"Advancing the Quality of Life."

Honorable Bill Richardson,
Secretary of Energy
U.S. Department of Energy
1000 Independence Ave. SW
Washington, D.C. 20585

Andrew Athy, Jr., Chair,
Secretary of Energy's Advisory Board
U.S. Department of Energy
1000 Independence Ave. SW
Washington, D.C. 20585

Dear Secretary Richardson and Mr. Athy:

We are dismayed that during the long awaited for conference call held last Thursday, Department staff were not prepared or willing to discuss issues related to the Secretary's first two commitments regarding the FFTF reactor EIS and the public comment process.

Initial review of the Draft EIS confirms our fears, expressed during our meeting with you of June 10, that analyses of impacts, and even definition of the scope, has been manipulated by reactor restart advocates. Furthermore, the unwillingness to address the concerns of the Hanford Public Interest Network citizen groups regarding the public notice and comment plans for the Draft EIS, stated in our prior letter to you, would appear to lock the Department into legally inadequate public notice and comment plans and a confrontational course. Plans and procedures for notice and the conduct of hearings require 30 to 45 days of notice and appear locked in from the publication in the Federal Register.

The first commitment of the Secretary was to ascertain if the EIS included independent analysis of:

- a) the need for medical isotopes and economic analyses of whether demand will be met by non-DOE investments and market forces; and,
- b) whether safety of the reactor and ancillary facilities was addressed. This was to be followed by serious discussion between ourselves and the Department, through the offices of Mr. Athy.

1305 Fourth Avenue - Suite 208
Seattle WA 98101

206/382-1014 • fax 206/382-1148 • e-mail: office@heartofamericannorthwest.org

Cynthia M. Hoffer, J.D. Executive Director

Response to Commentor No. 1

1-1: The Draft NI PEIS was prepared in compliance with the National Environmental Policy Act (NEPA) of 1969, as amended (42 U.S.C. 4321 et seq.), Council on Environmental Quality Implementing Regulations (40 CFR 1500 et seq.), and DOE's Implementation Regulations (10 CFR Part 1021). Other applicable laws, regulations, and requirements are discussed in Chapter 5 of Volume 1. Environmental impacts were analyzed for all of the alternatives and options (See Chapter 4 of Volume 1). None of the analysis was manipulated to obtain results favorable to any alternative. Details of the analysis are given in Appendixes H through J of Volume 2. The scope of the NI PEIS was determined in accordance with the laws and regulations cited above after public scoping meetings (See Section 1.4 of Volume 1 and Appendix N of Volume 2).

Public notice was given and public hearings on the Draft NI PEIS were conducted in accordance with federal law and regulations cited above. Chapter 1 of Volume 3 describes the public comment process used for the NI PEIS.

Dialogue between supporters and opponents of Alternative 1, Restart FFTF, was held in Seattle, Washington on September 5 and 6, 2000. According to the facilitator (Letter to the Secretary of Energy from Hallmark Pacific Group, LLC, dated September 22, 2000), no unanimous agreement was reached by the five participants in each of two panels. DOE observed, but did not participate in, the discussions. DOE is required to comply with statutory and regulatory requirements regardless of the outcome of dialogue among advocates and opposition for any particular alternative.

1-2: As described in Section 1.2 of Volume 1, forecasts of medical isotope needs were provided by the Expert Panel (Wagner et al. 1998) and the Nuclear Energy Research Advisory Committee (NERAC 2000a). DOE agrees with these projections. Mission effectiveness of Alternatives is discussed in Sections 2.7.3 and 2.8 of Volume 1.

Members of the expert advisory groups were selected for their medical credentials and knowledge of medical isotopes. The expert groups were directed to provide their best technical assessment of the need for medical isotopes over the next two decades (Wagner et al. 1998). Projections of market growth were given by the Expert Panel in terms of dollars, not percentage of the population. The Panel did not project

PAGE 83

00001

Review of the EIS (and we must urge you to take notice of the fact that the table of contents of the EIS was faxed to us less than 24 hours before our conference call and just two days before the entire EIS was handed to some reactor proponents) confirms that the EIS does not meet these basic expectations (and legal requirements)

[Note regarding medical isotopes: We have repeatedly objected to the EIS adopting a presumed need for isotopes based on the non-credible studies done on behalf of program advocates. The EIS adopts a forecast for need that has no economic basis or credibility. The convening of a panel composed of individuals with direct financial conflicts of interest vis a vis reactor and other Department contracts, to compare the two studies commissioned by advocates for production as part of their lobbying efforts, is NOT an independent economic assessment of demand and forecast capacity. We will demonstrate in further discussions the lack of credibility of this claimed forecast and reliance on advocates' documents to claim there is a need justifying the restart of the FFTF reactor. Suffice to say, one of those "studies" uses a ruler to project an incredible line of growth in use of medical isotopes, without differentiation, that would take their use from 1% of the population today to over half the population annually in 30 years of reactor use. The advocates' assumptions have already failed to live up to reality. A proper analysis will utilize econometrics, differentiate between types of isotopes and facilities to meet demand for each isotope, examine the market forces relative to investment in production facilities by other nations, universities or hospitals, and private investors.]

[As regards safety issues, the recent admissions of Hanford management's misleading and false statements regarding potential radiation/Plutonium releases during and after the Hanford fire, and their multiple failures to comply with emergency planning and reporting of potential hazardous materials pursuant to EPCRA, SARA, RCRA, and Washington Dangerous Waste Law reveal the hollowness of assurances that the department has considered safety previously, and the legal inadequacy of the EIS for failure to address evacuation planning, ability to meet external regulations and licensing standards, etc...]

While progress was made on last week's conference call defining the time frame and format for use of independently facilitated, principled negotiations between reactor restart proponents and opponents, the Department's staff appears to have failed to recognize that the value of such negotiations includes the opportunity to have reactor opponents formally agree not

Response to Commentor No. 1

percentages of the population that would benefit from medical isotopes. While the identification of specific isotopes as a focus for research or clinical application is sometimes uncertain, the Expert Panel's projection of expanding needs for medical isotopes is reasonable (Section 1.2.1 of Volume 1). DOE agrees with the Expert Panel's projections. The Expert Panel's projections were made in 1998. While recent increases in the market for medical isotopes suggest that the Panel's projections are correct, the accuracy of the Panel's projections will not be evident for several years. The purpose of this NI PEIS is to describe DOE's alternatives (Section 2.5 of Volume 1) for meeting its mission objectives and to evaluate the environmental impacts that would result from implementation (Chapter 4 of Volume 1) of the alternatives. As discussed in Section 2.6 of Volume 1, alternatives that would not meet DOE's mission requirements were dismissed.

1-1

1-2

1-3:

Safety and health were foremost considerations during preparation of the NI PEIS. No radiation or hazardous materials were released from facilities at the Hanford Site as a result of the wild fires of that occurred in June 2000. The fires did result in re-suspension of radioactive materials that were already in the environment. The amount of radioactive material that was re-suspended was only slightly above natural background levels and required several days of analysis to quantify. Information on this event has been made available to the public and can be accessed at <http://www.Hanford.gov/envmon/index.html>. This site also provides a link to information on the independent offsite air monitoring that was conducted by the U.S. Environmental Protection Agency. Estimates of the impacts of a spectrum of accidents that could occur under Alternative 1, Restart FFTF, at candidate facilities at the Hanford Site are given in Section 4.3 of Volume 1 and Appendix I of Volume 2. Applicable laws and regulations are described in Chapter 5 of Volume 1. DOE complies with all applicable laws and regulations.

to challenge the adequacy of the EIS and take other available legal actions if an agreement is reached. Such a result is only achievable if the Department meets the commitments of the Secretary regarding EIS content and provides for an adequate public notice and comment through a participatory planning effort. Time is running out for legally adequate notice and comment preparations. We are not willing to wait for a written response from the Office of Nuclear Energy to our letter of last week. The involvement of senior staff apart from the programmatic advocates for the EIS and reactor restart will be necessary in discussions following up on the Secretary's first two commitments on EIS scope and regarding the legal adequacy of the EIS.

As of today, despite your efforts, there is a lack of credibility in the process and substantive product. It is clear from our conference call that there will not be adequate public notice, and the conduct of the hearings will not meet basic requirements, amongst other alarming developments. We urge that there be an immediate discussion next week of our previously outlined proposals to resolve these concerns.

Sincerely yours,

Hyun Lee, JD, LL.M.

Kathy Grebstad
Wendy Green Lowe
Teri Tyler

Note: The Site-Specific Advisory Board for the Idaho National Engineering and Environmental Laboratory (INEEL), also known as the INEEL Citizens Advisory Board (CAB), is a local advisory committee chartered under the Department of Energy's (DOE) Environmental Management SSAB Federal Advisory Committee Act Charter.

The INEEL CAB recently received copies of the Draft Programmatic Environmental Impact Statement for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the United States, Including the Role of the Fast Flux Test Facility (DOE/EIS-0316D). We also received the orange postcard inviting our comment and announcing the public comment period. We look forward to reviewing the draft document and submitting our comments as a consensus recommendation.

The INEEL CAB develops its recommendations through consensus-building processes and they are finalized at meetings of the full board. Our next meeting will be held on September 19 and 20, 2000, in Jackson, Wyoming. The orange post card indicates that the public comment period for the Draft PEIS will end on September 18, 2000, one day before our meeting. **We therefore respectfully request an extension in the public comment period to allow our full Board to participate in the process of developing a recommendation in accordance with our normal procedures.** We should be able to complete our finalization processes by no later than close of business September 22, 2000.

We appreciate your consideration of this request. Thank you for your prompt response to this request.

Sincerely,

Stan Hobson
Chair, INEEL CAB

Response to Commentor No. 2

2-1

2-1: As stated in the Notice of Availability (65 FR 46443 et seq.), the comment period for the NI PEIS began on July 28, 2000 and extended through September 18, 2000. Council on Environmental Quality implementing regulations (40 CFR 1506.10(c)) require that at least 45 days be allowed for public comment on a draft environmental impact statement. DOE notified the INEEL CAB that although the public comment period would not be extended beyond the September 18, 2000 deadline, late comments would be considered to the extent practicable. Responses to the subsequent INEEL CAB comments are shown under Comment Number 2050 of this comment response document (Volume 3 of the NI PEIS).

Commentor No. 3: Lee A. Fisher

Draft PEIS Comment Form

I strongly urge you to Restart
FFTF, Alternative #1.
Many of my friends have been
cured by implantation of
'seeds' particularly those with
prostate problems.
Keep the skills alive for production.
Sorry to hear you've had to buy
isotopes from Russia. How many
years does it take to learn that
you can't - and shouldn't trust them!!

3-1
3-2

3-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.
3-2: The United States has purchased nine kilograms of plutonium-238 from the Russians since 1992. DOE is now considering re-establishing a domestic production capability of plutonium-238 at a United States facility because it is in our national interest to assure that the United States does not rely on any foreign government to support the NASA space program. A more detailed explanation of the need for a domestic source of plutonium-238 is found in Section 1.2.2 of Volume 1.

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Commentor No. 4: J. E. Kurtz

Draft PEIS Comment Form

From this draft, it is obvious that the FFTF option is prime candidate. IT CAN PERFORM ALL MISSIONS AND DOES NOT CAUSE THE GENERATION OF ANOTHER SITE TO CLEAN UP. EVEN THOUGH COST WAS NOT PART OF THE EVALUATION, IT APPEARS THAT IT WOULD BE OVERALL COST EFFECTIVE. YOUR DISCUSSION OF OPEN SESSION COMMENTS GIVEN AT PUBLIC MEETINGS DOES NOT REALLY DISCUSS ALL THE POSITIVE COMMENTS ON A FFTF RESTART. IT APPEARS TO HAVE BEEN "POLITICALLY" CORRECT TO ADDRESS THE MINORITY OPPOSITION. IT APPEARS THAT ANY ALTERNATIVE BEYOND FFTF WOULD BE WAY PROHIBITIVE AND NOT MEET ALL MISSION GOALS. IF FFTF IS NOT SELECTED AS DRAFT AND ALTERNATIVE, IT WOULD BE A MISTAKE AND WOULD ONLY DEEPEN PEOPLES BELIEF THAT POLITICS RUNS THE GOVERNMENT NOT GOOD COMMON SENSE. AS A TAXPAYER, I WOULD FEEL "RIPPED" OFF AGAIN.

Select FFTF AS THE OPTION -- IT IS GOOD, COMMON, TECHNICAL, AND COST EFFECTIVE SENSE!

Commentor No. 6: Stephen S. Hart

Draft PEIS Comment Form

After reviewing the Draft PEIS, I am strongly opposed to restarting the FFTE. Having worked at both Hanford and INEEL, the lower potential exposure to the population and much lower overall population in the vicinity of INEEL should be the determining factors. Therefore, I support Alternative 5, with Alternative 2, Option 8, held in reserve for the future if plutonium-238 supplies from Russia should be interrupted for either political or supply reasons. However, economic climate should not be a reason for interrupting the purchase of Russian plutonium-238 as keeping those supplies out of the hands of third parties should be of overriding priority. I would, in fact, support an increase in the rate of annual purchase of plutonium-238 from Russia under the DOE contract discussed on page S-5 of the PEIS, even if it meant that some current DOE remediation programs had to be cut to pay for it. I do not favor restarting any currently shut-down reactors at any DOE facility for this or any other program.

7/12/00

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Response to Commentor No. 6

6-1

6-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTE. DOE further notes the commentor's support for Alternative 5, Permanently Deactivate FFTE, with Alternative 2, Use Only Exiting Operational Facilities, Option 8, Irradiate at ATR and HFIR and Process at FDPF, held in reserve for future production of plutonium-238 should supplies from Russia be interrupted.

6-2

6-2: See response to comment 6-1.

6-3: The purpose of the existing DOE contract to purchase plutonium-238 from Russia is not to keep this material out of the hands of third parties but rather to ensure a supply for NASA space mission radioisotope power sources. Unlike plutonium-239, the radioisotope plutonium-238 is not a proliferation risk because its nuclear properties preclude it from use in a nuclear weapon. The International Atomic Energy Agency (IAEA) exempts plutonium that is more than 80 percent plutonium-238 from consideration as special fissionable material subject to safeguards. All plutonium-238 production alternatives in this EIS will produce this isotope in greater than 80 percent purity. Therefore, the purchase of plutonium-238 from Russia has no effect on nonproliferation of nuclear weapons since plutonium-238 is not a nuclear weapon material. Along with budget constraints, DOE has not purchased larger quantities of plutonium-238 from Russia because extended storage of this radioisotope results in the buildup of other radioisotopes which require their removal and pose a significant radiological health hazard to workers.

6-3

6-4

6-4: DOE notes the commentor's concerns regarding the restart of any DOE reactor facility.

Commentor No. 7: Edie Bradley

Response to Commentor No. 7

Draft PEIS Comment Form

I still believe that Solar energy is a better choice!

7-1

7-1: DOE notes the commentor's interest in solar energy. The DOE missions to be addressed in this EIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development, can currently only be met using nuclear reactor or accelerator technologies.

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Response to Commentor No. 8

- 8-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 8-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Commentor No. 9: Charles Greer

Response to Commentor No. 9

Draft PEIS Comment Form

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Continues deactivation of FFTF.
Continues clean-up at Hanford & INEL.
Continues removal of waste at INEL.

9-1
9-2
9-3

Preferred alternative is no. 2.
- Use only existing operational facilities.

9-4

Preferred option is no. 1 -
- Limits operations to 2 sites - Idaho's Tri-Party
- Lessens risk due to transport or accident

9-5

Without cost factors this is just an exercise.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

- 9-1:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF and support for Alternative 2, Use Only Existing Operational Facilities, Option 1, Irradiate at ATR and Process at REDC. It should be noted that deactivation of FFTF is a component of all options under Alternative 2 (as well as under Alternatives 3, and 4).
- 9-2:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 9-3:** Implementation of the nuclear infrastructure alternatives described in Section 2.5 of Volume 1 would not impact schedules or funding for cleanup activities at Idaho National Engineering and Environmental Laboratory (INEEL). As discussed in Volume 1, Section 3.3.11.1 of the NI PEIS, cleanup activities at INEEL are coordinated with the Environmental Protection Agency and the State of Idaho under a consent order. DOE's objective is to achieve delisting from the National Priorities List by the Year 2019.
- Waste management at INEEL is described in Section 3.3.11 of the NI PEIS, and waste generation that would result from implementation of Alternatives 1 or 2 is described in Sections 4.3.2.1.13 and 4.4.2.1.13, respectively. Waste that would be generated at INEEL under Alternatives 1 or 2 would be small in comparison to onsite treatment, storage and disposal capacities.
- 9-4:** See response to comment 9-1.
- 9-5:** The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the

Commentor No. 9: Charles Greer (Cont'd)

Response to Commentor No. 9

alternatives presented in the NI PEIS. Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. The associated cost report was made available to the public on August 24, 2000. DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS. The Record of Decision concerning enhancement of DOE's nuclear infrastructure is scheduled for January 2001.

Draft PEIS Comment Form

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

I HAVE READ THE DRAFT PEIS DOE/EIS - 0310D.
I BELIEVE THAT ALTERNATIVE 1 - RESTART FFTF
OR ALTERNATIVE 2 - USE ONLY EXISTING OPERATIONAL
FACILITIES - ARE THE BEST COURSES OF ACTION
AT THE PRESENT.

HOWEVER, IN THE LONG TERM, I BELIEVE THAT
ALTERNATIVE 4 - CONSTRUCT A NEW RESEARCH
REACTOR - SHOULD BE PURSUED. THE DOE
NERAC HAS STATED IN SEVERAL PLACES THAT
A NEW RESEARCH REACTOR IS NEEDED, AND
I AGREE.

SO, START WITH ALTERNATIVE 1 OR 2, BUT GET
DOE TO BEGIN LONG-TERM DESIGN OF A NEW
DOE RESEARCH REACTOR.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

- attending public meetings and giving your comments directly to DOE officials
- returning this comment form to the registration desk at the meeting or to the address below
- calling toll-free and leaving your comments: 1-877-562-4593
- faxing your comments toll-free to: 1-877-562-4592
- commenting via e-mail: Nuclear.Infrastructure-PEIS@hq.doe.gov

10-1

10-1: DOE notes the commentor's support for either Alternative 1, Restart FFTF, or Alternative 2, Use Only Existing Operational Facilities, while Alternative 4, Construct New Research Reactor, is being pursued.

10-2

10-2: See response to comment 10-1.

10-3

10-3: See response to comment 10-1.

Commentor No. 11: Laurie Gerber

Please restart FFTF for
medical isotopes. This is the
most cost effective solution
for isotope production.

Sincerely,
Laurie Gerber

11-1**Response to Commentor No. 11**

11-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 12: James Breed

Response to Commentor No. 12

Draft PEIS Comment Form

Since the FFTF is a research facility that will be useful when the U.S. returns to nuclear power and can be used now for making medical isotopes (admittedly at a loss), I feel it should be kept in operation. Shutting down destroys the facility and would require all new construction!

12-1

12-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Commentor No. 16: Doug Arbogast

Response to Commentor No. 16

Draft PEIS Comment Form

ENVIRONMENTAL IMPACT STATEMENT

FFTF is a test reactor. It needs more missions to like manufacturing of medical isotopes. Test log of new kinds of fuel for other reactors.

It is a low pressure type of reactor compared to water types. It produces a lot of heat that could be captured in turbines to generate power for parts of the Hanford area. It is to be noted that the portion of a mission was changed some years back.

Why waste more money on keeping it in constant-buy. Give it a project and get her to work. That can build more jobs as well.

I, ^(Print Name) Doug Arbogast, am in favor of restarting the Fast Flux Test Facility (FFTF) for the production of medical isotopes.

Dear Ms. Brown:

As Washington's oldest and largest statewide business organization whose 3,700 members employ more than 600,000 people, we are writing this letter to express our continued support for the on-going environmental review process initiated by the Department of Energy for the Fast Flux Test Facility (FFTF) on the Hanford Nuclear Reservation. We believe that the Department must continue the process leading to the bringing on line of the FFTF for medical isotope research and treatment.

It is obvious that there is a need for additional sources of medical isotopes for research and treatment. The benefits of these isotopes to the patients are numerous. They include improved efficacy, reduced cost, and a significantly improved quality of life while undergoing treatment. The citizens of the Pacific Northwest are blessed with one of the best health care provider and research networks in the world. Having isotopes readily available for our health care industry stands to improve the quality of care for our residents and those in other parts of the world.

We have additional concerns which we believe should be surfaced in the on-going environmental review process. With the very recent national electrical energy shortages coupled with concerns about global warming, there is a need for additional nuclear energy-based research. Given the concerns about carbon monoxide emissions from fossil-fuel generating facilities and the fact that existing non-fossil fuel, non-nuclear technologies, and conservation are not able to fill the gap; research to find acceptable solutions to the issues facing nuclear power production is necessary. If we are to have sufficient electricity to power our computers, heat and cool our homes and operate our facilities, nuclear power must be explored as an option for the future. At the very least,

We keep Washington working

19-1

19-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 19: Don C. Brunell (Cont'd)
Association of Washington Business

Page 2
Collette E. Brown Letter
August 10, 2000

this proven source of energy production should be re-examined.

As one who represents a diversity of businesses from our state's major corporations to very small shop owners, decisions must be made based on a sound cost-benefit analysis, ability to meet anticipated market needs and overall risk. Clearly, the Fast Flux Test Facility (FFTF) represents the lowest risk, since it is an existing facility where the medical isotope activities have already been performed. It also appears that the FFTF provides greater flexibility to meet the multiple missions identified in the EIS, whereas the other alternatives appear to be dedicated to a single purpose with limited growth potential.

We hope the Department will proceed expeditiously with the environment review and we would certainly hope it would lead to the safe and efficient restart and operation of the FFTF.

Thank you and if you need additional information, please let us know.

Sincerely,

Don C. Brunell

Response to Commentor No. 19

Commentor No. 20: Clyde Nash, Jr.

Draft PEIS Comment Form

IMPORTANT CONCERNS TO PUBLIC HEALTH AND SAFETY CODE MINIMIZING THE POTENTIAL RELEASE HAZARDOUS SUBSTANCES FROM THE K-BASIN by REMOVING THE SPENT NUCLEAR FUEL, SLUDGE, DEBRIS, AND WATER. THE MATERIAL WILL BE TAKEN TO HANFORDS CENTRAL PLANT FOR TREATMENT, STORAGE, AND/OR DISPOSAL.

20-1

20-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although disposition of K-Basin spent nuclear fuel is beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

HANFORD'S CLEANUP MISSION, AND FURTHER STATED THAT OPERATION OF FETE COULD HELP SAVE THE LIVES OF MANY PEOPLE BY PRODUCING ISOTOPES TO BE USED IN NEW WAYS TO TREAT CANCER, HEART DISEASE, AND OTHER ILLNESSES.

20-2

COMMENTORS WERE ALSO CONCERNED ABOUT THE POTENTIAL GENERATION OF RADIOACTIVE AND HAZARDOUS WASTE AS A RESULT OF THE PROPOSED MISSIONS, AS WELL AS DOE'S COMMITMENT TO ONGOING CLEANUP PROGRAMS, PARTICULARLY AT HANFORD.

20-3

20-2: DOE notes the commentor's support for Alternative 1, Restart FFTF and for the Hanford cleanup mission.

20-1

20-3: DOE notes the commentor's concern about waste generation. The NI PEIS addressed the environmental impacts due to the treatment, storage and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Greetings to Mr. Geehofer, et al. This is a Memo of Understanding to each of you, a follow-up, promised to the Washington State Medical Association—about the DOE/EIS-0319D, JULY 2000 “DRAFT Programmatic Environmental Impact Statement for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the United States,” and my asking their Washington State Medical Association to be the Civilian benefactor and Partner in/of FFTF’s RESTART AND OPERATION. Mr. Mike Talbert of DOE/RL made available to me “posthaste,” at my 8/2/00, request, to send to you and yours, DOE’S related Volumes 1 and 2 and DOE’s Summary Copy of both Volumes, that you may be informed concerning my request, and that you may inform others of the Washington State Medical Association’s Program Office to allow them to get a better understanding of DOE’s Role in/of the Fast Flux Test Facility (FFTF), and any DOE Mission Statements and responsibilities to our Medical World, concerning DOE Secretary Richardson, the U. S. Department of Energy’s Energy and Natural Resources’ Zaar, DOE’S RESPONSIBILITY FOR ENSURING THE AVAILABILITY OF ISOTOPIES FOR MEDICAL APPLICATION, ETC., as a follow-up to my informing your Office of my April 2000 letter to DOE’S Mr. William D. Magwood, IV, Director of DOE’s Office of Nuclear Energy, Science and Technology, requesting that DOE give FFTF to Washington State Doctors, namely, one and the same, who will be/are prime users of medical isotopes, in the same fashion DOE gave the Port of Benton to Benton County, to allow the doctors, NASA and/or DOE, or other Federal, or private entities to partner with the doctors to use whatever “fall-out” that will be generated in the production of isotopes... such as Pu-238 used by NASA, etc., keeping DOE’s presence AND Federal Dollars at Hanford. I thought was the most important “fall-out” until I received a copy of the PEIS DRAFT. The first paragraph of its Summary stating that ensuring the availability of isotopes for medical, industrial, and ensuring

21-1

Response to Commentor No. 21

- 21-1:** Although other private manufacturers produce medical radioisotopes, DOE remains the key provider for a large number of radioisotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large-enough quantities to make their production financially attractive to private industry. Under the NI PEIS proposed action and consistent with its mandates under the Atomic Energy Act, DOE would enhance its existing nuclear facility infrastructure to, among other things, more effectively support production of radioisotopes for medical applications and research. DOE’s intent is to complement commercial sector capabilities to ensure that a reliable supply of isotopes is available in the United States to meet future demands, and encourage the commercial sector to privatize the production of isotopes that have established applications to a level that would support commercial ventures.

The United States government believes that reasonable business relationships with Russia are important. If the purchase of plutonium-238 from the Russians becomes unnecessary, then no new contracts will be negotiated.

Commentor No. 21: Bernice C. Mitchell (Cont'd)

RESEARCH APPLICATIONS, AND UNDERTAKING RESEARCH AND DEVELOPMENT ACTIVITIES RELATED TO DEVELOPMENT OF NUCLEAR POWER FOR CIVILIAN USE; INDICATES THAT DOE NEEDS FFTF RESTARTED ASAP. DOE ALREADY APPEARS CRIMINALLY NEGLIGENT PER THE Atomic Energy Act of 1954, as amended. DOE should be begging the Washington Medical Association to partner with them, instead of my begging either, and they both should be seeking out each other, asking the above local, State and Federal people to help them, to help this materialize. Mr. Richardson signed a Congressional Contract and the members of the Medical Associations took the Hippocratic Oath. DOE and the Medical Associations are positioning the Local, State and National Economy and National Well-Being toward demise, while they force the Medical Associations and Federal Agencies to import medical and industrial isotopes, thereby building foreign economies - letting us ingest their "nuclear fall-out," while we keep FFTF in "deactivated status" at the cost of millions of dollars, in fear that we will ingest some of our own "nuclear fall-out," by having delayed and are still refusing to bring FFTF "ON LINE." (Nuclear fall-out is of no respecter of persons or place, somewhat different than people. Those foreign (Russian, et al) millionaires we are creating by importing their ISOTOPES will some day own the U.S.A. when our Economy sinks to "third world" status.... There was a recent World War II Update that stated the babies, fathered by American Soldiers, left overseas when the War Ended, were placed in insane asylums and not orphanages). FFTF COULD HAVE BEEN AND COULD BE PRODUCING THE ISOTOPES AND BUILDING THE COMMUNITY'S AND U.S.A.'s ECONOMY THROUGH THE NUMBER OF JOBS/EMPLOYEES WILL BE NEEDED TO OPERATE FFTF.

Mr. Rabun, thank you for considering to assemble Mr. Martin of TRIDEC, DOE/Mr. Talbert and Governor Locke to meet with the Medical Association concerning a DOE/WMA EXPLORATION OF THE REACTIVATION OF FFTF WITHIN THE ABOVE PREFERENTIALS. POSTHASTE--ATLEAST A MEETING OF THESE MINDS!!

ATTENTION MS. COLETTE E. BROWN, DOCUMENT MANAGER OF THE OFFICE OF SPACE AND DEFENSE POWER SYSTEMS (NE-50), OFFICE OF NUCLEAR ENERGY, SCIENCE AND TECHNOLOGY, U.S. DEPARTMENT OF ENERGY, ATTENTION: N/PEIS; AND MR. WILLIAM D. MAGWOOD, IV, DIRECTOR OF THE OFFICE OF NUCLEAR ENERGY, SCIENCE AND TECHNOLOGY; PLEASE ACCEPT YOUR COPIES OF THIS MEMO AS MY AUGUST 31, 6:00PM RICHLAND, WA, BEST WESTERN TOWER INN'S "PUBLIC MEETING REGISTRATION AND THE MEETING'S WRITTEN, PUBLIC COMMENT, AND A PART OF THE PERMANENT PUBLIC COMMENT FILE, WITH THE FOLLOWING ADDITION: "I WANT THE RESTARTING OF THE FAST FLUX TEST FACILITY THAT IS CURRENTLY IN STANDBY STATUS, INCLUDING, ELEVATING IT TO THE CAPABILITY OF PRODUCING BOTH MEDICAL AND INDUSTRIAL ISOTOPES, AND Pu-238 SUFFICIENT FOR ALL U. S. NEEDS, WITH MY ABOVE SUGGESTED PARTNERSHIPS, AND THE EARLY CANCELLATION OF ALL Pu-238 AND ISOTOPE PURCHASING CONTRACTS WITH RUSSIA; AND OTHERS; INCLUDING THE YEARLY \$155 MILLION DOLLARS MENTIONED IN THE TRI-CITY HERALD, THAT DOE IS FUNNELING THROUGH PNNL, TO RUSSIA AS SECURITY'S FUNDS; AND USE THESE FUNDS AND THE Pu-238 RUSSIAN CONTRACTURAL FUNDS; AND SUFFICIENT--NEW CONGRESSIONAL FUNDING, TO DEFRAY THE COST OF REACTIVATING AND UPGRADING FFTF "POST HASTE" " Thanks to all of you in advance!!

Yours truly,

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Commentor No. 22: Richard E. Schreiber (Cont'd)

951 West Outer Drive
Oak Ridge, TN 37830-8606
August 8, 2000

Colette E. Brown, NE-50
U.S. Department of Energy
19901 Germantown Road
Germantown, MD 20874

Dear Ms. Brown:

Please consider my comments on the proposed EIS for expansion of the Nuclear Energy R/D and Isotope Missions of the USDOE. I am now retired, but for several years I was in charge of the Iridium Project at the Oak Ridge National Laboratory. The radioactive iridium was produced in the High Flux Isotope Reactor (HFIR), packaged and shipped to commercial suppliers of gamma ray sources for radiographing welds in industry.

I am supportive of the production of Pu-238 as a heat source for NASA deep space missions and favor the restart of FFTF and the construction of a new research reactor. I am opposed to the use of the HFIR for Pu-238 production because it would involve cannibalizing facilities now used for iridium irradiation, as well as the manufacture of other radioisotopes.

The biggest problem with the production of any radioisotope is reliability of source. If there is any threat to that source, customers go elsewhere. This will be true for Pu-238, just as it is for iridium now. There are just two sources of radioactive iridium in the United States and both are dependent on the uninterrupted operation of two reactors, HFIR and ATR. Both are ancient machines and subject to frequent unscheduled shutdown. Modernization efforts are modest and the pressure-containing members are subject to radiation degradation and must be retired from service in the near term. This uncertainty in the production of iridium gamma sources in the U.S. has led many customers to choose Russia as their supplier. The same will be true for Pu-238 if the proposed program does not go forward.

Ideally, the development of another research reactor and the restart of FFTF would assure the uninterrupted production of all radioisotopes needed in civilian programs in this country.

I believe three other points need to be made with regard to the scope of the present and proposed programs in the NI PEIS.

Response to Commentor No. 22

22-1: DOE notes the commentor's support for Alternative 1, Restart FFTF, in combination with Alternative 4, Construct New Research Reactor. Based on the alternatives presented in the NI PEIS, the Record of Decision can implement one or more alternatives, or a combination of elements from one or more alternatives.

22-2: See response to comment 22-1.

22-3: The use of HFIR for plutonium-238 production would not involve cannibalizing facilities now used for iridium irradiation and would not impact current missions. As stated in the NI PEIS, Section 2.5.3 of Volume 1, "Depending on the combination of facilities used in Alternative 2, HFIR and ATR could continue their current support of the medical and industrial isotope and research and development missions, including some near-term growth, while accommodating the production of plutonium-238."

DOE agrees with the commentor's concern about the reliability of the current sources of radioisotopes. This PEIS is a necessary step in the process of expanding isotope production in the United States.

22-4: Current domestic and global producers of radioisotopes include governments that operate reactors and accelerators at national laboratories or institutes, and private sector companies that own and operate accelerators. There are also many partnership arrangements wherein companies lease irradiation space in government reactors or operate processing facilities in coordination with the government. A

Commentor No. 22: Richard E. Schreiber (Cont'd)

C.E. Brown

Page 2

- (1) The document makes no mention of how the government isotope program fits into the total isotope production and use in this country, and the world. There are many more isotopes used, and greater quantities (curies), that are produced in accelerators than in government reactors. Some materials are produced in university reactors and some of the dominant isotopes used in medicine are derived from sources provided by Canada. Some European countries other than Russia also provide isotopes that compete with USDOE sources. It would be useful if the PEIS examined in some detail just how the DOE program shares in the overall radioisotope economy. Those parts that compete and those parts that are unique should be highlighted.
- (2) The iridium program, and other radioisotope programs as well, could greatly benefit from expanded use of the calutrons at Oak Ridge (Y-12). These devices are used to separate naturally occurring mixtures of isotopes. At present, it is necessary to allow the iridium sources to cool after irradiation to reduce the amount of high energy gammas coming from an undesired isotope which decays faster than the lower energy, desired isotope. The time lost reduces the service longevity of the sources. Separation of the isotopes prior to irradiation would solve this problem and reduce handling difficulties, as well. The same concept applies to many other radioactive sources that have many (non-radioactive) isotopes occurring together in nature.
- (3) Radio- and non-radioisotopes are largely sold to commercial users, or provided to researchers with government grants. The income from commercial users should be retained by the DOE facility making the sale, instead of being sent to the US Treasury. Normal commercial incentives, and the flexibility to use income for development purposes, should be available to the local DOE laboratory or other facility that actually makes the transaction. This would not only be a spark plug for the operation, stimulating efficiencies and morale, but would also make visible the income-producing capability of the program. This visibility would be helpful when seeking funding from Congress, funding which would still be necessary because of the large infrastructure costs associated with reactor and hot cell operation. The same concept applies for calutron and accelerator-produced isotopes. Seeing the contribution and social need for these materials would give greater public and Congressional support.

I believe it would be of great benefit to the argument presented in the PEIS if these points are included.

Sincerely,

Richard E. Schreiber

Response to Commentor No. 22

few universities also produce radioisotopes, but their ability to provide reliable and diverse supplies are generally limited by the small-scale capabilities or operating schedules of their facilities.

DOE's production and sale of radioisotopes fall into two categories—"commercial" and "research" and both types of isotope production are considered under the proposed actions. Commercial radioisotopes are those that are produced in large, bulk quantities and sold to pharmaceutical companies or distributors, or to equipment or sealed source manufacturers. Examples of commercial radioisotopes produced by DOE include strontium-82 and germanium-68 for medical applications, and iridium-192 and californium-252 for industrial applications. DOE only produces commercial isotopes when there is no U.S. private sector capability or when foreign sources do not have the capacity to meet U.S. needs reliably. In contrast, research radioisotopes are typically produced and sold in small quantities in response to specialty orders from researchers preparing experiments in the field of medicine, with small quantities of these radioisotopes also purchased by industrial researchers. Because small-quantity production of research isotopes is not financially attractive to private-sector producers and is generally not undertaken, DOE attempts to provide all research radioisotopes that are requested, subject to production capability, inventory, and financial constraints. As successful application of a specific research isotope is established, the production and sales of that radioisotope may shift from research to commercial status. In recent years, over 95 percent of DOE's sales of radioisotopes by dollar volume were commercial and 5 percent have been for research. Additional discussion of how DOE's isotope program fits into the overall U.S. and foreign isotope production capabilities was incorporated into Section 1.2.1 of Volume 1.

- 22-4: The document makes no mention of how the government isotope program fits into the total isotope production and use in this country, and the world. There are many more isotopes used, and greater quantities (curies), that are produced in accelerators than in government reactors. Some materials are produced in university reactors and some of the dominant isotopes used in medicine are derived from sources provided by Canada. Some European countries other than Russia also provide isotopes that compete with USDOE sources. It would be useful if the PEIS examined in some detail just how the DOE program shares in the overall radioisotope economy. Those parts that compete and those parts that are unique should be highlighted.
- 22-5: The iridium program, and other radioisotope programs as well, could greatly benefit from expanded use of the calutrons at Oak Ridge (Y-12). These devices are used to separate naturally occurring mixtures of isotopes. At present, it is necessary to allow the iridium sources to cool after irradiation to reduce the amount of high energy gammas coming from an undesired isotope which decays faster than the lower energy, desired isotope. The time lost reduces the service longevity of the sources. Separation of the isotopes prior to irradiation would solve this problem and reduce handling difficulties, as well. The same concept applies to many other radioactive sources that have many (non-radioactive) isotopes occurring together in nature.
- 22-6: Radio- and non-radioisotopes are largely sold to commercial users, or provided to researchers with government grants. The income from commercial users should be retained by the DOE facility making the sale, instead of being sent to the US Treasury. Normal commercial incentives, and the flexibility to use income for development purposes, should be available to the local DOE laboratory or other facility that actually makes the transaction. This would not only be a spark plug for the operation, stimulating efficiencies and morale, but would also make visible the income-producing capability of the program. This visibility would be helpful when seeking funding from Congress, funding which would still be necessary because of the large infrastructure costs associated with reactor and hot cell operation. The same concept applies for calutron and accelerator-produced isotopes. Seeing the contribution and social need for these materials would give greater public and Congressional support.
- 22-5: Separation of naturally occurring isotopes using the Oak Ridge calutrons is not within the scope of the NI PEIS. However, nothing in this PEIS would prevent their use to purify isotopes prior to irradiation if DOE deemed such use to be beneficial.
- 22-6: DOE notes the commentor's ideas about income allocation. DOE has not ruled out shared-income approaches related to future operation of isotope production facilities.

Commentor No. 23: Eugene C. Koschik

U. S. Department of Energy, Office of Space and Defense Power Systems, NE-50
19901 Germantown Road
Germantown, Maryland 20874-1290

Dear Mr. Secretary,

I help build FFTF while an employee of Westinghouse Hanford Company starting in 1971.

During 1980, FFTF achieved power status.

It only operated a few years and then was on "standby status" - WHAT A WASTE!

My wife had colon cancer surgery last year and did not require chemo or radiation.

However, the future is very uncertain regarding necessary treatments?

PLEASE RESTART FFTF FOR MEDICAL ISOTOPIES.....

Thanks.

Eugene C Koschik

Draft PEIS Comment Form

I wish to show my support for Alt 1
 There is a growing need for medical +
 industrial isotopes and a need to support
 future NASA space missions. To be involved
 in civilian nuclear energy research
 is highly desirable, especially for Washington
 state & will keep our area highly employable.
 The first Flux Test Facility is an excellent
 way to expand our knowledge in many areas

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

- attending public meetings and giving your comments directly to DOE officials

Gresham OR 97030

Response to Commentor No. 25

25-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF. The commentor should be aware that FFTF is not an experimental reactor, but rather was built to test fuel for the breeder reactor program.

25-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

25-3: Current waste management activities are conducted in accordance with applicable Federal and state laws and regulations and appropriate DOE orders.

25-4: 25-3: The purpose of the NI PEIS is to evaluate the environmental impacts of a range of reasonable alternatives to fulfill the proposed action, one of which is the domestic production of plutonium-238. Plutonium-238, used to support NASA space missions, is not weapons-grade plutonium (i.e., plutonium-239), and no defense missions or weapons processing activities are associated with the proposed action. Section 1.2.2 of Volume 1 was revised to clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

25-4: DOE notes the commentor's opinion.

Commentor No. 26: George T. Dvorak

Response to Commentor No. 26

Draft PEIS Comment Form

I support the restart of FTFE for use in the production of tritium and medical isotopes.

26-1

26-1: DOE notes the commentor's support for Alternative 1, Restart FTFE. The production of tritium or any other defense-related mission are not within the scope of actions proposed for FTFE in this NI PEIS.

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Commentor No. 27: Craig A. Maydole

Response to Commentor No. 27

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

After fully reviewing the Draft PEIS I have concluded that the best possible action would be a restart of the FFTE for the production of medical isotopes, Pu-238, and nuclear research. I feel that further delaying the restart of the FFTE is a waste of my tax dollars. Further, delaying the restart of FFTE places undue risk on my life by delaying valuable research time to a cure for cancer and other diseases. Additionally delaying a restart of the FFTE places the US at risk by forcing us to become dependant on foreign sources of radioisotopes. I urge the Secretary to order the immediate restart of FFTE.

27-1

27-1: DOE notes the commentor's support for Alternative 1, Restart FFTE.

Commentor No. 28: Barry Egner

1639 SW Skyline Blvd.
Portland, OR 97211
August 11, 2000

Collette E. Brown
NE-50
U.S. Department of Energy
19901 Germantown Rd.
Germantown, MD 20874

Dear Ms. Brown,

Enclosed with the letter is a copy of a letter that I sent (twice!) before, dated as indicated, to which I received no reply.

I understand that the Department is considering restarting the reactor at Hanford. In 1994 Secretary O'Leary said that the Hanford reservation would never make nuclear material again, that its sole activity would be repairing the damage already done.

So aside from the further detriment to credibility that the reconsideration of this decision creates, what am I to make of current proposals?

I can only conclude that I do not trust those managing the Hanford reservation to be cautious or truthful.

I strongly urge Secretary Richardson to resist any consideration to reopen the reactor at Hanford.

Yours truly,

Barry Egner MD

28-1

28-2

Response to Commentor No. 28

28-1: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The prior Secretary's statement pertained to nuclear weapon materials. No weapons material will be produced within the stated mission. All stated missions are for civilian purposes.

28-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Commentor No. 28: Barry Egner (Cont'd)

July 18, 1997
1639 SW Skyline Blvd.
Portland, OR 97221

Department of Energy
Washington DC

To Whom It May Concern:

This letter is in regard to the May, 1997 explosion at Hanford in Washington.

As an American citizen and as a resident of the NW, I am concerned about the incompetence and (lack of) credibility of those managing this hazardous facility.

Since your office and the contractors have already established that information you provide to the public is not trustworthy, I am not interested in receiving reassurances about procedures or planned corrections. We've been there before.

Instead, this letter is a request for an address where I can write to follow subsequent actions that are taken in regard to the management of the facility. Preferably, this would be a public watchdog organization or a federal office outside of your own.

Thank-you.

Barry Egner MD

cc: Ron Wyden, US Senator

28-3

Response to Commentor No. 28

28-3: DOE notes the commentor's concern about continued safe operations at the Hanford site. For a specific response to the concerns over the May, 1997 tank explosion at the Plutonium Reclamation Facility, please refer to the Comment Response, ORD 07-16, p. 3-417, included in the Surplus Plutonium Disposition FEIS, Volume 3.

For a general oversight of Hanford cleanup operations, there are two information sources.

1. The Defense Nuclear Facilities Safety Board (Attention: Andrew L. Thibadeau, Post Office Box 7887, Washington, D.C. 20044-7887, 1-800-788-4016, mailbox@dnfsb.gov; URL: <http://www.dnfsb.gov/>) is responsible for independent, external, nuclear health and safety oversight of all activities in DOE's nuclear weapons complex. The Board reviews operations, practices, and occurrences at DOE's defense nuclear facilities and makes recommendations to the Secretary of Energy that are necessary to protect public health and safety. Activities that would occur under the nuclear infrastructure alternatives (described in Section 2.5 of Volume 1) are unrelated to the national defense. Neither nuclear weapons nor components for nuclear weapons would be produced under these alternatives (See Section 1.2 of Volume 1 for a description of the nuclear infrastructure missions).

2. The Hanford Advisory Board (Hanford_Advisory_Board@rl.gov; URL: <http://www.hanford.gov/boards/hab/charter/charter.htm>) may also be of interest. It is an independent, oversight body consisting of a balanced mix of the diverse interests that are affected by Hanford cleanup issues. Its mission is to provide informed recommendations and advice to the DOE's Richland Operations Office, the U.S. Environmental Protection Agency, and the State of Washington Department of Ecology -- the Tri-Party agencies -- on selected major policy issues related to the cleanup of the Hanford site.

Commentor No. 29: Anonymous

For your information
 In my opinion, this
 distorts the benefit
 of having public
 meetings. ADIS is
 trying to dominate
 the hearings.

29-1

Response to Commentor No. 29

29-1: DOE notes the commentor's concern that the public hearings are susceptible to domination by individual groups. In addition to the public hearings, comments could be submitted by various means including mail, a toll-free telephone and fax line, and a web site (<http://www.nuclear.gov>). The public hearing format used was based on stakeholder input and was presented in the Notice of Availability (65 FR 46443 et seq.) for the Draft NI PEIS. This format was intended to encourage public discussion, regardless of the motivation for attending the hearing. It provided an opportunity for the participants to meet one another, exchange information, and share concerns, with DOE personnel available throughout the course of each hearing to answer questions. The meetings were facilitated so as to ensure that all persons wishing to speak had an opportunity to do so. Persons wishing to comment were selected at random from the audiences rather than according to the order in which they registered. This was accomplished by a random number drawing. In addition to the comment recorder stationed at the main hearing, a second recorder was available in an adjacent room to receive comments without the need to await selection at the main proceeding. The hearing format used promoted open and equal representation by all individuals and groups. Equal consideration was given to all comments, regardless of how or where they were received.

A Call To Action!!!

The FFTF EIS Hearings are COMING!!!

August 28, Hood River, Or.
August 29, Portland, Or.
August 30, Seattle
August 31, Richland

All hearings are scheduled for 6:00 p.m. to 9:00 p.m.
Hood River hearing is at Hood River Inn, 1108 E. Marina Way.
Portland hearing is at Oregon Museum of Science & Industry (OMSI), 1945 SE Water Ave.
Seattle Hearing is at Wa. State Convention & Trade Center, 800 convention Place.
Richland hearing is at Tower Inn, 1515 George Washington Way.

These hearings are pivotal to the future of the FFTF!!
We have been told that public input will be a factor in
the final decision. Everyone who has an interest in
FFTF, please attend as many of these hearings as you
possibly can!! This may well be the make-or-break point
in the FFTF campaign. There has already been reaction to
the draft EIS. Do NOT let others dominate the
discussion! Get with your friends, co-workers and
neighbors and carpool. If you need transportation,
please call 946-6965 and leave a message.

It is also important that written comments be sent to:

Ms. Colerte Brown
DOE Office of Space & Defense Power Systems, NE-50
19901 Germantown Road
Germantown, Md. 20874-1290

.....or E-mail them to: Nuclear.Infrastructure-PEIS@hq.doe.gov
By September 18.

 19901 Germantown Road, Germantown, MD 20874_1290

Ms. Brown

This letter is to express my comments on the draft PEIS for accomplishing expanded civilian nuclear energy research and development and isotope production missions in the United States, including the role of the Fast Flux Test Facility.

I support option #1. Restart of the FFTF at Hanford, Washington, to meet all isotope production and research requirements.

Believe the FFTF is a valuable asset that should be utilized. It makes economic sense to use the FFTF since it is already constructed, had an outstanding operating history, and has fuel available for these missions. Here in San Diego, California we are experiencing electrical rate hikes due to deregulation and not enough generation capacity, therefore isotopes should not be made in other reactors, which could take away needed space for fuel and reduce generation capacity. Medical isotopes will be needed in quantities (after medical trial experimental quantities are used) for distribution that only a large reactor like FFTF can provide.

Construction of one or two accelerators would take years to license and would only be another drain on the already stretched power generation capacity of the United States.

Construction of a new research reactor is not required when FFTF is already there and fully capable to meet this need. The legal challenges to build a new reactor are also very big and a new reactor could not be constructed in less than ten years and at great expense in these times.

Again I want to express support for the restart of the FFTF.

Thank you very much

Dianne Cooper

Subject: FFTF Restart
Auto forwarded by a Rule

Dear Leaders of the Next Millennium,

It will not be physically possible for me to attend any of the upcoming public hearings associated with the FFTF EIS. Hence, please permit me to record my support for the restart for the FFTF in the strongest possible language!

I had the great privilege of working on the FFTF for a large part of my professional career. As such, critics may say that such an association clearly biases my support—somewhat akin to a father who would protect his son to the bitter end. If someone were to use such an analogy to dismiss my testimony, I would readily accept the charge. To me, the FFTF is very much like a son. It represents everything that is right about our nation and, in many ways, the technology that FFTF is capable of developing is, in my opinion, absolutely crucial to the welfare of our nation—and possibly all of humanity. Hence, like a responsible son, it deserves to live and make the unique contributions to society that only it can make.

During the last two years of my association with this marvelous machine, I had the pleasure of traveling all around the world in hopes of establishing sufficient support for FFTF to turn it into a true international user facility. Nowhere did I ever hear a disparaging remark about the technical capabilities of this queen ship. It is universally recognized among the qualified technical community that it is in a class all by itself.

There were certainly questions related its cost of operation. Indeed, it is not an inexpensive machine to run. But quite frankly, the costs of operation (though substantial) are, I believe, miniscule in comparison to the benefits that can still be derived from this facility. Furthermore, I know that substantial private capital is available to offset federal expenses, but this option has never been seriously considered by the Department of Energy. Hence, if costs are truly a pivotal issue, a public/private partnership should be given full and honest consideration.

The missions have been well articulated, so there is no reason to repeat these here. I simply submit that if the United States has any hope of re-establishing itself as a world leader of nuclear technology—a technology that is CERTAIN to gain in importance on the global scene—restarting the FFTF would be both technically and symbolically perhaps the most important forward-looking decision it could make.

Response to Commentor No. 31

- 31-1** **31-1:** DOE notes the commentor's support for Alternative 1, Restart FFTF.
- 31-2:** DOE has not ruled out shared-cost approaches related to future operations of isotope production facilities. Although private manufacturers produce medical radioisotopes, DOE remains the key provider for a large number of radioisotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large-enough quantities to make their production financially attractive to private industry. Under the NI PEIS proposed action and consistent with its mandates under the Atomic Energy Act, DOE would enhance its existing nuclear facility infrastructure to, among other things, more effectively support production of radioisotopes for medical applications and research. DOE's intent is to complement commercial sector capabilities to ensure that a reliable supply of isotopes is available in the United States to meet future demands, and encourage the commercial sector to privatize the production of isotopes that have established applications to a level that would support commercial ventures.
- 31-2**

To whom it may concern:

I am horrified by the arrogant schemes proposed by NASA to nuclearize space.

The risks being stealthily foisted on an unsuspecting public are atrociously unacceptable.

The assurances issued by NASA reek of unethical and stupid neglect of fundamental reality.

NASA's funding deserve drastic cuts.

Angry in Paramus,

Sidney J. Goodman, P.E., M.S.M.E.
 170 Villanova Drive
 Paramus, NJ 07652

33-1

Response to Commentor No. 33

33-1: DOE notes the commentor's opposition to NASA's use of nuclear materials for space missions. NASA's policies concerning nuclear power are outside of the scope of this PEIS. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and provides a thorough NEPA evaluation for each launch.

I am writing to express my sincere concern at learning of your intent to close down the Fast Flux Test Facility, as expressed in the draft "Nuclear Infrastructure Programmatic Environmental Impact Statement" issued for hearing and comment. As the newest, and the most advanced, versatile and safest of all DOE reactors, its purpose has always been beneficial uses of nuclear science. It has never been a defense reactor. We understand that some 20 years of design life remain for the reactor. The U. S. needs a wide variety of isotopes for leading edge medical research and therapy. Materials that could have been made at FFTF will result in clinical trials for several types of cancer, arthritis and other medical concerns being cancelled or abandoned. Useful Plutonium isotopes can also be produced at this facility rather than buying supplies from Russia. Any new facility to do these same important jobs would cost on the order of \$3 billion to \$9 billion to reestablish at another locality. We need FFTF, please restart it.

Sincerely,

Janice Jolly

To: INFRASTRUCTURE_PEIS, NUCLEAR
Subject: What happened to renewables?
Auto forwarded by a Rule

RE: DOE Releases Draft Nuclear Infrastructure Programmatic Environmental Impact Statement

I urge you stop your continued investment in nuclear technology. It is an outrage that the DOE has remained a major player in the promotion and subsidy of nuclear power and weapons research.

All DOE research and development money should be directed toward renewables such as solar voltaic, etc. There should be no more federal funding for nuclear of ANY kind. Both weapons and power are too dangerous and too expensive. All the social, environmental and medical costs are ignored and the public is once again being taken for a ride.

Right from the start "Atoms for Peace" was a cover for the nuclear weapons program. Unfortunately we know that all this "public input" is for show only. Your decisions to go with nuclear have already been made. It is unfortunate that neglect of human needs today and of future generation will be the price paid.

Tanja Winter, 8315 Paseo Del Ocaso, La Jolla, CA 92037

Response to Commentor No. 35

35-1

35-1: The commentor's opposition to nuclear technology is noted. DOE also notes the commentor's interest in alternative energy sources, although issues of research and development of alternative energy sources are beyond the scope of this NI PEIS. Other offices of DOE are responsible for the research and development of alternative energy sources.

35-2

The actions proposed in the NI PEIS neither support nor involve weapons material development. All social, medical, and environmental impacts of all alternatives, including no action, are evaluated in this PEIS. The results of this evaluation are presented in EIS Volume 1, Section 2.7.1.

35-2: The Atoms for Peace Program promoted peaceful applications of nuclear technology. The program was not a cover for nuclear weapons development. DOE policy encourages effective public participation in its decision-making process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE considered comments received from the public. No decisions have been made with regard to the facilities and locations evaluated to fulfill the requirements of the DOE missions. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

Dear Collette E. Brown:

I believe that FFTF should restart due to the variety and quantity of tasks FFTF can perform, and due its s proven safety and reliability. With alternative two, existing facilities can't provide the quantity and flexibility that FFTF offers. Construction of new accelerators are cost prohibitive, don't offer the flexibility FFTF offers, and will require far more electrical power than this country currently has available. Construction of a new research reactor makes totally no sense when you have a proven reactor that is already built and has procedures to operate it. Not to mention the politics to get a new reactor permitted, and the very high costs of trying to build it. The last alternative of permanently deactivating FFTF would mean deactivating a facility that is environmentally safe, and has an expected life of 35 years left of operation.

The simplest alternative is to do nothing, which DOE has perfected. Here in Washington State we amazingly enough have a Major League Baseball team in Seattle. For years they were looked upon as little more than a minor league team, then the State government had the foresight to build a state of the art baseball stadium in Seattle (Safeco Field). Now the Mariners are top of their division, and their stadium will host the MLB All_star Game next season. My point is, if you build it, they will come. If somebody has the vision to restart FFTF and manage it well, old successful missions will return, along with new missions not developed yet due to lack of opportunity. There is no telling how many lives can be saved, or significantly improved due to medical isotopes produced at FFTF.

Thank You For Your Time,

Kevin Bartlett

 Germantown, MD 20874

Ms. Brown,

These comments are in response to the news that the DOE is considering restart of the FFTF at Hanford, Wa. I will be unable to attend the public comment forums in Hood River, Or. and Portland, Or. Please see that this letter is included in the proceedings of one of those meetings.

I find the DOE's attitude remarkable, and not a little disgusting, that the government would consider restarting the FFTF before adequately providing for the waste stream that this reactor would produce. Hanford has an abysmal record of containing its past waste stream. This stream currently is moving toward the Columbia river and very little is being done to stop the plume. Now you are suggesting that the NorthWest should shoulder yet more toxins?

If I were the DOE's parent I would tell you to go clean up your room before you take anything else out to play with!

We need solutions; not more pollution.

As you will no doubt notice, I fall strongly on the NO category concerning the FFTF restart.

Thank you,

David Babad
 32865 Watson Rd.
 Scappoose, Or. 97056

40-1

40-2

40-3

Response to Commentor No. 40

40-1: Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435-1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

40-2: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

DOE notes the commentor's concerns regarding the migration of contaminants to the Columbia River. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

More specific to the stated missions presented in the NI PEIS, FFTF is located approximately 4.5 miles from the Columbia River. There are no

Commentor No. 40: David Babad (Cont'd)

Response to Commentor No. 40

discharges to the river from FFTF and no radioactive or hazardous discharges to the groundwater. Analyses presented in Chapter 4 of the NI PEIS (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4) indicate that there would be no discernible impacts to groundwater or surface water quality at Hanford from normal operation of the existing Hanford facilities in support of the stated missions. Also, no water quality impacts would be expected as a result of permanent deactivation of FFTF (Section 4.4.1.2.4).

The Hanford Site also has a comprehensive waste minimization and pollution prevention program in place as summarized in Volume 1, Section 3.4.11.7 that would control any new site activities.

40-3: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Subject: Fast Flux Test Facility at Hanford

Collette E. Brown,
NE_50
US Dept. of Energy
19901 Germantown Rd.
Germantown, MD 20874

Dear Ms. Brown:

I OPPOSE any nuclear reactor startup at Hanford. Specifically, I urge you to decommission the Fast Flux Test Facility FFTF, the advanced liquid metal nuclear reactor at Hanford. There are already billions of gallons of high_level waste out of control at Hanford, the most contaminated place in the Western Hemisphere. Reactor operation would only create more radioactive waste streams, which would mean even more dangerous waste to manage.

And I live downwind from this toxic mess!

Sincerely,

Richard A. Gorringer, Ph. D.
3574 NE Stanton Street
Portland, OR 97212

Response to Commentor No. 48

- 48-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF and support for Alternative 5, Permanently Deactivate FFTF.
- 48-2:** See response to comment 48-1.
- 48-3:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

There are currently 53 million gallons of waste stored in 177 underground tanks at Hanford, primarily in double-shell structures. The disposition of this waste has been determined and the project is currently underway. As discussed throughout Section 4.3 of Volume 1, none of the proposed alternatives would add waste to the waste tank inventories at Hanford.

Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435-1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

 Subject: Comment to DOE RE: development of nuclear energy facilities
 PEIS July 2000

Colette E. Brown, NE-50
 U.S. Department of Energy
 19901 Germantown Road
 Germantown, MD 20874

RE: Comment on DRAFT PEIS

Thank you for providing the Summary Document regarding the current Programmatic Environmental Impact Statement for Expanded Nuclear Energy Research and Development and Isotope Production Missions in the US. The document is an improvement in readability over past documents, and below are my comments.

Comment #1.

Regarding the mission of the Department of Energy as mandated by the Atomic Energy Act of 1954, a number enlightening experiences have occurred as a result of attempting to meet the "needed" isotopes for medical, industrial, and research applications. In subsidizing various industries "needing" these isotopes, the numerous DOE facilities have created environmental and economic burdens with no remediation endpoint in site. Thus, this brings to question if the mandate of the Atomic Energy Act of 1954 is still valid at this point in history. Therefore, it would seem prudent for the Department of Energy to request the U.S. Congress to aid the downsizing of the Department's mission by a modification that will limit the scope of responsibility of the Department to only meeting the requirements for nuclear isotopes in medical and research applications, and environmental restoration of the numerous facilities in North America.

49-1

Response to Commentor No. 49

49-1: DOE notes the commentor's views concerning DOE's missions. DOE is guided by the intentions of the U.S. Congress as found in legislation and appropriations. Currently, Congress continues to provide funding directing DOE to carry out its mandate for isotope production and civilian nuclear energy research and development. Congress continues to direct DOE to complete its environmental restoration commitments at existing DOE sites.

Commentor No. 49: George Baggett (Cont'd)

Granted, this reduction in the mission would greatly impact the nuclear power industry. However, as we look at the halting of the development and expansion of this technology, it becomes very clear that we will soon be entering a period of closure and remediation of aging facilities. Some of these facilities have been operating or are in a standby position, well beyond their anticipated closure. A notable reduction in the availability of fuel products will then force closure of these aging facilities, and greatly reduce complications that are so notable throughout the world.

The driving rationale in my mind is that nuclear isotopes have been demonstrated to have significant value. I am very concerned that future generations will look back upon the last forty-five years of use and waste of these valuable materials, and they will be extremely critical as to why we were so short sighted in wasting these materials primarily to boil water and contaminate the environment.

Comment #2

I strongly disagree with the statement that "In view of these energy and environmental contributions, there is renewed interest in nuclear power to meet an equivalent portion of the Nation's future expanding energy requirements." None of the environmentalists that I know are remotely considering nuclear power as a method of reducing greenhouse gases. Most familiar with the ramifications of this technology know the tradeoffs do not come close to meeting any benefit in the reduction of greenhouse gases.

There may be the ilk of Westinghouse, Bechtel, and others whom would profit from a so-called "renewed interest," but the Department should be assured that there is a quiet majority of Americans who oppose this technology, whom will side with more militant and vocal groups who will rise against any proposed commercial or research nuclear power plant development. The Department should also be aware that siting such facilities is and will continue to be virtually impossible. Further, as the fleet of nuclear power stations become obsolete, the cost of remediation and closure will place in public view such a staggering price tag upon the true costs of this technology that the circle of opponents will grow to include the economic and finance community.

**49-1
(Cont'd)**

49-2

Response to Commentor No. 49

49-2: Clean, safe, reliable nuclear power has a role today and in the future for our national energy security. In recognition of this need, nuclear energy research and development programs have been initiated to address potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) and to ensure that current nuclear power plants can continue to deliver adequate and affordable energy supplies. An enhanced DOE nuclear facility infrastructure is required to support such nuclear energy research and development for civilian applications. Information on the need for nuclear energy research and development is provided in Section 1.2.3 of Volume 1.

Commentor No. 49: George Baggett (Cont'd)

Comment #3

Granted, there are significant benefits from medical and some commercial use of nuclear isotopes. However, the gist of the public discussion regarding this document is how and where to draw the line on the continued mission of the Department of Energy. If one considers the current direction of remediation of DOE facilities throughout North America, the tasks and costs are staggering. There are considerable challenges at SRS, Hanford, as well as some of the smaller facilities like the Paducah - Gaseous Diffusion Plant. The environmental restoration program is the most important program mission for the Department, not only to ensure the problems do not worsen, but to demonstrate to the public that seemingly insurmountable problems can be resolved. The Department has demonstrated considerable talent and persistence in its environmental restoration program to date, but as for resolving the seemingly "insurmountable problems," there is considerable work to do.

As a member of the Waste Commission in Kansas City, Missouri, some years ago, we learned a valuable lesson in the management of specific tasks. That lesson was that though history had told us that we (the city) were responsible for the waste problems, it was not necessarily so. Two examples:

(1) old tires and (2) used motor oil come to mind. Under the old form of thinking the problem would need to be resolved by the city. The city would have to provide management for these waste products as an alternative to improper disposal - dumping and discharge of used motor oil to the sewer or a spot on the ground. We first resolved that it would be best to recycle these waste streams. Second, we noted where the waste streams were concentrated. We then approached tire dealers and oil change shops, and learned that they had a system in place to recycle these waste streams. We held meetings with representatives from these groups, requested that they aid us in expanding the program to include do-it-yourself sources, and then set in place a city ordinance requiring suppliers of tires and motor oil to provide suitable and responsible disposal options for the waste products generated by the use of their products. The result is that the city is not responsible for these waste streams, retail tire outlets will take used tires from ordinary citizens (often charging \$0.50 per tire), oil change stores and auto parts stores provide a service of taking and collecting used motor oil to be recycled, and all this is done without cost to the city or the tax payer.

Response to Commentor No. 49

49-3

49-3: DOE notes the concerns expressed by the commentor relating to the multiple missions of DOE. Both isotope production and environmental restoration must be managed in ways that address each mission. In the case of isotopes, DOE is aware of the advantages of commercial production, and its isotope programs have and will continue work to that end, where appropriate. DOE, at the direction of the U.S. Congress, has a wide range of cleanup as well as research and development missions under the Atomic Energy Act. Any enhancement of DOE's nuclear infrastructure would be made only if it is clear that to do so would help better meet isotope and civilian nuclear energy research missions, and be consistent and in balance with environmental stewardship at DOE sites.

Commentor No. 49: George Baggett (Cont'd)

The DOE is in the same situation. Asked to resolve all problems, the agency has evolved into a complex organization that assumes that they must provide all nuclear isotopes used in America. In my opinion, the mission of the DOE has changed to environmental restoration and management of the waste products and materials from decommissioning weapons. Conservation of the value of isotopes, as well as purchase valuable isotopes from the world communities are compatible with this mission. Yet just because a commercial venture desires a supply of isotopes for a nonmedical venture, I question the mission statement that results in subsidizing such a venture and adds considerable cost and burden to the Department and its more important missions.

**49-3
(Cont'd)**

Thus, considering options 1-5, Alternative 5 - Permanently Deactivate FFTF (with No New Missions) comes closest to my thinking. Second would be the No Action Alternative.

49-4

49-4: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, or as a second choice, the No Action Alternative.

49-5

49-5: See response to comment 49-4.

For discussion, I can be reached at the address below:

George Baggett
 820 West 35th Street
 Kansas City, Missouri 64111
 Phone#: 816-931-9578
 Fax#: 816-931-7578

As in the past, I will be more that pleased to continue to review DOE documents and summaries. I will also be pleased to provide comment as time permits.

**Commentor No. 50: Paige Knight

 Subject: FFTF report and hearings
 Message_ID: <20000726.115924._129217.0.paigeknt@juno.com>

Dear Collette,

I can't begin to express how frustrated and close to outrage I am at the DOE's separation of the of the cost and nonproliferation studies on the FFTF (Fast Flux Test Facility) at Hanford.

Apparently, the US DOE, in it's continuing disfunction, insists on the fragmentation or piece_mealing of nuclear weapons/cleanup issues. It also appears that the Department has retrenched more than ever into its "DECIDE, Announce, DEFEND" posture. You have heard the concerns of the public out West who have the most to loose if the FFTF is restarted.

So, isn't it great that we get a 3rd chance to say NO yet another time, but will not able to address the issues of cost and weapons proliferation because they are not "on the table" yet.

I request on behalf of numbers of us in the Hanford region that the hearings on the FFTF be delayed until the other studies come out. We have experienced receiving pertinent documents the day or hour after a public hearing is held. It doesn't fly.

You have little choice but to get us the pertinent documents or delay the hearings until we receive them with time to digest them, unless you want to be blatantly undemocratic (as in democracy) in your handling of these issues. I urge you to do the right thing.

Sincerely,
 Paige Knight, Hanford Watch

50-1

Response to Commentor No. 50

50-1: CEQ (40 CFR 1500 et seq.) and DOE (10 CFR Part 1021) implementation regulations do not require inclusion of cost and nonproliferation studies in an environmental impact statement. The basic purpose of the NI PEIS is to describe the alternatives under consideration for implementation (Section 2.5 of Volume 1) and the environmental impacts that would occur if these alternatives were implemented (Chapter 4 of Volume 1). Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. The associated cost report and nonproliferation report were made available to the public on August 24, 2000 and September 8, 2000, respectively.

Production of nuclear weapons and Hanford cleanup are outside the scope of this NI PEIS. Plutonium-238 produced in support of NASA's deep space missions (Section 1.2.2) is not used to make nuclear weapons. Missions described in Section 1.2 of Volume 1 are unrelated to the national defense. Implementation of Alternative 1, Restart FFTF, would have no impact on funding for ongoing cleanup activities at the Hanford Site (Section N.3.2 of Volume 2).

The commentor's concerns about Alternative 1, Restart FFTF, are noted. As discussed throughout Section 4.3 of Volume 1, implementation of Alternative 1 would pose small risks to persons in areas adjacent to the Hanford Site. Risks to persons in areas more than 80 kilometers (50 miles) from the site would be essentially zero.

DOE did not delay public meetings on the Draft NI PEIS because ancillary decision documents such as the cost report and nonproliferation report are not required to evaluate the environmental impacts that would result from implementation of the alternatives described in Section 2.5 of Volume 1.

Subject: civilian nuclear

DOE:

I have not read, word for word, the document sent to me in the mail.

However, I believe we are 25 (twenty_five) years behind what has been needed in the areas of products for the citizens developed by nuclear means.

We must move forward, for the good of the United States.

The agenda of multi_national enviornmental groups must be worked around. We are leading the world in our adherence to those issues.

Fast Flux must move forward.

ALL production must be domestic, please do not buy Pu_238 from Russia, or any other source.

I sense that our control and development of these product for the benefit of US civilians, is in the interest of our National Security.

I have no degree in this area.....but I have an awareness of our needs that can be met via what we seem to fear.

 To: INFRASTRUCTURE_PEIS, NUCLEAR
 Subject: draft peis comment due by 9/11/00

please forward or direct to:
 Ms. Colette E. Brown, NE_50
 usdoe germantown maryland

Dear Ms. Brown,

I appreciate very much receiving the draft doe/eis_03100 for expanded civilian nuclear energy R&D and for the opportunity to review the document.

However, as a resident within a 50 mile radius of the Hanford site, I must respectfully request that the department consider cleanup at Hanford and at the other national labs to be an absolute top priority ahead of all other missions. Land restoration at the Hanford site, specifically at the Fitzner_Eberhart Arid Lands Ecology reserve, also is in the public interest, as the native shrub_steppe sagebrush grasslands preserved at Hanford for the past 50 years are an outstanding example of lands among the most rare and endangered of those plant communities in the continental U.S. Very fine work has been done at the site to make inventories of the many plant and animal species occurring on Hanford lands by federal and state agencies, Battelle, and with the cooperation of The Nature Conservancy. A good effort has begun there which probably could use more funding and support.

However, additional R&D of the kind described in the eis under review does not appear to be compatible with those efforts. Please accept my preference for a No Action alternative, and if that is not a possibility, for alternative 2, use only existing operational facilities. Thanks for the chance to comment.

Very truly yours,
 kristine r. brotherton
 moses lake, washington

52-1

52-2

52-3

Response to Commentor No. 52

52-1: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to “ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use.” The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

DOE notes the commentor’s concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Although the land composing the Fitzner-Eberhart Arid Lands Ecology Reserve is owned by DOE, the management of this and nearly all other National Monument lands at Hanford are now the responsibility of the U.S. Fish and Wildlife Service (F&WS). Funding for that management comes directly from F&WS. All restoration activities from legacy DOE missions on these lands have been completed.

52-2: DOE notes the commentor’s support for the No Action Alternative, or as a second choice, Alternative 2, Use Only Existing Operational Facilities.

52-3: See response to comment 52-2.

To: INFRASTRUCTURE_PEIS, NUCLEAR
Cc: Johnson, Shane
Subject: re PEIS hearings

To Whom it Concerns:

I am writing to register my complaint about hearings on the FFTF/isotope production PEIS being held before the public has seen the associated cost and nonproliferation documents. These two documents should be included as part of the PEIS process but as DOE has not yet chosen that path, any PEIS hearings held prior to release of those documents is unacceptable.

I have been informed by DOE that the cost study will be out in early August and the nonproliferation statement at the end of August or first of September. Any slippage in the release of the cost study will insure that it will not be available far enough in advance of the PEIS hearings for the public to be adequately informed. Even as it stands, the nonproliferation assessment might not come out at all until the hearings are over.

Given this bad situation, I request one of two things:

1) that the cost and non_proliferation studies be released immediately, at least two weeks in advance of the first PEIS hearing, or 2) the PEIS hearings be postponed until after the two documents in question have been released and the public has adequate time to review them.

The decision about isotope production and FFTF restart is far too important to give the public short shrift in the decision_making process. I can assure you that withholding information before the hearings will not be productive for this entire process and urge you to take immediate action to change this situation.

Sincerely,

Tom Clements, Executive Director
Nuclear Control Institute
1000 Connecticut Ave., NW Suite 804
Washington, DC 20036, USA
tel. 1_202_822_8444, fax 1_202_452_0892
clements@nci.org www.nci.org/org

Response to Commentor No. 55

55-1: CEQ (40 CFR 1500 et seq.) and DOE (10 CFR Part 1021) implementation regulations do not require inclusion of cost and nonproliferation studies in an environmental impact statement. The basic purpose of the NI PEIS is to describe the alternatives under consideration for implementation (Section 2.5 of Volume 1) and the environmental impacts that would occur if these alternatives were implemented Chapter 4 of Volume 1). The comment response process concerned with the environmental impacts of the NI PEIS alternatives is described in Section 1.1 of Volume 3.

The associated cost report and nonproliferation report were made available to the public on August 24, 2000 and September 8, 2000, respectively. Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. The Record of Decision concerning enhancement of DOE's nuclear infrastructure is scheduled for January 2001.

Public hearings on the Draft NI PEIS were not delayed because ancillary decision documents are not required to evaluate the environmental impacts that would result from implementation of the alternatives described in Section 2.5 of Volume 1.

The decision process will be conducted in accordance with 40 CFR 1505.1. Public comments are an integral part of DOE's decision process. All relevant information required to evaluate the environmental impacts that would result from implementation of the alternatives was made available to the public on July 28, 2000. Public hearings on the draft NI PEIS were held at seven locations from August 22, 2000 to September 6, 2000.

I believe that medical isotopes are needed more than ever in the world today. We have a reactor that can produce them at minimal cost to the public. Since FFTF is a breeder reactor, and according to experts in the nuclear industry, it produces about half the waste that normal reactors do. It is also a smaller reactor; this means it even produces less nuclear waste than a full size breeder reactor. Also, if a great portion of the waste will be actually used as medical isotopes to treat people dying of cancer, why in the world would anybody consider destroying it??!! It seems totally absurd to me. Does anybody in charge of deciding what to do with it understand these facts?

Why haven't these facts been explained to rational environmentalists? Are people going to listen to the far environmental extremists who believe that any amount of waste is bad, or the other ignoramuses to don't even know what's is going on and just want to get involved with any "environmental" cause that comes there way?

If there is some rational explanation for destroy FFTF, I would like to know about it. Until then, I am totally against it.

 To: INFRASTRUCTURE_PEIS, NUCLEAR
 Subject: Comments
 Auto forwarded by a Rule

Comments resulting from a skimming of the Draft PEIS Summary are:

1) In discussing the subject of SPENT FUEL MANAGEMENT (p.S_63), the argument is made that the environmental impacts associated with spent fuel management would remain minimal because the 16 MTHM of spent fuel resulting from FFTF restart is less than 1% of the spent fuel already stored at Hanford. While the conclusion of minimal impact may be valid, the validity of the argument given in support of the conclusion is very questionable.

Comparison of risks should not be based just on spent fuel quantities; it should include factors such as the quantities of hazardous radionuclides contained in the spent fuel. For example, most of the spent fuel currently stored at Hanford contains plutonium at concentrations of ~0.1% or less, while the mixed oxide fuel used in the FFTF contains ~10% or more Pu. Thus, the amount of Pu contained in 16 MTHM of spent FFTF fuel is approximately the same as (NOT <1% as much as) the amount of Pu contained in the 2,133 MTHM of spent fuel that is currently stored at Hanford.

2) Near the bottom of page S_27 is the statement "Collocation would also minimize transportation risks because some isotopes have short half lives." I can readily understand how collocation would minimize transportation risks, but I don't understand the significance of short half lives in this context.

3) Conversions between units should be checked. Two errors that jumped out at me are: a) In the last paragraph on page S_27 _ "(0.2 to 20 kilometers [0.07 to 12.4 miles]) ___." A factor of 10 in kilometers should also be a factor of 10 in miles. b) In the next_to_last paragraph on page S_29 _ "___200 C (44 F) ___". At least one of these numbers is obviously incorrect.

John L. Swanson
 Richland, WA

Response to Commentor No. 57

57-1: The discussion in the Summary and Section 4.8.3.5 of Volume 1 on the cumulative impacts for spent nuclear fuel management at Hanford was revised to clarify that the management of the existing spent nuclear fuel at Hanford results in a dose of less than 0.1 millirem per year of the maximally exposed member of the public. This dose is well within the DOE limits given in DOE Order 5400.5. As discussed in that Order, the dose limit from airborne emissions is 10 millirem per year, as required by the Clean Air Act; drinking water is 4 millirem per year, as required by the Safe Drinking Water Act; and the dose limit from all pathways combined is 100 millirem per year. DOE has committed to remove the spent nuclear fuel at Hanford for ultimate disposition in a geologic repository.

57-1

The incremental impacts associated with managing the additional 16 MTHM of FFTF spent nuclear fuel were evaluated in Section 4.3.1.1.14 of the NI PEIS for the restart of the FFTF. As stated, the radiological impact to the public from overall radionuclide releases from the entire FFTF complex during the last year of reactor operation was less than 0.0001 mrem/year. Additionally, the dose contribution from FFTF spent fuel management would be expected to be a small fraction of the FFTF reactor operation dose. Therefore, it would have no discernible impact on the 0.1 mrem/year dose from the existing 2133 MTHM Hanford spent nuclear fuel inventory. The currently used FFTF-specific spent fuel storage system designs (i.e., facility storage vessels and dry storage casks) are the key contributors for determining that the incremental radiological impact is minimal, not the difference in plutonium quantity in the FFTF spent nuclear fuel.

57-2

57-2: The statement in the Summary has been revised as follows: Collocation with the irradiation facility would be needed to process some irradiated target materials promptly after removal from the reactor/accelerator because some isotopes have short half-lives. Collocation would also minimize transportation risks.

57-3

57-3: Conversions have been checked and corrected.

I have been a resident of Richland, Washington, for nearly 23 years, 17 as an employee of the site operating contractor (Rockwell, then Westinghouse) and 6 as a retiree. My background has been heavily in the areas of site performance assessment, long_term waste management, and Systems Engineering. I am currently an alternate to a Public_at_Large seat on the Hanford Advisory Board, but let me make it perfectly clear that my comments are entirely my own as a private citizen and in no way represent views of the Board. Some of my comments, as you will see, are focused upon Hanford cleanup rather than directly on FFTF startup and operation because one of the specious arguments against FFTF is that funding of FFTF will detract from Hanford cleanup funds.

The point I want to make most strongly is that the meetings in Seattle, Portland and Hood River are almost certainly not a source of useful scientific data. If I may be quite frank, the hysterical fears of cancer, etc., that you have heard (or will hear, depending on when you read my comment) in meetings at those locales, are totally unfounded and are the result of effective propagandizing by environmental activist groups. Quite obviously, Seattle is unaffected by FFTF and Hanford cleanup except that the residents pay federal taxes and in the unlikely event that shipments of foreign waste to Hanford are permitted and arrive at the port of Seattle. Residents of Portland, Hood River and, in fact, anyplace downstream of, say, Hermiston, really have no sound basis for claiming that they could be adversely affected by contaminants that might eventually reach the Columbia River from any Hanford sources.

59-1

Response to Commentor No. 59

59-1: DOE notes the commentor's views on the necessity for reliance on objective, scientific data as the basis for sound decision making. DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and to providing ample opportunity for public comment on those actions.

Commentor No. 59: Martin Bensky (Cont'd)

If unfounded fears should not be your concern, what then, should you be looking for in the comments from your meetings? The only real issues involve possible adverse impacts of a major facility on the local quality of life (e.g., adequacy of schools and local infrastructure) or perhaps a deep-seated revulsion towards anything "nuclear". I personally would be proud to live in a community that is producing life-saving isotopes and vital materials to support our space program. I believe that that is the prevalent attitude of Tri-citians, and if residents of other communities are somehow ashamed to be part of a "nuclear" project, let them keep FFTF or similar projects out of their communities. Their attitudes and false fears are their own problems, but the dedicated, competent scientists and engineers in this community want to continue to do what we know is right; we cannot combat the lies and distortions that have hampered, and will continue to hamper, our progress.

In summary, let me reiterate my initial point. Your own investigations, separate from these meetings, will provide the objective information that you need in your decision process. Subjective beliefs and attitudes are important, too, but the attitudes and beliefs of the people right on the scene; i.e., the people of Benton and Franklin counties, matter a whole lot more than those of activists far from where the action is.

Response to Commentor No. 59

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

Page 5-2 P.P. Isotope Production is done on a not to interfere basis. This is incorrect. Isotope Production has always been a primary mission of the HFIR. The only area of concern is if the impact of ~~production~~ ~~of~~ ~~specialty~~ ~~materials~~ ~~irradiation~~ ~~(not~~ ~~isotopes)~~ impacts the shut or fuel cycle length by more than 5-10%. The OSE at DOE will be informed as soon as the order to provide equity to users.

60-1

60-1: The commentor is mistaken about HFIR's primary mission. As stated on page 2-21 of the Draft PEIS, HFIR's primary mission is neutron science research. Isotope production at HFIR is done only on a not-to-interfere basis.

Page 2-66
 A HFIR this option is precluded. This is incorrect the ~~same~~ option is not precluded due to a long outage. The outage needed to implement 100mw operation is estimated to be less than 1 month. We will be an extensive ~~planned~~ effort to ~~change~~ change the authorization basis, get approval and change procedures. This work can be done while the reactor is operating. Going to 100 mw is high priority sensitive and is being designed by ~~the~~ ~~user~~ ~~needs~~ ~~for~~ ~~such~~ ~~a~~ ~~change~~ ~~(over)~~

60-2

60-2: The text on page 2-66 has been revised to incorporate the comment on extended outage. Growth estimates in diagnostic and therapeutic medical isotope usage in the United States were based on a study issued by Frost and Sullivan in 1997. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at a rate consistent with the study findings. The Cost Report presents operating costs for each alternative. The operating cost estimates did not take credit for revenue from the sale of isotopes or leasing facilities to offset the operating costs.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

 Subject: Hanford's FFTF

I'm not sure if this is the place for this type of comment, if it isn't if you could let me know where to submit it I would be glad to.

I fully support the idea of restarting the FFTF facility. I strongly feel it would greatly benefit almost everyone. FFTF has proven its capability and reliability during its early years. It would be a shame to close it down and decommission the facility since it has so many possibilities. I know that people are concerned about the "waste" from the facility but they don't understand that no matter what is done there is a waste product of some type.

Again, to keep it short I would like to see the facility operate once again, it has so many positives it can produce that will certainly out weigh the negatives!!!

To:

Ms. Colette Brown, Doe Office of Space and Defence
Power System

Ms. Brown:

I am presently working in chemical demilitarization. I have done nuclear work and hold a California Professional Nuclear Engineer license. I am very much concerned about the fate of FFTF. I enclosed a paper that I am still working on. The future looks bad, even with maximum nuclear power deployment. Absence of nuclear power, we are faced with disaster within 100 years. Breeder reactor deployment should start by 2020 for best results.

Thank You, William E. Schenewerk, Ph.D.

63-1

Response to Commentor No. 63

63-1: DOE notes the commentor's support for Alternative 1, Restart FFTF. None of the missions for which FFTF would be restarted involve fast breeder technology and, although FFTF would be used to test some nuclear fuels, they do not include fast breeder fuels. At present, U.S. policy prohibits the pursuit of breeder reactors and, as noted above, FFTF has other potential uses beyond testing fast breeder reactor technology.

Commentor No. 64: Daniel Axelrod

Hi. Good afternoon, Bobby Flowers calling from New York City.

The reason why I am calling is I want to protest expansion of the Nuclear Power for Space Missions. Thank you have a good day. Thank you.

65-1

Response to Commentor No. 65

65-1: DOE notes the commentor's opposition to enhancing its existing nuclear facility infrastructure to support production of plutonium-238 for use in future NASA space exploration missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. NASA makes the final determination, through its own NEPA process, whether or not these radioisotope power systems would be used to support individual NASA space exploration missions; this is not a DOE decision. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Commentor No. 66: John Saemann

NI PEIS Toll-Free Telephone

John Saemann
1775 Atkins Street
#2
Eugene, Oregon 97401
541-687-7712

This is John Saemann calling from Eugene, Oregon, to make a statement on the Nuclear Infrastructure Programmatic Environmental Impact Statement. I would like to go on record as preferring the no action alternative regarding the production of Pu-238 for future NASA space missions and civilian nuclear energy research and development activities. I oppose building any new accelerators or restarting the Fast Flux Test Facility and I believe we need not, we should not, make it easier to have more Pu-238 available for whatever use is claimed.

Let's first clean up the mess that we made and not go any further until that's taken care of.

Thank you.

66-1

66-2

66-3

66-4

Response to Commentor No. 66

- 66-1:** DOE notes the commentor's support for the No Action Alternative and opposition to Alternative 3, Construct New Accelerator(s), and Alternative 1, Restart FFTF.
- 66-2:** See response to comment 66-1.
- 66-3:** The commentor's opposition to the production and availability of plutonium-238 is noted. However, the United States has been using radioisotope power sources in space safely and reliably for approximately 40 years. In accordance with the Atomic Energy Act of 1954, DOE is obligated to continue supporting NASA in the use of radioisotope power sources. NASA has determined that it will continue to require plutonium-238 for power sources and heating in deep space missions.
- 66-4:** DOE notes the commentor's concerns regarding the cleanup of existing contaminants at the Hanford Site. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The Hanford Site has a comprehensive waste minimization and pollution prevention program in place as summarized in Volume 1, Section 3.4.11.8, that would control any new site activities.

Commentor No. 67: John Saemann

NI PEIS Toll-Free Telephone

08/24/00

John Saemann
541-687-7112

We looked at some more at the NI PEIS and out of a bad deal I think most desirable one alternative seems to be to us the option of purchasing Pu-238 from Russia through the existing contract. That's probably the best of a bunch of bad deals. Ideally we shouldn't proceed with it at all but if you gotta have some Pu-238 then probably the best way to proceed is to obtain from Russia. Thank you very much for asking for public comment, but I suspect you probably are going to do what the DOE wants to do in the first place. Anyway, lots of luck to you and thanks for spending taxpayer money on something we really don't need.

Goodbye.

67-1

67-2

Response to Commentor No. 67

67-1: DOE could purchase plutonium-238 from Russia to satisfy its responsibility to supply NASA with the necessary fuel to support future space exploration missions. Under the current contract set to expire in 2002, the United States is authorized to purchase up to 40 kilograms of plutonium-238, with the total available for purchase in any one year limited to 10 kilograms. To date, DOE has purchased approximately 9 kilograms of plutonium-238 under this contract. Under the No Action Alternative, DOE would continue to purchase plutonium-238 to meet the space mission needs for the 35-year evaluation period considered in the NI PEIS. However, DOE recognizes that any purchase beyond what is currently available to the United States through the existing contract would likely require negotiation of a new contract and may require additional NEPA review.

For supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

67-2: DOE policy encourages effective public participation in its decision-making process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

Commentor No. 68: Karen Kotchek

This is a comment on some of the proposals for use of nuclear power in the Draft Programmatic Environmental Impact Statement.

I strongly oppose expanding the use of nuclear power in space missions, which poses significant danger to Earth before and during launching, and pollutes the extra_terrestrial environment. Production and use of Pu_238 for deep_space probes is highly contaminating and dangerous; the idea of nuclear reactors on Mars is shocking and horrifying. Solar power is adequate to provide operating power for space probes, and alternatives to nuclear_powered rockets are safer and already well developed.

