR. However, there is a continuing need for transient irradiation, such as in the testing of new fuels. Steady_state reactors cannot perform the transient tests needed to show that new, proliferation_resistant fuels can operate safely under a variety of operating conditions. These testing needs can be met by TREAT at ANL_W and perhaps by the ACRR at Sandia. If the PEIS is really to encompass the infrastructure needs of nuclear research, then transient testing requirements should be addressed.

From a comparison of the risk profiles, it appears that the preferred alternative is Option 2, Alternative 2, i.e. the use of ATR and the FDPF/PPP651 facilities for the production of Pu_238 and medical isotopes.

Thank you,

Steve Herring
298 Call Avenue
Idaho Falls, Idaho 83402

1786-2
(Cont'd)

1786-3

1786-4

Response to Commentor No. 1786

1786-3: As stated in Section 1.2.3 of Volume 1, transient conditions are one of the requirements for nuclear fuel research. The ACRR is operational and available for testing new fuels with transient irradiation. TREAT could also be restarted without NEPA action to support transient irradiation tests of new fuels.

The purpose of this NI PEIS is to evaluate the environmental impacts of all reasonable alternatives capable of supplying steady state neutron streams to fulfill the requirements of the missions described in Section 1.2 of Volume 1, which include production of medical and industrial isotopes, production of plutonium-238 for NASA space missions, and civilian nuclear research and development. The Record of Decision will be based on a number of factors that include environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

1786-4: DOE notes the commentor's support for Option 2 of Alternative 2, Use Only Existing Operational Facilities. It should be noted that the preferred alternative need not be the alternative with the least environmental impacts.

Commentor No. 1787: Steve Hiller

From: Steve Hiller[SMTP:SWHILLER@TELEVAR.COM]
 Sent: Tuesday, September 19, 2000 1:32:44 AM

 Subject: NUCLEAR INFRASTRUCTURE PEIS
 Auto forwarded by a Rule

To: Colette Brown, NE_50
 US Dept. of Energy

CC: Slade Gorton, US Senator
 Patty Murray, US Senator
 Doc Hastings, US Representative
 Gary Locke, Washington State Governor

I have a few comments regarding the Nuclear Infrastructure PEIS:

I would like to see the FMEF facility, located adjacent to the FFTF, used in conjunction with the FFTF for the preparation and recovery of isotopes. This would allow all operations, especially those where time is critical, to be performed in one area. This would minimize greatly the time and more importantly the risk of transporting the materials between the isotope labs and the reactor. This would require some additional monies up front, but I believe that in the long run this would be the most cost effective by far and clearly the most sensible approach with regard to safety.

The second thing I would like to see is the listing of nonproliferation type activities as an actual mission to be included with the restart of the FFTF facility. There are significant quantities of plutonium and uranium, domestic and foreign (e.g., SNR300 fuel) that can be taken away from any kind of threat by operation of the FFTF. There is clearly a big international bonus and plus to this option and with the uncertainty in the world today, this would be an important and significant mission _ removing attractive special nuclear materials from the worlds stockpiles and transmuting them to an

1787-1**1787-2****Response to Commentor No. 1787**

1787-1: DOE notes the commentor's support for Options 3 and 6 of Alternative 1, Restart FFTF.

1787-2: As the commentor correctly pointed out, use of the Hanford MOX fuel would dispose of a significant U.S. stockpile of highly attractive fresh plutonium fuel by conversion to spent fuel through irradiation in FFTF. This represents a safe, low-cost, high benefit opportunity to reduce U.S. civilian plutonium without chemical or bulk processing. Use of the German MOX also represents a similar advantage with respect to the German stockpile of separated civilian plutonium. In addition, use of the German MOX would also extend the time for any research for designing a new low enriched uranium fuel for use at FFTF, and delay the need to produce HEU for the FFTF.

Commentor No. 1787: Steve Hiller (Cont'd)

unrecoverable status as far as weapons are concerned is a major plus and should be listed as an actual mission of the facility. Not only transmuting the material but getting significant use for the general public at the same time makes this a very attractive means.

**1787-2
(Cont'd)**

I would very much like to see the restart of the FFTF for the production of medical, industrial, research and space isotopes. I think that an acceptable approach due to the availability and cost effectiveness of the FFTF is to restart this facility and then go into a long term plan for its replacement which could then be to bring on line an accelerator or another reactor in the next 20 years to pick up from FFTF and to ensure long range isotope production. When you are talking a program of this size with the projected growth predicted, 20 years off is not that far away and therefore this becomes a very attractive alternative. Now (today), it only makes sense to go with one facility and the one that is already built with a proven operating history, but the day will come that a replacement and even sooner, a sister facility, would be needed. The time is available then to fully develop an acceptable replacement for the FFTF some 25 to 30+ years down the road. The DOE and our government must start thinking in more long term actions instead of just the current fiscal year driving all our decisions.

1787-1

Issues with the impact to Hanford Clean_up with the restart of FFTF need to be addressed and shown that first there is no real impact. FFTF does not produce any high level waste and that the spent fuel will be shipped to a repository with the fuel being held at FFTF until this facility is ready to receive spent fuel (FFTF has the capacity, so no impact to other facilities at Hanford). This reduced concern with Hanford Clean_up and the thousands of lives that will be provided a significantly higher quality of life with medical isotopes should make the preferred alternative obvious to being the restart of the FFTF.

I would also like to see something that discusses external regulation of the FFTF. This seems to occasionally get some concern based on DOE operating the facility and being their own regulator and police _ which some perceive the do poorly at due to budget

1787-3

Response to Commentor No. 1787

1787-3: DOE notes the commentor's support for Alternative 1, Restart FFTF. The purpose of this NI PEIS is to evaluate the environmental impacts of a range of reasonable alternatives to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238 for future NASA missions, and civilian nuclear research and development. The Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

With respect to external regulation, on February 19, 1999, Secretary Bill Richardson sent a letter to Senator John Warner, Chairman of the Committee on Armed Services to inform him of DOE's efforts in exploring a potential move toward the external regulation of DOE's nuclear facilities. Secretary Richardson reported that, based on DOE's analysis, many of the potential benefits that were expected from external regulation had not been demonstrated, and appear to be outweighed by associated costs and difficulties raised in the pilot projects. As a result, DOE had determined that submittal of legislation to exempt certain facilities from Departmental regulations was premature. It should be noted that FFTF meets all safety requirements established by DOE and the DOE requirements are consistent with those established and applied by other regulatory agencies such as the Nuclear Regulatory Commission.

Commentor No. 1787: Steve Hiller (Cont'd)

constraints and missions goals. It should be made clear that the FFTF would be operated outside the Hanford mission (maybe more associated with the PNNL research activities) and that an outside regulator, most likely the NRC, would be responsible for this aspect of the operation. I think this approach would put a lot of concerned peoples minds at ease and take some wind out of the sails of the anti_nuke, anti_DOE and anti_FFTF contingency. This would make the whole process of restarting FFTF more palatable for many.

**1787-3
(Cont'd)**

Thank you so much for considering my recommendations/suggestions. I am very much for the restart of the FFTF for an isotope mission and think any decision that would shutdown this fine irradiation facility would be a complete misuse of government funds and assets. Thank you again for the opportunity to respond and looking forward to your decision to move forward with the restart of this proven, dependable source of irradiation services and testing.

1787-1

Auto forwarded by a Rule

I support restart of FFTF (Alternative 1, Option 1) for the production of medical and industrial isotopes at Hanford, along with Pu_238 target fabrication, processing & storage at ORNL. The research being done with medical isotopes is so important to all humanity that it is unconscionable to not proceed due to the fears of those that do not understand science or accept the beneficial uses of nuclear. The more recent cost report for alternatives and nonproliferation impact assessment also support using the already existing, safe FFTF. Finally, neutron_rich isotopes produced in a nuclear reactor are much better for production of therapeutic medical isotopes than the neutron_poor isotopes produced in an accelerator.

Les Davenport
1922 Mahan Ave.
Richland, WA 99352

1788-1

Response to Commentor No. 1788

1788-1: DOE notes the commentor's support for Option 1 of Alternative 1, Restart FFTF. There is no qualitative difference between isotopes produced in an accelerator or a reactor and both are capable of producing medical isotopes in sufficient quantities.

 Germantown, MD 20874

Reference ANMS Letter to Ms C Brown, November 7, 1999
 Subject: Nuclear Infrastructure Programmatic EIS Comments

In my referenced letter, I identified three principal issues for the draft PEIS. For brevity, I will not repeat those issues or comments here but still consider the original comments valid and should be addressed in the Final PEIS. In this letter, I would like to address two issues:

* First, the list of Alternatives is not complete, as it does not include the alternative to privatize the FFTF and therefore the cost analysis does not adequately consider reduced costs to the taxpayer from commercialized operations.

* Second the cost analysis ignores the signed agreement ANMS has with SBK for the transfer of the fuel ownership and therefore does not address the cost impact of reconciling ANMS' legal position on the fuel.

* Privatize FFTF Operations: Privatization of isotope production has been a core mission for DOE and allows the private sector to meet the demands of isotope production and research facility availability at nominal cost and minimal risk to the government. This option is proposed as a new alternative rather than included under Alternative 1 because of the significant differences in potential mission management, cost assessment, policy issues and positive

1789-1**Response to Commentor No. 1789**

1789-1: DOE has not ruled out shared-cost approaches related to future operation of the FFTF, should that facility be restarted. The decision on whether to restart or shutdown that facility is based on many considerations, including cost effectiveness. Cost effectiveness, however, is not evaluated based on the source of funding for those costs, but rather on the effectiveness of the expenditure of funding in meeting critical mission needs. Program participation and cost-sharing would necessarily be considered once a decision was implemented, and the desirability and practicality of such an approach could be definitively evaluated, based on a clear projection of the use of the FFTF.

DOE will continue to seek out partnerships, which are mutually beneficial.

Commentor No. 1789: William J. Stokes (Cont'd)

socio_economic benefit to the community not available under Alternative 1 as described.

The benefits of privatization were reflected in correspondence from WA Governor Gary Locke to then Secretary Pena on April 10, 1997, in which the Governor writes: "This reactor (FFTF) is a valuable asset with an impressive operational record....It is capable of making a valuable contribution to society as well as to community economic development efforts....I support the concept of using the facility for the production of medical isotopes....Further, I feel that privatization could facilitate an expeditious transition to medical isotope production. While I do not endorse any single firm, I urge you to meet with representatives of Advanced Nuclear and Medical Systems (ANMS) at your earliest convenience to discuss the potential of privatization and I trust such a meeting can be arranged."

The range of alternatives identified in the public meeting is insufficient and does not conform to the Council on Environmental Quality guidance, which requires that all reasonable alternatives be evaluated. In determining the scope of alternatives to be considered, the emphasis is on what is "reasonable" rather than on whether the proponent or applicant likes or is itself capable of carrying out as a particular alternative. Reasonable alternatives include "those that are practical or feasible from the technical and economic standpoint and using common sense, rather than simply desirable from the standpoint of the applicant."

Clear and demonstrated evidence has been submitted that privatization of FFTF is a viable alternative from an "economic stand point" and that while it is potential that the government (proponent) may not be able to carry out the alternative, the private sector may be able to. Further, a privatization alternative would provide a basis for equitable comparison of privatization compared to government operations under Alternative 1.

**1789-1
(Cont'd)**

Response to Commentor No. 1789

Commentor No. 1789: William J. Stokes (Cont'd)

In correspondence to Secretary Richardson in 1999 and 2000, ANMS has proposed a public private partnership to pay for the cost of restart and initial operations of the facility. The proposal was supported with expressions of interest by a reputable lender for potential investment of \$200 million and a pharmaceutical firm interested in relocating their production facilities to Richland, under a commercial operations plan. DOE should vigorously pursue such opportunities consistent with the Administration's initiative to "reinvent" government and include such options in the cost assessment of this EIS

In the Financial Proforma, ANMS used the projected market from the 1997 Frost & Sullivan report cited in the PEIS. The growth rates were approximately 15% per year. The actual growth rates being experienced are higher than the projected. Growth in 1999 alone was 19%. Data from the Proforma was:

- * Assumed FFTF only captured portions of the market growth, the capture share of the existing market was zero
- * Restart and initials operations loan payback was 20 years, the IRR on the Proforma calculated out to be about 54%

Although the market growth rate may be on the high side of some estimates, it is well within limits of all projections, and less than current experience. The assumptions on market capture appear conservative and the assumed operational life in the analysis is probably 5_10 years lower than could be expected.

The financial proforma, as reviewed by Compass Group prior to their expression of interest for a \$200 Million restart construction loan, indicates a viable and financially attractive commercial project. Evidence of the "reasonableness" of this approach is in the expression of financing interest from Compass and should therefore be included in the cost analysis supporting this PEIS.

The Department of Energy committed to evaluate privatization of operations of the FFTF in the EIS in the July 29_30, 1999 NERAC meeting. This commitment and information which, was provided by

**1789-1
(Cont'd)**

Response to Commentor No. 1789

Commentor No. 1789: William J. Stokes (Cont'd)

the DOE FFTF Standby Office managed by PNNL, formed the basis of the NERAC Resolution Regarding the FFTF, recommending that the Secretary proceed toward a record of decision concerning the FFTF.

The NERAC Resolution states: "The specific missions identified by PNNL for FFTF should be further assessed, including a discussion of alternatives and privatization of some or al of the missions."

The committee was responding to the August 1999 Program Scoping Plan for the FFTF, Section 4.1.3.4, "Potential for Privatization" which states: "For the purposes of this plan (PNNL Scoping Plan), privatization was not considered for FFTF reactor operations. However, there have been expressions of interest in privatizing all operations associated with the FFTF by those believing that if DOE was willing to enter into a mutually acceptable long_term facility lease was a private company, private source funding could be obtained to support FFTF restart. During the EIS process for an FFTF restart, if initiated, privatization options will be evaluated for alternative management approaches, including:

- * full privatization of FFTF restart and operations,
- * etc.

The report also provided the following citation: "Advanced Nuclear & Medical Systems (ANMS) submitted an unsolicited proposal, dated September 1996, to the DOE for the privatization of the FFTF. In July 1997 the DOE notified ANMS that it was premature to consider privatization proposals for the FFTF. However, the DOE indicated that it would consider privatizing the facility if a decision were made to restart it."

ANMS has reiterated our offer to privatize FFTF for the production of medical, industrial and agricultural isotopes. Space would also be made available for research projects as appropriate. In support of our offer, ANMS has provided a letter of interest from a credible financial lender, identifying their interest in providing \$200 million in private financing for the restart and operation of the FFTF under a privatization plan. This letter is included in the Appendices of the PNNL Scoping Plan.

**1789-1
(Cont'd)**

Response to Commentor No. 1789

Commentor No. 1789: William J. Stokes (Cont'd)

ANMS has followed numerous models regarding privatization of existing DOE nuclear facilities, US Enrichment Corporation facilities, privatization of new DOE nuclear facilities, Hanford Tank Waste Immobilization Plant, and models regarding an isotope production and processing complex centered around the production reactor, Petten Holland, otherwise known as Medical Valley.

**1789-1
(Cont'd)**

Privatization of the FFTF for the missions identified has been demonstrated to be reasonable and financially feasible. I also submit that in order to provide the decision_maker with the full range of facts and information necessary to make a Decision, a full consideration and evaluation of the proposed alternative is necessary and required.

SNR_300 SURPLUS REACTOR FUEL FROM GERMANY

Restart of the FFTF assumes availability of SNR_300 surplus reactor fuel from Germany to support FFTF operations. As DOE has been informed on previous occasions (December 1998, January 1999, July 1999, etc.), ANMS has an agreement in place with SBK for the transfer of this fuel to ANMS for use at FFTF. It is fully reasonable and appropriate to assume this fuel to be available to DOE for use in FFTF, however, the cost analysis must reflect the appropriate cost for this transfer. ANMS has proposed several concepts for the utilization of this asset to promote medical research and further the development of a medical and agricultural isotope processing industry in the local community. Costs used in the PEIS should reflect a negotiated price between ANMS and the DOE for the use of this fuel in the FFTF.