The lessons of the 20th century with regard to nuclear power have to be learned: the many disasters, the radioactive pollution, the gigantic problem of waste, the dangers of terrorism, the high costs (both economic and social), and the long list of uneconomic, dangerous, polluted reactors that are now closed or will soon have to be. A program like the DOE's should be geared toward developing technologies for our future, not preserving the vested interests of outmoded, discredited technologies such as nuclear power. Investment in solar and other environmentally safer technologies is called for.

Laurence Kirby
 Professor of Mathematics
 Baruch College
 City University of New York

Response to Commentor No. 73

73-1

73-1: DOE notes the commentor's opposition to NASA's use of nuclear materials for space missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch.

73-2

73-2: The commentor's opposition to nuclear technology for space applications is noted. DOE also notes the commentor's interest in alternative energy sources [i.e., solar energy], although issues of research and development of alternative energy sources are beyond the scope of this NI PEIS. Other offices of DOE are responsible for the research and development of alternative energy sources. The missions to be addressed in this PEIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and nuclear research and development, can currently only be met using nuclear reactor or accelerator technologies.

 Auto forwarded by a Rule

As a Professional Nuclear Engineer and someone who has worked on the production of medical isotopes, I readily recognize the value and uniqueness of the Fast Flux Test Facility (FFTF). Although its original breeder reactor mission has long since vanished, it is nevertheless a particularly viable resource for the production of medical and industrial isotopes. Its high power, hard neutron spectrum, and large irradiation volumes offer great potential for not only producing high specific activities of commonly used isotopes, but also adequate quantities of lesser used research isotopes. It is hard to assign an economic value to the research isotopes. If new research isotopes were more reliably available, especially for diagnostic and therapeutic nuclear medicine procedures, researchers could take advantage of these isotopes to develop even better radiopharmaceuticals. Unfortunately, with an inadequate and irregular supply of these isotopes, researchers can't explore these areas because of cost and the uncertainty of isotope supply. There's no denying that new isotopes are costly; nonetheless they shouldn't be expected to pay their own way. What will prove to be financially beneficial in the long run is the improved health care that comes from newly developed radioisotope procedures.

75-1

Response to Commentor No. 75

75-1: DOE notes the commentor's support for Alternative 1, Restart FFTF. Cost/benefit analyses are normally required in connection with government regulatory actions. While it is plausible that the benefits of medical isotopes far outweigh the costs and risks, the NI PEIS is focused on the environmental impacts that would result from implementation of the alternatives described in Section 2.5 of Volume 1.

Commentor No. 75: Steve Binney (Cont'd)

In that regard, when considering the options of an EIS, consideration needs to be taken not only of the direct costs of operating a facility such as the FFTF and of the value of the isotopes produced, but also of the later costs saved by those isotopes. Although I can't quantify this statement, I would estimate it is conservative to say that for every dollar spent on producing medical isotopes, ten or more dollars are saved in health costs from improved diagnoses and elimination of subsequent costly and unnecessary surgeries. This hidden, but colossal, reduction in health care costs from improved diagnosis alone needs to be considered as a direct impact of operation of a facility such as FFTF.

Based on these and other concerns not mentioned, I strongly urge the adoption of Alternative 1 (Restart FFTF).

Subject: No more nuclear proliferation
Auto forwarded by a Rule

Dear Ms. Brown:

There is no excuse for the US continuing nuclear works of any kind in an age when to do so only destabilizes the fragility of our relationships with other countries. The US is acting like a terrorist nation by continuing this aggression, not ratifying the CTBT, and trying to abrogate the ABM Treaty. I am ashamed of this behaviour!

WE DO NOT NEED THE FAST FLUX REACTOR AT HANFORD TO BE REOPENED. WE DO NOT WANT STAR WARS, NUCLEAR BASED LASERS IN SPACE, BALLISTIC MISSILE DEFENSE PROGRAMS, INEPT AND UNPROVEN TECHNOLOGIES THAT WAGE DEATH AND DESTRUCTION AND POVERTY UPON THE PEOPLE OF EARTH IN THE NAME OF US SUPREMACY. Please, stop this insanity now.

We shut down the N_Reactor because it was filthy, spewing contaminants across the Downwind area throughout its existence. We were supposed to spend the money that's been used to keep those reactors on standby to SHUT THEM DOWN FOREVER AND CLEAN THEM UP. We told DOE in meetings in Seattle in 1998 that we do not want or need Tritium, or anything the Fast Flux Reactor can give us. We stated clearly then (hundreds of people) that we wanted Hanford cleaned up, and not reopened. You have not listened to us, but I guess because we are just the citizens, and not corporations who will gain billions by perpetuating this Obscene technology, we have no voice with our own agencies.

Response to Commentor No. 80

80-1: The pursuit of DOE's isotope and nuclear technology missions help rather than hurt our relationship with other nations, and are consistent with the policies and goals of the United States, including nuclear nonproliferation. In addition to the NEPA review, potential nonproliferation impacts of the alternatives evaluated in the PEIS have been assessed in a separate Nuclear Nonproliferation Impact Assessment. This report confirms that the alternatives are neither related to nuclear weapons production nor inconsistent with nonproliferation policy.

No radioactive materials were "released" in the Hanford Wildfires of 2000. Wildfires did resuspend some materials already in the environment. The resuspended materials were low, slightly above natural background levels. The low levels required several days of analysis to quantify.

80-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

80-3: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

DOE notes the commentor's opposition to the use of FFTF for the enhancement of its nuclear facility infrastructure. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Since all missions are for civilian purposes, production of tritium for defense use is not included in this PEIS.

80-4: In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and

Commentor No. 80: Holly G. Graham (Cont'd)

So I am saying yet again, NO TO YOUR PLANS! NO TO THE FAST FLUX REACTOR. NO TO STAR WARS. NO BMD. NO TMD. NO BILLIONS TO SUPPORT FOOLHARDY TECHNOLOGY TOSSED INTO WAR ON EARTH AND CONTROL OF EARTH FROM SPACE. NO TO US MILITARY SPENDING IN THE FACE OF THE THINGS WE NEED TO ACCOMPLISH ON THIS PLANET FOR THE INHABITANTS. YES TO PEACEFUL PURSUITS, NO TO MORE WEAPONRY. NO TO THE IDIOT "VISION FOR 2020" OFFERED BY THE AIR FORCE.

We are fortunate the fires at Hanford and Los Alamos were contained. There were still horrible radiation leakages, as you well know. What can be wrong with official thinking, to not realize the utter stupidity of continuing a nuclear attitude in this new millenium?

Add my voice to the millions of Americans who say NO MORE PROLIFERATION OF THIS NUCLEAR MADNESS! SHUT IT DOWN AND CLEAN IT UP!

Sincerely,

Holly G. Graham
Olympia, WA

80-2

80-1

Dear Ms. Brown:

Please oppose restart of the FFTF in Washington.
It is too hazardous.

Thank you.

Sincerely,
Mark M Giese

81-1

Response to Commentor No. 81

81-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF. Included in the NI PEIS are the results of analyses that show the risks associated with operating the FFTF are very small.

Portland, OR 97232

|| 83-1
|| 83-2

Response to Commentor No. 83

- 83-1:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 83-2:** The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

 Subject: Please re_start FFTF for medical isotopes!
 Auto forwarded by a Rule

Please re_start FFTF for medical isotopes!

Isotopes are an answer to cancer____over 1500 people die each day from cancer and the FFTF can supply a large quantity of high quality isotopes for treatment of cancer, heart disease and arthritis. It also will serve our nation's need for Pu_238 for space batteries, for "hardening" computer chips, and research for new non_proliferative fuels and transmuting our nation's plutonium wastes.

84-1

Response to Commentor No. 84

84-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

 Subject: Against Nuclear Power Production
 Auto forwarded by a Rule

To all Concerning:

To date there have been 347 nuclear accidents (recorded).
 WHAT MAKES PEOPLE BELIEVE THERE WILL NEVER
 BE POTENTIAL FOR ACCIDENTS FROM THIS DATE
 FOWARD?

The consequences of nuclear accidents are far too devastating
 to invest our country in. Our national health and commitment
 to its citizens must direct our monies into safer forms of energy.

The Moses Family,
 Medical Doctors, Chemical Engineer, Biologist,
 Environmental Engineer

85-1

Response to Commentor No. 85

85-1:

A detailed discussion of accidents and the evaluation of accidents that could occur under implementation of the alternatives described in Section 2.5 is provided in Appendix I of Volume 2. As discussed in Chapter 4 of Volume 1, implementation of the alternatives would pose a small risk to persons residing within 80 kilometers (50 miles) of candidate facilities, and essentially zero risk outside of that area.

Although outside the scope of this PEIS, the commentor's interest in alternate energy sources is noted. The missions described in Section 1.2 of Volume 1 can only be accomplished with reactors and/or accelerators.

 Sent: Wednesday, August 23, 2000 1:30:27 PM
 To: INFRASTRUCTURE_PEIS, NUCLEAR
 Subject: FFTF EIS
 Auto forwarded by a Rule

Gentlemen:

I support the restart of FFTF at Hanford as a viable means to produce cancer_fighting isotopes and other missions. Failure to restart FFTF will indicate a lack of objectivity by the USDOE. The USDOE Low Dose Research Program <http://lowdose.org/index.html> is beginning to quantify the effects of chronic low doses on cancer incidence. Since the concern about low levels of ionizing radiation stems from applying the Linear no_threshold Theory (LNT) to extremely low doses, any information regarding the lack of validity of the LNT needs to be presented in the EIS.

Sincerely,

Randy Brich
 1469 Rimrock Ave
 Richland, WA 99352

86-1

86-2

Response to Commentor No. 86

- 86-1:** DOE notes the commentor's support for Alternative 1, Restart FFTF.
- 86-2:** Ongoing research into the health effects of low level doses of ionizing radiation has the potential to impact the way in which low dose health effects are modeled. As indicated in Appendix H, the linear no threshold model uses dose to cancer conversion factors that are derived from studies of individuals who received relatively large individual doses or were members of groups who received large population doses. One of the goals of current research is to improve health impacts models based upon health impacts to groups who have been exposed to lower level doses. However, this research is not yet conclusive with regard to thresholds for health impacts (if thresholds exist). The linear no threshold model is conservative and remains the currently accepted approach to modeling low level radiation health impacts.

Germantown MD 20874

Attention: NI PEIS

Regarding: *Draft Programmatic Environmental Impact Statement for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the United States, Including the Role of the Fast Flux Test Facility*

Dear Ms. Brown,

The City of Kennewick formally supports Alternative No. 1 in this document (restart FFTF). Please reference attached City of Kennewick Resolution No. 99-13.

The FFTF has a history of successfully testing nuclear fuels, materials, components, operating protocols, and reactor safety designs. It has a proven capability to function as a nuclear science and irradiation services user facility, and has successfully supported large and varied test programs for industry, nuclear energy, medical isotope applications and research, space nuclear power and fusion research programs.

A restart of the FFTF provides an economically viable method to use mixed oxide fuels supplies before using low enriched uranium. At the proposed operating power level of 100 megawatts, the reactor life would be extended and the generation of spent fuel would be reduced. Restart of the FFTF makes sense for the Tri-City Area, for the State of Washington, for the Department of Energy, and the United States.

Restart of the FFTF will provide the quickest method of assuring the availability of isotopes for medical, industrial and research applications while at the same time meeting the material needs of other federal agencies and undertaking research and development activities for the development of nuclear power for civilian use.

Once again the City of Kennewick fully supports Alternative No. 1 contained in the Draft Programmatic Environmental Impact Statement for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the United States, Including the Role of the Fast Flux Test Facility (restart of the FFTF).

Sincerely,

James R. Beaver

CITY OF KENNEWICK
RESOLUTION NO. 99 - 13

A RESOLUTION OF THE CITY OF KENNEWICK IN SUPPORT OF PREPARING AN ENVIRONMENTAL IMPACT STATEMENT FOR RESTARTING THE FAST FLUX TEST FACILITY AT HANFORD

WHEREAS, medical isotopes are increasingly being used in research and in providing new, cost-effective, cutting-edge technologies for the diagnosis and treatment of disease, including cancer, heart disease, and arthritis; and

WHEREAS, the United States is importing more than ninety percent of the reactor-produced medical isotopes currently used to save a significant number of the lives of our citizens; and

WHEREAS, market projections for utilization of medical isotopes for diagnosis and treatment show our country will need new production sources to assure a domestic supply to meet the increasing demand; and

WHEREAS, the Hanford Fast Flux Test Facility (FFTF) has unique capabilities for providing large quantities and a wide variety of high quality medical isotopes; and

WHEREAS, the FFTF was designed, constructed, and safely operated as a state of the art reactor with world class isotope production capabilities and is the newest, most sophisticated reactor in the U.S. Department of Energy complex and as such is an irreplaceable national asset; and

WHEREAS, the FFTF is presently being maintained in a stand-by mode; and

WHEREAS, the public deserves an opportunity to be involved in the decision making process to consider whether the FFTF should be restarted or permanently shut down; and

WHEREAS, preparing an Environmental Impact Statement (EIS) will formally involve the public in any decision about FFTF's future,

NOW, THEREFORE, BE IT RESOLVED by the City Council of the City of Kennewick that it is in support of preparing an Environmental Impact Statement for restarting the Fast Flux Test Facility at Hanford and hereby encourages U.S. Department of Energy Secretary William Richardson to order an EIS for restarting the FFTF.

ADOPTED by the City Council of the City of Kennewick at its regular meeting on the 16th day of March, 1999.

ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

Our Nuclear Infrastructure has gone downhill since the election of President Carter. If the US desires to regain some of the forgotten nuclear technologies that it started but never used or developed, the keeping the FFTF on line for ^{research and} medical isotope production is a place to start.

Otherwise, rename the Dept. of Energy to what it really is: The Dept. of Anti Energy and eliminate it.

 To: INFRASTRUCTURE_PEIS, NUCLEAR
 Subject: Comments on Draft PEIS
 Auto forwarded by a Rule

Dear Collette E. Brown,

I am writing to provide my opinion on the draft PEIS for Expanded Nuclear Energy Research and Development and Isotope Production. It is quite obvious from the information provided that the restart of the FFTF is the best option for meeting all of the goals laid out in the statement.

Clearly, the most important reason for this is that the FFTF is already built, would not require a large investment in time and resources to restart and has a proven track record in meeting the mission objectives the Department of Energy is trying to accomplish. It is designed to meet NRC requirements and has been operated with excellence since being started up.

Other options such as an accelerator would not meet all of the mission objectives and would require a lengthy startup process and large budget expenditures. It would also require large amounts of power at a time when the electrical production in this country is becoming less able to meet current demands on a daily basis.

The PEIS speaks to the building of a new reactor as an option. I do not believe that all of the issues were addressed adequately in the PEIS. Scaling up a current design such as a TRIGA without an extensive re_licensing process would not be possible. Public reaction to a new reactor would most likely be as adverse as restarting FFTF. The cost for a new reactor would most likely be far in excess of the cost to restart FFTF. The Department of Energy would most likely suffer cost overruns and delays if this option were chosen.

99-1

99-1: DOE notes the commentor's support for Alternative 1, Restart FFTF, and opposition to Alternative 3, Construct New Accelerator(s), Alternative 4, Construct New Research Reactor, and the No Action Alternative.

99-2: See response to comment 99-1.

99-3: See response to comment 99-1.

99-2**99-3**

Commentor No. 99: Bryan Coles (Cont'd)

The option for maintaining the status quo is also untenable. It makes no sense to maintain the FFTF in standby for an indefinite time as this drains valuable resources from the Federal budget for no gain. If it is not restarted now, the odds of restart any time in the future will become even more improbable.

On a final note, the Department of Energy should look at the publicity that is being generated during this debate. It should be obvious there is an intensive propaganda campaign being conducted by anti_nuclear special interest groups with the full support of the media, to create hysteria and fear over risks that negligible. The Department should mount a rebuttal to these efforts to make sure that the truth is made available to the public so they may make an informed decision.

Thank you for the opportunity to comment on this important decision.

Bryan Coles

99-4

99-5

Response to Commentor No. 99

99-4: See response to comment 99-1.

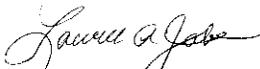

99-5: DOE notes the commentor's views including the need to keep the public accurately informed. In doing so, DOE has established reading rooms near DOE sites to provide easy access to information about DOE programs and encourages the use of this source of information. Further, DOE has numerous web sites, including one for NE (<http://www.nuclear.gov>), that provide up-to-date-information complete with fact sheets, news releases, and other materials. It is also DOE policy to encourage public input on matters of regional, national and international importance. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS DOE carefully considered comments received from the public.

**Commentor No. 100: Lowell A. Jobe
Coalition-21**

Comments on DOE NI-PEIS-0310D by Lowell A. Jobe, member Coalition-21, a volunteer organization of 80 people throughout Idaho, headquartered in Idaho Falls, dedicated to Supporting Tomorrow's Technologies with Facts, not Fears, focussing particularly on nuclear issues.

Although any EIS does not require a comparative cost evaluation of the alternatives, a complete systems analysis requires that this information is one of the key factors that needs to be used by DOE in their decision making to assure maximum cost effectiveness. The public also needs to have this information in order to make common sense decisions and comments on such documents. DOE should always strive to make this information publically available at the time the EIS is made available and before public hearings are held. Since this information is not currently available to us, our final comments will await its availability.

At this time we wish to express our support for the projects and our backing for the short term implementation of the ATR and FDPF/ CPP651 facilities as part of INEEL's designation as the DOE Lead Laboratory for Nuclear Energy Research & Development mission.

Lowell A. Jobe
14469 N. 55th E.
Idaho Falls, ID 83401

Response to Commentor No. 100

100-1

100-1: Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make decision documents such as the cost report available to the public before a decision is made. The cost report was made available to the public on August 24, 2000. The Record of Decision concerning enhancement of DOE's nuclear infrastructure is scheduled for January 2001. Comments from Coalition 21 and DOE's responses to those comments are given in comment number 1655 below.

100-2

100-2: DOE notes the commentor's support for Alternative 2, Use Only Existing Operational Facilities, Option 2, Irradiate at ATR and Process/Store at FDPF/ CPP651.

Commentor No. 101: Carolyn Gardner

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

My thought is that if we have this in Idaho and Ohio to us we will be in a better position to have a space port here. I have an M.S.T. even so often and am interested in the processing of the M.S.T. and its progression.

Also, I am a part of the Meater Hackner program and my interests there are in the development aspects of preparing or receiving prep for space flight of products going into space.

As an interest note, I wonder who helps get the astronauts ready for launch in their suits. I also am I.D.B. and the satellite work is of interest.

101-1

101-1: DOE notes the commentor's interest in opportunities related to space missions.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

- attending public meetings and giving your comments directly to DOE officials
- returning this comment form to the registration desk at the meeting or to the address below
- calling toll-free and leaving your comments: 1-877-562-4593
- faxing your comments toll-free to: 1-877-562-4592
- commenting via e-mail: Nuclear-Infrastructure-PEIS@hq.doe.gov

I am sending this email to ask you to restart the Fast Flux Test Facility. I think it is a shame you have this facility closed when it is in good shape and will be for years to come. Why are we importing isotopes when they could be made right here and better than anything we could import from Russia.

I think we should use all of the resources we have at home instead of depending on importing everything all of time.

Sincerely yours,
 Gay Arpan

Dear Secretary Richardson:

Over 1500 people die of cancer each day. The Fast Flux Test Facility is our nation's newest, most versatile reactor capable of producing large quantities of high quality medical isotopes for treating cancer, arthritis and other diseases.

We already face isotope shortages for research and treatment. Human clinical trials for breast cancer were cancelled due to a unavailability of Cu_67. Last year, the Seattle area faced shortages for the isotope "seed" treatment for prostate cancer.

The FFTF is desperately needed to produce isotopes for the treatment of bone pain associated with cancer. If you have ever witnessed a family member or a friend with terminal cancer with excruciating bone pain, you know what a God_send pain relief from medical isotopes are. This type of isotope cannot be produced in an accelerator__it must be produced in a reactor.

Restarting the FFTF will save lives and enable us to utilize cutting_edge technologies for the 21st century.

I implore you to make the right decision for the citizens of our nation. RESTART the FFTF!!! The life you save may be that of a family member, a friend, or your own.

Subject: I need medical isotopes. Please help!
Auto forwarded by a Rule

To Whom This May Concern:

I am a two year survivor of ovarian cancer with powerful odds against me for living beyond five years. The five year survival rate for ovarian cancer in this country is 14%, but the six year mortality rate in a study in England was only 10% with the use of "smart bullets" (medical isotopes), and this country needs our reactors and nuclear stockpiles to treat cancer patients.

I cannot urge you enough to please make the right decision. I need medical isotopes as do so many millions of other cancer patients. Some would call this is the "American Holocaust" with the death of so many from cancer who could have been treated with "smart bullets" but were not. It is a most frustrating situation.

Thank you for your help.

Sincerely,

You need to stop holding public meetings and you need to follow what you need to do. You need to close down FFTF forever. It is horribly contaminated. We do not need it for medical isotopes; that is a diversion. The Department of Energy and the government wants it to produce tritium, and the only reason for that is for nuclear weapons which are illegal according to international law.

You need to stop wasting the taxpayers money and you need to use all the money you have right now for cleanup. I have been to at least three of these hearings in Seattle, and each time I have stated that you need to close it down. You need to start following the law and you need to do it now. Thank you.

112-1

112-2

112-3

112-4

Response to Commentor No. 112

112-1: Comment noted. DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and holding public hearings is an essential and required part of the NEPA process.

112-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF. DOE also notes the commentor's concerns regarding the existing contamination at Hanford and the cleanup mission. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

112-3: DOE notes the commentor's views. However, the purpose of the NI PEIS is to evaluate the environmental impacts of reasonable alternatives to fulfill the requirements of the proposed actions, which include the production of medical and industrial radioisotopes, the production of plutonium-238 for future NASA space exploration missions, and civilian nuclear research and development. No component of the proposed action is for the purpose of producing tritium, nor is it for the purpose of supporting any other defense or weapons-related mission.

DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has

Commentor No. 112: Elizabeth Roberts (Cont'd)

Response to Commentor No. 112

tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

- 112-4:** See response to comment 112-2. Additionally, Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy agreed to a change in the Tri-Party Agreement to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on FFTF's future. Public meetings were held on this formal milestone change.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected. Therefore, the NI PEIS missions would not have an impact on Hanford cleanup activities.

Commentor No. 113: Brian Watson

NI PEIS Toll_Free Telephone

I would like to offer a comment as to the plans to produce plutonium and radioactive isotopes at FFTF at Hanford. Why do I have to keep calling back, this is ridiculous. You all know that there are so many problems with radioactive and other toxic wastes at Hanford already that can't really be dealt with. To even be considering additional production of radioactive materials and toxic materials at Hanford is unconscionable. DOE, you guys really need to look at _ look at yourself, how can you sleep at night. Really ridiculous. As you can guess, I really strongly feel that this additional production of Pu_238 is not only dangerous and it is unnecessary, and I'd ask you to consider the relative merits of putting more spacecrafts up into the air up in space versus the health and safety of our family and children. Frankly, I would rather have health and safety of our children than another satellite. So please don't start FFTF, and focus all of the energy and resources at Hanford on mitigation, remediation, and cleanup efforts. That's where our responsibility lie. You guys made a big mess and your job is to clean up and it will be the children's job to clean it up. Quite a gift. The least we can do is not make the gift any worse then it already is for our descendants. Please do what you outta do. Thank you.

113-1

113-2

113-3

113-1

Response to Commentor No. 113

113-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Steady and consistent progress in restoring the Hanford Site is documented in annual reports, available to the public at www.hanford.gov. The Hanford Site has a comprehensive waste minimization and pollution prevention program in place as summarized in Volume 1, Section 3.4.11.8 that would govern any proposed site activities.

113-2: DOE notes the commentor's opposition to enhancing its existing nuclear facility infrastructure to support production of plutonium-238 for use in future NASA space exploration missions. Section 1.2.2 of Volume 1 was revised to clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed production of plutonium-238 are low and are discussed in detail in Chapter 4 of Volume 1 and appendixes H, I, and J of Volume 2 in the Final NI PEIS. Potential health and safety impacts associated with future launches of spacecraft are not within the scope of the NI PEIS analysis, but would be addressed in the specific NEPA documentation prepared by NASA in support of such missions.

113-3: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Commentor No. 114: Valerie Nichols

NI PEIS Toll_Free Telephone

8/27/00

Valerie Nichols
206_417_5082

I am calling to comment on the proposed reopening of the Hanford site and also the proposed use of that site as a low_level waste facility. I am appalled that you people are considering reopening Hanford and using it as a waste dump. I thought this black hole had been plugged for good but apparently not. So I am planning to do everything I can to counter this action, and I plan to tell everyone I know that I am a US citizen that is voting. I am a US citizen and I definitely plan to get the word out. So please, as far as I am concerned don't No, No, No reopen the Hanford site and use it as a waste disposal site as well. Thank you.

114-1

Response to Commentor No. 114

114-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF. DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

Section 1.2 of the NI PEIS provides information on the purpose and need for DOE's proposed expansion of the nuclear infrastructure to ensure the availability of isotopes for medical, industrial, and research applications; providing plutonium-238 for NASA, and undertaking research and development activities related to development of nuclear power for civilian use. Although one irradiation facility and several support facilities on the Hanford Site (i.e., Alternative 1, Restart FFTF) were evaluated for mission effectiveness, the scope of this PEIS does not include using the Hanford Site as a "waste dump."

Currently, both government and commercial waste disposal sites operate within the boundaries of the Hanford Site. These are permitted by Washington State.

To: Nuclear.Infrastructure_PEIS@hq.doe.gov
CC: hanfordwatch@telelists.com
From: Hanford_Observer
Subject: Comments on the Nuclear Infrastructure PEIS.

Please excuse this form of providing comments on the Nuclear Infrastructure PEIS _ I dont wish to give my name and address, since I fear retaliation by the Dept. of Energy (otherwise called DoH! in the rest of this document). While DoH! talks a lot about a zero_tolerance policy for reprisals against whistleblowers, their actions show that in actuality, they have a zero_tolerance against whistleblowers themselves.

My comments are all general in nature and are as follows:

- 1) The environmental consequences of accidents are probably based on out_of_date accident analyses. Since the facility was last licensed to operate, DoH! has increased the safety requirements.
- 2) Because of 1) above, the conclusions based on this out_of_date analyses are suspect.
- 3) Because of the need to revisit the safety analysis, and modify the FFTF facility to meet the new tougher requirements, the costs and schedule for the FFTF restart are probably significantly underestimated.

117-1

117-2

Response to Commentor No. 117

- 117-1:** FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The accidents evaluated in the NI PEIS were based upon the latest facility safety analysis reports, recent analyses performed specifically in support of the NI PEIS and other pertinent information. The FFTF currently meets all safety and environmental requirements established by DOE. These DOE requirements are consistent with those established by regulatory agencies such as the Nuclear Regulatory Commission and the Environmental Protection Agency. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.
- 117-2:** DOE notes the commentor's opinion. DOE has confidence in the cost and schedule estimate for FFTF restart.
- 117-3:** The NI PEIS presents the incremental risk associated with each of the alternatives. Sections 4.2-4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected from implementation of the alternatives, including normal operations and a spectrum of accidents that included severe accidents. The accident review included internal events, external events, natural phenomena, common-cause events, and sabotage and terrorist activities. In the event of an earthquake, the FFTF could be safely shutdown, and nonessential personnel evacuated. The environmental analysis showed that radiological and nonradiological risks associated with an earthquake would be small.
- 117-4:** DOE notes the commentor's concerns. This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS. DOE made every effort to obtain, analyze, and disclose all required information to make a decision on expanding nuclear infrastructure. Further, DOE evaluated each environmental resource area in a consistent manner across all the alternatives to allow a fair comparison among the various alternatives. The costs of proposed

Commentor No. 117: Hanford Observer (Cont'd)

4) The FFTF facility sits on the Hanford site. There are several facilities that exist at the Hanford site that do not meet the increased safety requirements. In fact, these facilities provide an unacceptable risk from such common_cause accidents as seismic events, however these risks will not be reduced to acceptable level for years to come. If there were a seismic event and FFTF were operating, the consequences would be increased further, since a seismic event could reasonably be expected to affect not only FFTF, but other facilities such as the waste tanks, PFP, K_basins, and other facilities. How can you justify increasing environmental consequences of accidents further, when already they dont meet the current DoH! requirements?

117-3

5) DoH! always underestimates the costs and always underestimates the environmental consequences of their actions. Why should this PEIS be any different? The PEIS should be done by an independent organization, such as the EPA, or by the State of Washington, as it lacks credibility.

117-4

6) Restarting FFTF will increase the costs and scope for the Hanford cleanup mission. As a result funds will have to be used which could have been used to improve the environment and the cleanup schedule will probably have to be stretched out. How can we justify making a site that is already dirty even dirtier? You cant have it both ways _ either the site needs to be cleaned up or it doesnt. If it needs to be cleaned up, the first step needs to be stop activities which makes it dirtier.

117-5

7) In my view, there is no need to restart FFTF. There are cheaper ways to accomplish the proposed mission. This is simply a political payoff by the Klinton_Bore administration for the politically loyal _ it is a very expensive jobs program for the Tri_Cities area. Why not just pay everybody in the area a small sum of money a year and forget about restarting this dinosaur?

117-6

117-7

Response to Commentor No. 117

actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS.

117-5: The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected. Therefore, the missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

FFTF and the proposed support facilities at Hanford currently exist and will eventually be deactivated. The use of these facilities for this mission will not expand the scope of the Hanford cleanup. An increase in restoration costs should only result from postponing FFTF deactivation until after the Facility's contribution to the NI PEIS mission is completed.

117-6: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

117-7: DOE notes the commentor's concern. The purpose of the proposed action in the PEIS is not jobs, but to help meet the Nation's needs in isotope production and nuclear research.

**Commentor No. 118: Thomas Schaffer
Hanford Atomic Metal Trades Council**

August 23, 2000

Colette E. Brown, NE-50
U.S. Department of Energy
19901 Germantown Road
Germantown, MD 20874

Dear Ms. Brown:

FFTF already has a proven track record for safe and environmentally friendly operation, but the true benefits of this facility are yet to be realized. If you support restarting this reactor, it can produce high quality medical isotopes to treat numerous cancer patients, including some of our members, and possible other patients with other diseases. American production of isotopes will allow continued advancements in medical research, and provide jobs for American labor. This would keep American dollars in America, improving our economic as well as the well being of American families. As the new millennium progresses, alternatives to the use of petroleum fuels must also be identified. The research performed at the FFTF reactor will help scientists and engineers develop safe and economical sources of energy.

Therefore, on the behalf of the Hanford Atomic Metal Trades Council, we would like to express our support on the draft PEIS. We agree there is a need and that the Department of Energy should take immediate action in this area. It is also our opinion, that FFTF is a unique resource to implement a new path forward. This path forward would allow this country to advance technologically, medically, and economically in a totally safe manner.

Response to Commentor No. 118

118-1

118-1: DOE notes the Council's support for Alternative 1, Restart FFTF.

Commentor No. 118: Thomas Schaffer (Cont'd)
Hanford Atomic Metal Trades Council

The PEIS identified a number of alternatives to supply needed isotopes, and research opportunities that the Department of Energy is responsible for providing. We commend conducting an environmental review. We believe you will find FFTF is uniquely situated to address these needs and be cost effective. Our future is in our children, and we must leave them a legacy of sustainable health and sustainable energy. We have already built an outstanding facility capable of meeting these needs, and now it is time to recoup our investment by starting and operating this reactor. We must move forward. We look forward to your decision to restart FFTF.

Sincerely,

HANFORD ATOMIC METAL TRADES COUNCIL

Thomas Schaffer
President
H.A.M.T.C.

FFTF EIS Hearing on Isotopic Production

I attended the last information meeting on the subject here in Richland, but will be out of town and unable to attend the August 29 meeting. I recommend that the start up of the FFTF be expedited for the research and development of isotopes needed for medical, heat source and industrial purposes. Several isotopes needed are in short supply. Often we depend upon foreign and sometimes unreliable sources. The availability and quality of medical isotopes from foreign sources can be affected by the political climate in the supplying country and can cause delays in procurement of the needed materials.

Isotope production is admittedly expensive, but the use of medical isotopes would be beneficial to mankind. Isotopes have been used for the diagnosis, treatment, and extending life of patients with cancer and heart diseases well as other diseases. The FFTF could be a valuable research tool for breakthroughs in cancer treatment. This facility already exists and it would be a crime not to utilize it, especially for research, development and production of medical isotopes.

I recommend that the FFTF be made ready for research and the production of medical isotopes as soon as possible

Sincerely

Clarence A. Strand

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Commentor No. 121: Milton H. Campbell (Cont'd)

Comments on the Draft PEIS on Isotope Production Missions DOE/EIS-0310D

Thank you for sending me the full text of the PEIS so that I could review it before making comment. I will avoid the public comment meetings for they are dominated by activists who care little for my supportive opinion and make it very uncomfortable for conscientious people to express themselves.

I was most dismayed the day after I received the full PEIS to read in the paper that Heart of America spokesman felt that cost-wise the accelerator option was less costly than operating FFTF. I read the report carefully and found no cost comparison charts on which to base such an opinion. The PEIS by definition does not make such comparisons and such comments should be ignored. An additional comment that the PEIS authors were biased toward the FFTF should also be ignored. After all when you want a brain surgeon, you don't go to the garbage collector for an opinion!

On the whole, I found that the treatment of the alternatives was acceptable. I feel that the FFTF provides the most immediate and viable avenue to producing medical isotopes and ²³⁸Plutonium. The target prep and target processing operation is common to all alternatives presents a common waste source and risk potential to the public and to the workers.

Negative comments on waste production should be anticipated. That every activity has a waste release cannot be denied, even in our breathing we exhale carbon dioxide. Recognition of the waste stream, and good engineering practices to minimize and contain it are the solution, not where it will be treated or ultimately go.

As far as the PEIS goes, I am concerned with one major omission. The accelerators would require a major power source, but I do not find an impact assessment for this requirement. Considering the limited state of our electrical generation industry throughout the nation, I believe that this requirement should be included in the constraints for this option.

In summary, I believe the FFTF should be selected to fulfill the needs cited in this PEIS.

121-3

121-4

121-5

121-3

Response to Commentor No. 121

121-1: DOE notes the commentor's views. DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and to providing ample opportunity for public comment on those actions. The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS.

121-2: DOE notes the commentor's opinion.

121-3: DOE notes the commentor's support for Alternative 1, Restart FFTF.

121-4: The waste generated from target processing and fabrication, regardless of which alternative is considered, are very common and in most cases the volumes are the same.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

121-5: The impact assessment of the electrical demands of Alternative 3 on the local electrical grid is a site specific assessment and will be evaluated during subsequent NEPA review if the Record of Decision selects Alternative 3. The annual cost of utilities for operation of the high-energy and low-energy accelerators are presented on pages A-3 and A-4 of the Cost Report. The Cost Report summary is provided in Appendix P.

124-1: DOE notes the commentor's support for Alternative 1, Restart FFTF and opposition to Alternative 4, Construct New Research Reactor.

Draft PEIS Comment Form

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

I am providing the following comments in support of future operation of the Fast Flux Test Facility (FFTF) at DOE's Hanford site in Washington state. The FFTF is DOE's newest nuclear reactor and numerous studies have demonstrated its unique characteristics and exceptional versatility.

For example, this facility has the capability to produce plutonium-238 for the Radioisotope Thermal Generators (RTGs) that NASA will need for future deep-space missions while simultaneously producing large quantities of medical isotopes for use in diagnosis and treatment of disease.

As always happens, there is vocal opposition to an activity that can in any way be called "nuclear", even though that activity would lead to the production of isotopes for treatment of serious medical conditions such as cancer, heart disease and arthritis. However, you will find strong support from those most directly affected by the decision on the future of the FFTF. Don't waste this valuable asset - put the FFTF back into useful operation.

Draft PEIS Comment Form

DEAR LADIES AND GENTLEMEN:

WE NEED FFTF, PLEASE RESTART IT. THE WELL-KNOWN AXIOM, "LEAD, FOLLOW, OR GET OUT OF THE WAY" HAS ALWAYS BEEN THE STANDARD BY WHICH SOCIAL, MEDICAL AND TECHNOLOGICAL ADVANCES HAVE BEEN MADE IN THE UNITED STATES. DISCONTINUING OPERATION OF FFTF WOULD NOT ONLY DO A DISERVICE TO THE MEN AND WOMEN WHO DEVELOPED AND WORKED AT THE SITE, BUT WOULD SEND AN EMBARRASSING MESSAGE TO THE REST OF THE WORLD WHO LOOK TO OUR COUNTRY FOR LEADERSHIP... "LEAD (US) BECAUSE WE HAVE TO FOLLOW YOU NOW, AND DON'T WANT TO GET IN YOUR WAY."

PLEASE BASE THE DECISION ON A VISION FOR THE FUTURE. MEDICAL RESEARCH, SPACE EXPLORATION, ETC. WILL ALL BE ADVERSELY AFFECTED BY THE CLOSURE OF FFTF. I, FOR ONE, DO NOT WANT TO SOMEDAY BE IN NEED OF LIFESAVING TREATMENTS THAT HAVE TO BE PURCHASED AT A FOREIGN GARAGE SALE, BECAUSE OUR COUNTRY NO LONGER PRODUCES THE NECESSARY MATERIALS.

LISTEN TO THE PEOPLE. BASE YOUR DECISION(S) ON THEIR NEEDS AND FUTURE NEEDS. THANK YOU.

Response to Commentor No. 127

127-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

Ms. BROWN, 8/20/0
 The recent release of the National Research Council's study of U.S. Nuclear Waste Sites CALLS DOE'S CLEANUP APPROACH INADEQUATE (wall street journal 8/16) reaffirms what we know. It is paramount that we clean-up our wastes before we even consider creating more. The DOE has been mandated this responsibility.

It is our duty as adults to actualize what our parents taught us; Be kind to others, learn as much as we can, clean-up our mess. This is imperative to the health of future generations. Products from Nuclear Energy Sites are simply not worth the certain hazards of their by-products.

According to the report, "Today's SCIENTIFIC KNOWLEDGE and TECHNICAL and INSTITUTIONAL CAPABILITIES ARE INSUFFICIENT TO PROVIDE MUCH CONFIDENCE THAT SITES WITH RESIDUAL RISKS WILL CONTINUE TO FUNCTION AS EXPECTED FOR THE TIME PERIODS NECESSARY."

Sincerely, Paul Moyer

7/12/00

128-1

128-1: DOE notes the commentor's concern for the adequacy of ongoing cleanup activities, although issues of waste cleanup activities are beyond the scope of this NI PEIS. As discussed in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.13, 4.3.2.1.13, 4.3.3.1.13), waste will be generated by all of the proposed alternatives, including the No Action Alternative. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. DOE activities associated with this program would not impact the schedule or available funding for existing cleanup activities at candidate sites for implementation of the nuclear infrastructure alternatives.

As DOE is mandated to do cleanup, it is also mandated to provide for certain needs under the Atomic Energy Act. Consistent with its mandates under the Atomic Energy Act, DOE is proposing this enhancement for the purposes of addressing three primary needs: 1) to support the increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238 a fuel source that is required for deep space missions and for which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear energy research and development in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio.

129-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 130: Wayne H. Payzant

Aug 23, 2000

Ms. Colette E. Brown
U.S. Department of Energy
Office of Space and Defense Power Systems, NE-50
Germantown Road, Germantown, Maryland 20874-1290

Dear Ms. Brown:

Subject: Comments on Draft Nuclear Infrastructure PEIS (DOE/EIS-0310D, July 2000)

The alternatives listed in the referenced document are:

No Action

1. Restart FFTF at Hanford, Washington, to meet all isotope production and research requirements.
2. Use only existing operational facilities;
3. Construct one or two new accelerators;
4. Construct a new research reactor; or
5. Permanently deactivate FFTF (with no new missions).

Of these alternatives I strongly support Number 1, restart FFTF. The reasons are:

- A. We need the medical isotopes the FFTF can deliver. No other alternative can deliver the quantity and diversity of isotopes as economically as the FFTF. No patient should be denied life saving/enhancing treatment for lack of adequate medical isotopes. A large diversity of medical isotopes are needed to develop new and improved methodologies to treat diseases.
- B. The FFTF can produce adequate quantities of power generating isotopes to support NASA space missions.
- C. The FFTF has the flexibility to support other nuclear research and development that likely will be needed in the future.
- D. The FFTF is a Crown Jewel in the DOE reactor inventory, being the newest with an excellent operation history.
- E. Skilled nuclear workers are available in the communities near the FFTF reactor. This will minimize the time and cost to recruit and train additional personnel to restart and operate the FFTF.
- F. The local communities near the FFTF reactor strongly support restarting the FFTF.

In summary, restart of the FFTF appears to be the best economic and practical alternative to meet all the needs identified. The final decision should be made on "Sound Science and Long Term Economics" not the lies and fear tactics employed by the anti-nuclear movement.

Sincerely,
Wayne H. Payzant

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

I believe we need FFTF, please restart it.
 The nuclear policies of the government can only be described as completely nuclear hostile. These policies appear to be based on the opinions of uneducated and emotional environmentalists and on the opinion of media coverage-driven celebrities. The result of feeding the American public perceived discrimination with sensationalism is our leaving a legacy to our posterity that is arguably down-right criminal! Turning our back on nuclear technology and science is crippling our nation. The absence of funding has created an absence of nuclear research which has already put the United States behind other nations, and will eventually put us so far behind our best future will be endangered. It is high time that those who make our nuclear policies base their decisions not on people who irrationally fear it, or who want to profit by its demise, but on hard science and on the advice of engineers and scientists who actually work with and study it. I am asking that we please take this one small step to reverse the course of dementia: restart the FFTF!

131-1

131-2

131-1

131-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

131-2: DOE notes the views expressed in this comment. DOE remains committed to fulfilling its roles in technology development, energy security and environmental stewardship, while meeting the Nation's needs in the areas of medical and industrial isotopes, and nuclear research.

Commentor No. 132: J. Hyatt

Please Restart FFTF for Medical Isotopes!
J. Hyatt - Las Vegas

WHY DO WE NEED THE FFTF FOR MEDICAL ISOTOPES?

June, 2000

Medical Isotopes Are Improving Cancer Treatment

New treatments for cancer using medical isotopes are showing great promise in human clinical trials. A new medical isotope treatment for non-Hodgkin's lymphoma is having remarkable results – impressive remission rates and few side effects. Medical isotope "seeds" for prostate cancer, now FDA approved, are equally as effective as surgery for localized cancer yet much cheaper and kinder. The list of possible treatments using medical isotopes is growing – leukemia, breast cancer, ovarian cancer, myeloma, neuroendocrine cancers to name a few.

Will there be a shortage of medical isotopes for treatment?

The threat of a medical isotope shortage for treating patients is real. The quantity of isotopes required for research (treating only a few patients) is much smaller than the quantity that will be required when the treatment becomes FDA approved. In the next several years, demand for certain medical isotopes may skyrocket as a result of their excellent performance in clinical trials. Will we be ready or will we have to turn patients down while we scramble for a good source of a large quantity of medical isotopes?

The Fast Flux Test Facility has the capacity to produce 2-3 times more medical isotopes than all other reactors in the nation combined. We need it to be ready to supply large quantities of medical isotopes to cancer centers around the nation.

Is there a shortage of medical isotopes for research?

There are many different kinds of isotopes, and each isotope has different qualities that make it ideal for one use, but less ideal for another. Currently cancer researchers are not able to select from every possible isotope because only certain ones are available. This means that the course of cancer research is influenced by market conditions, and not solely by what makes the most sense scientifically and medically.

How do you quantify lost potential? Some have been quoted as saying there is no medical isotope shortage. All the isotopes that could be developed for cancer treatment are clearly not available. If they're not available, they won't be developed. If they're not developed, we have not done all we can to fight cancer.

Have isotope shortages interrupted the progress of innovative cancer therapies?

Yes. Following are 3 specific examples.

Copper-67 Copper-67 is a beta isotope that has shown excellent promise for treating cancer with radioimmunotherapy (RIT). In RIT, isotopes are paired with an antibody that is engineered to seek out certain cells in the body. The isotopes ride along as the antibody flows through the blood. When it reaches the cancer, the isotope zaps the cancer cells. In 1997, Dr. Sally DeNardo & Dr. Gerald DeNardo of U-C Davis were forced to abort a promising clinical trial using Cu-67 on non-Hodgkin's lymphoma because they could not obtain enough of this isotope.

132-1

Response to Commentor No. 132

132-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 132: J. Hyatt (Cont'd)

The FFTF reactor could produce enough Copper-67 for worthy cancer research such as this.

Alpha emitters. Alpha emitting isotopes (alphas) have great potential for treating blood cancers (leukemia, lymphoma, multiple myeloma) and micrometastatic deposits of cancer (any type of cancer that has spread throughout the body in small clusters of cells). Because alpha emitters can kill a cancer cell in as few as 1 or 2 hits, they might be developed into very effective treatments for metastatic cancer. Alphas paired with pre-engineered antibodies become a "seek and destroy" missile for cancer cells.

Research and clinical trials with alpha emitters is bottlenecked by serious supply problems. Dr. Darrell Fisher of Pacific Northwest National Laboratory describes the alpha emitter supply as "tight or virtually non-existent." Dr. David Scheinberg of Memorial Sloan Kettering Cancer Center in New York began human clinical trials against leukemia with the alpha isotope Bismuth-213 attached to a monoclonal antibody. Unfortunately, limited isotope supply and current high costs have slowed expansion of alpha emitters into other trials.

Will the potential of alpha emitting isotopes be tapped to benefit patients? The FFTF reactor could produce large quantities of the needed alpha emitting isotopes.

High Specific Activity Iodine-131.

Iodine-131 is an isotope that has been utilized more than any other in developing new cancer treatments. When isotope treatment for thyroid cancer was developed 30 years ago, Iodine-131 was used because it naturally sought out thyroid tissue. It is now the standard of care for thyroid cancer treatment. Iodine-131 currently shows great promise in advanced clinical trials against b-cell non-hodgkin's lymphoma, with FDA approval expected soon. Many other beneficial diagnostic and treatment uses have been developed and are continuing to grow.

High specific activity Iodine-131 is completely unavailable in the United States. The high specific activity isotope is much purer and therefore more effective than the low specific activity product that is now so widely used. When used in radioimmunotherapy, low specific activity Iodine-131 actually wastes about 90% of the available antibodies. Patients treated with these isotope mixes receive only 10% or so of the right isotope at the cancer site. A high specific activity product would cut the waste down to only 30 or 40%, potentially making a great difference in the effectiveness of the treatment.

The only reactor in the Western Hemisphere capable of producing large quantities of several high specific activity isotopes is the FFTF. The PNNL medical isotope program receives calls from researchers waiting for such isotopes as high specific activity Iodine-131.

Is Research and Development Hampered by Isotope Supply Problems?

Research utilizing medical isotopes is stuck in a "chicken & the egg" situation. Research isotopes can be made available when their promise in medical treatments is demonstrated. Researchers cannot demonstrate their promise without a reliable supply. Dr. Darrell Fisher believes "the growth in market demand for medical isotopes will be forever directly linked to isotope availability, and the market will increase with our increasing ability to produce high quality isotopes for special-purpose applications."

Many innovative cancer treatments are developed by pharmaceutical companies. Developing a new drug requires a heavy up-front research and development investment. No company would ever put heavy financial investment into a potential treatment when the drug development could be aborted by shortages.

What are we waiting for? If we expect more effective, less debilitating cancer treatments for the future, we need to invest in isotope availability now. We need the FFTF for medical isotopes.

Response to Commentor No. 132

Commentor No. 133: Chris Hofgren

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

Dear Ms. Brown:

I am opposed to restart of the Fast Flux Test Facility reactor because:

- ① SIPHONS FUNDS AWAY FROM OVERALL HANFORD CLEANUP
- ② REACTOR VESSEL HAS SEVERE STRUCTURAL PROBLEMS - SHUT DOWN FFTF!
- ③ MIXED OXIDE FUELS CREATE GREATER WASTE STREAM PROBLEMS

Name Chris Hofgren
Address 2434 SE Ankeny #16
City, state Portland, OR Zip 97214

Response to Commentor No. 133

- 133-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 133-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected. Therefore, the missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

- 133-3: The NI PEIS has incorporated all relevant information from facility safety analysis reports regarding the condition of the FFTF. The entire facility, including the reactor vessel, is considered to be in excellent condition and can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1.
- 133-4: As stated in Section 4.3.4.1.13 of the NI PEIS, "...the waste generation would not be affected by the type of fuel used (i.e., mixed oxide or highly enriched uranium)..."

Ladies and Gentlemen,

I have limited knowledge about this program. The knowledge that I do have leads me to write this short missive. Fifteen and one_half years ago, I lost my mother to cancer. The disease, itself, was horrible, but the torture of undergoing chemo and radiation therapy was devastating. As she slowly wasted away, she lost her ability to even care for herself. Do you have any idea how humiliating it is to have your daughter wipe and clean you after going to the bathroom? Do you have any idea how sad it is to have to do that for your parent?

As a result of her chemo and radiation, she lost more than weight. She lost clear speech and thought. No longer was she the quick joker of the family, the one who digs out the catcher's mitt for Thanksgiving Dinner when we were throwing rolls acrossed the table. No longer was she the one with the trigger memory who could tell you all about uncle or aunt so_and_so and who their kids were and their kids' names. No longer was she the daredevil who put on her ice skates and skated down the city street in the winter or borrowed one of the neighbor kids' skateboards to run down the sidewalk. No longer did she have any appetite for her favorite foods _ food was disgusting to her. By the time she felt decent again following chemo, it was time for another dose. Long before my mother died of cancer, she started dying from the treatments intended to put that cancer into remission. My mother's last two+ years of life were years of pain, misery, and torture.

138-1

Response to Commentor No. 138

138-1: DOE notes the commentor's support for greater availability of medical isotopes. For nearly 50 years, DOE's use of its unique technologies and capabilities to develop isotopes for civilian purposes has enabled the widespread application of medical isotopes seen today. Consistent with the mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure to support production of radioisotopes for medical applications and research.

Commentor No. 138: Noella Wyatt (Cont'd)
Career Development Services

Would you like some imagery? How about seeing a woman who once had the most beautiful head of rich, lusturous red hair have one small (quarter_size) patch of stiff gray hair on her head? How about a woman who's cancer had advanced to the point that almost all of her teeth had fallen out? How about a woman who died at the weight of 73 pounds? Are any of the images coming into focus? How about a woman desperately trying to stay alive to just be able to see her first born grandchild (she died 4 months too early)? Can you imagine a woman with hands that resembled claws because there was no flesh left on them? Can you see my mother who was so emaciated and in so much pain that she couldn't stand to sleep in bed because rolling over was agony? Have you seen someone you love pulled up into a fetal position because their body is racked with pain?

If you can imagine any of this.....if you have experienced any of this....how can you NOT move Heaven and earth (even HELL) to make Medical Isotopes available to anyone who needs it? How can you deny the opportunity for a CURE? Not a remimsson. To hell with remission. I'm asking for a cure. And that cure is there _ it is available _ but not if it isn't made available. It makes me ill to think that people are still going through the barbaric practice of chemo therapy and radiation when medical isotopes could be used. WHY is this still being done? Why aren't the isotopes available? FAT_ASSED BEAUROCRATS AND PHYSICIANS!!! Who would sponsor the research? Where would the doctors get their money? If the cure came too quickly, how could they afford their Corvette or Bayliner? How could they send their kids to the best schools?

138-1

 Subject: objection to restarting Hanford nuclear reactor
 Auto forwarded by a Rule

Dear Collette Brown/Secretary Richardson and committee members,

Please accept the following as public comments on the Draft Environmental Impact Statement on the Nuclear Infrastructure EIS.

As a citizen of the Pacific Northwest, I am deeply concerned about the United States Department of Energy's proposal to restart Hanford's Fast Flux Test Facility Nuclear Reactor. I wish to have my values incorporated into the formal administrative record and taken into consideration when adopting the final record of decision. I also want you to respond to my concerns before you make your record of decision.

Considering Hanford's overwhelming problems, including the crisis with tank waste treatment, as well as the damage caused by and radiation released from the Hanford wildfire, restarting FFTF is absolutely unacceptable. We must deal with the waste already at Hanford and focus on the clean_up mission. FFTF maintenance has already gobbled up \$100 million in clean_up money and distracted from desperately needed clean_up. Tank wastes are already seeping towards the Columbia River. More wastes must not be added to those tanks. Clean_up must be the only priority. We must save the Columbia River.

Also, I object to the fact that you are asking citizens to comment on an incomplete study. You have not told us how you will deal with non_proliferation issues or additional waste from FFTF. Should FFTF be restarted, that decision will be illegal under Federal law and will be overturned! Do the right thing, shut down FFTF now and save the future of the Columbia River!

Sincerely,
 Ann Minks

141-2

141-1

141-4

141-1

141-5

Response to Commentor No. 141

141-1: DOE notes the commentor's concerns. This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. DOE prepared a separate Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. DOE mailed this document to approximately 730 interested parties on September 8, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Nuclear Infrastructure Nonproliferation Impact Assessment in Appendix Q in the Final NI PEIS. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

141-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

DOE-RL, EPA, and Ecology agreed to a change in this agreement to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on FFTF's future. Public meetings were held on this formal milestone change.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the

Commentor No. 141: Ann Minks (Cont'd)

Response to Commentor No. 141

alternative(s) selected. Therefore, the NI PEIS missions would not have an impact on Hanford cleanup activities.

No waste would be added to Hanford's underground waste tanks if FFTF were restarted for this mission.

No radioactive materials were "released" in the Hanford Wildfires of 2000. Wildfires did resuspend some materials already in the environment. The resuspended materials were low, slightly above natural background levels. The low levels required several days of analysis to quantify.

- 141-3:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.
- 141-4:** Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.
- 141-5:** See response to comment 141-3. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Commentor No. 142: Brandon Juhl

From: Brandon Juhl[SMTP:BRANDONJUHL@HOTMAIL.COM]
Sent: Monday, August 28, 2000 8:49:32 PM
To: INFRASTRUCTURE_PEIS, NUCLEAR
Subject: don't re_start the Hanford tritium FFTF reactor!
Auto forwarded by a Rule

Dear Department of Energy:

What are you thinking? You already don't know what to do with the nuclear waste you HAVE, WHY on EARTH would you want to make MORE?

142-1

In the wake of a fire and a plutonium release, the firing of a contractor at Hanford for incompetence, delays, and other such madness and nonsense, you now have the gall to try to restart the FFTF reactor?

142-2

Plutonium 238__a speck of which, inhaled, will KILL YOU, is so deadly and dangerous I can't imagine why anyone would want to make it. Oh, so you want to use it to create medical isotopes to "cure cancer."

142-3

Maybe there wouldn't be so many cases of cancer if you would stop producing nuclear radioactive waste! Also, medical isotopes are widely available on the commercial market, at far cheaper costs than what the FFTF would ever produce.

142-4

Your justification for profitability (in restarting the reactor) assumed a steady 16% increase annually in the demand for medical isotopes, which means every person in the U.S. will need to have need for cancer treatment by the year 2030.

Response to Commentor No. 142

142-1: DOE notes the commentor's concern about waste generation. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and appropriate DOE orders.

142-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF. Direct effects of the referenced fire on the land and biota are addressed in this NI PEIS consistent with the scope of the affected environment descriptions for the Hanford Site provided in Section 3.4 of Volume 1. The secondary effects of the Hanford Wildfires of June 27-July 2, 2000 are beyond the scope of this NI PEIS. No radioactive materials were "released" in the Hanford Wildfires of 2000. Wildfires did resuspend some materials already in the environment. The resuspended materials were low, slightly above natural background levels. The low levels required several days of analysis to quantify.

FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. The analyses presented in this NI PEIS reflect the proposed changes to the reactor core (including fuel and irradiation targets) to perform the DOE missions. In the event that FFTF restart is selected in the Record of Decision, a new Safety Analysis Report, including a Probabilistic Risk Assessment (PRA), will be prepared and it will address any changes in plant configuration, operating conditions and procedures. The revised safety analyses will be subjected to a thorough independent review process. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

142-3: The commentor's concerns over the production of plutonium-238 are noted. As discussed in Section 1.2.2 of Volume 1, plutonium-238 produced under Alternatives 1 through 4 (described in Section 2.5) would be used to support NASA's deep space missions. NASA uses plutonium-238 sources when these sources enable their missions or

Commentor No. 142: Brandon Juhl (Cont'd)

The restart also undermines efforts (along with the Star Wars national missile defense program) to halt nuclear proliferation, and violates disarmament treaties!

142-5

In the last few months you've lied about how much plutonium was released into the air (during the June 27th fire) so why on Earth should we believe your assurances about the re_start of the FFTF that it is 'safe'?

142-6

Face it, DOE, your proposal to re_start the FFTF reactor at Hanford should be DOA. Kill it now, before it kills us all.

142-2

Sincerely,

Brandon Juhl
4638 90th Ave SE
Mercer Island, WA 98040

Response to Commentor No. 142

enhance mission capabilities. Prior to launch, NASA provides evaluations of the environmental impacts associated with their deep space missions in compliance with the National Environmental Policy Act.

Sections 4.2-4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from implementation of the alternatives, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with each alternative would be small.

142-4: The restart of FFTF would generate some additional wastes. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws, regulations, and applicable DOE orders.

DOE notes that private commercial vendors could produce a select set of isotopes that are economically attractive. It is not DOE's intent to enter into competition with the commercial sector in the production of isotopes. Rather, it is the intent of DOE to complement commercial sector capabilities to ensure that a reliable supply of isotopes is available in the United States to meet future demand, and to encourage the commercial sector to privatize the production of isotopes that have established applications to a level that would support commercial ventures.

DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope has tracked at levels consistent with the Expert Panel findings. Section 1.2.1

Commentor No. 142: Brandon Juhl (Cont'd)

Response to Commentor No. 142

of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

- 142-5:** The proposed action in the NI PEIS is consistent with and supports nuclear nonproliferation policy. Clearly, the evaluated alternatives do not violate any existing disarmament treaty. An assessment of the potential nonproliferation impacts of proposed isotope production and nuclear research missions, published in September 2000, confirms there are currently no U.S. nonproliferation policies, laws, regulations, or international agreements that preclude the use of any of the evaluated facilities in the manner described in the PEIS, including the potential restart of the FFTF. This nonproliferation impact assessment was managed and approved by the DOE Office of Arms Control and Nonproliferation.
- 142-6:** See comment 142-2.

 Auto forwarded by a Rule

To Whom it May Concern,

The crumbling infrastructure at Hanford is no place to house a nuclear reactor of any sort. True, you spend millions of taxpayer dollars annually to maintain a mothballed facility, but at what potential cost to the Columbia Basin?

Please cease and desist any attempt at starting an antiquated and potentially deadly nuclear reactor on the third largest river drainage system in North America. Millions of people depend on it.

Karsten Hagen
 Hood River

148-1

148-2

Response to Commentor No. 148

- 148-1:** The commentor's opposition to the restart of FFTF is noted. FFTF was constructed and initiated operations in the early 1980s making it the DOE's newest reactor. It is in excellent condition and evaluations have been performed to show that it has sufficient life remaining to fully support the 35 year mission. Likewise, the proposed support facilities are either recently constructed or renovated facilities or would be upgraded for these missions.
- 148-2:** FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. Section 3.4.4 of Volume 1 of the NI PEIS describes the current condition of water resources potentially affected by the Hanford Site, with specific discussions of surface water and groundwater resources in the Hanford 400 Area, where FFTF is located, provided in Sections 3.4.4.1.2 and 3.4.4.2.2, respectively. This information indicates that the only impact that 400 Area operations have had on water resources to date is contamination of the unconfined aquifer system with nitrate from sanitary sewage disposal. The source of this contamination has since been removed resulting in nitrate levels diminishing over time. The effects of maintaining FFTF in its current standby mode for 35 years are described in Section 4.2.1.2.4 of Volume 1 and this analysis indicates that the impact on water resources would be negligible. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. The analyses presented in this NI PEIS reflect the proposed changes to the reactor core (including fuel and irradiation targets) to perform the DOE missions. In the event that FFTF restart is selected in the Record of Decision, a new Safety Analysis Report, including a Probabilistic Risk Assessment (PRA), will be prepared and it will address any changes in plant configuration, operating conditions and procedures. The revised safety analyses will be subjected to a thorough independent review process. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

Yes, I am calling about the Public Hearing Evaluation Form. The 1st question is:

1. How could the public hearing format and materials be improved?

My answer is: Please listen and take the courage to do what the taxpayer wants, not what the government or businesses want.

2. Was the public hearing helpful to you?

My answer is: No. It is but another repeat of what the public has already expressed. No FFTF startup. Why can't the Secretary of Energy and others listen to us. Are you hoping to wear us down with apathy? That will not happen. People will humanly protest any FFTF startup at the Hanford factory. All isotopes can be purchased from Canada at new facilities. We do not need to make them, but what we need to do is clean up Hanford. All resources and all energy should go to that and nothing else.

150-1

150-2

150-1

150-3

150-4

Response to Commentor No. 150

- 150-1:** DOE policy encourages effective public participation in its decision making process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.
- 150-2:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 150-3:** The United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.
- 150-4:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram

Commentor No. 150: Anonymous (Cont'd)

Response to Commentor No. 150

budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to “ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use.” The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

I haven't read the EIS or anything, but I know about nuclear waste. OK. Thanks to the TAG program, when I was a kid, I learned about what I was interested in sparking off a nonstop environmental activism thing. I just want to make a comment that they have maps all around the Tri-Cities and actually all down the Columbia River showing incidences of thyroid cancer and cleft palate and all kinds of birth defects. The Columbia River way down in there with heavy water going through it, and it is radioactive and my brother was born with a cleft palate. He was born in Astoria and it was a huge mystery or nobody ever knew or guessed my mother never did drugs when she was pregnant. Just like, oh my God, oh my, this horrible thing. Through studying and not even looking for it, trying not to blame anything on it. I just know in my heart from instances of everybody else from the Tri-Cities and around Hanford that have cleft palates. This was nuclear contamination. I figured it was probably from fish that was canned in Astoria that my mom ate. I don't know, but all I know is that my brother has been through 13 incredibly painful operations. I have a friend that has cancer of the eye from the Rocky Mountain Arsenal, which is not nuclear I guess, but it leaked mustard gas and she has eye cancer and one of her sons has eye cancer. So, she doesn't have the cancer anymore because she is missing an eye; she has a glass one.

You know, don't reopen Hanford; it's just retarded. Please care about the people, animals, plants, and our earth. Ok we don't want nuclear power. We don't want nuclear energy. Put your energy into solar energy or something more useful than something that is going to contaminate the land forever. Thanks a lot. I guess that is about all that I have to say. It might not be very scientific, but you know you guys pooh _pooh it all you want, but nuclear radiation causes birth defects and it is not good for people. It causes cancer and everyone knows this. So, don't pretend like you don't know. Just shut it down. Give the American people a break. Please put your energy and money into something that is going to do good for the world, not something that is going to destroy the world. Don't sell out just for a paycheck. Thank you.

Response to Commentor No 152

| 152-1 | 152-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF. |
| 152-2 | 152-2: The commentor's opposition to nuclear power and nuclear energy is noted. DOE recognizes that there are potentially harmful effects associated with radiation such as cancer and these are quantified for each alternative in Chapter 4 of the PEIS and the results of this analysis are presented in EIS Volume 1, Section 2.7.1. The purpose of this PEIS is to evaluate and present the environmental consequences of a variety of alternatives for the proposed action. |

Commentor No. 153: Thomas Marshall

From: Thomas Marshall[SMTP:THOMASM@AVENUEA.COM]
 Sent: Tuesday, August 29, 2000 11:46:19 AM
 To: INFRASTRUCTURE_PEIS, NUCLEAR
 Subject: Opposed to restart of FFTF
 Auto forwarded by a Rule

Dear Collette Brown/Secretary Richardson,

Please accept the following as public comments on the Draft Environmental Impact Statement on the Nuclear Infrastructure EIS.

As a citizen of the Pacific Northwest, I am deeply concerned about the United States Department of Energy's proposal to restart Hanford's Fast Flux Test Facility Nuclear Reactor. I wish to have my values incorporated into the formal administrative record and taken into consideration when adopting the final record of decision. I also want you to respond to my concerns before you make your record of decision.

Considering Hanford's overwhelming problems, including the crisis with tank waste treatment, as well as the damage caused by and radiation released from the Hanford wildfire, restarting FFTF is absolutely unacceptable. We must deal with the waste already at Hanford and focus on the clean_up mission.

FFTF maintenance has already gobbled up \$100 million in clean_up money and distracted from desperately needed clean_up. Tank wastes are already seeping towards the Columbia River. More wastes must not be added to those tanks.

Clean_up must be the only priority. We must save the Columbia River.

153-1

153-2

153-3

153-2

Response to Commentor No. 153

153-1: DOE notes the commentor's concerns. This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. DOE prepared a separate Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. DOE mailed this document to approximately 730 interested parties on September 8, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Nuclear Infrastructure Nonproliferation Impact Assessment in Appendix Q in the Final NI PEIS. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

The associated Nuclear Infrastructure Nonproliferation Impact Assessment was made available to the public on September 8, 2000. The Record of Decision concerning enhancement of DOE's nuclear infrastructure is scheduled for January 2001.

153-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

DOE-RL, EPA, and Ecology agreed to a change in this agreement to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on FFTF's future. Public meetings were held on this formal milestone change.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the

Commentor No. 153: Thomas Marshall (Cont'd)

Also, I object to the fact that you are asking citizens to comment on an incomplete study. You have not told us how you will deal with non_proliferation issues or additional waste from FFTF. Should FFTF be restarted, that decision will be illegal under Federal law and will be overturned! Do the right thing, shut down FFTF now and save the future of the Columbia River!

153-1

And also please support Wild and Scenic status for the Hanford stretch of the mighty Columbia.

153-4**153-1****153-5**

Sincerely,

153-6

Response to Commentor No 153

FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected. Therefore, the NI PEIS missions would not have an impact on Hanford cleanup activities.

No waste would be added to Hanford's underground waste tanks if FFTF were restarted for this mission.

No radioactive materials were "released" in the Hanford Wildfires of 2000. Wildfires did resuspend some materials already in the environment. The resuspended materials were low, slightly above natural background levels. The low levels required several days of analysis to quantify.

153-3: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.

153-4: Management of wastes that would be generated under implementation of Alternative 1 (Restart FFTF) is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

153-5: See response to comment 153-3.

Commentor No. 153: Thomas Marshall (Cont'd)

Response to Commentor No 153

- 153-6:** On June 9, 2000, the President issued a proclamation establishing the Hanford Reach National Monument. The U.S. Fish and Wildlife Service will manage the monument under existing agreements with DOE and DOE will consult with the Secretary of the Interior on issues potentially affecting monument areas. DOE is committed to performing its missions in a manner that is compatible with the preservation of open space and protection of natural resources. Integrated land use planning is one means that DOE uses to accomplish mission and resource protection goals on its sites. However, these land use planning measures and specific resource protection initiatives and decisions are beyond the scope of this NI PEIS, and designation of the Hanford Reach as a Wild and Scenic River is not within DOE's authority. The Department of the Interior recommended that the Hanford Reach be designated a Wild and Scenic River and the entire Wahluke Slope a wildlife refuge in the ROD for the 1996 Hanford Reach EIS. Congress has not yet acted to implement the decisions contained in the ROD. DOE did prepare the Final Hanford Comprehensive Land-Use Plan Environmental Impact Statement (DOE EIS-0222-F) (issued in September 1999) in order to evaluate the implementation of a comprehensive land-use plan for the entire Hanford Site for the next 50 years. The Preferred Alternative for this EIS, as selected in the Record of Decision (64 FR 61615 et seq.), would designate the majority of the Columbia River Corridor including the Hanford Reach, nearly the entire Wahluke Slope, and nearly all of the Fitzner/Eberhardt Arid Lands Ecology Reserve as preservation use. This would include expansion of the Saddle Mountain National Wildlife Refuge to include all of the Wahluke Slope. In summary, the decisions contained in the ROD are consistent with those in the 1996 Department of the Interior Hanford Reach EIS ROD.

To whom it may concern,

I am sure that you are getting your fair share of feedback from the Columbia Gorge community regarding the issues at hand, so I'll keep this short but to the point.

As an advocate for the natural beauty and limited resources of the Columbia River Gorge area, I would like to take a stand against any future development at the Hanford Nuclear Plant. Any future development is not acceptable to the people who care about and recreate in our environment, until proper cleanup and disposal of the current situation is done.

I think I speak on behalf of all Hood River residents when I say that any potential pollutants to our river system will severely destruct the attractiveness of our town and will, without a doubt, affect our economy and quality of life here.

154-1

154-2

Response to Commentor No. 154

154-1: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The proposed alternatives delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

The use of Hanford Facilities for the NI PEIS mission would not be a new or future development, but a utilization of existing facilities.

154-2: FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Commentor No. 155: Andreas Juen

 To: INFRASTRUCTURE_PEIS, NUCLEAR
 Subject: FFTF restart MUST BE SHUTDOWN!
 Auto forwarded by a Rule

Colette,

Thank you for hearing me out. I am a community member in Hood River, Oregon, and I feel strongly that USDOE should choose Alternative_5_ SHUTDOWN FFTF, or Alternative_2_ Produce at existing sites with in conjunction with the SHUTDOWN of FFTF.

155-1

My message is clear I do not want to see the Nuclear facility at Hanford be reopened with any production capabilities.

155-2

HANFORD must remain closed and efforts to clean up the environmental, biological and ecological disaster must continue!

155-3

The EIS which has been submitted is misleading, inaccurate and false. Public comment is strongly in opposition to this plan and the need for an FFTF restart is unjustified. Financially it is a disaster and frankly I am tired of my taxes paying for your poor decision making. The money which you will waste on this effort alone would cover a healthy portion of the cleanup which should be taking place currently at the Hanford site.

155-4

155-2

I know you will heed your conscience at not allow, what is in my view, a criminal decision to restart FFTF.

155-5

Response to Commentor No 155

155-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, or Alternative 2, Use Only Existing Operational Facilities, and opposition to Alternative 1, Restart FFTF.

155-2: DOE notes the commentor's concerns regarding ongoing activities to remediate the existing contamination at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

155-3: This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS. DOE made every effort to obtain, analyze, and disclose all required information to make a decision on

Commentor No. 155: Andreas Juen (Cont'd)

I ask of you to SHUTDOWN FFTF PERMANENTLY. CLEAN UP HANFORD. And START POURING YOU TIME MONEY AND INTELLECTUAL RESOURCES INTO ALTERNATIVE, LOW IMPACT ENERGY SOURCES. There are 1000's out there and many we have not even begun to consider, please encourage your engineers, scientists, explorers and bureaucrat to think outside the box and I am sure they too would start to see the light and make the right decisions for themselves their families as well as the rest of the nation's.

I appreciate you time and effort, and look forward to your action and response.

Sincerely,

Andreas Juen

155-1

155-6

Response to Commentor No. 155

expanding nuclear infrastructure. Further, DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives.

155-4: DOE notes the commentor's opposition to restarting FFTF for maintaining and enhancing its existing nuclear facility infrastructure. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs:

1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;

2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and

3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2 of Volume 1 has been revised to clarify the purpose and need of the proposed action.

155-5: See response to comment 155-1.

155-6: DOE notes the commentor's interest in alternative energy sources, although issues of research and development of alternative energy sources are beyond the scope of this NI PEIS. The DOE missions to be addressed in this EIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development, can currently only be met using nuclear reactor or accelerator technologies.

R. Wyden; Representatives-B. Baird, J. McDermott, D. Wu,
A. Smith, E. Blumenauer, P. DeFazio, D. Hooley**

AUG. 28. 2000 6:13PM SEN RON WYDEN

NO. 266 P. 2/5

Congress of the United States

Washington, DC 20510
August 28, 2000

The Honorable Bill Richardson
Secretary of Energy
U.S. Department of Energy
1000 Independence Avenue, S.W.
Washington, D.C. 20585

Dear Secretary Richardson:

We are growing increasingly concerned with the apparent bias of the Environmental Impact Statement (EIS) for Hanford's FFTF nuclear reactor, and the public participation process for this EIS. The Draft EIS fails to reflect the fact that claimed justifications for restart of this reactor, with all of its risks and costs, have either evaporated with formal decisions from other agencies (NASA) or been called into question by the Department's own blue ribbon advisory committee.

Restart of the FFTF Nuclear Reactor and resumption of Plutonium processing at Hanford would have potentially catastrophic impacts on the health of Northwest citizens and our environment. Our constituents are entitled to a fair and impartial process to consider all reasonably foreseeable impacts and reasonable alternatives.

The Department is preventing our constituents and ourselves from reviewing and commenting on the Department's assessment of many of those potential impacts and alternatives by separating them from the Draft Environmental Impact Statement (EIS) and only disclosing them in reports to be made available after the public hearings are over. Apart from the clear bias of such an approach, this seems to be a violation of the National Environmental Policy Act (NEPA). Major public concerns stated in our comments for the scoping of this EIS, including public concerns detailed in the Seattle City Council and Portland City Commission Resolutions opposing FFTF restart (and formally entered into the record at scoping hearings), are ignored in the Draft EIS.

It is not acceptable to have left out of the Draft EIS what the Department will do with the nuclear and toxic wastes from restarting FFTF and Plutonium operations at Hanford. It is also unacceptable to have left out of the Draft EIS the costs of restarting the FFTF reactor and each alternative (especially when the Department has target budgets that are not adequate to comply with the Hanford Clean-Up Agreement), the impacts on the nation's nuclear non-proliferation policies from restarting the reactor and use of Plutonium or High Enriched Uranium fuels, and the independent assessment of the need for particular medical isotopes and the suitability of the FFTF reactor to produce them. For each of these four critical areas, the Department has chosen to issue a report separate from the Draft EIS and not to release that report before the public hearings on the Draft EIS.

158-12

Response to Commentor No. 158

- 158-1:** DOE notes the commentors' concerns. This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives.
- 158-2:** DOE policy encourages effective public participation in its decisionmaking process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.
- 158-3:** The content of recent correspondence between NASA and DOE regarding potential plutonium-238 requirements is discussed in response to Comment 158-15.
- 158-4:** DOE notes the commentors' concern regarding the suitability of FFTF in light of the NERAC subcommittee recommendations, as discussed in the response to Comment 158-13.
- 158-5:** The evaluation presented in the NI PEIS considered both normal operations and accidents and indicates that the environmental and human health impacts of these facilities would be low.
- 158-6:** See responses to Comments 158-1 and 158-2.
- 158-7:** The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS. DOE made every effort to obtain, analyze, and disclose all required information to make a decision on expanding nuclear infrastructure. The costs and nuclear nonproliferation impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make decision documents such as the cost report available

Commentor No. 158: Members of Congress; U.S. Senator- R. Wyden; Representatives-B. Baird, J. McDermott, D. Wu, A. Smith, E. Blumenauer, P. DeFazio, D. Hooley (Cont'd)

AUG. 28. 2000 6:14PM SEN RON WYDEN

NO. 265 P. 3/5

We are dismayed that the Draft EIS fails to disclose that the Department's own blue ribbon medical advisory committee recommended last April that *"the FFTF not be considered as a viable long-term source of research radioisotopes."* The NERAC Subcommittee for Isotope Research and Production Planning's findings regarding the suitability of the FFTF reactor for production of research medical isotopes¹, the claims of the contractors regarding FFTF's costs and projected revenues for producing isotopes, and "poor" rating of the manufacturing practices at Hanford are neither disclosed or referenced in the Draft EIS.

"The Subcommittee concludes that the FFTF will not be a viable source of research radioisotopes. Anticipated income from sales likely will not meet expectations thereby curtailing operations and reducing FFTF's capability to produce research radioisotopes in a timely and cost-efficient manner. ...

"The Subcommittee believes that the production needs of neutron-rich isotopes for research purposes can be met by existing reactors... Other neutron sources may also be available for research isotope production." Final Report at 31.

The Draft EIS should have considered the alternatives recommended by the Subcommittee, and fully disclosed its criticism of the claims made by the FFTF's contractors. Instead, the Draft EIS and DOE documents repeat the cost and isotope need claims that the Subcommittee found to be flawed and overly optimistic. The public deserved to have this fully disclosed in the Draft EIS instead of having it discovered by researchers from citizen groups.

The concerns of the City of Seattle (Resolution 30060 and Resolution 28848) regarding the import of Plutonium on board ships passing through inland waters (such as Puget Sound or the Columbia River to the Port of Portland), and transport of Plutonium through the crowded Puget Sound region, are entirely ignored in this EIS. A shipboard fire involving a shipment of Weapons Grade Plutonium fuel in inland waters poses horrific consequences. Exposure of our constituents to such risk is entirely unacceptable. Other major concerns raised in the Portland and Seattle resolutions, and by Members of Congress, are similarly ignored in the Draft EIS. The Department undermines all public confidence in its consideration of the restart of FFTF when it proposes such actions and ignores the formal input from elected officials and the region's major cities.

¹ The report notes that there are two major types of medical isotopes: large scale production quantities ("commercial" isotopes) and small quantity demand isotopes for clinical trials, research, etc... ("research" isotopes). The report urges that the Department focus on providing the research isotopes, and allowing market forces to provide commercial isotopes. Most of the claims for need for FFTF are based on research isotopes. The size of the reactor and its cost to restart, provide ancillary facilities and operate were negative factors in the committee's opinion.

Response to Commentor No. 158

to the public before a decision is made. DOE mailed these documents to approximately interested parties on August 24 and September 8, 2000, respectively. Both reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided summaries of the Cost Report and Nuclear Infrastructure Nonproliferation Impact assessment in Appendixes P and Q, respectively, in the Final NI PEIS.

- 158-8: DOE has read and considered the public concerns detailed in the Resolutions of the Seattle City Council and the Portland City Commission. Section 1.4 and the expanded discussion in Appendix N summarize the issues and concerns raised during the scoping process.
- 158-9: Management of wastes that would be generated under implementation of Alternative 1 (Restart FFTF) is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.
- 158-10: The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). Nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted fund designated for Hanford cleanup, regardless of the alternative(s) selected.

158-13

158-14

**Commentor No. 158: Members of Congress; U.S. Senator-
R. Wyden; Representatives-B. Baird, J. McDermott, D. Wu,
A. Smith, E. Blumenauer, P. DeFazio, D. Hooley (Cont'd)**

AUG. 28. 2000 6:14PM SEN RON WYDEN

NO. 266 P. 4/5

Although the major mission proposed for the FFTF reactor in this EIS is production of Plutonium 238 for NASA space reactors (Radioisotope Thermoelectric Generators), the Draft EIS fails to disclose that NASA informed the USDOE on May 22, 2000 that:

"NASA headquarters no longer has an identifiable planned requirement for Small Radioisotope Thermoelectric Generator (STRG) power systems."

Contrary to the DOE's assertion in the Draft EIS that "(W)ithout these power systems, these types of space exploration missions could not be performed by NASA."², NASA has determined that missions can utilize alternative technologies with lower costs and potentially much lower environmental impacts, which this Draft EIS should have disclosed.

The major claimed need for FFTF restart no longer exists, yet the Department continues to expend funds and undermine its credibility by continuing to propose the restart of the FFTF reactor to meet a need for Plutonium that NASA has informed you does not exist.

As the hearings on the Draft EIS approach, the Department is not providing for adequate notice of the hearings to our constituents. It also has not changed its plans for conduct of the hearings, which seem designed to repeat concerns over the bias of the process. And, the officials in charge of the EIS failed to live up to expectations for meaningful discussions regarding the substance of the EIS regarding its coverage of major areas of concern, including the need for medical isotopes, alternative market providers of medical isotopes, safety issues, waste streams from proposed activities, nonproliferation impacts and costs of FFTF restart and production.

We are also disturbed that the Department told facilities at which hearings are to be held that public interest groups are "opposition" and "protest" groups, and required them to pay for police in order to hold pre-hearing workshops. We must note that the Cities of Seattle and Portland are officially opposed to the restart of FFTF and, therefore, apparently, "opposition" groups that the Department feels pose a security threat if they seek to hold a pre-hearing workshop to assist citizens in preparing to comment at the hearing.

We urge you to have the Department immediately take the following steps to provide proper notice (designed to notify our constituents that these hearings are on an EIS regarding the possible restart of Hanford's FFTF Nuclear Reactor and Plutonium processing); establish unbiased procedures for the conduct of the hearings; apologize for any characterization of groups as "opposition" or "protest"; and ensure that there is no intimidation of public comment.

The claimed Plutonium and isotope needs, for which our region would be subjected to the risks of FFTF nuclear reactor restart, are now revealed to be illusory claims by the proponents of this dangerous project. The Draft EIS is deeply flawed by its failure to disclose information that is essential to informed decision making. Therefore, the most prudent course of action would be to remove restart of the FFTF reactor from consideration until these concerns are addressed.

² DEIS at S-5

158-16

158-17

158-18

158-19

158-20

158-21

158-22

158-23

Response to Commentor No 158

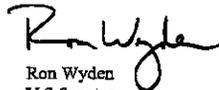

- 158-11:** DOE notes the commentors' concern that an independent assessment of the need for particular isotopes and the suitability of FFTF is not included in the NI PEIS. Section 1.2.1 of Volume 1 discusses the need for isotopes based on the Expert Panel and NERAC subcommittee recommendations. As further discussed in the response to Comment 158-13 and presented in Section 1.5 of Volume 1, the recommendations of these independent review groups were taken into consideration in developing the range of reasonable alternatives evaluated in the NI PEIS. The Expert Panel and NERAC are independent Federal advisory committees appointed by the Secretary of Energy to advise DOE on civilian nuclear energy research program as noted in Section 1.2 of Volume 1.
- 158-12:** The draft Waste Minimization and Management Plan for the Fast Flux Test Facility (May 2000) and the NERAC Isotope Subcommittee report (April 2000) were referenced in the NI PEIS and were available prior to the public hearings. The NI PEIS cost and Nonproliferation reports were made available on August 24 and September 8, 2000, respectively; immediately after they were completed, as discussed in response to Comment 158-7.
- 158-13:** DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel convened to forecast future demand for medical isotopes estimated that the expected growth rate of medical isotope use during the next 20 years will range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

Response to Commentor No. 158

The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost-efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without disturbing the existing missions of these facilities. DOE has taken the Expert Panel and NERAC report recommendations under consideration in developing the range of alternatives evaluated in the NI PEIS. These reports were made available to the public at the NI PEIS public information centers and on the Internet at www.nuclear.gov.

- 158-14:** DOE notes the Commentors' concerns about the import of plutonium through the Portland or Seattle areas. None of the proposed alternatives (Section 2.5 of Volume 1) would involve the shipment of weapons-grade plutonium through ports in the United States. Under implementation of Alternative 1 (Restart FFTF), DOE might import mixed oxide (i.e., plutonium-uranium) fuel from Europe. If Alternative 1 were selected for implementation, and if DOE decides to import mixed oxide fuel from Europe, a separate NEPA review would be conducted to select a port to receive the mixed oxide fuel. This review would address all relevant potential impacts of overseas and inland water transportation, shipboard fires, package handling, land transportation, as well as safeguards and security associated with the import of SNR-300 mixed oxide fuel through a variety of specific candidate ports on the west and

Commentor No. 158: Members of Congress; U.S. Senator-R. Wyden; Representatives-B. Baird, J. McDermott, D. Wu, A. Smith, E. Blumenauer, P. DeFazio, D. Hooley (Cont'd)

Response to Commentor No 158

east coasts. It would consider all public comments, including local resolutions, concerning the desirability of bringing mixed oxide fuel into candidate ports.

In the event that DOE decides to enhance its nuclear infrastructure, it would not expose any population to high, unacceptable risks under any alternative. Any transportation activities that would be conducted by DOE would comply with U.S. Nuclear Regulatory Commission and U.S. Department of Transportation regulations. Associated transatlantic shipment would comply with International Atomic Energy Agency requirements. In Section J.6.2, DOE evaluated potential impacts that would result from the marine transportation of mixed oxide fuel from Europe to a representative military port, Charleston, South Carolina, and overland transportation to Hanford. Also in that section, a bounding analysis demonstrates that radiological risks to the surrounding public from mixed oxide fuel shipments would be extremely small (e.g., less than 1 chance in a trillion for a latent cancer fatality per shipment from severe accidents at docks and in channels and less than 1 chance in 50 billion for a latent cancer fatality per shipment from overland highway accidents).

- 158-15:** Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Under the No Action Alternative, DOE would continue to purchase plutonium-238 to meet the space mission needs for the 35-year evaluation period considered in the NI PEIS. However, DOE recognizes that any purchase beyond what is currently available to the United States through the existing contract would likely require negotiation of a new contract and may require additional NEPA review.

The May 22, 2000, correspondence from NASA to DOE identifies that NASA no longer has a planned requirement for small radioisotope

Commentor No. 158: Members of Congress; U.S. Senator-R. Wyden; Representatives-B. Baird, J. McDermott, D. Wu, A. Smith, E. Blumenauer, P. DeFazio, D. Hooley (Cont'd)

Response to Commentor No 158

thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the SRTG development efforts were stopped in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires one-third less plutonium-238 as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000, letter to DOE that large RTGs be maintained as backup. Section 1.2.2 of Volume 1 was revised to clarify plutonium-238 mission needs. The major mission of FFTF would not be the production of plutonium-238. Rather, all three missions are of equal importance; no one mission is given priority in the NI PEIS.

- 158-16:** DOE provided notice of scheduled public hearings in accordance with the requirements of CEQ and DOE regulations (i.e., 40 CFR Parts 1503.1 and 1506.6 and 10 CFR Part 1021.313, respectively). This included announcement of the hearings in the Federal Register as well as in the local media. In addition, copies of the Draft NI PEIS and/or the Summary (including the public hearing schedule) were sent to each individual or group listed to receive it at the address on record. Additional notification to the public concerning meetings on the Draft PEIS were made by the Oregon Office of Energy to members of 20 focus groups in six Oregon communities and other Oregon interest groups.
- 158-17:** The public hearing format was designed to be fair and unbiased. The public hearing format used was based on stakeholder input and was presented in the Notice of Availability (65 FR 46443 et seq.) for the Draft NI PEIS. This format was intended to encourage public participation, regardless of the motivation for attending the hearing. It provided an opportunity for the participants to meet one another, exchange information, and share concerns with DOE personnel available throughout the course of each hearing to answer questions. The meetings were facilitated by an independent moderator to ensure that all persons wishing to speak had an opportunity to do so. Persons wishing to comment were selected at random from the audiences rather than according to the order in which they registered. This was accomplished by a random number drawing. In addition to the comment recorder stationed at the main hearing, a second recorder was available in an adjacent room to receive comments without the need to

***Commentor No. 158: Members of Congress; U.S. Senator-
R. Wyden; Representatives-B. Baird, J. McDermott, D. Wu,
A. Smith, E. Blumenauer, P. DeFazio, D. Hooley (Cont'd)***

Response to Commentor No. 158

await selection at the main proceeding. The hearing format used promoted open and equal representation by all individuals and groups.