1789-2

Thank you for consideration of our comments. If further discussion or clarification is required, please contact me at 509_946_9900 or 509_946_9800 FAX.

Sincerely,
WILLIAM J. STOKES
William J. Stokes
President

CC: WA State Congressional Delegation
Governor Gary Locke's Office

Response to Commentor No. 1789

1789-2: Costs for the use of SNR-300 (German MOX) reactor fuel were included in the estimated annual operating costs for FFTF. Table 2-3 of the Cost Report shows the cost of operating FFTF using foreign MOX fuel which includes an additional \$0.53 million per year for the domestic transport of this fuel from port-of-entry to FFTF. As stated on page 2-7 of the Cost Report, the German MOX fuel was assumed to be available to DOE at no additional cost for fabrication of fuel assemblies. Therefore, only domestic transportation costs would be incurred.

Commentor No. 1790: Dona Hippert

From: Brad Hippert[SMTP:BHIPPERT@TRANSPORT.COM]

Subject: Hanford
Auto forwarded by a Rule

Dear Ms. Brown,,

It was a pleasure to have the opportunity to speak with you in August at the Portland hearing. Thank you for the opportunity to comment on the Hanford situation and for your time in reading the comment.

Dona Hippert
11723 SW 47th Ave.
Portland, OR 97219

September 18, 2000

Ms. Collette Brown, NE_50
US Department of Energy
Office of Nuclear Energy, Science & Technology
19901 Germantown Rd., Room A_270
Germantown, MD 20874

Dear Ms. Brown,

It would be difficult for me to express my opposition to the restarting of the FFTF more eloquently than those who spoke at the Portland public hearing in August. However, I will add my voice to the chorus in hope that the more of us who speak out against the restart, the greater chance we have that the facility will finally be permanently deactivated. Therefore, I will simply echo the main objections to the draft EIS that were brought forward at that meeting.

First, the FFTF is not an economically viable or dependable source for the medical isotopes that are being used as a reason for restarting the FFTF. Existing reactors in Missouri and Tennessee are

1790-1

Response to Commentor No. 1790

1790-1: DOE notes the commentor's remarks concerning the Portland, Oregon public hearing.

1790-2: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1 2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements.

There currently is little room for growth of medical isotope production at either ATR or HFIR. At ATR the neptunium-237 targets for plutonium 238 production will compete for space in the reactor. There are potential negative impacts to the private company that leases reactor space for the production of radioisotopes due to being assigned less desirable irradiation space. At HFIR, the ability to expand medical isotope targets into additional reactor locations is limited by the potential impacts that the targets have on the primary experiments in the reactor. Medical isotope

1790-2

Commentor No. 1790: Dona Hippert (Cont'd)

better suited for this purpose. Additional capacity to produce these isotopes at the Tennessee reactor and at a reactor in Idaho, along with Canadian sources, assure there will be a sufficient supply. Second, the necessary capacity to produce plutonium 238 for space travel already exists. The DOE must simply remove the constraint that there be a single source to satisfy the needs of all future missions.

Finally, and perhaps most important, any further activity at Hanford would detract from the cleanup of the waste problems that already exist. It is this cleanup that should be the sole priority of the DOE at Hanford.

The assurances of the draft EIS that there would be no great danger in the restart of the FFTF are hard to believe in view of the track record of the nuclear industry. We were right 20 years ago when we voiced our concerns about nuclear waste; the nuclear industry was wrong in its prediction that the waste problem would be solved in short order. Please don't give us the chance to be right again. Deactivate the FFTF permanently now.

Sincerely,

Ms. Dona Hippert

**1790-2
(Cont'd)**

1790-3

1790-4

1790-5

1790-6

1790-7

Response to Commentor No. 1790

targets and neptunium-237 targets are not in competition for the same locations in at HFIR.

1790-3: DOE notes the commentor's views. There are approximately only 9 kilograms of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

DOE has no requirement to conduct all three missions at one site. In the Record of Decision process, DOE could choose to combine components of several alternatives in selecting the most appropriate strategy.

1790-4: Restoration of the Hanford Site and waste management activities are the primary missions at Hanford. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

1790-5: FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

Commentor No. 1790: Dona Hippert (Cont'd)

Response to Commentor No. 1790

- 1790-6:** DOE notes the commentor's concern regarding radioactive waste generation. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.
- 1790-7:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Re: DoE PLANS FOR EXPANDED PRODUCTION OF PLU_238 FOR FUTURE SPACE MISSIONS, specifically, solicited comments based on the DRAFT Programmatic Environmental Impact Statement for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the United States, Including the Role of the Fast Flux Test Facility, DOE/EIS_0310D, July, 2000

Dear Mrs. Brown,

I refer to the letters/e_mails to you from Jonathan Mark (September 14, 2000) and Russell Hoffman (September 9 and 14, 2000) with regards of the above mentioned matter.

I fully support both letters and like to exprss my deepest concern.

I became aware of the nuclear issue with the Cassini deep space mission and have contacted eminent independent scientists and researchers myself . I also have regularly contacted Prof. Karl

1791-1

Response to Commentor No. 1791

1791-1: DOE notes the commentor's concern for NASA's use of nuclear materials for space missions, although this issue is beyond the scope of this PEIS. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch.

Commentor No. 1791: Hans Karow (Cont'd)

Grossman, whom we have to thank that he made the Citizens on Earth aware about the nuclear issue with his book and two videos.

I hereby ask you and the relevant U.S. Government Departments that any further production and use of nuclear fuel (including all nuclear waste products) are to be stopped for the reasons giving below in a fact sheet about Plutonium also downloadable at:
<http://www.animatedsoftware.com/cassini/nltrs/nltr0139.htm>

I kindly ask you to please acknowledge my letter to you, and I especially ask you to please correct my findings about the Plutonium's fact, which I was also able to gather upon contacting a few independent eminent scientists and medical doctors. Please state where I am wrong. Please note: the fact sheet I wrote before Cassini's planned Earth fly_by. The facts about Plutonium's accidental release in/on/above Earth and in space are still valid, no matter in which project involved.

In deep concern,
Hans Karow, former Coordinator of the Cassini Redirection Coalition (CRC), S 32 / C 6, RR # 1, OLIVER, BC, V0H 1T0, CANADA
Tel./Fax: (250) 498 3135, Fax: (250) 498 3183, E_mail: core@vip.net

Facts about Cassini's Plutonium

The Cassini deep space mission to Saturn must be redirected to avoid its planned high risk Earth fly_by this year on August 18. Although a safe alternative solar technique was available instead of the use of Plutonium, NASA ignored worldwide warnings.

Here are some facts about Plutonium (Pu) that everybody should know about:

Pu was plentiful on Earth when it was first formed. Life did not appear on Earth until the Pu had decayed to Uranium.

Pu, almost entirely a man_made element, is a radioactive and highly toxic substance. Pu was first isolated in large (milligram) quantities in

**1791-1
(Cont'd)**

Response to Commentor No. 1791

Commentor No. 1791: Hans Karow (Cont'd)

1942 by Dr. John W. Gofman, who headed the Manhattan Project's Plutonium Group (Hiroshima and Nagasaki bombs).

Once it enters the body through inhalation, ingestion, or through a cut, it becomes an internal emitter that emits highly destructive radiation to the body tissue in which it concentrates. It is akin to an internal X-ray machine.

When lodged within tiny airways of the lung, Pu particles bombard surrounding tissue with alpha radiation. Smaller particles may break away from larger aggregates of the compound to be absorbed through the lung and enter the bloodstream. Because Pu has properties similar to iron, it is combined with the iron-transporting proteins in the blood and conveyed to iron-storage cells in the liver and bone marrow, inducing liver and bone cancer, and leukemia. Pu's iron-like properties also permit the element to cross the highly selective placental barrier and reach the developing fetus, possibly causing the development of abnormal structures in an embryo resulting in a severely deformed fetus and subsequent gross deformities in the newborn infant.

Pu can also migrate to the testicles and ovaries where it can cause genetic mutation to be passed on to future generations.