- 158-18:** The need for medical isotopes and alternate suppliers are discussed in Section 1.2.1 of Volume 1. Safety and health issues are discussed throughout Chapter 4 of Volume 1 with details given in Appendixes H through J of Volume 2. Waste generation and waste management for each of the alternatives are discussed throughout Chapter 4 of Volume 1. As discussed in the response to Comment Number 158-7, the cost report and nonproliferation report were made available to the public on August 24, 2000 and September 8, 2000, respectively.
- 158-19:** DOE does not engage in or condone the actions alleged in the comment. DOE did not and does not label organizations or individuals. Neither does it interfere with workshops held by an organization, nor exert any influence or authority in the matter of fees for security and law enforcement charged by the owners or managers of facilities in which public meetings are held. Such matters are determined by the rules and regulations adopted by or applied to these facilities, consistent with local laws and municipal requirements. For the record, DOE did not characterize public hearings participants as “opposition” or “protest” groups, and further, did not attempt to recommend or influence any meeting facility fees or security measures applicable to any group or individual.
- 158-20:** The commentors’ concern for proper notice of the public hearing process is addressed in response to Comment 158-16.
- 158-21:** The commentors’ request to establish procedures for unbiased hearings is addressed in response to Comment 158-17.
- 158-22:** The issue of opposition groups is addressed in response to Comment 158-19.
- 158-23:** DOE notes the commentors’ views.

**Commentor No. 159: Vera Katz, Mayor, City of Portland
(C. Hales, J. Francesconi, D. Saltzman, E. Sten)**

City of Portland
Vera Katz
Mayor

Honorable Bill Richardson,
Secretary of Energy
U.S. Department of Energy
1000 Independence Ave. SW
Washington, D.C. 20585

August 22, 2000

Dear Secretary Richardson:

We support your initiatives for discussions and use of independently facilitated, principled negotiations regarding the future of Hanford's FFTF Nuclear Reactor, which you put forward at the Washington State Democratic Convention on June 10th in a meeting with Washington Democrats. These commitments were innovative efforts at ensuring meaningful dialogue on an issue that has created deep opposition and undermined public confidence in Department commitments. We congratulate you for your willingness to make commitments to improve the EIS and engage in principled negotiations. We are growing increasingly concerned, however, with the apparent bias of the EIS, and the public participation process for the EIS. The Draft EIS appears to cover-up the fact that claimed justifications for restart of this reactor, with all of its risks and costs, have either evaporated with formal decisions from other agencies (NASA) or been called into question by the Department's own blue ribbon advisory committee.

Restart of the FFTF Nuclear Reactor and resumption of Plutonium processing at Hanford would have potentially catastrophic impacts on the health of Northwest citizens and our environment. Our constituents are entitled to a fair and impartial process to consider all reasonably foreseeable impacts and reasonable alternatives.

The Department is preventing our constituents and our selves from reviewing and commenting on the Department's assessment of many of those potential impacts and alternatives by separating them from the Draft Environmental Impact Statement (EIS) and only disclosing them in reports to be made available after the public hearings are over. Apart from the clear bias of such an approach, this seems to be a clear violation of the National Environmental Policy Act (NEPA). Major public concerns stated in our comments for the scoping of this EIS, including public concerns detailed in the Seattle City Council and Portland City Commission Resolutions opposing FFTF restart (and formally entered into the record at scoping hearings) are ignored in the Draft EIS.

It is not acceptable to have left out of the Draft EIS what the Department will do with the nuclear and toxic wastes from restarting FFTF and Plutonium operations at Hanford. It is also unacceptable to have left out of the Draft EIS the costs of restarting the FFTF reactor and each alternative (especially when the Department has target budgets that are not adequate to comply with the Hanford Clean-Up Agreement), the impacts on the nation's nuclear non-proliferation policies from restarting the reactor and use of Plutonium or High Enriched Uranium fuels, and the independent assessment of the need for particular medical isotopes and the suitability of the FFTF reactor to produce them.

For each of these four critical areas, the Department has chosen to issue a report separate from the Draft EIS and not to release that report before the public hearings on the Draft EIS. We must assume that these reports are not flattery to the Department's claims for the FFTF Nuclear Reactor, and that this is a deliberate strategy to avoid disclosures and public comment.

Response to Commentor No 159

- 159-1: DOE notes the commentors' concerns. This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives.
- 159-2: DOE policy encourages effective public participation in its decision making process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.
- 159-3: The content of recent correspondence between NASA and DOE regarding potential plutonium-238 requirements is discussed in response to Comment 159-15.
- 159-4: DOE notes the commentors' concern regarding the suitability of FFTF in light of the NERAC subcommittee recommendations, as discussed in the response to Comment 159-13.
- 159-5: The evaluation presented in the NI PEIS considered both normal operations and accidents and indicates that the environmental and human health impacts of these facilities would be low.
- 159-6: See responses to Comments 159-1 and 159-2.
- 159-7: The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS. DOE made every effort to obtain, analyze, and disclose all required information to make a decision on expanding nuclear infrastructure. The costs and nuclear nonproliferation impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Pursuant to CEQ regulations (40 CFR 15051(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. DOE mailed these documents to approximately 730

**Commentor No. 159: Vera Katz, Mayor, City of Portland
(Cont'd) (C. Hales, J. Francesconi, D. Saltzman E. Sten)**

DATE OF INFO PROVIDED: APRIL 11, 2000 823-4040

PAGE: 02

We are dismayed that the Draft EIS fails to disclose that the Department's own blue ribbon medical advisory committee recommended last April that *"the FFTF not be considered as a viable long-term source of research radioisotopes."* The NERAC Subcommittee for Isotope Research and Production Plannings' findings regarding the suitability of the FFTF reactor for production of research medical isotopes¹, the claims of the contractors regarding FFTF's costs and projected revenues for producing isotopes, and "poor" rating of the manufacturing practices at Hanford are neither disclosed or referenced in the Draft EIS.

"The Subcommittee concludes that the FFTF will not be a viable source of research radioisotopes. Anticipated income from sales likely will not meet expectations thereby curtailing operations and reducing FFTF's capability to produce research radioisotopes in a timely and cost-efficient manner. ...

*"The Subcommittee believes that the production needs of neutron-rich isotopes for research purposes can be met by existing reactors... Other neutron sources may also be available for research isotope production."
Final Report at 31.*

The Draft EIS should have considered the alternatives recommended by the Subcommittee, and fully disclosed its criticism of the claims made by the FFTF's contractors. Instead, the Draft EIS and DOE documents repeat the cost and isotope need claims that the Subcommittee found to be flawed and over optimistic. The public deserved to have this fully disclosed in the Draft EIS instead of having it discovered by researchers from citizen groups.

The concerns of the City of Seattle (Resolution 30060 and Resolution 28344) regarding the import of Plutonium on board ships passing through inland waters (such as Puget Sound or the Columbia River to the Port of Portland), and transport of Plutonium through the crowded Puget Sound region, are entirely ignored in this EIS. A shipboard fire involving a shipment of Weapons Grade Plutonium fuel in inland waters poses horrific consequences. Exposure of our constituents to such risk is entirely unacceptable. Other major concerns raised in the Portland and Seattle resolutions, and by Members of Congress, are similarly ignored in the Draft EIS. The Department undermines all public confidence in its consideration of the restart of FFTF when it proposes such actions and ignores the formal input from elected officials and the region's major cities.

Although the major mission proposed for the FFTF reactor in this EIS is production of Plutonium 238 for NASA space reactors (Radioisotope Thermoelectric Generators), the Draft EIS fails to disclose that NASA informed the USDOE on May 22, 2000 that:

"NASA headquarters no longer has an identifiable planned requirement for Small Radioisotope Thermoelectric Generator (STRG) power systems."

Contrary to the DOE's assertion in the Draft EIS that "(w)ithout these power systems, these types of space exploration missions could not be performed by NASA."², NASA has determined that missions can utilize alternative technologies with lower costs. (And, of course, potentially much lower environmental impacts, which this Draft EIS should have disclosed).

The major claimed need for FFTF restart no longer exists, yet the Department continues to expend funds and undermine its credibility by continuing to propose the restart of the FFTF reactor to meet a need for Plutonium that NASA has informed you does not exist.

As the hearings on the Draft Environmental Impact Statement (EIS) approach, the Department is not providing for adequate notice of the hearings to our constituents, has not changed its plans for conduct

¹ The report notes that there are two major types of medical isotopes: large-scale production quantities ("commercial" isotopes) and small quantity demand isotopes for clinical trials, research, etc... ("research" isotopes). The report urges that the Department focus on providing the research isotopes, and allowing market forces to provide commercial isotopes. Most of the claims for need for FFTF are based on research isotopes. The size of the reactor and its cost to restart, provide ancillary facilities and operate were negative factors in the committee's opinion.

² DEIS at S-5

Response to Commentor No. 159

interested parties on August 24 and September 8, 2000, respectively. Both reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided summaries of the Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment in Appendixes P and Q, respectively, in the Final NI PEIS.

- 159-8: DOE has read and considered the public concerns detailed in the Resolutions of the Seattle City Council and the Portland City Commission. Section 1.4 and the expanded discussion in Appendix N summarize the issues and concerns raised during the scoping process.
- 159-9: Management of wastes that would be generated under implementation of Alternative 1 (Restart FFTF) is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.
- 159-10: The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). Nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted fund designated for Hanford cleanup, regardless of the alternative(s) selected.

159-13

159-14

159-15

159-16

**Commentor No. 159: Vera Katz, Mayor, City of Portland
(Cont'd) (C. Hales, J. Francesconi, D. Saltzman E. Sten)**

of the hearings, which seem designed to repeat concerns over the bias of the process; and, the bureaucracy in charge of the EIS failed to live up to expectations for meaningful discussions regarding the substance of the EIS regarding its coverage of major areas of concern, including the need for medical isotopes, alternative market providers of medical isotopes, safety issues, waste streams from proposed activities, nonproliferation impacts and costs of FFTF restart and production.

The notice for these hearings is woefully inadequate. The published newspaper ad is an example of how to waste funding to claim money was spent on an ad, while seeking to avoid publication of a notice that the public might take notice of. Of primary interest to the citizens of the Northwest is the proposed restart of the FFTF Nuclear Reactor and resumption of Plutonium and other processing operations at Hanford. The notice provided by the Department seems designed to ensure that our constituents would not have notice that this is the topic of the EIS and proposal. Nor did the Department agree to send a meaningful notice to our constituents who are on the normal Hanford issues notice list.

Last year, the conduct of the hearings was itself a major controversy because the Department refused to use a sign in list for determining the order of speakers. Again, the Department appears intent to allow the process to appear biased by allowing the Department's moderator to hand choose the order of speakers. Last year, this resulted in the spokespeople for the region's major public interest groups not being called on to speak until late in the night at hearing after hearing.

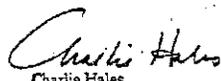

We are also disturbed that the Department told facilities at which hearings are to be held that public interest groups are "opposition" and "protest" groups, and required them to pay for police in order to hold pre-hearing workshops. We must note that the Cities of Seattle and Portland are officially opposed to the restart of FFTF and, therefore, apparently, "opposition" groups that the Department feels pose a security threat if they seek to hold a pre-hearing workshop to assist citizens in preparing to comment at the hearing.

We urge you to have the Department take immediate steps to provide proper notice (designed to notify our constituents that these hearings are on an EIS regarding the possible restart of Hanford's FFTF Nuclear Reactor and Plutonium processing), unbiased procedures for the conduct of the hearings; apologize for any characterization of groups as "opposition" or "protest" and ensure that there is no intimidation of public comment.

The claimed Plutonium and isotope needs, for which our region would be subjected to the risks of FFTF nuclear reactor restart, are now revealed to be illusory claims by the proponents of this dangerous project. The Draft EIS is so deeply flawed by its failure to disclose, and willful withholding of, information that is essential to informed decision making that the bias can only be overcome by removing the restart of the FFTF reactor from consideration.

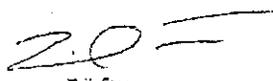

Sincerely,

Vera Katz
Mayor

Charlie Hales
Commissioner

Jim Francesconi

Dan Saltzman

E. Sten

Response to Commentor No. 159

The costs and nuclear nonproliferation impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report and Nuclear Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such ancillary documents need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed these documents to more than 730 interested parties on August 24, 2000 and September 8, 2000, respectively. The reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided the summary of the Cost Report and Nuclear Nonproliferation Impact Assessment in Appendixes P and Q in the Final NI PEIS.

- 159-11: DOE notes the commentors' concern that an independent assessment of the need for particular isotopes and the suitability of FFTF is not included in the NI PEIS. Section 1.2.1 of Volume 1 discusses the need for isotopes based on the Expert Panel and NERAC subcommittee recommendations. As further discussed in the response to Comment 159-13 and presented in Section 1.5 of Volume 1, the recommendations of these independent review groups were taken into consideration in developing the range of reasonable alternatives evaluated in the NI PEIS. NERAC is an independent Federal advisory committee appointed by the Secretary of Energy to advise DOE on civilian nuclear energy research program as noted in Section 1.2 of Volume 1.
- 159-12: The draft Waste Minimization and Management Plan for the Fast Flux Test Facility (May 2000) and the NERAC Isotope Subcommittee report (April 2000) were referenced in the NI PEIS and were available prior to the public hearings. The NI PEIS cost and Nonproliferation reports were made available on August 24 and September 8, 2000, respectively; immediately after they were completed, as discussed in response to Comment 158-7.
- 159-13: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel convened to forecast future demand for medical isotopes

Response to Commentor No. 159

estimated that the expected growth rate of medical isotope use during the next 20 years will range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost-efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production". In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without disturbing the existing missions of these facilities. DOE has taken the Expert Panel and NERAC report recommendations under consideration in developing the range of alternatives evaluated in

***Commentor No. 159: Vera Katz, Mayor, City of Portland
(Cont'd) (C. Hales, J. Francesconi, D. Saltzman E. Sten)***

Response to Commentor No. 159

the NI PEIS. These reports were made available to the public at the NI PEIS public information centers and on the Internet at <http://www.nuclear.gov>.

- 159-14:** The commentors appear to express the concern that DOE would expose constituents in the Seattle area to risks associated with the transport of weapons-grade plutonium. None of the proposed alternatives would involve the shipment of any weapons-grade plutonium to any port in the United States. Alternative 1 does postulate that DOE might decide at some point to import mixed oxide fuel from Europe to fuel FFTF. At this time, however, DOE has not proposed to import this fuel through any specific port. If DOE ultimately decides to import fuel from Europe, it would perform a separate NEPA analysis to select a port. This review would address all relevant potential impacts of overseas and inland water transportation, shipboard fires, package handling, land transportation, as well as safeguards and security associated with the import of SNR-300 mixed oxide fuel through a variety of specific candidate ports on the west and east coasts. It would consider all public comments, including local resolutions, concerning the desirability of bringing mixed oxide fuel into the proposed alternative ports.

In the event that DOE decides to enhance its nuclear infrastructure, it would not expose any population to high, unacceptable risks under any alternative. Any transportation activities that would be conducted by DOE would comply with U.S. Nuclear Regulatory Commission and U.S. Department of Transportation regulations. Associated transatlantic shipment would comply with International Atomic Energy Agency requirements. In Section J.6.2, DOE reviewed the potential maximum impacts from the marine transportation of mixed oxide fuel from Europe to a representative military port, Charleston, South Carolina, and overland transportation to Hanford. Also in that section, a bounding analysis demonstrates that the maximum potential radiological risks to the surrounding public from mixed oxide fuel shipments would be extremely small (e.g., less than 1 chance in a trillion for a latent cancer fatality per shipment from severe accidents at docks and in channels and less than 1 chance in 50 billion for a latent cancer fatality per shipment from overland highway accidents).

(Cont'd) (C. Hales, J. Francesconi, D. Saltzman E. Sten)***

Response to Commentor No. 159

159-15: Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Under the No Action Alternative, DOE would continue to purchase plutonium-238 to meet the space mission needs for the 35-year evaluation period considered in the NI PEIS. However, DOE recognizes that any purchase beyond what is currently available to the United States through the existing contract would likely require negotiation of a new contract and may require additional NEPA review.

The May 22, 2000, correspondence from NASA to DOE identifies that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the SRTG development efforts were stopped in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires one-third less plutonium-238 as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000, letter to DOE that large RTGs be maintained as backup. Section 1.2.2 of Volume 1 was revised to clarify plutonium-238 mission needs. The major mission of FFTF would not be the production of plutonium-238. Rather, all three missions are of equal importance; no one mission is given priority in the NI PEIS.

159-16: DOE provided notice of scheduled public hearings in accordance with the requirements of CEQ and DOE regulations (i.e., 40 CFR Parts 1503.1 and 1506.6 and 10 CFR Part 1021.313, respectively). This included announcement of the hearings in the Federal Register as well as in the

***Commentor No. 159: Vera Katz, Mayor, City of Portland
(Cont'd) (C. Hales, J. Francesconi, D. Saltzman E. Sten)***

Response to Commentor No. 159

local media. In addition, copies of the Draft NI PEIS and/or the Summary (including the public hearing schedule) were sent to each individual or group listed to receive it at the address on record. Additional notification to the public concerning meetings on the Draft PEIS were made by the Oregon Office of Energy to members of 20 focus groups in six Oregon communities and other Oregon interest groups.

- 159-17:** The public hearing format was designed to be fair and unbiased. The public hearing format used was based on stakeholder input and was presented in the Notice of Availability (65 FR 46443 et seq.) for the Draft NI PEIS. This format was intended to encourage public participation, regardless of the motivation for attending the hearing. It provided an opportunity for the participants to meet one another, exchange information, and share concerns with DOE personnel available throughout the course of each hearing to answer questions. The meetings were facilitated by an independent moderator to ensure that all persons wishing to speak had an opportunity to do so. Persons wishing to comment were selected at random from the audiences rather than according to the order in which they registered. This was accomplished by a random number drawing. In addition to the comment recorder stationed at the main hearing, a second recorder was available in an adjacent room to receive comments without the need to await selection at the main proceeding. The hearing format used promoted open and equal representation by all individuals and groups.
- 159-18:** The need for medical isotopes and alternate suppliers are discussed in Section 1.2.1 of Volume 1. Safety and health issues are discussed throughout Chapter 4 of Volume 1 with details given in Appendixes H through J of Volume 2. Waste generation and waste management for each of the alternatives are discussed throughout Chapter 4 of Volume 1. As discussed in the response to Comment Number 158-7, the cost report and nonproliferation report were made available to the public on August 24, 2000 and September 8, 2000, respectively.
- 159-19:** DOE does not engage in or condone the actions alleged in the comment. DOE did not and does not label organizations or individuals. Neither does it interfere with workshops held by an organization, nor exert any influence or authority in the matter of fees for security and law enforcement charged by the owners or managers of facilities in which public meetings are held. Such matters are determined by the rules and

***Commentor No. 159: Vera Katz, Mayor, City of Portland
(Cont'd) (C. Hales, J. Francesconi, D. Saltzman E. Sten)***

Response to Commentor No. 159

regulations adopted by or applied to these facilities, consistent with local laws and municipal requirements. For the record, DOE did not characterize public hearings participants as “opposition” or “protest” groups, and further, did not attempt to recommend or influence any meeting facility fees or security measures applicable to any group or individual.

- 159-20:** The commentors’ concern for proper notice of the public hearing process is addressed in response to Comment 159-16.
- 159-21:** The commentors’ request to establish procedures for unbiased hearings is addressed in response to Comment 159-17
- 159-22:** The issue of opposition groups is addressed in response to Comment 159-19.
- 159-23:** DOE notes the commentors’ views.

Columbia Gorge Audubon Society**

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

ON BEHALF OF COLUMBIA GORGE AUDUBON SOCIETY, WE EMPHATICALLY OPPOSE ANY PROPOSAL TO RE-START THE FFTF AT THE HANFORD FACILITY. REPRESENTING A MEMBERSHIP OF APPROXIMATELY 300 RESIDENTS OF THE MID-COLUMBIA GORGE REGION IN WASHINGTON AND OREGON, THE COLUMBIA GORGE AUDUBON SOCIETY PRIMARILY INSISTS THAT THE D.O.E. FOCUS ALL AVAILABLE RESOURCES ON HAZARDOUS WASTE CLEAN-UP AT HANFORD PRIOR TO ANY NEW ACTIVITIES THERE.

AS A VOLUNTEER FOR HEART OF AMERICA NORTHWEST DURING 1992, I FEEL CONFIDENT THAT THE D.O.E. (AND ITS CONTRACTORS) ARE NOT REMOTELY UPHOLDING THEIR PROMISE TO SUBSTANTIALLY CLEAN UP HANFORD.

REGARDING THE D.O.E. ARGUMENT FOR THE BENEFIT OF CREATING LARGE VOLUMES OF MEDICAL ISOTOPES, WE FEEL THAT A MAJOR MEDICAL HAZARD CONTINUES TO EXIST BECAUSE OF THE HAZARDOUS WASTE CLEAN-UP WHICH HAS NOT BEEN ACCOMPLISHED.

PLEASE SUBSTANTIALLY COMPLETE THE HANFORD CLEAN-UP (VIA VITRIFICATION) OR WHATEVER MEANS DEEMED BEST, BEFORE PURSUING ANY NEW USES AT HANFORD.

I VOTE TO SHUT DOWN FFTF PERMANENTLY. There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

- attending public meetings and giving your comments directly to DOE officials
- returning this comment form to the registration desk at the meeting or to the address below
- calling toll-free and leaving your comments: 1-877-562-4593

7/12/00

Response to Commentor No. 161

161-1

161-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.

161-2

161-2: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

161-3

DOE notes the commentor's and concerns regarding the existing cleanup at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

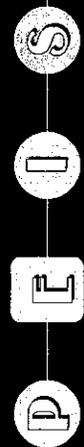

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected. Therefore, restart of FFTF would not impact current cleanup schedules.

161-3: See response to comment 161-1.

Chapter 2—Written Comments and DOE Responses

Commentor No. 163: Catherine Zangar

Draft PEIS Comment Form

I oppose alternative #1 adamantly, I support Alt. #5 - shut down the FFTF.
 - I see that the draft EIS does NOT address impact broadly or thoroughly. The waste stream is discussed vaguely and in elusive terms - 'plan' vs 'preference' & commercial disposal (what specifically) - nor do they address - the trenches are inadequate and illegal. - impacts (negative) to ecosystems including creatures besides humans.
 - impacts besides cancer
 - impacts from accidents, error, sabotage, vandalism, greed/dishonesty, etc.
 (worst case scenarios are possible + catastrophic)
 - your ARROGANCE in asking any citizens at this plant to accept MORE nuclear risk + waste is so offensive.
 - the selfishness of any person/group/agency in requesting to restart the FFTF for any, but especially such non-compelling reasons, is outrageous.
 - CLEAN UP HANFORD, make NO MORE NUCLEAR WASTE, NOR STORE IT THERE. The safe lands are NOT nuclear dumps.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Response to Commentor No. 163

- 163-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.
- 163-2: See response to comment 163-1.
- 163-3: Management of wastes that would be generated under implementation of Alternative 1 (Restart FFTF) is discussed in Section 4.3 of Volume 1 (e.g. see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.
- 163-4: _____
- 163-5: _____
- 163-6: _____
- 163-7: _____

The trenches (i.e., Hanford Site's 200 Area's Low-Level Waste Burial Ground) are regulated by DOE under the Atomic Energy Act of 1954, as amended, and under DOE Order 435.1, Radioactive Waste Management. The 200 Area's Low-Level Burial Ground also contain the following three active permitted mixed waste trenches whereby mixed low-level waste is both stored and disposed of: (1) Trench 31 is a permitted, lined Subtitle C disposal trench that is currently utilized for greater than 90-day storage of mixed low-level radioactive waste; (2) Trench 34 is permitted, lined Subtitle C disposal trench currently utilized for the disposal of mixed low-level radioactive waste that has been treated and is compliant with Land Disposal restrictions; and (3) Trench 94 is a permitted, unlined disposal trench utilized for the disposal of decommissioned naval reactor components. Use of Trench 94 for naval reactor compartments is authorized under a special exemption from the State of Washington Department of Ecology (Ecology). Currently, the Low-Level Burial Ground has a Part A Permit approved by Ecology under the State of Washington Dangerous Waste Regulations, State of Washington

Commentor No. 163: Catherine Zangar (Cont'd)

Response to Commentor No. 163

Administrative Code (WAC) 173-303, and, as such, is an interim status treatment, storage, and disposal (TSD) unit under the Resource Conservation and Recovery Act (RCRA). The permitted active and future mixed waste units of the Low-Level Burial Ground meet all regulatory requirements of WAC 173-303 and RCRA and will be incorporated into the Hanford Site RCRA Facility Part B Permit and will operate under final status regulations. In early June 2000, a working draft of the Hanford Site RCRA Facility Part B Permit application was submitted to Ecology.

- 163-4:** The NI PEIS identifies (in Chapter 3 of Volume 1) endangered species that live on or near all of the candidate sites, as well as aquatic and wetlands areas that may be impacted by operations at candidate locations. According to an International Atomic Energy Agency (IAEA) publication (IAEA Technical Report Series No. 332, Effects of Ionizing Radiation on Plants and Animals at Levels Implied by Current Radiation Protection Standards), a dose rate of 100 millirem per year to the most exposed human will lead to dose rates to plants and animals of less than 0.1 rad per day. The IAEA concluded that a dose rate of 0.1 rad per day or less for animals and 1 rad per day or less for plants would not affect these populations. The largest individual dose for any of the nuclear infrastructures alternatives under normal operations would be less than 0.1 millirem, which is three orders of magnitude less than the IAEA threshold for adverse effects. Therefore, implementation of any of the range of reasonable nuclear infrastructure alternatives would not be expected to result in adverse impacts on plants and animals living in potentially affected areas around the candidate sites.

Appendix H provides information on potential health effects other than fatal cancers. Of the three health impacts from low levels of radiation exposure (non-fatal cancers, hereditary effects, and fatal cancers), fatal cancers have the highest probability of occurrence, roughly 500 excess cancer fatalities per million person-rem. Non-fatal cancers and hereditary effects appear at rates of approximately 20 and 26 per cent of this number. Using a single number for human health impacts provides a simple direct means to compare impacts and risks among the alternatives. Cancer fatalities, being the largest impact, were selected for presentation throughout the NI PEIS.

- 163-5:** The NI PEIS presents the incremental risk associated with each of the alternatives. Sections 4.2-4.6 of Volume 1 provide the results of the

Commentor No. 163: Catherine Zangar (Cont'd)

Response to Commentor No. 163

evaluation of potential health impacts that would be expected from implementation of the alternatives, including normal operations and a spectrum of accidents that included severe accidents. The accident review included internal events, external events, natural phenomena, common-cause events, and sabotage and terrorist activities. The environmental analysis showed that radiological and nonradiological risks associated with each alternative would be small.

163-6: Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs:

1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;

2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and

3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2 of Volume 1 has been revised to clarify the purpose and need of the proposed action.

163-7: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Commentor No. 164: Anonymous

Response to Commentor No. 164

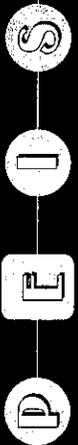

Draft PEIS Comment Form

THE D.O.E SHOULD CONSIDER A WIDER VIEW OF ENERGY SOURCES AND BURY THE DEAD TECHNOLOGIES OF THE PAST. LOOK INTO ALTERNATIVES AND SHOW THE PUBLIC OF INTEREST IN ALTERNATIVES.

164-1

164-1: DOE notes the commentor's interest in alternative energy sources, although issues of research and development of alternative energy sources are beyond the scope of this Nuclear Infrastructure PEIS. The DOE missions to be addressed in this EIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development, can currently only be met using nuclear reactor or accelerator technologies.

Commentor No. 165: Ann McKinney

Draft PEIS Comment Form

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

It is clear we need to rewrite or abolish the atomic energy act of 1954. There have been no new reactor orders in the US since the 1970's. The people of the US do not want nuclear energy. Safety is not as important as the continued use of toxins that stay for generations. Space exploration does not depend on the use of plutonium any longer. How the funds that were used to build FTF to clean up the present unforgivable mess at Hanford.

It is hard to trust the draft without proper documentation of the studies. How much is really disclosed - how much hidden in the name of national security? Why was the cost to the environment (birds, animals, fish) not discussed. How about Goddard - down wind - down river. And department of energy forget about solar energy? Why isn't this developed. I approve of # 5 - Shut it down & clean it up.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

- attending public meetings and giving your comments directly to DOE officials

7/12/00

Response to Commentor No. 165

- 165-1: The commentor's opposition to nuclear energy is noted. DOE, however, is committed to its charge to meet the national needs for isotope production and nuclear energy research, as directed by the U.S. Congress, under the Atomic Energy Act, as amended. The alternatives evaluated in the PEIS address these needs. The PEIS, along with other reports and information, will help DOE reach a decision on its nuclear infrastructure that will not only meet future needs, including nuclear isotopes and energy, but also provide good long-term stewardship of the environment.
- 165-2: Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.
- 165-3: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Commentor No. 165: Ann McKinney (Cont'd)

Response to Commentor No. 165

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

- 165-4:** DOE made every effort to obtain, analyze, and disclose all required information to make a decision on expanding nuclear infrastructure. All references used in preparing the NI PEIS are cited in the reference section of each chapter and appendix. DOE has made these references and other material relevant to review of the NI PEIS available to the public in the designated public reading rooms. No material has been withheld for national security reasons as the facilities under consideration would be operated to support civilian missions only, which will be affirmed in the Record of Decision for this NI PEIS, when issued. Subsequent proposals to operate the selected facilities to support missions other than those selected in the Record of Decision, such as for defense related missions with national security implications, would require the preparation of subsequent NEPA documentation along with the opportunity for public comment in accordance with NEPA.
- 165-5:** The NI PEIS does address impacts to ecological resources for each of the proposed alternatives and options, including the No Action alternative. Specifically, impacts to terrestrial resources, wetlands, aquatic resources, and threatened and endangered species were addressed. Potential impacts to down wind and down river resources are discussed under air quality and water resources sections. The impacts associated with the FFTF Restart Alternative are given in Section 4.3.1.1.3, "Air Quality"; Section 4.3.1.1.4, "Water Resources"; and Section 4.3.1.1.6, "Ecological Resources" of the NI PEIS. Impacts are shown to be small.
- 165-6:** DOE notes the commentor's interest in alternative energy sources, although issues of research and development of alternative energy sources are beyond the scope of this Nuclear Infrastructure PEIS. The DOE missions to be addressed in this EIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development, can currently only be met using nuclear reactor or accelerator technologies.

Commentor No. 165: Ann McKinney (Cont'd)

Response to Commentor No. 165

- 165-7:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF. DOE also notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site.

Commentor No. 166: Kathy Sneider

Response to Commentor No. 166

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

- 166-1:** DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and holding public hearings is an essential and required part of the NEPA process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS DOE carefully considered comments received from the public.
- 166-2:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

7/12/00

Response to Commentor No. 167

167-1

167-2

167-3

167-1

- 167-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 167-2: Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.
- 167-3: The restart of FFTF or any of the other proposed alternative facilities would not have an impact on the cleanup missions at Hanford, INEEL, or ORR. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and appropriate DOE orders.

Commentor No. 168: Jerry Gabay

Response to Commentor No. 168

Draft PEIS Comment Form

It seems to me that 2 years ago you had similar hearings in the NW. It seems to me that the voice of the public was loud at that time, and exquisitely clear: NO MORE PRODUCTION AT HANFORD.

Now you are having hearings on the same subject again. That tells me you either did not hear the public, or you don't care.

Whichever, whether you don't listen or don't care, why not stop the charade, and say you are adding to the economic interests that want a start-up.

You have poisoned our environment for too long. We don't want you - go home and defoul your own backyard.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

168-1

168-2

168-1

168-1: The public meetings referenced by the commentor concerned the October 1997 tentative agreement among the U.S. EPA, Washington State Department of Ecology, and DOE Richland Operations Office DOE-RL) to delete the FFTF's M-81 milestones (for both standby and transition activities) from the Tri-Party Agreement (TPA). This followed the January 1997 decision to place FFTF in standby. This Class I TPA modification was the specific focus of the TPA-required public review and comment period, which ran from November 24, 1997, to February 20, 1998. As a result of comments from the public, the milestones were placed in abeyance (temporary suspension), as opposed to being deleted, until such time as a decision is made by DOE regarding the future of FFTF. In August 1999, DOE-RL, Washington State Department of Ecology, and the U.S. EPA signed Tri-Party Agreement Change No. M-81-98-01 agreeing to the abeyance of FFTF's M-81-00 series milestones. Should the Secretary of Energy decide to return FFTF to operation, the TPA signatories have agreed that the aforementioned milestones will be considered deleted. Should the Secretary of Energy decide to permanently shut down FFTF, the signatories have agreed to either negotiate a new FFTF TPA transition milestone series within 120 days of receipt of DOE-RL's proposed changes or allow reinstatement of the M-81 milestones if the 120-day timeframe is not met. At this time, the extent of any TPA-required public involvement, if at all required, will be determined. It should be noted that the TPA and its associated public involvement process and NEPA, under which this NI PEIS is being prepared, are legally and functionally independent of each other. Specifically, the TPA's public involvement process, as per the TPA's Community Relations Plan, is not required for NEPA reviews and public involvement, including public scoping meetings and Draft NI PEIS public hearings.

168-2: DOE notes the commentor's opposition to any production mission at the Hanford Site.

Section 1.2 of the NI PEIS provides information on the purpose and need for DOE's proposed expansion of the nuclear infrastructure to ensure the availability of isotopes for medical, industrial, and research applications; providing plutonium-238 for NASA, and undertaking research and development activities related to development of nuclear power for civilian use. With respect to plutonium processing, no weapons material will be produced within the stated mission. All missions are for civilian purposes.

Chapter 2—Written Comments and DOE Responses

Commentor No. 169: Concerned ex Tri Citian

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

until April 2000 I lived directly west of Hanford in the farming community by Matthews Corner. I was born in the area and lived there most of my life. I went through Radiation Training at WPPSS (now Energy NIS) and have worked for many years on the Hanford Reach as a Fishery Biologist. I do not belong to any ecoterrorist group or any other organization. However, until you show a very strong need to start the reactor for the benefit of our society it should remain closed. We do not need to start it as a government waste machine to pump more taxpayer money into the Tri-Cities. It needs to contribute for the continued containment of radioactive wastes. We all know that "cleanup" is not reality but we need to continue down that path until we figure out a better way to contain and recycle radioactive material.

Keep FFTF closed until a compelling reason arises!

7/12/00

Response to Commentor No. 169

169-1: DOE notes the commentor's opposition to restarting FFTF for enhancing its existing nuclear facility infrastructure. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs:

1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;

169-1

2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and

169-2

3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action. As discussed in Section 4.3 of Volume 1, implementation of Alternative 1 would have no significant impact on jobs in the Hanford Area.

169-1

169-2: Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Waste management activities are safely conducted in compliance with applicable state and federal requirements and appropriate DOE Orders.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Commentor No. 171: Leon Swenson (Cont'd)

08/28/00

My name is Leon Swenson. I am a resident of Richland Wa, where I have lived since 1975. I am a former worker at the Hanford site, with over 30 years experience in nuclear technology and waste disposal. For the past five years I have worked on the staff of First Presbyterian Church, Kennewick, WA.

I have two basic concerns which I wish to share at this hearing this evening. In 1993 I lost my seven year old grandson to a malignant brain tumor. That was one of the hardest things that I have ever gone through. While various techniques were used to combat his tumor, the technology was not sufficiently advanced to save him. And now, as I work on the staff of our church, I have many occasions to just "be there" for a number of my friends as they are going through various stages of cancer diagnosis, treatment, and in many cases, death. Life is an interesting process, and none of us is going to get out of this alive. But to die of cancer can be a particularly difficult way to spend your last days. And the appropriate use of medical isotopes offers great promise in dealing with the ravages of cancer.

I believe that it is time for the Department of Energy and our government to truly lead, and get out of the mode of merely reacting to various kinds of lobbying and other input. I believe the current NI PEIS process is a good example of where strong leadership is needed. On Page S-4 of the Summary of the NI PEIS, it points out that "in the area of therapeutic medical isotopes, several ... are currently unavailable or are available only in limited quantities." That, ladies and gentleman, seems to me to be the crux of the issue, and should be the focus of the PEIS.

While the other two major concerns of the PEIS are indeed important, the tremendous impact on the health, and on the health care costs of this country, could alone justify going forward with a vigorous program to produce medical isotopes. In the grand scheme of things, national health care is a major concern of our country. And the use of medical isotopes offers a huge potential for impacting that health care. As also noted on Page S-4, "Currently, more than 12 million nuclear medicine procedures are performed each year in the United States, and approximately one-third of all patients admitted to U.S. hospitals undergo at least one medical procedure that employs the use of medical isotopes." Those are staggering figures. And the potential for significantly greater application is enormous.

During my career as a nuclear engineer, I spent nearly 15 years on the design, construction and operation of FFTF. I know the plant, its capabilities, and its potential. I also live just a few miles down the road from FFTF in North Richland. Do I want to see FFTF restarted and used for isotope production? You better believe it. I do not buy the rhetoric that insists that restart of FFTF will cripple the clean-up efforts at the Hanford site.

While I am qualified and could spend considerable time critiquing the technical merits of the PEIS, I have chosen not to do that. I believe the PEIS process is adequately addressing the issues that should be considered in restarting FFTF, or in choosing one of the other alternatives. I personally believe that restart of FFTF makes the most sense both technically and financially. But I am willing to let the process move forward to completion. In the final analysis, however, I believe the Department of Energy should provide strong leadership to assure that an adequate supply of medical isotopes will be

Response to Commentor No. 171

171-1

171-1: DOE notes the commentor's support for greater availability of medical isotopes. For nearly 50 years, DOE's use of its unique technologies and capabilities to develop isotopes for civilian purposes has enabled the widespread application of medical isotopes seen today. Consistent with the mandates under the Atomic Energy Act, DOE seeks to to maintain and enhance its infrastructure to support production of radioisotopes for medical applications and research.

171-2: DOE notes the commentor's support for Alternative 1, Restart FFTF.

171-2

available, both for current needs, and for the emerging needs of this life-saving technology.

Finally, I must note that I take exception to the idea that these hearings are to be treated as an informal plebiscite to determine the future course of action. Hearings of this type lend themselves to being "stacked" by those that have passionate feelings about the spoken and unspoken issues. For the broad mass of our population, that do not even understand the implications of this decision, silence is interpreted as "don't care." I contend that if they really understood the implications of the decisions about to be made, in terms of the impact on the health care of them and their loved ones, the flavor of these hearing would be very different. That is why I feel it is so important for the Department of Energy to lead, not follow, as the country sets priorities for meeting the needs for medical isotope production for the next 35 years.

Thank you.

171-2
(Cont'd)

171-3

Response to Commentor No. 171

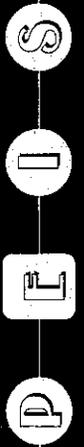

171-3: DOE policy encourages effective public participation in its decision making process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

Just a quick note to add my encouragement to putting FFTF back on line and to a useful purpose. This is the newest and most versatile of reactors, its history for safety is unparalleled. Its potential has been proven time & time again.

I believe it would be a tragedy to finally close this plant. For the past 10 years it has been in limbo - while the potential is untapped and other nations supply the U.S. with valuable radioisotopes that could be produced in FFTF.

We heard many of the economic reasons for not doing medical isotopes and liken them to those that face an entrepreneur on startup company. Take the chance! Produce the isotopes & watch the market grow. It will pay back - maybe the ROI won't be immediate, but it is certain. This is the now & future of medicine and science. Don't lose this national asset - preserve it & put it back

Colette E. Brown, NE-50
U.S Department of Energy
19901 Germantown Road
Germantown, MD 20874

Dear Ms. Brown,

Please support restarting the Fast Flux Test Facility.

And please encourage others to consider the magnitude of the benefit this facility is capable of providing. Cures for cancers and the long reaching benefits of interplanetary exploration are highly complex technologies that every basic citizen does not understand, nor should they be obligated to in order for all of us to benefit from related research. We have advanced technologies because a precious handful of people make their life work about exploring such issues. To turn our backs on the benefits of their accomplishments in a knee-jerk reaction to highly publicized fears is a sad mistake. And to allow the shut down of FFTF would be to abandon our self-reliance in such crucial matters and place them in the hands of others who may not always be our friends and allies. Please restart the Fast Flux Test Facility.

Thank you, in advance, for your effort in this matter.

Sincerely,

Dianna L. Stone

FFTF RESTART SUPPORT

August 24, 2000

COLETTE E. BROWN, NE-50
US DEPARTMENT OF ENERGY
19901 GERMANTOWN RD
GERMANTOWN MD 20874

Dear Ms. Brown:

I appreciate being given the opportunity to comment on the Department of Energy's Draft PEIS concerning the future plans for the nation's nuclear infrastructure, specifically the potential restart of the Fast Flux Test Facility (FFTF) located at the DOE Hanford Site.

The PEIS states, "Of particular need over the longer term are dependable sources of research isotopes and reactor facilities providing high volume flux irradiation for nuclear fuels and materials testing." I agree the nation must move forward in clinical medicine, scientific research, and industrial endeavors, and this already-existing facility has a proven track record in reliable and safe conduct of these operations.

Previous studies have noted inhibited growth in the use of radioisotopes to provide a better life for our citizens. We have drifted towards a reliance on foreign suppliers, which is detrimental to the best interests of our country. First, we place our country in the position of having to rely on a foreign entity, but more important we are funding jobs outside this country. We need to assure we take steps to sustain our loyal workers.

I fully support the intent of the NI PEIS in trying to determine the best answer to filling the gaps in the DOE infrastructure. The decision that the DOE has to make is not an easy one. There are many complex issues that need to be addressed. Choosing an already proven operating facility with a replacement value of almost \$2 billion makes the most sense to me. For the reasons mentioned above, I urge you to consider restart of the FFTF as the best alternative.

Fraternally,

GRB/mh

opeiu #11
afl-cio

Gary R. Barcom
Business Manager

Response to Commentor No. 183

183-1

183-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

183-2

183-2: DOE notes the commentor's view. If DOE decides to expand its nuclear infrastructure this will reduce our reliance on foreign suppliers. However, it is not the intention of the DOE to become the sole supplier of domestic medical isotopes.

183-1

Commentor No. 186: Fred Monette

From: Monette, Frederick A.[SMTP:FMONETTE@ANL.GOV]
 Sent: Thursday, August 24, 2000 10:13:27 AM
 To: INFRASTRUCTURE_PEIS, NUCLEAR
 Subject: Comment on the PEIS; Appendix J
 Auto forwarded by a Rule

To Whom It May Concern:

I thought that Appendix J, "Evaluation of Human Health Effects of Transportation," was extremely well written. Perhaps that is because I wrote most of it. The original source of much of the text in Appendix J was a submittal that I provided in April, 1994 in support of the Final Environmental Impact Statement on a Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel. Although it is flattering that SAIC gets so much use out of the material, it is generally customary to reference or otherwise acknowledge the work of others. Again, I thought that the writing was excellent.

Name: Fred Monette

 Home Address: 229 S. Linden St.
 Westmont, IL 60559
 Phone: 630_271_0988

186-1

Response to Commentor No. 186

186-1: Preparation of the Final Environmental Impact Statement on a Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel (FRR SNF EIS) was directed and funded by DOE. Portions of the FRR SNF EIS, such as general description of the transportation of radioactive materials, descriptions of the codes used and the analytic approach, are directly applicable to this PEIS, and were used with minimal modifications. This is common practice in the preparation of government documents, and causes a significant cost saving to the government. The references cited in Appendix J are to the original source of information, rather than to the source of the language, which was sometimes the FRR SNF EIS. The FRR SNF EIS is frequently referenced in Appendix J.

Commentor No. 187: Donna Smollen Rockwell

DONNA SMOLLEN ROCKWELL

Fax : 509-493-4373

Aug 30 '00 16:46 P.01

AUGUST 28, 2000

TO WHOM IT MAY CONCERN,

MY NAME IS DONNA SMOLLEN ROCKWELL. I LIVE AT 503 N.E. SPRING STREET, WHITE SALMON, WASHINGTON. I AM A RESIDENT, A BUSINESS OWNER AND MOST IMPORTANTLY A MOTHER.

TWO AND ONE HALF YEARS AGO, SOME OF US WERE HERE IN THIS ROOM TO EXPRESS OUR FEELINGS TOWARDS THE RESTART OF THE FFTF. THE MISSION AS EXPLAINED BY THE D.O.E. AT THAT TIME WAS AN URGENCY TO PRODUCE TRITIUM SO THAT OUR NATIONS NUCLEAR ARSENAL WOULD BE KEPT IN TACT. SECONDARY TO THAT WAS THE PRODUCTION OF MEDICAL ISOTOPE.

TODAY YOU COME HERE ONCE AGAIN TO HEAR PUBLIC COMMENT ON THE POSSIBLE RESTART OF THE FFTF. THIS TIME AROUND MEDICAL ISOTOPE ARE IN THE STARRING ROLE AND FUEL FOR POSSIBLE, NOT YET FUNDED NASA MISSIONS IS THE BACK UP REASON.

MEDICAL ISOTOPE ARE CURRENTLY BEING MANUFACTURED IN CANADA AND ARE PURCHASED BY THE UNITED STATES. SO IN EFFECT, THE D.O.E. IS ASKING THE CITIZENS OF OREGON AND WASHINGTON, THE DOWN RIVER PEOPLE, TO INCUR A NEW WASTE STREAM AT HANFORD AND JEOPARDIZE OUR HEALTH, OUR ENVIRONMENT, OUR HOME FOR FUEL FOR SPACE EXPLORATION.

SURELY YOU ARE JOKING.

IT'S OBVIOUS THAT D.O.E. IS DESPARATE TO CREATE A FUNCTION FOR THIS BUILDING THAT DRAWS SUSPICION.

UNTIL THE D.O.E. CAN IDENTIFY AND CLEAN UP THE WASTE AT HANFORD, DON'T EVEN CONSIDER CREATING NEW WASTES. I AM THOROUGHLY OPPOSED TO THE RESART FOR ANY REASON OF THE FFTF.

Response to Commentor No. 187

187-1: DOE notes the commentor's views. DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information.

The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA

187-1

187-2

187-1

187-3

187-4

Commentor No. 187: Donna Smollen Rockwell (Cont'd)

Response to Commentor No. 187

space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Under the No Action Alternative, DOE would continue to purchase plutonium-238 to meet the space mission needs for the 35-year evaluation period considered in the NI PEIS. However, DOE recognizes that any purchase beyond what is currently available to the United States through the existing contract would likely require negotiation of a new contract and may require additional NEPA review. Section 1.2.2 of Volume 1 has been revised to clarify the need for domestic plutonium-238 production to support future NASA space missions.

- 187-2:** DOE notes the commentor's concerns regarding the migration of contaminants to the Columbia River. Ongoing activities to remediate existing contamination at Hanford are of high priority to DOE. The Hanford Site has a comprehensive waste minimization and pollution prevention program in place as summarized in Section 3.4.11.8 of Volume 1 that would govern any proposed site activities.

More specific to the alternatives presented in the NI PEIS, FFTF is located approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to the groundwater. Analyses presented in Chapter 4 of the NI PEIS (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4) indicate that there would be no discernible impacts to groundwater or surface water quality at Hanford from normal operation of the existing Hanford facilities in support of the stated missions. Also, no water quality impacts would be expected as a result of permanent deactivation of FFTF (Section 4.4.1.2.4).

- 187-3:** DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

Commentor No. 187: Donna Smollen Rockwell (Cont'd)

Response to Commentor No. 187

The environmental impacts associated with operation of the FFTF and support facilities at Hanford during normal operations and from postulated accidents are presented and discussed in Section 4.3 of the NI PEIS. All impacts to human health and to ecological resources would be small in the immediate area of the Hanford Site and negligible at all distant locations.

187-4: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Commentor No. 188: C. David Cook

NI PEIS Toll_Free Telephone

8/28/00

C. David Cook
206_725_6886

I am strenuously opposed to any restarting of the FFTF. I think it is a very unwise idea and I don't think it is necessary. I am very concerned about the storage of the waste that we already have at that facility, let alone adding more waste to it.

188-1

188-2

Response to Commentor No. 188

188-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

188-2: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to wastes generated by other Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposal) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

Commentor No. 189: Nancy Jones

NI PEIS Toll_Free Telephone

8/30/00

Nancy Jones
3037 NW Market Street
Apartment 314
Seattle, WA 98107

I am calling to register our position to the restarting of the reactor. It is totally, totally irresponsible. For God's sake, clean up the mess there. We don't need any more nuclear waste to take care of and the medical establishment doesn't need this either, they said so. So, I don't know who you are pandering to, but I hope you won't start it up. Thank you.

189-1

Response to Commentor No. 189

189-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF. The NI PEIS addresses environmental impacts due to the treatment, storage, and disposition (prior to final disposition) of waste generated for all alternatives, including Alternative 1, Restart FFTF. It also addresses cumulative impacts related to waste generation. However, environmental impacts associated with existing waste storage, site contamination, and cleanup programs at candidate sites are not within the scope of the NI PEIS and, therefore, are not addressed.

With regard to the need for medical isotopes, an Expert Panel convened by DOE recently reviewed several industry projections for growth in demand for medical isotopes and concluded that the growth rate will be significant over the next 20 years. Further discussion on the need for medical isotopes is presented in Volume 1, Section 1.2.1 of the NI PEIS.

Commentor No. 190: Jeff Luke

NI PEIS Toll_Free Telephone

8/30/00

Jeff Luke

I am a registered voter in Benton County in Washington State. I am calling to say that I would very much like to see FFTF continue operation. I'd like to see it continue operation either for the production of medical isotopes. I am not adverse to seeing FFTF continue operations for other missions as well, including the production of tritium, should that be necessary in order to preclude the possibility of running out of tritium and being dependent upon an external source for the maintenance of a bare minimum number of weapons. So with that in mind, those are my thoughts. Thanks very much for listening.

190-1

190-2

Response to Commentor No. 190

190-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

190-2: DOE notes the commentor's support for the expanded use of FFTF. Under the proposed action and consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its existing nuclear facility infrastructure to support production of isotopes for medical research, and industrial uses; production of plutonium-238 for use in future NASA space exploration missions; and U.S. nuclear research and development needs for civilian application. However, no component of the proposed action is for the purpose of producing tritium, nor is it for the purpose of supporting any other defense or weapons-related mission.

Commentor No. 191: Tony Mitzle

NI PEIS Toll_Free Telephone

8/30/00

Tony Mitzle

I am in favor of FFTF for medical isotope production. || 191-1

Response to Commentor No. 191

191-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Colette Brown,
 NE_50, USDOE,
 19901 Germantown Rd.,
 Germantown, MD 20874

Dear Colette:

Obviously listening comprehension is not high on the list of skills necessary for employment with USDOE. I don't believe I heard anyone at any meeting in Hood River seriously intimate support for use of FFTF and FMEF for plutonium 238 production. Why are you going on these listening exercises if you cannot hear. Shut it down, clean it up, and forget about producing plutonium the USA does not need.

* Your compilations of prior public comment are grossly incorrect and show your failure to listen to the public. You state that only 320 comments were submitted on Hanford and yet Columbia River United sent in 420 written comments opposing restart not including comments from Seattle, Portland or Richland. You erroneously state that there were "roughly equal numbers" supporting and opposing use of FFTF and FMEF for plutonium 238 production. You also failed to mention the 5 City Council Resolutions opposing FFTF restart which means you have representatives of entire cities opposing it and their numbers should be included. Appendix N_4.

192-1

Response to Commentor No. 192

192-1: While all comments received during the scoping periods for both the Plutonium-238 Production EIS and the NI PEIS are part of the Administrative Record for the NI PEIS, Section 1.4 of Volume 1 and Appendix N are intended to provide a summary of the issues and associated trends identified during the scoping process rather than a tabulation of comments by specific issue. It should be noted, however, that NEPA and CEQ regulations do not require an agency to include and respond to each scoping comment as is required for public comments on a Draft EIS. In preparing the NI PEIS, DOE carefully considered scoping comments received from the public. Any perceived discrepancy in the grouping of comments raising any one particular issue or set of issues is attributable to the manner in which they were originally categorized and counted. For example, a number of statements, letters, or resolutions signed by multiple persons, such as city council resolutions mentioned by the commentor, were received by DOE (both for and against FFTF restart) in response to the request for scoping comments. Each such comment document was considered and counted as a single comment in the NI PEIS comment tracking system.

DOE did not receive 420 written comments opposing FFTF restart from Columbia River United as claimed by the commentor. The number of comments to which the commentor refers to on page N-4 of Section N.1.1 of the Draft NI PEIS is related only to the Plutonium-238 Production EIS scoping meetings which were held in November 1998, not the NI PEIS. The NI PEIS scoping comments are summarized beginning on page N-5. Nevertheless, the Plutonium-238 Production EIS scoping meetings were held in November 1998 in Idaho Falls, Idaho; Oak Ridge, Tennessee; and Richland, Washington. The scoping period was specifically focused on the production of plutonium-238 using one or more DOE research reactors and facilities. DOE received a letter from the Columbia River United. The NI PEIS scoping meetings were held in October 1999 in Oak Ridge, Tennessee; Idaho Falls, Idaho; Seattle, Washington; Portland, Oregon; Hood River, Oregon; Richland, Washington; and Washington, D.C. The scoping period focused on the enhancement of the existing nuclear infrastructure, including production of plutonium-238. DOE received a campaign from the Columbia River United that focused on the shutdown of FFTF, not the production of plutonium-238. This campaign represented about

Commentor No. 192: Dan Melkonian (Cont'd)

* You've failed to demonstrate a compelling need for the production of 1) plutonium for space, 2) medical or research isotopes or 3) nuclear energy research. Neither is there adequate justification for the need to produce all of them at one site. Neither is there justification for the need to produce them domestically (other than reference to some DOE policy) which makes no sense when we would continue to buy foreign nuclear fuel to run FFTF.

192-2

* You must include the recommendations of your own blue ribbon panel (Subcommittee for Isotope Research and Production Planning) that advised against the use of FFTF for medical isotope production. Furthermore, EIS Isotope demand projections are outdated and inadequate. They also fail to take into account possible cancer cures like gene therapy that could make medical isotopes unnecessary. In addition, medical isotopes can be adequately produced at other DOE sites if they are a high priority as implied. Current isotope production levels for DOE reactors are misstated in the EIS at near capacity when most are only at around 50%.

192-3

* You must include the current demand estimates from NASA for Plutonium 238 which are considerably lower than your need projections and could easily be met under the current contract with Russia. A discussion of alternatives to plutonium fuel must be included. A renegotiated contract with Russia (at double the current cost) could meet future NASA needs at 1/3 the cost of FFTF restart.

192-4

* It is improper to release the draft EIS for public comment without the critical information requested by the public in the scoping meetings including:

192-5

* cost analysis of restart and all alternatives with reasonable review time (FFTF will be much more expensive than reasonable alternatives by at least \$2 Billion.)

192-6

* studies on treatment of wastes at all proposed sites and

192-7

* nonproliferation impacts from FFTF and the importation of its necessary radioactive fuel from Europe. (Violation of the Nonproliferation Agreement by use of Highly Enriched Uranium fuel alone is reason enough to stop restart of FFTF!)

192-5**192-8****Response to Commentor No. 192**

250 comments and all were counted. Attached to the campaign was a signed petition.

192-2: DOE notes the commentor's opposition to restarting FFTF for enhancing its existing nuclear facility infrastructure. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

There is no requirement to conduct all of these missions at one site. In the Record of Decision process, DOE could choose to combine components of several alternatives in selecting the most appropriate strategy. For example, DOE could select a low-energy accelerator to produce certain medical, research, and industrial isotopes, and an existing operating reactor to produce plutonium-238 and conduct nuclear research and development. Should FFTF be selected for restart in support of these missions, DOE expects it could utilize a 15-year supply of mixed-oxide fuel that would be available from Germany under favorable economic terms (i.e., no charge for the fuel.)

192-3: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and

Commentor No. 192: Dan Melkonian (Cont'd)

* You have failed to adequately characterize environmental impacts from FFTF restart. An example is the statement, "Environmental impacts associated with the existing inventory of spent fuel at Hanford site are minimal." To imply that the existing spent nuclear fuel inventory poses no problems is massively incorrect. More than 2100 tons of corroding spent fuel sites in aging water-filled basins near the Columbia River posing one of the largest problems for cleanup and an expected cost of more than \$1.6 billion. You must address all impacts on waste management and the environment at Hanford not dismiss them with erroneous statements.

192-9

* You must include the cost of FFTF and all companion facilities decommissioning in the restart not just every other alternative.

192-10

* You have failed to assess all existing contaminant sources at Hanford and all other sites before adding additional waste. You must assess current waste inventories and then assess the addition of any new waste to existing waste sources.

192-11

* You fail to consider use of the Advanced Test Reactor (ATR) in Idaho and the High Flux Isotope Reactor (HFIR) in Oakridge for medical isotopes and acquiring Plutonium 238 from another source. You also fail to analyze lower cost alternatives such as subsidizing university reactors or buying time from private accelerators or reactors.

192-12

* The No Action Alternative must include the shutdown of FFTF not maintaining it on stand-by based on prior commitments of Secretaries O'Leary and Watkins and TPA milestones.

* You failed to address the conflict of interest of using PNNL's evaluations when they are a proponent of restart and stands to gain financially.

192-13

* You failed to include the standby costs of FFTF which are estimated to be \$360 million.

192-14

Response to Commentor No. 192

endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost-efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

DOE does not believe that isotope production levels were misstated in the Draft NI PEIS. Section 1.2.1 of Volume 1 identifies that approximately 50 percent of DOE's isotope production capability is being used.

Commentor No. 192: Dan Melkonian (Cont'd)

* You fail to assess the legality of introducing new programs and wastes into the highly contaminated 306 e or 325 buildings at Hanford that would be used with FFTF.

192-15

* You must admit that the real reasons to restart FFTF are in a hidden agenda that includes preserving jobs and starting new weapons research or other classified missions.

192-16

* The draft EIS must state the preferred alternative for adequate public review.

192-17

USDOE should choose Alternative 5_ SHUT DOWN FFTF, or Alternative 2_ Produce at existing sites with shutdown of FFTF.

192-18

Name: Dan Melkonian
Address: 210 Dogwood Lane
White Salmon, WA 98672

Additional Comments:

Response to Commentor No. 192

192-4: A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the SRTG development efforts were stopped in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

192-5: The costs and nuclear nonproliferation impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Pursuant to CEQ regulations (40 CFR 505.1(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. DOE mailed these documents to approximately 730 interested parties on August 24 and September 8, 2000, respectively. Both reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided summaries of the Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment in Appendixes P and Q, respectively, in the Final NI PEIS.

192-6: DOE notes the commentor's opinion.

192-7: The NI PEIS addressed the environmental impacts due to the treatment storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste

Commentor No. 192: Dan Melkonian (Cont'd)

Response to Commentor No. 192

minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposal) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

- 192-8:** If restarted, the FFTF would be fueled with Hanford MOX fuel for about 6 years. During that time, use of German MOX fuel would be explored, which would fuel the FFTF for an additional 15 years. Also during this initial period, in compliance with nonproliferation policy, the use of low-enriched uranium (LEU) fuel would be analyzed under the Reduced Enrichment Research and Test Reactor (RERTR) program. If this analysis were to establish the infeasibility of using LEU fuel in the FFTF to meet mission needs, only then would HEU fuel be used. Such use of HEU fuel would then have met, under RERTR, nonproliferation and HEU-use policy requirements, and would not violate U.S. nonproliferation agreements. This is discussed in PEIS Volume 1, Section 2.3.1.1.3.
- 192-9:** The discussion in the Summary and Section 4.8.3.5 of Volume 1 on the cumulative impacts for spent nuclear fuel management at Hanford was revised to clarify that the management of the existing spent nuclear fuel at Hanford results in a dose of less than 0.1 millirem per year of the maximally exposed member of the public. This dose is well within the DOE limits given in DOE Order 5400.5. As discussed in that Order, the dose limit from airborne emissions is 10 millirem per year, as required by the Clean Air Act; drinking water is 4 millirem per year, as required by the Safe Drinking Water Act; and the dose limit from all pathways combined is 100 millirem per year. DOE has committed to remove the spent nuclear fuel at Hanford for ultimate disposition in a geologic repository.
- 192-10:** DOE assumes that the commentor is referring to deactivation, not decommission. Decommission costs were not included for any alternative. Deactivation of FFTF is not part of implementing Alternative 1, Restart FFTF. Deactivation of FFTF is part of implementing Alternatives 2, 3, 4, and 5 and including the cost of FFTF deactivation in the implementation costs for these alternatives is appropriate. The Cost Report was structured to identify the

Commentor No. 192: Dan Melkonian (Cont'd)

Response to Commentor No. 192

implementation costs of the various alternatives so the Secretary of Energy would have this information along with other data for consideration.

- 192-11:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The current inventory of wastes managed at the Hanford Site are identified in Section 3.4.11.1 of Volume 1. In addition, the generation rates of wastes associated with the NI PEIS options that use Hanford facilities are compared with the current waste generation rates at the site in Section 4.3 of Volume 1. As stated in Sections 4.3.1.1.13, 4.3.3.1.13, and 4.4.3.1.13, the generation rates of wastes at Hanford associated with the options that utilize either FFTF, FMEF and/or RPL/306-E would be much smaller than the current waste generation rates at the site. These volumes would also be small in comparison to the existing inventory at the site Section 3.4.11.1, Volume 1). These comparisons were also made for the other options which involved INEEL and ORR facilities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram funds designated for Hanford cleanup, regardless of the alternative(s) selected.

- 192-12:** Both ATR and HFIR are currently producing medical isotopes and under the No Action Alternative both would continue to do so. Further, under this alternative DOE would not establish a domestic source of polonium-238 production but could instead continue to purchase it from Russia to meet the needs of future U.S. space missions. Thus, the No Action alternative addresses the commentor's concern.

With regard to the commentor's second concern, DOE did consider the use of irradiation facilities other than those addressed under

Commentor No. 192: Dan Melkonian (Cont'd)

Response to Commentor No. 192

Alternatives 2 through 5. However, their use was dismissed for a variety of reasons as discussed in Volume 1, Section 2.6.1.

The No Action alternative is required under Council on Environmental Quality regulations (40 CFR 1502.14(d)). It provides a point of comparison for the action alternatives. The No Action Alternative generally represents the status quo; that is, it includes those actions that would normally take place without the proposed action. Since the status quo involves maintaining FFTF in standby and not its deactivation, it is not appropriate to include its deactivation as part of the No Action Alternative. Deactivation of FFTF is included as Alternative 5, Permanently Deactivate FFTF, and as part of Alternative 2, Use Only Existing Operational Facilities, Alternative 3, Construct New Accelerator(s), and Alternative 4, Construct New Research Reactor.

- 192-13:** PNNL is not preparing this PEIS, although it has offered technical comments on it. These comments have been evaluated by DOE and the contractor preparing the PEIS. PNNL has also previously provided technical and cost analyses on matters related to the FFTF, which have undergone independent scrutiny, and have helped confirm the need for the environmental review now being independently developed. PNNL's work does not present a conflict of interest. Ultimately, DOE has full control over the contents of the PEIS.
- 192-14:** The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. The costs already incurred by the DOE, e.g., the FFTF Standby Costs, are not a part of the financial evaluation of the funding that is required for future actions. Consequently, they are not included.
- 192-15:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). DOE is fully committed to honoring this agreement.

Commentor No. 192: Dan Melkonian (Cont'd)

Response to Commentor No. 192

DOE-RL, EPA, and Ecology agreed to a change in the Tri-Party Agreement to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on FFTF's future. Public meetings were held on this formal milestone change. The NI PEIS missions would not have an impact on Hanford cleanup activities.

FFTF and any associated facilities remain subject to compliance with environmental laws regardless of its future operational status. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

The 306-E facility is not contaminated and is being proposed as a location to conduct activities that do not involve radioactive materials. While the 325 Building has a large inventory of radionuclides associated with ongoing activities at the facility, the building is not contaminated in worker accessible areas. Operations at the 325 Building are conducted in accordance with applicable federal and state regulations and appropriate DOE Orders.

The 300 Area Revitalization Plan (DOE 1999) provides for continued multi-program R&D operations in the 300 Area, including operation of various laboratories, office facilities, and services. It also provides for consolidation (but not complete elimination) of radiological operations, with support for Hanford Site facility transition and environmental restoration efforts. The plan does not require closure of the 325 and 306-E buildings as long as they are needed for active research projects. Operation of these facilities would not violate any existing agreements between DOE and stakeholders or other legal obligations, nor would it affect ongoing or planned environmental restoration and facility transition activities.

- 192-16:** DOE notes the commentor's concern relating to job creation at the Hanford site. The socioeconomic impacts of restarting FFTF and for all of the other alternatives are presented in Chapter 4 of the NI PEIS. The economic welfare of Hanford and all DOE sites is important to DOE. However, any economic impact is secondary to the proper expenditure of taxpayer dollars.

Commentor No. 192: Dan Melkonian (Cont'd)

Response to Commentor No. 192

As discussed in Section 1.2 of Volume 1, plutonium-238 would be produced to support NASA's deep space missions. Plutonium-238 is not used to produce nuclear weapons. All missions considered in the NI PEIS are for civilian purposes. If changes in policy are required the public will be informed and the appropriate NEPA reviews would be conducted.

- 192-17:** At the time the Draft NI PEIS was completed and published, DOE did not have a preferred alternative. DOE used the environmental evaluation in the Draft NI PEIS, and also other reports on cost and nonproliferation impacts, as well as input from the public to develop its preferred alternative. Council on Environmental Quality regulations (40 CFR 1502.14(e)) do not require the inclusion of a preferred alternative in a draft EIS if one has not been identified at that time. However, the regulations do require identification of a preferred alternative in the final document. DOE has identified a preferred alternative in Section 2.8 of the Final NI PEIS.
- 192-18:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, or Alternative 2, Use Only Existing Operational Facilities.

Commentor No. 193: Kathryn Roberg

From: Kathy Roberg[SMTP:KROBERG@HSCIS.NET]
Sent: Tuesday, August 29, 2000 7:20:59 PM
To: INFRASTRUCTURE_PEIS, NUCLEAR
Subject: FFTF_restart
Auto forwarded by a Rule

I am sending my comments in regards to the proposal of restarting the FFTF (Fast Flux Testing Facility) in Hanford, WA. These are my concerns: Already in this world, we are experiencing a drastic global warming, as evidenced by the draught, lack of vegetation and harvests, horrible forests fires this summer. I am afraid that a restart of the FFTF will send more gases into the Universe, whether in the air, water or soil and add to this horrendous problem we are faced with.

Rivers, watersheds, lakes are becoming highly contaminated, we are loosing fish, foliage and water creatures. Isn't a restart of FFTF another way to add to this contamination that is globally being seen?

DOE promised to shut down FFTF in 1995, and use the resulting additional source of funding for clean_up at Hanford Nuclear Reservation. \$100 million designated for waste clean_up has instead been used to keep FFTF on hot standly. Isn't this a highly dishonest misuse of allocated funds?

Is plutonium really needed for the medical system?

If plutonium is produced, what are the SAFEST MEANS OF TRANSPORTING this material to Hanford? We already have had problems with the transporting of unwanted waste. Do we want a disaster to happen through transportation?

The deadly radioactive waste of Hanford will, if not contained properly and thoroughly, for thousands of years and countless generations, contaminate the Northwestern US and beyond. What are we sending on to our children and their children...a contaminated and hazardous world???

Response to Commentor No. 193

193-1: DOE notes the commentor's concerns on the potential for environmental impacts of FFTF operation. FFTF operation would result in a small impact to the environment and would not contribute to global warming. Section 4.3 of the NI PEIS includes an evaluation of potential environmental impacts due to air emissions and wastewater discharges associated with the proposed operation of FFTF and existing Hanford support facilities. All air emissions and wastewater discharges would be in accordance with applicable permit and regulatory requirements. The release of criteria air pollutants would result in concentrations well below Federal and state air standards (Table 4-13); impacts from emissions of hazardous chemicals would have a negligible effect on human health or the environment (Table 4-19); and there would be no discernible impacts to groundwater or surface water quality (Section 4.3.1.1.4).

193-2: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

DOE-RL, EPA, and Ecology agreed to a change in the Tri-Party Agreement to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on FFTF's future. Public meetings were held on this formal milestone change. The NI PEIS missions would not have an impact on Hanford cleanup activities.

193-1

193-3

193-4

193-2

Commentor No. 193: Kathryn Roberg (Cont'd)

177 massive, underground high_level nuclear waste tanks, some explosive, dozens leaking are the reality at Hanford, WA. The Department of Energy wants to RESTART the dangerous FFTF Nuclear Reactor and add even more waste to these tanks. What are we doing to this world???

DESTRUCTION!!!

Almost every day I am hearing more and more cases of CANCER...My question is could this air, water, food we are taking into our systems, that are in part being contaminated, be the root of this cancer. Are we going to allow it to grow... OUT OF HAND????

Thank you for hearing my concerns. I live in Walla Walla, WA, just about 75 miles south of Hanford, WA and the Hanford Nuclear Reservation.

Kathryn Roberg, a very concerned citizen

**193-2
(Cont'd)**

193-5

Response to Commentor No. 193

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

FFTF can be operated safely to accomplish the stated missions. There have been no serious safety-related accidents or accidental releases of hazardous or radioactive materials causing significant injury or harm to workers, or posing any threat or harm to the offsite public at FFTF during its lifetime. Also, no waste would be added to the underground waste tanks at Hanford from operation of FFTF.

Wastes are treated, stored, and disposed in a safe manner in compliance with state and federal regulations and appropriate DOE Orders.

- 193-3:** The plutonium that would be produced under the proposed action would not be intended for medical applications. Rather, it is intended for use in NASA space exploration missions.
- 193-4:** DOE notes the commentor's concern regarding the safety of nuclear materials transportation. DOE is committed to safety and safeguards for its facilities and the transport of materials. As discussed in Appendix J of the NI PEIS, all transportation activities conducted by DOE (including SST/SGT operations discussed in section J.3.4) would take place in accordance with U.S Nuclear Regulatory Commission (NRC) and U.S. Department of Transportation (DOT) regulations. Transatlantic shipments would also be in accordance with the International Atomic Energy Agency (IAEA) regulations which are consistent with DOT and NRC regulations (see Section J.3.1). Type B shipping casks, which are designed to protect and retain their contents under transport accident conditions, and purpose-built ships, which are specifically designed to safely transport casks containing radioactive materials, would be used to transport most nuclear materials covered in the NI PEIS. Type B shipping casks have been used for thousands of shipments by road, rail, and water and there have been no cases of a major release of radioactive materials (see Section J.3.2.1). As shown

Commentor No. 193: Kathryn Roberg (Cont'd)

Response to Commentor No. 193

in Volume 1, Section 2.7, the transportation impacts would be small for any of the NI PEIS alternatives. Transportation risks are summarized in Section 2.7.1.6 of Volume 1 and are discussed in more detail throughout Chapter 4 and Appendix J.

- 193-5:** The commentor's concern about increasing cancer rates is noted. Chapter 4 of Volume 1 and Appendixes H through J discuss radiological exposures to the public that would be expected to result from implementation of the nuclear infrastructure alternatives. The analysis in Chapter 4 shows that under normal operating conditions and for severe accidents, implementation of the nuclear infrastructure alternatives would pose a low radiological risk to human health; the most likely impacts are no additional cancer fatalities. See, for example, Sections 4.3.1.1.9, 4.3.2.1.9, and 4.3.3.1.9 in Chapter 4 and the Summary Tables in Chapter 2 of Volume 1 of the NI PEIS.

Dear Sirs:

It appears Hanford is a nation unto itself, acting without regard for anyone but itself. My question to you is: what will you do with the nuclear waste at Hanford?

Peter Giese
 PO Box 16303
 Seattle, WA 98116

194-1

Response to Commentor No. 194

194-1: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "- ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

Chapter 3, Affected Environment, addresses waste produced for each alternative evaluated in the NI PEIS. The Hanford Site has a comprehensive waste minimization and pollution prevention program in place as summarized in Volume 1, Section 3.4.11.8, that would control any new site activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Restart of FFTF to meet as many as possible of the needs for medical isotopes, plutonium_238, and general nuclear research seems to be the most reasonable of the alternatives presented, for the following reasons:

- 1) We already have FFTF and are paying maintenance on it. No new irradiation facility would be needed.
- 2) FFTF is the last fast neutron reactor left in the US. We should be doing research on the disposition of TRU from spent fuel in preparation for the inevitable resumption of reprocessing.

I would encourage use of INEEL facilities for target fabrication and processing for the plutonium_238 production.

John E. Tanner, Jr., Idaho Falls, home address pust@srv.net

198-1**198-2****198-1****Response to Commentor No. 198**

- 198-1:** DOE notes the commentor's support for Alternative 1, Restart FFTF, and specifically Option 2, whereby INEEL facilities would be used to fabricate and process plutonium-237 targets for plutonium-238 production.
- 198-2:** Spent nuclear fuel is not reprocessed in the United States. Reiterating President Clinton's September 1993 statement on Nonproliferation and Export Control Policy, "the United States does not encourage the civil use of plutonium and, accordingly, does not itself engage in plutonium reprocessing for either nuclear power or nuclear explosive purposes."

Auto forwarded by a Rule

I am strongly in favor of restarting the FFTF located in the Hanford Reservation near Richland, Washington.

This facility is located in an isolated area some distance from any populated area. It is in an area which pioneered much of the Nuclear work. Adequate staff is available to restart the facility.

Much discussion concerning nuclear activities fails to recognize that this location does not change the fact that other nuclear facilities are here. Also this plant has operated. It can be used for significant benefits to humanity in its present location.

We have been hearing of significant research in nuclear medicine, much of it being done here. My wife, Irene, had heart problems in the recent past. The hospital put her through examination which involved the use of nuclear medicine. We were shocked to find that for her to complete the tests, the only nuclear medicine available came either from Canada or France.

It seems strange that the country which has led in nuclear development must go to other sources to find nuclear medicines. We lead in development and it seems we should be able to utilize this facility to provided these needed medicines.

Commentor No. 208: Richard E. Rust

Richard E. Rust, MD
18747 Ridgely Rd. NW
Shoreline, Wa. 98177

Collette E. Brown
U.S. Department of Energy
NE-50
19901 Germantown road Germantown MD 20874-1290

Dear Collette E. Brown:

Please add my voice to those of the multitude of Washington State Physicians- Washington State Medical Society, Washington Academy of Family Physicians, and Washington Physicians For Social Responsibility- in urging the prompt shut-down of the Hanford Fast Flux Test Facility. The proposed reasons to restart the reactor are all suspect in their true need, and the reasons to proceed with shut-down are cogent to public health and essential to the future safety of our Northwest environment.

While radio-active isotopes are important for their treatment of malignant disease and in testing for disease, there is no need for production of these materials at Hanford. Power for space exploration will continue to be a need in the future, but NASA has stated that production of Plutonium-238 at Hanford is not necessary for their program. The FFTF reactor was designed to produce weapons grade material, and not for research. In the new century, the world depends on reduction of further weapons production. Continuing the capacity for such production is not desirable or necessary, and will be counterproductive to furtherance of a peaceful world.

As one of many, I urge shut-down of the Fast Flux Test Facility as soon as possible. More, I urge expeditious progress on the Hanford cleanup, which has been far too long delayed.

Sincerely,

Richard E. Rust

Response to Commentor No. 208

- 208-1:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 208-2:** DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.
- A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires one-third less plutonium-238 as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000, letter to DOE that large RTGs be maintained as backup. Section 1.2.2 was revised to clarify plutonium-238 mission needs.
- 208-3:** FFTF was built for research as described in Volume 1, Section 2.3.1.1, not for weapons production. FFTF has never been used for weapons production, although it is capable of being used for tritium production and

208-1

208-2

208-3

208-4

Commentor No. 208: Richard E. Rust (Cont'd)

Response to Commentor No. 208

very limited production of plutonium-239. DOE is not considering restart of FFTF with the intent of preserving a weapons production capability. The DOE missions to be addressed in this EIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development, are not national defense missions.

- 208-4:** See response to comment 208-1. DOE notes the commentor's concerns regarding the existing cleanup mission and migration of contaminants to the Columbia River. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Commentor No. 209: Derek D. Jones

August 28, 2000

Attn: Colette E. Brown
U.S. Department of Energy, NE-50
19901 Germantown Road,
Germantown, MD 20874-1290

Ladies and Gentlemen,

Now that we have the draft PIES in hand, there are plenty of facts available to prove what restart supporters have known for years, that FFTF is safest, lowest cost option to produce the isotopes that are needed for future generations.

This year one million people will hear from their doctor that their worst fear is now a reality. They will be told that they have cancer. Many will know that they face surgery, chemotherapy or both. This person could be you, a friend, or a close family member. If you know a cancer survivor you know that there is no cure for cancer. You know that they face several years of treatment and suffering to hopefully be able to go into remission. What most people don't want to admit is that these people now face the very likely possibility that this or another form of cancerous growth will return again later in their life. Often the treatment that was used before will not work the second time around. These people need options. We as a society need those options now. They do not need sympathy. They need a new form of treatment. We do need medical isotopes and we need them now!

Last year over one half million real men, women and children died from cancer. We can't change that statistic, but the eventual restart of FFTF can give our children options that are not available today. We can turn the tide on cancer. We can make a difference. We must put aside antiquated environmental phobias and see the restart of FFTF for what it is, it is hope for the future.

Response to Commentor No. 209

209-1

209-1: DOE notes the commentor's support for Alternative 1, Restart FFTF, and opposition to the No Action Alternative and Alternative 2, Use Only Existing Operational Facilities.

Commentor No. 209: Derek D. Jones (Cont'd)

The no action option^{and Alternative 2 are} is totally unacceptable. The no action option is a death sentence for untold millions of people. I realize that by law the report had to include this option, but it should not be seen as a viable option. While it might be popular to some very vocal environmentalists, it is no less than medical malpractice followed by euthanasia. Cancer means suffering! Some Medical isotope treatments reduce pain and suffering. Some provide life extensions, time for a mother to help finish the rearing of a child. One is even used to help patients with Heart Disease a better chance of surviving bypass surgery.

Let's stop wasting time and money studying cancer, it is time to start truly winning the war against cancer. It is time to start saving lives. It is time to restart the Fast Flux Test Facility!

Thank you,

 Derek D. Jones

COMMENTS OF U.S. CONGRESSMAN EARL BLUMENAUER FAST FLUX TEST FACILITY PUBLIC HEARING Portland, Oregon August 29, 2000

- As a citizen of the Northwest, and an elected official, I think nuclear contamination at Hanford is our most serious threat facing citizens and our environment today.
- Hanford is one of the most polluted sites in the country. Clean-up must be our Number 1, long term priority. Every action we take must be viewed through the prism of protecting citizens and the environment from further contamination.
- Restarting the FFTF reactor would increase contamination by creating **6,000 cubic meters of new radioactive waste**. It would also contaminate new facilities that have never been contaminated.
- DOE states FFTF start-up will facilitate manufacturing of medical isotopes. Yet private markets and other facilities could be explored to meet demand.
- This remains “a reactor in search of a mission.”
- Extending the life of the reactor will only increase costs of eventual decommissioning and extend period of time for clean-up.

210-1

210-2

210-3

210-4

PRINTED ON RECYCLED PAPER

Response to Commentor No. 210

210-1: DOE notes the commentor’s concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM). Congress also funds FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram funds designated for Hanford cleanup, regardless of the alternative(s) selected.

210-2: As identified in Sections 4.3.1.1.13 and 4.3.3.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (i.e., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. High-level radioactive waste would not be generated from merely operating FFTF. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE’s policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

***Commentor No. 210: U.S. Representative Earl Blumenauer
(Cont'd)***

- With regard to Hanford, we should in no way undertake any project that would divert resources or attention away from the overall goal: complete toxic clean-up, and improved public safety and environmental conditions. This proposal to restart FFTF fails to meet those criteria in every way.

210-5

Response to Commentor No. 210

The decision on the use of FMEF will take into account that it is currently not a contaminated facility.

- 210-3:** Although other private manufacturers produce medical isotopes, DOE remains the key provider for a large number of isotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large-enough quantities to make their production financially attractive to private industry. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure to support the production of radioisotopes for medical applications and research. DOE's intent is to fulfill its responsibility to ensure that there is a reliable supply of isotopes in the United States to meet future demand. DOE encourages the commercial sector to privatize the production of medical isotopes in certain instances. DOE does this by turning over production of certain isotopes to commercial entities once DOE has established that commercial production is economically viable. Section 1.2.1 of Volume 1 has been revised to clarify DOE's role and other producers' capabilities in fulfilling U.S. research and commercial isotope needs.

DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of the PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

- 210-4:** Decommissioning FFTF, including associated costs and cleanup, is not within the scope of the NI PEIS. Before decommission activities were undertaken, DOE would prepare the appropriate environmental documentation to address the associated environmental impacts. Cost assessments would also be prepared.

DOE remains committed to cleaning up the Hanford Site independent of ultimate decisions on FFTF. The amounts of wastes associated with

***Commentor No. 210: U.S. Representative Earl Blumenauer
(Cont'd)***

Response to Commentor No. 210

decommissioning FFTF would be small. The schedule for cleaning up these other wastes would not be affected if FFTF were restarted and its lifetime thereby extended.

- 210-5:** The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure mission described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected. Evaluations performed in Chapter 4 of the PEIS demonstrate that restart and operation of FFTF would have a very small impact on public safety or the environment.

Commentor No. 211: Chris Kerchum

Response to Commentor No. 211

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

The Hanford Reach has not been cleaned and leaking tanks full of plumbic radio active wastes. The fees should strongly take into account and not just to FTF

As a Portland area resident I worry that Hanford threatens not only my property value but my life.

FFTF is 20 years old. Decommission the plant. The DOE needs to fulfill an earlier promise to clean up Hanford Reach.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

7/12/00

211-1

211-1: DOE notes the commentor's concerns regarding the existing cleanup mission and migration of contaminants to the Columbia River. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

211-2

No DOE waste tanks are located within the Hanford Reach. The underground waste tanks are located on the 200 Area Plateau of the Hanford Site, several kilometers from the Columbia River.

211-1

211-2: DOE notes the commentor's opposition to Alternative 1, Restart FTF, and support for Alternative 5, Permanently Deactivate FTF.

211-3

211-3: See response to comment 211-2. The FTF reactor was constructed and initiated operation in the mid 1980s, making it DOE's newest reactor. It has no structural flaws that would prevent safe operations. As stated in Volume 1, Section 2.3.1.1.2, several upgrades would be implemented if a decision to restart FTF was made by DOE. These upgrades would improve efficiency and reliability, minimize waste, and conform to current industry standards. Throughout the life of FTF, the FSAR has been maintained via approved change control and engineering change notices. All updates and revisions have had the required reviews and approvals. No deficiencies in the FTF design, analysis, facility condition, or operations have been identified or recognized that would prevent FTF from meeting the safety objectives and intent of commercial nuclear safety regulations for equivalent facilities. If the Record of Decision concludes that FTF should be restarted, a Probabilistic Risk Assessment would be completed and a new FSAR would be prepared in accordance with applicable regulations. With planned plant upgrades, FTF would be able to operate safely for the 35 year time period being considered in the NI PEIS.

211-1

WE the undersigned
want the DOE to
NOT restart the FFF

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

My government has a strong moral obligation to clean up Hanford, and at a pace that is as rapid as possible consistent with safety. Already, much of the project is already behind schedule.

The restart of the FFTF should not be done. It will impede the cleanup, and, in addition, generate additional wastes. Further, the need for radioisotopes is overstated. I work in the biomedical research area at OHSU and am familiar with these needs.

To conclude, Hanford should be cleaned up on time and the FFTF should not be implemented.

7/12/00

212-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected. Therefore, no evaluated alternative would impact the schedule or available funding for existing Hanford cleanup activities.

212-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

212-3: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is very small when compared to wastes generated by other Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposal) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

Chapter 2—Written Comments and DOE Responses

Commentor No. 212: Don Stephens (Cont'd)

Response to Commentor No. 212

212-4: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

Commentor No. 213: Sandra J. Gray

The Department of Energy has issued a Draft Programmatic Environmental Impact Statement for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Mission in the United States, Including the Role of the Fast Flux Test Facility.

My name is Sandra Gray, and I am a resident of Richland, Washington. I claim the right to offer an opinion on the Draft PEIS from several points of view. I have lived in Richland since 1978 and take pride in the quality of life I enjoy in that community. As is true for many of you, cancer and other debilitating diseases that have the potential to be identified and treated with radioactive isotopes have cruelly touched my life. I have completed all requirements except the thesis towards a Masters degree in environmental science, so my position on environmental issues comes from knowledge as well as emotion. From personal, academic and professional perspectives I have concluded that the best option presented in the Draft PEIS is that which would restart the FFTF.

Detractors state that Hanford already has too much waste to clean up, and restarting the FFTF would increase that burden. I say that the FFTF has generated very small amounts of waste during its ten years of operation and contributed no unacceptable discharges to the environment in that time and this clean mode of operation will not change.

Detractors state that Hanford clean-up monies will be diverted from those valid efforts in order to fund the FFTF operation. I say that, by law, the operating funds for the FFTF cannot come from clean-up funds and this argument is not based in fact.

Detractors state that the other options proposed by the Draft PEIS are as effective as the FFTF would be. I say that those options cannot match the range, quality or quantity of isotopes that can be produced by the FFTF. This fact is documented in the PEIS and supporting documentation.

Detractors argue that the medical community has available all the medical isotopes that it needs for the uses currently understood. I say that numerous affidavits contradict that statement. Reputable doctors and scientists have written these affidavits from reputable institutions both in the United States and abroad.

I say that the Fast Flux Test Facility should be restarted and finish out her lifetime in offering life and hope for people who now have only unacceptable options available to them. Detractors say that the cost of restarting the FFTF is too high. I ask them, what is the cost to our society if we don't? My mind is clear; the right option is the restart of the FFTF.

Respectfully submitted by Sandra J. Gray,
Richland, Washington,
August 29, 2000

213-1

213-2

213-3

213-1

213-4

213-1

Response to Commentor No. 213

213-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

213-2: DOE notes the comment regarding waste generation.

213-3: The commentor is correct concerning the difference in funding sources from the different congressional subcommittees. In addition, the U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

213-4: For nearly 50 years, DOE's use of its unique technologies and capabilities to develop isotopes for civilian purposes has enabled the widespread application of medical isotopes seen today. While its market share is a small fraction of total world isotope production, DOE remains the key provider for a large number of isotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large-enough quantities to make their production financially attractive to private industry.

The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's role and other producer's capabilities to fulfill U.S. isotope needs.

Commentor No. 214: Tom Cropper

Draft PEIS Comment Form

I can see a problem. The FFTF will produce a new generation of plutonium production facilities. The current plans will for space exploration programs with perhaps ten or five percent output geared to a supposed production of medical isotopes.

However the facilities will outlast the current plans. What would keep the dangerous plutonium from being used for war or supposed enemies?

How could this dangerous nuclear material be kept out of the hands of blackmarket and other criminals?

The Hanford area is already the site of the largest dump of nuclear wastes in the world. Our people suffer excessive rates of cancers and we have a large cancer hospital in Portland which seems to prove my point.