No quantity inhaled has been found too small to [be able to] induce lung cancer in animals. It has also been found, by any reasonable standard of scientific proof, that there is no safe dose or safe dose_rate of ionizing radiation, meaning there is no safe threshold.

It has been estimated that only one pound of Pu_238, if uniformly deposited in the lungs of the world's population, would be enough to induce lung cancer in everyone on Earth.

In the event of Cassini's accidental atmosphere re_entry during its planned Earth fly_by, or any other time due to a loss of control and subsequent random collision, its 72.3 pounds of Pu would get vaporized into invisible particles and spread as a dust all over the world. Even though over four tons of Pu_239 were released during

Response to Commentor No. 1791

Commentor No. 1791: Hans Karow (Cont'd)

atmospheric nuclear bomb testing, Cassini's 72.3 pounds of Pu_238 would carry more radioactivity than all the Pu_239 from the bomb tests.

The cancer rate will increase (humans and animals), induced over years by Cassini's accidentally released Pu.

If Pu is released into the environment, there is no way to stop its radioactive decay. As it decays, it produces the highly dangerous alpha radiation mentioned above.

Pu cannot be destroyed by any means. Pu does not disappear in the environment. It is not water_soluble. As a dust it easily becomes airborne. Once dispersed into the environment it can mix with organic substances forming compounds that can enable it to be taken up in bodies of all live species: plants, animals, and humans.

A Pu particle constantly produces radiation _ and can harm any living thing, whether human, animal or plant, that it enters, also meaning as many times as it changes its living host. If someone were to die of lung cancer induced by Pu and were cremated, contaminated smoke might carry that Pu particle into someone else's lungs. If an animal dies or is killed, its meat may be eaten by other animals or humans. Or it rots and its poisoned dust could be scattered by the wind and inhaled by other creatures. Pu_238 will be radioactive over more than 800 years [~10X the half_life __ rdh] (14% of Cassini's Plutonium consists of Pu_239, being radioactive for over 240,000 years [~10X the half_life __ rdh], although somewhat less toxic than Pu_238). Once Pu is deposited in the lung, there is no way to remove it from the lung and there is nothing that medical science can do to reduce the risk of lung cancer.

In case all vaporized Pu particles are of the size of the invisible 1,000,000 atoms_particle, there will be about 1.63×10^5 particles per square meter (163,000 particles!) of Earth's surface (including water surface) awaiting all living on Earth, to be absorbed over and over again for many generations!

Response to Commentor No. 1791

Commentor No. 1791: Hans Karow (Cont'd)

Subject: Plutonium production at INEEL
Auto forwarded by a Rule

Dear Ms. Brown,

Here's my two cents' worth on the subject:

a.. Reprocessing is not acceptable and should not be considered at INEEL or any other facility

1792-1

b.. Building 666 is a decrepit and highly contaminated building and should be decommissioned in a manner that is protective of human health and the environment

c.. Plutonium_238 production is unnecessary and its use too risky

1792-2

D.. Using ATR at INEEL would interfere with its current mission of producing medical and industrial isotopes

1792-3

e.. Extend the comment deadline 30 days

1792-4

Thanks,
Chuck Mercer

Response to Commentor No. 1792

1792-1: DOE would not reprocess spent nuclear fuel under any of the alternatives considered under this programmatic environmental impact statement. The alternatives do include processing of target materials used to produce isotopes for medical and industrial uses, plutonium-238 for space missions, and nuclear materials research and development.

Building CPP-666 is divided into two parts, the Fuel Storage Facility and the Fluorinel Dissolution Process Facility (FDPF). The FDPF is under consideration in this PEIS for storage of neptunium-237 oxide, preparation of neptunium-237 targets, and separation of plutonium-238 from irradiated targets. DOE expects that this facility will meet, with further analysis and/or modifications, all requirements to safely conduct these processes.

1792-2: Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed production of plutonium-238 are relatively low and are discussed in detail in Chapter 4 of Volume 1, and Appendixes H, I, and J of Volume 2 in the Final NI PEIS.

Commentor No. 1792: Chuck Mercer (Cont'd)

Response to Commentor No. 1792

- 1792-3:** As stated in EIS Volume 1, Section 2.3.1.2, ATR would continue to meet its medical and industrial radioisotope production mission for the no action and most other alternatives considered where ATR is not used for the production of plutonium-238. If ATR were to be used as a production facility for plutonium-238 (options 1, 2, 3, 7, 8, and 9 under Alternative 2), it would support medical and industrial radioisotope production to the extent possible. DOE would try to minimize the impact of the new mission on current medical and industrial radioisotope production.
- 1792-4:** DOE notes the commentor's request for extension of the public comment period. The Council on Environmental Quality's (CEQ) "Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act" (40 CFR 1506.10(c)) require that a minimum of 45 days be allowed for public comment on the Draft NI PEIS. As stated in the Notice of Availability (65 FR 46443 et seq.), the public comment period began on July 28, 2000 and continued to September 18, 2000. In preparing the Final PEIS, DOE has assessed and considered both oral and written comments received on the Draft PEIS during the public comment period and has responded to these comments in the Final PEIS. Volume 3 of the NI PEIS contains public comments received on the NI PEIS and DOE responses to those comments. Moreover, late comments were considered to the extent practicable.

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

I vote for alternative #5! (A 35 yr. environmental impact study is ridiculous.)
I am opposed to restart of the Fast Flux Test Facility reactor because:

① The need for production of isotopes at Hanford is not proven. ② Restarting the plant would produce more dangerous wastes which we obviously can't deal with the wastes we already have. ③ Environmental impacts will be horrendous yet no serious environmental impact survey has been done. ④ Frankly I don't trust the DOE - their past history of covering up the truth re. plutonium releases is scary. We need an outside, independent oversight agency.

Name Jo Anne Nordling
Address 7105 SW Elmhurst Dr.
City, state Tigard, OR Zip 97223

Response to Commentor No. 1794

1794-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.

It should be noted that the NI PEIS considered a 35-year operational period for purposes of analysis. The 35-year operation period is based upon the estimated length of time existing DOE irradiation facilities would continue operating if used for accommodating these missions. This time frame also accommodates current projections that indicate the demand for radioisotopes and nuclear research and development requiring these enhancements will extend for at least the next 20 years.

1794-2: See response to comment 1794-1.

1794-3: DOE notes the commentor's opposition to restarting FFTF for medical isotope production. DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

Although other manufacturers produce medical radioisotopes, DOE remains the key provider for a large number of radioisotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large-enough quantities to make their production financially attractive to private industry. However, supplies of many research isotopes are not readily available from existing

1794-1

1794-2

1794-3

1794-4

1794-5

1794-6

Commentor No. 1794: Jo Anne Nordling (Cont'd)**Response to Commentor No. 1794**

domestic or foreign sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed. Consistent with the mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure to support production of radioisotopes for medical applications and research.

Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term (less than 5 years).

- 1794-4:** As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

- 1794-5:** DOE notes the commentor's concern about potential environmental impacts associated with restart of FFTF and with the additional concern about performing environmental impact surveys.

The incremental environmental impacts at Hanford specifically associated with the Alternative 1, Restart FFTF, are presented and discussed in Section 4.3 of the NI PEIS. The incremental impacts include those

Commentor No. 1794: Jo Anne Nordling (Cont'd)

Response to Commentor No. 1794

associated with normal operations and from postulated accidents. All impacts to human health and to ecological resources would be small in the immediate area of the Hanford site and negligible at all distant locations.

An environmental report is issued annually by DOE for the Hanford site. The report includes the results of effluent monitoring and environmental surveillance programs and surveys for all areas of Hanford. The results are reflected in the information presented in Section 3.4 of the NI PEIS, in which the existing environment at Hanford is described.

- 1794-6:** The commentor's position with regard to an outside, independent oversight agency is noted. Human health and safety are a priority in all of DOE's programs. With respect to actions that would result from implementation of the nuclear infrastructure alternatives, Chapters 2 and 4 of Volume 1 (e.g., Sections 4.3.1.1.9, 4.3.2.1.9, 4.3.3.1.9) and Appendixes H through J of Volume 2 address health and safety of the public and workers in detail. If Alternative 1, Restart FFTF, were selected for implementation, the issue of external, independent oversight could be considered at that time.

Public comment on Nuclear Infrastructure Draft Programmatic
Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

*one day I would again
like to swim in the
~~water~~ Columbia River
on the banks of Sawvie island.
i only if Hanford is cleaned up!*

Name Kesher Bryant-Stanek
Address 2626 NE 16th St
City, state Portland, OR Zip 97212

Response to Commentor No. 1795

1795-1

1795-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1795-2

1795-2: The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1. No food or water restrictions are in place outside the Hanford Site as a result of Hanford activities.

1796-1

1796-2

1796-3

Response to Commentor No. 1796

1796-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1796-2: DOE notes the commentor's concern about the potential environmental impacts associated with FFTF restart. The environmental impacts associated with operation of the FFTF and support facilities at Hanford during normal operations and from postulated accidents are presented and discussed in Section 4.3 of the NI PEIS. All impacts to human health and to ecological resources would be small in the immediate area of the Hanford site and negligible at all distant locations.

1796-3: DOE notes the commentor's interest in alternative energy sources. It is the current United States policy that clean, safe, reliable nuclear power continue as a viable component of the United States' energy portfolio. In recognition of this need, the government has initiated nuclear energy research and development programs to address potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) and to ensure that current nuclear power plants can continue to deliver adequate and affordable energy supplies. An enhanced DOE nuclear facility infrastructure is required to support such nuclear energy research and development for civilian applications.

I am opposed to restart of the Fast Flux Test Facility reactor because:

BECAUSE OF ENVIRONMENTAL AND HEALTH
SENSIBUS, THERE ARE SAFER METHODS
OF OBTAINING NEEDED ENERGY.

Name Phillip Saumpty
Address 1404 SW CARSON ST
City, state Portland, Oregon Zip 97219

Response to Commentor No. 1797

- 1797-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 1797-2:** The environmental impacts associated with operation of the FFTF and support facilities at Hanford during normal operations and from postulated accidents are presented and discussed in Section 4.3 of the NI PEIS. All impacts to human health and to ecological resources would be small in the immediate area of the Hanford site and negligible at all distant locations.
- 1797-3:** DOE notes the commentor's opposition to restarting FFTF. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action. DOE considers various facilities, including FFTF and others, for carrying out these missions. The public health and safety and other environmental impacts associated with the restart of FFTF as well as other proposed alternatives and facilities are described in Chapter 4 of Volume 1 and additional details are provided in Appendixes H, I, J, K, L, and M of Volume 2. In any case, FFTF, if restarted, would not be used for the production of energy.

Issues of research and development of alternative energy sources are beyond the scope of this NI PEIS. Other offices of DOE are responsible for the research and development of alternative energy sources. The stated missions to be addressed in this EIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and nuclear research and development, can currently only be met using nuclear reactor or accelerator technologies.

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

There is no sat. factory way to deal with nuclear waste

Name Dr. Thomas Bergeron
Address 18990 Bridgport Rd
City, state Dallas OR Zip 97338

1798-1

1798-2

Response to Commentor No. 1798

1798-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1798-2: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

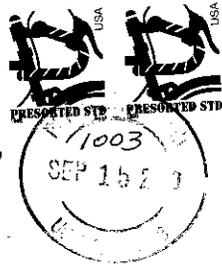

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

Olette E. Brown,
 U.S. Department of Energy, NE_50,
 19901 Germantown R, Germantown, MD 20874_1290

Dear Olette,

The Nuclear Free & Independent Pacific Movement for nearly three decades worked very hard to promote education awareness programme to educate the peoples of the Pacific region and Pacific rim in the importance of maintaining clean environment for the sustenance of its peoples. The Movement has conflicts with other metropolitan powers due to our contradictory philosophies about clean environment; for example in their denial that nuclear testing is not harmful to the environment and to human health. However, the United States of America has always been committed to its environmental obligations. In this regard, we would like to encourage the U.S. Department of Energy to talk with NASA to promote developing more alternative (solar, hydro) power sources for space missions. NASA certainly can swallow its pride for a moment and follow suit with the European Space Agency (ESA) which has developed high_ efficiency solar cells for deep space mission.

1858-1

Response to Commentor No. 1858

1858-1: DOE notes the commentor's opposition to NASA's use of nuclear materials for space missions, concern for the funding of ongoing cleanup activities, and concern over the use of nuclear power in space-based weapons. Issues such as NASA research priorities are beyond the scope of this PEIS. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. None of the DOE missions stated in the NI PEIS are defense- or weapons-related.

***Commentor No. 1858: Losena Tubanavau-Salabula
(Cont'd)***

Also one problem that has been experienced is the production/fabrication process for space nuclear power missions has recently led to several worker contamination accidents. The expansion of production will certainly just worsen the problem.

The NFIP Movement has kept records of failures of launches of nuclear powered space devices in Cape Canaveral on rockets with 10% failure rates will only increase the possibility of a deadly mishap.

We are dismayed in the massive cost of expanded production of plu_238 cannot be just at a time when the DoE admits it needs over \$US300billion to clean_up exist problems at DoE facilities.

Furthermore, NFIP earlier mentioned the commitment by the US government to clean environment. It is very contradictory to learn that the US Military is promoting the use of nuclear power in space for the space_based weapons technology. Using nuclear power for space war will severe environmental implications for life on Earth.

We sincerely hope that one day the United States of America will halt completely all its nuclear and military activities to allow peace and harmony prevail in the globe.

In Peace

Losena Tubanavau_Salabula
Assistant Director_Demilitarization
PCRC Inc;

**1858-1
(Cont'd)**

Response to Commentor No. 1858

As discussed in Chapter 4 of Volume 1 (e.g. Sections 4.3.1.1.13, 4.3.2.1.13, 4.3.3.1.13), waste will be generated by all of the proposed alternatives, including the No Action Alternative. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. DOE activities associated with this program would not impact the schedule or available funding for existing cleanup activities at candidate sites for implementation of the nuclear infrastructure alternatives.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Commentor No. 1859: Kim Cook

**Public comment on Nuclear Infrastructure Draft Programmatic
Environmental Impact Statement (NI PEIS)**

I am opposed to restart of the Fast Flux Test Facility reactor because:

*Clean-up the waste + find a safe way
to store the waste 1st!! How can we
consider reopening the FFTF - without
knowing the costs 1st!! I am extremely
concerned about SAFETY of transportation
& storage of reactor*

Name Kim Cook
Address 3806 SE Stephens St.
City, state Portland, OR Zip 97214

Response to Commentor No. 1859

- 1859-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 1859-2:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.
- 1859-3:** The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS.
- 1859-4:** The commentor's concerns about safety during transportation and storage of nuclear materials are noted.
- Volume 1, Section 2.4 of the NI PEIS describes measures that would be used to ensure that radioactive materials would be safely transported under the nuclear infrastructure alternatives. Special nuclear materials would be transported with DOE's SST/SGT system and many materials would be carried in Type B shipping containers.
- Since its establishment in 1975, the SST/SGT system has transported DOE-owned cargo over more than 151 million kilometers (94 million miles) with no accidents causing a fatality or release of radioactive material. Type B shipping containers that would be used for

Commentor No. 1859: Kim Cook (Cont'd)

Response to Commentor No. 1859

transportation of plutonium in various forms are described in Appendix J. Requirements for certification of a Type B container include maintaining its integrity through a series of accident conditions illustrated in Figure J-1. Type B packages have been used for years to ship radioactive materials in the United States and around the world. To date, no Type B package has ever been punctured or released any of its content, even in actual highway accidents. As described in Appendix J, the Type B package is robust and provides a high degree of confidence that even in severe accidents, the integrity of the package would be maintained with essentially no loss of the radioactive contents or serious impairment of the shielding capability.

Transportation of nuclear materials under the nuclear infrastructure alternatives would be subject regulation by the U.S. Department of Transportation (DOT) and the U.S. Nuclear Regulatory Commission (NRC). Populations and traffic congestion are factors that DOE would consider when planning for the actual route to be used for the transportation of radioactive materials.