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Response to Commentor No. 214

214-1

214-1: In the event that a decision is made to restart FFTF, the isotope of plutonium that would be produced is plutonium-238. Plutonium-238 is not used in nuclear weapons because its neutron physics properties are not suitable for this application. The FFTF core will not be designed to produce weapons grade plutonium. All spent nuclear fuel, including the separated non-weapons grade plutonium-238 as well as medical or industrial radioisotopes would be stored, handled, and transported in accordance with safety practices and procedures commensurate with their toxicity and quantities. All nuclear material at DOE facilities, including FFTF, are subject to safeguards and security controls for the specific intent of preventing any diversion of the material.

214-2

214-2: DOE notes the commentor's views. As discussed in Section 3.4.9.3 of Volume 1, the question of whether the population surrounding the Hanford Site is subject to elevated rates of cancer incidence or cancer mortality is unresolved. Existing studies and data suggest that cancer mortality and cancer incidence rates in the Hanford area are not elevated. A National Cancer Institute survey published in the Journal of the American Medical Association in 1991 showed no general increased risk of death for people living near nuclear facilities, including the Hanford Site (Jablon et al. 1991:1403-1408). Cancers are believed to be caused by a combination of hereditary and environmental factors, including radiological and chemical agents. In ongoing clinical testing, therapeutic radioisotopes have proven effective in treating cancers and other illnesses while minimizing adverse side effects, making their use an attractive alternative to traditional chemotherapy and radiation treatments.

Radiological impacts on the Portland area that would result from implementation of the Alternatives described in Section 2.5 of Volume 1 would be smaller than the radiological impacts described in Section 4.3 for the area immediately surrounding the Hanford Site. Radiological risks to the Portland area that would result from implementation of the alternatives would be essentially zero.

Commentor No. 215: Art Lewellan

My work is in TRANSPORTATION & URBAN PLANNING. IN MY FIELD, ENERGY consumption is greater than any other use of energy. Aluminum, oil refining, steel production, coal & other ores, plastic, glass, road & bridge construction, all contribute the greatest demand for energy. THIS SYSTEM OF TRANSPORTATION/DISTRIBUTION IS NOT SUSTAINABLE. IN THE NEAR FUTURE, PETROLEUM SUPPLIES ALONE WILL DWINDLE TO THE POINT WHERE THE SYSTEMS' ENERGY DEMAND WILL ALSO DWINDLE. SHOULD WE NEGLECT TO TAKE STEPS TOWARD AN ENERGY FUTURE THAT IS LESS THAN WE NOW REQUIRE, A DRASTIC "IMPLOSION" OF SHORTAGES WILL DEVASTATE WORLD ECONOMIES & LIVING STANDARDS.

I SHOULD STATE THAT INCREASED NUCLEAR POWER PRODUCTION WILL NOT PROVIDE AN ANSWER; FOR AN INDUSTRIAL TRANSPORTATION SYSTEM THAT HAS A "BUILT-IN" INCREASE OF ENERGY DEMAND. I AM NOT A Luddite, HOWEVER THERE ARE FUNDAMENTAL LIMITS, WE MUST FACE. IF WE MUST CONSERVE, ENERGY, WE MUST CUT OUT WASTE, NOT SEARCH FOR MORE SOURCES.

ART LEWELLAN
3205 SE 85 #9
PORTLAND, OR. 97202

215-1

Response to Commentor No. 215

215-1: DOE notes the commentor's interest in energy conservation, although issues of energy efficiency and supply are beyond the scope of this Nuclear Infrastructure PEIS. The DOE missions to be addressed in this PEIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development, can currently only be met using nuclear reactor or accelerator technologies.

Commentor No. 216: Rose M. Rummel-Eury

Draft PEIS Comment Form

FFTF restart would add more radioactive waste to what's ~~already~~ already here. I talked to my retired nuclear physicist father last night & told him the DOE was considering reopening Hanford. The risks to the public are too great now, he said. He believes this country can't continue making more waste until we perfect the method for getting the old stuff disposed of safely. That takes more energy than it took to create it! When I asked him what we should do for power in the future - he said WIND POWER!

NO on FFTF.

Thanks for listening!

Rose Rummel-Eury

7/12/00

Response to Commentor No. 216

216-1

216-1: Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

216-2

216-2: DOE notes the commentor's interest in wind power, although issues of research and development of alternative energy sources are beyond the scope of this Nuclear Infrastructure PEIS. The DOE missions to be addressed in this EIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development, can currently only be met using nuclear reactor or accelerator technologies.

216-3

216-3: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Commentor No. 217: Anonymous

Response to Commentor No. 217

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

I am completely opposed to the restart of the FFTF facility. I am demanding the permanent shut down of the FFTF reactor. I cannot believe that after years of consistent public opposition that DOE did not reflect the will of the public. I cannot believe that the DOE is trying to fabricate a "compelling need" through medical isotopes and public relations (smoke-screen). I cannot believe the PEIS does not include adequate evaluations of existing contaminant sources at Hanford. I cannot believe that the PEIS doesn't address the potential of waterborne accidents (which are likely) on the earth and public health. I cannot believe the PEIS does not include a shut down (permanent) option. I cannot believe that DOE is trying to waste more public money on this Northwest's most dangerous public safety threat - SHUT DOWN FFTF NOW! ALL MONEY, EFFORTS, STUDIES, ETC. SHOULD BE ORIENTED TOWARDS SHUT-DOWN and CLEAN-UP.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

- attending public meetings and giving your comments directly to DOE officials
- returning this comment form to the registration desk at the meeting or to the address below

217-1
217-2
217-3
217-4
217-5
217-1
217-2

I just add to the proposed alternatives that demand a new PEIS.

- 217-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF. DOE also notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site.
- 217-2:** DOE notes the commentor's position. DOE policy encourages effective public participation in its decisionmaking process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.
- No fundamental factors relating to purpose and need, the alternatives under consideration, or the associated environmental impact evaluations have changed since the Draft NI PEIS was published.
- 217-3:** DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to

Chapter 2—Written Comments and DOE Responses

Commentor No. 217: Anonymous (Cont'd)

Response to Commentor No. 217

clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

- 217-4:** DOE notes the commentor's concerns on NI PEIS evaluations of existing contaminant sources at Hanford. Section 4.8.3 of the NI PEIS, "Cumulative Impacts at Hanford," includes the impacts associated with existing contaminant sources. Specifically, the information presented in the tables of this section in the entry "Existing Site Activities" includes environmental impacts associated with past and present Hanford activities thus reflecting existing contamination impacts at the site.
- 217-5:** Sections 4.2-4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from implementation of the alternatives, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with each alternative would be small.

Commentor No. 218: John Gunn

Response to Commentor No. 218

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

- ① I am opposed to the ^{existing} (FFTF) ^{reactor} at Hanford.
- ② The Department of Energy has not demonstrated a need for the medical isotopes.
- ③ The Department of Energy (DOE) has not demonstrated a need for the Plutonium 238 for NASA.
- ④ The PEIS does not adequately address the additional wastes created by the FFTF in the existing wastes at Hanford.
- ⑤ The PEIS inadequately covers the cost of disposal and decommission.
- ⑥ I support alternative 5.

7/12/00

218-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.

218-2: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost. Section 1.2.2 of Volume 1 was revised to further

Commentor No. 218: John Gunn (Cont'd)

Response to Commentor No. 218

clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

218-3: The current inventory of wastes managed at the Hanford Site are identified in Volume 1, Section 3.4.11.1 of the NI PEIS. In addition, the generation rates of wastes associated with the NI PEIS options that use Hanford facilities are compared with the current waste generation rates at the site in Section 4.3. As stated in Sections 4.3.1.1.13, 4.3.3.1.13, and 4.4.3.1.13, the generation rates of wastes at Hanford associated with the options that utilize either FFTF, FMEF and/or RPL/306-E would be much smaller than the current waste generation rates at the site. These volumes would also be small in comparison to the existing inventory at the site (Section 3.4.11.1). These comparisons were also made for the other options which involved INEEL and ORR facilities.

218-4: The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). DOE mailed this document to approximately 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix Pin the Final NI PEIS.

Decommissioning FFTF, including associated costs and cleanup, is not within the scope of the NI PEIS. Before decommission activities were undertaken, DOE would prepare the appropriate environmental documentation to address the associated environmental impacts. Cost assessments would also be prepared.

218-5: See response to comment 218-1.

Commentor No. 219: Nancy Matela

Response to Commentor No. 219

Draft PEIS Comment Form

I support Alternative 5.
 35 years is only 1 1/2 generations! We need
 to consider "several generations"
 The cleanup funds must not be diverted.
 Accidents will happen!

219-1

219-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

The NI PEIS addresses the impacts from postulated accidents associated with the restart of FFTF in Section 4.3 of Volume 1.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Commentor No. 220: Anonymous

Response to Commentor No. 220

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

I am opposed to the restart of the FFTF for more reasons than I can fit onto this page. I have serious concerns about the process and options presented in the Environmental Impact Statement. We already have the most environmental threat facing the Pacific Northwest at Hanford. We should not only not worsen the situation we are in now in terms of contamination, we need spend all of our time and attention on getting ourselves out of our current mess. The Department of Energy needs to clean up the mess and not come up with new missions for the site. There is not a legitimate reason for ~~the~~ plutonium that is already available on the market. The DOE needs to listen to its opponents & the taxpayers public and CLEAN UP the site NOW. The ADE is engaged for some reason on a mission to worsen our environment & threaten our health. Giving proper notice for hearings and ensuring there is a fair public participation process will certainly lead to a resounding "No" by the public.

220-1

220-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

220-2

220-2: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

220-3

220-2

DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

220-4

Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

Commentor No. 220: Anonymous (Cont'd)

Response to Commentor No. 220

the target fabrication and processing in FMEF and how this waste would be managed at the site.

220-3: DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

220-4: DOE provided notice of scheduled public hearings in accordance with the requirements of CEQ and DOE regulations (i.e., 40 CFR Parts 1503.1 and 1506.6 and 10 CFR Part 1021.313, respectively). This included announcement of the hearings in the Federal Register as well as in the local media. In addition, copies of the Draft NI PEIS and/or the Summary (including the public hearing schedule) were sent to each individual or group listed to receive it at the address on record.

The public hearing format was designed to be fair and unbiased. The public hearing format used was based on stakeholder input and was presented in the Notice of Availability (65 FR 46443 et seq.) for the Draft NI PEIS. This format was intended to encourage public participation, regardless of the motivation for attending the hearing. It provided an opportunity for the participants to meet one another, exchange information, and share concerns with DOE personnel available throughout the course of each hearing to answer questions. The meetings were facilitated by an independent moderator to ensure that all persons wishing to speak had an opportunity to do so. Persons wishing to comment were selected at random from the audiences rather than according to the order in which they registered. This was accomplished by a random number drawing. In addition to the comment recorder stationed at the main hearing, a second recorder was available in an adjacent room to receive comments without the need to await selection at the main proceeding. The hearing format used promoted open and equal representation by all individuals and groups.

Commentor No. 221: Jane Civiletti

Response to Commentor No. 221

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

As stated unanimously by the Portland City Council, I strongly urge Alternative 5 - Permanently deactivating FFTF. We at the Pacific NW have seen to it that a commercial nuclear reactor along the Columbia River has been permanently shut down. We expect the Federal government to do nothing with our tax dollars at Hanford than to attempt a clean-up of the disaster it has created over the past 60 yrs. No new reactors should be built. No old reactors should be restarted. No existing facilities should be converted to new uses. At the hearings our elected officials or their designees have stated unequivocally their opposition to any further production of nuclear materials. They represent us, listen to us.

221-1

221-2

221-1

- 221-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 221-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and Alternative 4, Construct New Research Reactor, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Chapter 2—Written Comments and DOE Responses

Commentor No. 223: Everett Anttila

Everett Anttila
3415 NE 22nd Avenue
Portland, Oregon 97212 – 2432

United States Doe

I'm here to say a definitive No to the starting the fff for any reason including isotopes for medical purposes or for nuclear weapons production be it material for the existing weapons under stewardship.

223-1

Nuclear weapons are and will be the scourge to all life on earth.

*AS A CRIMINAL
LIFE*

The war to end all wars was fought supposedly already in the first w.w. .

The third w.w. with nuclear weaponry will be the end of all wars ,there will nothing to live for, if any remain.

223-2

There is no better time or place to start an end to this nuclear madness than on the Hanford reservation though greedy corporations vehemently are in opposition . Thank you reading this,

Everett Anttila

Response to Commentor No. 223

223-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

223-2: DOE notes the commentor's view on nuclear weapons. The scope of this Nuclear Infrastructure PEIS is limited to analysis of alternatives to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development. The three missions are civilian missions and are not defense-related.

Commentor No. 224: Anonymous

Response to Commentor No. 224

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

Dear Friends,

Clearly, NASA's "apparent" need for U-238 must be weighed against public opposition. NASA has no direct authority over DOE's hearings results. NASA's own hearings are only a part, perhaps a less relevant part, since NASA is not holding hearings here where the public - taxpayers, your funders - is most potentially impacted.

Bottomline: There are sufficient supplies available for this nuclear material.

This misuse of US/Oregonian/Washingtonian dollars is not justified and instead is much better off the left unbudgeted or applied to further research to find safe alternatives to U-238 and other such radioactive material.

Thank you.

224-1

224-1: Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted within the next several years. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost. DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Commentor No. 225: David Amundson

Draft PEIS Comment Form

I support taking option five
~~I support taking the Fast Flux test Facility permanently offline.~~

225-1

~~By doing this it will not add to pile up of nuclear waste at Hanford which is at a nightmare proportion.~~

225-2

* I demand that the Department of Energy disclose all risks associated with FFTF restart and examine all benefits associated with cleaning up and shutting down the reactor for good.

225-3

* Just starting a nuclear plant up to cure cancer is absurd ~~there is no way to fix~~ all the cancer victims that Hanford has caused. To restart it with a mission to heal is a insult. Besides we do not have a shortage of medical isotopes.

225-4

~~Before we explore Plutonium and beyond we have to clean up our environmental messes here~~

225-2

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Response to Commentor No. 225

- 225-1:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 225-2:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

Commentor No. 225: David Amundoon (Cont'd)

Response to Commentor No. 225

225-3: The risks during normal operations and postulated accidents associated with the restart and operation of FFTF are addressed in detail in Section 4.3 of the NI PEIS. Decommissioning of the FFTF, including clean-up efforts, is not within the scope of the NI PEIS, nor is an assessment of any potential benefits that may, or may not, result from shutdown of FFTF. Before decommissioning activities were undertaken, DOE would prepare the appropriate environmental documentation to address the associated environmental impacts.

225-4: DOE notes the commentor's views. However, a National Cancer Institute survey published in the Journal of the American Medical Association in 1991 showed no general increased risk of death for people living near nuclear facilities, including the Hanford Site. Cancers are believed to be caused by a combination of hereditary and environmental factors, including radiological and chemical agents. In ongoing clinical testing, therapeutic radioisotopes have proven effective in treating cancers and other illnesses while minimizing adverse side effects, making their use an attractive alternative to traditional chemotherapy and radiation treatments.

DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

Commentor No. 225: David Amundoon (Cont'd)

Response to Commentor No. 225

Although other manufacturers produce medical radioisotopes, DOE remains the key provider for a large number of radioisotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large-enough quantities to make their production financially attractive to private industry. However, supplies of many research isotopes are not readily available from existing domestic or foreign sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed. Consistent with the mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure to support production of radioisotopes for medical applications and research. DOE's intent is to complement commercial sector capabilities to ensure that a reliable supply of isotopes is available in the U.S. to meet future demand, and to encourage the commercial sector to privatize the production of isotopes that have established applications to a level that would support commercial ventures.

Commentor No. 226: Jack Spadaro

Response to Commentor No. 226

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

The FFF restart ^{alternative} is not appropriate for several reasons;
 ① The ~~alternative~~ ^{alternative} increases transportation needs for radioactive materials;
 ② The cost differential between FFF restart and accelerator usage is less than 5% on the face of it, ~~but~~ ^{an insignificant cost when considering risks of FFF restart;}
 ③ The United States has not nearly maximized its ability to purchase the necessary isotopes abroad, many available from our strongest democratic allies.

I do not believe that ~~on~~ the Dept. of Energy track record in managing the current Hanford operations allows for a responsible restart of the FFF. Nuclear criticality is not the only issue. Nuclear waste production, diversion of Hanford cleanup resources, and dismissal of less harmful alternatives are also issues. The Hanford site has seen numerous management failures over the past 5 decades, from official denial and then admission of management failures demonstrates a continuing inability to responsibly sit and carry out safe missions at the reservation. The Dept. of Energy needs to focus on performing one mission well - cleanup of the Hanford reservation.

Every ~~time~~ you people develop cancer due to residue of nuclear production. Making more PEs residue does not seem like a smart way to cure cancer. Please follow your Tr. Party Agreement obligation to close down the FFF.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

7/12/00

226-1

226-2

226-3

226-4

226-5

226-4

226-6

226-4

226-1: DOE notes the commentor's opposition to Alternative 1, Restart FFF. While there are differences in shipping distances and risks among the alternatives, risks from transportation are small for all the alternatives. Transportation risks are summarized in Section 2.7.1.6 of Volume 1 and are discussed in more detail throughout Chapter 4 and Appendix J.

226-2: The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS. DOE made every effort to obtain, analyze, and disclose all required information to make a decision on expanding nuclear infrastructure. The cost impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make decision documents such as the cost report available to the public before a decision is made. DOE mailed this document to interested parties on August 24, 2000, and was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS.

226-3: The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

With respect to the purchase of plutonium-238 from Russia, the United States has purchased 9 kilograms of plutonium-238 from the Russians since 1992. DOE is now considering re-establishing a domestic production capability of plutonium-238 at a United States facility because it is in our national interest to assure that the United States does not rely in the long term on any foreign government to support the NASA space program. A more detailed explanation of the need for a domestic source of plutonium-238 is found in Chapter 1 of Volume 1 of the Final NI PEIS.

Commentor No. 226: Jack Spadaro (Cont'd)

Response to Commentor No. 226

226-4: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy agreed to a change in the Tri-Party Agreement to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on FFTF's future. Public meetings were held on this formal milestone change. The NI PEIS missions would not have an impact on Hanford cleanup activities.

226-5: DOE notes the commentor's concerns. A range of reasonable alternatives are assessed in the NI PEIS. The development of these alternatives and descriptions of others considered, but dismissed, are presented in Chapter 2 of Volume 1. For each alternative assessed, a wide spectrum of postulated accidents has been evaluated and the management of all wastes generated during operations assessed. The environmental impacts, as given in Chapter 4, are small.

DOE remains committed to the cleanup of the Hanford site. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

226-6: Cancers are believed to be caused by a combination of hereditary and environmental factors, including radiological and chemical agents. In ongoing clinical testing, therapeutic radioisotopes have proven effective in

Commentor No. 226: Jack Spadaro (Cont'd)

Response to Commentor No. 226

treating cancers and other illnesses while minimizing adverse side effects, making their use an attractive alternative to traditional chemotherapy and radiation treatments.

The NI PEIS provides an estimate of waste generation and potential human health impacts associated with each of the alternatives proposed for the production of medical, industrial and research isotopes, production of plutonium-238, and nuclear research and development. Any additional wastes generated in support of these missions would be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws, regulations, and applicable DOE orders. In terms of potential human health impacts, the NI PEIS analysis indicates that the most likely impacts would not result in additional cancer fatalities among the population surrounding the DOE facilities that may be selected for use.

Commentor No. 227: Spring Svart

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

To William D. Magwood, IV and Collette Brown and the Dept. of Energy including the Office of Nuclear Energy

The only responsible action at Hanford Nuclear Reservation is clean-up as quickly and completely as possible. The more than \$15.2 billion (by accepted contractor BNFL, Inc.'s latest estimate) which could begin the clean-up process MUST be paid NOW. Initiate the clean-up process as quickly and completely as possible. "What part of NO don't you understand?"

The only responsible action at Hanford is a start to clean-up the 54 million gallons of radioactive waste already stored there. Bottom Line. Enough!

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

- attending public meetings and giving your comments directly to DOE officials

Response to Commentor No. 227

227-1

227-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Commentor No. 228: Matthew Kenaga

Response to Commentor No. 228

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

- Shut down the FFFTF
- Hanford Cleanup should be a core mission of the DOE
- The Missions of Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the United States are flawed, we don't need them and don't want them. Candu has committed itself to national work and Pu-238 can be made or purchased from existing facilities.

228-1
228-2
228-3

228-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFFTF.

228-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

228-3: The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Chapter 2—Written Comments and DOE Responses

Commentor No. 229: Anonymous

Response to Commentor No. 229

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

First, the D.O.E. needs to completely re-evaluate their (our) missions: do the people (taxpayers) want nuclear powered space missions? do the people want more nuclear medical isotopes or nuclear isotope research? Who is pushing this agenda? It's not me. I completely oppose restarting the FFTF - ~~we~~ we haven't even finished cleaning up the existing mess at Hanford!

My "guess" is that the demand for med. isotopes is directly proportional to the nuclear waste ~~and~~ and cancer-causing emissions from Hanford & other reactors. I don't care how "small" the FFTF would be, I want all nuclear power, fuel & medical isotope production + research out of my backyard and off this earth. Why don't we do the right thing for future generations and stop feeding & subsidizing big pharmaceutical companies (the U.S. government)

229-1

229-1: Cancers are believed to be caused by a combination of hereditary and environmental factors, including radiological and chemical agents. In ongoing clinical testing, therapeutic radioisotopes have proven effective in treating cancers and other illnesses while minimizing adverse side effects, making their use an attractive alternative to traditional chemotherapy and radiation treatments. However, supplies of many research isotopes are not readily available from existing domestic or foreign sources, causing a number of medical research programs to be terminated, deferred, or seriously delayed.

229-2

229-3

229-1

The NI PEIS provides an estimate of waste generation and potential human health impacts associated with each of the alternatives proposed for the production of medical, industrial and research isotopes, production of plutonium-238, and nuclear research and development. Any additional wastes generated in support of these missions would be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws, regulations, and applicable DOE orders. In terms of potential human health impacts, the NI PEIS analysis indicates that the most likely impacts would not result in additional cancer fatalities among the population surrounding the DOE facilities that may be selected for use.

DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility

229-4

Response to Commentor No. 229

infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

229-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

229-3: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

229-4: DOE disagrees with the commentor's characterization of the exchange between an audience member and the DOE PEIS Program Manager, Ms. Colette Brown, which took place during the short, interactive question and answer session immediately following DOE's overview presentation. Specifically, Ms. Brown was responding to one of several cost questions asked by an audience member, as the verbatim transcript from the hearing clearly shows. During this exchange, the audience member interrupted Ms. Brown while replying to the audience member's previous question regarding the cost of FFTF restart compared to building two new accelerators. The audience member then made the statements: "You

Commentor No. 229: Anonymous (Cont'd)

Response to Commentor No. 229

mentioned several different things. I wasn't able to do the math in my head. I apologize." To this, Ms. Brown replied, "There was no math to be done, sir." This was a conciliatory statement on the part of Ms. Brown and was not intended to be terse or demeaning. Instead, it was intended to convey Ms. Brown's understanding that the audience member appeared to be having difficulty with the cost analyses the audience member was questioning. Subsequently, the audience member asked an additional question on decommissioning which was then answered by Ms. Brown. DOE strives to ensure that all proceedings and matters of discourse are conducted in a professional manner.

Commentor No. 230: Lloyd K. Marbet
Don't Waste Oregon Council

Lloyd K. Marbet

19142 SE Bakers Ferry Road - Boring, OR 97009-9158 - Phone: (503) 637-3549, Fax: (503) 637-6130

Testimony of Don't Waste Oregon Council

Representatives of the Department of Energy and members of the Public, my name is Lloyd Marbet and I represent a citizens activist organization known as Don't Waste Oregon Council. I appreciate the opportunity to appear before you today and testify on the "Draft Programmatic Environmental Statement for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Missions In the United States. Including the Role of the Fast Flux Test Facility."

In reading this report it is not surprising that once again we find those directly involved in the nuclear industry telling us that we have to expand our reliance on nuclear power:

"There is an urgent sense that the nation must rapidly restore an adequate investment in basic and applied research in nuclear energy if it is to sustain a viable United States capability in the 21st Century." The chairman of NERAC

It not hard to tell who's urgent sense this really is, but the Department of Energy and this administration needs to know that there is another "urgent sense" out there and it is in the people and communities who have born the brunt of this ongoing experiment with Nuclear Technology.

The proponents of this industry never fail to remind me of the words contained in a song sung by Pete Seeger: "Waste deep in the big muddy and the big fool said push on." We are repeatedly told to "push on," one false promise after another. Compounding this tragedy is that once our government was through committing its acts of treachery on Native Americans, from broken treaties to uranium mines, it turned around and started in on ourselves.

Take the latest headlines: "Hanford will never be clean study says" Aug 8, 2000 Oregonian.

(Read quotes from the paper.)

Now juxtapose this with what we are being told in this draft study:

"It is the policy of this Administration that clean, safe, reliable nuclear power has a role in the future for our national energy security."

We can't clean our waste up but we've got to have "our own supply" of plutonium 238 for space missions because we obviously can't rely on Russian instability to keep us in large enough quantities. Like drug addicts in withdrawal, we are desperately being told that we need our own source of supply and there's nothing better than "home grown," especially if it keeps the failing infrastructure of the nuclear industry going.

But then there's "global warming" the new savior of the nuclear industry. Act two of the ongoing global drama of environmental deterioration, and what do you expect, when the policies of this administration has been to support business as usual. Surprisingly enough that is exactly what we have here "business as usual." And that is exactly what this document is,

Response to Commentor No. 230

230-1

230-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

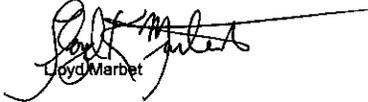

Commentor No. 230: Lloyd Marbet (Cont'd)

"business as usual!" Is there any wonder why we desperately need someone like Ralph Nader to become President?

How much longer do you think we are going to go down the road of the "big muddy" before we confront the fallacy of this Emperor persistently parading in front of us without any clothes. Instead of continuing the myth of dominating this throw away world, doesn't it make more sense to devote our precious resources to finding a way to live in balance on this earth, especially before importing anymore of our waste into outer space? Isn't it time for America to put the cart before the horse and have the decency to clean up the soiled radioactive diapers we have already produced before lulling ourselves into creating yet more national sacrifice zones?

The real urgency before us is the integrity of our ecological and biological life support systems and until we acknowledge this and accept the role we must play in protecting our planet, our government will forever bring these dog and pony shows into our communities asking us to embrace their predetermined goals of sanctioning yet another experiment upon the very fabric of life. Instead, let us take responsibility and wear the mantel of real accountability. This will not be done by starting up the Fast Flux Test Facility for one more round of nuclear experimentation. It will not be done by accepting any thing less than real alternatives, energy or otherwise. **Our only hope is to change the political leadership on our watch and putting stewardship back in our lives.**

Respectfully submitted,

Lloyd Marbet

7/27/00

232-1

232-1: DOE is committed to discharging its responsibilities in an open manner and providing the public with comprehensive environmental reviews of its proposed actions. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the environmental impact analysis of DOE's proposed alternatives for meeting mission requirements. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

7/27/00

233-1: The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

233-1

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

How could the public hearing format and materials be improved? *There seemed to be little or no questioning that the priorities & demands of DOE nuclear project are inappropriate or inconsistent with local & national public opinion.*

Was the public hearing helpful to you? *It was frustrating. I don't believe health & human welfare, the environment & the use of non-polluting safe energy options are receiving adequate consideration. The PEIS is incomplete & inadequate.*

Please continue on the other side if you run out of space. Please return your completed evaluation form to the registration desk or mail or fax to the address below.

234-1

234-1: DOE notes the commentor's views. However, the furtherance of isotope production and nuclear research are consistent with good stewardship of the environment and human welfare. The NI PEIS is a complete evaluation of the environmental impacts of a range of reasonable alternatives for this proposed action. In addition to restarting the FFTF, the NI PEIS also evaluates alternatives that would either employ the use of existing facilities or rely on the construction of new facilities. Section 1.2 of Volume 1 was revised to clarify the purpose and need for the proposed action.

Commentor No. 234: Anonymous (Cont'd)

Although the missions of this project may be justifiable they are not without criticism, they are not justified just because they are justifiable. Nuclear reactors are just not consistent with human & environmental well-being, particularly not in the long-term. Our priorities should be to address existing problems, not to move forward on new ventures that just are not warranted or wanted. Existing reactors in other locations should be used & maximized if that makes sense. I don't understand why any needed materials cannot be gotten from Russia or any other location that provides them without starting new initiatives. How can you expect support when the track record of the DOE & safety & clean-up has been abysmal. The mission here should be on clean-up. It should certainly not be about any commercial objectives.

234-1
(Cont'd)

Response to Commentor No. 234

The United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Consistent with the mandates under the Atomic Energy Act, DOE seeks to fulfill its responsibility to ensure that there is a reliable supply of isotopes in the U.S. to meet future demand. DOE does not subsidize commercial producers. DOE encourages the commercial sector to privatize the production of medical isotopes in certain instances, and does this by turning over production of certain isotopes to commercial entities once DOE has established that commercial production is economically viable. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed action are relatively low and are discussed in detail in Chapter 4 and Appendixes H, I, and J in the Final NI PEIS. The proposed action would not have an impact on the cleanup missions at the candidate sites.

Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Draft PEIS Comment Form

The Fast Flux Test Facility represents over \$1 billion in taxpayer investment that has operated efficiently and according to design. Changing the mission from one of applied research to radioisotope production for medical use is a prudent use of this capital resource. Critics are simply "non-nuclear" without regard to the chest X-rays and microwave ovens that all rely on nuclear science. Do the right thing: re-commission FFTF.

238-1

238-1: DOE notes the commentor's opinion.

238-2: DOE notes the commentor's support for radioisotope production for medical use.

238-3: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

Stop using the planet and
all creation on it as a personal
experiment - No FFER
here or anywhere,

Name Valorie Blaser

Address 1050 W 28

City, state Eugene, Ore Zip 97405

239-1

239-1: DOE notes the commentor's opposition to Alternative 1, Restart FTFE.

Commentor No. 240: Virginia J. Morrison

Draft PEIS Comment Form

Please consider the following in regards to restarting the Fast Flux Test Facility in Southeastern Washington:

- This facility can provide isotopes for many special purposes such as medical research and therapy, as well as deep space probes.
- This facility can produce these isotopes at the least cost and in the shortest time.
- There is still a 20 year lifetime in this facility and it makes no sense to simply destroy such a useful and needed resource.

Virginia J Morrison

240-1

240-1: DOE notes the commentor's support for Alternative 1, Restart FFTF. It should be noted that the FFTF would be operated for 35 years under this proposed action if selected in the Record of Decision.

7/27/00

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

242-1: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The Secretary of Energy will make the final determination on the alternative or combination of alternatives to satisfy the NI PEIS missions. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

242-2: DOE is committed to discharging its responsibilities in an open manner and providing the public with comprehensive environmental reviews of its proposed actions. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the environmental impact analysis of DOE's proposed alternatives for meeting mission requirements. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

242-3: The comment on the credibility of environmental impacts is noted. The environmental impacts associated with operation of the Hanford facilities during normal operations and from postulated accidents are presented in Section 4.3 of the NI PEIS. The assessments were made using well established and accepted analytical methods, as described in Appendixes

Draft PEIS Comment Form

While I do not pretend to understand the complexities of this issue, there are several factors which have gone into my vehement opposition to restart of the FFTF reactor.

- 1- The toxic mess presently at Hanford must be cleaned up!! Your statement that environmental impacts are minimal is absurd.
- 2- Your commitment made years ago to clean up this Hanford mess has not been honored - leakage into the Columbia River is now imminent.
- 3- DOE is not credible - your claim of the need for medical isotopes is not valid and your claim for NASA's needs is distorted.
- 4- DOE is not paying attention to the message of northwest residents - WE DO NOT WANT THIS REACTOR RESTARTED. SHUT IT DOWN ENTIRELY.
- 5- The decision is being made in the wrong place - in Washington DC instead of the Northwest. DOE officials do not have to live w/ the mess that is already there, let alone more.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

- attending public meetings and giving your comments directly to DOE officials
- returning this comment form to the registration desk at the meeting or to the address below
- calling toll-free and leaving your comments: 1-877-562-4593
- faxing your comments toll-free to: 1-877-562-4592

Response to Commentor No. 242

G through L. The analytical methodology is conservative by nature; the actual impacts to the environment would be expected to be less than calculated. All impacts have been shown to be small. No fatalities among workers or the general public would be expected over the full 35 year operational period. The impacts to the biosphere (air, water, and land) are also seen to be small.

242-1

242-3

242-1

242-4

242-5

242-1

- 242-4: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings.

The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's

Commentor No. 242: Patricia Sims (Cont'd)

Response to Commentor No. 242

charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Under the No Action Alternative, DOE would continue to purchase plutonium-238 to meet the space mission needs for the 35-year evaluation period considered in the NI PEIS. However, DOE recognizes that any purchase beyond what is currently available to the United States through the existing contract would likely require negotiation of a new contract and may require additional NEPA review. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

242-5: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 243: Edith D. Iler

to: the Honorable Senators Crapo & Craig,
 The Honorable Representatives Chenoweth & Simpson,
 and Ms. Colette Brown _ Dept. of Energy, Office of Space & Defense Power Systems

RE: My political and environmental opposition to the draft environmental impact statement for accomplishing expanded nuclear energy research and development and isotope production missions in the U.S. including the role of the FFTF facility at Hanford, WA _ none of this in Idaho, please keep it at Hanford!

Please tell the Department of Energy:

- a. Reprocessing is not acceptable and should not be considered at INEEL or any other facility.
- b. Building 666 is a decrepit and highly contaminated building and should be decommissioned in a manner that is protective of human health and the environment.
- c. Plutonium_238 production is unnecessary and its use too risky.
- d. Using ATR at INEEL would interfere with its current mission of producing medical and industrial isotopes.
- e. Extend the comment deadline 30 days

243-1

243-2

243-3

243-4

243-5

Response to Commentor No. 243

243-1: The commentor's position on the roles of Hanford and INEEL is noted.

243-2: DOE would not conduct any reprocessing to produce weapons grade plutonium under any of the alternatives considered under this programmatic environmental impact statement. The alternatives do include processing of target materials used to produce isotopes for medical and industrial uses, plutonium-238 for space missions, and nuclear materials research and development. Sections 4.3.1.1.13; 4.3.2.1.13; 4.3.3.1.13; and 4.4.3.1.13 were revised to clarify the waste management approach for waste resulting from processing of target materials for plutonium-238 production.

Building CPP-666 is divided into two parts, the Fuel Storage Facility and the Fluorinel Dissolution Process Facility (FDPF). The FDPF is under consideration in this PEIS for storage of neptunium-237 oxide, preparation of neptunium-237 targets, and separation of plutonium-238 from irradiated targets. This facility will meet, with further analysis and/or minor modifications, the criteria to safely conduct these operations.

243-3: DOE notes the commentor's opposition to enhancing its existing nuclear facility infrastructure to support production of plutonium-238 for use in future NASA space exploration missions. Section 1.2.2 of Volume 1 was revised to clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed production of plutonium-238 are relatively low and are discussed in detail in Chapter 4 of Volume 1 and appendixes H, I, and J of Volume 2 in the Final NI PEIS. For almost 40 years, radioisotope power systems have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. However, potential health and safety impacts associated with future launches of spacecraft utilizing plutonium 238 are not within the scope of the NI PEIS analysis, but would be addressed in the specific NEPA documentation prepared by NASA in support of such missions.

243-4: As stated in EIS Section 2.3.1.2, ATR would continue to meet its medical and industrial radioisotope production mission for the no action and most other alternatives considered where ATR is not used for the production

Commentor No. 243: Edith D. Iler (Cont'd)

While there is no preferred alternative in this study, which is entitled Draft Programmatic Environmental Impact Statement for Accomplishing Expanded Nuclear Energy Research and Development and Isotope Production Missions in the United States, Including the Role of the Fast Flux Test Facility (FFTF) at Hanford, WA., DOE would prefer to accomplish the aforementioned activities at the Fast Flux Test Facility at Hanford.

243-6

I am strongly opposed to the possibility that this program may end up in Idaho by default.

243-1

Sincerely,
Edith D. Iler
Ketchum, Idaho

Response to Commentor No. 243

of plutonium-238. If ATR were to be used as a production facility for plutonium-238 (options 1, 2, 3, 7, 8, and 9 under Alternative 2), it would support medical and industrial radioisotope production to the extent possible. DOE would try to minimize the impact of the new mission on current medical and industrial radioisotope production.

243-5: DOE notes the commentor's request for extension of the public comment period. The Council on Environmental Quality's (CEQ) "Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act" (40 CFR 1506.10(c)) require that a minimum of 45 days be allowed for public comment on the Draft NI PEIS. As stated in the Notice of Availability (65 FR 46443 et seq.), the public comment period began on July 28, 2000 and continued to September 18, 2000. In preparing the Final PEIS, DOE has assessed and considered both oral and written comments received on the Draft PEIS during the public comment period and has responded to these comments in the Final PEIS. Volume 3 of the NI PEIS contains public comments received on the NI PEIS and DOE responses to those comments. Moreover, late comments were considered to the extent practicable.

243-6: As outlined in 40 CFR Part 1502.14 (e), an agency is not required to specify a preferred alternative or alternatives in the Draft EIS if one does not exist, but must do so in the Final EIS. Accordingly, DOE has identified its preferred alternative in Section 2.8 of Volume 1 that includes a discussion of DOE's reasons for selecting it. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

Dear Ms. Brown,

Starting up the FFTF reactor is sheer lunacy. No kind way of putting that. When my brother was dying of cancer I learned that Oregon has the highest cancer stats on the West coast. I can believe it as I've lost five family members and friends to the disease. My Uncle who died of cancer had actually worked for Hanford in the 50's. Firing up the FFTF reactor, creating cancer victims in order to make isotopes to cure the cancer is a bit like a mad dog chasing its tail (capitalism).

After last night's hearing in Portland, I really don't imagine people in this region are going to stand by while the USDOE and its partner corporations spend billions of tax payer dollars to add to the nuclear waste that hasn't been safely contained or disposed of turning the Columbia watershed into nuclear dumpsite. Please spend our money and your agency's energies on cleaning up Hanford. Nothing else is acceptable.

Sincerely,

Laura Feldman
817 SE 29th
Portland, OR 97214
503_236_8499

Response to Commentor No. 245

245-1: DOE notes the commentor's views and opposition to Alternative 1, Restart FFTF. However, a National Cancer Institute survey published in the Journal of the American Medical Association in 1991 showed no general increased risk of death for people living near nuclear facilities, including the Hanford Site. Cancers are believed to be caused by a combination of hereditary and environmental factors, including radiological and chemical agents. In ongoing clinical testing, therapeutic radioisotopes have proven effective in treating cancers and other illnesses while minimizing adverse side effects, making their use an attractive alternative to traditional chemotherapy and radiation treatments.

245-2: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Response to Commentor No. 245

Wastes generated for the NI PEIS missions will be managed in accordance with applicable Federal and state laws and regulations and appropriate DOE orders.

246-1

246-2

246-3

246-4

Response to Commentor No. 246

246-1: DOE would not conduct any reprocessing to produce weapons grade plutonium under any of the alternatives considered under this PEIS. The alternatives include processing of target materials used to produce isotopes for medical and industrial uses, plutonium-238 for space missions, and nuclear materials research and development. Sections 4.3.1.1.13; 4.3.2.1.13; 4.3.3.1.13; and 4.4.3.1.13 were revised to clarify the waste management approach for waste resulting from processing of target materials for plutonium-238 production.

Building CPP-666 is divided into two parts, the Fuel Storage Facility and the Fluorinel Dissolution Process Facility (FDPF). The FDPF is under consideration in this PEIS for storage of neptunium-237 oxide, preparation of neptunium-237 targets, and separation of plutonium-238 from irradiated targets. This facility will meet, with further analysis and/or minor modifications, the criteria to safely conduct these operations.

246-2: DOE notes the commentor's opposition to enhancing its existing nuclear facility infrastructure to support production of plutonium-238 for use in future NASA space exploration missions. Section 1.2.2 of Volume 1 was revised to clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed production of plutonium-238 are relatively low and are discussed in detail in Chapter 4 of Volume 1 and Appendixes H, I, and J of Volume 2 in the Final NI PEIS. For over 30 years, radioisotope power systems have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. However, potential health and safety impacts associated with future launches of spacecraft utilizing plutonium-238 are not within the scope of the NI PEIS analysis, but would be addressed in the specific NEPA documentation prepared by NASA in support of such missions.

246-3: As stated in EIS Volume 1, Section 2.3.1.2, ATR would continue to meet its medical and industrial radioisotope production mission for the no action and most other alternatives considered where ATR is not used for the production of plutonium-238. If ATR were to be used as a production facility for plutonium-238 (options 1, 2, 3, 7, 8, and 9 under Alternative 2), it would support medical and industrial radioisotope production to the

Commentor No. 246: Chris Francovich (Cont'd)

Response to Commentor No. 246

extent possible. DOE would try to minimize the impact of the new mission on current medical and industrial radioisotope production.

- 246-4:** DOE notes the commentor's request for extension of the public comment period. The Council on Environmental Quality's (CEQ) "Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act" (40 CFR 1506.10(c)) require that a minimum of 45 days be allowed for public comment on the Draft NI PEIS. As stated in the Notice of Availability (65 FR 46443 et seq.), the public comment period began on July 28, 2000 and continued to September 18, 2000. In preparing the Final PEIS, DOE has assessed and considered both oral and written comments received on the Draft PEIS during the public comment period and has responded to these comments in the Final PEIS. Volume 3 of the NI PEIS contains public comments received on the NI PEIS and DOE responses to those comments. Moreover, late comments were considered to the extent practicable.

No Plutonium at INEEL or anywhere. We need to find alternatives to this highly dangerous substance. Our building where the proposed site of production would be is 666. This building is already contaminated and has not been in use for years. The danger of a space shuttle crash releasing pounds of this substance would kill thousands of people, when you consider just one tiny particle is deadly.

Please consider the health of future generations and avoid a terrible catastrophe by stopping all production of plutonium. God is your judge and He is watching you...666.

Sincerely,
 Brenda Goodwin

247-1

247-2

247-3

247-1

Response to Commentor No. 247

247-1: DOE notes the commentor's opposition to enhancing its existing nuclear facility infrastructure to support production of plutonium-238 for use in future NASA space exploration missions. Section 1.2.2 of Volume 1 was revised to clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed production of plutonium-238 are relatively low and are discussed in detail in Chapter 4 of Volume 1 and appendixes H, I, and J of Volume 2 in the Final NI PEIS. For over 30 years, radioisotope power systems have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. However, potential health and safety impacts associated with future launches of spacecraft utilizing plutonium-238 are not within the scope of the NI PEIS analysis, but would be addressed in the specific NEPA documentation prepared by NASA in support of such missions.

247-2: Building CPP-666 is divided into two parts, the Fuel Storage Facility and the Fluorinel Dissolution Process Facility (FDPF). The FDPF is under consideration in this PEIS for storage of neptunium-237 oxide, preparation of neptunium-237 targets, and separation of plutonium-238 from irradiated targets. This facility will meet, with further analysis and/or minor modifications, the criteria to safely conduct these processes.

247-3: DOE notes the commentor's opposition to NASA's use of nuclear materials for space missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. As used by NASA, the plutonium-238 is encapsulated and shielded to minimize any hazards to personnel or to the environment, even in the event of a catastrophic launch accident or inadvertent earth re-entry.

Commentor No. 248: Jeffrey Belt

From: Jeffrey Belt[SMTP:JEFFOU@SPEAKEASY.ORG]

 Subject: Nuclear Infrastructure PEIS comments
 Auto forwarded by a Rule

I strongly favor initiative 5 (permanent shutdown of FFTF and no new facilities) for the following reasons:

1. From an investment perspective, I don't want public funds spent on an unsure and hugely controversial technology.

a. There's no assurance that the benefits (medical isotopes, NASA instrument fuel) outweighs the risk (soil or groundwater contamination, even the unlikely accident). I also find suspicious the almost contradictory statistics and incomprehensible technical details bandied by both the "pro" and "con" sides. Either the technology is not well understood, or there's some hidden agenda around the FFTF restart which muddies the details.

b. The funds may be separate from cleanup funds, but it's still tax money, and it's money that could be spent on cleanup anyway. Spending funds on FFTF restart now is basically saying Hanford will need more cleanup funds later. If you can really clean up to prove it's possible, thereby showing complete control of the entire nuclear cycle, then I would be more favorable to the FFTF or other facilities restarted or being built.

2. The DoE discredited its own PEIS by making verbal statements that things as they stand now are not as they are in the EIS: the cost report is separate, final treatment of wastes is unspecified and probably unknown, and distinctions were made between research vs. commercial isotopes that aren't in the EIS. This should all be part of the EIS. I am looking forward to a second draft.

Thank you for this opportunity to provide feedback. I hope public feedback is of use and not ignored, whichever way the final decision goes.

248-4

248-5

248-6

248-5

248-7

Response to Commentor No. 248

- 248-1:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 248-2:** DOE notes the commentor's opinion. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.
- 248-3:** There is no hidden agenda around the restart of FFTF. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.
- Potential environmental, health, and safety impacts associated with the proposed action are relatively low, and are discussed in detail in Chapter 4 of Volume 1 and associated appendixes in Volume 2 of the Final NI PEIS.
- 248-4:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE).

Commentor No. 248: Jeffrey Belt (Cont'd)

Response to Commentor No. 248

The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

248-5: DOE notes the views expressed but the nature and scope of the statements referenced by the commentor are unclear. The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS.

DOE does make the distinction between research and commercial quantities of isotopes. Although the discussion of purpose and need in the NI PEIS (Section 1.2 of Volume 1) is more focused on the two broad civilian applications for isotopes (medical and industrial), the differentiation between research and commercial isotopes is made within the context of DOE isotope production capacity. Specifically, Section 1.2.1 of the Final NI PEIS has been revised to better make the distinction between the relatively small quantities of individual isotopes used in research and development and those that have proven application and are produced in relatively larger quantities to meet commercial demands.

248-6: DOE notes the commentor's concern regarding waste treatment. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and

Commentor No. 248: Jeffrey Belt (Cont'd)

Response to Commentor No. 248

environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and appropriate DOE orders.

- 248-7:** DOE policy encourages effective public participation in its decision making process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

Please do not allow plutonium reprocessing to start again at INEEL. It is a hazardous material and the means of generating it has been proven to be faulty, resulting in massive clean-ups at Hanford and Savannah River.

252-1

No one wants this level of isotope production, especially those of us in Idaho _ we're trying to get INEEL cleaned up!

It is also not acceptable that this is being pushed through without a longer public comment period _ please extend the deadline by at least another 4 weeks.

252-2

The site that is proposed is Building 666 _ how ironic that number is thought of as being a satanic expression _ take the hint _ don't continue with this proposal. Besides that, the building has already been classified as highly contaminated _ how do you make it fit for people to work there?

252-1

I doubt NASA really needs this isotope _ the government has done little to prove to the people that these dangerous hazards in any form are for the good of mankind. The Bush administration shut down reprocessing in 1992 __ This was done to demonstrate US willingness to staunch the flow of plutonium and to persuade other countries not to engage in this threatening technology. Let's keep it that way. I understand the ATR at INEEL is being used to produce medical and industrial isotopes _ that at least seems credible _ to switch to something that is so hazardous and NASA doesn't really need it, is foolish.

252-3

252-4

Please deny this proposal. Thank you
 Jan Nissl
 1115 E. State, Boise, Id 83712

Response to Commentor No. 252

252-1: DOE would not conduct any reprocessing to produce weapons grade plutonium under any of the alternatives considered under this programmatic environmental impact statement. The alternatives include processing of target materials used to produce isotopes for medical and industrial uses, plutonium-238 for space missions, and nuclear materials research and development. Sections 4.3.1.1.13; 4.3.2.1.13; 4.3.3.1.13; and 4.4.3.1.13 were revised to clarify the waste management approach for waste resulting from processing of target materials for plutonium-238 production.

Building CPP-666 is divided into two parts, the Fuel Storage Facility and the Fluorine Dissolution Process Facility (FDPF). The FDPF is under consideration in this PEIS for storage of neptunium-237 oxide, preparation of neptunium-237 targets, and separation of plutonium-238 from irradiated targets. This facility will meet, with further analysis and/or minor modifications, the criteria to safely conduct these operations.

252-2: DOE notes the commentor's request for extension of the public comment period. The Council on Environmental Quality's (CEQ) "Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act" (40 CFR 1506.10(c)) require that a minimum of 45 days be allowed for public comment on the Draft NI PEIS. As stated in the Notice of Availability (65 FR 46443 et seq.), the public comment period began on July 28, 2000 and continued to September 18, 2000. In preparing the Final PEIS, DOE has assessed and considered both oral and written comments received on the Draft PEIS during the public comment period and has responded to these comments in the Final PEIS. Volume 3 of the NI PEIS contains public comments received on the NI PEIS and DOE responses to those comments. Moreover, late comments were considered to the extent practicable.

252-3: Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the

Commentor No. 252: Jan Nissl (Cont'd)

Response to Commentor No. 252

potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions would be in jeopardy. Section 1.2.2 of Volume 1 was revised to clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed production of plutonium-238 are relatively low and are discussed in detail in Chapter 4 of Volume 1 and appendixes H, I, and J of Volume 2 in the may be lost. For over 30 years, radioisotope power systems have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. However, potential health and safety impacts associated with future launches of spacecraft utilizing plutonium 238 are not within the scope of the NI PEIS analysis, but would be addressed in the specific NEPA documentation prepared by NASA in support of such missions.

Unlike plutonium-239, plutonium-238 is not used in nuclear weapons. The technology that is discussed in the NI PEIS would be used to chemically separate plutonium-238 and neptunium from irradiated targets and not from irradiated or spent nuclear fuel, whereas reprocessing separates weapons grade plutonium-239 from irradiated nuclear fuel. As discussed in the separate nonproliferation impact assessment report, use of this technology to produce plutonium-238 from irradiated targets will not create a nonproliferation threat. DOE is committed to full compliance with and support of the U.S. policy prohibiting reprocessing.

- 252-4:** As stated in PEIS Section 2.3.1.2 of Volume 1, ATR would continue to meet its medical and industrial radioisotope production mission for the no action and most other alternatives considered where ATR is not used for the production of plutonium-238. If ATR were to be used as a production facility for plutonium-238 (options 1, 2, 3, 7, 8, and 9 under Alternative 2), it would support medical and industrial radioisotope production to the extent possible. DOE would try to minimize the impact of the new mission on current medical and industrial radioisotope production. Specific future NASA space missions which will require significant quantities of plutonium-238 are identified in EIS Section 1.2.2. The commentor's opposition to the production of plutonium-238 for NASA is noted.

Commentor No. 253: Parke G. Burgess, Jr.

 Subject: Do Not Restart the FFTF Reactor at Hanford
 Auto forwarded by a Rule

I am writing to urgently oppose the restart of the FFTF reactor at Hanford.

I believe that the materials produced, the manner of their production, and the waste such production entails are too dangerous to undertake. DOE has a long-standing obligation to cleanup Hanford, at which task DOE is woefully behind schedule. Creating more hazards at Hanford, on our roadways, railways and sea lanes is utterly unacceptable.

When are we going to learn that we cannot control these highly toxic substances; that accidents do happen; that we do not have sufficient understanding to take care of wastes that will be lethal for thousands of years to come?

By the way, your safety assurances in the PEIS are laughably optimistic: do you take us for fools?

Parke G. Burgess Jr
 5316 2nd Ave NW

253-1

253-2

253-3

253-2

Response to Commentor No. 253

253-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

253-2: The comments on the production of materials, and on the safety of operations considered under Alternative 1, have been noted. The types of materials produced under Alternative 1, Restart FFTF, are given in Section 1.2 of Volume 1, Purpose and Need for Agency Actions, of the NI PEIS. All of the materials (mainly radioactive isotopes) have been safely managed by DOE in the past. The manner of their production, including target production, processing and irradiation is described briefly in Section 2.3 of Volume 1, Description of Facilities and in more detail in Appendixes A through D. The impacts associated with each of these production activities are presented in Section 4.3. The presentations include the numbers of human health effects to Hanford workers and the general public in the Hanford area, and an assessment of the management of radioactive and hazardous wastes generated during facility operations. The analytical methodology (described in Appendix G through L) is conservative by nature; the actual impacts during normal operations and the risks associated with postulated accidents would be expected to be less than calculated. All impacts are shown to be small.

253-3: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Chapter 4 of the PEIS, Environmental Consequences, evaluates the risk from transportation activities associated with each alternative. Transportation risks were determined to be very low.

Commentor No. 254: Ruthann Saphier

To: INFRASTRUCTURE_PEIS, NUCLEAR
Subject: No Reprocessing at INEEL PLEASE!!!!
Auto forwarded by a Rule

Ms. Colette Brown
DOE, Office of Space and Defense Power Systems

I am a resident of Sun Valley in the great state of Idaho. I am terrified by the news of reprocessing at INEEL. Not only is INEEL over our Snake River Aquifer is also located over a seismic fault line. The question might be WHY with the educated group at DOE does INEEL still exist in its present location. Any more activity there is simply unacceptable and hazardous to our health!

254-1

Reprocessing is not acceptable and should not be considered at INEEL or any other facility .

254-2

Building 666 is a decrepit and highly contaminated building and should be decommissioned in a manner that is protective of human health and the environment .

Plutonium_238 production is unnecessary and its use too risky .

254-3

Using ATR at INEEL would interfere with its current mission of producing medical and industrial isotopes.

254-4

Response to Commentor No. 254

254-1: The commentor's position concerning additional activities at INEEL is noted. Reprocessing spent nuclear fuel is prohibited by DOE policy, and reprocessing would not occur under any of the nuclear infrastructure alternatives described in Section 2.5 of Volume 1. Under Alternatives 1 through 4, the Fluorinel Dissolution Process Facility at INEEL is a candidate facility for processing irradiated neptunium-237 targets to harvest plutonium-238 for use in NASA's deep space missions. Postirradiation processing is described in Section 2.2.2.3.

The Snake River Plain aquifer and the DOE's use of the aquifer are described in Section 3.3.4.2.1 of the NI PEIS. An analysis of water resource impacts that would result from selection of the Fluorinel Dissolution Process Facility as a fabrication/processing facility for production of plutonium-238 is given in Section 4.3.2.1.4 of the NI PEIS. An annual increase of 23,000 liters of process wastewater would result from plutonium-238 target processing. Under normal operations, no radioactive liquid effluent discharges would occur. Selection of the Fluorinel Dissolution Process Facility as a fabrication/processing facility would have no significant effect on the Snake River Plain aquifer. As discussed in Section 4.4.1.1.4, selection of the Advanced Test Reactor for irradiation of plutonium-238 targets would not measurably alter groundwater use or effluent discharge from the reactor.

Capable fault segments of the Lost River Fault and the Lemhi Fault are thought to terminate near the site boundary of INEEL (see Section 3.3.5 of the NI PEIS). However, INEEL is not located over a seismic fault line. Analyses shown in Sections 4.2.3.2.5, 4.3.2.1.5, 4.4.1.1.5, 4.4.2.1.5, 4.5.2.2.5, and 4.6.2.2.5 of the NI PEIS show that earthquakes pose no significant risk to Building CPP-651, the Fluorinel Dissolution Processing Facility, or the Advanced Test Reactor.

254-2: DOE would not conduct any reprocessing to produce weapons grade plutonium under any of the alternatives considered under this programmatic environmental impact statement. The alternatives include processing of target materials used to produce isotopes for medical and industrial uses, plutonium-238 for space missions, and nuclear materials research and development. Sections 4.3.1.1.13; 4.3.2.1.13; 4.3.3.1.13; and 4.4.3.1.13 were revised to clarify the waste management approach for waste resulting from processing of target materials for plutonium-238 production.

Commentor No. 254: Ruthann Saphier (Cont'd)

Please extend the comment deadline 30 days. This is too critical an issue to rush through.

254-5

Could you accomplish the activities at the Fast Flux Test Facility at Hanford? We folks in Idaho do not want to end up with this program.

254-6

Sincerely yours,
Ruthann Saphier
Concerned citizen from the beautiful state of Idaho

Response to Commentor No. 254

Building CPP-666 is divided into two parts, the Fuel Storage Facility and the Fluorine Dissolution Process Facility (FDPF). The FDPF is under consideration in this PEIS for storage of neptunium-237 oxide, preparation of neptunium-237 targets, and separation of plutonium-238 from irradiated targets. This facility will meet, with further analysis and/or minor modifications, the criteria to safely conduct these operations.

254-3: DOE notes the commentor's opposition to enhancing its existing nuclear facility infrastructure to support production of plutonium-238 for use in future NASA space exploration missions. Section 1.2.2 of Volume 1 was revised to clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed production of plutonium-238 are relatively low and are discussed in detail in Chapter 4 of Volume 1 and appendixes H, I, and J of Volume 2 in the Final NI PEIS. For over 30 years, radioisotope power systems have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. However, potential health and safety impacts associated with future launches of spacecraft utilizing plutonium 238 are not within the scope of the NI PEIS analysis, but would be addressed in the specific NEPA documentation prepared by NASA in support of such missions.

254-4: As stated in EIS Volume 1, Section 2.3.1.2, ATR would continue to meet its medical and industrial radioisotope production mission for the no action and most other alternatives considered where ATR is not used for the production of plutonium-238. If ATR were to be used as a production facility for plutonium-238 (options 1, 2, 3, 7, 8, and 9 under Alternative 2), it would support medical and industrial radioisotope production to the extent possible. DOE would try to minimize the impact of the new mission on current medical and industrial radioisotope production.

254-5: DOE notes the commentor's request for extension of the public comment period. The Council on Environmental Quality's (CEQ) "Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act" (40 CFR 1506.10(c)) require that a minimum of 45 days be allowed for public comment on the Draft NI PEIS. As stated in the Notice of Availability (65 FR 46443 et seq.), the public comment period

Commentor No. 254: Ruthann Saphier (Cont'd)

Response to Commentor No. 254

began on July 28, 2000 and continued to September 18, 2000. In preparing the Final PEIS, DOE has assessed and considered both oral and written comments received on the Draft PEIS during the public comment period and has responded to these comments in the Final PEIS. Volume 3 of the NI PEIS contains public comments received on the NI PEIS and DOE responses to those comments. Moreover, late comments were considered to the extent practicable.

254-6: DOE notes the commentor's support for Alternative 1, Restart FTFE, and opposition to using any facilities in Idaho for the DOE missions covered in the NI PEIS.

Commentor No. 255: Charles E. Weems

From: Charles/Sally Weems[SMTP:FLOATING@SEANET.COM]
 Sent: Thursday, August 31, 2000 1:21:53 PM
 To: INFRASTRUCTURE_PEIS, NUCLEAR
 Auto forwarded by a Rule

Dear Ms. Colette Brown:

I wish these comments to be placed in the record as I was unable to give them at either the forum or to a Court reporter during the hearings in Seattle on August 30th.

I was disappointed in the hearings for the following reasons. (1) Your PEIS had failed to make available to us answers to several key questions that should have been addressed prior to the meetings. A partial completion of this job with a mailing on the Friday before a Wednesday meeting only increases the public's perception that the DOE is trying to withhold information and obfuscate the issues. (2) My disappointment with the entire tone of the meeting cannot be laid at your feet, but I greatly fault the confrontational style of the letter read into the record from our Senator Gorton and I will let him know of this. This tone was continued by many speakers, however, and restricted any meaningful debate. (3) The packing of the audience by members of the Hanford employees makes it important that in the future the speakers should state their affiliations or at least their name and home address. How it occurred that the majority of them got chosen to read their prepared statements suggests a large number of tickets were picked up by that group and the holding of more than one number led to their preponderance in those allowed to speak.

255-1

Response to Commentor No. 255

255-1: DOE notes the commentor's concerns regarding the timing of the issuance of the Cost Report and the tone and format of the Seattle public hearing. DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and to providing ample opportunity for public comment on those actions. The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS.

The public hearing format was designed to be fair and unbiased. The public hearing format used was based on stakeholder input and was presented in the Notice of Availability (65 FR 46443 et seq.) for the Draft NI PEIS. This format was intended to encourage public participation, regardless of the motivation for attending the hearing. It provided an opportunity for the participants to meet one another, exchange information, and share concerns with DOE personnel available throughout the course of each hearing to answer questions. The meetings were facilitated by an independent moderator to ensure that all persons wishing to speak had an opportunity to do so. Persons wishing to comment were selected at random from the audiences rather than according to the order in which they registered. This was accomplished by a random number drawing. In addition to the comment recorder stationed at the main hearing, a second recorder was available in an adjacent room to receive comments without the need to await selection at the main proceeding. The hearing format used promoted open and equal representation by all individuals and groups.

255-2: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the

Commentor No. 255: Charles E. Weems (Cont'd)

I was glad to hear in your prepared address some explanation of alternatives. Your PEIS and your talk did not display any real sign of impartiality however. These alternatives need to be thoughtfully considered before a decision is made. Despite the emotional rhetoric and obvious confusion about research versus commercial production of medical isotopes, this reason for the FFTF is neither needed nor will be cost effective. Several groups including the American Institute of Medicine and your own group do not feel that it will be effective or needed. The DOE loses credibility in using this very emotional item to push their goals. Research of medical isotopes is by your own admission not the goal. It is for many of the known and stated reasons also unfeasible at that facility or could be done equally well elsewhere. I admire the pride in their role that the Hanford contingent takes but it does not detract from a reasoned analysis of the FFTF need.

255-2

An equally troublesome aspect is the commercial production proposed, this is not the role of government and should not be used as an excuse to restart. The cure of cancer is not with isotopes, any more than it is with current conventional therapy. In sum the medical isotope use of FFTF is unneeded... Plutonium_238 has been discussed so far in a curious way. Statements have been made that it probably won't come through Puget Sound but continue to come into Charlestown South Carolina. So to get to Hanford it would cross the entire US. This does not compute. Is there an alternative source for this item for NASA? By both your admission and their statement there is. I would further add that to state that Plutonium_238 because it is not used for bombs is therefore "safe" is neither true an excuse to restart FFTF. Nuclear Energy research as an alternative to the current "dirty" carbon dioxide emitting sources is another reason stated for reopening the FFTF. With all the solid information currently in on the cost effectiveness of nuclear plants, the current and projected needs, and the other technologies emerging this reason is clearly used to fill a projected hope rather than a real need.

255-3

255-2

Response to Commentor No. 255

next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

DOE's production and sale of radioisotopes fall into two categories "commercial" and "research" and both types of isotope production are considered under the proposed actions. Commercial radioisotopes are those that are produced in large, bulk quantities and sold to pharmaceutical companies or distributors, or to equipment or sealed source manufacturers. Examples of commercial radioisotopes produced by DOE include strontium-82 and germanium-68 for medical applications, and iridium-192 and californium-252 for industrial applications. DOE only produces commercial isotopes when there is no U.S. private sector capability or when foreign sources do not have the capacity to meet U.S. needs reliably. In contrast, research radioisotopes are typically produced and sold in small quantities in response to specialty orders from researchers preparing experiments in the field of medicine, with small quantities of these radioisotopes also purchased by industrial researchers. Because small-quantity production of research isotopes is not financially attractive to private-sector producers and is generally not undertaken, DOE attempts to provide all research radioisotopes that are requested, subject to production capability, inventory, and financial constraints. As successful application of a specific research isotope is established, the production and sales of that radioisotope may shift from research to commercial status. In recent years, over 95 percent of DOE's sales of radioisotopes by dollar volume were commercial and 5 percent have been for research.

The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the

Commentor No. 255: Charles E. Weems (Cont'd)

Much has been said about low risk. We have been told that transportation is without risk, storage of waste (even without a known final destination) is without risk, we are given levels of radioactive elements above that found naturally occurring that are said to be without risk. A risk must be evaluated in relation to its statistical likelihood but also in relation to its severity. The risks of continuing with an unnecessary FFTF are catastrophic, the calculated risk ratios do not justify it. The only reasonable decision should be the alternative of using only existing facilities and permanently deactivating FFTF.

Charles E. Weems, M.D.
933 No.Northlake Way #9
Seattle, WA 98103_8874
floating@seanet.com

255-4

255-5

Response to Commentor No. 255

suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost. Potential health and safety impacts associated with the proposed production of plutonium-238 are relatively low and are discussed in detail in Chapter 4 of Volume 1 and Appendixes H, I, and J of Volume 2 in the Final NI PEIS.

Commentor No. 255: Charles E. Weems (Cont'd)

Response to Commentor No. 255

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

In January 1997, President Clinton tasked his Committee of Advisors on Science and Technology (PCAST) to evaluate the current national energy research and development portfolio and to provide a strategy that ensures the United States has a program to address the Nation's energy and environmental needs for the next century. In its November 1997 report responding to this request, the PCAST Energy Research and Development Panel determined that restoring a viable nuclear energy option to help meet our future energy needs is important and that a properly focused research and development effort to address the potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) was appropriate. The PCAST panel further recommended that DOE reinvigorate its nuclear energy research and development activities to address these potential barriers. Section 1.2.3 provides information on the nuclear energy research and development mission.

255-3: Alternative 1 does postulate that DOE might decide at some point to import mixed oxide fuel from Europe to fuel FFTF. At this time, however, DOE has not proposed to import this fuel through any specific port. If DOE ultimately decides to import fuel from Europe, it would perform a separate NEPA analysis to select a port. This review would address all relevant potential impacts of overseas and inland water transportation, shipboard fires, package handling, land transportation, as well as safeguards and security associated with the import of SNR-300 mixed oxide fuel through a variety of specific candidate ports on the east and west coasts. It would consider all public comments, including local resolutions, concerning the desirability of bringing mixed oxide fuel into the proposed alternative ports.

In the event that DOE decides to enhance its nuclear infrastructure, it would not expose any population to high, unacceptable risks under any alternative. Any transportation activities that would be conducted by DOE would comply with U.S. Nuclear Regulatory Commission and U.S.

Commentor No. 255: Charles E. Weems (Cont'd)

Response to Commentor No. 255

Department of Transportation regulations. Associated transatlantic shipment would comply with International Atomic Energy Agency requirements. In Section J.6.2, DOE reviewed the potential maximum impacts from the marine transportation of mixed oxide fuel from Europe to a representative military port, Charleston, South Carolina, and overland transportation to Hanford. Also in that section, a bounding analysis demonstrates that the maximum potential radiological risks to the surrounding public from mixed oxide fuel shipments would be small (e.g., less than 1 chance in a trillion for a latent cancer fatality per shipment from severe accidents at docks and in channels and less than 1 chance in 50 billion for a latent cancer fatality per shipment from overland highway accidents).

- 255-4:** The environmental impacts associated with restart and operation of the FFTF are presented in Section 4.3 of the NI PEIS. The impacts include human health risks to workers and the general public associated with operation of the FFTF, with the management of waste, and with the transportation of reactor fuel, targets, and irradiated products to and from Hanford. Details of the accident assessments are presented in Appendix I. It is not claimed in the NI PEIS that the activities associated with the FFTF restart alternative are without risks. However, it is shown that they are small.
- 255-5:** DOE notes the commentor's support for Alternative 2, Use Only Existing Operational Facilities, which includes permanently deactivating FFTF.

Commentor No. 256: Nancy Dolan

Subject: FFTF restart
Auto forwarded by a Rule

There is NO reason to restart this. The current waste isn't being dealt with, so why accumulate more? There is no shortage of medical isotopes, and putting nuclear powered anything in space is dangerous and could lead to militarization of space. Is that what we want?

Nancy Dolan

Response to Commentor No. 256

- 256-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 256-2:** DOE notes the commentor's concern regarding waste generation. The restart of FFTF would not impact the schedule or available funding for the cleanup missions at Hanford. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and appropriate DOE orders.
- 256-3:** DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings.
- The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been

Commentor No. 256: Nancy Dolan (Cont'd)

Response to Commentor No. 256

revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

Potential environmental, health, and safety impacts associated with the proposed action are relatively low, and are discussed in detail in Chapter 4 of Volume 1 and associated appendixes in Volume 2 of the Final NI PEIS. Potential health and safety impacts associated with future launches of spacecraft utilizing plutonium-238 are not within the scope of the NI PEIS analysis, but would be addressed in the specific NEPA documentation prepared by NASA in support of such missions.

Subject: restart fftf for medical isotopes
Auto forwarded by a Rule

To Colette E. Brown

I think it would be great thing to restart the FFTF for medical use and for PU 238. my father had bladder cancer 3 years ago, went throught a couple of surgerys and took almost 2 years for him to recover from all of that he is 77 years old now. If the FFTF had been making Isotopes back then it would not have been as hard on him, lot less recovery time and maybe even cost less. Lets get it restarted to help man kind.

Thanks

John E. Cozad

Dear Ms. Brown:

We are writing to oppose attempts to restart the Fast Flux Test Facility at the Hanford Nuclear reservation. This absurd and costly idea flies in the face of logic.

Over the past several years, it has become obvious that neither DOE nor its Hanford contractors have found a satisfactory way to deal with the toxic waste already on the site. Yet DOE has simply ignored the additional waste this proposal will create at what is already considered the most contaminated nuclear site in the Western hemisphere.

There is already a glut of isotopes available for medical treatment. Rather than restart the FFTF, we strongly support the option of permanently shutting down the reactor, despite the \$281 million cost. This is the responsible, sane option and we hope you will take it.

Sincerely,
Irene Svete

258-2

258-3

Response to Commentor No. 258

258-1: Management of wastes that would be generated under implementation of Alternative 1 (Restart FFTF) is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

258-2: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information.

Although other private manufacturers produce medical isotopes, DOE remains the key provider for a large number of isotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these

***Commentor No. 258: Irene Svete, Charles Terrill,
Garry Boyden (Cont'd)***

Response to Commentor No. 258

isotopes are not generally purchased in large-enough quantities to make their production financially attractive to private industry. The United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. Section 1.2.1 of Volume 1 has been revised to clarify DOE's role and other producers' capabilities to fulfill U.S. isotope needs.

- 258-3:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 259: Pennie Stasik O'Grady

Draft PEIS Comment Form

If it is true that the DOE at this date (8-30-00) "has no preference" for any of the 6 alternatives in the PEIS, then why are the 3 tasks and tripods and comments made by the DOE at this hearing in support of Pu238 for medical + space technologies? Where are the beautifully done displays for alternative 5, ~~where are the displays~~ in particular? I am for clean energy - I am for the health + well-being of our citizens - I am for workers + quality employment opportunities - I am for business - but I am NOT for anything which risks the ultimate health + well-being of our citizens. What is causing this level of cancer and ill-health in our population in the first place? Why does the US use so much more energy per capita than any other country? We need to look at solutions to the underlying problems presumably addressed by ETRF - not use a supposedly "low-risk" technology with devastating potential consequences should our human infallibility kick in. Remainder The Titanic?

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

- attending public meetings and giving your comments directly to DOE officials
- returning this comment form to the registration desk at the meeting or to the address below
- calling toll-free and leaving your comments: 1-877-562-4593
- faxing your comments toll-free to: 1-877-562-4592
- commenting via e-mail: NuclearInfrastructure-PEIS@hq.doe.gov

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Response to Commentor No. 259

259-1

259-1: The displays developed for the public meeting were not intended to convey a preference for any alternative. The displays were developed to address the information contained in the Draft PEIS.

259-2

259-2: DOE notes the commentor's concerns. However, the many factors contributing to current U.S. cancer levels and energy demands are not within the scope of the NI PEIS. Rather, the NI PEIS evaluates a range of reasonable alternatives for maintaining and enhancing DOE's existing nuclear facility infrastructure for the purposes of addressing three primary needs:

- 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;
- 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and
- 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2 of Volume 1 has been revised to clarify the purpose and need of the proposed action.

Potential environmental, health, and safety impacts associated with the proposed action are relatively low, and are discussed in detail in Chapter 4 of Volume 1 and associated appendixes in Volume 2 of the NI PEIS.

Commentor No. 260: Ralph Nielsen

Ralph Nielsen
4182 Ironton Drive
West Richland, Washington 99353

I would like to thank the Department of Energy for preparing the PEIS and considering restart of FFTF to produce medical isotopes, plutonium-238 and for nuclear research and development. I believe these missions are important to this nation. Production of medical isotopes is costly and needs government support so that a stable and varied supply of specialized isotopes is available to the medical and research community. I believe that only a facility like FFTF can create these special isotopes.

FFTF can be operated safely with very minimal impacts to the environment. The facility provides the greatest flexibility and capability of any of the alternatives that were evaluated in the PEIS. I believe that it should be selected as the preferred alternative.

260-1

Response to Commentor No. 260

260-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 261: Jim Montano

PEIS COMMENTS

I would like to go on record in support of the FFTF option in the PEIS based on the demonstrated mission capability of the FFTF. I do have a major concern that some people will oppose FFTF just because it is part of the Hanford Site and/or that it is a nuclear facility. It is in the best interest of Washington, the Northwest and the country to examine the factual data available and to not be misled by inaccurate information and fear of the unknown or unfamiliar.

As citizens and taxpayers it should be in all our interests that our nations assets and resources are utilized to the best extent possible. FFTF is a known commodity, not a new risk operation or process. It has previously demonstrated 10 years of outstanding capabilities and safe operation. It is not a single use facility and can be effectively utilized for materials testing, energy research, support of NASA space missions, and most importantly to the general public a wide spectrum of medical isotope production that can meet quantity and quality needs in this growing field. Medical isotope production provides a significant opportunity to improve the future health care for all our citizens.

In closing, I urge all citizens and the DOE to base the PEIS decision on factual data including the cost effectiveness and versatility of the alternatives. Lets all contribute to keeping the PEIS process open, factual and avoid unfounded rhetoric and statements.

Jim Montano

Richland, WA 99352

261-1

Response to Commentor No. 261

261-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 262: The Sierra Club

Testimony Regarding the Draft Environmental Impact Statement on the Proposed Re-Start of the Fast Flux Test Facility at Hanford

The Sierra Club
Carole Woods, Cascade Chapter
Aug. 30, 2000

We are deeply dismayed that the Department of Energy is considering re-starting the FFTF in the face of a 'slow-motion catastrophe' comprised of extensive contamination of air, land, and water on and around the Hanford Nuclear Reservation. While sixty-nine huge underground storage tanks are known to be leaking extremely radioactive and toxic materials, all resources should be directed to mitigating this and other problems at Hanford. To divert any resources toward anything else at Hanford is unconscionable.

In 1995 the Department of Energy promised (in the Hanford Cleanup Agreement) to shut down the FFTF and use the money saved for higher priority cleanup. Instead, USDOE has spent more than 100 million dollars of cleanup money to keep the FFTF on hot stand-by while searching for a mission to justify re-start. Arguments for re-start are ludicrous. Specifically:

Plutonium 238 for NASA:

NASA has stated they have no need to purchase Plutonium-238 for the specific space mission used to justify FFTF restart.

Medical Isotopes:

USDOE's own Subcommittee for Isotope Research and Production Planning concluded that FFTF is not a viable source for medical research radioisotopes. Even the Washington State Medical Association says there is no need for FFTF as an additional source of medical isotopes.

Finally, the Draft Environmental Impact Statement misleads the public by omitting information that shows that FFTF restart is dangerous and unnecessary. Specifically:

Cost:

The costs of restarting the FFTF are not disclosed.

Nuclear Fuel for the FFTF:

The need to ship weapons-grade Plutonium fuel through Puget Sound is not mentioned.

Nuclear Waste From the FFTF:

The effects and risks of waste production, storage, reprocessing and transportation resulting from the FFTF re-start are not disclosed.

There's an important question of stewardship here. We do not feel that the Pacific Northwest is ours to pollute and deplete at will. We believe it is a trust that we must protect for future generations. We must do all we can to restore the Hanford region, including the groundwater and Columbia River, to a state of cleanliness that will not threaten the people, or wildlife that will live there for a very, very long time.

I have lost count of how many years I've testified at hearings like this on FFTF re-start. At every one of those hearings I observed that the vast majority of those testifying -- all who did not have financial interests in Hanford -- were clearly and strongly opposed to FFTF re-start. How many times do the majority of citizens of this region have to tell you that we want cleanup, not more nuclear waste at Hanford, before you will act on our mandate?

In summary, the DEIS for FFTF re-start is incomplete. It omits information that proves that there is no justification for FFTF re-start, and that the risks of restart are unacceptable. Moreover, the Department of Energy made a promise in the Tri-Party Agreement to make cleanup Hanford's primary mission. Re-starting the FFTF will be a violation of that promise.

Response to Commentor No. 262

262-1: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

The U.S. Congress funds Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM). Congress also funds FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The proposed actions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

Hanford tank waste issues are not within the scope of this PEIS, as none of the alternatives considered would add to these waste volumes.

262-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

262-3: Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science

262-9

262-10

262-11

Commentor No. 262: The Sierra Club (Cont'd)

Response to Commentor No. 262

and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. DOE does not stockpile large quantities of Russian plutonium-238 long in advance of needs due to budget constraints and the additional processing required to remove decay products that occur following extended storage of the material.

The May 22, 2000, correspondence from NASA to DOE identifies that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium 238 to support deep space missions. Rather, SRTG development efforts were stopped in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires one-third less plutonium-238 as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000, letter to DOE that large RTGs be maintained as backup. Section 1.2.2 of Volume 1 was revised to clarify plutonium-238 mission needs.

The major mission of FFTF would not be the production of plutonium-238. Rather, all three missions are of equal importance; no one mission is given priority in the NI PEIS.

- 262-4:** The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and

Commentor No. 262: The Sierra Club (Cont'd)

Response to Commentor No. 262

conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

DOE has taken the Expert Panel and NERAC report recommendations under consideration in developing the range of alternatives evaluated in the NI PEIS. These reports were made available to the public at the NI PEIS public information centers and on the Internet at <http://www.nuclear.gov>.

262-5: This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS. DOE made every effort to obtain, analyze, and disclose all required information, including information on FFTF, to make a decision on expanding nuclear infrastructure. Further, DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives.

The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. DOE mailed this document to about 730 interested parties on August 24, 2000. The

Commentor No. 262: The Sierra Club (Cont'd)

Response to Commentor No. 262

report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS.

262-6: The commentor's concern about shipments of plutonium through Puget Sound is noted. None of the proposed alternatives would involve the shipment of weapons-grade plutonium to any port in the United States. Alternative 1 does postulate that DOE might decide at some point to import mixed oxide fuel from Europe to fuel FFTF. At this time, however, DOE has not proposed to import this fuel through any specific port. If DOE ultimately decides to restart FFTF and to import fuel from Europe, it would perform a separate NEPA analysis to select a port. This review would address all relevant potential impacts of overseas and inland water transportation, shipboard fires, package handling, land transportation, as well as safeguards and security associated with the import of SNR-300 mixed oxide fuel through a variety of specific candidate ports on the east and west coasts. It would consider all public comments, including local resolutions, concerning the desirability of bringing mixed oxide fuel into the proposed alternative ports.

In the event that DOE decides to enhance its nuclear infrastructure, it would not expose any population to high, unacceptable risks under any alternative. Any transportation activities that would be conducted by DOE would comply with U.S. Nuclear Regulatory Commission and U.S. Department of Transportation regulations. Associated transatlantic shipment would comply with International Atomic Energy Agency requirements. In Section J.6.2, DOE reviewed the potential maximum impacts from the marine transportation of mixed oxide fuel from Europe to a representative military port, Charleston, South Carolina, and overland transportation to Hanford. Also in that section, a bounding analysis demonstrates that the maximum potential radiological risks to the surrounding public from mixed oxide fuel shipments would be extremely small (e.g., less than 1 chance in a trillion for a latent cancer fatality per shipment from severe accidents at docks and in channels and less than 1 chance in 50 billion for a latent cancer fatality per shipment from overland highway accidents).

262-7: This NI PEIS addressed wastes produced for each alternative, as well as cumulative impacts related to waste production. In particular, Section 4.3.1.1.13 of Volume 1 provides information on waste that would

Commentor No. 262: The Sierra Club (Cont'd)

Response to Commentor No. 262

be associated with the restart of the FFTF. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. In most cases, wastes will be managed on the site it was generated. Transportation of waste off site is covered by other NEPA review specific to the site of waste generation.

262-8: DOE notes the commentor's concerns regarding potential impacts to groundwater and the Columbia River. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

More specific to the alternatives presented in the NI PEIS, FFTF is located approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to the groundwater. Analyses presented in Chapter 4 of the NI PEIS (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4) indicate that there would be no discernible impacts to groundwater or surface water quality at Hanford from normal operation of the existing Hanford facilities in support of the stated missions. Also, no water quality impacts would be expected as a result of permanent deactivation of FFTF (Section 4.4.1.2.4).

The environmental impacts associated with operation of the FFTF and support facilities at Hanford during normal operations and from postulated accidents are presented in Section 4.3 of the PEIS. All impacts to human health and ecological resources, e.g., wildlife, were demonstrated to be small in the immediate area of the Hanford Site and negligible at all distant locations.

262-9: This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE

Commentor No. 262: The Sierra Club (Cont'd)

Response to Commentor No. 262

implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS. Further, DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives. DOE made every effort to obtain, analyze, and disclose all required information to make a decision on expanding nuclear infrastructure. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

- 262-10:** The environmental impacts associated with operation of the FFTF are addressed in detail in Section 4.3 of the NI PEIS. The impacts are shown to be small. These impacts specifically include the risks to human health during normal operations and associated with postulated accidents. Over the 35-year operational period no fatalities would be expected among workers or in the general public.
- 262-11:** Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- Ecology, EPA, and DOE agreed to a change in the Tri-Party Agreement to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on FFTF's future. Public meetings were held on this formal milestone change. The NI PEIS missions would not have an impact on Hanford cleanup activities.

Commentor No. 263: Gary Boehnke

My name is Gary Boehnke and I am speaking today as private citizen who has resided in eastern Washington for 23 years. In recent years I have watched several close family members during their fights to survive battles with cancer. Sadly, one was not successful.

It is extremely important that the United States develop and maintain a means of producing a much greater supply of isotopes for medical research, diagnostic and therapeutic use. The demand for an increasing amount and wider variety of isotopes is growing and the U. S. now only produces about 10% of what it needs and must rely on sources outside the country. The FFTF is the quickest and safest way to begin producing the high quality isotopes needed by the medical and research communities while a national long term production strategy is finalized and we citizens of Washington should be proud to be able to play a vital part in serving this growing need.

I have worked in commercial industry including shipyards and can assure those with concerns about waste that by design and proven after 10 years of excellent operation ratings there is no waste problem at FFTF. Anyone in this room can go to the site right now and observe the fuel used to date safely stored in concrete containers in a space about the size of a basketball court. My kids and grandkids have used the Columbia river for recreation for many years and the FFTF is not a cause for concern to that activity since it's operation is completely self contained.

I am proud to support the restart of a facility that can help all of us and also proud to have it "IN MY BACKYARD".

GARY BOEHNKE
6012 N. CONWAY PL.
KENNEWICK, WASHINGTON

Commentor No. 264: *Bernie Patterson*

Good Evening,

My Name is Bernie Patterson and I would like to offer this personal testimony on behalf of restarting the FFTF. I am a concerned citizen, representing myself.

Isotopes are an extremely important tool used in the life sciences. 13 million medical procedures and 100 million lab tests use isotopes every year in the U.S. 80% of all newly approved drugs use isotopes during research and development. Without question, medical isotopes have a tremendous role in our health care yet the true benefits of isotopes are just now starting to be realized.

Until now, most medical isotopes were used in diagnosing injuries and diseases. The main isotope used in these diagnostic procedures is technetium-99m, which is derived from its parent isotope molybdenum-99. Large quantities of this isotope are easily produced in small reactors, such as the ones in Canada that now provide most of our supply. Most other diagnostic isotopes are produced in accelerators or cyclotrons scattered across the U.S. Recent advances in biotechnology have opened a whole new dimension for the role of isotopes in treating diseases like arthritis, heart disease, and cancer. Isotopes can now be effectively attached to antibodies and other biological targeting tools that are designed to seek out unwanted tissues such as cancer cells. The isotope can then deliver its close range particles to kill the unwanted cell.

Therapeutic isotopes are fundamentally different than their diagnostic cousins. Therapeutic isotopes need to deliver large amounts of killing energy over very short distances. For this reason therapeutic isotopes need to give off alpha or beta particles. These particles come from radioactive isotopes that are neutron-rich and seek to obtain stability by ridding themselves of excess neutrons...in the form of alpha and beta particles. These isotopes are generally made in reactors, not accelerators or cyclotrons. Accelerators and cyclotrons make neutron-poor isotopes. These isotopes decay by methods that produce photons that can be used by special cameras to provide a picture of what's happening in a particular area of the body. Accelerators and cyclotrons cannot effectively make large quantities of therapeutic isotopes.

264-1

Response to Commentor No. 264

264-1: DOE notes the commentor's support for greater availability of medical isotopes.

264-2: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 264: Bernie Patterson (Cont'd)

As stated several years ago in the often- misquoted Institute of Medicine report on isotopes, "if isotopes become important for cancer therapy, the current number and condition of reactors in North America will be inadequate". As of now, isotopes are becoming very important in curing cancer and other diseases. The main problem is that there are not enough isotope production reactors in the U.S. to meet even the demand for clinical trials of certain isotopes much less be able to meet the demand when these trials are finished and the therapy gets approved by the FDA.

264-1
(Cont'd)

As shown in report after report, the DOE infrastructure is not capable of providing the variety and quantity of isotopes that will be required by the medical and research communities, and the millions of patients over the next several decades. Indeed, enhancing this infrastructure is the purpose of the PEIS and of these public hearings.

The FFTF is the only reactor in North America that has the volume, high flux, and overall capabilities to make a significant contribution towards meeting this nations' need for isotopes, while also meeting the other mission needs in the PEIS. It is a unique asset to the Pacific Northwest, and to the United States. When first built and operated it was labeled as the finest test reactor in the world yet many felt that the FFTF was ahead of its time. Well, its time has come and the FFTF is ready to meet the challenges of producing the next generation of therapeutic isotopes. Isotopes that will dramatically alter the course of our war on cancer, providing superior, low-cost care to millions of suffering patients.

DRAFT PROGRAMMATIC ENVIRONMENTAL STATEMENT
 FOR
 ACCOMPLISHING EXPANDED CIVILIAN NUCLEAR
 ENERGY RESEARCH AND DEVELOPMENT AND
 ISOTOPE PRODUCTION MISSIONS IN THE UNITED STATES
 INCLUDING THE ROLE OF THE FAST FLUX TEST FACILITY (NI PEIS)

Dear Ms. Brown:

Transmitted herewith, is a copy of the statement made by William Martin, President of the Tri-City Industrial Development Council, at the NI-PEIS hearing in Richland, Washington on August 31. As indicated in our statement, TRIDEC and the regional business community strongly supports the restart of the FFTF to meet the national programmatic needs described in the draft EIS. We are submitting this statement for inclusion in the record of the EIS hearings.

Subsequent to the preparation of this statement, we have received and reviewed the supporting Alternative Cost Analyses and the Non Proliferation Impact Assessment reports. We support the conclusion in these reports that the FFTF provides the lowest cost alternative for meeting the mission needs, and restart of the FFTF does not raise any significant non-proliferation concerns.

We also wish to thank you for the conduct of the EIS hearings. The hearings were carried out in a controlled, fair and balanced manner. All of the competing and conflicting interests represented at the hearings were provided with balanced opportunities to present their views on this subject, which is of significant interest in this region. The patience and conduct of you and your staff during the hearing process is commendable.