In regards to concern with storage of nuclear materials, provisions for in process storage of nuclear fuel, target isotopes, unirradiated targets, irradiated targets and purified isotopes are included in the various facility designs. Design-basis and beyond-design-basis accidents analyzed in Appendix I include materials stored at the storage, irradiation and production facilities proposed in the NI PEIS. These analyses show that over the 35-year operational period no fatalities would be expected among workers or in the general public in the vicinity of Hanford or at distant locations.

**Public comment on Nuclear Infrastructure Draft Programmatic
Environmental Impact Statement (NI PEIS)**

I am opposed to restart of the Fast Flux Test Facility reactor because:

1) You have NOT cleaned up the mess
from 60+ yrs ago.
2) There was NOT in my opinion,
been a safe disposal designed yet.
and 3) There ARE alternatives!

Name Loren Fenwell

Address PO 4111

City, state PDX OR Zip 97208

1860-1

1860-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1860-2

1860-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

1860-3

1860-4

1860-3: DOE notes the commentor's concern regarding the disposal of wastes. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for

Commentor No. 1860: Loren Fenwell (Cont'd)

Response to Commentor No. 1860

all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

1860-4: This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS. In accordance with Council on Environmental Quality regulations (40 CFR Part 1502.14(e)), DOE has identified its preferred alternative in Section 2.8 of Volume 1 and includes a discussion of DOE's reasons for selecting it.

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

IT IS NOT SAFE & WE DO NOT NEED

IT. IT IS A COWARDLY LIE TO

SAY WE NEED IT FOR MEDICAL ISOTOPES.

LISTEN TO YOUR OWN PANEL! STOP IT!

& CLEAN IT UP!

Name ROBERT HANSEN

Address 2156 N. WYLAND

City, state PORTLAND OR Zip 97217

Response to Commentor No. 1862

1862-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1862-2: FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

1862-3: DOE notes the commentor's opposition to Alternative 1, Restart FFTF. DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost-efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and

1862-1

1862-2

1862-3

1862-4

Commentor No. 1862: Robert Hansen (Cont'd)

Response to Commentor No. 1862

conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

- 1862-4:** DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

Response to Commentor No. 1863

- 1863-1: DOE notes the commentor's opposition to Alternative 1, Restart FTF.
- 1863-2: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.
- 1863-3: This PEIS has provided an estimate of the potential human health impacts associated with each of the alternatives proposed for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of this evaluation of potential health impacts that would be expected to result from a reasonable range of alternatives, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with these alternatives, including alternatives that make use of Hanford facilities, would be small.

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

Please stop the Nuclear Reactor! One
of the biggest concerns is not only
the nuclear waste but the possible
attack of slowly growing terrorism
all over the world.

Name Tomas Svoboda
Address 4729 SE 34th Ave.
City, state Portland, OR Zip 97202

1864-1

1864-2

1864-3

Response to Commentor No. 1864

1864-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1864-2: DOE notes the commentor's concern regarding wastes. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

1864-3: The commentor's opposition to the use of nuclear reactors because of world terrorism is noted. DOE completed a separate nonproliferation impacts assessment report which concluded that the mission described in this EIS would not violate U.S. nonproliferation policy and international nonproliferation agreements. All DOE facilities are operated in accordance with DOE approved safeguards and security plans and procedures which are designed to preclude acts of terrorism. The Record of Decision for the PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

*it is unnecessary!!
Hanford needs to
be cleaned up, re-
start of the FFTF would
create more waste to*

Name contend with
Address Kate Doran
City, state 425 SE 32nd Ave #9 Zip Portland, OR 97214

Response to Commentor No. 1867

1867-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1867-2: DOE notes the commentor's opposition to the use of FFTF for the expansion of its nuclear facility infrastructure. The NI PEIS evaluates the environmental impacts of a range of reasonable alternatives for expanding DOE's existing nuclear facility infrastructure to support production of isotopes for medical, research, and industrial uses; production of plutonium-238 for use in future NASA space exploration missions; and U.S. nuclear research and development needs for civilian application. In addition to restarting the FFTF, the NI PEIS also evaluates alternatives that would either employ the use of other existing facilities or rely on the construction of new facilities.

1867-3: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

1867-4: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

Public comment on Nuclear Infrastructure Draft Programmatic
Environmental Impact Statement (NI PEIS) *I should go*
to cleanup, not restart 7/1/11
I am opposed to restart of the Fast Flux Test Facility reactor because:

There is already way too much waste at Hanford, which was never cleaned up according to the agreement. We will be dealing with that mess forever why add to it?
Also none of the reasons for restart are valid -
Name *isotope 238 are obtainable elsewhere!*
Address *Laura Follingstad 2123 NE 53rd*
City, state *PORTLAND OR* Zip *97215*

1868-1
1868-2
1868-1
1868-3

Response to Commentor No. 1868

1868-1: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FTFE through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

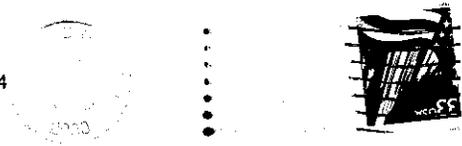

1868-2: DOE notes the commentor's opposition to Alternative 1, Restart FTFE.

1868-3: The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily Molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. Further, supplies of many research isotopes are not readily available from existing foreign or domestic sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed. As such, reliance on these other sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

*It is impossible to deal completely with
the waste through this facility.
This remains unproven if there is any
evidence that this is true from the acre
remains currently on Hanford*

Name Tom Davidson
Address 288 NE 15th Ave
City, state Portland OR Zip 97212

Response to Commentor No. 1869

- 1869-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 1869-2:** Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

We already have nuclear warheads that will last for many (too many) years to come! Already too much nuclear waste that has no place to safely go! We must not use plutonium for any more space missions.

Name Robin Bee
Address Box 3991
City, state Portland, OR. Zip 97208

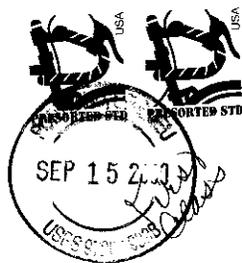

Response to Commentor No. 1871

- 1871-1:** DOE notes the commentor's opposition to Alternative 1, Restart FTF.
- 1871-2:** DOE notes the commentor's view on nuclear weapons. It should be noted that no component of the proposed action is for the purpose of supporting any defense- or weapons-related mission.
- 1871-3:** DOE notes the commentor's concern regarding wastes. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.
- 1871-4:** DOE notes the commentor's opposition to the use of plutonium in space. NASA, not DOE, is responsible for spacecraft design and for determining what electric power source best suits the mission-specific needs. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

*I live downstream in Portland
Ore. Clean up the old mess first.
We don't need salmon that
glow in the dark.*

Name George Nordling
Address 7105 S.W. Elmhurst St
City, state _____ Zip 97223

Response to Commentor No. 1873

1873-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1873-2: DOE notes the commentor's concern about cleanup, although issues of waste cleanup activities are beyond the scope of this Nuclear Infrastructure PEIS. Cleanup at Hanford is high priority for DOE. As discussed in Chapter 4 of Volume 1 (e.g. 4.3.1.1.13, 4.3.2.1.13, 4.3.3.1.13), waste will be generated by all of the proposed alternatives, including the No Action Alternative. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

Please write me your response.
I am opposed to restart of the Fast Flux Test Facility reactor because:

Clean up of existing waste should be the first & only priority at Hanford. The last thing we want or need is more radioactive waste. NO means NO. Focus on cleaning the 54 million gallons first!

Name Donald W Fantin
Address 2230 SE Oak St
City, state Portland OR Zip 97214

1874-1
1874-2

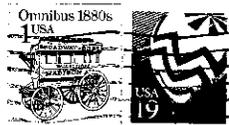

Response to Commentor No. 1874

- 1874-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 1874-2: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The restart of FFTF or any of the other proposed alternative facilities would not have an impact on the cleanup missions at Hanford, INEEL, or ORR. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and appropriate DOE orders.

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

there is no valid reason to restart it. Hanford needs to be cleaned up, not be a part of continuing waste production.

Name William H. Braudt
Address 2623 SE Brooklyn St.
City, state Portland, OR Zip 97202

Response to Commentor No. 1875

1875-1: DOE notes the commentor's opposition to Alternative 1, Restart FTF.