We appreciate the opportunity to present our views on the FFTF.

Very truly yours,

Sam Volpentest
 Executive Vice President

TRI-CITY INDUSTRIAL DEVELOPMENT COUNCIL

901 N. Colorado, Kennewick, WA 99336-7685 USA 1-800-TRI-CITY 509-735-1000 509-735-6609 fax tridec@tridec.org www.tridec.org

NUCLEAR INFRASTRUCTURE
DRAFT ENVIRONMENTAL IMPACT STATEMENT
EXPANDED CIVILIAN NUCLEAR ENERGY RESEARCH & DEVELOPMENT
DOE/EIS-03100

August 31, 2000

Thank you for the opportunity to provide comments regarding this Draft Environmental Impact Statement. My name is Sam Volpentest and I am the Executive Vice President of TRIDEC. The Tri-City Industrial Development Council is a non-profit organization, whose objective is the economic development and health of the Tri-City area, which encompasses the Hanford site. Our membership is composed of over 500 businesses, organizations, labor, and governmental entities interested in the welfare of the Tri-Cities.

TRIDEC strongly supports the objectives of the Department's Nuclear Energy Program and specifically endorses the implementation of the various missions identified and evaluated in the Draft EIS. We also strongly support and urge the identification of the Fast Flux Test Facility as the preferred option for accomplishing these missions.

The Draft EIS evaluation of these alternatives clearly shows the capability and superiority of the FFTF over the other alternatives considered. The FFTF is the most modern reactor available in the DOE complex, was designed and constructed to meet both Department of Energy and Nuclear Regulatory Commission requirements and operated flawlessly for over ten years with no significant safety incidents or issues. With its large volume core, it has the capability to carry out a number of production or research and development missions simultaneously. The proposed low power operation of the reactor provides added safety margins above the already high standard safety requirements established for this reactor.

The FFTF was never intended for or utilized in nuclear weapons production missions and none are proposed or considered in the current Draft EIS evaluation.

The FFTF has the demonstrated capability to produce a number of medical isotopes which are either unavailable or in limited supply. There is a significant national need for the production of these isotopes, many of which cannot be effectively produced in an accelerator. An accelerator of the size and energy level, which would be required for this mission, does not exist and the construction of such a speculative untried machine in the future is highly questionable.

The startup and operation of the FFTF for the missions evaluated in this EIS will not interfere with or detract from the Hanford cleanup mission. The funding for FFTF programs is provided through Nuclear Energy program appropriated funds, which by law are separately appropriated and segregated from the Environmental Management program. Conversely, if the decision were to be

Response to Commentor No. 265

265-1: The commentor's support for implementation of Alternative 1, Restart FFTF, is noted. The Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, costs, nonproliferation issues, schedules, technical assurance, policy, and program objectives.

The commentor's position concerning FFTF capabilities is noted. Descriptions of the capabilities of candidate irradiation facilities are discussed in Section 2.3.1 of Volume 1.

The commentor's positions on socioeconomic impacts and the supply of medical isotopes that would result from implementation of Alternative 1 are noted. Socioeconomic impacts that would result from implementation of Alternative 1 are discussed in Section 4.3 of Volume 1. Section 2.7.3 of Volume 1 contains a discussion of the mission effectiveness of the alternatives.

265-2: As discussed in Section 1.2 of Volume 1, the nuclear infrastructure missions are unrelated to the national defense or weapons production.

The commentor's support of FFTF for radioisotope production is noted. As stated in Section 2.3.1.1 of Volume 1, during its operation, FFTF successfully produced a variety of medical isotopes. Section 2.5 of Volume 1 describes alternatives, including the construction of one or more accelerators, for accomplishing the nuclear infrastructure missions. Section 2.7.3 contains a discussion of the mission effectiveness of the Alternatives. Accelerators are not speculative or untried. DOE and the U.S. have considerable experience in designing, building, and operating accelerators similar to the accelerators that would be constructed and operated under Alternative 3.

265-3: The commentor is correct on the separation of NI PEIS mission and Hanford cleanup funding sources and a possible impact of deactivation of FFTF on existing cleanup activities. FFTF restart and operation would not impact the schedule or available funding for existing cleanup activities.

265-4: DOE notes the commentor's views that Alternative 1 options involving the restart of FFTF are preferred on the basis of associated environmental and socioeconomic impacts. No decisions have been made with regard to the facilities and locations evaluated to fulfill the requirements of the stated missions, which include the production of

265-1

265-2

265-3

Commentor No. 265: Sam Volpentest (Cont'd)
TRIDEC

made to shutdown the FFTF and decommission it, then responsibility for the facility would be transferred to the Environmental Management program. This would have a major negative impact on the limited cleanup program funding which is available.

The opponents of the FFTF have made a number of allegations regarding safety and waste management issues related to the operation of the FFTF. These allegations are not factually correct and are being responded to by other commenters who support the FFTF. We will not repeat these issues in this statement but are enclosing two attachments for record purposes, which provide issue papers on these topics and respond to recent public statements by the opponents.

We wish to call your attention to the agreement reached between DOE and the State of Oregon and Washington for the preparation of a "Waste Management and Minimization Plan" to ensure that FFTF waste issues do not negatively impact the Hanford Site cleanup programs.

We believe that the FFTF has been clearly identified in the EIS studies to be the preferred options for meeting the identified program missions without any significant negative social, environmental, or economic impacts. Operation of the FFTF will provide significant positive economic and social impacts not only to the Pacific Northwest, but also to the nation. The supply of currently unavailable or limited medical isotopes for general use is of particular significance.

Local area business, labor and governmental leaders strongly support the restart and operation of the FFTF. During the review of the draft EIS, we expect that these interests as well as our Congressional Delegation will submit strong statements of support for restart of the EIS. We expect that regional and national environmental interests will also continue to express their opposition to operation of the reactor. However, these are not the views of the local community and reflect a "knee jerk" reaction to any new programs at Hanford and in particular to any consideration of restarting the Fast Flux Test Facility. We have reviewed recent letters and press releases, which have been released by these interests regarding the FFTF. Many of the allegations contained in these papers are factually incorrect or scare statements and do not apply to the current program proposals.

We have submitted to the Department as an attachment to previous testimony a compilation of position statements and letters from our Congressional Delegation, the State of Washington, and other regional interests supporting the FFTF. Please consider this previous submission for inclusion in the record of this hearing. We expect that this same level of support will continue to be available in support of the FFTF for the currently proposed missions.

We request that the assets of the FFTF receive an objective, balanced, and realistic evaluation of the alternatives during the preparation of the Record of Decision on this Environmental Impact Statement.

Thank you for the opportunity to present our views on this subject.

265-3
(Cont'd)

265-3

265-4

265-1

265-5

Response to Commentor No. 265

medical and industrial isotopes, the production of plutonium-238 for NASA space missions, and nuclear research and development. In accordance with Council on Environmental Quality regulations (40 CFR 1502.14(e)), DOE has identified its preferred alternative in Section 2.8 of the Final NI PEIS. The Record of Decision for the PEIS will be based on a number of factors including environmental impacts, costs, public input, nonproliferation issues, schedules, technical assurance, policy, and program objectives.

265-5: DOE notes the commentor's views and contention that local interests support Alternative 1, Restart FFTF. In preparing this NI PEIS, DOE carefully considered all scoping comments received from the public, and all comments received during the scoping periods are part of the Administrative Record for this NI PEIS. The Record of Decision for the PEIS will be based on a number of factors including environmental impacts, costs, public input, nonproliferation issues, schedules, technical assurance, policy, and program objectives.

Commentor No. 266: Sol Guttenberg

Good evening. My name is Sol Guttenberg and I am representing myself. I recently went to the Heart of America Northwest homepage to see what information they were making available to the public about FFTF. One article that really caught my eye is called "Nuclear Safety at FFTF and Hanford: Unsafe, Unregulated, No Public Right to Review". I was amazed at the inaccuracy and misleading nature of the articles that I found there. It is truly unfortunate that distortions and fabrications are being circulated to create unsupported fear and distrust in people that live in the Northwest. Public opinion plays an important role in the Department of Energy's decision making process. Each of us here tonight will be affected by these upcoming decisions, especially those related to medical isotope production. I would like to set the record straight on some of the inaccuracies in this article. It would take most of the evening to address each false statement, so I will limit my response to a few examples.

One HOA topic area states "Government planning documents reveal that if FFTF were to resume production, the risk of a large radiation release accident serious enough to require crop seizure and mass evacuation is as high as 30%." The accident referred to is associated with the drop of a cask containing tritium targets. It is also interesting to note that the probability of this particular accident is incredible which means that it has less than 1 in a million chance of occurring, not the claimed 30 percent. Not only was this quote taken out of context, it doesn't even relate to the missions being discussed here tonight! FFTF will not be making tritium if restarted. HOA apparently likes to use this misrepresentation over and over again to frighten the public.

Another misinformed HOA topic area states " FFTF will require Highly Enriched Uranium or Plutonium fuel, which was the type of fuel being fabricated at Tokaimura, Japan... In light of the recent accident in Japan, many are concerned that a similar accident could happen here." Operation of FFTF does not involve the fabrication of any nuclear fuel at Hanford so how can there be a risk to the region? If additional fuel for FFTF is eventually required, it is expected that it would be fabricated at an existing commercial facility. The U.S. nuclear fuel fabrication facilities have an exemplary safety record, including the fabrication of highly enriched fuel for the U.S. Navy. Existing DOE reactors and many international test reactors safely use highly enriched uranium fuel.

Lastly, HOA states "Nor does USDOE plan to disclose that Plutonium and target processing will add more liquid High-level Nuclear Wastes to Hanford's leaking and explosive High-Level Nuclear Waste tanks." This is an example of using scare tactics to reach an unsupported conclusion. As stated in the PEIS, FFTF has never generated high level waste, nor will any high

Response to Commentor No. 266

266-1

266-1: DOE notes the commentor's views and observations. DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and to providing ample opportunity for public comment on those actions.

266-2: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 266: Sol Guttenberg (Cont'd)

level radioactive waste be generated by any of the proposed missions. Since no waste of this type will be generated, the truth is that not a single drop of waste will be added to Hanford's high-level waste tanks. Well, there goes HOA again. They continue to use this outright falsification to suit their needs.

I would challenge each of you tonight to keep an open mind, carefully evaluate where you are obtaining your information on these important issues, and formulate your own opinions based on truth and facts. The very vocal antinuclear activists in this area are not large in number, but they are quite skilled at taking information and data out of context and twisting it to meet their own agenda. It is clear to me that these groups do not represent the good of the public at large. I believe that FFTF is the best alternative evaluated in the PEIS. It provides the greatest capability and flexibility to meet the proposed mission needs.

**266-1

266-2

Response to Commentor No. 266

Commentor No. 267: Pat Schweiger

Nuclear Research and Development

Hello. My name is Pat Schweiger. I live in Kennewick, Washington, and I am here representing myself. I fully support conducting the three missions outlined in the PEIS using Alternative #1, which is to Operate the FFTF. I would like to focus on one of the missions in particular – the expanded nuclear research and development work.

I believe nuclear energy is very important in meeting increasing electrical power needs and in helping to protect the environment. In the United States, nuclear energy is the second largest source of electricity and generated about 20 percent of all electricity in 1999.

Nuclear power plants do not have a combustion process like that in a fossil-fuel plant. The heat in a nuclear power plant is produced by a process in which atoms of uranium or plutonium in fuel rods are split by neutrons in a controlled reaction to produce heat. Coolant water absorbs this heat from the fuel rods which is used to produce steam to generate electricity. Since this process does not involve any combustion, nuclear power plants emit none of the combustion gases associated with air pollution, acid rain, or global climate changes. Nuclear power plants are thus a key factor in reducing greenhouse gas emissions. For example, in 1999, if the electricity produced by the 103 nuclear power plants in the U.S. had instead been produced by coal or oil fired plants, 90 million cars would have to be removed from America's highways just to maintain air quality at its current level.

With the current shortage of electricity just to the south of us in California and developing elsewhere, with oil and gas prices skyrocketing, and with a growing need for electricity worldwide, the role of nuclear power in producing safe, reliable electricity is likely to increase. This will be particularly true when it comes time to meet greenhouse gas restrictions specified in the Kyoto accord. To ensure that nuclear power will be a viable option for the future, it will be necessary to reduce nuclear waste, to provide more proliferation resistant fuel and to develop the technology for cheaper, more efficient power plants. To do these things requires a renewed nuclear energy research and development program.

Response to Commentor No. 267

267-1

267-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

267-2: DOE notes the commentor's support for nuclear research and development initiatives.

267-2

Commentor No. 267: Pat Schweiger (Cont'd)

Current U.S. nuclear power plants are based on the technology of the 1970's to early 1980's and include very large design margins to address any technical uncertainties and to ensure safety. Improvements in materials and nuclear fuel behavior as well as investigation of advanced design concepts will lead to plant designs with improved performance and economy of operation. Future reactor technologies are likely to involve higher temperatures which will improve plant thermal efficiency and reduce costs, will use longer life nuclear fuel rods which will reduce the amount of spent nuclear fuel generated, and may use different coolants. Testing of these concepts and improved materials will require irradiation in a reactor environment.

**267-2
(Cont'd)**

The FFTF can make a significant contribution to the nuclear research and development needed. The FFTF is unique in the United States and is one of only several reactors in the world that has a combination of high temperature, high neutron flux, and fast neutron energy spectrum with a liquid metal coolant that makes it ideal for many types of advanced irradiation testing. The FFTF has performed flawlessly in conducting extensive testing on various materials and nuclear fuels. This included international testing of materials for a fusion reactor which could have major positive environmental impacts as an energy source in the future. The neutron flux in the FFTF can also be adjusted (tailored) to different energies to provide custom irradiation environments providing greater flexibility.

267-1

I believe that the modern FFTF reactor and associated support facilities represents a multi-billion dollar national asset that is essential to ensuring that a clean and reliable nuclear energy option be maintained for our future. I strongly urge the Department of Energy to restart the FFTF to help ensure that there will be a viable nuclear energy option when it is needed.

Response to Commentor No. 267

Commentor No. 268: Robert R. Beach

TESTIMONY AT THE NI PEIS PUBLIC HEARING – SEATTLE, OREGON – AUGUST 30, 2000
BY
ROBERT R. BEACH OF KENNEWICK, WASHINGTON

I, Robert R. Beach, residing at 7803 West Deschutes Ave. Kennewick, Washington would like to make the following personal statement related to the DOE request for public comment on their draft Nuclear Infrastructure Environmental Impact Statement.

First, I commend the efforts to make this an actual public hearing, as opposed to a political sideshow. I will attempt to stay away from political cliché and outright propaganda and lies. Unfortunately, you will hear more untruths than truths here tonight from the representatives of supposedly public outcry organizations.

Secondly, the DOE should be commended for the recognition that they require additional resources to provide the public services that they are charged with doing. This is contrary to the tenets of the present Clintonesque oligarchy, and certainly required courage and moral fiber.

As for technical comments:

First, the DOE should proceed with the development of an enhanced nuclear infrastructure with the utmost in speed and great determination. The gains to the people of the United States are extremely clear, and urgent to meet. We are presently frittering away every opportunity due to inaction.

Second, it should be noted, that from an environmental impact standpoint, each of the alternatives contained in the EIS is completely acceptable. From an environmental standpoint, this EIS is actually unnecessary and only serves to meet the legal requirement. The care of the environment is being engineered into the systems and processes.

Third, the DOE should carefully review each alternative to define the extent to which that alternative meets the requirements of the three missions. The concern is that some of the options are “cheapies” that attract the political eye, but actually are not capable of meeting the needs of the three missions.

Fourth, the DOE should utilize available resources rather than shutting down and deactivating one facility, so that they can build another. This is not good management of my taxpayer funding. There is altogether too little attention paid to what is thrown away – since it doesn’t require funding.

Fifth, the DOE should carefully review the costs for the Alternatives 3 and 4 that are provided in the Cost Study. These costs, particularly for the low-power accelerator and the pool reactor are sorely underestimated. In my opinion, there is no way that the DOE can obtain and operate these facilities with the required supporting facilities and services for the stated costs. The capability of the described systems to meet each of the three mission goals is also highly questionable, without extended designs and much higher costs.

Sixth, the cost benefit for this Nuclear Infrastructure Program goes far beyond the DOE. For example, in the case of medical isotopes, the benefits accrue to the taxpayers themselves, the insurers for the medical industry, and finally to the administrators of MEDICARE. The first return in battling cancer through the use of radioisotopes is the better chance for recovery for any of us who may be afflicted. But, the financial return to each group is also extraordinary, and these are not presently considered a part of the DOE decision, in fact, they are not even discussed. It is time that the needs of the taxpayer are considered – not the political needs of the politician.

Seventh, the DOE should break itself free from the encumbrances of the “Nuclear Weapons and Cleanup” missions, and begin to fill the needs of the American public. The full capabilities of the nuclear medicine alternatives need to be exploited, and support for the civil use of nuclear energy needs to be greatly

268-1

268-2

268-3

268-4

268-5

268-6

Response to Commentor No. 268

268-1: DOE notes the commentor’s views and remarks concerning the Seattle, Washington, public hearing.

268-2: DOE notes the commentor’s support for the proposed action.

268-3: The results of analyses described and shown in the NI PEIS indicate that from an environmental impact standpoint, each of the alternatives assessed in the NI PEIS is acceptable.

268-4: Section 2.5 describes each alternative analyzed in the NI PEIS. Part of that description includes a review of the extent to which each alternative can meet the purpose and need for agency action as described in Section 1.2. Volume 1, Section 2.7.3 compares the mission effectiveness among alternatives.

268-5: DOE notes the commentor’s views on costs, support for Alternative 1, Restart FFTF, and opposition to Alternative 3, Construct New Accelerator(s) and Alternative 5, Construct New Research Reactor. DOE acknowledges that Alternative 1, 3, and 4 do not meet the mission objectives in the same manner.

268-6: DOE notes the commentor’s concern about the cost benefit of the Nuclear Infrastructure missions described in the Final PEIS and the support for the stated missions. The estimated costs of the range of reasonable alternatives are presented in the Cost Report, summarized in Appendix P of the Final NI PEIS. However, the Cost Report is not a cost-benefit analysis. While it is reasonable to believe that the benefits of medical isotopes are substantial, the purpose of this NI PEIS is to describe the nuclear infrastructure missions (Section 1.2 of Volume 1), a range of reasonable alternatives for satisfying the mission requirements (Section 2.5 of Volume 1), and the environmental impacts that would result from implementation of the alternatives.

268-7: The commentor’s support of FFTF is noted. Many of the commentor’s FFTF facts are contained in PEIS Section 2.3.1.1 of Volume 1. Evaluation of the environmental impact of restarting FFTF, denoted Alternative 1 in the PEIS, is presented in the Summary, Section 2.7, and Section 4.3.

Commentor No. 268: Robert R. Beach (Cont'd)

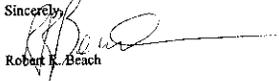

expanded. It is clear that there is no technical, health or environmental reason not to utilize the benefits of the technologies. LEADERSHIP IN THIS BENEFICIAL EFFORT IS WHY DOE EXISTS.

Eighth, the facts related to the Fast Flux Test Facility should be clearly presented to the public.

- The FFTF has already operated for ten years with no adverse environmental impact.
- The FFTF has demonstrated an excellent safety record during this period in addition to the extended standby period.
- The FFTF has already demonstrated production of many of the isotopes that are considered.
- Operation of the FFTF does not impact cleanup of the Hanford wastes.
- The FFTF can be operated for more than twenty years without having to manufacture any new fuel. This would also remove plutonium fuels from inventory that will otherwise probably require chemical processing to remediate.
- The reliability of FFTF is known. Any new facility of equal capability is an unknown.
- The FFTF is certainly not the "old" Hanford. If the FFTF was in any other DOE laboratory, it would probably already be in operation and providing beneficial services to the people of the United States.

I welcome this opportunity to present my comments for your consideration.

Sincerely,

Robert R. Beach

268-6
(Cont'd)

268-7

Response to Commentor No. 268

Commentor No. 269: Shirley Breitenstein

My name is Shirley Breitenstein. I lived in Richland, WA from 1974 to 1984. During that period I was married to Dr. Bryce Breitenstein who was chairman of Hanford Environmental Health Foundation.

I now live in Redmond, WA - however, spend many weekends in West Richland with a friend who is dying of bone cancer or in Kennewick with my oldest daughter and her family.

In the summer of '75 we were awakened by the phone in the middle of the night. Bryce was called to receive a patient at the decontamination center located next to Kadlec Hospital - a facility constructed at the request of Dr. Dag Norwood, a former chairman of HEHF. An explosion in the small room the patient had been working in had left him with pieces of glass and a highly radioactive substance imbedded in his face.

The newspapers were very interested in this accident. Within 2 days, Bryce was told by DOE authorities that he was not to speak to the newspapers. He was very aware of patient confidentiality. If you've ever been placed in that position, perhaps you know how it feels. He is presently working at a facility on Long Island. I would imagine he still says very little to the public.

The patient was held in the center for several weeks, finally released to a trailer parked nearby - with all water and waste contaminants that touched his body, placed in containers and taken to the site. A substance created by Batelle Laboratories and never before used on humans, was used on this patient.

Response to Commentor No. 269

Commentor No. 269: Shirley Breitenstein (Cont'd)

2

I believe very few people realize, in spite of our fantastic space travel and science fiction movies, what type of facility, expertise, money, technology, etc. it takes to keep one man alive after such an accident.

I believe very few people realize what a major disaster at Hanford would be like - least of all our politicians and perhaps even some of our Department of Energy experts. Do we consider the disaster at Chernobyl happened because that particular facility was not constructed properly nor maintained and monitored responsibly?

For years Hanford has been a vast piece of desert land in Eastern Washington that no one really cared about - sadly, even many of us who have lived there. One day someone must have said, "Oh dear!" "I do believe that a bit of the waste is not being held in their containers as we had hoped. This may become a problem."

I don't know what's out there or how much contaminant is already going into the beautiful Columbia river. I don't know how much money it's going to take to get it cleaned up or if it can be cleaned up. I also realize that the restart of the reactor would provide jobs for many people and boost the economy of the Tri-Cities and thus the economy of this state. But at what cost?

The Tri-City Herald recently printed a full front page article that described some of the many issues surrounding the clean-up and how the person in charge (described as quite responsible) had quit, apparently due to his frustration with DOE authorities. Even the people of the community were expressing frustration. That's unusual for a community that largely depends on Hanford for its survival.

269-1

Response to Commentor No. 269

269-1: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford and the risk of contamination to the Columbia River. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Commentor No. 269: Shirley Breitenstein (Cont'd)

3

As small children, our parents attempted to teach us we should clean up one mess before starting another. Parents are still giving their children the same messages but with what validity. Aren't we now adults that refuse to even see our messes.

Let's wake up and take responsibility. It would even be refreshing to hear our politicians take on a new slant with words that would encourage responsibility.

Response to Commentor No. 269

Commentor No. 270: Greg Bergquist

Greg Bergquist
1312 Cedar Ave
Richland, WA 99352

Good Evening. I'm Greg Bergquist, representing myself. I have a few points that I'd like to make in the next couple of minutes.

First, I'd like to thank the DOE for going forward with this PEIS. I too, as a private citizen, am concerned about the degradation of the DOE nuclear infrastructure and the associated impact that it has on the people in the Pacific Northwest as well as the nation. I recognize that completion of the PEIS is a key step in the decision process to enhance this capability, so that DOE can fulfill their obligation for the identified missions in the PEIS. I believe it is imperative that they do so and in a timely manner, with specific emphasis on promoting the development and utilization of diagnostic and therapeutic medical isotopes in conjunction with pharmaceutical firms by assuring an adequate and stable supply of these isotopes.

Second, the purpose of the PEIS is to address the environmental impacts of the proposed actions. It does, and it concludes that they are extremely small for all the alternatives under consideration. However, there is a major void that would likely prohibit the Secretary from making what I consider to be an informed decision, and that is, there is no comparison of capabilities for the alternatives. As a result, the implication is that Alternatives 1, 3, and 4 (i.e. startup of the FFTF, two new accelerators or a new reactor) all equally meet the mission needs. This is not the case. We the public can't tell if we're buying a VW, Cadillac, Minivan or truck. They all provide transportation, but they don't meet the same requirements. Therefore, it is essential that a technical comparison of capabilities for the alternatives be performed either as a stand-alone document or folded into the PEIS. In concert with the environmental consequences, cost information and other inputs, this will enable the decision process to move forward on an even keel and for the Department to recognize where they're getting the best bang for their buck.

270-1

270-2

Response to Commentor No. 270

270-1: DOE notes the commentor's support for the proposed action.

270-2: The summary of environmental impacts (Sections 2.7.1 of Volume 1) has been completely revised and reformatted in the Final NI PEIS for the reader to compare the environmental impacts between alternatives. Section 2.7.3 of Volume 1, "Comparison of Mission Effectiveness Among Alternatives," has been revised in the Final NI PEIS to provide the reader a better understanding of the medical isotopes that can be produced using accelerator technology (Alternative 3) and reactor technology alternatives (Alternatives 1 and 4).

Commentor No. 270: Greg Bergquist (Cont'd)

Greg Bergquist
1312 Cedar Ave
Richland, WA 99352

Third, I'd like to set the record straight with respect to the so-called diversion of funds that others indicate the startup of FFTF would have on the cleanup budget at Hanford. The reality is, there is no diversion. Funding for the potential restart of FFTF would be provided by Nuclear Energy, which is completely unrelated to the cleanup budget under Environmental Management. This funding level is approximately \$314M. If another alternative is selected, appropriate funding would still be required. It is also important to recognize that additional funding of \$281M would also be required to deactivate the FFTF. This funding would come from the Hanford cleanup budget and would have a significant impact on the Hanford cleanup. So, if FFTF is not selected as the preferred alternative, the cost to the DOE would be almost twice as much or greater for the first five years or so (roughly the deactivation time for the FFTF.)

Well, it seems to me that the conclusion is obvious. Selection of FFTF makes sense economically as well as environmentally and technically. The startup costs and shutdown costs are comparable. If shutdown, the hit on Hanford cleanup costs would be substantial. FFTF has the largest capability and flexibility of all the options. It is the premier test reactor in the world with a proven performance and a safety record second to none. I am sure that when the Department completes the capabilities comparisons, that I spoke to earlier, coupled with other technical input, they will come to the same conclusion that I have – and that is the FFTF is and should be the preferred alternative.

Response to Commentor No. 270

270-3

270-3: The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

270-4

270-4: Except for Alternative 2, the cost of implementing Alternatives 3 and 4 (construction of new accelerators or new research reactor) would be at least twice the cost of restarting FFTF, when FFTF deactivation costs are included. Volume 2, Appendix P contains the Cost Report Summary.

270-5

270-5: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 271: Heidi Wills

Statement regarding FFTF Nuclear Reactor - Public Hearing - 8/30/00

Seattle City Councilmember Heidi Wills
Read by Legislative Assistant Katy Carter

My name is Katy Carter and I work for Seattle City Councilmember Heidi Wills. Councilmember Wills is unfortunately out of town tonight, but I do have a statement from her to present.

I would like to emphasize my opposition to restarting Hanford's FFTF Nuclear Reactor.

First of all, restarting the reactor is unnecessary. Officials have claimed that it would produce needed medical isotopes and fuel for NASA spacecraft. However, the Department of Energy's own Nuclear Energy Research Advisory Committee concluded that "the reactor will not be a viable source of research isotopes." In addition, NASA has informed the Department of Energy that it no longer needs the fuel the FFTF might have produced.

Secondly, the FFTF poses great risks to human health and to the environment. Nuclear waste from the facility may contaminate the water used by the people of Puget Sound, threatening the health of millions of people as well as endangered salmon and other parts of our ecosystem.

Finally, I am concerned that there has not been enough public input into the decision to restart the FFTF. The Department of Energy should disclose the costs of restarting FFTF and the effects of waste production before public hearings are held, so that the public is fully informed.

Thank you for the opportunity to speak about this important issue.

271-1

271-2

271-3

271-4

Response to Commentor No. 271

271-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

271-2: The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April, 2000, regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

The May 22, 2000, correspondence from NASA to DOE identifies that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium 238 to support deep space missions. Rather, SRTG development efforts were suspended in order to permit reprogramming of funds to support development of a new power system based on a Stirling technology generator. This new power system, referred to in the subject correspondence, similarly requires plutonium-238 as its fuel source. Section 1.2.2 was revised to clarify plutonium-238 mission needs.

271-3: The potential health and environmental impacts associated with operation of the Hanford facilities during normal operations and from postulated accidents are presented in Section 4.3 of Volume 1. All impacts to human health and to ecological resources would be small in the immediate area and negligible at all distant locations.

Commentor No. 271: Heidi Wills (Cont'd)

Response to Commentor No. 271

271-4: No decisions have been made with regard to the facilities and locations evaluated to fulfill the requirements of the stated missions. In accordance with Council on Environmental Quality regulations (40 CFR Section 1502.14(e)), DOE has identified its preferred alternative in Section 2.8 of Volume 1. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the environmental impact analysis of DOE's proposed alternatives for meeting the mission requirements, and gave equal consideration to all comments, regardless of how or where they were received. DOE has analyzed each environmental resource area in a consistent, unbiased manner across all the alternatives to allow for a fair comparison among the various alternatives. The analysis included the effects of waste generation to include the quantities and types of waste expected to be generated under each alternative, expected path of disposition, and the impact on waste management infrastructure.

The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS. DOE made every effort to obtain, analyze, and disclose all required information to make a decision on expanding nuclear infrastructure. The costs of the proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. DOE mailed these documents to more than 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P of the Final NI PEIS.

Commentor No. 272: Joe Szwaja

Statement of Joe Szwaja concerning the NI PEIS

My name is Joe Szwaja. I am the Green Party's nominee for Congress from the 7th District. I am a teacher at Nova, a public High School in Seattle. From 1986 to 1993 served on the City Council of Madison, Wisconsin.

The NI-PEIS, as it currently stands, is not acceptable. It does not give an objective, comprehensive review of the need for radioisotopes, and it does not accurately compare the advantages and disadvantages of the possible strategies for meeting America's needs for radioisotopes.

The need for Plutonium 238 for space exploration has not been accurately portrayed in the NI-PEIS. NASA has plainly stated that its usage of Pu-238 will be much less than DOE is projecting. As technology improves, more and more deep space missions will use solar power. It is unlikely that Plutonium will ever again be a significant item on NASA's exploratory mission shopping list.

The military stockpile and demand for Pu-238 has also not been accurately portrayed. The U.S. Air Force's Space Command is planning, in its own words, to "Dominate Space...to dominate the world". On whose behalf? In the words of Arthur Stephenson, director of NASA's Marshall Space Flight Center, "We serve American industry..."

The Air Force and NASA are planning to spend more than a quarter trillion dollars in new military spacecraft in the next ten years. Longer range plans call for much more. Space Command is planning weapons to use in space, but also against ground targets. It even envisions destroying subversives with space-based lasers. Many of its weapons would employ Pu-238. Why is there no discussion of this need for Pu-238 in this PEIS? One possibility is obvious—the DOD and DOE want FTF to produce Pu-238 for space warfare, but they know the American people would reject such belligerence. They are hiding behind a smokescreen of space exploration and cancer fighting.

The people of the seventh district, and in deed of Washington as a whole, have a different agenda for Hanford. Again and again, we repeat: your job is to clean up the mess you made. Your job is to stop nuclear pollution from entering the Columbia. Your job is to stabilize the high level waste to eliminate leakage and prevent catastrophe. Your job is to decontaminate what can be decontaminated, and return those portions of the Hanford site to ecologically sustainable, economically useful purposes. Your job is not to restart FTF, not to import radioactive material to the Northwest, not to contaminate the FMEF, not to persecute whistleblowers, not to lie to the public and not to produce more waste. It is a good job, a vital job, and a challenging job. Get on with it.

Joe Szwaja,
P.O. Box 30929
Seattle, WA 98103
(206) 633-2464

8/30/00

272-1

272-2

Response to Commentor No. 272

272-1: The NI PEIS evaluates a range of reasonable alternatives for maintaining and enhancing DOE's existing nuclear facility infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. However, no component of the proposed action is for the purpose of supporting any defense or weapons-related mission.

DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1 2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG

Commentor No. 272: Joe Szwaja (Cont'd)

Response to Commentor No. 272

development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires one-third less plutonium-238 as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000, letter to DOE that large RTGs be maintained as backup. Section 1.2.2 was revised to clarify plutonium-238 mission needs.

272-2: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to “ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use.” The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

DOE notes the commentor’s opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission and migration of contaminants to the Columbia River. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Commentor No. 272: Joe Szwaja (Cont'd)

Response to Commentor No. 272

More specific to the DOE missions presented in the NI PEIS, FFTF is located approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to the groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

All workers at Hanford are free to, and in fact, encouraged to disclose safety hazards associated with DOE activities. Workers are protected against reprisals by legislation applicable to the U.S. Departments of Energy and Labor.

Commentor No. 273: David Johnson
Heart of America Northwest

COMMENTS TO USDOE NI PEIS HEARING
SEATTLE, WASHINGTON _ AUGUST 30, 2000

- MY NAME IS DAVE JOHNSON, I AM A MEMBER OF THE BOARD OF HEART OF AMERICA NORTHWEST
- I HAVE A Ph.D. IN NUCLEAR PHYSICS FROM THE UNIVERSITY OF WASHINGTON
- I WORKED FOR A NUMBER OF YEARS AT HANFORD
- THAT WORK INCLUDED DOING REACTOR PHYSICS ON THE FFTF REACTOR
- I WAS ALSO RESPONSIBLE FOR ALL MEASUREMENTS OF RADIO-ISOTOPES IN SUPPORT OF DESIGN OF A HIGH POWER ACCELERATOR BASED NEUTRON SOURCE
- I TESTIFIED ON OCTOBER 18, 1999 HERE IN SEATTLE AT THE SCOPING HEARING THAT A SPECIALLY DESIGNED ACCELERATOR BASED NEUTRON SOURCE FACILITY WAS A MUCH BETTER WAY TO MAKE MEDICAL ISOTOPES THAN RESTARTING THE FFTF REACTOR
- THE NI PEIS HAS ANALYZED THE ALTERNATIVE OF BUILDING TWO ACCELERATORS TO FULFILL IT'S NEEDS FOR NEUTRON SOURCES AS SPECIFIED IN THE PEIS
- * HOWEVER, AS I WILL SHOW, THE ANALYSIS APPEARS TO BE A STRAW MAN THAT IS DOOMED TO FAIL IN COMPARISON TO THE FFTF REACTOR
- IT IS APPARENTLY SET UP SO THAT THE FFTF WILL LOOK FAR SUPERIOR
- WHY DO I SAY THIS? LET ME EXPLAIN
- THE TWO ACCELERATORS THAT ARE PROPOSED ARE AS FOLLOWS
- THE FIRST ACCELERATOR IS A LOW ENERGY CYCLOTRON THAT IS PROPOSED FOR MAKING RADIO-ISOTOPES FROM A BEAM OF UP TO 70 MEV PROTONS
- NOTE THAT THIS ACCELERATOR WOULD NOT BE DESIGNED AS A NEUTRON SOURCE
- HENCE, IT WOULD NOT BE CAPABLE OF PRODUCING THE SAME ISOTOPES THAT COULD BE MADE BY THE NEUTRONS IN THE FFTF REACTOR
- FURTHERMORE, I HAVE A LETTER SIGNED BY WILLIAM D MAGWOOD IV, THE USDOE DIRECTOR OF THE OFFICE OF NUCLEAR ENERGY, SCIENCE, AND TECHNOLOGY DATED JULY 7, 1999 THAT STATES THAT THE USDOE DOES NOT NEED SUCH ACCELERATORS

273-1

Response to Commentor No. 273

273-1: DOE notes the commentor's view but contends that Alternative 3, Construct New Accelerators, is a reasonable alternative for meeting the mission objectives.

The high-energy accelerator supports both the plutonium-238 production mission and the civilian nuclear energy research and development mission. The commentor concluded that there is no need for this accelerator because the May 22, 2000, correspondence from NASA to DOE identifies that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium-238 as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that large RTG be maintained as backup. Volume 1, Section 1.1.2 was revised to clarify the plutonium-238 mission needs.

The commentor observed that the low-energy accelerator in Alternative 3 is proposed for the production of medical isotopes. DOE acknowledges that this accelerator will not produce the same array of medical and industrial isotopes produced by reactors or high-energy accelerators. Each irradiation device evaluated in this PEIS for the production of medical isotopes (FFTF, new low-energy accelerator, and new research reactor) will produce an array of medical and industrial isotopes unique to the facility. As indicated above, the design of the high-energy accelerator presented in the PEIS focused on supporting the plutonium-238 production mission, but as stated in Volume 1, Section 2.3.1.5.2, the design could be refined and expanded to perform additional missions such as the production of a select set of medical and industrial isotopes. The low-energy accelerator was configured primarily for the production of a spectrum of proton enriched medical and industrial isotopes. The modified high-energy accelerator and low-energy accelerator could jointly produce a broader spectrum of medical and industrial isotopes.

Commentor No. 273: David Johnson (Cont'd)
Heart of America Northwest

- A DIRECT QUOTE FROM THE LETTER IS "GIVEN OUR EXISTING ACCELERATOR FACILITIES, THE DEPARTMENT DOES NOT REQUIRE A NEW ACCELERATOR FACILITY FOR THE PRODUCTION OF ISOTOPES"
- HE MEANT THE PRODUCTION OF ISOTOPES VIA CHARGED PARTICLES, NOT VIA NEUTRONS
- I WILL ATTACH A COPY OF THIS LETTER TO MY TESTIMONY AS ITEM 1
- BY THE WAY, HE IS ALSO RESPONSIBLE FOR THIS NI PEIS
- FINALLY, SUCH AN ACCELERATOR WOULD COMPETE DIRECTLY WITH INDUSTRY WHICH IS NOT ALLOWED BY THE USDOE'S OWN POLICIES
- HENCE, THERE ARE THREE REASONS THAT THE FIRST ACCELERATOR IS A STRAW MAN, DOOMED TO FAIL AGAINST THE FFTF REACTOR
- THE SECOND ACCELERATOR THAT WAS PROPOSED IN THE NI PEIS IS A LARGE LINEAR ACCELERATOR THAT IS DESCRIBED ONLY FOR USE IN PRODUCING THE ISOTOPE PLUTONIUM -238 FOR POSSIBLE USE IN NASA SPACE PROJECTS
- IT IS A CONVENTIONAL SPALLATION NEUTRON SOURCE THAT IS WELL KNOWN TO WORK WELL, BUT THE BEAM ENERGY IS HIGH AT 1000 MEV
- THE COST OF THIS ACCELERATOR WAS STATED IN A RECENT REPORT AS OVER \$1 BILLION, BUT WITH SIGNIFICANT CONTINGENCY BECAUSE OF SO-CALLED UNCERTAINTIES
- HENCE, IT CLEARLY WOULD NOT COMPETE DIRECTLY WITH THE FFTF RESTART ON THE BASIS OF CAPITAL COST ALONE
- HOWEVER, SURPRISINGLY, IT IS MUCH CHEAPER TO OPERATE THAN THE FFTF
- MORE IMPORTANTLY, HOWEVER, IN MAY OF THIS YEAR NASA FORMALLY TOLD THE USDOE THAT IT DOES NOT NEED THE PLUTONIUM-238 THAT COULD BE PRODUCED BY THE FFTF OR SOME OTHER SOURCE
- HENCE, THE SECOND ACCELERATOR IS ALSO A STRAW MAN, SINCE PLUTONIUM-238 IS NOT NEEDED, THE SECOND ACCELERATOR IS NOT NEEDED
- I HAVE ANOTHER PROPOSAL THAT SHOULD BE THOROUGHLY EXAMINED FOR THE FINAL NI PEIS
- IN DECEMBER OF 1999, THE USDOE SHUT DOWN THE HFBR REACTOR AT BROOKHAVEN NATIONAL LABORATORY FOR SAFETY AND ENVIRONMENTAL REASONS

273-1
(Cont'd)

273-2

Response to Commentor No. 273

The commentor also concluded that based on a July 7, 1999 DOE letter, there is no need for an accelerator to produce medical and industrial isotopes. The letter stated, "Given our existing accelerator facilities, DOE does not require a new accelerator facility for the production of isotopes." DOE operates two accelerators that are being utilized for the production of medical isotopes, the Brookhaven Linac Isotope Producer (BLIP) located at the Brookhaven National Laboratory and the Los Alamos Neutron Science Center (LANSCE) located at the Los Alamos National Laboratory. DOE is currently in the process of upgrading the LANSCE facility with the 100 MeV isotope production facility. The upgrade is scheduled for completion in 2001. After the completion of the LANSCE upgrade, the existing capability at these two facilities will be twice the current need for accelerator generated medical isotopes. Thus, no new accelerator capacity is needed in the short term. In 1998, an Expert Panel convened to forecast future demand for medical isotopes estimated that the expected growth rate of medical isotope use during the next 20 years will range between 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These growth projections were adopted by DOE as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Should the isotope demand grow consistent with the Expert Panel Report, as it has recently, there will be a need for expanded isotope production capacity.

- 273-2: The PEIS did examine a steady state spallation neutron source, the high energy accelerator. As stated in Volume 1, Section 2.3.1.5.2, the design of the high-energy accelerator presented in the PEIS focused on supporting the plutonium-238 production mission, but the design could be refined and expanded to perform additional missions such as the production of a select set of medical and industrial isotopes. The modified high-energy accelerator and low-energy accelerators could jointly produce a broad spectrum of neutron and proton enriched medical and industrial isotopes.

The commentor stated that the capital cost of his proposed accelerator design could be made, "with more study," comparable to restarting FFTF. He estimated the total program cost of the proposed accelerator to be in the range of \$420-570 million. This estimate was based on 1985 dollars.

Commentor No. 273: David Johnson (Cont'd)
Heart of America Northwest

- THIS REACTOR WAS A VITAL PART OF THIS COUNTRY'S NEUTRON SCATTERING RESEARCH PROGRAM. IT HAD SPECIAL LOW TEMPERATURE CAPABILITIES THAT ARE RARE
- I PROPOSE THAT THE NIPES EXAMINE A STEADY STATE SPALLATION NEUTRON SOURCE
- * IT WOULD BE DESIGNED TO DO STEADY STATE NEUTRON SCATTERING RESEARCH AS WELL AS PRODUCE MEDICAL ISOTOPES FROM THE NEUTRONS
- * IT COULD ALSO BE USED FOR SOME OF THE OTHER PROPOSED NUCLEAR RESEARCH ACTIVITIES
- ACCORDING TO EXPERTS IN THE FIELD OF NEUTRON SCATTERING, THERE IS STILL A NEED FOR A STEADY STATE NEUTRON SOURCE EVEN THOUGH A LARGE PULSED NEUTRON SOURCE (THE SNS AT OAK RIDGE NATIONAL LAB) IS UNDER CONSTRUCTION
- I HAVE INCLUDED ITEM 2 AS AN ATTACHMENT TO THIS TESTIMONY TO VERIFY THE NEED FOR A STEADY STATE NEUTRON SOURCE
- THE COST OF SUCH A SPALLATION FACILITY SHOULD BE LESS THAN FOR THE SECOND ACCELERATOR IN THE DRAFT NIPES
- THE FACILITY IS FEASIBLE, IN FACT IT WAS PROPOSED 15 YEARS AGO AT A WORKSHOP AT THE (THEN) NATIONAL BUREAU OF STANDARDS
- I KNOW BECAUSE I AM CO-AUTHOR OF THE PROPOSAL PAPER
- IT WAS TO BE A SPALLATION NEUTRON SOURCE WITH A BEAM ENERGY OF 300 MEV OR MORE
- HENCE, THE ENERGY WOULD BE MUCH LESS THAN THE SECOND ACCELERATOR
- THE BEAM CURRENT WOULD BE MUCH HIGHER HOWEVER
- I HAVE ATTACHED A COPY OF THE PROPOSED STEADY STATE NEUTRON SOURCE AS ITEM 3
- I IMPLORE THE USDOE TO CONSIDER THE STEADY STATE NEUTRON SOURCE AS I HAVE PROPOSED
- IT WOULD BE CAPABLE OF DOING THE NEUTRON SCATTERING RESEARCH AS WELL AS MAKE ALL THE MEDICAL ISOTOPES AND OTHER RESEARCH THAT COULD BE DONE IN THE FFTF
- HOWEVER, IT WOULD DO ALL THAT WITHOUT MAKING MORE FISSION PRODUCT OR TRANSURANIC WASTES

273-2
(Cont'd)

Response to Commentor No. 273

This cost would escalate to \$603-818 million in 2000 dollars due to an inflation rate of 43.5 percent between 1985 and 2000 (<http://www.economagic.com/em-egi/data.exe/fedstl/gnpdef+1>). The total cost of FFTF restart, which includes facility modifications, startup, target development, testing, and evaluation, presented in Table S-3 of the Cost Report, is \$314 million in 2000 dollars. The capital costs of the commentor's proposed accelerator design would have to be decreased, "with more study," more than 48-61 percent to be comparable to the total cost of FFTF restart.

The commentor stated that the annual operating cost of his proposed accelerator should be less than FFTF. Operating costs for the proposed accelerator estimated at \$20-40 million per year in 1985 dollars is \$29-57 million in 2000 dollars. The upper end of the estimated operating cost range is slightly less than the FFTF annual operating cost, \$58.9 million.

273-3: Deactivation of FFTF is not part of implementing Alternative 1, Restart FFTF. Deactivation of FFTF is part of implementing Alternatives 2, 3, 4, and 5 and including the cost of FFTF deactivation in the implementation costs for these alternatives is appropriate. The Cost Report was structured to identify the implementation costs of the various alternatives so the Secretary of Energy would have this information along with other data for consideration. The Cost Report did not identify the source of funding for implementation.

Commentor No. 273: David Johnson (Cont'd)
Heart of America Northwest

- FURTHERMORE, WITH MORE STUDY, THE CAPITAL COST COULD BE MADE QUITE COMPARABLE TO RESTARTING THE FFTF
- FINALLY, THE OPERATING COST SHOULD BE LESS THAN THAT OF THE FFTF WHICH MEANS THAT REVENUE FROM SALE OF ISOTOPES COULD MORE QUICKLY PAY OFF THE DEBT
- AS AN ADDED POINT, IT IS NOT FAIR TO ADD \$281 MILLION TO THE COST OF ACCELERATORS WHEN THE COST FOR DISMANTALLING THE FFTF WOULD COME OUT OF THE ENVIRONMENTAL MANAGEMENT BUDGET, NOT THE NUCLEAR ENERGY BUDGET
- THANK YOU

273-2

Response to Commentor No. 273

**Commentor No. 274: Nancy Rising
Peace Action of Washington**

Statement of Nancy Rising concerning the NI PEIS

I am the Chairperson of Peace Action of Washington, representing almost 18,000 households in Western and Eastern Washington. Peace Action's members have been concerned about Hanford for many years. We want the DOE to stick to first things first. We want the clean up of Hanford to become the primary objective of the DOE, without distractions such as a return to production of nuclear waste for whatever purpose.

Until you have shown that you can clean out all leaking or "watch list" tanks, and stabilize all high-level waste in a timely and cost-effective fashion, that is your job. Until you have identified all significant bodies of pollution on the site and downstream, and taken appropriate measures to keep them out of the Columbia and out of our environment, that is your job. Until you have thoroughly decontaminated usable land and facilities, so that they can again make positive contributions to the region and the nation, that is your job. Until Hanford workers are free to speak out when they see safety hazards, incompetence or corruption, without fear of reprisal, that is your job. Other priorities can wait.

The Department of Energy's draft NI PEIS is neither complete nor objective. Whether deliberate or inadvertent, the cumulative effect of numerous omissions to the PEIS are unprofessional and bias the PEIS in favor of a de-facto "preferred alternative," the restart of the Fast Flux Reactor. Many have already been brought to your attention, especially the NASA letter should have been included in the discussion of the need for Pu-238.

An omission that hasn't been mentioned since it was pointed out by Peace Action members during the scoping process is the military Pu-238 stockpile. Since the START treaty, the number of deployed nuclear warheads has been drastically reduced. Further reductions are expected. The Pu-238 used to power the electronics on these warheads can now be used to power spacecraft, if necessary. The omission of any discussion of this resource tends to bias the PEIS further in favor of restarting FFTF.

The tri-cities economy is dependent on Hanford, and the DOE has an obligation to continue to provide steady employment in the area. If the DOE does not make real progress on the Hanford cleanup, and continues to pursue pork-barrel projects instead of real solutions to America's energy and security needs, we are concerned that Congress will continue underfunding the Hanford clean up. Hanford will become an environmental and economic national sacrifice area.

Nancy Rising, Chair
Peace Action - Washington
5001 - 112th Ave. NE
Kirkland, WA 98033

Response to Commentor No. 274

274-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

DOE was tasked by Congress in the Atomic Energy Act to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental impacts to accomplishing the proposed action. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure mission described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected. FFTF restart and operation would not impact the schedule or available funding for existing cleanup activities.

Steady and consistent progress in restoring Hanford is documented in annual reports. These are available at www.hanford.gov. Hanford has a comprehensive waste minimization and pollution prevention program in place as summarized in Section 3.4.11.8 that controls any activity generating waste on the site.

Workers at Hanford are free to and encouraged to disclose safety hazards associated with DOE activities. Workers are protected against reprisals by legislation.

274-1

274-2

274-1

***Commentor No. 274: Nancy Rising (Cont'd)
Peace Action of Washington***

Response to Commentor No. 274

274-2: This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR 1500 through 1508 and 10 CFR 1021, respectively). DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives.

The acquisition and use of surplus, defense-related plutonium-238, if available, were not considered and are outside the scope of the civilian nuclear infrastructure missions considered in this NI PEIS. The commentor is correct that small radioisotope thermoelectric generators (RTGs) using plutonium-238 are used to power electronic systems on some strategic weapons, some of which have become surplus due to strategic arms reductions. Although the exact configuration of these RTGs is classified, the amount of plutonium-238 in each unit is relatively small and the assay of the plutonium-238 is much lower than that required for use in NASA spacecraft.

DOE assumes that the commentor's reference to the "NASA letter" refers to the May 22, 2000, letter from NASA Headquarters to the DOE Office of Space and Defense Power Systems. This letter is cited in Section 1.2.2 of Volume 1 of the Draft and Final NI PEIS with regard to the discussion of plutonium-238 needs for future space missions. While this letter states that NASA no longer has a need for Small Radioisotope Thermoelectric Generator (SRTG) power systems, this letter also lists the planned deep space probe missions which would specifically require plutonium-238. These missions and their planned launch dates are outlined in Section 1.2.2 of this NI PEIS. For reference, this letter and all of the references cited in this NI PEIS are available in the public reading rooms established by DOE.

Commentor No. 275: Chris Jackins

August 30, 2000

REGARDING:

Opposition to restarting FFTF Nuclear Reactor
(Fast Flux Test Facility reactor)

FROM: Chris Jackins
P.O. Box 84063, Seattle, WA 98124

My name is Chris Jackins.

Thank you sending me a copy of the draft Environmental Impact Statement. Looking through the documents, I saw information on economic (socioeconomic) impacts, like jobs.

For example, the documents mention that more Plutonium-238 could have been purchased from Russia, but was not purchased, "due to budget constraints". (page S-5) And, some alternatives were dismissed based on projected costs. (page S-19)

Three questions:

1. The documents state that some 12 million nuclear medicine procedures are performed each year. (page S-2) If the FFTF reactor were to supply medical isotopes for these procedures, do you have an estimate for the average cost per procedure attributable to the FFTF reactor, and a comparison to the cost from other sources?
2. Do you have an estimate for the average cost per kilogram of Plutonium-238 produced by the FFTF reactor, and a comparison to the cost from other sources?
3. If FFTF costs are higher, would subsidizing production be legal under World Trade Organization (WTO) agreements?

After recent fires at Hanford, traces of a number of radioactive elements were detected in nearby areas. This is a reminder that Hanford already has an existing abundant supply of radioactive elements.

It has been reported for some time that the precise contents of a number of the waste tanks at Hanford is not known. Perhaps there is a lot of "swell stuff" in those storage tanks.

The process of dealing with this waste is already on the agenda. It would be sensible to look the waste over first, before shopping around for more. One need not be like alchemists, who, not content at owning an actual gold mine, wish instead to manufacture the element themselves.

According to recent news reports, NASA does not need the Plutonium-238 that would be produced by the FFTF reactor, and there is already adequate production of medical isotopes. (See, for example, Seattle Times, August 29, 2000, "Restart of reactor challenged"; Seattle Times, August 29, 2000, "Hanford's FFTF reactor poses unacceptable risks")

The FFTF reactor should not be restarted. The focus should be on cleaning up Hanford's radioactive waste.

Thank you.

Response to Commentor No. 275

275-1: The estimated costs of the range of reasonable alternatives are presented in the Cost Report and are summarized in Appendix P of the Final NI PEIS. However, the Cost Report is not a cost-benefit analysis. While it is reasonable to believe that the benefits of medical isotopes are substantial, the purpose of this NI PEIS is to describe the nuclear infrastructure missions (Section 1.2 of Volume 1), a range of reasonable alternatives for satisfying the mission requirements (Section 2.5 of Volume 1), and the environmental impacts that would result from implementation of the alternatives. According to 40 CFR Section 1502.23, if a cost-benefit analysis exists, it must be reported and summarized in the NI PEIS.

No estimate of average cost per procedure or cost per kilogram of plutonium-238 attributable to FFTF was made in the Cost Report. DOE also does not anticipate any need to subsidize the operation of FFTF.

275-2: No radioactive materials were "released" in the Hanford wildfires of 2000. Wildfires did resuspend some materials already in the environment. The resuspended materials were low; slightly above natural background levels. The very low levels required several days of analysis to quantify. Additional information is available to the public at <http://www.Hanford.gov/envmon/index.html>. This site also provides a link to information on the independent offsite air monitoring conducted by the U.S. Environmental Protection Agency.

The utilization of radioisotopes in current Hanford wastes for medical isotope use was not in the scope of this PEIS. The primary reason is that Hanford wastes contain "aged" isotopes not typically useful in medical procedures (i.e., short-lived isotopes). A secondary reason is that nearly all wastes at Hanford has had a treatment and disposition determined.

275-3: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice

Commentor No. 275: Chris Jackins (Cont'd)

Response to Commentor No. 275

regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires one-third less plutonium-238 as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000, letter to DOE that large RTGs be maintained as backup. Section 1.2.2 was revised to clarify plutonium-238 mission needs.

275-4: DOE notes the commentor's opposition to Alternative 1, Restart FFTE.

276-1

276-1: DOE notes the commentor's views and concerns and receipt of the referenced attachment. The purpose of this NI PEIS is to evaluate the environmental impacts of reasonable alternatives to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238 for NASA space missions, and nuclear research and development. As evaluated under Alternative 1 in this NI PEIS, FFTF would be restarted to accomplish these nondefense-related missions. Other unrelated nuclear energy and defense-related considerations are beyond the scope of this NI PEIS.

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Commentor No. 277: Roy D. Goodman

8/30/00 Presentation in Seattle at Department of Energy public hearing
on NI PEIS for Fast Flux Test Facility at Hanford
(to the tune of the Village People's "Y.M.C.A.")
by Roy D. Goodman,
Seattle, Washington

**Hanford, it's in Washington State,
I said Hanford, full of nuclear waste,
I said Hanford, suffers from your delay
To honor your clean-up agreement,**

**Hanford's where you want to restart,
I said Hanford, making plutonium as part
Of your charter to power NASA in space,
First fix the earthly mess you've made.**

**It's time to shutdown the F.F.T.F.,
It's time to shutdown the F.F.T.F.,
Hanford's fouled up enough, you don't need to make more
Deadly waste you don't know how to store.**

**It's time to shutdown the F.F.T.F.,
It's time to shutdown the F.F.T.F.,
And get on with your task of clean-up till it's done,
Make life safer for everyone.**

**Hanford's not where you need to impose
To produce medical isotopes,
Your own folks said don't be such dopes,
It can be done cheaper elsewhere.**

**Hanford for research nuclear,
Ship plutonium thru ports around here,
Vhat?! Are you crazy?! If ve all vant to live,
There's only one alternative.**

**And that's to shutdown the F.F.T.F.,
It's time to shutdown the F.F.T.F.,
Hanford's messed up enough, you don't need to make more
Deadly waste you don't know how to store.**

277-1

277-1: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

277-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

277-2

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost-efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of

Response to Commentor No. 277

various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NIPeIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

The commentor appears to express the concern that DOE would expose constituents in the Seattle area to risks associated with the transport of weapons-grade plutonium. None of the proposed alternatives involve the shipment of any weapons-grade plutonium to any port in the United States. Alternative 1 does postulate that DOE might decide at some point to import mixed oxide fuel from Europe to fuel FFTF. At this time, however, DOE has not proposed to import this fuel through any specific port. If DOE ultimately decides to import fuel from Europe, it would perform a separate NEPA analysis to select a port. This review would address all relevant potential impacts of overseas and inland water transportation, shipboard fires, package handling, land transportation, as well as safeguards and security associated with the import of SNR-300 mixed oxide fuel through a variety of specific candidate ports on the west and east coasts. It would consider all public comments, including local resolutions, concerning the desirability of bringing mixed oxide fuel into the proposed alternative ports.

In the event that DOE decides to enhance its nuclear infrastructure, it would not expose any population to high, unacceptable risks under any alternative. Any transportation activities that would be conducted by DOE would comply with U.S. Nuclear Regulatory Commission and U.S. Department of Transportation regulations. Associated transatlantic shipment would comply with International Atomic Energy Agency

Commentor No. 277: Roy D. Goodman (Cont'd)

Response to Commentor No. 277

requirements. In Section J.6.2, DOE reviewed the potential maximum impacts from the marine transportation of mixed oxide fuel from Europe to a representative military port, Charleston, South Carolina, and overland transportation to Hanford. Also in that section, a bounding analysis demonstrates that the maximum potential radiological risks to the surrounding public from mixed oxide fuel shipments would be extremely small (e.g., less than 1 chance in a trillion for a latent cancer fatality per shipment from severe accidents at docks and in channels and less than 1 chance in 50 billion for a latent cancer fatality per shipment from overland highway accidents).

Commentor No. 278: Rick Mounce

Rick Mounce
2806 W. 46th Ave
Kennewick, Washington 99337

Good Evening, my name is Rick Mounce. I reside in Kennewick, WA. I am speaking tonight as a private citizen.

I was not surprised that the PEIS confirmed that there was essentially no public risk associated with operation of the FFTF to support an expanded isotope mission. Since I have been associated with operation of the FFTF for many years, I can personally attest to its high standards of safety.

278-1

But tonight, I would like to comment on information that I have seen distributed by some of the anti-nuclear activist groups attending these meetings.

One activist brochure I picked up is titled "Hanford and the River" by Columbia River United. This brochure identifies the major areas and past operations at Hanford that have impacted the Columbia River. I read this document front to back and would like to point out that the FFTF operated for ten years, but is not mentioned one single time as having had a past impact on the Columbia River. Why? Because operation of FFTF has absolutely no impact on the river.

278-2

Another hand-out I read was from Columbia Riverkeeper. In it they demand that the following statement be removed from the PEIS summary on spent fuel management. "The environmental impacts associated with the existing inventory of spent fuel at the Hanford site are minimal."

I agree that this statement should be removed. Instead, the PEIS summary should reflect DOE's well-publicized and appropriate commitment to remove the 2100 metric tons of spent fuel from Hanford's 100 area water basins. This defense mission spent fuel does not include the 16 metric tons of non-defense spent FFTF fuel.

278-3

The PEIS summary should also discuss the minimal environmental impacts associated with storing the spent FFTF fuel on its own merits. Namely, that it is not corroded and is stored in dry storage casks, not the aging defense mission water basins. This section should also be consistent with Chapter 4 of the PEIS which correctly states that the FFTF spent fuel will be packaged and shipped to the repository for disposal.

However, I am surprised at some of the information I have seen distributed by Heart of America Northwest. Maybe I shouldn't be. It seems that because they could not find any significant or legitimate comments on the PEIS, they have had to resort to distributing inflammatory half-truths and outright fabrications under the guise of "public education."

278-2

Response to Commentor No. 278

278-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

278-2: DOE notes the commentor's views and observations. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to the groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

278-3: The discussions in the Summary and Section 4.8.3.5 of Volume 1 on the cumulative impacts for spent nuclear fuel management at Hanford were revised to clarify that the management of the existing spent nuclear fuel at Hanford results in a dose of less than 0.1 millirem per year of the maximally exposed member of the public. This dose is well within the DOE limits given in DOE Order 5400.5. As discussed in that Order, the dose limit from airborne emissions is 10 millirem per year, as required by the Clean Air Act; drinking water is 4 millirem per year, as required by the Safe Drinking Water Act; and the dose limit from all pathways combined is 100 millirem per year. DOE has committed to remove the spent nuclear fuel at Hanford for ultimate disposition in a geologic repository.

Commentor No. 278: Rick Mounce (Cont'd)

The lengths they will go to mislead the public into supporting their agenda is evidenced in information they publish and distribute. One example of their so-called "credible" educational material is their statement that; "Restart of the FFTF nuclear reactor will have enormous environmental consequences for the Pacific Northwest for generations to come. Restart of the FFTF nuclear reactor will mean importation of Weapons Grade Plutonium in "Mixed Oxide" fuel to Hanford from Germany and production of 35,000 pounds of High-Level Nuclear Waste - waste which USDOE has no idea of where or how to dispose of, but the report (and here they mean the PEIS) just concludes that the waste can be stored indefinitely at Hanford."

Note that the 35,000 pounds of High-level Nuclear Waste they are referring to is the 16 metric tons of spent FFTF fuel that I mentioned earlier. Also note that FFTF fuel is not, nor could it ever be, classified as weapons-grade plutonium.

Well, had Heart of America Northwest read the PEIS, they would have noticed the section entitled Spent Nuclear Fuel Management in Chapter 4. In it they would have discovered that DOE did not, in any way, conclude that the spent fuel would be stored indefinitely at Hanford. Instead, they would know that the disposition path for the 16 metric tons of spent FFTF fuel is to package it in acceptable containers and ship it to the repository for disposal, the same process as for the nation's 105,000 metric tons of commercial reactor fuel. They would also know that the time-line for doing this is either during operation or at cessation of reactor operation.

Furthermore, if Heart of America Northwest really had public education in mind they would be knowledgeable about the status of the repository at Yucca Mountain. They would then know that the FFTF fuel is suitable for repository disposal in its current form and that its contribution to the overall projected repository inventory is a whopping 0.015%.

This hardly qualifies as enormous environmental consequence for generations to come.

This is just one example of deliberate misrepresentation of the facts by a handful of anti-nuclear activists. You have already heard or will hear other examples tonight.

By using false pretenses to intentionally scare and mislead the public into supporting their agenda, some of these organizations have seriously undermined the NEPA process and their own credibility and it is my opinion that they are not trustworthy nor qualified to speak on behalf of the public interest.

On a personal note, just last month I lost my brother to cancer. He was 49 years old. Perhaps, had FFTF been restarted to produce medical isotopes earlier, he may still be alive today; therefore I fully support the restart of the FFTF to produce medical isotopes in support of the eradication of this and other debilitating diseases.

278-2
(Cont'd)

278-1

7/12/00

279-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

279-2: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site.

279-3: DOE notes the commentor's concern regarding the proper handling and transportation of wastes. DOE Order 435.1 "Radioactive Waste Management" was issued on July 9, 1999. Per this Order, each DOE radioactive waste receiving facility shall evaluate waste for acceptance, including confirmation that the technical and administrative requirements have been met including the facilities waste acceptance criteria. A process for the disposition of nonconforming wastes is also to be established. The commentor provided a few examples of when the waste receiving facility had identified certain wastes that did not meet the technical and administrative requirements.

FFTF restart would not impact the cleanup missions at Hanford. With respect to waste management and cleanup issues, the Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Chapter 2—Written Comments and DOE Responses

Commentor No. 279: Sarah Schmidt (Cont'd)

Sarah Schmidt
3815 Woodland Park Ave N #205
Seattle, WA 98103

The following information was researched and compiled during my internship at Heart of America Northwest. This information, consisting of internal memos and reports, was sent by the Department of Energy and obtained through the Freedom of Information Act.

Per Memo dated May of 1995, issued by The Hanford Public Westing House Company, document number 9502473R1. Pertaining to a mismanaged waste shipment sent by the Lawrence Berkeley National Laboratories to Hanford's Low Level Burial Ground. Problems with this shipment included, but were not limited to:

- Leaking containers
- Mislabeled Waste
- Improper Packaging such as mixing, and overfilling

Per reports by Lana Richterich, dates ranging from December 1996 to January 98, document number SWIR611. Pertaining to repeated nonconformance by Argonne National Laboratories in their shipment of waste to Hanford. These violations contained but were not limited to:

- Leaking containers
- Mislabeling of waste
- Exceeding allowed weight of waste
- Mixing of potentially incompatible waste

Because these examples were repeat errors by Argonne National Laboratories, the reader of the reports is lead to the conclusion that nothing was done to solve the problem.

Per Memos pertaining to End of the Year Assessments by Department of Energy Contractors to confirm that they are up to State and Federal guidelines on waste management:

Martin Marietta Energy Systems March 1994, Document number 9452287.

Restricted Status.

Problems identified at the various locations mentioned above included but were not limited to:

- mislabeling of waste
- mixing of waste
- inadequately trained staff handling the waste

This is just a small example of the incompetence that is displayed in the handling of the waste already buried at Hanford. Now you expect the citizens of Washington and Oregon to trust you when you say that the Department of Energy can handle the excessive waste that will be created by the Fast Flux Test Facility?

It is time to stop robbing the cleanup fund and keep the promises you made in the Tri-Party Agreement.

SHUT DOWN FFTF ONCE AND FOR ALL AND CLEAN UP THE MESS YOU HAVE ALREADY CREATED.

This is our state and we will be heard.

Commentor No. 280: Sally Lamson

Good Evening. My name is Sally Lamson. I'm ^{currently} a resident of Kennewick Washington and representing myself. I would like to spend the next few minutes setting the record straight on one of the topics in Heart of Americas citizens guide for these hearings. Specifically, the distortion and fabrications that DOE is "Violating the Hanford Cleanup Agreement" and that "cleanup funds are lost every year to FFTF."

Let's go over the facts.

Fact 1.

The decision to shut down the FFTF was a unilateral decision by the U.S. Department of Energy, not a "covenant" or promise between the DOE, Environmental Protection Agency and Washington Department of Ecology. Following the shutdown decision in December 1993, FFTF was included in the Tri-Party Agreement to establish milestones with the goal of conducting shutdown work in an orderly sequence to ensure coordination with other Hanford Site cleanup actions.

Fact 2.

When DOE identified a possible future mission for the reactor, shutdown work was terminated and the facility was placed in standby. ¹ DOE initiated discussions with the Washington State Department of Ecology to revise the TPA milestones, and public meetings were held. As a result, the milestones were placed in temporary suspension until the Secretary of Energy issues a final decision on whether or not to restart the FFTF. If the FFTF restarts, the milestones will be deleted. If the FFTF is directed to shut down, new dates for the milestones will be negotiated. What I described is the TPA change process. Therefore, is Heart of America also inferring

280-1: DOE notes the commentor's views and observations.

280-2: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 280: Sally Lamson (Cont'd)

that the EPA and the WDOE are violating the Hanford Cleanup Agreement? I don't think so, and neither is the DOE.

Fact 3.

The statement that cleanup funds are being directed to the FFTF is recurring and false ^{distortion.} ~~Heart of America rhetoric.~~ They are fully aware that resources for maintaining the FFTF in standby is provided by separate funding appropriations from Nuclear Energy, which is completely unrelated to the cleanup budget under Environmental Management. If the FFTF were to restart, Nuclear Energy funding appropriations would continue. Let me reemphasize, **FFTF funding for standby and potential restart does not come out of the cleanup budget.**

Fact 4.

If FFTF was selected for the proposed missions, the estimated restart funding is \$314M. If the missions under consideration in the PEIS were assigned to other DOE sites, appropriate funding from Nuclear Energy, **not clean up**, will still be required. Interestingly, if this were to occur, additional funding of ~\$281M would also be required for the concurrent deactivation of the FFTF, and this funding would come from the Hanford cleanup budget. It takes money to shut the FFTF down. Recapping, if the FFTF were not selected as the preferred alternative, the cost to the DOE would be almost twice as much or greater to meet the PEIS needs, depending on which alternative was selected. And the hit on Hanford cleanup costs would be substantial.

280-1
(Cont'd)

Response to Commentor No. 280

Commentor No. 280: Sally Lamson (Cont'd)

My conclusions are:

- 1.) The Heart of America statements discussed earlier are completely unfounded and without merit.
- 2.) Selection of the FFTF as the preferred alternative makes sense economically as well as environmentally and technically. The startup costs and shutdown costs are comparable. The FFTF has the largest capability and flexibility of all the options. It meets the needs and requirements of the PEIS. It is the premier test reactor in the world with a proven performance and a safety record second to none. I trust that the DOE will agree and make the right decision.

**280-1

280-2

Response to Commentor No. 280

Commentor No. 281: Brian Berglin

Good evening, my name is Brian Berglin. I live in the Tri-Cities and I am representing myself this evening. First, I would like to thank the DOE for preparation of this PEIS and addressing the need for expanding the nation's nuclear infrastructure to support these important civilian missions. I believe that FFTF should be selected as the preferred alternative in the final PEIS because it provides the greatest capacity and flexibility of the options being evaluated and, as the PEIS analyses clearly indicate, the environmental impacts associated with restart and operation are small.

I want to also express my concerns tonight about the misleading information being circulated by Heart of America Northwest regarding FFTF restart, apparently to scare and mislead the public. This does a great disservice to the EIS and decision-making process, and more importantly, to the people in this region. A lot is at stake with the upcoming decision on this PEIS, and opinions should be based on truthful information, not obvious fabrications being made under the guise of informing the public. I would like to address one topic in particular where this is occurring, waste generation and management.

Waste generation is an area of importance to everyone in the northwest. I would like to address several false statements that were made related to the wastes that would be generated by the proposed restart of FFTF and how these wastes would be managed. I have been involved with operation of FFTF for many years and I believe I am knowledgeable to speak in this area.

Heart of America claims that "Internal USDOE documents reveal that restarting the FFTF Nuclear Reactor will add more liquid radioactive waste to Hanford's leaking and explosive High-Level Nuclear Waste tanks." This is untrue and a good example of the use of scare tactics. FFTF has never generated high level waste and as stated in the PEIS there will be **NO** high level radioactive waste produced by any of the proposed missions. Since not a single drop is generated, then it goes without saying that operation of FFTF, or the Hanford facilities being considered for processing, would not add a single drop of waste to the Hanford High Level Waste tanks, nor in any way affect the Columbia River. In fact, as stated in the PEIS waste management sections, if the FFTF is selected for the proposed missions, DOE plans to use available 400 Area and commercial facilities to store, process and dispose of the wastes that would be generated.

Heart of America claims that "Radioactive Wastes would be buried in Hanford's unlined, unregulated low-level waste trenches -with no consideration of environmental and health

281-1

281-2

Response to Commentor No. 281

281-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

281-2: DOE notes the commentor's views and observations. DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and to providing ample opportunity for public comment on those actions.

The use of proposed alternative facilities associated with processing of neptunium-237 targets would have no impact on schedules or available funding for high-level radioactive waste programs at either Hanford or the INEEL sites. At INEEL the tanks would not be used although certain facilities at the Idaho Nuclear Technology Engineering Center (INTEC) would be used to treat the wastes resulting from processing the irradiated targets. These are reliable systems that would process a maximum of 1,050 cubic meters of low-level radioactive waste over the 35-year nuclear infrastructure operational period. The higher activity waste would be treated as a solid form via a stand-alone vitrification system, separate from any tank waste treatment system. At Hanford, the existing high-level radioactive waste facilities would also not be used, and as analyzed in the PEIS, no existing or planned high-level radioactive waste facilities would be used to treat the wastes resulting from processing the irradiated targets.

Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

Commentor No. 281: Brian Berglin (Cont'd)

impacts.” As I mentioned before, available 400 Area and commercial facilities would be used for waste disposition. Therefore, DOE does not intend to send any waste generated at FFTF to the Hanford burial trenches. And by the way, wastes disposed of in Hanford’s burial trenches must meet specific criteria for burial and be appropriately packaged before being accepted for burial in the trenches, which are operated in accordance with federal regulations.

Heart of America claims that “USDOE deliberately violates NEPA (the law requiring this EIS) by saying they will disclose plans for these wastes in a future document instead of right now.” This is another example of Heart of America rhetoric. What the PEIS does say is that DOE intends that waste be managed independent of the existing Hanford site waste management infrastructure by using commercially available facilities. Contrary to statements made at earlier public meetings, use of commercial facilities is consistent with current DOE policy and is already in practice at other sites. It further discusses the Waste Minimization and Management Plan for FFTF that was developed in consultation with the Washington State Department of Ecology and the Oregon Office of Energy. This Plan identifies a program and process for incorporating pollution prevention and waste minimization practices into FFTF’s restart and operations planning, if FFTF is selected to restart. The process laid out in this plan would involve key stakeholders, including the states of Washington and Oregon, in waste management, waste minimization and pollution prevention decisions. Are these the actions of an agency trying to ignore the public’s concern with waste generation? I don’t think so.

Heart of America also claims that the PEIS does not look at safety or environmental impacts from adding more wastes. This again is untrue. The PEIS addresses the radiological and chemical impacts on workers and the public from waste management activities. The amount of wastes that would be generated are very small and would be safely managed in full compliance with state and federal laws, as they are now, and pose no threat to the public or the environment. The humanitarian benefits to the general population from the production of medical isotopes clearly outweighs the small impact of the waste that would be produced. I am confident that FFTF can safely and competently support these missions and that the wastes generated would likewise be safely and appropriately managed.

**281-2
(Cont'd)**

Response to Commentor No. 281

Commentor No. 282: Dan Arrigoni

Good Evening, my name is Dan Arrigoni and I am a citizen of the Pacific Northwest.

I am pleased to have the opportunity to provide my comments to DOE regarding the PEIS alternative to operate the FFTF.

I have become very frustrated with newspaper articles that have been published in Pacific Northwest regarding the DOE alternative to operate the FFTF. It seems that unreliable sources have purposely and unfairly influenced the media with propoganda designed to scare and mislead the public into supporting an anti-nuclear agenda.

This is why I find a recent article published in the Oregonian so refreshing. I am impressed that they sought out factual information so they could fairly present the virtues of operating the FFTF to the public.

I would like to read this article into the record that was published on August 29, 2000, prior to the public hearing in Portland.

READ ARTICLE

In closing, I urge everyone in this room to follow the Oregonian's lead and accept your responsibility to seek out factual information seriously.

The opportunity to provide the public with progressive cancer treatments is too important to throw out based on the self-centered bias of a few individuals.

Dan Arrigoni

282-1

Response to Commentor No. 282

282-1: DOE notes the commentor's views and observations as well as those expressed in the Oregonian newspaper article.

Commentor No. 283: Bill Dautel

Good evening, my name is Bill Dautel and I am speaking tonight as a citizen of the Pacific Northwest.

Recently, I read a citizen's guide that was distributed by an anti-nuclear activist group called Heart of America Northwest. These anti-nuclear activists claim that they serve to "educate" the citizens of the Pacific Northwest on a number of topics addressed in this guide. This material is so chock full of misquotes, distortions, and outright fabrication that it appears that the sole purpose is only to scare and mislead the citizens of the Pacific Northwest into supporting their anti-nuclear platform.

Because of the time limitation, I will only touch on one area of this so-called "educational" material and contrast this to the factual information stated in the PEIS. I am not asking you to change your position, I merely ask that you listen with an open mind. Then I challenge you to personally seek out the facts. It is only by this process that you will be able to form an informed position. The benefits of operating FFTF to alleviate the very real future health risks to you and your family are too important to throw them out based on heresay.

The area I would like to address tonight is the section of the Heart of America guide titled "Weapons-Grade Plutonium Could Come Through Puget Sound." The plutonium that they are referring to is unused mixed oxide fuel that has no future use in Germany but can be used to operate the FFTF reactor for 15 years. This fuel is essentially identical to FFTF fuel. As such it is not, nor could it ever be classified as "weapons-grade" plutonium.

They also claim that DOE has ignored transportation risk concerns in the PEIS and that citizens <quote> "demand that USDOE acknowledge that a ship fire in Puget Sound, with plutonium on board, could kill thousands and permanently leave a large area uninhabitable. Oppose any scheme to import plutonium fuel through any port to FFTF." <unquote> Maybe Heart of America Northwest hasn't read the Table of Contents of the

283-1

Response to Commentor No. 283

283-1: DOE notes the commentor's views and observations.

Commentor No. 283: Bill Dautel (Cont'd)

PEIS yet. Otherwise, they would discover that an entire appendix is dedicated to impacts of transportation.

If you read this section, you will discover that public and environmental safety is paramount. You will also discover that it is unlikely that DOE will even ship the fuel to Puget Sound, not because of any risk, but because it costs more to sail to the west coast than to sail directly to an eastern port. Charleston Naval Station has been the primary port for receiving foreign fuel for the past five years and was the port selected for detailed analysis in the PEIS.

The activist material claims that a ship fire could kill thousands and leave a large area uninhabitable. Have they supplied you with an independently reviewed risk analysis that explains just how this event could occur? I don't think so.

Let's examine the facts. First, the FFTF fuel is designed to operate at temperatures up to 1500 degrees fahrenheit and is not susceptible to damage from the DOT severe transportation fire temperature of 1475 degrees fahrenheit. Additionally, FFTF fuel has been safety tested and shown not to leak under these conditions. Second, the fuel is transported in certified high integrity casks. These casks are subject to stringent regulatory safety testing to verify beyond doubt that they will not leak during severe transportation accident conditions, including fire. Third, certified purpose-built ships would be used to transport the fuel casks from Europe to the U.S. These ships are constructed with double hulls to assure that they can withstand a collision without penetrating the inner hull. Every part of the ship is protected by an automatic fire system which will quickly detect, isolate, and suppress a fire should one break out in any one of the separate compartments. The individual holds can also be deliberately flooded with water, and, if all the holds were flooded the ship would still remain afloat. These levels of safety are what contribute to the low level of risk to transport the fuel. In fact, the accident risk in the PEIS was determined to be less than 10^{-12} latent cancer fatalities or 1 in a trillion.

**283-1
(Cont'd)**

Response to Commentor No. 283

Commentor No. 283: Bill Dautel (Cont'd)

Let me put this in perspective. The risk of dying from radiation exposure received from flying round trip cross-country is approximately 1 in a million. Mightly small. The risk from fuel transportation is a million times less. So I ask you, is this the enormous risk that results in thousands of deaths as claimed by Heart of America Northwest? Hardly!! In my view this is a blatant insult to the intelligence of the public and undermines the entire NEPA process. The transportation of nuclear fuel is completely safe.

Thank you for this opportunity to comment.

testimony from Seattle Raging Grannies

Sung to Solidarity forever

HANFORD

The chosen site of Hanford
 Is for radioactive waste
 It mixes in our water
 And we all can have a taste
 The river called Columbia
 Is about to get some too
 Nuclear soup for me and you

Leaking tanks forever
 Leaking tanks forever
 Leaking tanks forever
 Plutonium makes us strong

We have so little money
 For cleaning up the mess
 We're spending it on armaments
 That bring us happiness
 So what's a little poison
 When you mix it in your tea
 It builds our economy

Leaking tanks forever
 Leaking tanks forever
 Leaking tanks forever
 Plutonium makes us strong

STOP WASTING MONEY ON FFTF

Yes: Pack up Your Troubles!

Stop wasting money on FFTF
 Its "leak", clean, "leak"
 Clean up the messes you've already made,
 And don't make any more.

FFTF's not needed,
 To make those isotopes,
 So, shut down FFTF
 For diox and all,
 and clean, clean, clean.

FFTF is blowing in the wind

How many times must we come before you
 to tell you to shut that thing down?

How much clean-up could you have done
 with all that money & time?

How many years will you keep sanding &
 A reason for it to survive?

The answer my friends is all politics
 The answer is blowing in the wind

284-2

284-1

Response to Commentor No. 284

284-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford and the potential for contaminants in the Columbia River. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The proposed action described in the NI PEIS would not have an impact on Hanford cleanup activities. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to the groundwater. As indicated in analyses presented in Chapter 4 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

With respect to plutonium processing, no weapons material will be produced under the proposed action. All missions in this PEIS are for civilian purposes.

Hanford tank waste issues are not within the scope of this PEIS, as none of the alternatives considered would add to these waste volumes.

284-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF. DOE also notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site.

Commentor No. 284: Raging Grannies of Seattle (Cont'd)

Why Do We Sing?

We sing to encourage respect for all people, to encourage casting aside prejudice... to help in the struggle to build a world we will be happy and proud to pass on to our precious grandchildren. We sing for a JUST world in which PEACE reigns.

What Are We Raging About?

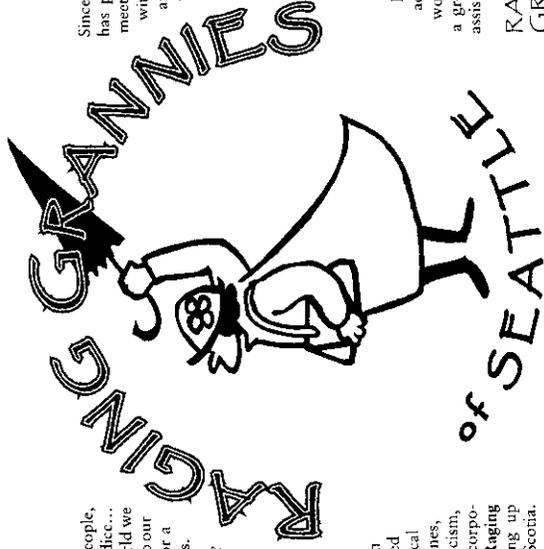

We are enraged about the poor conditions that people are forced to endure in their lives. We rage about the pollution on the earth, and we rage against corporate greed.

The Beginning

In Victoria, British Columbia, in 1986, several peace activists dressed up in outrageous hats and sang satirical songs to protest nuclear submarines, uranium mining, nuclear power, racism, militarism, clear-cut logging and corporate greed. They called themselves Raging Grannies. Groups promptly sprang up across Canada, all the way to Nova Scotia.

The idea spread across the border to Vermont and inspired the first U.S. Raging Grannies. Kathleen Kelley, a member of the Vermont group, called the first meeting of the Raging Grannies of Seattle.

Our debut performance, on February 12, 1996, was in Olympia at the President's Day rally sponsored by the Washington State Labor Council. The cold weather and pouring rain did not dampen our spirit as we sang...

Since 1996, Raging Grannies of Seattle has performed at hundreds of rallies, meetings and demonstrations. Together with Raging Grannies from Victoria and Vancouver, British Columbia, we took part in the demonstrations which prevented the World Trade Organization (WTO) from meeting in Seattle in November 1999.

For that, we received a great deal of media attention, national and international.

And Now...

We hope to see more and more Raging Grannies groups form all across the U.S. and throughout the world. If you are interested in starting a group in your area and need some assistance, please contact us.

**RAGING
GRANNIES
of SEATTLE**

|| 285-1 || 285-2

|| 285-1

|| 285-3

Response to Commentor No. 285

285-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The Hanford Site has a comprehensive waste minimization and pollution prevention program in place, as summarized in Section 3.4.11.8 of Volume 1, that would govern any proposed site activities.

285-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

285-3: DOE notes the commentor's views. However, the purpose of the NI PEIS is to evaluate the environmental impacts of a range of reasonable alternatives to maintaining and enhancing DOE's existing nuclear facility infrastructure to support production of isotopes for medical, research, and industrial uses, production of plutonium-238 for use in future NASA space exploration missions, and U.S. nuclear research and development needs for civilian application. No component of the proposed action is for the purpose of supporting any other defense or weapons-related mission.

Cancers are believed to be caused by a combination of hereditary and environmental factors, including radiological and chemical agents. In ongoing clinical testing, therapeutic radioisotopes have proven effective in treating cancers and other illnesses while minimizing adverse side effects, making their use an attractive alternative to traditional chemotherapy and radiation treatments.

Chapter 4, Volume 1, of the NI PEIS provides an estimate of waste generation and potential human health impacts associated with each of the alternatives proposed for the production of medical, industrial and research isotopes, plutonium-238, and nuclear research and development. Any additional wastes generated in support of these missions would be managed (i.e., treated, stored and disposed) in a safe and environmentally protective

Commentor No. 285: Megan Cornish (Cont'd)

Response to Commentor No. 285

manner and in compliance with all applicable Federal and state laws, regulations, and applicable DOE orders. In terms of potential human health impacts, the NI PEIS analysis indicates that the most likely impacts would not result in additional cancer fatalities among the population surrounding the DOE facilities that may be selected for use.

Consistent with the mandates under the Atomic Energy Act, DOE seeks to fulfill its responsibility to ensure that there is a reliable supply of isotopes in the U.S. to meet future demand. DOE does not subsidize commercial producers. DOE encourages the commercial sector to privatize the production of medical isotopes in certain instances, and does this by turning over production of certain isotopes to commercial entities once DOE has established that commercial production is economically viable. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

Commentor No. 286: Tom Burke

Thank you. My name is Tom Burke. I am a resident of Kennewick Washington and I would like to make a few comments relative to the potential restart of the Fast Flux Test Facility.

The FFTF was designed as a large test reactor and thus has many features that make it ideal for the multi-mission role proposed by the Nuclear Infrastructure PEIS. It has a test volume that is significantly larger than all other operational Department of Energy reactors combined and it has a much higher neutron flux density than any other DOE reactor. The FFTF produces neutrons in the high-energy spectrum; these are called fast neutrons (most reactors produce much lower energy, or thermal, neutrons). The fast neutrons produced in FFTF can be "moderated" to virtually any desired energy level. This is extremely important for supporting the variety of missions identified in the NI PEIS. For example, some medical isotopes can only be produced by irradiating targets with high-energy neutrons while others require thermal neutrons. Finally, the FFTF incorporates many features not found in other reactors. This includes, for example, the ability to install specially instrumented and controlled test assemblies into the core. This capability was demonstrated and used many times during the previous ten years of outstanding operation of the facility.

Let me say more about the outstanding design and operation of the FFTF. It is the only DOE reactor designed to modern commercial reactor standards. For example, it includes a containment building that was designed, constructed and tested to very stringent leak rate criteria. It incorporates a sophisticated reactor shutdown system designed with both diversity and redundancy in its operation. Finally, because emergency core cooling is provided by natural circulation of the coolant, no emergency powered equipment is required to perform this critical function. Due to these, and other design and safety features, the probability of a severe accident at the FFTF is much lower than at a typical commercial power reactor.

Prior to its initial operation, the Nuclear Regulatory Commission performed a thorough review of the FFTF design and Safety Analysis Report. This review concluded that the FFTF met modern reactor design and safety standards. Although the FFTF is not licensed by the NRC, this is the same review process that all commercial reactors undergo to obtain a license. It is expected that the NRC would be involved in restart of the facility in a similar manner.

During its ten years of operation, the FFTF achieved an impeccable operating and safety record, better than that compiled by commercial reactors over the same time period. The plant received many awards recognizing this industry standard setting operational and safety performance. This tradition of operational excellence is an ingrained quality in the experienced staff that is committed to continue this performance when the facility is restarted.

The FFTF is the only existing DOE reactor that can fully support all three of the important missions described in the Nuclear Infrastructure PEIS. The other existing facilities, even taken together, can only partially support these missions. The new reactor and new accelerator options may be able to meet most of the needs, but there are significant technical and cost issues and uncertainties associated with the concepts described in the PEIS. So the answer is clear. Restarting the FFTF is the only real option for successfully supporting the combination of missions described in the Nuclear Infrastructure PEIS.

 Thomas M. Burke

287-1:

The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

The proposed action would not have an impact on the cleanup missions at the candidate sites. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws, regulations and applicable DOE orders.

Chapter 2—Written Comments and DOE Responses

Commentor No. 288: Anonymous

Draft PEIS Comment Form

I find the DOE's actions regarding restart of the FFTF to be utterly despicable. We do not need this. We do not need more waste.

288-1

The way the DOE has attempted to hide critical information from the public is equally despicable.

288-2

We need to clean up Hanford, not make it worse.

288-3

The DOE's actions has contributed to my growing belief that we no longer live in a democracy.

288-2

Please listen to the people not corporations and bought-off politicians. Do not restart FFTF.

288-1

Thank you.

Alternative 5 - permanent deactivation is the only safe option.

288-4

nuclear nonproliferation concerns were not even addressed in the EIS.

288-5

Response to Commentor No. 288

288-1: Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

288-2: This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS. DOE made every effort to obtain, analyze, and disclose all required information to make a decision on expanding nuclear infrastructure. Further, DOE evaluated each environmental resource area in a consistent, unbiased manner across all the alternatives to allow a fair comparison among the various alternatives.

288-3: DOE notes the commentor's concerns regarding the existing cleanup mission. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Commentor No. 288: Anonymous (Cont'd)

Response to Commentor No. 288

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

The Hanford Site has a comprehensive waste minimization and pollution prevention program in place, as summarized in Section 3.4.11.8 of Volume, that would govern any proposed site activities.

- 288-4:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 288-5:** DOE prepared a separate Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Such an ancillary document need only be made available to the public prior to any decision being made under CEQ regulations (40 CFR Part 1505.1(e)). Nevertheless, DOE mailed this document to about 730 interested parties on September 8, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Nuclear Infrastructure Nonproliferation Impact Assessment in Appendix Q in the Final NI PEIS.

Commentor No. 289: Terry Dunsmore

Draft PEIS Comment Form

The DOE has a primary responsibility in Washington State -- to clean up the existing wastes at the Hanford facility. The citizens of Washington care very much about this issue, given the fact that it directly affects our health and the future of this region.

We deserve to have a say about the place where we live; we deserve the right to choose to have no further production at the Hanford facility. Washington is already inundated with CANCER-CAUSING wastes -- it is ludicrous to suggest that we need to poison a significant sector of the U.S. population in order to fund private research or NASA systems, when we should 'redirect our efforts' toward developing alternative energy systems.

Radiation causes cancer. This is unacceptable on every level, and I pray the D.O.E. considers alternative energy systems before this debate necessitates a reorganization of the infrastructure of the D.O.E.

Response to Commentor No. 289

289-1

289-1: Worker and public health and safety are of paramount and primary importance to the DOE. Restoration of the Hanford Site and waste management activities are the primary missions at Hanford. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

The environmental impacts associated with operation of the FFTF and support facilities at Hanford during normal operations and from postulated accidents are presented and discussed in Section 4.3 of the NI PEIS. All impacts to human health and to ecological resources would be small in the immediate area of the Hanford Site and negligible at all distant locations.

289-2

289-2: The commentor's support of alternative energy systems is noted. Issues of research and development of alternative energy sources are beyond the scope of this Nuclear Infrastructure EIS. Other offices of DOE are responsible for the research and development of alternative energy sources. The stated missions to be addressed in this EIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and nuclear research and development, can currently only be met using nuclear reactor or accelerator technologies.

Commentor No. 290: J. L. Moore

Response to Commentor No. 290

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

With a confirmed 69 tanks leaking in Hanford, it's clear that the Columbia River is in danger of receiving many dangerous cancer causing agents. Starting up the FFTF reactor would add waste to those tanks - not to mention taking a lot of funds and focus away from cleaning up waste. What really bothers me about the DOE continuing to cite the FFTF as a possible candidate for the noble mission of curing cancer is the hypocrisy behind it. If you want to cause cancer, start the reactor up and produce more cancer causing waste. If you want to stop cancer, well an ounce of prevention is worth a pound of cure - so shut down FFTF and prevent more cancer causing radioactive materials from getting into the environment. But please stop lying and saying that FFTF is a viable source of radioisotopes when particle accelerators are a far superior method of production and when your OWN BLUE

 E-mail: NuclearInfrastructure-PEIS@hq.doe.gov

7/12/00

290-1: The restart of FFTF would not impact the schedule or available funding for existing cleanup activities at Hanford nor would it generate high-level radioactive waste. The additional radioactive waste that would be generated from the restart of FFTF (e.g., low-level radioactive waste) would not be stored in the high-level radioactive waste tanks located at Hanford. As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

290-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Chapter 2—Written Comments and DOE Responses

Commentor No. 290: J. L. Moore (Cont'd)

RIBBON MEDICAL ADVISORY COMMITTEE HAS
 RECOMMENDED THAT FFTF IS NOT A VIABLE
 LONG-TERM SOURCE OF RADIOISOTOPES! Please
 stop making this poison and putting it into
 the environment. No space mission or political rhetoric
 masquerading as a medical mission can justify the
 cancer that radioactive materials will cause.
 Please shut down FFTF - it's good karma.

290-4
 (Cont'd)

290-3

290-5

Response to Commentor No. 290

- 290-3:** Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.
- 290-4:** The Nuclear Energy Research Advisory Committee (NERAC) subcommittee for Isotope Research and Production Planning, reviewed various DOE and industry accelerators and nuclear reactors including FFTF. The review covered both the research and production capabilities in meeting a set list of isotopes. The commentor's reference to "blue ribbon medical advisory committee recommendation," is the above subcommittee's conclusion. The conclusions presented in the "NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000" regarding the suitability of the Fast Flux Test Facility (FFTF) to produce research isotopes in a timely and cost-efficient manner were made in the context of the facility producing research isotopes as its sole mission. DOE agrees that the FFTF's large size and configuration are not particularly well suited for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of the FFTF for the production of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production". In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates use of the FFTF when coupled with the other proposed missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without disturbing the existing missions of these facilities.

Commentor No. 290: J. L. Moore (Cont'd)

Response to Commentor No. 290

DOE has taken the expert panel and NERAC recommendations under consideration in developing the range of alternatives evaluated in the NI PEIS. These reports were made available to the public at the NI PEIS public information centers and on the internet at www.nuclear.gov.

290-5: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 291: Margaret Jean Tuthill

Response to Commentor No. 291

Draft PEIS Comment Form

I associate myself with the comments from City Council member Nick Deaton. The city of Seattle has gone on record as opposed to the re-start of the restart of the FFFTF nuclear reactor. I agree with the position of the City of Seattle. I associate myself also with the comments of City Council member Heidi Willis and Congressman Jim McDermott.

291-1

You have not told us what you will do with the waste that would be produced by the FFFTF.

291-2

Your own blue ribbon committee has said that FFFTF would not be suitable for production of medical isotopes. Why did Mr Brown not make that clear in her presentation?

291-3

Copy analyses of the risk from an accident is absurd sounding to me.

291-4

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

- 291-1: DOE notes the commentor's opposition to Alternative 1, Restart FFFTF.
- 291-2: Management of wastes that would be generated under implementation of Alternative 1, Restart FFFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.
- 291-3: The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFFTF to produce research isotopes in a timely and cost-efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to

Commentor No. 291: Margaret Jean Tuthill (Cont'd)

Response to Commentor No. 291

support projected needs could be accomplished without impacting the existing missions of these facilities.

DOE has taken the Expert Panel and NERAC report recommendations under consideration in developing the range of alternatives evaluated in the NI PEIS. These reports were made available to the public at the NI PEIS public information centers and on the Internet at <http://www.nuclear.gov>.

- 291-4:** The NI PEIS accident risk analysis was conducted in a manner consistent with the “Recommendations for the Preparation of Environmental Assessments and Environmental Impact Statements” DOE Office of NEPA Oversight, May 1993. Sections 4.2-4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from implementation of the alternatives, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with each alternative would be small.

Commentor No. 292: Donn Colby

Draft PEIS Comment Form

As a physician, I know the importance of nuclear materials for medical research and clinical treatment. The DOE has looked for a private contractor to use PFF for the production of medical isotopes and has been unable to find one. Medical isotope production at Hanford is not commercially viable. There is no shortage of medical isotopes. More than enough are available from current sources, mostly foreign, which produce them cheaper than they could be produced at any US facility.

292-1

The primary mission at Hanford is now to clean-up the most contaminated nuclear site in the western world. Any new production mission will have to add to the load of nuclear waste at the site and will make clean up harder and more prolonged.

292-2

It is time, after years and years on stand-by, to develop a clean mission yet developed, to shut down the PFF.

292-3

7/12/00

Response to Commentor No. 292

292-1: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings.

DOE acknowledges that other manufacturers can produce certain isotopes at lower costs. In fact, the United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume I has been revised to clarify DOE's role and other producers' capabilities in fulfilling U.S. isotope needs.

292-2: DOE notes the commentor's concerns regarding ongoing activities to remediate the existing contamination at Hanford. Although beyond the scope of this NI PEIS, the Hanford Site environmental restoration activities are high priority to DOE and are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Commentor No. 292: Donn Colby (Cont'd)

Response to Commentor No. 292

Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

292-3: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 293: Marianne Sullivan

Draft PEIS Comment Form

Re starting FFTF diverting funding and attention from clean up at Hanford. We very concerned that we continue to debate this issue, meanwhile the Columbia River grows increasingly contaminated! The wildfires and release of plutonium this summer should be a wake up call to DOE and the public. We are on the brink of irreparable disaster at Hanford. Meanwhile DOE fails to meet clean up milestones.

To play on people's sympathies by granting FFTF status on the basis of providing medical support is dishonest and a ploy. The public does not trust DOE - you have a significant credibility problem. You've posted the most contaminated site in the western hemisphere. Two accidents in the last 3 years have exposed citizens to plutonium. In both cases DOE lied about the exposure. We are fed up with this! We don't want to live in fear of another accident at Hanford. Clean it up! Don't restart FFTF!!!

293-1

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Response to Commentor No. 293

293-1: DOE notes the commentor's concerns regarding the existing cleanup mission and migration of contaminants to the Columbia River. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

The Hanford Site has a comprehensive waste minimization and pollution prevention program in place, as summarized in Section 3.4.11.8 of Volume 1, that would govern any proposed site activities.

No radioactive materials were "released" in the Hanford Wildfires of 2000. Wildfires did resuspend some materials already in the environment. The resuspended materials were low, slightly above natural background levels. The low levels required several days of analysis to quantify.

The Columbia River does not continue to grow increasingly contaminated from Hanford activities. Steady and consistent progress in restoring the Hanford Site is documented in annual reports. These are available at www.hanford.gov.

293-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

The Fast Flux Test Facility must be shut down NOW! You are wasting precious time and resources while the future of the Columbia River and public are put at risk. This is what you must put at the forefront of your decision making process in restarting FFTF:

- ① How many lives are at risk because millions of dollars have been diverted from cleanup to maintaining FFTF on hot standby?
- ② How many more jobs will be created by cleaning up the leaking tanks - unfired burial grounds instead of maintaining and restarting FFTF?
- ③ What precious ecological habitats are being knocked off balance because of the waste created and stored at Hanford from restarting FFTF?
- ④ How many risks are associated with transport of Plutonium to restart FFTF especially through a major port such as the Puget Sound?

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

- attending public meetings and giving your comments directly to DOE officials
- returning this comment form to the registration desk at the meeting or to the address below
- calling toll-free and leaving your comments: 1-877-562-4593
- faxing your comments toll-free to: 1-877-562-4592

7/12/00

294-1

294-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF and concern for the future of the Columbia River. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

294-2

294-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The proposed alternatives would not have an impact on Hanford cleanup activities.

294-3

Ecology, EPA, and DOE agreed to a change in the Tri-Party Agreement to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on FFTF's future. Public meetings were held on this formal milestone change. The NI PEIS missions would not have an impact on Hanford cleanup activities.

294-4

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

The Hanford Site has a comprehensive waste minimization and pollution prevention program in place, as summarized in Section 3.4.11.8 of Volume 1, that would govern any proposed site activities.

Commentor No. 294: Erin Jeziorski (Cont'd)

Response to Commentor No. 294

The environmental consequences associated with each alternative were assessed in Chapter 4 of Volume 1 of the PEIS. The socioeconomic impacts associated with each alternative were presented in Chapter 3 of Volume 1.

294-3: The NI PEIS addressed wastes produced for each alternative, as well as cumulative impacts related to waste production. The Hanford waste management infrastructure was analyzed in the NI PEIS (see Section 4.8.3.4 of Volume 1). This analysis determined that it is unlikely that there would be major impacts (including those to ecological habitat) at Hanford because sufficient capacity would exist to manage the site wastes and none of the NI PEIS alternatives would generate more than a relatively small amount of additional waste at Hanford.

294-4: Alternative 1 does postulate that DOE might decide at some point to import mixed oxide fuel from Europe to fuel FFTF. At this time, however, DOE has not proposed to import this fuel through any specific port. If DOE ultimately decides to import fuel from Europe, it would perform a separate NEPA analysis to select a port. This review would address all relevant potential impacts of overseas and inland water transportation, shipboard fires, package handling, land transportation, as well as safeguards and security associated with the import of SNR-300 mixed oxide fuel through a variety of specific candidate ports on the east and west coasts. It would consider all public comments, including local resolutions, concerning the desirability of bringing mixed oxide fuel into the proposed alternative ports.

In the event that DOE decides to enhance its nuclear infrastructure, it would not expose any population to high, unacceptable risks under any alternative. Any transportation activities that would be conducted by DOE would comply with U.S. Nuclear Regulatory Commission and U.S. Department of Transportation regulations. Associated transatlantic shipment would comply with International Atomic Energy Agency requirements. In Section J.6.2, DOE reviewed the potential maximum impacts from the marine transportation of mixed oxide fuel from Europe to a representative military port, Charleston, South Carolina, and overland transportation to Hanford. Also in that section, a bounding analysis demonstrates that the maximum potential radiological risks to the surrounding public from mixed oxide fuel shipments would be extremely small (e.g., less than 1 chance in a trillion for a latent cancer fatality per shipment from severe accidents at docks and in channels and less than 1 chance in 50 billion for a latent cancer fatality per shipment from overland highway accidents).

Commentor No. 295: Margaret T. Swartzman

Response to Commentor No. 295

Draft PEIS Comment Form

Dear Secretary
 As Barbara Fitzhaber wrote you so articulately, the citizens of Washington and Oregon are angry that the tri-state agree to clean up nuclear waste at Hanford has not occurred and that money set aside for that have been sequestered - just to keep FFTF on standby. He raised the points that there is no compelling need for medical isotopes, Canadian sources should be sufficient. He criticized the draft EIS disregarding all international sources + domestic alternatives for plutonium-238.

I am strongly urging you to take option 3 and shut down the FFTF. Please include in the EIS the cost of clean up of the FFTF in start up costs! Please include and acknowledge the danger of transporting high grade plutonium through Puget Sound.

The lives and health of citizens are in your hands. Please do not let greed guide you in further delaying and channeling. There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

- attending public meetings and giving your comments directly to DOE officials
- returning this comment form to the registration desk at the meeting or to the address below
- calling toll-free and leaving your comments: 1-877-562-4593
- faxing your comments toll-free to: 1-877-562-4592
- commenting via e-mail: Nuclear.Infrastructure-PEIS@hq.doe.gov

7/12/00

295-1

295-2

295-3

295-4

295-5

295-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. Ecology, EPA, and DOE agreed to a change in the Tri-Party Agreement to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on FFTF's future. Public meetings were held on this formal milestone change.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

295-2: The NI PEIS evaluates the environmental impacts of a range of reasonable alternatives for maintaining and enhancing DOE's existing nuclear facility infrastructure to support production of isotopes for medical research, and industrial uses, production of plutonium-238 for use in future NASA space exploration missions, and U.S. nuclear research and development needs for civilian application. In addition to restarting the FFTF, the NI PEIS also evaluates alternatives that would either employ the use of existing facilities or rely on the construction of new facilities.

DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic

Chapter 2—Written Comments and DOE Responses

Commentor No. 295: Margaret T. Swartzman (Cont'd)

Response to Commentor No. 295

applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings.

The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

- 295-3:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 295-4:** Decommissioning FFTF, including associated costs and cleanup, is not within the scope of the NI PEIS. Before decommission activities were undertaken, DOE would prepare the appropriate environmental documentation to address the associated environmental impacts. Cost assessments would also be prepared.

DOE remains committed to cleaning up the Hanford Site independent of the ultimate decision on FFTF. The amounts of wastes associated with decommissioning FFTF would be small. The schedule for cleaning up these other wastes would not be affected if FFTF were restarted.

Commentor No. 295: Margaret T. Swartzman (Cont'd)

Response to Commentor No. 295

295-5: Alternative 1 does postulate that DOE might decide at some point to import mixed oxide fuel from Europe to fuel FFTF. At this time, however, DOE has not proposed to import this fuel through any specific port. If DOE ultimately decides to import fuel from Europe, it would perform a separate NEPA analysis to select a port. This review would address all relevant potential impacts of overseas and inland water transportation, shipboard fires, package handling, land transportation, as well as safeguards and security associated with the import of SNR-300 mixed oxide fuel through a variety of specific candidate ports on the east and west coasts. It would consider all public comments, including local resolutions, concerning the desirability of bringing mixed oxide fuel into the proposed alternative ports.

In the event that DOE decides to enhance its nuclear infrastructure, it would not expose any population to high, unacceptable risks under any alternative. Any transportation activities that would be conducted by DOE would comply with U.S. Nuclear Regulatory Commission and U.S. Department of Transportation regulations. Associated transatlantic shipment would comply with International Atomic Energy Agency requirements. In Section J.6.2, DOE reviewed the potential maximum impacts from the marine transportation of mixed oxide fuel from Europe to a representative military port, Charleston, South Carolina, and overland transportation to Hanford. Also in that section, a bounding analysis demonstrates that the maximum potential radiological risks to the surrounding public from mixed oxide fuel shipments would be extremely small (e.g., less than 1 chance in a trillion for a latent cancer fatality per shipment from severe accidents at docks and in channels and less than 1 chance in 50 billion for a latent cancer fatality per shipment from overland highway accidents).

Commentor No. 296: Mary Eccon Smith

Draft PEIS Comment Form

I am strongly opposed to Restarting the FFTF at Hanford. The draft ~~PE~~ EIS was not adequately looked at the dangers inherent in restarting the FFTF. In addition to this, I have seen no reputable source that states that this facility is needed for the production of medical isotopes. The physicians for Social Responsibility, a group of highly intelligent and reputable individuals, have given no reason opposing the restart of FFTF. I see no reason to make new waste at Hanford when we haven't cleaned up the mess we already have - especially for something we don't need. The draft statement also does not address the case of restarting the FFTF or what would happen with the waste - another concern I have is that the EIS did not take into consideration the medical blue ribbon recommendation that the FFTF was not a long term viable source of medical research radioisotopes. It escapes my logic as to why ~~you~~ the DOE would go against the blue ribbon committee unless there is some other reason someone is talking about.

Response to Commentor No. 296

- 296-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 296-2:** DOE notes the concerns expressed in the comment on the potential impacts of restarting the FFTF. Assessments of all potential environmental impacts associated with restart of the FFTF have been performed and the results presented in Section 4.3 of the NI PEIS. The assessments include detailed analyses of a wide spectrum of postulated accidents. The risks associated with operating the FFTF are shown to be small.
- 296-3:** DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian

Commentor No. 296: Mary Eccon Smith (Cont'd)

Response to Commentor No. 296

applications. As the NERAC report states: “In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production.” In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

296-4: Consistent with its mandates under the Atomic Energy Act, DOE is proposing enhancement of its nuclear facility infrastructure for the purposes of addressing three primary needs:

- 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;
- 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long term, assured supply; and
- 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. The FFTF at the Hanford Site was one of several existing DOE resources that were assessed for these missions.

Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. Waste management activities, such as treatment, storage, and disposal, are conducted via permits from the Washington State Department of Ecology. As stated in Section N.3.2

Commentor No. 296: Mary Eccon Smith (Cont'd)

Response to Commentor No. 296

implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

- 296-5:** The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site <http://www.nuclear.gov> and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS.
- 296-6:** Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

Commentor No. 297: Nancy Hannah

Response to Commentor No. 297

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

FFTF will greatly impact the environment and the use of that product is not needed. If the medical community is in favor of this then why are they not stating this - Physicians in Social Responsibility are strongly against this. The danger to the citizens of Washington is too great - Clean up the waste already produced!

297-1

One of the arguments stated over & over is to reduce cost of health care - this ~~is~~ not be a major position because what may be ~~cost~~ cost reducing who - often has huge costs in the future with clean up

297-2

I am a downwinder - let's not do it again!

297-3

7/12/00

297-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF. Chapter 4 of Volume 1 of the NI PEIS provides an impact analysis that includes an estimate of waste generation and potential human health impacts associated with each of the alternatives proposed for the production of medical, industrial and research isotopes. Any additional wastes generated in support of these missions would be managed in a safe an environmentally protective manner and in compliance with all applicable Federal and state laws, regulations, and applicable DOE orders. In terms of potential human health impacts, the NI PEIS analysis indicates that the most likely impacts would not result in additional cancer fatalities among the population surrounding the DOE facilities that may be selected for use.

DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

297-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies

Chapter 2—Written Comments and DOE Responses

Commentor No. 297: Nancy Hannah (Cont'd)

Response to Commentor No. 297

milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The proposed alternatives would not have an impact on Hanford cleanup activities. The Hanford Site has a comprehensive waste minimization and pollution prevention program in place, as summarized in Section 3.4.11.8 of Volume 1, that would govern any proposed site activities.

- 297-3:** DOE notes the commentor's concern for the long-term cleanup costs associated with the alternatives.

Commentor No. 298: R. G. Peterson

Response to Commentor No. 298

Draft PEIS Comment Form

Thank you for holding meetings at several locations. These are complex issues and benefit from advice and comment by many people. Thank you for taking everyone's comments into consideration.

My main concern is that we have a history of moving forward with technical processes when we are not clear how the whole life cycle of the materials produced and by products can be managed safely. The effect of the PEIS refers to vitrification of byproducts or waste, is of concern to me when we haven't yet been able to vitrify anything at Hanford and there have been problems with the contractor for the vitrification project, according to what I've read in the newspaper.

Those of you in Washington DC may not be aware of the sad record of Hanford's managers in not honestly reporting on the release of radiation in the recent wildfires in the Hanford area, and the an accident on the Hanford site a few years ago. When Hanford's managers first say there were no releases, then they discover there were - why should we trust them with new production of radioactive materials?

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

7/12/00

298-1

298-1: DOE notes the commentor's concern regarding vitrification of waste.

298-2

298-2: No radioactive materials were "released" in the Hanford Wildfires of 2000. Wildfires did resuspend some materials already in the environment. The resuspended materials were low, slightly above natural background levels.

In both cases referenced, the low levels required several days of analysis to quantify. Levels were much too low to detect with real-time monitoring instruments. Special analysis over several days were required to measure the environmental levels of contaminants encountered. Data was accurately reported to the public as it became available.

298-3

DOE will ensure that FFTF is safe to accomplish the stated missions. In the event that FFTF restart is selected in the Record of Decision, complete safety and operational readiness reviews will be performed prior to the restart. The FFTF Safety Analysis Report is routinely reassessed and updated when required to address any changes in plant configuration due to physical modifications or changes in plant operation procedures. The operational readiness review would assess the current updated Safety Analysis Report to ensure that the analyses bound the reactor-operating envelope. The analyses presented in this NI PEIS reflect the proposed changes to the reactor core (including fuel and irradiation targets) to perform the DOE missions.

298-3: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Commentor No. 299: Bud Taylor

Draft PEIS Comment Form

I support the Restart of FETF for the purposes of producing ^{238}Pu , therapeutic medical isotopes, testing of materials & fuels, neutron activation for research & analysis and for the burnup of existing weapons material stockpiles. The last purpose is in my opinion the most important single item, along with R&D for commercial nuclear fuel.

299-1

299-1: DOE notes the commentor's support for Alternative 1, Restart FETF. It should be noted that the research and development mission includes research for the burnup of weapons materials but not for the burnup of the materials themselves.

In future, I would prefer that DOE include all the key points identified in scoping hearings in their draft Environmental Impact Statements. This is a necessary precursor to meaningful public comment hearings. Issues that are left unspoken to become points of misunderstanding and misinformation that are exploited.

299-2

299-2: DOE notes the commentor's concerns and recognizes the necessity for clear representation of issues raised throughout the public participation process as a means of facilitating informed decisionmaking. Section 1.4 of Volume 1 of this NI PEIS, as supplemented by an expanded discussion provided in Appendix N, summarizes the prevailing issues and concerns raised during the scoping process to include identification of prevalent issues raised at individual scoping meetings. In fact, based on the scoping comments received, the scope of the NI PEIS was expanded in a number of areas as outlined in Section 1.4 and Appendix N. It should be noted, however, that NEPA and CEQ regulations do not require an agency to include and respond to each scoping comment as is required for public comments on a Draft EIS. While all comments received during the scoping periods are part of the Administrative Record for the NI PEIS, Section 1.4 and Appendix N are intended to provide a summary of the issues and associated trends identified during the scoping process rather than a tabulation of comments by specific issue. In preparing the NI PEIS, DOE carefully considered all scoping comments received from the public.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

- attending public meetings and giving your comments directly to DOE officials
- returning this comment form to the registration desk at the meeting or to the address below
- calling toll-free and leaving your comments: 1-877-562-4593
- faxing your comments toll-free to: 1-877-562-4592
- commenting via e-mail: Nuclear.Infrastructure-PEIS@hq.doe.gov

Commentor No. 301: Sandra Gray

Response to Commentor No. 301

Draft PEIS Comment Form

I am a resident of Richland, Washington, and I am in favor of restarting FFTF for making medical and space isotopes. I have investigated the claims of some groups, such as Heart of America, and I find them to be unfounded. Please do not succumb to pressure from these anti nuclear groups to stop progress on this important mission - they want to deprive the American people and offer no alternative.

301-1

301-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

The FFTF has enjoyed a legacy of excellent design, proven during reactor operations and challenged in a variety of tests designed to push the limits. The facility has met or exceeded all expectations. The intangible force is the quality of the people associated with FFTF.

301-2

301-2: DOE notes the commentor's views and observations.

This facility is an excellent resource not only for Richland or for DOE, but for the American people. Put it to use!

301-1

Response to Commentor No. 302

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

*You've built up waste for fifty years
 in storage tanks with leaks and tears
 you claim you're cleaning up this waste
 with hearings now to find our taste
 yet you ignore us every time
 Even when we speak in rhyme
 Whenever you all come to town
 We always tell you, "Shut it down!"
 The Fast Flux Test Facility
 is of no use to you or me!
 The isotopes have other sources
 And NASA can use other forces
 So here are several hearing aids
 To help you hear all our tirades.
 When will you hear us as we speak?
 When all your tanks have rips and leaks?
 Before I turn this platform loose
 Apologies to Dr. Seuss*

302-1

7/12/00

302-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected. The Hanford Site has a comprehensive waste minimization and pollution prevention program in place, as summarized in Section 3.4.11.8 of Volume 1, that would govern any proposed site activities.

DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

302-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

The United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, including Canada, South Africa, and the former Soviet Union. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions, although issues such as NASA research priorities are beyond the scope of the PEIS. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. Plutonium-238 sources are used only when they enable the missions or enhance mission capabilities.

Chapter 2—Written Comments and DOE Responses

Commentor No. 303 Alan E. Niehaus

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

I am a resident of Pasco Washington and I strongly support the restart of FFTF for isotope production. My father died from a class 4 stomach cancer some years ago. He had 1/3 of his stomach removed and was taking chemotherapy but to no prevail. My feelings are that if FFTF was operating in isotope research and production a cure could have been found and that he would be alive today. I strongly urge the restart of FFTF to improve the fight against cancer.

Draft PEIS Comment Form

I am a Washington State resident who believes that FFTF should be restarted in order to produce the much needed medical isotopes so important in the treatment of cancer.

FFTF, in my opinion, is the logical choice for "American" produced isotopes.

What a shame it would be not to make good use of this existing facility.

As a taxpayer I would much rather see my dollars going into funding missions for reactors such as FFTF rather than seeing them abandoned and left standing like large "White Elephants".

Let's stop wasting our money building new. Let's stop wasting money and technology abandoning facilities rather than making use of them.

Draft PEIS Comment Form

The PEIS should also consider Infrastructure available to the various alternatives.

FFTF is the best alternative because it has the best infrastructure available. PNM is the strongest part of this infrastructure, as PNM is the nation's leading and premier lsb for nuclear isotope production and marketing.

What other option has the infrastructure in place to make isotope production marketable and profitable and successful? PPTF and PNM?

Thank You and please make the right choice, not the politically correct choice.

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Commentor No. 307: Al Rasmussen

Draft PEIS Comment Form

If nuclear production continues at Hanford, there will be additional accidents there. Some day there will be an accident in the port city nuclear materials are shipped through. Nobody knows when it will happen, but there can be little doubt that it will happen.

Seismologists cannot say when Seattle will suffer a major earthquake — much bigger than any in recorded history here — but they know it will happen. Volcanologists do not know when Mt. Rainier will next erupt, but they know it will happen again and again.

It is likely none of these things will happen during my lifetime, but there is one thing that could happen. Reason and responsibility can take hold to put an end to the danger and pollution and waste and expense of continuing nuclear production at Hanford. The FFTF reactor should not be restarted and it should be removed from hot standby. Stop it. Stop it now.

307-1

E-mail: Nuclear.Infrastructure-PEIS@hq.doe.gov

Response to Commentor No. 307

307-1: FFTF and fabrication/processing facilities at the Hanford Site can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.2-4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from implementation of the alternatives, including normal operations and a spectrum of accidents that included severe accidents. The spectrum of accidents reviewed included both design basis and beyond design basis seismic events. The environmental analysis showed that radiological and nonradiological risks associated with each of the alternatives is small. In addition, prior to restarting FFTF, a revised safety analysis report and probabilistic risk assessment which address the potential consequences of a variety of events, including earthquakes would be prepared.

Alternative 1 postulates that DOE might decide at some point to import mixed oxide fuel from Europe to fuel FFTF. At this time, however, DOE has not proposed to import this fuel through any specific port. If DOE ultimately decides to import fuel from Europe, it would perform a separate NEPA analysis to select a port. This review would address all relevant potential impacts of overseas and inland water transportation, shipboard fires, package handling, land transportation, as well as safeguards and security associated with the import of SNR-300 mixed oxide fuel through a variety of specific candidate ports on the east and west coasts. It would consider all public comments, including local resolutions, concerning the desirability of bringing mixed oxide fuel into the proposed alternative ports.

In the event that DOE decides to enhance its nuclear infrastructure, it would not expose any population to high, unacceptable risks under any alternative. Any transportation activities that would be conducted by DOE would comply with U.S. Nuclear Regulatory Commission and U.S. Department of Transportation regulations. Associated transatlantic shipment would comply with International Atomic Energy Agency requirements. In Section J.6.2, DOE reviewed the potential maximum impacts from the marine transportation of mixed oxide fuel from Europe to a representative military port, Charleston, South Carolina, and overland transportation to Hanford. Also in that section, a bounding analysis demonstrates that the maximum potential radiological risks to the surrounding public from mixed oxide fuel shipments would be small (e.g., less than 1 chance in a trillion for a latent cancer fatality per shipment

Commentor No. 307: Al Rasmussen

Response to Commentor No. 307

from severe accidents at docks and in channels and less than 1 chance in 50 billion for a latent cancer fatality per shipment from overland highway accidents).

307-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 308: Anonymous

Draft PEIS Comment Form

WHEN THEY CAN COMPLETELY NEUTRALIZE THE WASTE, WHEN ALL IS RETRIEVED & NEUTRALIZED THEN - MAYBE MEANWHILE WE SHOULD BE ABLE TO RESOLVE OUR NEEDS BY OTHER MEANS WHICH WE SHOULD ALREADY HAVE DONE BY NOW

GET ON IT!!!

308-1

308-1: DOE notes the commentor's concern regarding the wastes currently stored in the high-level radioactive waste tanks located at Hanford. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram funds designated for Hanford cleanup, regardless of the alternative(s) selected. FFTF restart would not generate high-level radioactive waste. The NI PEIS addresses wastes produced for each alternative, as well as cumulative impacts related to waste production. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and appropriate DOE orders.

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

As Sec. 2.3.1.1.3 says, 3/4 of proposed FFTF load is not for stated missions, but rather for R+D "activities." These can include nuclear weapons material production. Include the environmental impact of the deployment and use of these possible products of FFTF operation in the final EIS!

309-1

309-1: Section 2.3.1.1.3 of the NI PEIS identifies that for other than periodic increases up to 400 megawatts to support nuclear research and development activities, FFTF would be operated at a nominal 100 megawatts in order to extend the reactor life and significantly reduce the generation rate of spent fuel. The nuclear research and development activities that this discussion is referring to would be for civilian applications.

The purpose of the NI PEIS is to evaluate the environmental impacts of reasonable alternatives to enhancing DOE's existing nuclear facility infrastructure to support production of isotopes for medical, research, and industrial uses, production of plutonium-238 for use in future NASA space exploration missions, and U.S. nuclear research and development needs for civilian application. As discussed in Section 1.2 of Volume 1, plutonium-238 would be produced to support NASA's deep space missions. Plutonium-238 is not used to produce nuclear weapons. All missions considered in the NI PEIS are for civilian purposes.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

Commentor No. 311: Jeanne Welsch

Response to Commentor No. 311

Draft PEIS Comment Form

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

The cost savings for producing medical isotopes and the lives it would save the United States is reason alone to keep the FFTF facility and Startup production. Let's start the Fast Flux Test Facility.

311-1

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

Genetic research is coming up with better ways to cure cancer. Medical therapeutic isotopes can be made from materials from Russia that are for sale + cheaper. We have not cleaned up the mess that has been created over the last 55 or more years. We are poisoning the ~~the~~ Columbia River. If the highest priority of the US Dept of Energy was clean up I believe it would already be done. There are other ways to fight cancer that does not create a lot more cancer causing material. We (the USA) said we would destroy our huge stock of nuclear weapons, so far this has not been happening. The Trident subs for example have bombs equal to eight Hiroshima bombs some are to be mothballed but others upgraded 4 times. These are not weapons. They are as destructive to ourselves as to any other persons, as well as animals + everything else on the planet. If we only had a it would be too many I don't know how many we have but it is a huge number, by the grace of God we have not destroyed ourselves yet I wish a ~~There are several ways to provide comments on the Nuclear Infrastructure PEIS. 7/12/00

321-1
321-2
321-3
321-1
321-3
321-4

- 321-1: The commentor's position on genetic research and opposition to the use of medical isotopes are noted. Potential benefits of genetic research are outside the scope of the NI PEIS. As discussed in Section 1.2.1 of Volume 1, one of the DOE's missions is to insure a reliable supply of radioisotopes for clinical applications and research.
- 321-2: DOE acknowledges that other manufacturers can produce certain isotopes at lower costs. In fact, the United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, including Canada, South Africa, and the former Soviet Union. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S isotope needs.
- 321-3: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The Hanford Site has a comprehensive waste minimization and pollution prevention program in place, as summarized in Section 3.4.11.8 of Volume 1, that would govern any proposed site activities.

More specific to the DOE missions presented in the NI PEIS, FFTF is located approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to the groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Commentor No. 321: Anonymous (Cont'd)

Response to Commentor No. 321

- 321-4:** The commentor's positions on nuclear disarmament and reduction of stockpiles of nuclear weapons are noted, although nuclear weaponry is outside of the scope of this NI PEIS. The nuclear infrastructure missions described in Section 1.2 of Volume 1 are unrelated to the national defense. Nuclear weaponry would not be produced under any of the nuclear infrastructure alternatives described in Section 2.5.

Commentor No. 322: Rosemary E. Brodie

8/30/00

**How many times must we return here to protest the restarting of the dangerous, and expensive Fast Flux Test Facility?
We have said it all already. What more is there to say?**

Medical isotopes? We killed that argument many times over in the past. Experts in the field say there is absolutely no need for an additional source of these isotopes. There are sources in this country and Canada as well.

Plutonium 238 for fuel of the space missions- Today's PI tells us even that is not needed.

Clean-up is where it's at!!!! Not more money down the tube for FFTF.

**Meanwhile, Keith Klein, Manager of Hanford says: "Are there going to be trade offs? Almost certainly. We do not have adequate funding to do it all. When we get those trade offs better defined - hopefully in the next few months - we will again be seeking your input"-
That's supposed to reassure us that all is well? We will come back as long as it takes.**

**How about this one: "We may decide to initiate negotiations that could result in changes to the Tripartite Agreement (TPA) butwe would conduct a formal public involvement process". - Are we being listened to?
PI does not seem to help.**

As public citizens we should not accept anything short of a thorough job of clean up.

**Everything that is physically possible - never mind financially possible!
Selling off a couple of TRIDENT subs might boost the kitty to pay for this.**

Rosemary E. Brodie
3842 NE 90th St
Seattle WA 98115

Response to Commentor No. 322

- 322-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF. Included in the PEIS are the results of analyses that show that the risks associated with operating the FFTF are very small.
- 322-2:** DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information.
- The United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.
- 322-3:** Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these

Commentor No. 322: Rosemary E. Brodie (Cont'd)

Response to Commentor No. 322

missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Section 1.2.2 of Volume 1 was revised to clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

- 322-4:** DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "...ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected. The Hanford Site has a comprehensive waste

Commentor No. 322: Rosemary E. Brodie (Cont'd)

Response to Commentor No. 322

minimization and pollution prevention program in place, as summarized in Section 3.4.11.8 of Volume 1, that would govern any proposed site activities.

Excessing U.S. defense assets to fund DOE activities is not within the scope of this PEIS.

Commentor No. 323: Richard O. Zimmerman

T. date 7/9/06/24

Date: August 30, 2000
 Location: Seattle, Washington
 Subject: Public Comment to the Draft Programmatic Environmental Impact Statement that includes the option to restart the FFTF.

Commenter: Dr. Richard Orin Zimmerman
 220 Orchard Way
 Richland, WA 99352

Thank you for the opportunity for the public to make comments on this important topic. My name is Dr. Rick Zimmerman and I am a resident of Richland Washington. I come in support of the Draft PEIS Alternative 1.

The medical community is in need of production level quantities of medical isotopes for cancer diagnosis and treatment. I am a cancer survivor of a form that has a 50% mortality rate. Just last week I had dinner with a friend who has cancer with a 95% mortality rate within two years. By the grace of God, she is at the 4-year mark since her diagnosis. One of the reasons for her survival is that new treatment regimes are being discovered and approved as she reaches the end of the effectiveness of an earlier prescribed treatment. She and many others need the medical isotopes option now to enjoy a quality of life without the abuses of existing treatments.

Alternative 1, restarting the FFTF, provides the fastest option to provide research and production scale quantities of the many needed forms of isotopes to the medical community. This in turn, helps those courageous cancer patients maintain their quality of life.

Additionally, I'd like to endorse the testimony of others at the earlier NOI hearings that provide compelling evidence to restart the FFTF.

1. FFTF is a facility ready, with staff in place, to undertake this mission.
2. Within years of restart, operational costs of the FFTF would be paid for by sales of isotope production. (A remarkable way for a government facility to operate without burden on the federal budget)
3. Cost savings through medical isotope use is projected to equal the current national financial burden of Medicare, which in 1999 was \$213 billion. (Talk about Return on Investment).

Thank you for your time, I trust this information will be useful.

 Richard Orin Zimmerman

Response to Commentor No. 323

323-1

323-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

323-2

323-2: DOE notes the commentor's views on the costs and benefits of the proposed production of medical radioisotopes in the FFTF. The estimated costs of the range of reasonable alternatives are presented in the Cost Report, summarized in Appendix P of the Final NI PEIS. However, the Cost Report is not a cost-benefit analysis. While it is reasonable to believe that the benefits of medical isotopes are substantial, the purpose of this NI PEIS is to describe the nuclear infrastructure missions (Section 1.2 of Volume 1), a range of reasonable alternatives for satisfying the mission requirements (Section 2.5 of Volume 1), and the environmental impacts that would result from implementation of the alternatives. According to 40 CFR Section 1502.23, if a cost-benefit analysis exists, it must be reported and summarized in the NI PEIS.

Commentor No. 324: Eldon L. Ball

Response to Commentor No. 324

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

I SERIOUSLY DOUBT THAT 55 YEARS AGO (8:30-45) THE JAPANESE CONSIDERED HIROSHIMA OR NAGASAKI AS NATIONAL ASSETS, OR THAT 10 YEARS AGO THE SOVIET UNION THOUGHT OF CHERNOBYL AS A "NATIONAL ASSET" OR THE PEOPLE OF PENNSYLVANIA FELT 3 MILE ISLAND WAS A "NATIONAL ASSET" WHEN IT NEARLY EXPLODED. HAS THE RISK OF WILD-FIRE BEEN ADEQUATELY CONSIDERED? IF ANY PLUTONIUM IS NEEDED, BUY IT FROM RUSSIA. THEY HAVE PLENTY IT WOULD GIVE WORK TO RUSSIANS. WE COULD THEN GET ON WITH LONG OVERDUE CLEANUP. IT COULD BE A WIN-WIN SITUATION ALSO. SHUT DOWN THE FAST FLUX TEST FACILITY PERMANENTLY. CONSIDER THIS ALTERNATIVE G. GET ON WITH THE TRI-PARTITE AGREEMENT & CLEANUP HANFORD ON THE SCHEDULE THAT WAS AGREED 10 YEARS AGO BY THE DEPT OF ENERGY. THE DOE HAS BEEN DRAGGING ITS FEET MUCH TOO LONG. STOP THE HEARINGS, GET ON WITH THE CLEANUP. THE DOE SUBCOMMITTEE FOR ISOTOPE RESEARCH CONCLUDED THAT "FFTF IS NOT A VIABLE SOURCE FOR MEDICAL RESEARCH ISOTOPES."

7/12/00

324-1

324-1: FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

324-2

An assessment of the risk of a wildfire indicated that, in the worst case, it could lead to a loss of offsite power, which the FFTF, because of its passive cooling capability, could withstand without overheating the core or leading to the release of any radioactivity.

324-3

324-2: DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

324-4

324-3: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

324-5

324-4: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Public meetings were held on this formal milestone change.

The alternatives delineated in the NI PEIS would not have an impact on Hanford cleanup activities. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions

Chapter 2—Written Comments and DOE Responses

Commentor No. 324: Eldon L. Ball (Cont'd)

Response to Commentor No. 324

described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

- 324-5:** DOE assumes the commentor is referring to the Fast Flux Test Facility (FFTF). The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost-efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

Commentor No. 325: Liesl Zappler Rogers

Response to Commentor No. 325

Draft PEIS Comment Form

It is inconceivable to me that the DOE would even consider starting up the FTFF at Hanford. The isotopes for cancer research as the draw to start the FTFF is ironic considering the cancer rate of the citizens in the Tri-cities area. The costs, the wastes, the risks to human & environmental health are far too great to even consider this start-up. I am proud that our city council members are opposed to the FTFF and I stand with them. There are other facilities to create these isotopes & there is no point in trying to cure cancer by starting up another potentially cancer causing facility and creating such a threat to the environmentally sensitive Pacific Northwest. Hanford has been listed to be cleaned up and that should be the focus of the activities there.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

325-1

325-1: DOE notes the commentor's opposition to Alternative 1, Restart FTFF. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FTFF), including normal operations and a spectrum of accidents that included severe accidents.

325-2

The environmental analysis showed that radiological and nonradiological risks associated with restarting FTFF would be small.

325-3

As discussed in Section 3.4.9.3 of Volume 1, the question of whether residents in the Hanford area are subject to elevated cancer rates is unresolved. Existing studies and data suggest that cancer mortality rates in counties adjacent to the Hanford Site are not elevated. Prevailing winds at the Hanford Site blow toward Grant County, Washington from the south (14.2 percent of the time) and south-southwest (11.5 percent of the time) directions. Hence, Grant County would be expected to bear a major burden of wind borne contamination from the Hanford Site.

325-4

However, if an excess cancer mortality risk is present in Grant County, it was too small to be identified at the county-level of resolution in the survey and available National Cancer Institute data discussed in Section 3.4.9.3. Epidemiological studies in Benton and Franklin counties provided no conclusive evidence of elevated congenital defects in the two counties.

325-2:

DOE notes the commentor's opposition to Alternative 1, Restart FTFF.

325-3:

This PEIS provides estimates of the human health impacts associated with a range of reasonable alternatives (including restart of FTFF) for the production of isotopes for medical uses, research and development, and as heat sources for radioisotope power systems. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FTFF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FTFF would be small.

Commentor No. 325: Liesl Zappler Rogers (Cont'd)

Response to Commentor No. 325

325-4: Restoration of the Hanford Site and waste management activities are the primary missions at Hanford.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Heart of America Northwest**

Response to Commentor No. 326

Draft PEIS Comment Form

I oppose FFFTF restart because

1) Restart of FFFTF will lead to generation of what the Draft EIS refers to as "excess high activity waste" that will sent to the evaporator tank feed existing treatment and vitrification for disposal. This waste will be stored in Hanford's FMEF until 2007 when vit-photos will essentially be operable. This violates state and Federal hazardous waste laws which allow only a few months of storage before waste must be disposed of. This is highly violative state and federal law.

2) Just the possibility of FFFTF restart has delayed Hanford cleanup 2 buildings in the 300 Area (325 & 306F) which are being kept quiet for FFFTF support are highly contaminated. It has a long history of methane and radon release during both the 60's & 70's.

3) Shipping FFFTF wastes to "commercial disposal facilities" violates existing USDFE policy that requires wastes to be sent only to NRC licensed facilities. This is the only US facility in Hanford that accepts disposal of FFFTF wastes of US Energy would violate the Compact between states (which Congress adopted) for the storage, shipping of FFFTF wastes there would require USDFE to CERCLA consent.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

E-mail: Nuclear.Infrastructure-PEIS@hq.doe.gov

7/12/00

326-1

326-2

326-3

326-4

326-1: DOE notes the commentor's opposition to Alternative 1, Restart FFFTF.

326-2: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

The use of proposed alternative facilities associated with processing of neptunium-237 targets would have no impact on schedules or available funding for high-level radioactive waste programs at Hanford. The higher activity waste would be treated as a solid form via a stand-alone vitrification system, separate from any tank waste treatment system. Therefore, the existing Hanford high-level radioactive waste facilities would not be used, and as analyzed in the PEIS, no existing or planned high-level radioactive waste facilities would be used to treat the wastes resulting from processing the irradiated targets.

326-3: Hanford Site environmental restoration activities, including those involving the Hanford 300 Area, are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The consideration of FFFTF for the NI PEIS mission has not impacted any Hanford cleanup projects, except for a Tri-Party Agreement change involving the FFFTF status. The Department of Ecology, EPA, and DOE agreed to the change to place the milestones for FFFTF's permanent

Chapter 2—Written Comments and DOE Responses

Commentor No. 326: Hyun Lee (Cont'd)
Heart of America Northwest

Response to Commentor No. 326

deactivation in abeyance until the DOE reaches a decision on FFTF's future. Public meetings were held on this formal milestone change. The DOE missions would also have no impact on future Hanford cleanup activities.

The 306-E facility is not contaminated and is being proposed as a location to conduct activities that involve no radioactive materials. While the 325 Building has an inventory of radionuclides associated with ongoing activities at the facility, the building is not contaminated in worker accessible areas. Operations at the 325 Building are conducted in accordance with applicable federal and state regulations and appropriate DOE Orders.

The 300 Area Revitalization Plan (DOE 1999) provides for continued multi-program R&D operations in the 300 Area, including operation of various laboratories, office facilities, and services. It also provides for consolidation (but not complete elimination) of radiological operations, with support for Hanford Site facility transition and environmental restoration efforts. The plan does not require closure of the 325 and 306 E buildings as long as they are needed for active research projects. Operation of these facilities would not violate any existing agreements between DOE and stakeholders or other legal obligations, nor would it affect ongoing or planned environmental restoration and facility transition activities.

326-4: DOE Order 435.1 "Waste Management" gives responsibility to the DOE Field Element Managers to approve exemptions for use of non-DOE facilities for the storage, treatment or disposal of DOE radioactive waste based on certain requirements. One of these requirements is that the facility must have the necessary permits, licenses, and approvals for the specific waste.

As discussed in DOE's "Commercial Disposal Policy Analysis for Low Level and Mixed Low-Level Wastes" dated March 9, 1999, there are three commercial low-level radioactive waste disposal facilities (i.e., Envirocare of Utah; Barnwell, South Carolina; and U.S. Ecology, Richland, Washington) which are currently operating and licensed to receive low-level radioactive waste. Envirocare of Utah also has a permit to receive RCRA hazardous wastes. DOE has and is currently disposing of low level radioactive waste and mixed low-level radioactive waste at Envirocare of Utah and has sent low-level radioactive waste to Barnwell, South

Commentor No. 326: Hyun Lee (Cont'd)
Heart of America Northwest

Response to Commentor No. 326

Carolina. In June 1995, U.S. Ecology submitted an unsolicited proposal to DOE for the disposal of DOE waste at the U.S. Ecology facility. In November 1995, the State of Washington informed U.S. Ecology and DOE that the State would allow the disposal of DOE waste at the facility subject to certain conditions.

Commentor No. 327: D. Doyle

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

We have a scant ten to twenty five years before the high level liquid nuclear waste slurry begins to enter the Columbia river from Hanford. In the mean time, activity continues at Hanford to extract the PFGE sludge. Any action on site should be directed to protecting our river and our ecology until chemical threats in the groundwater from the tanks and K-basins are eliminated.

327-1

327-1: DOE notes the commentor's concerns regarding the existing cleanup mission and migration of contaminants to the Columbia River. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

The Hanford Site has a comprehensive waste minimization and pollution prevention program in place, as summarized in Section 3.4.11.8 of Volume 1, that would govern any proposed site activities.

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

The 3 major reasons that the PEIS is giving to restart the FFTF. ① Medical Isotopes: to help fight cancer. My response: We must realize that we can't cancer. Our environment is making us sick!!! If we start the FFTF we will make more people sick. We need to stop looking for a CURE & start looking for a cause - which isn't too hard to find. ② We can't drink our water because of WASTE!!! ③ We have deadly air because of WASTE!!! If we're dead, money, jobs & politics are going to do us any good?

I am a breast cancer survivor, and I know it's because of the environment. I implore you - think

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Response to Commentor No. 329

329-1: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

For the purposes of analyses in the NI PEIS, a representative set of isotopes was selected on the basis of the recommendations of the Expert Panel, medical market forecasts, reviews of medical literature, and more than 100 types of ongoing clinical trials that use radioisotopes for the treatment of cancer and other diseases. This set includes both reactor- and accelerator-produced isotopes, and is listed in Table 1-1 of Volume 1 along with a brief description of their medical and/or industrial applications. Although these isotopes are a representative sample of possible isotopes which could be produced, DOE expects that the actual isotopes and specific amounts produced as a result of the proposed action would vary from year to year in response to the focus of clinical research and the specific market needs occurring at that time.

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

The PEIS provides "negative" risk statistics relative to all facets of EFTF operation and product handling. These are normally in terms of latent cancer fatalities.

If cancer effects are pertinent, then the TOTAL effects MUST BE estimated. The PEIS needs to estimate the number of cancer lives SAVED.

For example, the conclusion of the EIS might conclude:

For each year of EFTF operation
 #of new cancers: 10^{-6} #of cancer patients saved: 1000

↳ whenever the number, the contrast needs to be shown.

7/12/00

330-1

330-1: Medical isotope production has been identified as one of the purposes and needs (Chapter 1 of Volume 1) for which DOE action is necessary. The NI PEIS addresses the impacts of the production of radioisotopes for this purpose. Although the 12 million medical procedures a year utilizing radioisotopes result in significant health benefits to the public, the impact of the use of the radioisotopes is not within the scope of the environmental impacts of the production of the isotopes.

Commentor No. 331: Magna Sundstrom

Draft PEIS Comment Form

As a citizen of the Northwest it baffles me that you would consider ANYTHING at the Hanford nuclear reservation that would add more waste. The contamination problems are so bad we already are seeing the beginning effects of the nuclear arms race. During my involvement in this issue I have seen two high level waste tanks start leaking, two releases of Strontium-90 detected, one of Tritium and one of plutonium. This all during a year and a half restart of FFTF with only acid to his problem of waste and slow clean up. The bottom line is we need to be focusing solely on clean up. Hanford is the 2nd most contaminated site in the world I am not willing to wait around for his to bleed up in our faces. **CLEAN UP HANFORD**
DO NOT RESTART THE FFTF REACTOR!

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Response to Commentor No. 331

331-1: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

331-1

DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The DOE missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

331-2

Management of wastes that would be generated under implementation of Alternative 1 (Restart FFTF) is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

331-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Commentor No. 332: Tamara Travers

Response to Commentor No. 332

Draft PEIS Comment Form

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Shut the FFTF Reactor down
 Hanford is already the most contaminated
 site in the western hemisphere,
 second only to Chernobyl. We need to
 clean up the waste of a already
 mine produced rather than
 producing more waste, while we
 can't afford to clean up the waste
 we already have. There are 67
 high-level nuclear waste tanks
 looking toward the Columbia
 river, threatening are health even
 more. FFTF was supposed to have
 been shut down 5 years ago, according
 to the Tri-Party Agreement. Please,
 shut FFTF down for good and turn
 your focus to clean up!

332-1

332-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

332-2

332-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Public meetings were held on this formal milestone change.

Chapter 2—Written Comments and DOE Responses

Commentor No. 333: Marjorie Rhodes

Draft PEIS Comment Form

many non-governmental organizations and individuals oppose restarting of the nuclear reactor. When people organize and work together we can make a difference, as we proved here in Seattle Nov 30, 1999. If people coming together could shut down the WTO we can also shut down nuclear power plants through mass demonstrations which educate the public. Listen to the people and not the special interests.

Let's not have anymore hidden facts or other cover-ups by the Dept. of Energy. There are people watching who will expose these cover-ups.

Also your hand-outs are blatantly biased in favor of corporate interests. Why? Your hand-outs even look like slick propaganda typical of corporate interests.

P.S. The use of paper for these hearings is shameful disregard for the environment.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Response to Commentor No. 333

333-1: DOE notes the commentor's opinion regarding opposition to the restart of FFTF. It is DOE policy to encourage public input on matters of regional, national and international importance. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the environmental impact analysis of DOE's proposed alternatives for meeting mission requirements. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

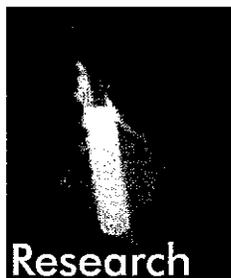

This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. The environmental impacts of reasonable alternatives to fulfill the requirements of the missions were disclosed and evaluated in the NI PEIS. DOE made every effort to obtain, analyze, and disclose all required information to make a decision on expanding nuclear infrastructure. All references used in preparing the NI PEIS are cited in the reference section of each chapter and appendix. DOE has made these references and other material relevant to review of the NI PEIS available to the public in the designated public reading rooms.

The handouts provided during the public hearings were intended to convey pertinent information on the DOE missions and options for accomplishing them, as well as to provide other relevant background material, in a clear and concise manner for the benefit of the public. The handouts are not intended to promote any particular alternative or corporate, institutional, or government interest in the decisions to be made but rather to communicate the reach and importance of such decisions to the public as a whole.

The commentor's concern for the use of paper for the public hearings is noted. DOE is committed to the principles of waste minimization and pollution prevention, and all public informational materials and this NI PEIS are printed with soy ink on recycled paper. Electronic publishing via the Internet is also used extensively by DOE for NEPA analyses and many other types of documents in order to reduce publication costs and material usage. However, it is customary to provide copies of fact sheets, public comment forms, hearing evaluation forms, and other information materials as a convenience to the public and to ensure that those attending are as fully informed as possible as to the matters on which public input is being solicited. The provision of such materials at

333-1

Isotopes for Medicine and Science

This DOE paper reads like an advertisement from corporate America.

Overview

DOE produces and sells hundreds of stable and radioactive isotopes for commercial uses, medical applications, and research purposes throughout the United States and to approximately 25 other countries. Products and services are provided that are not readily available commercially but are required by domestic and international customers for a variety of purposes. Program goals are to:

- Provide a reliable supply of quality products and services based on customers' needs
- Develop new isotopes and isotope application technologies to meet future national needs
- Manage and operate the Office of Isotopes for Medicine and Science in a cost-effective manner that best serves the interests of customers and the U.S. taxpayer

Description

The Office of Isotopes for Medicine and Science operates by using a revolving fund and maintains financial viability through sales revenues and annual appropriations from Congress. DOE is the only U.S. source of many important isotopes.

- Isotopes for research are made available at prices that support a reasonable return to the Government but do not discourage their use.
- Commercial isotopes are sold on a cost-recovery basis.

In fiscal year 1999, this program served a total of 380 customers, generating revenues of \$10.1 million.

Facilities and Capabilities

This program maintains production sites at several of DOE's national laboratories, including Oak Ridge, Los Alamos, Brookhaven, and Sandia. These laboratories offer unique isotope production and separation facilities and processes such as reactors, associated hot cells, and accelerators.

Mission and Visions

The mission of the U.S. Department of Energy's (DOE's) Office of Isotopes for Medicine and Science is to meet the national need for a reliable supply of isotope products and services for medicine, industry, and research. Its vision is to ensure the reliable supply and development of isotopes to meet customers' changing needs through cost-effective use of unique Government facilities to complement and encourage private sector capabilities.

08/15/00

public hearings is in part in response to feedback from other public hearing attendees. Of course, persons attending the hearing could elect to forgo handouts and public comment forms. A presentation was provided by DOE at the start of the hearings and poster boards were on display as alternative means of communicating key points of information. Comments by attendees could be made orally to a comment recorder or submitted via one of the other means provided (i.e., U.S. mail, e-mail, a toll-free fax number, and a toll-free phone number) in lieu of a completed comment form.

333-2: As referenced in DOE's response to the commentor's previous comment 333-1), the fact sheet handouts are not biased. In particular, the fact sheet questioned by the commentor is intended to provide a summary of the mission drivers behind the medical and industrial isotope production mission and to serve as an aid to the public in understanding one of the three missions identified in the PEIS. Fact sheets for the other two missions were also provided for information purposes.

Commentor No. 333: Marjorie Rhodes (Cont'd)

Isotope Uses

Isotopes save lives: they help doctors diagnose illnesses and treat diseases. They also make our lives safer. A radioisotope is used in smoke detectors; another detects explosives in luggage at airports. Radioisotopes are used in devices for manufacturing many of the products we use regularly including plastic wrap, radial tires, and coffee filters.

Medicine

Nearly every aspect of medicine involves the use of isotopes.

- Radioisotopes are used in a process called nuclear imaging to diagnose various diseases in certain organs. An estimated 10 million nuclear-imaging procedures are performed each year just in the United States.
- Radioisotopes are used to identify cardiac conditions, to locate cancers, and to treat health problems including cardiovascular disease, leukemia, and other types of cancers.
- Thirty percent of all biomedical research involves the use of radioisotopes. At least 80 percent of all new drugs approved for use today result from research using radioisotopes. Medical researchers are now using radioisotopes to find cures for AIDS, Parkinson's disease, and diabetes.

08/15/00

Industry

There is a wide range of industrial applications for radioisotopes including such diverse activities as:

- Production quality control
- Product testing
- The manufacture of fuel for nuclear power plants

Isotopes are also used to detect cracks and leaks in underground pipes and gas lines and to ensure the strength of high-rise buildings and bridges. Smoke detectors use a small amount of the isotope americium-241 to trigger an alarm when smoke is present.

Agriculture

Radioisotopes are also used in agriculture to:

- Produce higher-yielding food crops
- Preserve food products
- Trace fertilizer uptake in plants
- Develop seeds with improved disease resistance and product yields
- Extend the shelf life of certain foods
- Produce the shrink wrap used to package food

These processes do not make food radioactive.

Advanced Nuclear Medicine Initiative

The Advanced Nuclear Medicine Initiative will support peer-reviewed research to further advance nuclear medicine technology in the United States. Three major elements comprise this initiative.

- 1) Sponsor nuclear medical science using a peer-review selection process. DOE's support is in two forms: direct research grants, and making isotopes available for research at prices that researchers can afford.
- 2) Encourage the training of individuals in nuclear medicine methods by establishing scholarships and fellowships for nuclear medicine specialists and by sponsoring summer internships at appropriate institutions.

page 2

Response to Commentor No. 333

3) Initiate a focused program to apply alpha-emitting isotopes available in the United States from DOE to fight a spectrum of malignancies, including most common cancers, and infectious diseases, such as meningitis and AIDS. Additional applications may include treatment of other immune disorders and of rheumatoid and degenerating joint diseases.

Privatizing Isotope Activities

DOE is seeking opportunities for private industry to assume control of some or all of its isotope production and distribution activities. This could reduce annual appropriation requirements, enhance U.S. economic competitiveness, create private sector jobs, and reduce the costs to the U.S. taxpayer.

FAST FACTS

Thousands of lives and millions of dollars are saved every year because of medical isotope procedures.

- One of every three persons admitted to U.S. hospitals undergoes a medical procedure that uses medical radioisotopes including the diagnosis and treatment of heart disease, arthritis, cancer brain scans, bone scans, diagnosis of AIDS, Alzheimer's, and many other maladies.
- Isotope use is critical to ensuring structural safety for dams, aircraft, bridges, and piping.
- The Department of Energy is seeking opportunities for private industry to assume control of some or all of its production and distribution activities.

ISOTOPES FOR MEDICINE AND SCIENCE

page 3

Commentor No. 333: Marjorie Rhodes (Cont'd)

Medical and Industrial Isotope Production

The U.S. Department of Energy (DOE) is responsible for ensuring a reliable supply of isotopes not available in the marketplace and a supply of commercial isotopes that can only be produced in unique DOE facilities. With the anticipated increase in demand for medical and industrial isotopes, DOE is evaluating the capabilities of its existing facilities and determining its future ability to meet these obligations.

DOE Office of Isotopes for Medicine and Science

The mission of DOE's Office of Isotopes for Medicine and Science is to meet the national need for a reliable supply of isotope products and services for medicine, industry, and research. Isotopes are produced by DOE only where there is no U.S. private sector capability or when the private sector's production capacity is insufficient to meet U.S. needs. DOE encourages private sector investment in new isotope production ventures and will sell or lease its existing facilities and inventories for commercial purposes.

Medical Isotope Uses

Nearly every aspect of medicine involves the use of isotopes, including diagnosis, treatment of several major diseases, and biomedical research.

Diagnostic Isotopes

Diagnostic isotopes are used for imaging internal organs. Unlike conventional radiology, imaging with isotopes reveals organ function and structure and provides more accurate diagnostic information.

An estimated 10 million nuclear-imaging procedures are performed each year in the United States. In these procedures, a patient is given a specific isotope in the form of a radiopharmaceutical. A camera can then trace the radiopharmaceutical through the body, providing pictures of alterations caused by disease. For example, during brain scans, an

isotope traces brain activity to give doctors a clear picture of whether the brain is functioning normally.

Therapeutic Isotopes

Therapeutic isotopes play an important role in effectively treating diseases. For example, isotopes are used in radiotherapy to destroy cancerous cells, to help arteries stay unlogged after coronary angioplasty, and to alleviate arthritis pain.

A recently developed technique being used in several trial studies is called cell-directed localized radiation therapy. This therapy, also referred to as "smart bullets," uses isotopes linked to cancer-seeking antibodies. The antibodies act as "homing" materials that seek and attach themselves to cancer cells and in the process deliver the isotope to the cancer cell. This directed therapy results in effectively killing the cancer cell but not the surrounding cells, thus minimizing the debilitating side effects seen with chemotherapy or full body radiation.

Biomedical Research

Thirty percent of all biomedical research involves the use of isotopes. At least 80 percent of all new drugs approved for use today result from research using isotopes. Medical researchers are now using isotopes in the search for cures for AIDS, Parkinson's disease, and diabetes.

Industrial Isotope Uses

Industrial isotope applications fall into three broad categories: nucleonic instrumentation, irradiation and radiation processing, and radioactive tracers.

Nucleonic Instrumentation

Nucleonic instruments contain radioactive isotopes. Some of these instruments are used for detecting and/or measuring quantities of pollutants, explosives, drugs, ores, petroleum, and natural gases. As an example, smoke detectors use a small amount of americium-241 to trigger an alarm when smoke is present.

333-2

Response to Commentor No. 333

Other instruments are used for nondestructive testing of materials. For example, iridium-192 is used to detect cracks and leaks in underground pipes and gas lines or in high-rise buildings, bridges, or aircraft.

Irradiation and Radiation Processing

Traditionally, medical products are sterilized in autoclaves at high temperatures and pressures. However, high heat can damage some medical products and equipment. Cobalt-60 is used to sterilize instruments that cannot be sterilized by other methods.

Radioactive Tracers

Isotopes can be used as tracers to follow atoms or molecules during studies. For example, isotopes are used to trace fertilizer and nutrient uptake in plants, to study chemical synthesis reactions, and to monitor the movement of materials through an industrial plant. Numerous isotopes are used as tracers in these applications.

Future Demand for Medical Isotopes

In 1998, an Expert Panel convened by DOE was asked to provide its analysis of the current and future medical isotope demands. The Expert Panel also developed a list of isotopes for DOE to consider for production. The Expert Panel findings include the following.

- The growth rate of medical isotope usage could be significant over the next 20 years. A 7-14 percent increase is predicted for therapeutic applications and a 7-16 percent increase is expected for diagnostic applications. This projected growth in demand for isotopes is contingent on continued Government support for basic research and technological improvements in nuclear medicine.

- Due to the development of new uses of medical isotopes and the limited number of facilities to produce isotopes, shortages of some major isotopes are expected.
- There is not a reliable supply of research isotopes produced at a reasonable cost. Without an adequate supply of high-quality, exotic isotopes, nuclear medicine cannot develop.
- The United States is over dependent on foreign isotope production.
- DOE's infrastructure for producing medical isotopes is diminishing due to changes in missions and aging facilities. It is unlikely that the existing infrastructure can support the rising demand for medical isotopes.

Based on its findings, the Expert Panel recommended that DOE and the National Institutes of Health develop the capability to produce a diverse supply of isotopes for medical use in quantities sufficient to support research and clinical activities. Such a capability would prevent shortages of isotopes, reduce American dependence on foreign isotopes, and stimulate biomedical research. They further recommended that this capability be built around either a reactor, an accelerator, or a combination of both so that isotopes for clinical and research applications can be supplied reliably.

United Food and Commercial Workers Local 141, United Staff Nurses Union, is a state wide local union that represents registered nurses in 24 hospitals, clinics, and home health agencies throughout the State of Washington. Founded in 1989, the union's mission is not only to provide collective bargaining representation for registered nurses, but also to work with other health care providers to advocate for quality, affordable, and accessible health care for consumers.

The nurses we represent are a diverse group of professionals providing care to patients in traditional hospitals as well as community settings. Some of these community settings are home health and hospice care. We care for patients who are diagnosed with cancer everyday. We see first hand the suffering that some must endure, not only from the disease that has ravished them, but from the treatment that, hopefully, benefits them. We watch as cancer racks their bodies with pain, and chemotherapy or radiation treatments cause unbearable side effects.

It is for these reasons that we support the use of the Fast Flux Test Facility for the production of medical isotopes for cancer treatment and research. We know that many research projects have been stalled or stopped because of a shortage of isotopes. We also know that continued research will benefit cancer patients.

We urge the Secretary of Energy, Bill Richardson, and the Department of Energy to restart the Fast Flux Test Facility for the vital mission of the production of medical isotopes for the treatment of cancer and cancer research.

Marilyn Savage

Comments of Public Citizen's Critical Mass Energy & Environment Program
on the Department Of Energy's *Draft* Programmatic Environmental Impact Statement
for
Accomplishing Expanded Civilian Nuclear Energy Research and Development and
Isotope Production Missions in the United States, Including the Role of the
Fast Flux Test Facility (DOE/EIS-0310D)

August 30, 2000

Thank you for the opportunity comment on the U.S. Department of Energy's (DOE) draft programmatic environmental impact statement (PEIS) on the nuclear infrastructure including resuming operation of the Fast Flux Test Facility (FFTF) at the Hanford Nuclear Reservation. I am Wenonah Hauter, Director of Public Citizen's Critical Mass Energy Project, a non-profit research, lobbying, and advocacy organization founded by Ralph Nader in 1971.

The Nuclear Infrastructure *Draft* PEIS evaluates the environmental impacts of several options:

- No Action
1. Restart the Fast Flux Test Facility;
 2. Use only existing operational facilities;
 3. Construct one or two new accelerators;
 4. Construct a new research reactor;
 5. Permanently deactivate the FFTF.

As we noted in our previous comments, conducting a PEIS on the production of isotopes in the FFTF was an unnecessary waste of taxpayer money. Instead of seeking new missions for the reactor, the DOE should have used its resources to permanently decommission the plant, which if restarted would pose a threat to the public's health and safety. Once again the Department of Energy is squandering taxpayer dollars looking to restart a dangerous reactor or construct new reactors and accelerators. The options that DOE has put forth are unneeded, uneconomical and unsafe. Accordingly, Public Citizen supports option 5 to permanently deactivate the fast flux test facility.

The FFTF was closed in 1983 because new missions could not be identified. In 1993, an independent review team reported that no combination of missions would be financially viable over the next ten years. Despite these findings, the DOE has prolonged the inevitable and used this process to propose other nuclear boondoggles.

Ralph Nader, Founder

Response to Commentor No. 336

336-1: DOE notes the commentor's opposition to enhancing its existing nuclear facility infrastructure. Consistent with its mandates under the Atomic Energy Act, DOE is seeking to maintain and enhance its infrastructure for the purposes of addressing three primary needs: 1) to support the increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and for which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2. of Volume 1 has been revised to clarify the purpose and need of the proposed action.

The NI PEIS evaluates the environmental impacts of a range of reasonable alternatives for accomplishing this mission. In addition to restarting the FFTF, the NI PEIS also evaluates alternatives that would either employ the use of existing facilities or rely on the construction of new facilities. Potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed action are relatively low and are discussed in detail in Chapter 4 of Volume 1 (e.g. Sections 4.3.1.1.9, 4.3.1.1.10, 4.3.1.1.11) and Appendixes H, I, and J in Volume 2 of the Final NI PEIS.

DOE notes the commentor's opposition to Alternative 1, Restart FFTF, Alternative 3, Construct New Accelerator(s); and Alternative 4, Construct New Research Reactor.

336-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

336-3: The restart of FFTF or use of any of the other proposed alternative facilities would not have an impact on the schedule or available funding for existing cleanup activities at Hanford, INEEL, or ORR. As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure

336-1

336-2

336-1

Commentor No. 336 : Joan Claybrook (Cont'd)

The absence of any credible mission for the FFTF is instructive. We do not need to restart this dangerous reactor, nor do we need the proposed alternatives of new reactors or accelerators. According to Dr. Janet Eary, Director of the University of Washington's Nuclear Medicine Department, "I see no shortage of radioactive isotopes for medical research and no need to restart this nuclear reactor to produce medical isotopes." Additionally, the continued production of radioactive waste either by the FFTF or one of the proposed alternative facilities will undermine DOE's clean up goals and further contaminate our air, water and land.

I'd specifically like to address the purported necessity of producing isotopes for food irradiation, the danger of creating more sealed sources of radiation, and the hazard to the public and the environment of restarting the reactor.

First, merely because the U.S. regulatory agencies have legalized irradiation does not mean consumers will buy irradiated food. Nothing is more important to most Americans than the health and safety of their families. Consumers are increasingly concerned about protecting their health. No long term studies have been done on the effects of food irradiation, and there is ample evidence that the process destroys vitamins and produces carcinogenic chemical compounds in food.

There is overwhelming evidence that Americans are skeptical of food irradiation. A 1997 poll conducted by CBS News found that 73 percent of the public opposes irradiation, and 77 percent of the public would not eat irradiated food. While the food and nuclear industries are telling the U.S. Food and Drug Administration (FDA) to stop requiring irradiated foods to be labeled, it is unlikely that they will be successful.

The FDA has received thousands of cards and letters demanding that it continue to require the labeling of irradiated food. A 1999 poll, jointly sponsored by the American Association of Retired Persons (AARP) and the Center for Science in the Public Interest (CSPI), found that 86 percent of Americans want irradiated food to be labeled.

However, even the economic interests that are promoting food irradiation do not necessarily believe that the use of radioactive isotopes Cesium 137 and Cobalt 60 is the best way to irradiate food. A large percentage of the industry intends to use the electron beam (also known as the e-beam) for irradiating food. The e-beam produces the same dangerous products in food as do radioactive isotopes, but it does not require the transport and use of radioactive material. The e-beam process utilizes an electronic machine called a linear accelerator to produce a stream of electrons moving at an extremely high speed. The beam disrupts the DNA structure of micro-organisms, rendering them sterile, it also creates chemical products ranging from formaldehyde and benzene to unnamed chemical compounds.

Titan Corporation, the leading provider of e-beam technology with its SureBeam subsidiary registered an initial public offering to spin off SureBeam. According to papers filed with the Securities and Exchange Commission the company states, "We have

336-1

336-3

336-4

Response to Commentor No. 336

operations. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

336-4: The availability of radioisotopes for the purposes of food irradiation is not the focus of DOE's proposed action. Although radiation sterilization of food is a possible application for certain industrial radioisotopes, including cesium-137 and cobalt-60, DOE does not anticipate a similar need for increased production of radioisotopes used for these purposes.

Although not within the scope of the NI PEIS, DOE recognizes the importance of improving control of radioactive sources, and is working with EPA and NRC on developing a nation-wide disposition system for orphaned sources of radiation.

336-5: DOE notes the commentor's concerns regarding the existing cleanup mission and migration of contaminants to the Columbia River. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Commentor No. 336: Joan Claybrook (Cont'd)

a history of losses and we may not achieve or sustain profitability." The company has incurred operating losses in each quarter of its existence.

In addition, Food Technology Services, a Florida based company that irradiates food with gamma radiation, has lost \$9.2 million since it was founded in 1985.

Despite an unprecedented number of meat recalls this summer and numerous incidents of food-borne illness, the public is not clamoring for irradiated food. Test marketing results have been mixed at best - irradiated meat has yet to earn the public trust. Even with massive marketing campaigns and extensive advertising sales are slow.

Restarting the FFTF for the purpose of creating Cesium 137 or Cobalt 60 is completely unnecessary. Nor should food irradiation be used as a justification for moving ahead with the alternatives of a new reactor or accelerator. There is simply no public demand for irradiated food and the existing technologies and corporations are unable to turn a profit.

Second, the idea of creating more sealed sources of radiation is ludicrous, given the amount of money that the Environmental Protection Agency (EPA) is spending on locating "orphaned" radiation sources. EPA's Orphaned Source Initiative (OSI) is completing a nationwide survey to identify the location of lost radiation sources in the US, and is planning a one-year pilot "cesium source round-up" to remove radiation sources from the public domain. Unfortunately, while sealed radiation sources are licensed, their final disposition is not tracked. These orphaned radiation sources gain entrance into metal recycling facilities and cause catastrophic contamination of recycled metals.

The fact that DOE is attempting to engage in producing large numbers of sealed radiation sources for medical and industrial purposes is contrary to EPA's effort at rounding-up all radiation sources. Why is no coordination taking place between these two agencies?

Third, I would like to address the impact on human health and the environment of restarting the FFTF. At the Hanford nuclear reservation in Washington state, there are over 300 tanks boiling cesium and burping hydrogen while leaking radioactive wastes into the Columbia river. It seems absolutely ludicrous that the DOE would attempt to restart this controversial, accident prone nuclear reactor, which would likely compound the waste problems at Hanford.

According to the public-interest organization Columbia River United, Hanford has spewed over 444 billion gallons of radioactive and chemical waste into the soil of the Hanford site. Hundreds of billions of gallons of wastewater were discharged directly into the Columbia River. Soil and groundwater contamination has resulted in massive underground plumes of deadly materials moving toward and in some cases already reaching the Columbia River. The largest plumes contain nitrate and tritium. Other large plumes include uranium, strontium 90, and chromium. Contaminants include carbon

336-4
(Cont'd)

336-5

Response to Commentor No. 336

As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. The radioactive waste that would be generated from the restart of FFTF (e.g., low-level radioactive waste) would not be dispositioned in the Hanford waste tanks.

The potential health and environmental impacts associated with operation of the Hanford facilities during normal operations and from postulated accidents are presented in Section 4.3 of the PEIS. All impacts to human health and to ecological resources would be small in the immediate area and negligible at all distant locations.

The 200 Area Plateau at Hanford contains 177 underground waste storage tanks. None of the tanks currently generate a sufficient heat load to boil. Cesium and other high-heat load radionuclides were removed from the waste tanks years ago. Tanks that generate hydrogen gas have had engineered features installed to make the tanks safe from a flammable gas standpoint.

There have been no serious safety-related accidents or release of hazardous or radioactive material causing significant injury or harm to workers, or posing any threat or harm to the offsite public at FFTF during its operational lifetime.

No food or water restrictions are in place outside the Hanford Reservation as a result of Hanford activities.

Operations of FFTF have been and will continue to be conducted under Washington State discharge permits. Any future operations of the facility would therefore not contribute to any of the referenced conditions.

336-6: FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that

Commentor No. 336: Joan Claybrook (Cont'd)

tetrachloride, sodium dichromate, technitium-99, and ferro-cyanide. The groundwater in the area is unusable.

Furthermore, while all nuclear reactors are inherently dangerous, some reactors are more dangerous than others. The reactor that the DOE proposes to restart is a sodium cooled "fast-breeder." Fast Breeder reactors are even more dangerous than the 103 light water reactors that are currently operating in the U.S. for several reasons:

- The FFTF uses sodium rather than water to cool the reactor. Sodium burns when exposed to air and explodes upon contact with water.
- Rapid increases in power, like the power excursion that blew apart the Chernobyl reactor, occur much more rapidly in fast breeder reactors than they do in conventional light water reactors.
- "Fast breeder" reactors are particularly susceptible to power instability due to the fact that they operate at higher power density.

The U.S. experience with "fast breeder" reactors argues against restarting the Fast Flux Test Facility. In November 1955, the first U.S. "power reactor" ever to produce electricity, the EBR-1, (experimental breeder reactor) melted down during testing. Rather than scrambling the reactor, the operator mistakenly hit the button for slow shut down, and in the few seconds it took to press the correct button, approximately half of the reactor core melted down. The public was not made aware of this meltdown until Lewis Strauss, head of the Atomic Energy Commission, and the man who claimed nuclear power would be "too cheap to meter," was confronted by the Wall Street Journal and had to admit his ignorance of the accident.

Not to be dissuaded by the meltdown of the EBR-1, The Power Reactor Development Corporation, a consortium of 35 utilities headed by Detroit Edison forged ahead with the first commercial fast breeder reactor. The Fermi reactor was to be a scaled up version of the EBR-1 with a small dense core made up of 14,700 uranium fuel pins. On October 6, 1966 the Fermi reactor also melted down.

The U.S. is not the only country to experience accidents with fast breeder reactors:

- France's Superphenix was permanently shut down in 1987 after leaking 20 tons of sodium. The \$10 billion dollar reactor only operated for 278 days in its 11-year history.
- The Japanese Monju fast breeder reactor was shutdown in 1995 after three tons of sodium leaked, causing the reactor to over heat and burn holes in cooling pipes. In the aftermath of the accident, the plant manager was so distraught that he committed suicide.

336-5
(Cont'd)

336-6

Response to Commentor No. 336

would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small. Prior to an FFTF restart, a revised safety analysis report and a probabilistic risk assessment would be prepared which would address any changes in plant configuration, operating conditions, and procedures. The revised safety analyses would be subjected to a thorough independent review process.

Commentor No. 336: Joan Claybrook (Cont'd)

- Both the British and the Germans have terminated their breeder reactor programs.

The DOE's misguided attempt to re-start this dangerous nuclear reactor or its proposed alternatives of new reactors and accelerators is little more than a welfare program for the nuclear establishment. Restarting the FFTF will create a new nuclear waste stream at the Hanford reservation at a time when the DOE's efforts should be focused on the dangerous mess they've already created.

339-1: Although a few radioisotopes can be produced by separating them from existing stockpiles of transuranic materials or other long-lived radioisotopes, the two primary means for producing radioisotopes is through the use of nuclear reactors or particle accelerators.

339-2: DOE does not falsify health records. Human health effects information presented in the NI PEIS is based on data collected at the candidate sites: ORR, INEEL, and Hanford. Data used to quantify offsite consequences were extracted from reports (available to the public) concerned with operational releases at candidate facilities. (See for example, DOE/RL-99-41, Radiological Air Emissions Report for the Hanford Site Calendar Year 1998).

These reports are generated in response to DOE's requirements for radiological control. DOE Order 231.1, Environment, Safety, and Health Reporting, requires an annual radiation dose summary that evaluates doses to members of the public and workers. DOE's radiological control requirements meet the legal requirements of 10 CFR 835. There are provisions for enforcement actions should the requirements of 10 CFR 835 not be met. In 1996, DOE established the DOE Radiological Health and Safety Policy (DOEP 441.1, April 26 1996). Accuracy of radiological records is among the goals of this policy: the policy states in part "Ensure radiological measurements, analyses, worker monitoring results and estimates of public exposures are accurate and appropriately made."

7/27/00

345-1: DOE notes the commentor's concerns and agrees that information presented at public hearings should be verbally conveyed and written in plain language. This is in accordance with the spirit of the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR 1500 through 1508 and 10 CFR 1021, respectively) which stipulate that NEPA documents be written in plain language. It is DOE's public participation policy to verbally present information and to provide handouts and other informational materials that are easily understood by the public and which avoid the use of jargon. The use of acronyms is avoided to the extent possible or they are spelled out the first time used, and essential technical terms or concepts are defined through the use of more common terms of understanding. Also, DOE made every effort to respond to each question asked during the public hearings. DOE is committed to the continual improvement of the public participation process and regrets if any member of the public felt that any information presented at the public hearings, either verbally or in written form, was unclear or otherwise unhelpful, or that any question went unanswered.

345-2: DOE notes the commentor's opposition to Alternative 1, Restart FTF.

345-3: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. A Tri-Party Agreement change was made to place the milestones for FTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Public meetings were held on this formal milestone change.

Response to Commentor No. 346

346-1: DOE notes the commentor's position. Public hearings are critical to the public participation process and provide valuable information to DOE. However, in ongoing clinical testing, therapeutic radioisotopes have proven effective in treating cancers and other illnesses while minimizing adverse side effects, making their use an attractive alternative to traditional chemotherapy and radiation treatments.

346-2: The NI PEIS provides an estimate of the potential human health impacts associated with a range of reasonable alternatives considered for the production of radioisotopes for medical and industrial uses, research and development, and as heat sources for radioisotope power systems (see Sections 1.2 and 2.5 of Volume 1). The methodology used in the analysis of health effects, which is detailed in Appendixes H through J, is based upon our current knowledge of the health impacts that may result from exposure to low doses of ionizing radiation and chemical agents. Sections 4.3 through 4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from implementation of any of the reasonable alternatives (some of which include use of facilities at Hanford), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with Hanford operations in support of the nuclear infrastructure would be small.

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

- 1) The money should be spent to clean up Hanford
- 2) It's dangerous
- 3) the Hanford Reach is National Monument
- 4) We don't need it

Name John Jay Fichter
Address 1135 SE 45th Avenue
City, state Portland OR 97215 Zip _____

Response to Commentor No. 350

350-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

350-2: The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

350-3: FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

350-4: On June 9, 2000, the President issued a proclamation that established the 78,900 hectares (195,000 acres) Hanford Reach National Monument (65 FR 37253). The proclamation recognized the unique character and biological diversity of the area, as well as its geological, paleontological, historic and archaeological significance. However, it should be noted that the 400 Area, within which the FFTF is located, does not fall within the monument boundaries and its operation would not impact the values for which the monument was established. If fact, as shown on Figure 3-6 of the NI PEIS, the 400 Area is located within an area that has been designated as industrial. The Hanford Reach National Monument is discussed in Section 3.4.1.1.1 of the NI PEIS.

Commentor No. 350: John Jay Fichter (Cont'd)

Response to Commentor No. 350

350-5: DOE notes the commentor's opposition to the use of FFTF for the expansion of its nuclear facility infrastructure. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs:

- 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;
- 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and
- 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

352-1

352-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTE.

352-2

352-2: DOE notes the commentor's concern regarding waste generation. It should be noted that nuclear power generation is not within the scope of the NI PEIS. The NI PEIS does address the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and appropriate DOE orders.

Response to Commentor No. 355

355-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

355-2: Hanford facilities can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with Alternative 1 would be small.

FFTF operated for more than 10 years with no discernible impact to the environment. Air emissions from the facility were in accordance with applicable permit and regulatory requirements and were well below federal and state air standards. Wastewater discharges were also in accordance with applicable permit and regulatory requirements. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner in compliance with applicable Federal and state laws and appropriate DOE orders.

Commentor No. 356: Joanna Bailey

Hanford Watch

356-1

356-2

Response to Commentor No. 356

356-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

356-2: The concerns expressed in the comment with respect to NI PEIS Alternative 1 are noted. FFTF operated for more than 10 years with no discernible impact to the environment. Air emissions from the facility were in accordance with applicable permit and regulatory requirements and were well below federal and state air standards. Wastewater discharges were also in accordance with applicable permit and regulatory requirements. Wastes generated were managed in a safe and environmentally protective manner in compliance with applicable federal and state laws and appropriate DOE Orders.

Restart and operation of the FFTF would result in small impacts to the biosphere. All air emissions and wastewater discharges to the environment would be in accordance with applicable permit and regulatory requirements. The releases of air pollutants and contaminated liquids associated with FFTF operations are addressed in detail in Section 4.3 of the NI PEIS. The release of criteria air pollutants would result in concentrations well below Federal and state air standards (Table 4-13); the releases of radioactivity and hazardous chemicals into the environment would have a negligible effect on human health (Tables 4-17 and 4-19); and no discernible impacts to groundwater or surface water quality would result from water discharges (Section 4.3.1.1.4).

Commentor No. 360: Anonymous

Response to Commentor No. 360

Draft PEIS Comment Form

We need FFTE, please restart it. This would reduce U.S. dependence on foreign sources for isotopes that could be produced at FFTE. Also, studies being conducted for the use of "smart bullet" isotopes for the treatment of cancer and other health problems appears promising.