1875-2: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Although research to identify other potential fuel sources to support these space exploration missions has been conducted, no viable alternative to using plutonium-238 has been established. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost. Section 1.2.2 of Volume 1 was

1875-1

1875-2

1875-3

Commentor No. 1875: William H. Braudt (Cont'd)

Response to Commentor No. 1875

revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

In January 1997, President Clinton tasked his Committee of Advisors on Science and Technology (PCAST) to evaluate the current national energy research and development portfolio and to provide a strategy that ensures the United States has a program to address the Nation's energy and environmental needs for the next century. In its November 1997 report responding to this request, the PCAST Energy Research and Development Panel determined that restoring a viable nuclear energy option to help meet our future energy needs is important and that a properly focused research and development effort to address the potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) was appropriate. The PCAST panel further recommended that DOE reinvigorate its nuclear energy research and development activities to address these potential barriers. Section 1.2.3 provides information on the nuclear energy research and development mission.

- 1875-3:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

Nuclear Reactors are not proven to
be safe. Dealing with waste is not
only a nightmare currently, but
potentially UNSOLVABLE. I beg
you to stop this foolish project.

Name Kelly Caldwell
Address 2615 SE 35th Ave
City, state Portland OR Zip 97202

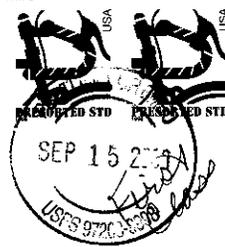

Response to Commentor No. 1876

- 1876-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 1876-2: This NI PEIS has examined the risks associated with the operation of the FFTF for the purpose of producing isotopes for medical use, research and development, and for the production of radioactive heat sources for power supply systems. The EIS addressed the risks associated with normal operation and with accident conditions. (Accident analysis is described in Appendix I and the normal operations risk analysis is described in Appendix H.) Section 4.3 of Volume I provides the results of these evaluations. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small. Based upon these analyses, as well as the previous safe operation of the facility, FFTF can be operated safely.
- 1876-3: DOE notes the commentor's concern regarding wastes. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

 1877-2

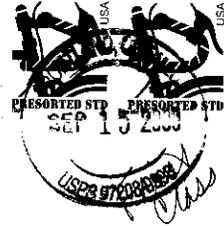

Response to Commentor No. 1877

- 1877-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 1877-2: DOE policy encourages effective public participation in its decision making process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments, regardless of where or from whom they were received. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

**Public comment on Nuclear Infrastructure Draft Programmatic
Environmental Impact Statement (NI PEIS)**

I am opposed to restart of the Fast Flux Test Facility reactor because:

any gain in terms of
medical isotopes use
will be off set by an
increase in illness &
cancer from Nuclear Waste
Creating pollution causes cancer
Name It does not save us
Address from Cancer
City, state _____ Zip _____

Response to Commentor No. 1879

1879-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1879-2: DOE notes the commentor's concern regarding waste generation. As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposal) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

1879-1

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed.

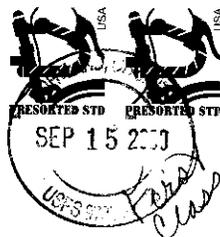

1879-2

This PEIS has provided an estimate of the potential human health impacts associated with a range of reasonable alternatives proposed for the production of isotopes, some of which include the restart of FFTF. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

Commentor No. 1880: R. Skar

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

It is a total waste of public money, a mind-boggling danger to the health + livelihood of NW citizens and a scam to keep nuclear weapons research going.

Name R. SKAR
Address 2227 SE Madison
City, state PORTLAND OR Zip 97214

Response to Commentor No. 1880

1880-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1880-2: DOE notes the commentor's opinion regarding the use of public funds.

1880-3: The commentor's position regarding the restart of FFTF is noted. The PEIS has evaluated the risks associated with a reasonable range of alternatives for isotope production. The analysis addresses both normal operation and with accident conditions. Accident analysis is described in Appendix I and the normal operations risk analysis is described in Appendix H. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, which includes the restart of FFTF. The analysis addresses normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

1880-4: DOE notes the commentor's views. The NI PEIS evaluates a range of reasonable alternatives for enhancing DOE's existing nuclear facility infrastructure for the purposes of addressing three primary needs:

1880-1

1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;

1880-2

1880-3

2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and

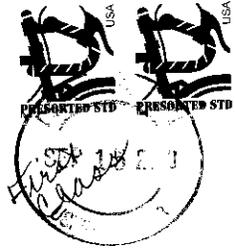

1880-4

3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. However, no component of the proposed action is for the purpose of supporting any defense or weapons related mission.

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

The FFTF is unneeded, unsafe, expensive, and an existing, and potentially, immense, detriment to the entire NW. Do not endanger my life (hazard for products that may never be used) or state health.

Name Gabriel Larson
Address ~~Gabriel Larson~~ 2524 NE Flanders, #B
City, state Portland, OR Zip 97232

Response to Commentor No. 1881

1881-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1881-2: DOE notes the concerns expressed in the comment with respect to restart of FFTF. The need for the irradiation services that would be provided by FFTF (or the other alternative irradiation facilities, e.g. a new research reactor) is addressed in detail in Section 1.2 of the NI PEIS.

1881-1

1881-2

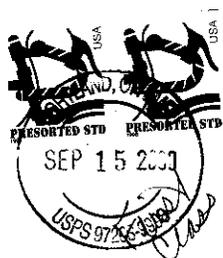

The environmental impacts associated with operation of the FFTF and support facilities during normal operations and from postulated accidents are presented and discussed in Section 4.3 of the NI PEIS. All impacts to human health and to ecological resources would be small in the immediate area of the Hanford site and negligible at all distant locations.

The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. However, DOE prepared a separate cost report which was made available immediately upon release of the final NI PEIS on the web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the cost report in Appendix P of the final NI PEIS.

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:
it is an irresponsible and clearly unnecessary action.
Hanford's tanks are already leaking and explosive. The
USDOE needs to honor it's commitment to clean-up the
mess at Hanford as stated in the Tri-Party agreement.
The USDOE needs to take the FTF off of 'hot stand-by' and
stop diverting clean-up money they are using to keep it
there. Hanford's high-level nuclear waste tanks are
already leaking radioactive waste into the groundwater
which is moving imminently closer to the waters of the
Columbia. Citizens of Portland, a unanimous Portland City
Council, Gov. Kitzhaber, Sen. Ron Waples, Rep. Blumenthal and I call for
Name SHERYL MURRAY-HANSEN the shut down of the FTF
and the continuance
of the cleanup mission.

Address 2156 N WYOMANT ST

City, state PORTLAND OR Zip 97217

Response to Commentor No. 1884

1884-1: DOE notes the commentor's opposition to Alternative 1, Restart FTF and support for Alternative 5, Permanently Deactivate FTF.

1884-2: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Although research to identify other potential fuel sources to support these space exploration missions has been conducted, no viable alternative to using plutonium-238 has been established. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for

1884-1

1884-2

1884-3

1884-4

1884-3

Commentor No. 1884: Sheryl Murray-Hansen**Response to Commentor No. 1884**

reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

In January 1997, President Clinton tasked his Committee of Advisors on Science and Technology (PCAST) to evaluate the current national energy research and development portfolio and to provide a strategy that ensures the United States has a program to address the Nation's energy and environmental needs for the next century. In its November 1997 report responding to this request, the PCAST Energy Research and Development Panel determined that restoring a viable nuclear energy option to help meet our future energy needs is important and that a properly focused research and development effort to address the potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) was appropriate. The PCAST panel further recommended that DOE reinvigorate its nuclear energy research and development activities to address these potential barriers. Section 1.2.3 provides information on the nuclear energy research and development mission.

1884-3: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Public meetings were held on this formal milestone change.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

1884-4: See response to comment 1884-1.

Public comment on Nuclear Infrastructure Draft Programmatic
Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

① I do not believe there is a compelling need for the medical isotopes, ^{nor for NASA's use} which can be obtained from other existing facilities.

② There is an urgent and compelling need to clean up the toxic waste existing at Hanford, and assure that we will not have to clean up more, or prevent potential disaster.

Name Maria Simon

Address 5831 SE Belmont

City, state Portland, OR Zip 97215

Response to Commentor No. 1885

1885-1: DOE notes the commentor's opposition to Alternative 1, Restart FTF.

1885-2: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings.

The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily Molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. Further, supplies of many research isotopes are not readily available from existing foreign or domestic sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed. As such, reliance on these other sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

1885-1

1885-2

1885-3

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these

**Public comment on Nuclear Infrastructure Draft Programmatic
Environmental Impact Statement (NI PEIS) Alternative 5**

I am opposed to restart of the Fast Flux Test Facility reactor because:

*The Columbia River belongs to all of us in the N.W. -
The U.S. Government has a moral obligation
to clean up Hanford, not to add another
radioactive waste stream to jeopardize human
health & safety. Medical isotopes can be
produced at other DOE sites & workers at
Hanford will eventually need to be retrained
anyway. For the common good I am against this
FFTF re-start*

Name GRACE WEINSTEIN

Address 7352 S.W. 26th Ave.

City, state Portland, OR Zip 97219

Response to Commentor No. 1888

- 1888-1:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and opposition to Alternative 1, Restart FFTF.
- 1888-2:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.
- 1888-3:** DOE notes the commentor's concern regarding waste generation. As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposal) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed.

This PEIS has provided an estimate of the potential human health impacts associated with a reasonable range of alternatives for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems, including the restart of FFTF. The methodology used is intended to provide realistic results based upon our current knowledge of the health impact of low doses of radiation. Section 4.3 of Volume 1 provides the results of this evaluation of potential health impacts that would be expected to result from implementation of any of

Commentor No. 1888: Grace Weinstein (Cont'd)

Response to Commentor No. 1888

the alternatives (some of which include restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting each of the alternatives would be small.

- 1888-4:** Currently, approximately 50 percent of DOE's isotope production capability is being used. Much of the remaining isotope production capability is dispersed throughout the DOE complex. This capability supports secondary missions, but cannot be effectively used due to the operating constraints associated with the facilities' primary missions (basic energy sciences or defense). DOE is currently meeting most of its short-term requirements. However, in the long-term (next 5 to 10 years) there will be a shortfall in available DOE capacity to meet demand. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, or if DOE's market share increases, there will be a need for expanded isotope production capacity in the short-term (less than 5 years).
- 1888-5:** FFTF would be deactivated under Alternatives 2 through 5 (See Section 2.5 of Volume 1). If any of these alternatives were selected for implementation, deactivation of FFTF would result in the loss of approximately 300 direct jobs (See Section 4.4.1.2.8 of Volume 1). The loss of 300 direct jobs at FFTF due to deactivation would potentially result in the loss of up to 760 indirect jobs in the Hanford region. However, it is expected that some of the displaced FFTF workers would be employed by other projects at Hanford such as construction of the tank waste remediation system.

Commentor No. 1889: Max Wilkins

Dear Secretary Richardson,

Please honor the Clean-Up Agreement and Shut Down the FFTF Nuclear Reactor:

For there to be any activities that either continues or amplifies the risk of nuclear waste seeping into the great Columbia river is unconscionable. The subjects millions of people, maine life to danger - unacceptable

Sincerely,

Name Max Wilkins Address 13703 SE May St.
City Portland State OR. ZIP 97233

Please include my comments in the official record for the DOE/FFTF Environmental Impact Statement. Also, please respond to my comments and concerns.

|| 1889-1 || 1889-2

1889-3

Response to Commentor No. 1889

1889-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Public meetings were held on this formal milestone change. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

1889-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

1889-3: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Commentor No. 1890: Chelsea Brown

Response to Commentor No. 1890

I do not agree or support the restart of the FFTF at Hanford nuclear reactor. The reason being ~~from~~ from what I have learned about this situation. I believe that the Hanford nuclear reactor should not be re opened for operation. In 1946 this plant was in operation by General Electric to design nuclear weapons with petroleum. As years past the ~~effects~~ plant became toxic to the environment. ~~Some~~ The toxins effected many people and animals very severely. People and animals were dying because of the toxic waste from the Hanford plant. In 1989 the Hanford plant was shut down do to the severe damages the waste cause the environment. From what I learned is that it would take at least 80 yrs. to properly clean up the waste. The toxic waste of the Hanford plant could be deadly to people, and animals and the environment. So, if the Hanford plant was ever to be reopened our environment and our lives would be in extreme danger. If you really care about your life take a stand and voice your opinion. For these reasons I've explained I do not oppose the reopening of the FFTF at Hanford nuclear reactor.

1890-1

1890-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF (It is assumed that the commentor's conclusionary statement was intended to reiterate their opposition to restart of FFTF.)

1890-2

1890-2: DOE notes the commentor's opposition to the use of FFTF for the enhancement of its nuclear facility infrastructure. The FFTF reactor at Hanford was constructed and initiated operations in the mid- 1980s making it the DOE's newest reactor. All of the DOE missions are for civilian purposes. No weapons material will be produced.

The environmental impacts associated with operation of the FFTF are addressed in Section 4.3 of Volume 1 of the NI PEIS. The impacts are shown to be small. These impacts specifically include the risks to human health during normal operations and associated with postulated accidents. Over the 35-year operational period no fatalities would be expected among workers or in the general public in the vicinity of Hanford or at distant locations.

No food or water restrictions are in place outside the Hanford Reservation as a result of Hanford activities.

1890-3

1890-3: Hanford is committed to cleaning up its wastes in a safe and environmentally acceptable manner. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are of high priority to DOE. The restart of FFTF would not divert or reprogram budgeted funds designated for this effort. The management of all wastes associated with restart and operation of the FFTF is addressed in Section 4.3.1.1.13 of the NI PEIS. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. The management of these wastes would be well within management capacities and would not be expected to adversely affect the environment. Impacts on people and ecological resources would be small.

1890-1

Commentor No. 1891: Tabitha Gilmore

Draft PEIS Comment Form

I oppose the restart of the FFTF at Savannah River because I don't want people to die... I don't see how the restart is going to be safe... I don't think the public health risks are being fully addressed...

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Response to Commentor No. 1891

1891-1
1891-2
1891-3

- 1891-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
1891-2: Cancers are believed to be caused by a combination of hereditary and environmental factors, including exposure to ionizing radiation and chemical agents. This NI PEIS provides an estimate of the potential human health impacts associated with each of the alternatives considered for the production of radioisotopes for medical and industrial uses, research and development, and as heat sources for radioisotope power systems (See Sections 1.2 and 2.5 of Volume 1). The methodology used in the analysis of health effects, which is detailed in Appendix H through J, is based upon our current knowledge of the health impacts that may result from exposure to low doses of ionizing radiation and chemical agents. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of each of the alternatives (Alternative 1 includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with each alternative, including restarting FFTF, would be small.
1891-3: DOE notes the commentor's concern about potential environmental impacts associated with FFTF restart. The environment impacts from FFTF operations are addressed in Section 4.3 of the NI PEIS. All air emissions and wastewater discharges would be in accordance with applicable permit and regulatory requirements. The release of criteria air pollutants would result in concentrations well below Federal and state air standards (Table 4-13). The release of radioactivity and hazardous chemicals into the atmosphere would have a negligible effect on human health (Tables 4-17 and 4-19). There would be no discernible impacts to groundwater or surface water quality (Section 4.3.1.1.4). It is concluded that operation of FFTF would result in small impacts to the biosphere.

Commentor No. 1892: Adriana Morales

Response to Commentor No. 1892

Draft PEIS Comment Form

I strongly oppose the restart of the FFTF at Hanford Nuclear reactor. I'm outraged that you would even consider restarting the FFTF. I personally think this would be a senseless act, considering it is unhealthy for many Oregonian citizens. This is morally wrong.

1892-1

1892-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1892-2

1892-2: Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks to all people, including citizens of Oregon and Washington, associated with restarting FFTF would be small.

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Commentor No. 1893: Kimberly T.

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

I oppose the restart of the FTF at Hanford nuclear reactor. Because it can kill people and animals. It affects too many things on the Earth.

1893-1

1893-2