360-1

360-1: DOE notes the commentor's support for Alternative 1, Restart FFTE.

 E-mail: Nuclear.Infrastructure-PEIS@hq.doe.gov

361-1:

DOE notes the commentor's support for Alternative 4, Construct New Research Reactor. It should be noted that permanent deactivation of FFTF is a part of this alternative.

361-2:

DOE notes the commentor's interest in the reuse of nuclear fuel and surplus plutonium, although issues of fuel reprocessing and surplus plutonium disposition are beyond the scope of this Nuclear Infrastructure PEIS. U.S. policy dating back to the Ford Administration has prohibited the commercial, chemical reprocessing and separation of plutonium from spent nuclear fuel. The "Surplus Plutonium Disposition Final Environmental Impact Statement" (DOE/EIS-0283, November 1999) Record of Decision (January 2000, 65 FR 1608) (see description in Volume 1, Section 1.7) includes the reuse of some surplus plutonium from dismantled weapons in mixed oxide fuel (MOX).

361-3:

DOE notes the commentor's concern regarding the need to expedite cleanup at DOE facilities. The restart of FFTF or any of the other proposed alternative facilities would not impact the schedule or available funding for existing cleanup activities at Hanford, INEEL, or ORR.

361-4:

DOE notes the commentor's concern relating to the cost of DOE programs.

Commentor No. 363: F. P. Brown

Response to Commentor No. 363

Draft PEIS Comment Form

Please restart the Fast Flux Test Facility in Washington. We need this facility and we need to reduce our dependency on foreign countries.

Comments on DOE Draft NI PEIS:

Reference: DRAFT Programmatic Environmental Impact Statement for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the United States, Including the Role of the Fast Flux Test Facility. DOE/EIS-00100. July 2000.

Please accept these comments on the reference NI PEIS. I conclude that restart and operation of the FFTF should be a key element of the subject program, together with utilization of existing thermal neutron reactor irradiation facilities to the extent of their capability and availability.

1. This report indicates that Alternative 1: "Restart FFTF", provides the greatest Mission Effectiveness of the alternatives evaluated. The report did not evaluate the national VALUE of the Mission Effectiveness of the alternatives, nor the cost. The report stated that cost will be considered in alternative selection, but is not a required environmental impact consideration.

(A recent news report states that a cost analysis "confirms that the Fast Flux Test Facility is the most effective means for meeting the entire suite of missions proposed by the Department of Energy." The quote is attributed to Senator Slade Gorton in reference to the cost analysis).

2. The NI PEIS report indicates no environmental impact bar to any of the alternatives. All could be carried out within the bounds of sound practice and applicable standards and regulations.

3. This report clearly indicates that national mission needs would be best met by a combination of a fast neutron reactor and one or more thermal reactors available for irradiation services. FFTF restart is the obvious path to fast reactor availability. ATR is an excellent thermal irradiation reactor facility, but limited in availability due a priority mission. It would be logical to utilize the irradiation capability of Candu reactors, in cooperation with Canada, up to the limits of capacity. When thermal irradiation needs exceed the Candu plus DOE facility available capacity, construction of the new research reactor becomes logical.

4. A key reason for providing both fast reactor and thermal reactor irradiation facilities is to produce the wide variety of isotopes for which there is a need. Some isotopes are most efficiently produced in

365-1

365-2

365-3

365-4

Response to Commentor No. 365

365-1: DOE notes the commentor's support for Alternative 1, Restart FFTF, along with the use of existing thermal neutron reactor irradiation facilities, it is assumed that the commentor is referring specifically to ATR and HFIR to the extent of their capability and availability. Under Alternative 1 ATR and HFIR would continue to perform their present missions; however, they would not undertake any new missions as outlined in the NI PEIS.

365-2: The estimated costs of the range of reasonable alternatives are presented in the Cost Report, summarized in Appendix P of the Final NI PEIS. However, the Cost Report is not a cost-benefit analysis. While it is reasonable to believe that the benefits of medical isotopes are substantial, the purpose of this NI PEIS is to describe the nuclear infrastructure missions (Section 1.2 of Volume 1), a range of reasonable alternatives for satisfying the mission requirements (Section 2.5 of Volume 1), and the environmental impacts that would result from implementation of the alternatives. According to 40 CFR Section 1502.23, if a cost-benefit analysis exists, it must be reported and summarized in the NI PEIS.

365-3: This comment is noted. Analyses in the NI PEIS indicate that all of the alternatives assessed in the NI PEIS can be conducted within the bounds of sound practice and applicable standards and regulations.

365-4: As stated in EIS Volume 1, Section 2.6.1, the use of CANDU reactors was considered, but dismissed because this would not meet the programmatic issue of enhancing the United States infrastructure to support the stated missions.

DOE notes the commentor's recommendation to use FFTF for fast neutron produced radioisotopes and to use a new research reactor for thermal neutron produced radioisotopes should existing facility capacities prove insufficient. This combination of facility use is not a specific PEIS alternative. However, in the process of reaching a decision the Secretary may consider, as appropriate, combinations of PEIS alternatives. All isotopes capable of being produced in a thermal reactor can be produced in the FFTF reactor.

365-5: The NI PEIS evaluates alternative ways of achieving the program objectives on a programmatic basis. Therefore, both reactors and accelerators were considered in the evaluation of irradiation facilities. DOE acknowledges that all of the alternatives are not equally effective in meeting the program objectives.

Commentor No. 365: Daniel E. Simpson (Cont'd)

Response to Commentor No. 365

the high energy neutron flux of a fast reactor; many others are most efficiently produced by thermal neutrons. FFTF target assemblies can be configured to accomplish thermal energy neutron irradiations, but fast neutron irradiation is its natural role. The new research reactor described in the report is well designed for thermal neutron irradiation for isotope production, and is a logical choice to expand production if existing facility capacities, including FFTF, are insufficient.

365-4
(Cont'd)

5. It appears from the information provided that particle accelerators are not inherently ideal for isotope production. This approach, it seems, would be complex and uncertain and would not be a logical choice for the production missions.

365-5

6. In conclusion, thorough analyses by DOE have shown that restart of the FFTF and operation as a neutron irradiation facility is in the national interest. Furthermore, a long period of operation in this service can be expected with confidence. The FFTF was conceived, designed, and built to develop advanced technology for civilian nuclear program needs. It was subject to high standards and exacting criteria for safety and operational performance. The safety of the design and the adequacy of the safety analysis were confirmed by detailed independent review by the Nuclear Regulatory Commission staff and the national Advisory Committee on Reactor Safeguards. The FFTF remains today a modern facility, with a demonstrated record of safe and successful operation. Its design for irradiation of diverse materials and components in the reactor core provides inherent flexibility that fits well with missions of isotope production; both the facility design and its management procedures are consistent with such uses. In particular, there are well-developed procedures for safety analysis, review, and approval of irradiation target specimens.

365-1

Thank you for your consideration.

Daniel E. Simpson

Commentor No. 366: James Chung

From: James.Chung@fluor.com%internet
 [SMTP:JAMES.CHUNG@FLUOR.COM]
 Sent: Thursday, August 31, 2000 7:10:59 PM
 To: INFRASTRUCTURE_PEIS, NUCLEAR
 Subject: FFTF Environmental Impact Statement
 Auto forwarded by a Rule

Dear Sir or Madam,

It is with great concern that I write this e_mail to you regarding the decision to re_start the FFTF. The draft EIS has all the pertinent facts included, but will the facts alone determine your decision?

366-1

If logic dictated our actions then FFTF would never have been put in standby mode in the first place. The arguments for re_starting the FFTF, and thereby correcting our past mistakes, have been promulgated more thoroughly and eloquently than that which follows. Nevertheless, I will reiterate the key point. Nuclear Sciences are vital to our National Security, National Energy Policy, Medical Science, Global Economic Sustainability, and Global Climate stability.

366-2

There are many legitimate and sound reasons to re_start the FFTF. Often these technical arguments are drowned out in a cacophony of emotional and illogical voices whose sole purpose is to feel a sense of accomplishment by ridding our nation of the specter of radioactivity and all things nuclear. I believe that the followers in the anti_nuclear movement are honestly ignorant of the scientific merit of nuclear technology, these people are genuine in their fear and mistrust of things nuclear. The leaders of these movements however, are not to be excused for their part in furthering and exploiting this ignorance.

366-1

Response to Commentor No. 366

366-1: DOE notes the commentor's views and observations.

366-2: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 366: James Chung (Cont'd)

Please, let us not be swayed by the strident cries of those who opinions are formed in ignorance and misinformation. Instead, why not decide to re_start FFTF based solely on the facts. Thank you for your thoughtful consideration.

366-2

Sincerely,

James Chung

Ms. Colette Brown

I am a concerned citizen in Idaho. We do not want any production of Plutonium in our state.

367-1

Reprocessing is not acceptable and should not be considered at INEEL or any other facility

367-2

Building 666 is a decrepit and highly contaminated building and should be decommissioned in a manner that is protective of human health and the environment _ AND THE WATER IN IDAHO! How can you live with yourself knowing that the aquifer in Idaho that is being contaminated under that building is running into the Snake River and then into the Columbia?

367-3

On top of that Plutonium_238 production is unnecessary, NASA doesn't even need it and its use too risky to produce.

367-4

Using ATR at INEEL would interfere with its current mission of producing medical and industrial isotopes that is at least beneficial to humans instead of deadly.

367-5

Also, please consider extending the comment deadline 30 days.

367-6

Thanks for listening.

Dr. Carolyn Keeler

Response to Commentor No. 367

- 367-1:** The commentor's position concerning the production of plutonium in Idaho is noted. Under Alternatives 1 through 4, the Fluorinel Dissolution Processing Facility is a candidate facility for the production of plutonium-238 to support NASA's deep space missions. Plutonium-238 is not used to make nuclear weapons.
- 367-2:** DOE would not conduct any reprocessing to produce weapons grade plutonium under any of the alternatives considered under this PEIS. The alternatives include processing of target materials used to produce isotopes for medical and industrial uses, plutonium-238 for space missions, and nuclear materials research and development. Sections 4.3.1.1.13; 4.3.2.1.13; 4.3.3.1.13; and 4.4.3.1.13 were revised to clarify the waste management approach for waste resulting from processing of target materials for plutonium-238 production.
- Building CPP-666 is divided into two parts, the Fuel Storage Facility and the Fluorinel Dissolution Process Facility (FDPF). The FDPF is under consideration in this PEIS for storage of neptunium-237 oxide, preparation of neptunium-237 targets, and separation of plutonium-238 from irradiated targets. This facility will meet the criteria to conduct these operations safely with further analysis and/or minor modifications.
- 367-3:** DOE notes the commentor's concerns regarding groundwater contamination and the potential for its migration to the Snake and Columbia River systems. Although beyond the scope of this NI PEIS, activities to remediate existing contamination of the Snake River Plain aquifer attributable to INEEL sources are ongoing and of high priority to DOE. INEEL has a comprehensive waste minimization and pollution prevention program in place as summarized in Volume 1, Section 3.3.11.8 that would govern any proposed site activities. Analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.2.1.4, 4.4.2.1.4, 4.5.2.2.4, and 4.6.2.2.4) addressing use of the FDPF indicate that there would be no discernible impacts to groundwater or surface water quality at INEEL from normal operation of FDPF in support of the proposed activities.
- 367-4:** DOE notes the commentor's opposition to the production of plutonium-238 for use in future NASA space exploration missions. Section 1.2.2 of Volume 1 was revised to clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Commentor No. 367: Carolyn Keeler (Cont'd)

Response to Commentor No. 367

Potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed production of plutonium-238 are relatively low and are discussed in detail in Chapter 4 of Volume 1 and Appendixes H, I, and J of Volume 2 in the Final NI PEIS. For over 30 years, radioisotope power systems have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. However, potential health and safety impacts associated with future launches of spacecraft utilizing plutonium-238 are not within the scope of the NI PEIS analysis, but would be addressed in the specific NEPA documentation prepared by NASA in support of such missions.

- 367-5:** As stated in EIS Volume 1, Section 2.3.1.2, ATR would continue to meet its medical and industrial radioisotope production mission for the no action and most other alternatives considered where ATR is not used for the production of plutonium-238. If ATR were to be used as a production facility for plutonium-238 (options 1, 2, 3, 7, 8, and 9 under Alternative 2), it would support medical and industrial radioisotope production to the extent possible. DOE would try to minimize the impact of the new mission on current medical and industrial radioisotope production.
- 367-6:** DOE notes the commentor's request for extension of the public comment period. The Council on Environmental Quality's (CEQ) "Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act" (40 CFR 1506.10(c)) require that a minimum of 45 days be allowed for public comment on the Draft NI PEIS. As stated in the Notice of Availability (65 FR 46443 et seq.), the public comment period began on July 28, 2000 and continued to September 18, 2000. In preparing the Final PEIS, DOE has assessed and considered both oral and written comments received on the Draft PEIS during the public comment period and has responded to these comments in the Final PEIS. Volume 3 of the NI PEIS contains public comments received on the NI PEIS and DOE responses to those comments. Moreover, late comments were considered to the extent practicable.

Please consider halting any further efforts to reprocess plutonium_238 at the INEEL in Idaho. The production of such substance appears to be unneeded and far too risky. The danger to the environment far outweighs any possible benefit that could come from the results of such efforts. Thank you.

Samuel E. Snider
 SJSnider@micron.net

368-1**368-2****Response to Commentor No. 368**

-
- 368-1:** DOE notes the commentor's opposition to the production of plutonium-238 at INEEL for use in future NASA space exploration missions. Section 1.2.2 of Volume 1 was revised to clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.
- 368-2:** Sections 4.2-4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from implementation of the alternatives, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with each alternative would be small.

Commentor No. 369: Peter B. Roth

Subject: FFTF Restart
Auto forwarded by a Rule

Dear Collette Brown/Secretary Richardson,

Please accept the following as public comments on the Draft Environmental Impact Statement on the Nuclear Infrastructure EIS.

As a citizen of the Pacific Northwest, I am deeply concerned about the United States Department of Energy's proposal to restart Hanford's Fast Flux Test Facility Nuclear Reactor. I wish to have my values incorporated into the formal administrative record and taken into consideration when adopting the final record of decision. I also want you to respond to my concerns before you make your record of decision.

369-1

First of all, I do not want any plutonium produced in this world. It is such an extremely toxic substance that it is not worth using it for any purpose (especially when alternatives to its use exist)! In addition, considering Hanford's overwhelming problems, including the crisis with tank waste treatment, as well as the damage caused by and radiation released from the Hanford wildfire, restarting FFTF is absolutely unacceptable. We must deal with the waste already at Hanford and focus on the clean_up mission. FFTF maintenance has already gobbled up \$100 million in clean_up money and distracted from desperately needed clean_up. Tank wastes are already seeping towards the Columbia River. More wastes must not be added to those tanks. Clean_up must be the only priority. We must save the Columbia River.

369-2

369-3

369-4

369-3

Response to Commentor No. 369

369-1: DOE notes the commentor's concerns. This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. DOE prepared a separate Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. DOE mailed this document to about 730 interested parties on September 8, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Nuclear Infrastructure Nonproliferation Impact Assessment in Appendix Q in the Final NI PEIS. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

369-2: DOE notes the commentor's opposition to enhancing its existing nuclear facility infrastructure to support production of plutonium-238 for use in future NASA space exploration missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration

Commentor No. 369: Peter B. Roth (Cont'd)

Also, I object to the fact that you are asking citizens to comment on an incomplete study. You have not told us how you will deal with non_proliferation issues or additional waste from FFTF. Should FFTF be restarted, that decision will be illegal under Federal law and will be overturned! Do the right thing, shut down FFTF now and save the future of the Columbia River!

Sincerely,

Peter B. Roth
7415 _ 5th Ave NE #208
Seattle WA 98115_5370

369-1

369-5

369-1

369-6

Response to Commentor No. 369

missions may be lost. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed production of plutonium-238 are relatively low and are discussed in detail in Chapter 4 of Volume 2 and appendixes H, I, and J of Volume 2 in the Final NI PEIS. Potential health and safety impacts associated with future launches of spacecraft utilizing plutonium-238 are not within the scope of the NI PEIS analysis, but would be addressed in the specific NEPA documentation prepared by NASA in support of such missions.

369-3: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford and migration of contamination towards the Columbia River. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

FFTF is located approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to the groundwater. Further, none of the proposed activities considered by this PEIS will be added to the tank wastes.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

In regards to the Hanford wildfire of 2000, the DOE Richland Operations Office, the State of Washington Department of Health, and U.S.

Commentor No. 369: Peter B. Roth (Cont'd)

Response to Commentor No. 369

Environmental Protection Agency performed environmental monitoring on and around the Site to assess potential radiological impacts. The wildfire did not cause a release of radioactive materials from any Hanford facility but did result in resuspension of radioactive materials which were already in the environment. The low levels of radioactive materials that were resuspended were slightly above natural background levels and required several days of analysis to quantify. Information on this event has been made available to the public and can be accessed at <http://www.Hanford.gov/envmon/indes.html>. This site also provides a link to information on the independent offsite air monitoring that was conducted by the U.S. Environmental Protection Agency.

- 369-4:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.
- 369-5:** Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.
- 369-6:** See response to comment 369-4. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Subject: Public Comments on the NI PEIS for the FFTF

Ms. Colette E. Brown:

Thankyou for the opportunity to make comments on the Nuclear Infrastructure Programmatic Environmental Impact Statement for the Fast Flux Test Facility (FFTF) dated July 24, 2000. My name is Roger Webb, and I am an engineering consultant in the nuclear industry as well as an 11_year resident of the Tri_Cities. I have a B.S. in Nuclear Engineering and am a registered professional engineer in the state of Washington. I am submitting my comments electronically as I have a schedule conflict with the available public comment opportunities.

Although I can expand upon my comments if needed, I am submitting a brief and concise set of comments to limit volume in the federal records:

Response to Commentor No. 370

Commentor No. 370: Roger H. Webb (Cont'd)

D Medical isotopes have proven overwhelmingly beneficial for the health and welfare of our families and friends and a solid source is needed. Anyone who has had personal experience with a family member or friend that could have been saved from death, diagnosed for specific life_enhancing treatments, or given isotope life_enhancing treatments but was not could and most likely would testify for the restart of the FFTF. The issue of restarting the FFTF is fundamentally political and economical, but the overwhelming benefits provided to peoples lives cannot and must not be limited to some political game. After all, what is the monetary value of ours or our loved ones lives?

D The restart of the FFTF to generate medical isotopes will accelerate the medical isotope technology for continued improvements in the quality of people's lives. Additionally, restart of the FFTF as an existing facility will surely save lives and money. Clearly, restart of the FFTF will take 3 years and the building of a new facility will take approximately 10 years. From a safety and performance point_of_view, the FFTF has a proven track_record of excellent and safe performance and is expected to have a remaining lifetime of at least 35 years to support said missions.

D The restart of the FFTF will provide a long_term economic diversification multiplication effect for the Tri_Cities, Washington state, and the whole United States. Cleanup of legacy Hanford waste will continue to be a priority for the Department of Energy and as this is completed, economic diversity will be reduced. Restart of the FFTF will result in the development of core medical isotope technology and health business and treatment centers in the Tri_Cities and across the nation as well as internationally. In a nutshell, restart of the FFTF to support the generation of medical isotopes will provide our great country with the foundation of being internationally reknown in the area of medical isotope technology.

Response to Commentor No. 370

370-1 **370-1:** DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 370: Roger H. Webb (Cont'd)

I request that you have FFTF declared the preferred alternative in final PEIS and that you do so with a quick record of decision to restart to save cancer patient lives.

370-1
(Cont'd)

Very Truly Yours,

Roger H. Webb, P.E.
(submitted via e_mail)

I attended the August 30, 2000 public hearing in Seattle, Washington, and listened to arguments for and against the restart of the Hanford FFTF reactor. The hearing clarified my long held conviction that proponents of plans to activate the reactor are in some way connected with _ or buying into the arguments of the "military and industrial complex" against which Dwight Eisenhower warned citizens of this country over nearly 50 years ago.

Have we not yet learned that it is in our best interest to serve ourselves, our fellow occupants of this fragile planet, and future generations by cleaning up the messes with which we have polluted our environment, and concentrating on finding less harmful ways to harness energy, to share and cooperate with each other in more creative ways?

We must start with our own communities, and keep our promises.. Cleanup at Hanford is an imperative. PLEASE honor the Tri_Party agreement, shut down FFTF, and put all efforts into CLEANUP at Hanford.

Marjorie Worthington
Enumclaw, WA 98022

371-1

371-2

371-3

371-4

Response to Commentor No. 371

371-1: DOE notes the commentor's concerns related to the use of its facilities for defense purposes. DOE made clear in its presentations and discussions during the public hearings that the missions being addressed were non-defense. It is hoped that DOE's openness and desire for public input were evident to the public attending the hearings. The purpose of this NI PEIS is to evaluate the environmental impacts of reasonable alternatives to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238 for NASA space missions, and civilian nuclear research and development. As evaluated under Alternative 1 in this NI PEIS, FFTF would be restarted to accomplish these nondefense-related missions. Other unrelated nuclear energy and defense-related considerations are beyond the scope of this NI PEIS. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

371-2: The restart of FFTF or any of the other proposed alternative facilities would not impact the schedule or available funding for existing cleanup activities at Hanford, INEEL, or ORR. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and appropriate DOE orders.

371-3: DOE notes the commentor's interest in alternative energy sources, although issues of research and development of alternative energy sources are beyond the scope of this Nuclear Infrastructure PEIS. The DOE missions to be addressed in this EIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development, can currently only be met using nuclear reactor or accelerator technologies.

371-4: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, and concerns regarding the existing cleanup mission at

Commentor No. 371: Marjorie Worthington (Cont'd)

Response to Commentor No. 371

Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Prior public meetings were held on this formal milestone change.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected. If the decision is made to shutdown the FFTF, then cleanup dollars will be needed to deactivate the facility, which could impact the overall Hanford cleanup schedule.

Auto forwarded by a Rule

Colette Brown, Document Manager

Reference DOE/EIS_0310D, Draft IN PEIS

I strongly support the option to restart the FFTF at Hanford, Washington, to meet all isotope production and research requirements. Reports have shown that the FFTF can meet all of the nations needs relative to production of Plutonium 238, to make isotopes for medicine, and provide an excellent tool for research and development.

This "newest and most modern" of existing DOE reactors is a proven and dependable facility. Why think of starting from scratch to construct new facilities at immense expense to the taxpayers when we have an existing facility. I know from personal experience while working my entire professional career on Government projects that inevitably such high technology facilities cost more and take longer to place in operation than initially estimated. Such increased costs and delays would very likely be true of any new reactor or accelerator.

I believe that the medical isotope technology field will grow to be a major health contributor for the nation and the world. FFTF has the capacity for the production of the many and varied types of isotopes needed. Some isotopes that will surely be needed and used in the future, such as copper 67, cannot be produced in the proposed new research reactor. The FFTF, and the fast neutrons it produces, has that capability.

372-1

372-2

Response to Commentor No. 372

- 372-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.
- 372-2: DOE notes the commentor's support for restarting FFTF for enhancing its existing nuclear facility infrastructure for medical isotope production.
- 372-3: DOE notes the commentor's opinion.

Commentor No. 372: Del Ballard (Cont'd)

Estimates have show that the construction cost of a new small, and less productive, reactor will be almost twice that of restarting the FFTF_ when adding on the cost of FFTF deactivation. The slightly higher annual operating cost of the FFTF over a new reactor will be well worth the price.

372-3

FFTF exists and is paid for _ lets use it!!

Ms. Colette Brown
DOE Office of Space & Defense Power Systems, NE_50

My name is Craig L. Bennett and I am a former cognizant safety engineer for the Reactor and Heat Transport systems of the FFTF and also a former FFTF Reactor Core Management Nuclear Engineer. I have been in the Nuclear Business since 1955 with General Electric, Battelle Northwest, Westinghouse Nuclear Fuel Division, and finally Westinghouse Hanford Company when I retired in 1996.

I am wholeheartedly in favor of restart of the FFTF, it is the safest, most stable reactor I've been around and worked on. I believe it should be kept in operation and used for Medical Isotope production and continued testing of fuels and materials for the next generation of fast reactors. It's a good place to convert excess weapons grade plutonium to a peaceful use. I have NO problems living here in the Tri_Cities, WA nearby operating reactors.

373-1

Response to Commentor No. 373

373-1: DOE notes the commentor's support for Alternative 1, Restart FFTF, although it should be noted that conversion of excess weapons grade plutonium is not one of the stated missions for which it would be restarted.

I actually just heard that there was a hearing but I missed it in Seattle. I actually grew up in Eastern Washington near the Tri_Cities in a small farming town. I just wanted to let you know that I feel it is really extremely important that we clean up Hanford and not just do it now, but we should have done it years ago. We shouldn't be putting any more waste in the State of Washington at all. We have the most hazardous waste of any other state in the nation and that is ridiculous. That is right near my home town, so you should not add any more waste. You should clean it up as soon as possible. Like, it just seems really crazy that the places that ship the waste to us get to comment about the state of the environment and the State of Washington and that scares me. Scares me because the [area] of eastern Washington and the Columbia River are the most beautiful places, and I mean it is great. If you can send me information about your process and what your final decision is going to be that would be great. That was probably the same amount of testimony time that you gave everyone at the public hearing. Hopefully that works for you. Thank you.

375-1

375-2

375-1

375-3

Response to Commentor No. 375

375-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The proposed activities delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

375-2: DOE notes the commentor's concern regarding waste generation. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and appropriate DOE orders.

375-3: Although not within in the scope of the NI PEIS, DOE notes the commentor's concerns regarding river transportation of waste to the Hanford Site and cleanliness of the Columbia River. In general, hazardous wastes are not shipped to Hanford by barging on the Columbia River. There are two exceptions to this: 1) transport of Trojan Nuclear Reactor components for disposal in a commercial disposal site, and 2) transport of decommissioned submarine reactor compartments for burial at Hanford.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to the groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Commentor No. 375: Theresa Howell

Response to Commentor No. 375

DOE notes the commentor's questions regarding the NEPA process and request for information. As requested, the commentor has been added to the program mailing list and will receive a notice announcing the availability of the Final NI PEIS and the Record of Decision, when published. DOE is required under the National Environmental Policy Act (NEPA) (42 U.S.C. 4321 et seq.) to prepare an environmental impact statement when its actions could significantly affect the quality of the human environment. Also in compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

September 2, 2000

VIA FACSIMILE

Colette E. Brown
U.S. Department of Energy
NE-50
19901 Germantown Road
Germantown, MD 20874-1290

Dear Colette E. Brown:

I wish to comment regarding the draft PEIS, the DOE plan for expanded production of PLU-238 for future space missions. While, in general, I support space exploration, I question the safety of the nuclear-powered spacecraft involved in many of these flights.

NASA is simply not doing enough to develop alternative (solar) power sources for space missions. The European Space Agency (ESA) has now developed high-efficiency solar cells for use in deep space missions. NASA should be designing its own solar cells or working jointly with the ESA to implement their panels in NASA space missions.

The plutonium production/fabrication process for space nuclear power missions has recently led to several worker contamination accidents. An expansion of production will only worsen this problem. And expanding the number of launches of nuclear powered space devices from Cape Canaveral on rockets with 10% failure rates will only increase the possibility of a deadly mishap.

378-1

378-2

378-1

Response to Commentor No. 378

- 378-1:** DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch.
- 378-2:** Plutonium-238 processing facilities can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Sections 4.2-4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from plutonium-238 processing, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that the radiological and nonradiological risks associated with plutonium-238 processing would be small.

Commentor No. 378: Brian J. Lutenegger (Cont'd)

• Page 2

September 2, 2000

Furthermore, the massive cost of expanded production of plu-238 cannot be justified at a time when DOE admits it needs over \$300 billion to clean-up existing problems at DOE facilities.

Finally, the military is promoting the use of nuclear power in space for space-based weapons technology. Using nuclear power for space war will have severe environmental implications for life on Earth. We simply cannot afford to take this risk for our children's future.

Thank you for your attention.

Sincerely,

Brian J. Lutenegger

378-3

378-4

Response to Commentor No. 378

378-3: DOE notes the commentor's opinion and concern about funding available for cleanup at DOE facilities.

378-4: DOE notes the commentor's concern for the use of nuclear power in space-based weapons, although issues such as the use of nuclear power sources in space-based weapons systems are beyond the scope of this Nuclear Infrastructure PEIS. None of the proposed actions are defense or weapons related. The plutonium-238 produced would be for civilian NASA space exploration missions, not for defense missions.

AUTOMOTIVE RESEARCH ARE

001

Draft PEIS Comment Form

I strongly urge the AEF to NOT waste public money and trying to subsidize the nuclear power industry, as we are moving closer to the production of electric field space electrical power systems. These generators utilize the space at the electric field to produce electricity and do not require the production of a force via thermal means to produce electricity. The beginnings of this work is contained in U.S. Patent # 4,897,572 which is a mechanical version which has been since upgraded to a solid state version. There is some information on the internet but I can't vouch for its accuracy as I have not read it. We plan to manufacture this electrical power generator to replace current electrical generation systems including nuclear and are talking to NASA about their long distance space missions.

Strongly urge either NO ACTION or Alternative 5.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

- attending public meetings and giving your comments directly to DOE officials

hensel@tetonvalley.net

Dear Ms. Brown,

I am writing to voice my opposition to reprocessing plutonium, whether it is done at the INEEL or any other facility. In 1992, President Bush officially halted reprocessing, in an effort to stem the flow of plutonium and to encourage other nations not to engage in this activity. I realize that the proposed facility will not produce weapons grade plutonium. The technology is nearly identical to the one used to produce P-239. One of the most disturbing similarities is the fact that alone with the plutonium the facility will produce hundreds of thousands of gallons of highly radioactive and hazardous waste. The US currently has millions of gallons of this waste that is leaking into the environment. The DOE has no viable cleanup plans for the existing waste. It makes no sense to produce more waste.

Especially when more plutonium is not needed or wanted. The DOE attempts to justify this reprocessing by claiming the material is needed to power space probes. NASA has stated that they do not need anymore P-238.

Another shortcoming of the DOE plans are using Building 666, at the INEEL, which is one of the most contaminated buildings in America. Building 666 should be treated as the pile of nuclear waste that it is and be decommissioned in a manner that is protective of human health and the environment.

Thank you for taking the time to read my comments.

Sincerely

 David Hensel

380-1

380-2

380-3

380-4

Response to Commentor No. 380

380-1: As stated in the comment, the proposed facility will not produce weapons grade plutonium. Unlike plutonium-239, plutonium-238 is not used in nuclear weapons. The technology that is discussed in the NI PEIS would be used to chemically separate plutonium-238 and neptunium from irradiated targets and not from irradiated or spent nuclear fuel, whereas reprocessing separates weapons grade plutonium-239 from irradiated nuclear fuel. As discussed in the separate nonproliferation impact assessment report, use of this technology to produce plutonium-238 from irradiated targets will not create a nonproliferation threat. DOE is committed to full compliance with and support of the U.S. policy prohibiting reprocessing. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

380-2: The use of any of the proposed alternative facilities for the stated missions would not have an impact on the cleanup missions at Hanford, INEEL, or ORR. The NI PEIS addresses the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and appropriate DOE orders. Waste generation is detailed in Chapter 4 of the NI PEIS for each of the alternatives.

380-3: A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a

Commentor No. 380: David Hensel (Cont'd)

Response to Commentor No. 380

September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

- 380-4:** Building CPP-666 is divided into two parts, the Fuel Storage Facility and the Fluorinel Dissolution Process Facility (FDPF). The FDPF is under consideration in this PEIS for storage of neptunium-237 oxide, preparation of neptunium-237 targets, and separation of plutonium-238 from irradiated targets. This facility will meet the criteria to conduct these operations safely with further analysis and/or minor modifications.

Commentor No. 381: Ellen Glaccum

Ms. Colette Brown
 DOE
 Office of Space & Defense Power Systems
 fax 1-877-562-4592

Dear Ms. Brown:

I am writing you with regard to the DOE's plan to produce PU-238. I have VERY strong feelings about this misguided scheme. First and foremost -- PU-238 production is unnecessary. I assume said production is destined for NASA which recently has stated that it will NOT need more PU-238.

Also, given that reprocessing technology has been responsible for huge volumes of liquid waste contaminated with radioisotopes as well as toxic chemicals creating monumental cleanup problems at INEL, Hanford and Savannah River why, in God's name, would any rational human being propose to create more? It's about time that DOE concentrate on cleaning up its toxic legacy, not create more.

With regard to specific problems at INEL, there is no way we should be getting back into the reprocessing business. Remember that this facility sits atop the Snake River Aquifer in a highly unstable (both volcanic and earthquakes) geological area. The two facilities DOE is considering for possible production sites are both unacceptable. Building 666 is old and is scheduled for demolition (rightfully so) by DOE. The Advanced Test Reactor is currently producing medical and industrial isotopes and producing PU-238 would prevent said production. Finally, the state of Idaho has an agreement to remove, not produce, dangerous nuclear waste.

In short, this is yet another unnecessary, expensive, hazardous, stupid, DOE scheme. I strongly urge the DOE to concentrate on cleaning up the mess it's made over the past 50 years and forget about these sorts of bogus, un-needed, garbage-producing, pork-barrel ventures, such as the production of PU-238.

Sincerely,

 Ellen Glaccum

cc: Senators Craig & Crapo, Representatives Simpson & Chawoweth, Governor Kempthorne

Response to Commentor No. 381

381-1: DOE notes the commentor's opposition to enhancing its existing nuclear facility infrastructure to support production of plutonium-238 for use in future NASA space exploration missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost.

The May 22, 2000, correspondence from NASA to DOE identifies that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

The technology that is discussed in the NI PEIS would be used to chemically separate plutonium-238 and neptunium from irradiated targets and not from irradiated or spent nuclear fuel, whereas

381-1

381-2

381-1

381-3

381-4

381-5

381-2

381-1

Commentor No. 381: Ellen Glaccum (Cont'd)

Response to Commentor No. 381

reprocessing separates weapons grade plutonium-239 from irradiated nuclear fuel. As discussed in the separate nonproliferation impact assessment report, use of this technology to produce plutonium-238 from irradiated targets will not create a nonproliferation threat. DOE is committed to full compliance with and support of the U.S. policy prohibiting reprocessing.

Use of any of these facilities for the stated missions would not impact cleanup missions at DOE sites.

- 381-2:** The use of proposed alternative facilities associated with processing of neptunium-237 targets would have no impact on schedules or available funding for high-level radioactive waste programs at either Hanford or INEEL. At INEEL, the tanks would not be used although certain facilities at the Idaho Nuclear Technology Engineering Center (INTEC) would be used to treat the wastes resulting from processing the irradiated targets. These are reliable systems that would process a maximum of 1,050 cubic meters of low-level radioactive waste over the 35-year nuclear infrastructure operational period. The higher activity waste would be treated as a solid form via a stand-alone vitrification system, separate from any tank waste treatment system. At Hanford, the existing high-level radioactive waste facilities would not be used, and as analyzed in the PEIS, no existing or planned high-level radioactive waste facilities would be used to treat the wastes resulting from processing the irradiated targets.

The Settlement Agreement (i.e., Spent Fuel Settlement Agreement, dated October 16, 1995) between U.S. DOE and the State of Idaho established schedules for the treatment of existing high-level radioactive waste, transuranic waste, mixed waste and removal of spent nuclear fuel from the state. This agreement is not applicable to newly generated wastes.

- 381-3:** An extensive discussion of the geology and associated geologic hazards of INEEL and vicinity is provided in Volume 1, Section 3.3.5 of this NI PEIS. The hydrogeology of the site, to include the Snake River Plain aquifer, is described in Section 3.3.4.2.1. Since publication of the Draft NI PEIS, additional facility location-specific information has been added to these referenced sections as reflected in this Final NI PEIS. Analyses presented in Chapter 4 of the NI PEIS (e.g., Sections 4.2.3.2.5, 4.3.2.1.5, 4.4.1.1.5, 4.4.2.1.5, 4.5.2.2.5, and 4.6.2.2.5) addressing use of Building CPP-651, FDPF, and ATR indicate that large-scale geologic

Commentor No. 381: Ellen Glaccum (Cont'd)

Response to Commentor No. 381

conditions (i.e., seismic and volcanic activity) present a relatively low risk to the proposed facilities. Historically, regional earthquakes have resulted in small effects on INEEL and would not be expected to significantly affect specially designed or reinforced structures. Also, the potential for recurrence of volcanic activity associated with identified volcanic rift zones during the 35-year mission timeframe is also very low. In addition, DOE will assess the need to evaluate and upgrade the existing facilities in response to natural geologic hazards in accordance with DOE Order 420.1 Facility Safety. This evaluation is periodically performed as part of facility Safety Analysis Report updates.

- 381-4:** Building CPP-666 is divided into two parts, the Fuel Storage Facility and the Fluorinel Dissolution Process Facility (FDPF). The FDPF is under consideration in this PEIS for storage of neptunium-237 oxide, preparation of neptunium-237 targets, and separation of plutonium-238 from irradiated targets. This facility will meet the criteria to conduct these operations safely with further analysis and/or minor modifications.
- 381-5:** As stated in EIS Volume 1, Section 2.3.1.2, ATR would continue to meet its medical and industrial radioisotope production mission for the no action and most other alternatives considered where ATR is not used for the production of plutonium-238. If ATR were to be used as a production facility for plutonium-238 (options 1, 2, 3, 7, 8, and 9 under Alternative 2), it would support medical and industrial radioisotope production to the extent possible. DOE would try to minimize the impact of the new mission on current medical and industrial radioisotope production.

383-1

383-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 386: Beth Call

Restart of FFTF at Hanford, WA, public comment

Beth Call
102 Otis
Walla Walla, WA 99362

The USDOE, in spite of recommendations by its own experts and an outcry of NW citizens, is planning to restart the Fast Flux Testing Facility at Hanford. Restarting FFTF would be disastrous for many reasons:

1. FFTF would add further high level nuclear waste to 177 underground High Level Nuclear Waste Tanks, 68 of which are already leaking life-threatening nuclear waste into the ground water seeping toward the Columbia River at a rapid rate. How can DOE propose to create yet more High Level waste when none of the present waste has yet been successfully transformed to a stabler form by vitrification? Insufficient clean-up funding is a major factor in the painfully slow progress being made in this vital project.
2. In 1995 DOE, promised in the Hanford Clean-up Agreement to shut down FFTF and use resulting savings for clean-up. \$100 million designated for waste clean-up has instead been used to keep FFTF on hot standby. Much more would be spent to restart and maintain FFTF, thus using clean-up funds to instead produce yet more highly radioactive waste.
3. The Washington State Medical Association says it does not need FFTF as an additional source of medical radioactive isotopes. NASA says it does not need Plutonium 238 for its space program. So why does DOE want to restart FFTF? DOE says it could use the Plutonium 238 for other unspecified missions. This could include **nuclear weapons testing and development.**
4. The DOE's Programmatic Environmental Impact Statement (PEIS) suggests shipping weapons-grade Plutonium through Puget Sound to fuel the FFTF Reactor, despite recent vehement protests of nearby residents and the Seattle and Tacoma City Councils against receiving even spent nuclear fuel. Fire on a Plutonium bearing ship could kill thousands and permanently leave a large area uninhabitable.
5. The deadly radioactive waste of Hanford will, if not contained, contaminate the Northwestern US and beyond, for thousands of years and countless generations, potentially rendering this beautiful area unfit for human habitation. We have an inescapable responsibility to present and future human civilization to clean up Hanford **NOW**. As a first step we must stop the restart of the Fast Flux Testing Facility.

Please include my comments in the official record for the Pu-238/FFTF Environmental Impact Statement.

Response to Commentor No. 386

- 386-1:** The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

386-2: DOE notes the commentor's opposition for Alternative 1, Restart FFTF.

386-3: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. High-level radioactive waste would not be generated from merely operating FFTF. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at

Commentor No. 386: Beth Call (Cont'd)

Response to Commentor No. 386

each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

- 386-4:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Prior public meetings were held on this formal milestone change.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected. If the decision is made to shutdown the FFTF, then cleanup dollars will be needed to deactivate the facility, which could impact the overall Hanford cleanup schedule.

Any future waste generated by these activities will be conducted in accordance with applicable Federal and state laws and regulations and appropriate DOE orders.

- 386-5:** DOE notes the commentor's opposition to restarting FFTF for expanding its existing nuclear facility infrastructure. No component of the proposed action is for the purpose of supporting any defense or weapons-related mission.

DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes,

Commentor No. 386: Beth Call (Cont'd)

Response to Commentor No. 386

estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings.

The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost.

Commentor No. 386: Beth Call (Cont'd)

Response to Commentor No. 386

A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires one-third less plutonium-238 as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000, letter to DOE that large RTGs be maintained as backup. Section 1.2.2 was revised to clarify plutonium-238 mission needs.

- 386-6:** The commentor appears to express the concern that DOE would expose people in the Puget Sound area to risks associated with the transport of weapons-grade plutonium. None of the proposed alternatives would involve the shipment of any weapons-grade plutonium to any port in the United States. Alternative 1 does postulate that DOE might decide at some point to import mixed oxide fuel from Europe to fuel FFTF. At this time, however, DOE has not proposed to import this fuel through any specific port. If DOE ultimately decides to import fuel from Europe, it would perform a separate NEPA analysis to select a port. This review would address all relevant potential impacts of overseas and inland water transportation, shipboard fires, package handling, land transportation, as well as safeguards and security associated with the import of SNR-300 mixed oxide fuel through a variety of specific candidate ports on the east and west coasts. It would consider all public comments, including local resolutions, concerning the desirability of bringing mixed oxide fuel into the proposed alternative ports.

In the event that DOE decides to enhance its nuclear infrastructure, it would not expose any population to high, unacceptable risks under any alternative. Any transportation activities that would be conducted by DOE would comply with U.S. Nuclear Regulatory Commission and U.S. Department of Transportation regulations. Associated transatlantic shipment would comply with International Atomic Energy Agency requirements. In Section J.6.2, DOE reviewed the potential maximum impacts from the marine transportation of mixed oxide fuel from Europe

Commentor No. 386: Beth Call (Cont'd)

Response to Commentor No. 386

to a representative military port, Charleston, South Carolina, and overland transportation to Hanford. Also in that section, a bounding analysis demonstrates that the maximum potential radiological risks to the surrounding public from mixed oxide fuel shipments would be extremely small (e.g., less than 1 chance in a trillion for a latent cancer fatality per shipment from severe accidents at docks and in channels and less than 1 chance in 50 billion for a latent cancer fatality per shipment from overland highway accidents).

Statement of Congressman Doc Hastings at the Hearing on the Draft Programmatic Environmental Impact Statement for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the United States, Including the Role of the Fast Flux Test Facility.

August 31, 2000

Thank you for allowing me the opportunity to share my views with you this evening.

I'm here tonight as a strong supporter of the Fast Flux Test Facility and I urge the Department to move forward with the restart in the Final PEIS.

As a life long resident of the Tri-Cities, I understand the unique challenges our community faces as a result of the Hanford site. And, as the hometown Congressman, I know that a majority of Tri-Cities residents support restart of FFTF. As the DEIS reported: " FFTF would provide the greatest flexibility for both the isotope production and nuclear-based research and development...for all of the proposed alternatives."

It's time to end the politics of fear that has plagued the debate for far too long. We must focus on truth not innuendo, on science not scare tactics, and on the benefit FFTF will provide to this community, the country, and the world.

Tonight we'll hear that cleanup funding at Hanford will be diverted if FFTF is restarted. That's just not true. In fact, the Fast Flux Test Facility is funded under an entirely different account from cleanup dollars in the federal budget. I pledge that I will not allow the restart to jeopardize cleanup dollars for Hanford.

Tonight we'll hear that new tank waste will be added to Hanford if FFTF is restarted. That's just not true. The spent nuclear fuel will be managed independent of the existing Hanford site waste management infrastructure by using commercially available facilities for all waste treatment and disposal activities.

Tonight we'll hear that the Columbia River would be harmed if FFTF is restarted. That's just not true. The fact is FFTF's fuel cycle is a closed cycle with no release of contaminated liquids to the Columbia River or the environment.

387-1

387-2

387-3

387-4

Response to Commentor No. 387

387-1: DOE notes the commentor's support for implementation of Alternative 1 (Restart FFTF). The alternatives evaluated in this NI PEIS are described in Section 2.5 of Volume 1.

387-2: The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As described in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

387-3: As discussed throughout Section 4.3 of Volume 1, none of the proposed alternatives would add waste to the high-level waste tanks at Hanford.

Spent nuclear fuel resulting from implementation of Alternative 1, Restart FFTF, would not be managed at commercially available facilities. As described in Section 4.3.1.1.14 of Volume 1, it would be placed in existing storage facilities or dry storage casks at FFTF, pending availability of a disposal site.

387-4: FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to the groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

**Commentor No. 387: U.S. Representative Doc Hastings
(Cont'd)**

Tonight we'll hear that FFTF will be used to make weapons grade plutonium. That's just not true. In fact, Plutonium-238 cannot be made into a warhead. And in order for any new missions to be undertaken at Hanford, a new Environmental Impact Statement must be completed.

387-5

Tonight we'll hear that the FFTF is unsafe and will put our region in jeopardy. That's just not true. FFTF is much safer than commercial power reactors due to its unique design.

387-6

The truth is that FFTF will fulfill our nation's nuclear infrastructure needs and help save the lives of millions of Americans and citizens worldwide. At this hearing we'll hear from many in our community about the benefits nuclear medicine has provided. This is just the tip of the iceberg. FFTF is the only facility in the nation that can produce these isotopes in the size, quantity, and variety needed to fight all the different types of cancer.

387-7

Most of us know someone with cancer or have seen a loved one suffer from cancer. Recent developments in the medical isotope field suggest that our ability to combat deadly cancer strains will be revolutionized by these new isotopes. Section 31 of the Atomic Energy Act requires the federal government to maintain research and production quantities of isotopes. The FFTF has the unique ability to produce a steady stream of different medical isotopes simultaneously at one reactor. FFTF offers the added benefit of allowing the government to meet its statutory responsibilities at a low cost to taxpayers rather than building the capacity from scratch.

387-8

Medical isotope research is showing tremendous potential to improve the lives of millions of people worldwide. There have been many highly successful clinical trials in the treatment of several major classes of cancer and other medical problems. Medical isotopes offer innovative new ways to treat cardiovascular disease, arthritis, and other rheumatic conditions.

387-9

Restarting the FFTF would increase the reliability and diversity of medical isotopes while stabilizing the supply of these promising disease-fighting tools. The rapid growth of this field could support the majority of the costs to operate the reactor. The Expert Panel has estimated that the expected growth rate of medical isotope use during the next 20 years will range between 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications.

387-10

Some question these numbers but in 1999 alone the demand for therapeutic isotopes increased by 19 percent. That's not a projection -- that's a fact. However, without the ability to produce these isotopes, lives will be lost and research delayed. I believe that the restart of FFTF will increase the production of isotopes more than any other option in the DEIS. We can operate the FFTF safely and efficiently with little risk to local residents or Americans anywhere in the country.

387-11

Response to Commentor No. 387

387-5: As discussed in Section 1.2 of Volume 1, plutonium-238 would be produced to support NASA's deep space missions. Plutonium-238 is not used to produce nuclear weapons. All missions considered in the NI PEIS are for civilian purposes.

387-6: As discussed in Section 4.3, implementation of Alternative 1, Restart FFTF, would pose no significant risk to the health and safety of the public or workers.

387-7: The commentor's position on medical isotope production in FFTF is noted. As discussed in Section 2.7.3 of Volume 1, no single-production method evaluated could satisfy all of the Expert Panel's medical isotope projections. The medical isotope mission is discussed in Section 1.2.1 of Volume 1.

387-8: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "... ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." Cost is one of the factors that will be considered in developing the Record of Decision. Other factors include environmental impacts, public input, nonproliferation issues, schedules, technical assurance, policy, and program objectives.

387-9: DOE notes the commentor's position on medical research and applications of radioisotopes.

387-10: The commentor's position on FFTF capabilities to produce medical isotopes is noted. Findings of the Expert Panel are discussed in Section 1.2.1 of Volume 1. The use of medical isotopes has tracked at levels consistent with the Expert Panel's growth projections made in 1998.

387-11: DOE agrees that the FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

**Commentor No. 387: U.S. Representative Doc Hastings
(Cont'd)**

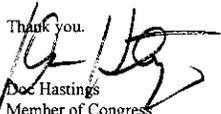

I continue to believe that the EIS should determine the amount of future health care costs that would be avoided by using these isotopes. Only then will we be able to quantify the enormous benefit provided by this unique facility. Any responsible analysis of FFTF must quantify expected benefits as well as potential risks and costs.

The PEIS should also include the benefits of isotope production not only for medicine, but also for biological and agricultural research, food irradiation, and numerous other industrial uses that would benefit the entire nation.

Further, the final PEIS must include a detailed account of the benefits provided for research and education. We must ensure that this nation maintains the ability for American students to learn firsthand the benefits and challenges associated with nuclear reactors. Research is an essential component to ensure further developments in the nuclear field.

In closing, I want to thank everyone for coming tonight. Government works best when we can debate policy freely and openly. I want to thank the Department of Energy for their efforts to ensure an open and fair public comment period. I look forward to working with you in the coming months to ensure that all the considerations of the public are addressed in the final EIS and urge you to conclude that the restart of FFTF is in our country's best interest.

Thank you.

Doc Hastings
Member of Congress

387-12

387-13

387-14

Response to Commentor No. 387

- 387-12:** The estimated costs of the range of reasonable alternatives are presented in the Cost Report, summarized in Appendix P of the Final NI PEIS. However, the Cost Report is not a cost-benefit analysis. While it is reasonable to believe that the benefits of medical isotopes are substantial, the purpose of this NI PEIS is to describe the nuclear infrastructure missions (Section 1.2 of Volume 1), a range of reasonable alternatives for satisfying the mission requirements (Section 2.5 of Volume 1), and the environmental impacts that would result from implementation of the alternatives. According to 40 CFR Section 1502.23, if a cost-benefit analysis exists, it must be reported and summarized in the PEIS.
- 387-13:** While it is reasonable to believe that the benefits of radioisotopes in biological, agricultural, and industrial applications may be substantial, the purpose of the NI PEIS is to describe the nuclear infrastructure missions (Section 1.2 of Volume 1), a range of reasonable alternatives for satisfying the mission requirements (Section 2.5 of Volume 1), and the environmental impacts that would result from implementation of the alternatives.
- 387-14:** The commentor's position on nuclear research and education is noted. The nuclear energy research and development mission for civilian applications is described in Section 1.2.3 of Volume 1.

Commentor No. 388: Shakir Zaman

The following views are submitted in support of FFTF restart:

- FFTF is the preferred alternative for materials testing in support of life extension of existing LWR's for which operating license may be expiring in the next decade or two.
- FFTF should be the preferred alternative for testing of advanced fuels to increase the operating time by reducing refueling cycles of the LWR's.
- In view of the breakdown of the Russian infrastructure soon after the breakdown of the Soviet Union, it should be noted that it is easy to lose the scientific base through benign neglect and or inaction. To ensure that such a phenomenon does not happen in USA, there is a need to build and preserve an infrastructure to maintain the scientific base, experience and knowledge in support of our national programs through positive actions. FFTF is needed to maintain such a scientific base.
- Recent reports of accidents (nuclear submarine accident), breakdown in morale in Russian administration, and prevailing corruption in that country demonstrate potential instability in the Russian institutions. The Russian sources therefore, can not be relied upon to provide Pu-238 on a long-term basis. FFTF is the preferred alternative for the needed production of Pu-238 for the US space program.
- To believe that Hanford can have only one mission i.e. "cleanup only", is naive. We live in a complex and intellectual society. The citizens of this society including Hanford workers can be trusted with multiple missions for multiple facilities geared according to national priorities. FFTF mission can be significantly different than PFP or the Tank Farms and still that mission can be understood and followed successfully according to national priorities.

388-1

388-2

388-3

Response to Commentor No. 388

388-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

388-2: DOE notes commentor's support for restarting FFTF for enhancing its existing nuclear facility infrastructure. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs:

1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;

2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and

3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

388-3: DOE notes the commentor's support for using the FFTF for the enhancement of its nuclear facility infrastructure.

In Support of the Restart of FFTF

To Whom It May Concern:

It is a pleasure for me to speak on behalf of the restart of FFTF. I come perhaps wearing three hats. The first hat is that of a local citizen who has been a part of this community for some 25 years. The second hat is that of a former research scientist who has conducted research utilizing nuclear reactors in the past. And the third is that of a physician who has been in practice for some 20+ years in this community. I speak to you, therefore, with first hand knowledge of the importance of medical research and in particular, radio isotopes that can be utilized for research, diagnosis, as well as treatment of those who are ill. I have, I believe, a unique perspective and so I would like to relate to you very briefly what I think is very important as we give consideration for the restart of FFTF.

In the early sixties, I was a graduate student at Washington State University and utilized the nuclear reactor there for neutron defraction studies that allowed me to elucidate a very accurate structure of ortho-phosphoric acid. The phosphate moiety, as you know, plays a very important role in biology and biological reactions. I had the opportunity to obtain data from the Oakridge National Laboratory Reactor and utilize these data as part of my Ph.D. thesis. When I was a young post-doctoral fellow, at Roswell Park Memorial Institute, I was a co-author of a paper that very accurately determined the structure of a very primary, yet important amino acid. The data for this research was created at Brookhaven National Laboratories.

Response to Commentor No. 389

Commentor No. 389: Frank E. Cole (Cont'd)

Page 2

It was during those times, the early sixties, that the electron microscope was beginning to play an important role in biology, radio-chemistry was clearly becoming very important, and crystal structure analysis was becoming even more important in terms of elucidating the structure of ribonuclease as well as DNA. We had crude instruments to say the least, at our disposal. The computers were fairly slow and I specifically recall friends of mine using little red wagons to take their computer cards from the chemistry building to the computing center where, if it became too hot, the computer did not run. I remember the early biochemical studies, which addressed enzymes and proteins and their mechanisms of action. And I remember how the pieces were not yet there that would have implications for the treatment of diseases.

Some twenty years later, I could not have dreamed or anticipated all of the tremendous progress that has occurred. And I am convinced progress has occurred because the infrastructure for research; i.e. increased knowledge of radioactive isotopes for biological research, computers, better knowledge of biochemical and cellular reactions, and a better understanding of disease and disease processes, slowly came into place. As I look again some twenty years into the future, it would be literally impossible to visualize the advances that can be made for the curing of diseases and the decrease in the morbidity and the mortality that has attended to these diseases. These advances can only be made if a research infrastructure is in place. What is needed is more research and not less. We need "smart drugs" that are made of antibodies linked to a radioisotope. We need to produce in our own country, medical isotopes such that quality issues are adequately addressed. We need not have to depend on resources outside of our borders that clearly has the possibility of restricting, or at least limiting, our research efforts. These components of the infrastructure along with the FFTF facility I believe will bring good to all mankind that is far beyond our imagination today.

Therefore, it is my feeling that we should, and must, move forward with the restart of the FFTF for the reasons that I have just previously outlined. There is now, and there will be, a need for medical research utilizing isotopes as far into the future as I can see. I believe that the groundwork has already been laid.

PhD*

Response to Commentor No. 389

389-1

389-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 389: Frank E. Cole (Cont'd)

Page 3

As we are well aware, safety issues and environmental impact studies have been extensively addressed and in my opinion, pose no problems. I think the only problem that we have, is related to the fear that is currently being raised, and which I find on a scientific basis, to be unfounded. Therefore, I believe that we should go forth with diligence and not be afraid.

Sincerely Yours,

Frank E. Cole, M.D., Ph.D.

SUBJECT: Commons on Nuclear Infrastructure Preliminary
Environmental Impact Statement

Dear Ms. Brown:

As a practicing radiation oncologist, I am writing to express my strong support of efforts by the U.S. Department of Energy to strengthen its nuclear infrastructure and become a reliable domestic supplier of medical isotopes.

Recent advances in the diagnosis and treatment of human disease by nuclear medicine procedures have made it more important for the U.S. to supply the needed quantities of isotopes required in the country. Both the draft Programmatic Environmental Impact Statement (PEIS) and the Nuclear Energy Research Advisory Committee have validated the need for D.O.E. to take the lead in establishing a facility capable of producing radioisotopes.

I would like to express my opinion that the restart of the Fast Flux Test Facility (FFTF) at Hanford is the best option to meet the projected future demand for medical isotopes. The FFTF reactors isotope production capabilities far exceed those of other operating U.S. reactors. It would prevent us from continuing to be dependent on Canada and Europe for our medical isotope needs. Because of its high neutron flux and energy spectrum, the FFTF can produce more types of medical isotopes with a higher quality than those supplied by other reactors that are operating today. I understand that the reactor has more than 30 years of lifetime remaining and this appears to be the most practical option for isotope production than the others described in the PEIS.

For the above reasons, I strongly urge that the restart of FFTF be the option chosen by D.O.E. for supplying the quantity and quality of isotopes needed for biomedical research as well as diagnosis and treatment of human diseases.

Department of Energy

Dear Sirs:

I support restart of the Fast Flux Test Facility (FFTF). The FFTF will provide much needed medical isotopes at the lowest cost. In addition, restarting the FFTF will ensure that a vital nuclear technology is retained. The U. S. A. will need FFTF technology in the future as the supply of oil and gas declines.

Sincerely,

391-1

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

8/31/00

The FFTF is the facility most capable of producing the full range of isotopes that will be needed to meet the healthcare needs for diagnosis & treatment of health illnesses & disease. When the FDA approves upcoming health treatments, there will be an unprecedented demand for isotopes. I think the American government could well serve the people of America & the world if they would utilize the FFTF for isotope production.

Thank you —

Patricia S. Heasler

Commentor No. 394: *Walter W. Laity*

Draft PEIS Comment Form

As a 26-year resident of Richland, and as a taxpayer who believes in getting maximum benefit from the nation's capital resources, I am in favor of restarting FFTF. FFTF would be ideal for supporting research such as that called for in "A Roadmap for Developing Accelerator Transmutation of Waste (ATW) Technology," which DOE submitted to Congress on Nov. 1, 1999. Among FFTF's significant advantages for research are the following:

- Only fast reactor remaining in the U.S.
- Designed explicitly for testing fuels and materials.
- Can accommodate a wide variety of test vehicles and large assembly sizes.
- It's high peak neutron flux is an important attribute for completing irradiation tests in a timely manner.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

Commentor No. 395: John B. Logan

Comments on the Draft NLEIS

I would like to express my support for the Restart of FFTF as the best option considered in the Draft document.

If the United States is to maintain any form of leadership in the world wide development of the peaceful use of Nuclear Energy we must actively pursue research with any asset at our disposal. The Fast Flux Test Facility is not only one of the newest facilities in the DOE complex, it offers unique capabilities that are not available anywhere else in the world. Because of its large core volume and high flux density it is the only option that can simultaneously meet the requirements of the multiple missions that DOE has identified.

In the field of Medical Isotope Research alone the FFTF offers a potential to dramatically increase the US ability to develop new treatments for Cancer. Promising research is being deferred because isotopes that could be made at FFTF are not available. Meanwhile over 1,000,000 new cases of cancer will be diagnosed this year. Americans deserve the best possible treatments available and the failure of DOE to support such research is reprehensible.

Opponents to restarting FFTF will claim that the risks are too high. The risk of operating FFTF are insignificant compared to the potential benefits. Opponents will claim that the costs are too great. Medical Isotope treatment of cancer is not only less expensive than traditional treatments but it is also less debilitating to patients. What cost are too great if they relieve human suffering?

The United States has historically been a world leader in Research and Development. The choice now is, do we continue to lead? Or do we step back and wait for a new leader?

Restart FFTF

Thank you

Please change the definition of safety
 to one that closely matches a dictionary.

Draft Programmatic Environmental Impact Statement for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the United States, Including the Role of the Fast Flux Test Facility

rem (roentgen equivalent man) - A unit of dose equivalent. The dose equivalent in rems equals the absorbed dose in rads in tissue multiplied by the appropriate quality factor and possibly other modifying factors. Derived from "roentgen equivalent man," referring to the dosage of ionizing radiation that will cause the same biological effect as one roentgen of x-ray or gamma-ray exposure. One rem equals 0.01 sievert (See absorbed dose, dose equivalent, and quality factor.)

remediation - The process, or a phase in the process, of rendering radioactive, hazardous, or mixed waste environmentally safe, whether through processing, entombment, or other methods.

remote-handled waste - In general, refers to radioactive waste that must be handled at a distance to protect workers from unnecessary exposure (e.g., waste with a dose rate of 200 millirem per hour or more at the surface of the waste package). (See contact-handled waste.)

resin - See ion exchange resin.

Resource Conservation and Recovery Act, as Amended - A law that gives the U.S. Environmental Protection Agency the authority to control hazardous waste from "cradle to grave" (i.e., from the point of generation to the point of ultimate disposal), including its minimization, generation, transportation, treatment, storage, and disposal. Resource Conservation and Recovery Act also sets forth a framework for the management of nonhazardous solid wastes. (See hazardous waste.)

riparian - Of, on, or relating to the banks of a natural course of water.

risk - The probability of a detrimental effect from exposure to a hazard. Risk is often expressed quantitatively as the probability of an adverse event occurring multiplied by the consequence of that event (i.e., the product of these two factors). However, separate presentation of probability and consequence is often more informative.

risk assessment (chemical or radiological) - The qualitative and quantitative evaluation performed in an effort to define the risk posed to human health and/or the environment by the presence or potential presence and/or use of specific chemical or radiological materials.

roentgen - A unit of exposure to ionizing x- or gamma radiation equal to or producing one electrostatic unit of charge per cubic centimeter of air. It is approximately equal to 1 rad.

runoff - The portion of rainfall, melted snow, or irrigation water that flows across the ground surface, and eventually enters streams.

Safe Drinking Water Act - This act protects the quality of public water supplies, water supply and distribution systems, and all sources of drinking water.

safe, secure trailer - A specially modified semi-trailer, pulled by an armored tractor truck, which DOE uses to transport nuclear weapons, nuclear weapons components, or special nuclear material over public highways.

safeguards - An integrated system of physical protection, material accounting, and material control measures designed to deter, prevent, detect, and respond to unauthorized access, possession, use, or sabotage of nuclear materials.

safety - With regard to nuclear weapons, minimizing the possibility that a nuclear weapon will be exposed to accidents and preventing the possibility of nuclear yield or plutonium dispersal should there be an accident involving a nuclear weapon.

Safety analysis report - A report that systematically identifies potential hazards within a nuclear facility, describes and analyzes the adequacy of measures to eliminate or control identified hazards, and analyzes potential accidents and their associated risks. Safety analysis reports are used to ensure that a nuclear facility can be constructed, operated, maintained, shut down, and decommissioned safely and in compliance with applicable laws and regulations. Germantown, MD 20874

Re: NI PEIS

Dear Ms. Brown:

I am writing you to restate the position of the City of Richland regarding the Draft Environmental Impact Statement that addresses future use of the Fast Flux Test Facility (FFTF) at Hanford. The City has stated in several letters to the Department of Energy over the past few years that we unequivocally support the use of FFTF for production of isotopes for medicine, space missions as well as other research and development projects.

In 1996 we formed an advisory committee with over 30 participants from a wide spectrum of interests in our community. They studied the use of FFTF and other Hanford facilities for isotope production and plutonium disposition. The committee concluded that the FFTF, which was designed to operate with mixed oxide fuel and has more than a 20-year remaining life, should be used to produce medical isotopes and other products. Operating the facility has the added advantage of disposing of surplus weapon's material by converting it to reactor fuel and irradiating it to the spent fuel standard, which makes the material unavailable for weapons.

Residents of our community were involved in the design construction and operation of FFTF. They are extremely knowledgeable about the facility's track record for safe operation. We have no reservations about the reactor being restarted to serve various national missions. We would however object to our federal tax dollars being spent to build a new facility somewhere else that has less capability than FFTF. We were pleased that the cost analysis done by the Department of Energy as part of the current Environmental Impact Statement, confirms that FFTF is the most cost effective means for meeting the entire suite of missions proposed.

Response to Commentor No. 397

397-1

397-1: DOE notes the commentor's support for Alternative 1, Restart FFTF, although it should be noted that conversion of weapons grade plutonium is not one of the stated missions for which it would be restarted.

**Commentor No. 397: Robert J. Thompson, Mayor,
City of Richland, WA (Cont'd)**

NI PEIS
Page 2

Hanford's legacy is the production of plutonium for the defense of our country. It is a proud history but one that leaves this region with a significant environmental cleanup challenge. It is our dream to develop a new legacy, which is the production of a wide range of medical isotopes. Many isotopes have not been examined for their life saving potential because they have not been available to researchers. Others that have proven successful in clinical trials will not be available in the quantity needed when FDA approval is granted. It is shocking that the United States currently lacks the capability to provide needed isotopes for cancer victims in this country. FFTF is the solution to this problem. Department of Energy must make the bold decision to restart the reactor.

Sincerely,

Robert J. Thompson
Mayor

398-1: Comment noted.

**Commentor No. 399: Donna Noski, Council Member,
City of West Richland, WA**

The time is close when a decision will be made on the future of the Fast Flux Test Facility. When all the information is compiled, it will come down to the Department of Energy determining what is the "right" decision on the future of the controversial FFTF.

How will DOE make the "right" decision? How will ^{DOE} you determine what is in the highest and best interest of our nation? I offer that the decision process simply comes down to determining "what works". "What works" cannot be separate from the highest and best interests of the nation and the world.

FFTF is capable of: *Civilian Nuclear Research & Development*
Transmutation of Waste to reduce nuclear waste stockpiles *to include*

FFTF is capable of:
Producing power for NASA's deep space probes

FFTF is capable of:
Producing medical isotopes for treatment of cancer and other diseases.

As a result of these capabilities, the final EIS should identify

- FFTF as the preferred alternative
 - it should include health care cost savings
- and,
- it should identify the importance of the need for expansion of medical isotope production

Restart of FFTF is in the highest and best interest of our nation. Making the decision to restart FFTF is "what works".

*Donna Noski
West Richland City Council Member*

399-1

399-2

399-3

399-2

Response to Commentor No. 399

- 399-1:** DOE notes the commentor's views on decisionmaking in the NEPA process.
- 399-2:** DOE notes the commentor's support for Alternative 1, Restart FFTF.
- 399-3:** DOE notes the commentor's views that health care cost savings and the importance for expanded medical isotope production be identified in the NI PEIS. The estimated costs of the range of reasonable alternatives are presented in the Cost Report, summarized in Appendix P of the Final NI PEIS. However, the Cost Report is not a cost-benefit analysis. While it is reasonable to believe that the benefits of medical isotopes are substantial, the purpose of this NI PEIS is to describe the nuclear infrastructure missions (Section 1.2 of Volume 1), a range of reasonable alternatives for satisfying the mission requirements (Section 2.5 of Volume 1), and the environmental impacts that would result from implementation of the alternatives. According to 40 CFR Section 1502.23 if a cost-benefit analysis exists, it must be reported and summarized in the NI PEIS.

**Commentor No. 400: Ken Dobbin, Councilman,
City of West Richland, WA**

Secretary William Richardson
United States Department of Energy
Forrestal Building
1000 Independence Avenue SW
Washington, DC 20585

August 31, 2000

Dear Mr. Secretary:

During the FFTF scoping meetings last year, I spoke on behalf of the residents of West Richland. This year, I am morally compelled to speak on behalf of a larger constituency. I must speak for the thousands of American children and tens of thousands of American adults, across our great land, who will, over the next 35 years, owe their lives to the FFTF. The citizens of West Richland expect me to speak out for those helpless in the face of cancers not now curable.

On behalf of those Americans, from coast to coast, whose lives will be saved from FFTF isotopes, I want to thank the United States Department of Energy, from the bottom of my heart. Thank you for carefully weighing the science in preparing this Programmatic Environmental Impact Statement (PEIS). It would have been far easier to fold under the political pressure of anti-nuclear fanatics who don't care about the helpless, but only in advancing their own agendas. I am speaking of fanatics who say we don't have a shortage of medical isotopes, even though there is a one-year backlog for Pd 103 seed therapy and patients have been denied clinical trials using nuclides such as Cu-67 due to lack of supply. I am speaking of fanatics who propose either a red herring of an accelerator that only has a target volume the size of a pop can or one that costs billions of dollars and 10 years to build. I am speaking of fanatics who falsify safety data to say that there is a one-in-three chance of an accident that will contaminate eastern Washington. I am speaking of fanatics who say let people die rather than bring one more atom of waste to Hanford--then they turn around and dump the 1000 ton radioactive Trojan reactor vessel on us!

On behalf of those Americans whose future depends upon the FFTF, I respectfully ask that the argument for restart be strengthened. Please add to the final PEIS the medical cost savings from a sufficient supply of medical isotopes as a first line defense against cancer, heart disease, and arthritis. Estimates I have seen put these savings in the billions of dollars. Please add the loss of life that will result from choosing an option that takes longer to build than the three year startup time of the FFTF. These data should be added to Figures S-5 and 2-24. The four years quoted in Table E-12 must be a misprint. I cannot conceive of a facility that could produce all the required isotopes being built in that short of a time. Please compare the debt service on the capital cost to build new production capability, with the much smaller annual operating cost of the FFTF. In addition to the saving of lives, taxpayers expect us to be good stewards of their dollars.

Our opponents, who have shown they don't understand science, medicine, or engineering, have falsely accused the FFTF of generating too much waste. Please clarify the facts for them. Show a picture of one of the score of dry fuel storage casks now stored on a pad at

Response to Commentor No. 400

400-1

400-1: DOE notes the Councilman's views and observations.

400-2: DOE notes the commentor's views on the costs and benefits of the proposed production of medical radioisotopes. The estimated costs of the range of reasonable alternatives are presented in the Cost Report, summarized in Appendix P of the Final NI PEIS. However, the Cost Report is not a cost-benefit analysis. While it is reasonable to believe that the benefits of medical isotopes are substantial, the purpose of this NI PEIS is to describe the nuclear infrastructure missions (Section 1.2 of Volume 1), a range of reasonable alternatives for satisfying the mission requirements (Section 2.5 of Volume 1), and the environmental impacts that would result from implementation of the alternatives. According to 40 CFR Section 1502.23, if a cost-benefit analysis exists, it must be reported and summarized in the NI PEIS.

400-2

400-3

400-2

400-4

400-3: The four years stated in the NI PEIS Table E-12 is not a misprint, but is based on comparable radioisotope production research reactors that have been designed and are being constructed in Canada and Australia, as referenced in Section E.10. The four year time period is for new research reactor construction only and does not include design, licensing, and pre-operational startup activities, which were assumed to require an additional four years as presented in PEIS Figure 2-34 of Volume 1.

400-4: DOE notes the comment.

Commentor No. 400: Ken Dobbin, Councilman (Cont'd)
City of West Richland, WA

Response to Commentor No. 400

the FFTF. Each cask, about the size of a compact car, contains 7 spent fuel assemblies, already in a dry, controlled environment that is safe until a repository is opened. To save the lives of the constituents I am representing tonight, it will only take two more casks per year. Compare this volume with the spent fuel the Navy is generating that must go to the same repository. Each day, a foreign power, called cancer, enters the US and murders 1500 Americans. We need the FFTF to defend those people as much as the Navy needs submarines! Also compare the one truckload of low-level waste from the FFTF each year with that generated by other sources such as hospitals. Will our fanatical opponents declare war on hospitals next? It will take the FFTF much longer than 35 years to generate as much low-level waste as Oregon sent us last August on one barge! Let our hypocritical opponents declare war on Oregon, not on those suffering from cancer.

400-4

Please emphasize how the FFTF is complimentary with other DOE sites and facilities. For my 25 years as a nuclear engineer, too often I have seen one site pitted against another rather than cultivating cooperation. I was told in 1993 that the FFTF would have to be shut down to save EBR-2 and the Integral Fast Reactor (IFR) program. I was also told that the Advanced Neutron Source would produce all needed medical isotopes. It was not long after the FFTF shutdown order that these facilities were shut down and canceled, invalidating the justification for FFTF shutdown. We know now that without the FFTF, the DOE cannot produce a space power source, provide for material science testing along with the other nuclear technology needs and still provide the quantity and quality of medical isotopes that my constituents will need. New facilities with the same capability cannot be built in the three year period that it takes to get the FFTF restarted. Every minute, every hour, every day, every month that we delay, human life is lost! All DOE sites cannot help but embrace the FFTF startup to create a rising nuclear technology tide that will raise the well-being of all Americans. No one could support delay in getting on line a medical facility to supply the required quantity and quality of isotopes. No one could intentionally delay a facility that will transform the new promising clinical trials to a first line defense, coast to coast.

400-5

400-5: DOE notes the concerns expressed about efficient and coordinated use of its facilities and resources.

400-6

400-6: DOE notes the commentor's support for Alternative 1, Restart FFTF.

FFTF operation is good for America. Our opponents have tried but failed during the last 4 years to find a legitimate reason not to restart. I have sat through public meeting after public meeting listening to their false testimony. I have read their internet sites. They have not developed one legitimate reason why the FFTF should not be restarted!

400-1

Therefore, let's get on with it. Please designate the FFTF as the preferred alternative in the final PEIS and make a record of decision to restart as soon as possible. Every minute of every day another American man, woman, or child dies of cancer. They are depending upon us!

400-6

Sincerely,

Ken Dobbin

Jim Davis Strongly Favors Restart of FFTF

Testimony submitted August 31, 2000 by Jim Davis in support of FFTF at Richland's

Tower Inn:

This letter is in response to the comment period concerning the findings of the Department of Energy's (DOE) Nuclear Infrastructure Programmatic Environmental Impact Statement (NI PEIS).

I strongly endorse the restart of the Fast Flux Test Facility (FFTF) for essential peaceful, civilian missions. I believe this can be done without sacrificing the primary clean-up mission of Hanford and without generating substantial new waste streams that pose a significant burden to the clean-up mission.

401-1

Response to Commentor No. 401

401-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 401: Jim Davis (Cont'd)

FFTF is America's best answer for medical isotope production. Reactivation of FFTF will allow more people to effectively combat cancer. In addition, FFTF can also produce more kinds of isotopes, providing more flexibility for isotope research, which can lead to more effective treatments for cancer.

From my reading of the cost analysis released by the Department of Energy, I feel the restart of FFTF is the most cost-effective solution. The added costs of converting FFTF from standby to shutdown will cost an estimated \$281.2 million. This would take a substantial amount of money away from environmental cleanup.

FFTF is not an issue we should be playing politics with. Like all difficult issues, we are going to have to work with local officials, with the Administration and with both sides of the state to produce results. We have the unique opportunity to operate a state-of-the-art research facility here in the Tri-Cities community. We can truly save lives, as thousands will be treated with the medical isotopes that are produced at FFTF.

I am convinced that FFTF can be restarted without endangering the critical cleanup missions at Hanford. In congress, I will fight to ensure that FFTF funding does not cut into cleanup missions. We have to restart FFTF; people's lives depend on it.

Draft PEIS Comment Form

So often when local state or national government try to erect or construct a new controversial project, there is the NIMBY effect - Not In My Backyard. Here in the Tri-Cities, we want the FFTF to be restarted because of all the good results that will occur. If it is not restarted, you can believe that getting another reactor or accelerator built will be exceedingly difficult to do. The same groups that are trying to deactivate FFTF will try to prevent or delay the construction & activation of these other projects. In other words, you can almost be assured that the production of adequate isotopes, W238 and research will not be available for many years, if even.

Commentor No. 404: Roger J. Thiede

Response to Commentor No. 404

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

- ① Recommended returning FFTE as operating reactor for primarily medical isotopes. Although I retired in 1989, I was intimately involved in the standards used to construct FFTE. FFTE is a good machine and is too valuable to shut down.
- ② Wife died in 1995 of cancer. New treatments with isotopes might have saved her.
- ③ Grandfather died of prostate cancer.
- ④ Grandmother died of cancer even though it was in remission after 5 yrs following radiation therapy.

404-1

Commentor No. 405: Walt Apley

My name is Walt Apley and I am a resident of Richland, Washington. I support FFTF restart for medical and industrial isotope production, Plutonium-238 production, and research & development irradiation requirements.

Besides expressing that support, I have three comments:

(1) The debate on FFTF should not distract us from acknowledging how critically important the nuclear infrastructure needs are.

A great nation like ours must: promote the health and welfare of its citizenry; protect the environment we live in; and support the beneficial expansion of human knowledge.

Failure to provide medical isotopes is not an option.

Failure to provide nuclear research capabilities is not an option.

Failure of this EIS to result in a decision that fixes what is a clear and present danger is not an option.

(2) My second comment relates to, given the need, why FFTF?

FFTF has the size no other available test reactor has to meet a self-supporting set of missions. FFTF's safety record is superb and it remains the Department of Energy's only reactor that meets modern commercial U.S. nuclear standards. FFTF's neutron spectrum is a unique scientific asset, and it would be a technological tragedy were that asset to disappear. The fast neutron spectrum is a critical tool needed for high purity isotope production, fusion materials research, waste transmutation development, and nuclear materials lifetime extension studies. Eliminate this scientific tool and you take an almost irreversible step to set nuclear research back in a major way.

(3) My third comment is a concern, and a cautionary statement. FFTF is an outstanding facility that

Response to Commentor No. 405

- 405-1 405-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.
405-2: DOE notes the commentor's opinion.

Commentor No. 405: Walt Apley (Cont'd)

should be restarted and could be ^{an incredible} ~~such a~~ boon to health care and nuclear research. But DOE and Congress must recognize that a great investment like FFTF requires sustained and sufficient investment. I'm sick and tired of the short-sighted, penny-pinching, do it with less attitude that Congress and this administration has displayed towards its nuclear infrastructure. A decision to restart FFTF needs to come with the firm resolve to fund excellence.

405-1
(Cont'd)

405-2

I know that the people involved in putting together this EIS and making the decision are doing their best. But as Winston Churchill ~~once~~ said "Sometimes it is not enough to do your best. You must do what is right." Restarting FFTF is the right decision.

405-1

Response to Commentor No. 405

Commentor No. 406: Bruce Klos (Cont'd)

Although the three-page letter had many of these half-truths I will limit my remarks to three or four of them, depending on the time. A couple of these were addressed in the opening remarks but I believe bear repeating.

FFTF - copy of relevant pages are available at the DOE table.

First half-truth - The NERAC subcommittee (the referenced "blue ribbon panel") did indeed state that the FFTF was ill suited (because of

IN FACT I noticed

financial - not technical reasons) to produce research isotopes. However, *IN FACT, I NOTICED COPIES OF EXCERPTED PAGES FROM THIS REPORT*

the NERAC subcommittee also said that there was a shortage of isotopes and that the FFTF was well suited for large scale production of isotopes;

ON THE DOE TABLE

isotopes that will be needed to treat patients, not just conduct research.

What use is the research if you don't have the production quantities to treat patients? The report encouraged the FFTF supporters to seek partnership with private industry for the production of these treatment quantities. Quantities that will be used to treat hundreds of thousand of patients. The NERAC subcommittee also heartily endorsed the Expert Panel Report, which predicted the growth to be 7% - 14% for therapeutic isotopes. NERAC saw the obvious potential of the FFTF as a large-scale

406-1
(Cont'd)

Response to Commentor No. 406

Commentor No. 406: Bruce Klos (Cont'd)

isotope production machine and applauded this capability throughout the report.

Second half-truth - The PEIS identified Puget Sound as a possible Port of Entry for the German Reactor-Grade fuel. However, the Senator failed to recognize it is unlikely that DOE will even ship the fuel to Puget Sound, not because of any risk, but because it costs more to sail to the west coast than to sail directly to an eastern port. The PEIS also indicates that Charleston Naval Station has been the primary port for receiving foreign fuel for the past five years and was the port selected for ~~detailed~~ ^{the boundaries} analysis in the PEIS.

The signers of the letter also failed to recognize that the accident risk in the PEIS was determined to be less than 10^{-12} latent cancer fatalities or 1 in a trillion. For perspective, the chance of dying from cancer from one flight across the U.S. is 1 in 1 million. The chance of dying from an asteroid is 1 in 1.6 million. The chance of dying from this fuel shipment is

**406-1
(Cont'd)**

Response to Commentor No. 406

Commentor No. 406: Bruce Klos (Cont'd)

approximately
 A million times less. Clearly these members of Congress Senator are
 misinformed of the risks or have been misled.

Relates to the need for Pu²³⁸

Third half-truth - In Seattle, last night I referred to this as a half
 truth. I have since re-read the letter, and must confess that I was too
 generous in that assessment. This aspect of the letter appears to be an
 outright falsehood. The letter states "The major claimed need for
 FFTF restart no longer exists, yet the Department continues to expend
 funds and undermine its credibility by continuing to propose the restart
 of the FFTF reactor to meet a need for **Plutonium that NASA has
 informed you does not exist.**" NASA did not say they no longer need
 Plutonium. NASA did state that they no longer required small RTGs for
 long space missions. These batteries use Pu-238 for the heat source.
 The same letter also indicated that NASA is transitioning to the more
 efficient Stirling Radioisotope Power System. This generator still
 requires Pu-238.

406-1
 (Cont'd)

Response to Commentor No. 406

Commentor No. 406: Bruce Klos (Cont'd)

How much effort would it have taken to for a Representative of the Federal Government to find this simple truth? Last night I ~~said~~^{asked} where was the other half of the truth, tonight I ask them where is any aspect of the truth?

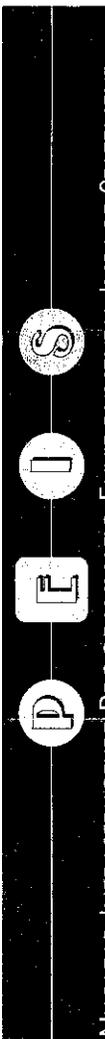

As evidenced by the letter from the Association of Washington Business, and a recent Portland Oregonian editorial, there are those in Western parts of Washington and Oregon who support a balanced view of the issues; not just the anti-nuclear, anti-technology, anti-business views of many who were at the Hood River, Portland and Seattle meetings. As elected representatives you have a responsibility to your entire constituency. By not researching the whole truth, you do a disservice to them and to the remaining residents of the great state of Washington.

MS. Collette Brown
U.S. Dept. of Energy
NE, -50 Germantown Road
Germantown, MD 20874-1290

My wife and I moved to Kennewick, WA a little over two years ago. We were under the impression from what we could find out, that the mission for the Hanford project was to be clean-up.

408-1

Now comes the "boosters" for the restart of a moth-balled reactor in hopes of producing medical isotopes, although evidently, they are easily obtained from other countries.

408-2

The "boosters" also are pushing to perhaps produce space batteries, although we read that NASA says they have changed their requirements to a different form of energy.

408-3

Restarting the FFTF would mean adding more nuclear waste to the already overloaded wastestream that has no good way of disposal and no place to go.

408-4

Count us in the column to stay the course and continue with the Clean-up Mission!

408-1

No more production from Hanford until clean-up is accomplished.

Thank you,

Victor Moore

Victor Moore

Response to Commentor No. 408

408-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Prior public meetings were held on this formal milestone change.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected. If the decision is made to shutdown the FFTF, then cleanup dollars will be needed to deactivate the facility, which could impact the overall Hanford cleanup schedule.

DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to "... ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use." The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

With respect to plutonium processing, no weapons material will be produced within the stated mission. All proposed activities are for civilian purposes.

Commentor No. 408: Victor and Roberta Moore (Cont'd)

Response to Commentor No. 408

408-2: For nearly 50 years, DOE's use of its unique technologies and capabilities to develop isotopes for civilian purposes has enabled the widespread application of medical isotopes seen today. While its market share is a small fraction of total world isotope production, DOE remains the key provider for a large number of isotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Because their application is initially experimental, these isotopes are not generally purchased in large-enough quantities to make their production financially attractive to private industry.

The United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

408-3: A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Commentor No. 408: Victor and Roberta Moore (Cont'd)

Response to Commentor No. 408

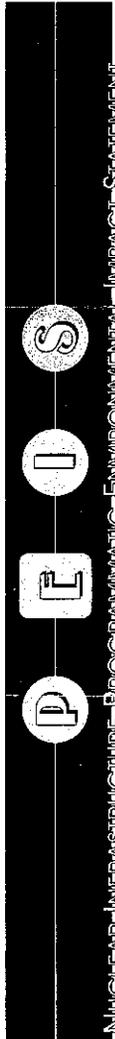

408-4: FFTF restart would not impact the schedule or available funding for existing cleanup activities nor would it generate high-level radioactive waste. As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram funds designated for Hanford cleanup, regardless of the alternative(s) selected.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

PEOPLE FOR A KINDER AND GENTLER TREATMENT FOR CANCER

FFTF4

Collette Brown
Department of Energy
August 31, 2000

CANCER SURVIVOR LAUREL PIIPO

Dear Ms. Brown,

I've attended hearings in Hood River and Portland this week, plus hearings last year, and I'm exhausted. In those cities I've been called a 3-hour carpet bagger, told I was arrogant for being there and told to stay home, because it was THEIR hearing, told NOT to leave a hearing at 10:30 PM for the 3 hour drive home because the hearing wasn't over and I should have the courtesy to stay, asked how I had the gall to come to THEIR hearing. I've also been called a Bimbo, asked if my friends and I were the Singing Grandmas or a bowling team and accused of being a Communist because I wear a red shirt, but the accuser would rather be red than dead ha ha. Any time children's treatment for cancer was mentioned, a group of gigglers giggled. They probably laugh their way through the obituary column. People so vociferously opposed to nuclear medicine would rather be dead than cured. Having taught in the public schools for 20 years, rude treatment and name-calling rolls right off me because it says everything about the speaker and nothing about me.

410-1

I am appalled that an issue of such importance to the health of the American people should be decided by showmanship at expensive and wasteful hearings where ignorant people voice their emotions and little else. In Hood River we were subjected to papier-mâché Mardi Gras clowns representing Gore and Bush, also a man with a guitar and a lady friend who distributed words against FFTF for everyone to sing. In Portland a woman "testified" by singing a song. I admire their enthusiasm and creativity, but deplore their lack of scientific knowledge and technical expertise. Unfortunately, I share that particular deficiency, but I can say CLEAN UP HANFORD and CURE CANCER.

When my friends and I drove home from Portland yesterday we stopped at a view point high on a cliff above the Columbia River. The beauty of that river is so stunning I can't describe it. DOE, don't you dare dilly-dally in cleaning up the toxic waste at Hanford, which is seeping toward the river. That river runs through my town, Richland, where I've lived with my husband since 1951. Our two sons were born here and our seven grandchildren, who still live here. My husband used to be a great steelhead fisherman, and we all enjoyed eating it for many years. I am the only one of 13 in our family who has had cancer. I do not believe living near Hanford caused my cancer, but I am not a scientist, so I don't know -- and neither do you. I do know that we have a lower cancer rate than the national average, and a much lower rate than our neighbors in Hood River County, Oregon, according to the American Cancer Society.

410-2

I am here for two reasons: CLEAN UP HANFORD. The DOE has an obligation to the people of the Pacific Northwest to CLEAN UP HANFORD, and I appreciate their focus expressed by people I heard in Hood River and Portland. I'm offended by another kind of waste -- the waste of taxpayer money in building FFTF and letting it sit costing millions of dollars for the past seven years. The DOE has an obligation to the American people to restart FFTF for the manufacture of medical isotopes for a kinder, gentler treatment for cancer. We have wasted seven years, wasted money, while 600,000 people per year die of cancer. A friend, mystified, asked me, "How could anyone be against medical isotopes?"

410-3

410-4

Medical isotopes offer a less traumatic treatment for many kinds of cancer. Cancer survivors like me go through barbaric and brutal traditional treatments, partly because anti-nuclear hysterics want to maintain the status quo. I am a four time cancer survivor, three times life-threatening. I hate boring you with a repetition of my medical

Response to Commentor No. 410

410-1: DOE notes the commentor's views and observations. It is DOE policy to encourage public input on matters of regional, national and international importance. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

410-2: DOE notes the commentor's support for Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

410-3: DOE notes the commentor's opinion.

410-4: DOE notes the commentor's support for Alternative 1, Restart FFTF.

410-5: DOE notes the commentor's views about lessons to be learned from other countries on waste management and the limited benefit of the hearing process. See also response to comment 410-1. The U.S. frequently collaborates with France and other nations with developed nuclear power industries to share technology and nuclear practice information and experience.

Commentor No. 410: Laurel Piippo (Cont'd)

history. I had a radical mastectomy and removal of 18 lymph nodes in 1989 followed by six months of chemotherapy, the traditional brutal treatment that poisons the entire body. I know. For 18 hours after each chemo treatment, I lay on the bed trying not to throw up, unable to eat or drink anything, as close to hell as I've ever come. I would rather be dead than go through chemotherapy again. I had a Rubbermaid waste basket next to the bed for throwing up. When I tried to clean the bucket afterwards, it was black and corroded from the poison I had vomited. I looked at that bucket and thought, "My God, this brutality is supposed to cure me?" Of course my hair fell out and not just on my head -- eyebrows, eyelashes, nose hair, pubic hair, underarm and leg hair thinned out disgustingly. I told my husband, "I am a two-legged bald-headed hairless freak," stuck the hair that fell off by head in a box and gift-wrapped it for my doctor. Incidentally, the cancer was found by an X-ray -- nuclear medicine. I had extensive reconstructive surgery in May 1990.

In September 1990 a chest X-ray discovered lung cancer. Surgery was required to remove the lung. At that time I was so dumb I didn't know why half a dozen doctors standing by my bed at Virginia Mason Hospital seemed so relieved to tell me the lung cancer had nothing to do with the breast cancer. My main worry was that surgery might ruin my reconstruction. I had no idea that some kinds of cancer run round the body attacking organs until they kill you. I was fortunate to have primary cancer cured by surgery! The cancer had not metastasized, but for about six weeks the pain was excruciating. Since I have a high pain threshold, this surprised me. Recovering from previous surgeries was not a big deal, but my nurses were perturbed because I refused pain pills. Finally, I asked for two aspirin every night at midnight, and they felt much better. Lung surgery is something else. When a surgeon inserts a knife and removes a vital organ, the body is brutalized, and the pain is dreadful. I ate pain pills like popcorn and quit feeling so smug about being tough.

A couple of years later I finished reconstructive surgery when tissue was removed from the inner thigh and transplanted onto the breast to form a nipple and areola, just to give you all the intimate details. In 1993 cancer on the scar tissue came back on my right side. More surgery. I would have refused chemotherapy, but thank heavens the doctors prescribed radiation treatment -- 35 treatments over a 7 week period during which the entire upper right side of my body was ~~radiation~~ was burned red, blistered, raw, and bloody so treatment had to be suspended for 10 days. "This is barbaric. There must be a better way," I yelled.

Old-fashioned blasts of radiation melted down the last part of my breast reconstruction. The side effects over the years include lymphedema (swollen arm) because surgery, chemotherapy, and radiation finally broke down my formerly efficient lymph system in January 1997. I have to exercise and massage my arm daily and purchase compression garments three times a year at a total cost of about \$350 for the rest of my life. Another side effect were weakened bones on my right side, which resulted in fractured ribs on two different occasions. Shingles is another predictable side effect of radiation, and I didn't miss out on that one either. A persistent little cough is another side-effect of fried lungs. I never had a moment's pain from cancer because nuclear medicine caught it in time. It's the treatment that is awful. I am grateful to be alive and am dedicating my life to supporting medical isotopes as a more humane treatment for many types of cancer. Cancer fatalities are generally described in the obituary column as having "fought a courageous battle against cancer." I'm looking for a new disease, but if I do die of cancer, it won't be courageously. It will be a cowardly ~~and~~ demise because this wimp refuses to take chemotherapy, and I am furious with anti-FFTF demonstrators who heartlessly demand, "Clean up Hanford and postpone cancer treatment." In other words, "Suffer and die because of our fear and ignorance." I'm told that FFTF would produce about the same amount of nuclear waste as two of our state universities. Again, I'm not a scientist, but I'd believe scientists before I'd believe the "Suffer and die" proponents. As a nation, aren't we smart enough to clean up and cure at the same time?

I don't know enough to comment about the other missions suggested for FFTF, but I do know that certain kinds of blood cancer, thyroid cancer, prostate cancer have been successfully treated with medical isotopes, called smart bullets, which directly attack the cancer cells without poisoning or burning surrounding tissue. I was

Response to Commentor No. 410

Commentor No. 410: Laurel Piippo (Cont'd)

astounded to hear from many people testifying against reactivating FFTF that this is about money, that the selfish Tri-Citians want jobs regardless of nuclear waste. They have the gall to judge my values by theirs. Money and jobs have nothing to do with my attending these tedious hearings. One person in my family works at Hanford in waste clean-up. My major concern is health, with the equally important concern of clean up. If they think this is about money, they must have left their brains and ~~any~~ compassion in the parking lot.

A couple of years ago I heard a program at Richland Kiwanis from a man who had studied nuclear waste disposal in France where nuclear power is an accepted fact of life. He visited their nuclear site, describing the area as beautifully landscaped with flowers, trees and green grass, and several large neat boxes which contain nuclear waste, controlled and contained. If the French can do it, why can't we? Why not direct your energies to going to France and coming back with a solution instead of looking for it among ignorant and emotional folks like me. I shouldn't have to come to these damn hearings over and over again when scientists and others who care about health and the environment should make an intelligent and compassionate decision: *restart FFTF*

Sincerely,

LAUREL PIIPPO

FMIT versus FFTF

Hello. My name is Ken Greenwell. I live in Kennewick, Washington, and I am here representing myself. I would like to respond to statements that have been made about using an accelerator based facility like the Fusion Materials Irradiation Test (FMIT) facility to produce isotopes instead of the FFTF. I worked on the FMIT project, and there are several basic problems with this approach.

For background, the FMIT facility was being developed at Hanford in the early 1980's to test materials that could be used in a fusion reactor. Due to changing program needs and priorities, the project was cancelled before the development and design was totally completed or demonstrated.

In the FMIT facility, a beam of neutrons was to be used to irradiate small metal samples that might be used in a fusion reactor. The neutrons were to be produced by what is called a charged particle stripping reaction in which deuterium would be accelerated to impact a liquid metal target. When the deuteron beam hit the target, charged protons would be stripped off leaving only non-charged neutrons to continue out the back of the target. This would produce a beam of neutrons continuing in the same direction as the original deuteron beam superimposed on a lower flux neutron field.

Although suitable for the special purposes of the FMIT project, the neutron beam and available irradiation volume would not be very usable for many of the missions proposed here tonight. As an example, the higher neutron flux volumes, without targets in place, were very small, ranging from about one hundredth of a liter to one half liter dependent on the neutron flux level. This relatively small irradiation volume at the higher flux levels would severely limit the number and amount of medical isotopes that could be irradiated in a short time. Additionally, the neutrons from the FMIT target would include many very fast neutrons. The efficient production of many medical isotopes requires slower neutrons which are obtained by the use of what is called moderator materials. Adding moderator material and coolant within the irradiation volume would further cut down on the flux and the volume available for targets. Finally, the neutron

Response to Commentor No. 411

411-1

- 411-1:** DOE agrees with the commentor that an accelerator like the FMIT would not be a viable alternative for the proposed action. The accelerators proposed for Alternative 3, Construct New Accelerator(s), are discussed in Volume 1, Section 2.3.1.5 and Appendix F.
- 411-2:** DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 411: Ken Greenwell (Cont'd)

beam was directional near the FMIT target with steep variations in flux level which would affect uniformity of irradiation. In the region outside the highest flux volumes mentioned above, there are of course other neutrons, but the neutron flux level drops off significantly with distance making it less attractive for producing high quality isotopes.

The above factors, particularly limited irradiation volume at higher fluxes, would make an FMIT size facility impractical for making any significant amount of high quality isotopes or irradiating physically large targets in a reasonably short time. Based on a usable FFTF target irradiation volume of about 80 liters, the FFTF would provide up to 8,000 times the irradiation volume of the FMIT at the highest corresponding FFTF flux level and over 160 times the volume at the lowest FFTF flux level.

Therefore, to provide a high flux irradiation volume comparable to FFTF would require building many FMIT type facilities. At a cost of more than 105 million dollars nearly 20 years ago, it would cost billions of dollars today to provide the required number of FMIT type facilities. It is conceivable that changes in technology might allow some scale-up to reduce costs, but this would likely mean a return to a research and development project perhaps with new technical uncertainties, additional costs, and delays. These facilities would also require hundreds of megawatts of electrical power for operation, with the associated added costs and environmental impacts for providing power. Finally, the FMIT was never built nor was it proven full scale. The free surface, high power, liquid metal target, which was essential to satisfactory operation of FMIT, was never actually demonstrated on any accelerator in the world, and thus it is not a readily available technology.

Based on the above, the FMIT approach is not a viable option. There is no valid basis for saying that an FMIT type facility would be superior to, or even remotely comparable to, the FFTF for medical isotope production or for civilian nuclear research and development work. I strongly urge the DOE to restart the proven, existing FFTF for the PEIS missions.

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

and gratefully lead.

- I'm here this evening to support your restart of FFTF.*
- I'm here as a cancer survivor and would like others to have the opportunity to receive therapeutic isotopes like I have. FFTF can provide that opportunity.*
- I also would like support to restart the generation of Pu-239. Back in the early 70's I worked at RTG fabrication facility and we never had any radiological or biological problems associated with the Pu-239.*
- My job was at a company which was radiologically safe. I was not a destructive test in the laboratory. Many applications are being used in correcting environmental issues such as Pb detection in paint in older properties and in the process.*
- Finally, I am very convinced that people who are opposed to restart, do not appear to be open to factual, objective technical data. I believe if they had an opportunity to work in nuclear facilities such as FFTF, they would realize their fears are unfounded.*
- It is my sincere hope that DOE's Record of Decision will be based solely on a thorough, technical analysis. Not the emotional or currently politically correct positions.*

412-1
412-2

412-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

412-2: DOE notes the commentor's views. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

- attending public meetings and giving your comments directly to DOE officials
- returning this comment form to the registration desk at the meeting or to the address below
- calling toll-free and leaving your comments: 1-877-562-4593
- faxing your comments toll-free to: 1-877-562-4592

Commentor No. 413: Rick Mounce

Good Evening, my name is Rick Mounce. I reside in Kennewick, WA. I am speaking tonight as a private citizen.

I was not surprised that the PEIS confirmed that there was essentially no public risk associated with operation of the FFTF to support an expanded isotope mission. Since I have been associated with operation of the FFTF for many years, I can personally attest to its high standards of safety.

But tonight, I would like to comment on some of the information that has been distributed by the activist groups attending these meetings.

One brochure I have read from front to back is titled "Hanford and the River" by Columbia River United. This brochure identifies the major areas and past operations at Hanford that have impacted the Columbia River. I would like to point out that the FFTF operated for over 10 years. FFTF is not mentioned one single time in this activist publication for impacting the Columbia River. Why? Because operation of FFTF has absolutely no impact on the river.

Another hand-out I read was from Columbia Riverkeeper. In it they demand that the following statement be removed from the PEIS summary on spent fuel management. "The environmental impacts associated with the existing inventory of spent fuel at the Hanford site are minimal."

I agree that this statement should be removed. Instead, the PEIS summary should reflect DOE's well-publicized and appropriate commitment to remove the 2100 metric tons of corroded defense mission spent fuel from Hanford's 100 area water basins. This defense mission spent fuel does not include the 16 metric tons of non-defense spent FFTF fuel.

The PEIS summary should also discuss the minimal environmental impacts associated with the spent FFTF fuel on its own merits. Namely, that it is not corroded and is stored in dry storage casks, not aging defense mission water basins. This section should also be consistent with Chapter 4 of the PEIS which correctly states that the FFTF spent fuel will be shipped to the repository for disposal.

Another activist statement made by Seattle-based Heart of America Northwest contends:

Quote "Restart of the FFTF nuclear reactor will have enormous environmental consequences for the Pacific Northwest for generations to come. Restart of the FFTF nuclear reactor will mean importation of Weapons Grade Plutonium in "Mixed Oxide" fuel to Hanford from Germany and production of 35,000 pounds of High-Level Nuclear Waste (here they mean the 16 metric tons of spent FFTF fuel)- waste which USDOE has no idea of where or how to dispose of, but the report (and here they mean the PEIS) just

Response to Commentor No. 413

413-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

413-2: DOE notes the commentor's views and observations. DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and to providing ample opportunity for public comment on those actions.

413-2: DOE notes the commentor's views and observations. DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and to providing ample opportunity for public comment on those actions.

413-3: The discussion in the Summary and Section 4.8.3.5 of Volume 1 on the cumulative impacts for spent nuclear fuel management at Hanford was revised to clarify that the management of the existing spent nuclear fuel at Hanford results in a dose of less than 0.1 millirem per year of the maximally exposed member of the public. This dose is well within the DOE limits given in DOE Order 5400.5. As discussed in that Order, the dose limit from airborne emissions is 10 millirem per year, as required by the Clean Air Act; drinking water is 4 millirem per year, as required by the Safe Drinking Water Act; and the dose limit from all pathways combined is 100 millirem per year. DOE has committed to remove the spent nuclear fuel at Hanford for ultimate disposition in a geologic repository.

413-3

413-2

Commentor No. 413: Rick Mounce (Cont'd)

concludes that the waste can be stored indefinitely at Hanford.” End Quote

First, the FFTF fuel is not, nor could it ever be, classified as weapons-grade plutonium. Also, had Heart of America Northwest read Chapter 4 of the PEIS, they would know that DOE did not, in any way, conclude that the spent fuel would be stored indefinitely at Hanford. Instead, they would know that the disposition path for the 16 metric tons of spent FFTF fuel is ship it to the repository for disposal, the same process as for the nation's 105,000 metric tons of commercial reactor fuel. They would also know that the time-line for doing this is either during operation or at cessation of reactor operation.

Furthermore, if Heart of America Northwest really had public education in mind, they would be knowledgeable about the status of the repository at Yucca Mountain. They would then know that the FFTF fuel is suitable for repository disposal in its current form and that its contribution to the overall projected repository inventory is only 0.015%.

I honestly do not understand the basis for many of Heart of America Northwest's claims that restarting FFTF will have “enormous environmental consequences for the Pacific Northwest for generations to come”. Or their claim that the public must demand that DOE shutdown FFTF to “prevent more disasters at Hanford” and “save the future of Hanford Cleanup.”

Heart of America Northwest must provide accurate credible analysis too substantiate their claims. They must also be willing to come to the table with their concerns so that they can be resolved. Operation of FFTF to produce isotopes for this nation is too important to throw out based on the here-say of a few activist groups.

By using unsubstantiated claims in an attempt to manipulate the public into forcing DOE to shutdown FFTF, it is my opinion that Heart of America Northwest has seriously undermined the NEPA process and their own credibility as a stakeholder.

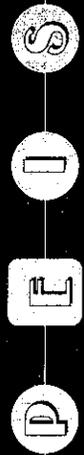

On a personal note, just last month I lost my brother to cancer. He was 49 years old. Perhaps, had FFTF been restarted to produce medical isotopes earlier, he may still be alive today; therefore I fully support the restart of the FFTF to produce medical isotopes in support of the eradication of this and other debilitating diseases.

Commentor No. 414: Alice and Peter Shaw (Cont'd)

This was handed to us as we sat down & waited for the meeting to start 8/31/00 @ Iowa Inn, Richland, WA.

BREEDER TECHNOLOGY: THE KEY TO NATIONAL ENERGY INDEPENDENCE! (1990)

The sodium metal cooled Fast Flux Test Facility (FFTF) was obsolete before construction was ever begun, and has never operated as a plutonium breeder. Breeder technology predates FFTF by 25 years! FFTF was preceded by Experimental Breeder Reactor #1 (EBR-1, completed in 1951) and by EBR-II (completed in 1964), both of which proved the breeder concept by producing their own oxide fuel, which was recycled on site, at the same time producing electricity. The only shortcoming of either reactor is that neither recovered fission products for reuse.

Not true! FFTF was proposed to develop methods and materials that had already been developed, tested and proven in EBR-1 & II by 1968. FFTF, fueled with highly enriched (weapons grade) fuel, has never bred fuel, never produced electricity and has only served to heat the desert air. It has no end product that cannot be better produced in a commercial power plant. It has never paid for itself through production. It is only a costly consumer of resources. *not true*

The proposal to tap heat generated at FFTF for power production, by utilizing the generators from the abandoned CLINCH RIVER BREEDER, is ludicrous. One must only remember the lessons on metal-water reactions taught in high school chemistry, or the destruction of the Soviet MIKE class submarine on 8 April 1989 to be reminded that water and sodium metal react vigorously to liberate flammable hydrogen gas. One small leak in a sodium/water heat exchanger installed at FFTF would be the last leak. More research on inherently hazardous liquid-metal cooled breeder technology is not the answer. What is required is that the Department of Energy get out of the way and allow production of oxide-fueled breeder reactors which do one thing best: They produce more fissile fuel than they consume while producing heat (convertible to electricity) and light.

Tri-City Herald: 29 Oct 1990
"FFTF REPORTS RECORD ENERGY PRODUCTION"

FFTF fuel assemblies have produced energy at a rate four times greater than commercial nuclear power plants. Two advanced oxide fuel assemblies have produced about 210 megawatt days of energy for each kilogram of fuel.

Letter to the Editor: Tri-City Herald
"JACKED UP REACTOR"

Four months of operation has produced not one kilowatt-hour, not 3 cent of recoverable energy. Can we afford to operate a "fleet of buses" continuously with the rear wheels jacked off the ground? Can we afford FFTF, which has never been blanketed with U-238, nor has it produced electrical power?

"In light of the experience gained from EBR-1 and EBR-2
FFTF SERVES ONLY AS A MONUMENT TO MAN'S STUPIDITY!"

It's not true! It's not true! It's not true! It's not true!
Galen Winsor

Robert Dupuy
(FFTF WPD, Nov 1990)

The public has to be educated in terms they understand or they'll be misled by gobble-de-gook like this.

Response to Commentor No. 414

Commentor No. 414: Alice and Peter Shaw (Cont'd)

THE SCAM OF NUCLEAR "WASTE" DISPOSAL (1984)

Every argument opposing the Basalt Project I have read is based upon fear of polluting the earth and water here in the Tri-Cities. Nowhere has anyone questioned the definition of "nuclear waste" or the wisdom of disposing of nuclear material.

The term "nuclear waste" is used to legalize theft from the ratepayers. The Basalt Project is justified upon the presumption that products of irradiation are harmful (any amount), are of no value and benefit and are "dangerous wastes" to be confiscated by the Federal government for permanent disposal at public expense; ALL FALSE PRESUMPTIONS!

Reactors have been built for 40 years at Hanford specifically to recover products of irradiation from "spent fuel" or "waste"! Even if we dumped all the heat from a reactor into the air (as was done with the original Hanford reactors and is now done at FFTF), we would still build nuclear reactors for the fission products. Electricity is simply a convenient by-product of material enrichment. If you purchased a bucket of coal and burned two lumps, would you dispose of the remainder of the coal as "waste"? We are!

WHO OWNS THE MATERIALS CREATED BY IRRADIATION AND JUST HOW MUCH ARE THEY WORTH?

Since the nuclear power consumer pays tribute to the Federal government and is financially liable for the disposal of "spent fuel" or Reusable Uranium Fuel (RUF), that consumer must then be the legal owner. The rate paying public has paid for "RUF", its mining, processing, utilization and now is billed for its burial.

WORTH? A TONNE OF "SPENT FUEL", "RUF", CONTAINS PRECIOUS METALS WORTH UPWARDS OF 10 MILLION DOLLARS. THE VALUE OF ALL SPENT FUEL SCHEDULED TO BE PERMANENTLY DISPOSED OF PROBABLY EXCEEDS THE NATIONAL DEBT!

WHAT IS THE FINANCIAL COST TO THE RATEPAYERS OF THIS SWINDLE?

Utilities carry spent fuel on the books as a liability, not a 10 million dollar per tonne asset and add this "expense" to the cost of your electricity. The nonsense put in place by Congress called the "Nuclear Waste Policy Act of 1982" multiplies the cost of power by at least a factor of 10. Our \$200. per month power bills should be \$20 or less!

The consumer pays \$1100. in tribute to the Secretary of Energy per hour of operation of WNP-2 to permanently dispose of the energy resources of the future. This charge equals the cost of recycling these materials and making them available to the public! Recycled fuel would yield zirconium for fuel cladding, fuel for new reactors, irradiation sources for food processing, for chemotherapy and medical research and superconducting metals for industrial applications. These by-products are not to be feared but to be used prudently and with wisdom to raise the standard of living of our society.

WHAT SHOULD WE DO WITH "NUCLEAR WASTE" ("RUF"/"SPENT FUEL")?

There is no "nuclear waste", simply transuranic materials to be recycled! It should be recycled routinely in existing facilities such as Purex, Barnwell Nuclear Fuel Plant (BNFP), G.E.'s Morris operation or at Nuclear Fuel Service (NFS) in New York. The recovered metals should be made available to industry.

WITH ALL THE FLACK OVER BURYING "WASTE", WON'T ANYONE STOP TO ASK -- WHY WE ARE BURYING OUR NUCLEAR RESOURCES?

THE ONLY NUCLEAR WASTE, I PERCEIVE, IS THE WASTING OF NUCLEAR RESOURCES!

Robert Dupuy

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

It is time that DOE restarted FFTF. It is the best facility for the production of Medical isotopes & performing research. Both my parents died of cancer. My uncle & I cousin died from cancer & the conventional treatments available at the time. With medical isotope treatment they would have survived. My brother in law was cured using isotope treatment for prostate cancer. Conventional cancer treatment debilitates & devastates the victims. Nuclear is the best option.

Commentor No. 417: William B. Garrard, Jr.

Draft PEIS Comment Form

I, as a private tax paying citizen, fully support the restart of the Fast Flux Test Facility (FFTF) for the following purposes: Medical & Research Isotopes, Pu-238 and advanced nuclear research. I also support the use of the FMEF to support the operation of the FFTF. The US needs a domestic reliable source of Pu-238 and Medical & Research Isotopes, and I believe the FFTF and FMEF are the most cost effective and viable facilities to meet these missions.

Thank you

William B. Garrard, Jr.

Commentor No. 420: Brad Evans

Response to Commentor No. 420

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

The evidence provided by the PEIS strongly supports the selection of Alternative #1, restart of the FFTF to support the three missions:
 - medical isotopes
 - nuclear technology advancement
 - production of Pu-238

Please do not allow the politics of fear and ignorance dictate a decision ^{permanently} to shut down FFTF and compromise our ability to fulfill these important objectives, especially medical isotope production.

Please exhibit foresight and courage in doing the right thing and restart FFTF.

Thank-you.

420-1

Chapter 2—Written Comments and DOE Responses

Commentor No. 421: Monte Bemham

Response to Commentor No. 421

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

① The report must include the importance of providing a back up method of producing medical isotopes

The BEC provided backup facilities to ~~isotopes~~ such as: Oak Ridge & Hanford Savannah River & Hanford.

Commercial Aircraft provide safety back up systems - a backup to produce medical isotopes

② The report should clearly state that restart of FTFE will benefit everyone - even opponent will benefit when they are diagnosed with cancer

421-1

421-1: DOE notes the commentor's views regarding the need to provide backup production capacity for medical isotopes. The medical and industrial isotope production mission considered as part of this NI PEIS fulfills this need. As stated in Section 1.2.1 of Volume 1, nearly 50 percent of DOE's isotope production capacity is being utilized with the remaining capacity dispersed throughout the DOE complex and not readily available due to existing operating constraints. While other facilities exist to produce medical isotopes, many are dedicated to existing missions, as outlined in Section 2.6.1 of Volume 1. The selection of the preferred alternative in this NI PEIS will enable DOE to meet its program objectives for medical isotope production.

421-2

421-2: While this NI PEIS includes consideration of the alternative that would best enable DOE to meet its responsibilities under the Atomic Energy Act to provide isotopes for medical, industrial, and research applications, it is beyond the scope of this NI PEIS to specifically consider the benefits to individual persons or groups.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

Draft PEIS Comment Form

August 31, 2000
 To: Collette Brown
 From: Bernice C. Mitchell

After talking to some people today at the yard and not being able to talk to some others - none other, especially Mr. Pisco. I now see keeping EFTF as another DOE award/proposal for B.N.W. in what seems a long line for DOE's partnering with Congress and the Senate to assist B.N.W. to acquire the business and Educational worlds, while we attend hearings etc., and watching notes and Ted Turner and the others. In short, this hearing is and was in justifying and promoting that we are an "Necessary Evil!!" B.N.W. can take their time and go home anytime.

I withdrew my previous request. I sent to Collette Brown this mail. See attachment PS "Slade Barton is not working for me."

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

The preferred alternative should be starting of the FFTF. I am a cancer survivor who wants the DOE to understand and appreciate the emotional and physical tribulations to which cancer patients are subjected. Some medical isotopes are in short supply, so patients may not be able to obtain treatment until it is too late. Some isotopes are so unavailable that research cannot practically be conducted although potential cures are promising. The Government should consider medical applications and the relief of human suffering as well as just the raw financial analysis. The cost of operating the FFTF for diagnostics and treatment is a small price to pay for the benefits.

Commentor No. 425: Debbie Nielsen

Good evening, my name is Debbie Nielsen and I represent myself. My family and I have lived in the shadow of Hanford for more than 23 years. From our property, we look out over the Site and see the white dome and cooling towers of FFTF in the distance. This sight does not fill me with fear or apprehension for my family. My husband and I have raised 8 children in West Richland and I believe my community is a safe and wonderful place to live and for kids to grow up. As a matter of fact, when I look at FFTF I feel an enormous sense of pride and accomplishment.

I've been an engineer at FFTF for more than 15 years and I know what an outstanding and safe reactor this is. FFTF is DOE's largest and newest reactor complex which has received numerous awards recognizing its performance and impeccable safety record during its 10 year operating history. I would like to take a few minutes to share a few of my views with you.

First, I would like to thank the DOE for considering restart of the FFTF to support the important missions being discussed here tonight, in particular the production of medical isotopes. Having survived cancer myself, I know the devastation that comes with being diagnosed with cancer and the horrible impact that it has on your family. My cancer was removed in two painful, invasive procedures, but it hasn't returned. I was lucky. But many others aren't so fortunate. According to the American Cancer Society, this year about 552,000 Americans are expected to die of cancer, more than 1,500 people a day. Unfortunately, nearly everyone in this room tonight will experience the pain cancer will inflict to you, a loved one or a friend.

There is hope available, if we only decide to move forward and develop it. Recent advancements in the field of nuclear medicine have dramatically opened a whole new dimension in cancer treatment by being able to target isotopes directly to unwanted cancer cells without damaging healthy ones. Sadly though, these treatments are only available for a select few because of the severely limited supply. I firmly believe the DOE should expand the nuclear infrastructure by restarting FFTF to provide physicians and

425-1

Response to Commentor No. 425

425-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 425: Debbie Nielsen (Cont'd)

researchers with a stable, large, and varied isotope supply to help this country in its battle against cancer.

FFTF stands out above the other alternatives evaluated in the PEIS both in its flexibility and capability to support DOE's objectives. As a matter of fact, I believe one thing missing in the PEIS is a capabilities assessment. Right now it is difficult for someone not technically familiar with these alternatives to recognize that the options vary greatly in their capability to meet the mission needs. I am sure that if the Department of Energy completes a capabilities comparison, coupled with the results of the PEIS, cost study, and nonproliferation report, they will come to the same conclusion that I have.

I know there are concerns about wastes that would be generated and the possible impacts of FFTF operation on the environment and current cleanup activities at Hanford. I want to see Hanford cleaned up too. I've been involved in environmental compliance and safety at FFTF for many years so I was not surprised that the PEIS indicated impacts of FFTF operation are extremely small. I know that FFTF operation does not pose a threat to the public or the environment. I would never support restart if I believed the reactor posed a danger to my family or community.

However, I believe it is important to recognize that there are some significant impacts that would occur by selecting FFTF. These impacts will manifest themselves in tremendous humanitarian benefits to the people in this country. The medical isotopes FFTF could produce would dramatically alter the course of cancer treatment, and provide hope and low cost care to millions of suffering Americans. I have complete confidence in the skill and competence of the staff at FFTF and the quality of the facility itself to safely and effectively meet these missions. I fervently hope that the DOE won't allow the anti nuclear sentiment and unfounded fear of a few vocal activists in this region to force shutdown of this important national asset. During my talk alone tonight, 5 more Americans have died of cancer. It is critical that the upcoming decision be based on facts, not fiction.

425-1
(Cont'd)

425-2

425-3

425-1

Response to Commentor No. 425

- 425-2: The comment with respect to the need for a capabilities assessment of NI PEIS alternatives is noted. Volume 1, Section 2.7.1.2.3 of the Draft NI PEIS presents a comparison of mission effectiveness among alternatives. This section has been revised in the Final NI PEIS (see Section 2.7.1.8, "Comparison of Mission Effectiveness Among Alternatives") to provide the reader a better understanding of the medical isotopes that can be produced using accelerator technology (Alternative 3) and reactor technology alternatives (Alternatives 1 and 4).
- 425-3: DOE notes the commentor's support for Alternative I, restart of FFTF. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram funds designated for Hanford cleanup, regardless of the alternative(s) selected.

"One voice, one perspective from life in the trenches of America"

August 31, 2000

Page 1

**Public hearing on the Nuclear Infrastructure PEIS
Tower Inn, Richland, Washington**

Good Evening, Ladies and Gentlemen.

My name is Dennis Fitzgerald. Tonight I represent the West Richland Chamber of Commerce. I also desire to speak on behalf of my fellow cancer FIGHTERS.

I wish for no one to "walk a mile in the moccasins" of a cancer FIGHTER. However, if one wants a sense of what it is like, read Chapter Six of Lance Armstrong's book, "It is Not About the Bike, My Journey Back to Life". Or read "The Warrior's Way", by John R. Cope from Lake Oswego, Oregon, a four-time breast cancer survivor. (Men get 1 ½% of all breast cancers.) Or talk to the parents and grandparents of my nine-year old fellow cancer FIGHTER Larry, who after a bone transplant in his leg, has eight months to go in his year of hard chemo treatment. They can give you a sense of what it is like to care for a child with cancer.

In Mr. Cope's book he states, " Three words will change you life forever, 'YOU HAVE CANCER'. It will affect your loved ones, too. Mr. Armstrong writes, "I never thought I knew what fear was until I heard the words, 'YOU HAVE CANCER'". Mr. Armstrong, the recent two-time winner of the Tour de France, had testicular cancer, which in a short time spread to his lungs, then to his brain. That is why early detection is so important.

Latest input from the American cancer Society predicts that in one's lifetime for women, one in three will get cancer, one in eight will get breast cancer. For men, one in two will get cancer, one in six will get prostate cancer. **These odds are the same whether you are for or against the restart of FFTF**

- For you ladies, if you did get breast cancer, would you prefer a medical isotope "smart bullet" that would attack only the cancer, or prefer surgery that may disfigure you, followed by hard chemo that will leave you temporarily bald?
- For you men, if you did get prostate cancer would you prefer outpatient implant of medical isotope seeds, or surgery with almost a week of hospitalization, follow by several weeks of home recovery with a catheter in your bladder? Plus being at equal or higher risk of permanent impotence or incontinence, or both.
- You could be one of the eight million suffers of rheumatoid arthritis in our country and the doctor told you medical isotopes would help, but you have to go to Europe for treatment.

August 31, 2000

Page 2

**Public hearing on the Nuclear Infrastructure PEIS
Tower Inn, Richland, Washington**

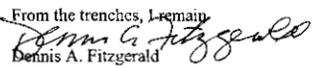

What if the doctor told you medical isotopes would be the best treatment you. However due to shortages, causing delays in clinical trials or in general supply the desired isotopes are not available to you now, but the doctor will put you on a waiting list. Since we import 90% of our isotopes these are real scenarios

Let us talk about what I call emotional uncertainties or perhaps fears and seek to overcome them with facts.

- Operating FFTF will come from separate funds than Hanford clean up funds. In fact **shutting down FFTF will add \$281.2 million** to the existing clean up budget burden.
- No existing accelerators in the western hemisphere can compete in variety, quantity and purity of the FFTF an existing facility in which you and I as taxpayers have already invested millions and millions and millions of dollars. Reportedly a high-energy accelerator may come close to matching the FFTF but it does not yet exist and will require years and more millions of our tax dollars to bring on line.

Unfortunately cancer does not wait. It is like our recent Twin Forks Fire. While the bureaucrats and political entities were "fiddling" over how to control the fire, the fire raged out of control, eventually burning over 300 square miles. While the bureaucrats and politicians have been pondering the fate of the FFTF for too many years now, thousands of our fellow citizens have died an early death and many, many thousands more have had to endure prolong suffering. Why? Because our government has no effective strategy or programs in place to meet the medical isotope needs of our people. That includes the present and future medical isotope needs of everyone of us in this meeting tonight, plus our family, friends and neighbors.

The bottom line is this: Medical isotopes offer a kinder and gentler treatment for an expanding array of cancer types and an easier and longer "walk in the moccasins" for the cancer FIGHTER. For the health of our nation that is the case for the for restart of FFTF.

From the trenches, I remain,

Dennis A. Fitzgerald
Citizen
Cancer FIGHTER
Member, West Richland Chamber of Commerce

CC: West Richland Chamber of Commerce
Citizens for Medical Isotopes (CMI)

Response to Commentor No. 426

426-1

426-1: DOE notes the commentor's support for Alternative 1, Restart FFTF, and opposition to Alternative 3, Construct New Accelerator(s).

426-2

426-2: See response to comment 426-1. A combination of low energy and high energy accelerators can meet mission objectives although they might not be able to do some research and development that requires fast neutrons or liquid metal loops. The reference accelerator design is mature and DOE has considerable experience in designing and building such accelerators.

Stand in Support of Medical Isotope
Production for Cancer Research and
Cancer Treatment. We also support the
restart of the FFTE for this purpose.
We understand that the use of medical
isotopes is a more humane way of
treating people with cancer diagnoses
with less side effects than the
traditional treatments of chemotherapy
or radiation therapy. As registered nurses
we advocate for patients on a daily basis, we
care for patients with cancer diagnoses
and see first hand the pain & suffering
that these pts must endure not only from
their cancer but from the side effects of their
treatments. It is for this reason we
encourage the DOE to consider restart of FFTE
for the production of medical isotopes for cancer
research. There are several ways to provide comments on the Nuclear Infrastructure
PEIS. These include:

- attending public meetings and giving your comments directly to DOE officials
- returning this comment form to the registration desk at the meeting or to the address below
- calling toll-free and leaving your comments: 1-877-562-4593
- faxing your comments toll-free to: 1-877-562-4592
- commenting via e-mail: Nuclear.Infrastructure-PEIS@hq.doe.gov

"I believe our nuclear medicine/research programs are in great jeopardy."

- Thomas Maloney, President, Iso-Tex Diagnostics, Friendswood, Texas

"Without the availability of radioisotopes such as Cu-67, we will essentially be depriving the American public of a new drug that has already shown responses in cancer patients."

- Sally J. DeNardo, M.D., University of California, Davis

It is critical that FFTF be brought back on-line to ensure adequate supplies (of isotopes) for medical uses."

- Michael R. Henson, CEO, Radiance Medical Systems, Inc.

"Our research has been severely hampered over the years because the government has so poorly supported a strong isotope production program...We have had difficulty sustaining some of our research efforts because of a lack of radioisotope availability. . . We believe that FFTF should be restarted to help meet projected needs for many isotopes that (we would like to explore and develop into cancer treatments)."

- Robert M. Sharkey, Ph.D., Director of Clinical Research, Garden State Cancer Center

"We believe that FFTF is a valuable asset and consider the national interest better served by keeping the reactor in service."

- E. Allen Womack, Jr., BWX Technologies, Inc. Lynchburg, VA

"The field of therapeutic isotopes is just opening up and has tremendous potential for the future. However, this future will be heavily impacted by availability of ...these new isotopes at costs that basic research can afford."

- Victor J. Becker, Sr. Director – Operations, Diatide, Inc. (Developer of new diagnostic and therapeutic imaging agents)

Response to Commentor No. 428

428-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 428: Citizens for Medical Isotopes (Cont'd)

"The FFTF is a unique facility with capabilities...that no other device in the world can match. It also has an outstanding record of research, operational excellence, safety, and environmental stewardship. A reactor with the capabilities of the FFTF might never be built again. "

- Wilson C. "Toby" Hayes, Vice Provost for Research, Oregon State University, Corvallis, OR

"I am writing to express my strong support for... the restart of the Fast Flux Test Facility (FFTF). I hope that the decision on its future will fully weigh its considerable merits and many prospective contributions to the nation's health and welfare."

- Manuel Martinez-Maldonado, M.D., Vice Provost for Research, Oregon Health Sciences University

"Immunomedics, Inc., is developing radiolabeled monoclonal antibodies as specific targeting agents for the treatment of human disease, particularly cancer... as we at Immunomedics work to make this promising technology a clinical reality...the major impediment to progress in this type of work is a steady reliable supply of promising new radioisotopes."

- Dr. Gary Griffiths, Director of Chemistry, Immunomedics, Inc.

CAN YOU SAVE MY LIFE?

Medical Isotopes –new opportunities to survive and regain quality of life

The following expressions of gratitude are made by cancer patients and their family members - father, mother, sister, cousin or they, themselves had a terminal disease and no hope of survival with standard treatments.

Patients treated experimentally with medical isotopes for Carcinoid Cancer

“My cousin has been released from a prison of suffering and has once again joined in the world of the living. . . every person who faces a terminal disease should have the right to exhaust any and all medical treatment that could make the difference between life and death.”
- December, 1999 letter to Dr. Lowell B. Anthony of Stanley S. Scott Cancer Center - Louisiana State University

“Your ‘potion’ is an amazing thing: one might even say a thing of beauty; a work of nuclear art, even. . . her clinical response borders on the unbelievable. . . I can even begin to hope that this saga will have a happy ending. Whatever you guys are doing, you’re doing it right. From one deeply grateful husband.” *-March, 1998 letter to Dr. Anthony*

“I truly believe that this is my best and only answer to the cancer. There have been no side effects – no hear loss, nausea, pain, nothing! This is by far the greatest thing I’ve heard of and I always looked forward to the 8 hour drive for my treatments because I knew they were working!”
- 1998 handwritten letter

“I appreciate very much not only what (this medical isotope treatment) has done to increase my life span but also appreciate your company for standing behind people like myself with no where else to go.”
-1998 letter to Thomas Maloney of ISO-TEX Diagnostics

“My dad was very depressed and despairing . . . We knew that the only standard options available would not arrest the progression of this disease. What a blessing it is that he happened onto this research project. . . I think I speak for the entire family when I say that this therapy has improved his emotional and mental well being as well as his overall physical health. You have given my father the gift of hope.”
- Written by daughter of patient with carcinoid tumor of the thymus

“My wife’s response to the (medical isotopes) has been nothing short of phenomenal! Her quality of life had fallen to near non-existence and I sensed that she was preparing to die. . . (After the medical isotopes infusions), the pain was completely gone. . . and the wheelchair was collecting dust. You are the people who gave me this additional time with my beloved wife. For that, sir, I shall be eternally grateful.” *-March, 1998*

A PATIENT SPEAKS OUT

"I had no side effects at all with the medical isotope treatment. It was the easiest time I have ever spent in the hospital. I was just hanging out reading a book and watching the T.V. Afterward the x-rays showed my tumors had been reduced and some had completely disappeared, even though no previous treatment had done anything to reduce my tumors. Before the medical isotope treatment I had experienced tremendous pain in my back and I was on morphine quite a bit. After the treatment I had almost no back pain at all. What I love about this treatment is, it works, it takes the pain away and there's no side effects." - Laura Mosher of Mentone, Alabama

**Why FFTF is Hanford's
"Desert Diamond"**

- ◆ The FFTF is a state-of-the-art facility – the most advanced research reactor in the United States.
- ◆ Research & Development reactor (not a defense reactor)
- ◆ The most versatile reactor in the U.S. and the world.
- ◆ The newest reactor in the U.S.
- ◆ It can "use up" old weapons materials in the process of making medical isotopes. No other reactor can do this on a large scale.
- ◆ Named one of the nation's top 10 engineering achievements by the national Society of Professional Engineers.
- ◆ Received the NEA's Federal Design Achievement Award
- ◆ Superior safety and environmental performance record carefully documented during construction and operation.

Company Press Release

NeoRx Corporation Reports Cures of Lung, Breast, and Colon Cancers in Preclinical Animal Studies Using a Single Dose of Pretarget Technology

Results published in the Proceedings of the National Academy of Sciences

SEATTLE--(BUSINESS WIRE)--March 6, 2000-- NeoRx Corporation (Nasdaq:NERX - news) today announced publication of a peer-reviewed manuscript in the Proceedings of the National Academy of Sciences, reporting that a single dose of its proprietary Pretarget® technology cured established human lung (10/10 animals), colon (10/10 animals) and breast cancers (8/10 animals) implanted in mice. To be judged a cure, both complete disappearance of the tumor and absence of any re-growth for at least one year were required. These results were achieved with a single dose of radioactivity developed with NeoRx's proprietary Pretarget® technology. The manuscript appears in the February 15, 2000 issue of the journal.

"The key finding in these experiments was the ability to actually cure large, established tumors using the higher doses of radiation that can be safely administered with our Pretarget® technology," said Don Axworthy, NeoRx scientist and lead author on the paper. "Unlike other therapies that have been reported to be curative in animals, Pretarget® effected cures with only a single administration. We are looking forward to testing our latest Pretarget® therapy, with the incorporation of various improvements we have made since the original animal studies were done, in the clinic later this year."

In the manuscript, NeoRx scientists compared Pretarget® technology to the conventional targeting approach used by others. With Pretarget®, the targeting antibody and radiation are injected separately and at different times, and join at tumor sites where the antibody has pre-localized. Radiation that does not join the antibody is rapidly eliminated from the body. This brief exposure of normal organs permits higher doses than the conventional approach to be administered safely, as has been shown in these animal trials and in patients. By contrast, the conventional approach links the radiation (a small drug) to the large antibody molecule, irradiating normal tissues such as bone marrow as it circulates for prolonged periods in the blood. Doses using the conventional approach are limited by normal organ exposure.

"Several groups have products under development using the conventional approach to radiotherapy," said Paul G. Abrams, M.D., J.D., NeoRx's chief executive officer. "We expect to begin formal Phase I trials with at least one Pretarget® product this year. Using a prototype Pretarget® product in patients with lymphoma, we have already observed 3 complete remissions (two of which occurred in patients who had progressed after high dose therapy and stem cell transplantation) in the 7 patients treated. As in the animal studies reported in our manuscript, these responses were observed after a single dose of Pretarget®. Moreover, we began our clinical study at a dose higher than the maximum tolerated dose of conventional radiotherapy products, yet we did not see any clinically significant toxicity"

Response to Commentor No. 428

Safety and Efficacy of Colorectal Cancer Therapy Confirmed

June 8, 2000
MedscapeWire

Immunomedics, Inc. has announced the results of ongoing phase 2 clinical studies using CEA-Cide for the treatment of patients with metastatic colorectal cancer who failed or were intolerant to prior chemotherapy. CEA-Cide is a humanized antibody against carcinoembryonic antigen (CEA), which is produced by colorectal and many other cancer types. In this study, the antibody was radiolabeled with iodine-131, which is a therapeutic isotope.

The results reported by a clinical research team from the University of Goettingen, in Germany, led by Docent Thomas Behr, MD, involved 21 patients (group 1) studied with metastatic cancers of the colon and rectum, and 9 patients (group 2) who had their liver metastases surgically removed, and who were at high risk for recurrence. The patients received 1 dose of CEA-Cide, and were then followed for up to 18 months.

Dr. Behr reported that the patients tolerated the single injection very well, with minimal, if any, adverse effects. Of 15 evaluable patients in the first group, 2 had a partial response (more than 50% reduction in tumor) for an average of 7 months, while another 6 patients showed lower levels of tumor reduction, providing an overall response rate of 53%. In the second group, 8 (89%) of 9 patients remain free of disease for more than 15 months, whereas 47% of previously studied patients with resected liver metastases, who did not receive CEA-Cide, showed

cancer recurrence in the same time period.

"These are very encouraging results, especially since we believe that such patients can tolerate repeated courses of this therapy," stated Dr. David M. Goldenberg, chairman and chief executive officer of Immunomedics.

Colorectal cancer is the third highest cancer killer, resulting in more than 56,000 deaths each year in the United States. "Once the cancer spreads, the 5-year survival rate of patients with inoperable metastases is virtually zero, despite the development of several new chemotherapeutic agents," Dr. Behr remarked.

Commentor No. 429: Kathryn Roberg

I am for alternative 5 - close down FFTF.

These are the concerns I have in regard to the restart of the FFTF Nuclear Reactor

1. Already we are experiencing a drastic global warming, as evidenced almost throughout the whole world. I am afraid that a restart of FFTF Nuclear Reactor will send more gases and waste into the Universe, whether in the air, soil or water and add to this horrendous problem of global warming. The waste has to go somewhere. What cost are we going to have to pay because of these facilities?

2. In 1995, DOE promised in the Hanford Clean-Up Agreement to shut down the FFTF, and use the resulting savings for radioactive nuclear waste clean-up. \$100 million designated for waste-clean-up has instead been used to keep FFTF on hot standby. To restart and maintain the FFTF would cost much more. I'm concerned that the funds set aside for clean-up would be used to produce yet more highly radioactive nuclear waste. I am also very concerned about the honest use of allocated funds.

3. I understand that The USDOE's own panel of experts (Subcommittee for Isotope Research and Production planning) and the Washington State Medical Association say there is no need for FFTF as an additional source of medical isotopes. I ask the question - Is plutonium really needed for medical research radioisotopes?

4. If plutonium is produced, what are the SAFEST MEANS OF TRANSPORTING this weapons-grade plutonium to fuel the FFTF in Hanford? If transported through Puget Sound, I am concerned about the potential deadly hazards to the watersheds, to not only the entire Puget Sound but also the entire Pacific Ocean and to the millions of people who live there.

5. The deadly radioactive waste of Hanford will, if not contained properly and thoroughly, for thousands of years and countless generations, contaminate not only the Northwestern US but also beyond - (a global destruction) What are we sending on to our children and their children... a contaminated and hazardously wasted world? Already there 177 massive, underground high-level nuclear waste tanks, some explosive, dozens leaking at Hanford. A restart of FFTF would add even more radioactive waste to these tanks. What are we doing to this world? DESTROYING IT!!!

Nuclear Energy account

429-1

429-2

429-3

429-4

429-5

429-3

Response to Commentor No. 429

- 429-1: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 429-2: The concerns expressed in the comment with respect to potential FFTF emissions and global warming in the event of FFTF restart are noted. FFTF operations would result in small impacts to the environment and would not contribute to global warming because nuclear, rather than fossil, fuels provide the primary source of energy, resulting in negligible releases of greenhouse gases. Section 4.3 of the NI PEIS includes an evaluation of potential environmental impacts due to air emissions and wastewater discharges associated with the proposed operation of FFTF and existing Hanford support facilities. All air emissions and wastewater discharges would be in accordance with applicable permit and regulatory requirements. The release of criteria air pollutants would result in concentrations well below Federal and state air standards (Table 4-13); impacts from emissions of hazardous chemicals would have a negligible effect on human health or the environment (Tables 4-17 and 4-19); and there would be no discernible impacts to groundwater or surface water quality (Section 4.3.1.1.4). The management of the wastes that are associated with nuclear infrastructure activities at Hanford is assessed in Section 4.3.1.1.13. The ultimate disposition of these wastes is addressed in that section.
- 429-3: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Prior public meetings were held on this formal milestone change.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1

Commentor No. 429: Kathryn Roberg (Cont'd)

It has been emphasized that production will cause cancer. which are some major causes of cancer in the first place?
6. Almost every day I am hearing more and more cases of CANCER...My concern is that what we are putting into the whole ecosystem in this world has a tremendous impact on our health. Restarting the FFTF with its nuclear waste would add to this destruction of health and life.

429-6

I ask that these concerns be included in the official record for PU-238/FFTF

Thank you

Sr. Kathryn Roberg

429-7

I am supporting alternative 5 - Shut down FFTF!

429-1

Why does EIS not address any strategies in regard to waste removal or holding? and the impact this will have on the environment?

429-7

Response to Commentor No. 429

would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected. If the decision is made to shutdown the FFTF, then cleanup dollars will be needed to deactivate the facility, which could impact the overall Hanford cleanup schedule.

Restart and operation of FFTF would not add any waste to the Hanford underground waste storage tanks. The impacts to the environment from the NI PEIS mission were determined in Chapter 4 of Volume 1 to be negligible to the Northwest population.

429-4: The purpose of the NI PEIS is to evaluate the environmental impacts of reasonable alternatives to enhancing DOE's existing nuclear facility infrastructure to support production of radioisotopes for medical, research and industrial uses, production of plutonium-238 for use in future NASA space exploration missions, and U.S. nuclear research and development needs for civilian application. The plutonium that would be produced under the proposed action would not be intended for medical applications.

DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

Commentor No. 429: Kathryn Roberg (Cont'd)

Response to Commentor No. 429

The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

- 429-5:** The commentor appears to express the concern that DOE would expose people in along the Pacific Coast and in the Puget Sound area to risks associated with the transport of weapons-grade plutonium. None of the proposed alternatives would involve the shipment of any weapons-grade plutonium to any port in the United States. Alternative 1 does postulate that DOE might decide at some point to import mixed oxide fuel from Europe to fuel FFTF. At this time, however, DOE has not proposed to import this fuel through any specific port. If DOE ultimately decides to import fuel from Europe, it would perform a separate NEPA analysis to select a port. This review would address all relevant potential impacts of overseas and inland water transportation, shipboard fires, package handling, land transportation, as well as safeguards and security associated with the import of SNR-300 mixed oxide fuel through a variety of specific candidate ports on the east and west coasts. It would consider all public comments, including local resolutions, concerning the desirability of bringing mixed oxide fuel into the proposed alternative ports.

Commentor No. 429: Kathryn Roberg (Cont'd)

Response to Commentor No. 429

In the event that DOE decides to enhance its nuclear infrastructure, it would not expose any population to high, unacceptable risks under any alternative. Any transportation activities that would be conducted by DOE would comply with U.S. Nuclear Regulatory Commission and U.S. Department of Transportation regulations. Associated transatlantic shipment would comply with International Atomic Energy Agency requirements. In Section J.6.2, DOE reviewed the potential maximum impacts from the marine transportation of mixed oxide fuel from Europe to a representative military port, Charleston, South Carolina, and overland transportation to Hanford. Also in that section, a bounding analysis demonstrates that the maximum potential radiological risks to the surrounding public from mixed oxide fuel shipments would be extremely small (e.g., less than 1 chance in a trillion for a latent cancer fatality per shipment from severe accidents at docks and in channels and less than 1 chance in 50 billion for a latent cancer fatality per shipment from overland highway accidents).

- 429-6:** Cancers are believed to be caused by a combination of hereditary and environmental factors, including exposure to ionizing radiation and chemical agents. This NI PEIS provides an estimate of the potential human health impacts associated with a range of reasonable alternatives considered for the production of radioisotopes for medical and industrial uses, research and development, and as heat sources for radioisotope power systems (see Sections 1.2 and 2.5 of Volume 1). The methodology used in the analysis of health effects, which is detailed in Appendixes H through J, is based upon our current knowledge of the health impacts that may result from exposure to low doses of ionizing radiation and chemical agents. Sections 4.3 through 4.6 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of any of the alternatives, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with each of the alternatives would be small.
- 429-7:** The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be

Commentor No. 429: Kathryn Roberg (Cont'd)

Response to Commentor No. 429

implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

Commentor No. 430: Charity Schweiger

August 31, 2000

My grandfather moved his family to Richland, WA, because of Hanford, and my father, the youngest of six, kept his family here because of the FFTF. Out of all the places we could have been, we ended up here. While I was growing up I was enchanted by big cities like Seattle. The big lights, the skyscrapers, the beautiful architecture, the Puget Sound. It was all so large and exciting, so purposeful. I thought the Tri-Cities was small, hot, and boring. But last year I began a study on Hanford. I studied White Bluffs, and other towns which were evicted, the trailer park it became, the operations which finally announced itself to the world in the form of "Fat Boy", the bomb dropped on Nagasaki. True, the Tri-Cities area is developing, but along side it is my view which is steadily growing also. Beneath the so-called uneventful exterior lie so many important things, which have always been there, but which I have never taken the time to discover. The FFTF is part of all of it. It has a history, and it has a purpose. Unlike the atomic bomb, which destroyed so many innocent lives, the FFTF has the ability to save lives in the form of medical isotopes. My grandmother died of cancer, and the kind of medical treatment FFTF can produce could have saved her beautiful and precious life. Please consider those lives, which are affected by cancer now, and those who will be affected by it later, as you make your decision about the Fast Flux Test Facility. Thank you!
Charity Schweiger
Richland, WA

430-1

Response to Commentor No. 430

430-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 431: Bill Dautel

8/31/00

Good evening, my name is Bill Dautel and I am speaking tonight as a citizen of the Pacific Northwest.

Recently, I read the citizen's guide distributed by Heart of America Northwest of Seattle. This guide claims that the guide "is designed to help citizens understand and comment on the draft PEIS." However, it appears that the sole purpose of this guide is to deliberately misinform citizens in an effort to force DOE's hand in the decision to restart FFTF.

This guide claims that public outcry to shutdown FFTF will "prevent more nuclear disasters at Hanford" and "save the future of Hanford cleanup."

How absurd. I have lived here for 26 years with my family. Do you think for one moment that nuclear disasters and cleanup at Hanford are not my major concerns?

I am speaking to this citizen's guide tonight because I feel the public deserves to know that most of the material in it is unsubstantiated and wrong. However, because of the time limitation, I will only be able present substantiated facts about one of its outrageous statements. I am not asking you to change your position; I merely ask that you listen with an open mind. Then I challenge you to bring your specific concerns to the table so they can be addressed. It is only by this process that you will be able to form an objective, informed position. The benefits of operating FFTF to alleviate the very real future health risks to you and your family are too important to throw them out based on heresay.

The area I would like to address tonight is the section of the Heart of America guide titled "Weapons-Grade Plutonium Could Come Through Puget Sound." The plutonium that they are referring to is unused mixed oxide fuel that has no future use in Germany but can be used to operate the FFTF reactor for 15 years. This fuel is essentially identical to FFTF fuel. As such it is not, nor could it ever be classified as, "weapons-grade" plutonium.

431-1**Response to Commentor No. 431**

431-1: DOE notes the commentor's views and observations. DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and to providing ample opportunity for public comment on those actions.

Commentor No. 431: Bill Dautel (Cont'd)

They also claim that DOE has ignored transportation risk concerns in the PEIS and that citizens <quote> "demand that USDOE acknowledge that a ship fire in Puget Sound, with plutonium on board, could kill thousands and permanently leave a large area uninhabitable. Oppose any scheme to import plutonium fuel through any port to FFTF." <unquote>

Heart of America Northwest apparently hasn't read the Appendix J of the PEIS which is entirely dedicated to the impacts of transportation.

As Colette Brown stated earlier, the port for receiving the German fuel has not been officially selected. However,
If you read this section, you will discover that public and environmental safety is paramount. ~~You will also discover that~~ it is unlikely that DOE will even ship the fuel to Puget Sound, not because of any risk, but because it costs more to sail to the west coast than to sail directly to an eastern port. Charleston Naval Station has been the primary port for receiving foreign fuel for the past five years and was the port selected for detailed analysis in the PEIS.

Heart of America Northwest claims that a ship fire could kill thousands and leave a large area uninhabitable. Have they supplied you with an independently reviewed risk analysis that explains just how this event could occur? I don't think so.

Let's examine the facts. First, the FFTF fuel is designed to operate at temperatures up to 1500 degrees fahrenheit and is not susceptible to damage from the DOT severe transportation fire temperature of 1475 degrees fahrenheit. Additionally, FFTF fuel has been safety tested and shown not to leak under these conditions. Second, the fuel is transported in certified high integrity casks. These casks are subject to stringent regulatory safety testing to verify beyond doubt that they will not leak during severe transportation accident conditions, including fire. Third, certified purpose-built ships would be used to transport the fuel casks from Europe to the U.S. These ships are constructed with double hulls to assure that they can withstand a collision without

**431-1
(Cont'd)**

Response to Commentor No. 431

Commentor No. 431: Bill Dautel (Cont'd)

penetrating the inner hull. Every part of the ship is protected by an automatic fire system which will quickly detect, isolate, and suppress a fire should one break out in any one of the separate compartments. The individual holds can also be deliberately flooded with water, and, if all the holds were flooded the ship would still remain afloat. These levels of safety are what contribute to the low level of risk to transport the fuel. In fact, the accident risk in the PEIS was determined to be less than 10^{-12} latent cancer fatalities or 1 in a trillion.

Let me put this in perspective. The risk of dying from radiation exposure received from flying round trip cross-country is approximately 1 in a million. Mightily small. The risk from fuel transportation is a million times less. So I ask you, is this the enormous risk that results in thousands of deaths as claimed by Heart of America Northwest? Hardly!! In my view this is a blatant insult to the intelligence of the public and undermines the entire NEPA process. The transportation of nuclear fuel is completely safe.

Thank you for the opportunity to speak about this PEIS issue.

Response to Commentor No. 432

432-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 433: Leland Besel

To Whom It May Concern:

This is my testimony in support of the FFTF being used for the production of medical and industrial isotopes and the production of plutonium-238 for use in future NASA space missions. FFTF is the most modern reactor facility that the DOE currently has and has an exemplary operational history. To not use this facility for such needed isotope and U-238 missions would be inappropriate in my estimation. FFTF has been shown to be the most cost effective alternative in producing the nuclear isotopes needed for cancer treatments and cancer research. As one who has had cancer, the need to have these isotopes available within the United States for both cancer treatment and research is of paramount importance to me.

Yours truly,

Leland Besel

Germantown, MD 20874

Dear Ms Brown:

Subject: Comments on DOE/EIS-03100

I am pleased to offer the following comments on the Nuclear Infrastructure PEIS, DOE/EIS-03100:

1. First, I would like to compliment the preparers of this PEIS for a thorough and comprehensive report. I generally agree with the data and conclusions of the PEIS, at least in the areas where I have some knowledge.
2. I strongly recommend choice of Alternative 1, "Restart of FFTF at Hanford WA, to meet all isotope production and research requirements." My reasons for this recommendation are defined in the following comments.
3. A major reason for recommending Restart of the FFTF is **Humanitarian**. Prudent restart of the FFTF provides the greatest assurance of meeting the needs for Isotopes required for research and treatment of cancer victims, and thus will save the lives of countless people.
4. A second major reason for recommending restart of the FFTF is the fact that it is an existing facility that has started up and operated successfully for numerous years. There are in existence operating procedures, support equipment, and a trained and capable staff. It is hard to put a value on this experience base, but as an engineer that has gone through several complex plant startups, I know it represents a large amount of money and time. There will always be a large unknown risk factor associated with building a new and different facility; and with the effort to test and bring this new facility into the operating mode. For this reason alone, starting up the FFTF is the most assured and conservative way to provide the required supply of radio-isotopes. I recommend that the value of using an existing and proven facility be given much more consideration in your final draft.
5. Another factor favoring use of the FFTF is the large base of skilled and trained personnel, and laboratories and industrial resources, available in the Tri-city area, to provide technical support to the FFTF operation.
6. One concern that is raised by many of those who are opposed to a restart of the FFTF is that this action could delay the cleanup activities at Hanford, mainly by diverting funds away from the cleanup budget. However, the commitment by the DOE that the FFTF restart would not divert or reprogram budgeted funds from Hanford cleanup should resolve this issue. In fact, restart of the FFTF should make a positive contribution to funding available for cleanup, for the following reasons: (a) If the FFTF is deactivated in 5 to 10 years, funds for this activity would come out of the Hanford cleanup budget during a critical period in the Hanford Program, i.e. about when the first Waste Glassification plant is in the startup phase. Restart of

Response to Commentor No. 434

434-1

434-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

434-2: DOE notes the commentor's support for restarting FFTF to conduct nuclear energy research and development as part of its nuclear infrastructure enhancement.

Commentor No. 434: Denny L. Condotta (Cont'd)

the FFTF would defer deactivation by 35 years or more, well past the peak of Hanford cleanup activities (b) If the FFTF is restarted and operated, it would utilize some general Hanford support activities, such as security, utilities, health services, etc. It would then be charged a portion of the Hanford overhead costs, resulting in lower costs being assigned to the plant cleanup activity.

7. In Section S-1 of the Summary of the PEIS it is noted that the Nuclear Energy Research Advisory Committee (NERAC) has informed the Secretary of Energy that: "There is an **urgent sense that the nation must rapidly restore an adequate investment in basic and applied research in nuclear energy if it is to sustain a viable United States capability in the 21st Century.**"
- It should be recognized that restarting the FFTF will make a large contribution to the above goal; both by maintaining and enhancing skills, and also by providing a test facility for fuels and materials and possibly in areas that are not now recognized. This essentially free contribution needs further emphasis in the PEIS.

The FFTF represents a large investment of time, money and materials. It is the newest reactor in the DOE complex, and is a valuable national resource. It would be both an economic loss and also a strategic folly to permanently deactivate this facility, and then try to duplicate its capabilities elsewhere.

Respectfully submitted,

Denny L. Condotta

Draft PEIS Comment Form

Money should be spent on eco-friendly alternative energy sources such as solar & wind power. Nuclear power whether civilian or government requires digging into land for plutonium & uranium. The majority of these resources are either in areas that should be left untouched or are on reservations. Also the majority of nuclear waste is dumped in neighborhoods with poor blacks, Hispanics and Native Americans. Just look at the waste on reservations across America. Please do not expand our country's nuclear program and instead look to alternatives.

Response to Commentor No. 441

- 441-1:** DOE notes the commentor's interest in alternative energy sources, although issues of research and development of alternative energy sources are beyond the scope of this Nuclear Infrastructure PEIS. The DOE missions to be addressed in this EIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development, can currently only be met using nuclear reactor or accelerator technologies.
- 441-2:** Although beyond the scope of this PEIS, the commentor's concern for nationwide waste disposal practices is noted. Nuclear waste that would be generated under the alternatives and the disposition of generated waste are discussed in Chapter 4 of the NI PEIS. Potential environmental impacts on low-income and minority populations that would be expected to result from implementation of the nuclear infrastructure alternatives are evaluated in Appendix K. DOE would disposition waste generated under the nuclear infrastructure alternatives in compliance with current site practices. None of the waste would be disposed of on the Fort Hall Reservation near Idaho National Engineering and Environmental Laboratory or the Yakama Reservation near the Hanford Site.
- Environmental justice is a key part of an environmental impact statement and is addressed in detail in Appendix K of the NI PEIS.

Please re-start the *Fast Flux Test Facility* for Medical Isotopes.

New treatments for cancer using medical isotopes are showing great promise in human clinical trials. A new medical isotope treatment for research (treating only a few patients) is much smaller than the quantity that will be required when the treatment becomes FDA approved. In the next several years, demand for certain medical isotopes may skyrocket as a result of their excellent performance in clinical trials.

The *Fast Flux Test Facility* (FFTF) has the capacity to produce 2-3 times more medical isotopes than all other reactors in the nation combined. We need it to be ready to supply large quantities of medical isotopes to cancer centers around the nation. The only reactor in the Western Hemisphere capable of producing large quantities of several high specific activity isotopes is the FFTF, located in the Tri-Cities in the state of Washington. The *Pacific Northwest National Laboratory* (PNNL) medical isotope program receives calls from researchers waiting for such isotopes.

Thank you very much for any help that you can give.

Sincerely,

William J. Condotta

Response to Commentor No. 445

- 445-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Prior public meetings were held on this formal milestone change.
- 445-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 452: Susan B. O'Donnell

316 NE 191st St.
Shoreline, WA 98155

August 30, 2000

Bill Richardson
Secretary of Energy
United States Department of Energy
NE - 50
19901 Germantown Road
Germantown, MD 20874-1290

Dear Secretary Richardson:

I am unable to attend the public hearings regarding the plans for Hanford's FFTF Nuclear Reactor, so I am writing to express my opinion on the consideration to restart Hanford's FFTF Nuclear Reactor.

I am outraged that restart of the Reactor is being considered while many of the existing nuclear waste tanks at Hanford are leaking. As a biologist and resident of Washington, I fear the disastrous effects of nuclear contamination reaching the Columbia River. Clean up of Hanford must be continued without delay and without additional waste being added to already inadequate tanks. Please honor the Hanford clean-up agreement and shut down the FFTF Nuclear Reactor.

Sincerely,

Susan B. O'Donnell, Ph.D.

Response to Commentor No. 452

452-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford and protection of the Columbia River. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected. If the decision is made to shutdown the FFTF, then cleanup dollars will be needed to deactivate the facility, which could impact the overall Hanford cleanup schedule.

In regard to the concerns about the migration of contaminants to the Columbia River, the Hanford Site has a comprehensive waste minimization and pollution prevention program in place as summarized in Section 3.4.11.8 that would govern any proposed site activities. The alternatives delineated in the NI PEIS would not have an impact on Hanford cleanup activities and none of the alternatives considered would add to existing tank waste volumes.

More specific to the alternatives presented in the NI PEIS, FFTF is located approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to the groundwater. Analyses presented in Chapter 4 of the NI PEIS (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4) indicate that there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of the existing Hanford facilities in support of the proposed activities. Also, no

452-1

452-2

Response to Commentor No. 452

water quality impacts would be expected as a result of permanent deactivation of FFTF (Section 4.4.1.2.4).

452-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Ms. Colette E. Brown, NE-50
U.S. Department of Energy
19901 Germantown Road
Germantown, Maryland 20874

Dear Ms. Brown:

As State Senator for Washington's 8th legislative district, I represent the area in which the Hanford Site is located. Hanford's neighbors are my constituents, and I welcome this opportunity to speak out on their behalf.

The Fast Flux Test Facility (FFTF) has long been the crown jewel of the nuclear industry. It remains the nation's newest and safest reactor, which has been borne out by ten years of operating excellence. But the government has never tapped into the enormous potential of this remarkable facility, and the time has come to do so.

With the FFTF, we have a reactor with the unique capability to produce life-saving medical isotopes while leading the way to breakthroughs in medical research. The FFTF is the only existing facility that can provide our country with the projected quantity, variety and quality of isotopes that will be needed in the coming decades. Why then is the United States supporting some 100 research reactors in 40 foreign countries? It seems incomprehensible that our government would choose to invest in foreign facilities rather than the far superior test reactor we have right here at home.

Obviously, there is a clear and compelling need for medical isotopes. This year, in the United States alone, more than 550,000 people will die of cancer and more than 950,000 will die of heart disease. The annual cost of healthcare has already surpassed the \$1 trillion mark and is expected to reach a staggering \$2.3 trillion by 2015.

Our country can no longer afford to turn its back on an existing, state-of-the-art facility – already paid for by taxpayer dollars – that could and should lead the world in medical isotope production

453-1

Response to Commentor No. 453

453-1: DOE notes the commentor's support for Alternative 1, Restart FFTF. DOE also notes the commentor's statement about the Foreign Research Reactor Program; however, this program, managed by the DOE Office of Environmental Management, is separate from the proposed action in this PEIS.

***Commentor No. 453: Patricia Hale, Washington State Senator
8th Legislative District (Cont'd)***

Ms. Colette E. Brown, NE-50
Page 2

and research. Nor should we risk heavy reliance on foreign sources – no matter how friendly – for our isotope supply. History is filled with grim reminders of national vulnerabilities that were created and consequences wrought by changing political winds.

And finally, at a time when the world is struggling with scientific challenges -- in medical treatments, energy production, waste management and space exploration -- it would be both wasteful and foolhardy for the government to dismantle this versatile facility that could bolster our national capabilities and lead the way to important new discoveries.

I wholeheartedly support the restart of the FFTF and urge the Department of Energy to move ahead without further delay.

Thank you for allowing me to voice these views.

Sincerely,

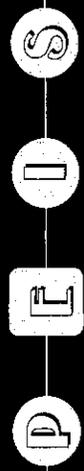

Senator Patricia S. Hale
8th District

**453-1
(Cont'd)**

Response to Commentor No. 453

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

We support restart of FFTF Now. We don't have time to build new facilities (10 or 15 years) & don't have the money to build new accelerators (which might need a reactor to power the operation). People who are dying from cancer cannot wait. We need to have empathy for those who are suffering. ~~Investment in space technology~~
 Buying from Russia or other countries is NOT a long term solution and it jeopardizes National Security.

**Public comment on Nuclear Infrastructure Draft Programmatic
Environmental Impact Statement (NI PEIS)**

I am opposed to restart of the Fast Flux Test Facility reactor because:

*There is no safe way to dispose of
the waste produced by this reactor,
and the facility is up stream from
many populated areas which use
the Columbia for food and recreation*

Name Andrew Butterfield
Address 2830 NE 35TH AVE
City, state Portland, OR Zip 97212

Response to Commentor No. 460

460-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

460-2: The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE Orders. The potential impacts to human health and environmental media including air, water, and land are shown in Section 4.3 of Volume 1 to be small.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Commentor No. 462: Pat Hazlett (Cont'd)

Response to Commentor No. 462

then cleanup dollars will be needed to deactivate the facility, which could impact the overall Hanford cleanup schedule.

- 462-4:** In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

467-1

467-2

467-3

Response to Commentor No. 467

467-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

467-2: DOE notes the commentor's concerns related to potential environmental impacts.

The environmental impacts associated with operation of the FFTF during normal operations and from postulated accidents are presented and discussed in Section 4.3 of the draft NI PEIS. All impacts to human health and insults to environmental media including air, water, and land are shown to be small. No fatalities would be expected from the 35-year operating period of the FFTF. Any discharges would be in accordance with applicable permit and regulatory requirements and the impacts on air and water quality would be small. The potential impacts to the Hanford area and transportation corridors to and from Hanford associated with FFTF operations are also shown to be small. Because of the small impacts associated with FFTF restart, the danger to our planet or to the survival of the human species would be virtually nonexistent.

467-3: DOE notes the commentor's views on nuclear power.

Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 470-3: FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

Is not the world
contaminated enough!!!

Name Richard Bailey
Address 2837 NE 14th Ave
City, state Portland OR Zip 97212

Response to Commentor No. 471

- 471-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 471-2: The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

I would like to leave a comment on the FFTF at Richland, Washington. I believe this plant should be put into use for the production of radioisotopes and possibly power. It is a multi-million dollar plant that is just sitting out there, and because the people in Seattle and Portland don't seem to want to utilize this utility is totally ridiculous. I think we need it, and I think it needs to be started.

473-1

Response to Commentor No. 473

473-1: DOE notes the commentor's support for Alternative 1, Restart FFTF. The commentor should note that the heat generated by FFTF operation will not be used for generation of electricity.

Commentor No. 474: Edwin Schlupford

NI PEIS Toll-Free Telephone
9/2/00

Edwin Schlupford
206_767_4710

This comment is in regards to restarting of Fast Flux Reactor. I am very strongly opposed to it. I would like to make the following comments. First of all, we have never figured out what to do with nuclear waste. The Germans have finally pulled themselves up to their knees with their bootstraps and decided to shut down their nuclear infrastructure. Thank goodness they worked out with industry a good compromise, and it is happening very shortly in a matter of years from now. We need to go that same direction, and I don't know or understand why us Americans can't be leaders for a change instead of late Charlie followers. We don't know what to do with nuclear waste. We've got a big, big mess on our hands. We've tried to find places like Yucca Mountain, which ironically we later find out that has a faster leak rate than we anticipated because of a man-made product that has only been in the world since the development of the nuclear age, and we were able to trace it down to Yucca Mountain. The whole idea of transferring nuclear waste from the private sector into the public is a complete transfer of liability. We need to as citizens stand up and say what is right and wrong.

This type of restarting and continuing on with this thing, which has even been written into it the possibility of potential other uses, which could be many different things, including weapons, is totally ridiculous. And sitting under the ruse of nuclear medicine is exactly that.

Thank you very much for your time. We need to, you know, nuclear energy would be fine if it was a total start to finish solution, but we only [have] half [of] that thing figured out. Until we figure out the whole end of it, in other words, the disposal end, we should not be and it is irresponsible to be involved with this and burdening our future generations. We should spend the money on shutting this stuff down; getting people into other jobs that can do something useful in cleaning up our messes that we have inherited from our fathers.

474-1

474-2

474-3

474-2

474-4

Response to Commentor No. 474

474-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

474-2: The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS assumes, for the purposes of analysis, that Yucca Mountain Nevada, would be the final disposal site for DOE's high-level radioactive waste and spent nuclear fuel. As directed by the U.S. Congress through the Nuclear Waste Policy Act, as amended, Yucca Mountain is the only candidate site currently being characterized as a potential geologic repository for high-level radioactive waste and spent nuclear fuel. DOE has prepared a separate EIS, "Draft Environmental Impact Statement for a Geologic Repository for the Disposal of Spent Nuclear Fuel and High Level Radioactive Waste at Yucca Mountain, Nye County, Nevada" (DOE/EIS-0250D, July 1999), which analyzes the environmental impacts from construction, operation and monitoring, related transportation, and eventual closure of a potential geological repository.

474-3: DOE notes the commentor's views. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio.

Commentor No. 474: Edwin Schlupford (Cont'd)

Response to Commentor No. 474

However, no component of the proposed action is for the purpose of supporting any defense or weapons-related mission. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

- 474-4:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Commentor No. 475: The Ritter Family

NI PEIS Toll_Free Telephone

9/4/00

Jeanna Ritter
Sean Ritter
Katherine Ritter
John Ritter
Hood River, OR

I would like to voice my concern about the start of the Hanford nuclear plant. Hanford's highlevel nuclear waste tanks are already presently leaking radioactive waste into the groundwater. This is moving much closer to the Columbia River, and it is threatening the life of the river and also the people downstream. With this real and intermittent danger, how can anyone reasonablypropose restarting a reactor that will add more waste to this ecosystem. My family and I arestrongly against restart of this nuclear plant.

475-1

475-2

Response to Commentor No. 475

475-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to the waste generated by current Hanford activities. This waste would not be sent to the high-level radioactive waste tank farms. High-level radioactive waste would not be generated from merely operating FFTF. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

475-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Commentor No. 566: Kevin Kraal

From: Kevin Kraal[SMTP:KEVINK@MICRON.NET]
Sent: Friday, September 01, 2000 2:51:48 PM
To: INFRASTRUCTURE_PEIS, NUCLEAR
Subject: Plutonium production
Auto forwarded by a Rule

Sirs:

I am opposed to any plan involving the production of more Pu-238, especially at INEEL in a building already considered unsafe. I certainly understand the need for this element in various scientific endeavors, however there is, as I understand it, no need for more of this at the present or the foreseeable future. NASA has reportedly enough for its missions. There is already documented groundwater contamination under the site. Our town (Twin Falls) obtains its drinking water from the very same aquifer under INEEL. The reprocessing method will produce even more potential contamination. The current technology does not allow for truly safe disposal, and until it does, to produce yet more toxic (deadly, in fact) waste would be folly.

Most sincerely,

Kevin Kraal, MD
4155 Meadowridge Circle
Twin Falls, ID

566-1

566-2

566-3

Response to Commentor No. 566

566-1: DOE notes the commentor's opposition to enhancing its existing nuclear facility infrastructure to support production of plutonium-238 for use in future NASA space exploration missions, and in particular the use of INEEL for support of this action. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost.

A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

566-2: DOE notes the commentor's concerns regarding existing groundwater contamination at INEEL and for additional groundwater impacts. DOE would not reprocess spent nuclear fuel under any of the alternatives

Commentor No. 566: Kevin Kraal (Cont'd)

Response to Commentor No. 566

considered in this NI PEIS. Options under the nuclear infrastructure alternatives include fabricating and processing neptunium-237 targets at the Fluorinel Dissolution Process Facility (FDPF) at INEEL to produce plutonium-238 for NASA space missions.

Although beyond the scope of this NI PEIS, activities to remediate existing contamination of the Snake River Plain aquifer attributable to INEEL sources are ongoing and of high priority to DOE. Section 3.3.4.2 describes the current condition of groundwater potentially affected by INEEL operations, with a specific discussion of groundwater quality of the proposed facility location provided in Section 3.3.4.2.2. Analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.2.1.4, 4.4.2.1.4, 4.5.2.2.4, and 4.6.2.2.4) addressing use of the FDPF indicate that there would be no discernible impacts to groundwater or surface water quality at INEEL from normal operation of FDPF in support of the proposed activities. Use of Advanced Test Reactor to irradiate neptunium-237 targets would have no additional impact on water resources in the Test Reactor Area of INEEL as discussed in Section 4.4.1.1.4.

Waste that would be generated as a result of target processing are discussed in Section 4.3.2.1.13. Waste generated from the candidate facilities at INEEL under the nuclear infrastructure alternatives would be managed in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and DOE orders. INEEL also has a comprehensive waste minimization and pollution prevention program in place as summarized in Volume 1, Section 3.3.11.8 that would govern any proposed site activities.

- 566-3:** The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

To whom it may concern,

I am writing this brief e-mail to encourage restarting the Fast Flux Test Facility. I understand the importance of the FFTF and wish for its being brought back from stand-by mode.

Thank you.

567-1

Response to Commentor No. 567

567-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 568: Holly Conley

From: Holly Conley[SMTP:HCONLEY@KMPS.COM]
 Sent: Friday, September 01, 2000 6:57:08 PM
 To: INFRASTRUCTURE_PEIS, NUCLEAR
 Subject: shut down!
 Auto forwarded by a Rule

Please hear my request to NOT restart FFTF in Hanford. This reactor needs to be shut down completely, and the existing waste cleaned up as promised. Please; no more waste, no more danger, no more plutonium production at Hanford.

Thank you for your serious consideration in this matter.

Regards,

Holly Conley

568-1

568-2

Response to Commentor No. 568

568-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.

568-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. A Tri-Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Public meetings were held on this formal milestone change.

With respect to plutonium processing, no weapons material will be produced within the stated mission. All proposed activities are for civilian purposes.

Commentor No. 569: Roberta Wilson

From: Roberta Wilson[SMTP:BERTAW@MICROSOFT.COM]

To: INFRASTRUCTURE_PEIS, NUCLEAR
Subject: Comments on start up of FFTF
Auto forwarded by a Rule

Please write these comments into the record:

Dear Ms. Brown,

In 1986 I walked across the country with the Great Peace March for GlobalNuclear Disarmament. I was 31, and I had left my job in the computerindustry to do this nine_month walk during which we spoke with thousands ofcitizens about the danger of nuclear weapons.

When we arrived in your neighborhood__the DC office of the Department ofEnergy__we shut the place down for awhile. I bought cookies and coffee foryour locked out workers. I figured I might be able to talk to them that way.

They were mad, of course, but we finally did talk. I think I showed themthat I was the same as they were__I had an education, a job, and I vote.Still, my voice was not being heard by my government regarding nuclearenergy and weapons.

We "anti_nuke activists" are portrayed as troublesome and dangerous at worstand silly and misinformed at best. We are neither. We are citizens who aretelling you that WE DO NOT WANT NUCLEAR TECHNOLOGY__primarily because wasteissues and accident issues are unresolved and it seems at presentunresolvable. Hanford is the most polluted site in our country, and clean_upshould be the first priority. We've waited years for it. I suspect that thereason Hanford is not cleaned up is that there is no way to clean up nuclearwaste that is seeping into the groundwater near the Columbia River.

569-1

569-2

Response to Commentor No. 569

569-1: The Commentor’s opposition to nuclear technology because of waste and accident issues is noted. The PEIS evaluates the impact on waste generation and the consequences of accidents for all alternatives in detail in Volume 1 Chapter 4. The results of this evaluation are presented in PEIS Volume 1, Section 2.7.1.

569-2: Restoration of the Hanford Site and waste management activities are the primary missions at Hanford. DOE notes the commentor’s concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to the groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Commentor No. 569: Roberta Wilson (Cont'd)

I find the medical excuse for starting the Fast Flux Test Facility to be an untenable and extremely cynical attempt to get the public back on board for nuclear power. As the doctor at the Seattle DOE hearings said, other technology is a better choice for addressing cancer than the production of medical isotopes. Even a better choice is to eliminate the causes of cancer__environmental pollutants, including nuclear.

569-3

I urge you and Secretary Bill Richards to do the right thing__Clean up Hanford (if possible) and do not start the Fast Flux Test Facility.

569-2**569-4**

Roberta Wilson
353 Wallace Way NE #14
Bainbridge Island, WA 98110

Response to Commentor No. 569

569-3: DOE notes the commentor's views regarding the potential use of FFTF for enhancing DOE's existing nuclear facility infrastructure and the use of isotopes in treating cancer. Cancers are believed to be caused by a combination of hereditary and environmental factors, including radiological and chemical agents. In ongoing clinical testing, therapeutic radioisotopes have proven effective in treating cancers and other illnesses while minimizing adverse side effects, making their use an attractive alternative to traditional chemotherapy and radiation treatments.

569-4: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Commentor No. 570: Michael Tobin

From: MTobin1907@cs.com%internet
[SMTP:MTOBIN1907@CS.COM]
Sent: Saturday, September 02, 2000 11:22:24 AM
To: INFRASTRUCTURE_PEIS, NUCLEAR
Subject: plutonium production
Auto forwarded by a Rule

Ms. Colette Brown
DOE, Office of Space and Defense Power Systems

Dear Ms. Brown,

As an Idaho resident I have these comments regarding DOE plans to produce plutonium_238 at the INEEL.

- a.. Reprocessing is not acceptable and should not be considered at INEEL or any other facility
- b.. Building 666 is a decrepit and highly contaminated building and should be decommissioned in a manner that is protective of human health and the environment
- c.. Plutonium_238 production is unnecessary and its use too risky
- d.. Using ATR at INEEL would interfere with its current mission of producing medical and industrial isotopes
- e.. Extend the comment deadline 30 days

While there is no preferred alternative in this study, which is entitled Draft Programmatic Environmental Impact Statement for Accomplishing Expanded Nuclear Energy Research and Development and Isotope Production Missions in the United States, Including the Role of the Fast Flux Test Facility (FFTF) at Hanford, WA., DOE would prefer to accomplish the aforementioned activities at the Fast Flux Test Facility at Hanford. However, there is significant popular and political opposition within Washington state to the FFTF proposal, political opposition that does not exist in Idaho. Thus, without strong opposition in Idaho, we could well end up with this program by default.

Sincerely,

Michael Tobin
Boise

Response to Commentor No. 570

570-1: DOE would not conduct any reprocessing to produce weapons grade plutonium under any of the alternatives considered in this PEIS. The alternatives do include processing of target materials used to produce isotopes for medical and industrial uses, plutonium-238 for space missions, and nuclear materials research and development. Sections 4.3.1.1.13; 4.3.2.1.13; 4.3.3.1.13; and 4.4.3.1.13 were revised to clarify the waste management approach for waste resulting from processing of target materials for plutonium-238 production.

Building CPP-666 is divided into two parts, the Fuel Storage Facility and the Fluorinel Dissolution Process Facility (FDPF). The FDPF is under consideration in this PEIS for storage of neptunium-237 oxide, preparation of neptunium-237 targets, and separation of plutonium-238 from irradiated targets. DOE believes that this facility will meet, with further analysis and/or minor modifications, the criteria to safely conduct these operations.

570-2: DOE notes the commentor's opposition to enhancing its existing nuclear facility infrastructure to support production of plutonium-238 for use in future NASA space exploration missions. Section 1.2.2 of Volume 1 was revised to clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed production of plutonium-238 are relatively low and are discussed in detail in Chapter 4 of Volume 1 and Appendixes H, I, and J of Volume 2 in the Final NI PEIS. For over 30 years, radioisotope power systems have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. However, potential health and safety impacts associated with future launches of spacecraft utilizing plutonium-238 are not within the scope of the NI PEIS analysis, but would be addressed in the specific NEPA documentation prepared by NASA in support of such missions.

570-3: As stated in EIS Volume 1, Section 2.3.1.2, ATR would continue to meet its medical and industrial radioisotope production mission for the no action and most other alternatives considered where ATR is not used for the production of plutonium-238. If ATR were to be used as a production facility for plutonium-238 (options 1, 2, 3, 7, 8, and 9 under

570-1

570-2

570-3

570-4

570-5

570-6

Commentor No. 570: Michael Tobin (Cont'd)

Response to Commentor No. 570

Alternative 2), it would support medical and industrial radioisotope production to the extent possible. DOE would try to minimize the impact of the new mission on current medical and industrial radioisotope production.

- 570-4:** DOE notes the commentor's request for extension of the public comment period. The Council on Environmental Quality's (CEQ) "Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act" (40 CFR 1506.10(c)) require that a minimum of 45 days be allowed for public comment on the Draft NI PEIS. As stated in the Notice of Availability (65 FR 46443 et seq.), the public comment period began on July 28, 2000 and continued to September 18, 2000. In preparing the Final PEIS, DOE has assessed and considered both oral and written comments received on the Draft PEIS during the public comment period and has responded to these comments in the Final PEIS. Volume 3 of the NI PEIS contains public comments received on the NI PEIS and DOE responses to those comments. Moreover, late comments were considered to the extent practicable.
- 570-5:** As outlined in 40 CFR Part 1502.14 (e), an agency is not required to specify a preferred alternative or alternatives in the Draft EIS if one does not exist, but must do so in the Final EIS. Accordingly, DOE has identified its preferred alternative in Section 2.8 of Volume 1 and included a discussion of DOE's reasons for selecting it. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.
- 570-6:** During the comment period for the NI PEIS, DOE received comments both for and against implementation of Alternative 1, Restart FFTF. Public comment is one of the factors that will influence the Record of Decision. The Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives. DOE's decision will not default to any of the candidate sites because of popular support or opposition.

WA
Auto forwarded by a Rule

To Whom It May Concern,

I have reviewed the Draft Programmatic Environmental Impact Statement(DPEIS) "for accomplishing civilian nuclear energy R&D and isotopeproduction missions in the United States." Although the report makes norecommendations, I believe it is clear that the United States must have a reliable source from which these isotopes may be procured. I believethethe only way to insure this is to manufacture them within the UnitedStates. Further, I believe that the Fast Flux Test Facility located atHanford, WA would be ideal for production of these isotopes. Thefacility is fairly new, has an excellent safety record, and has the bestcapabilities, in both equipment and personnel, to accomplish the mission.

To whom this may concern:

I recently attended the DOE public discussion In Portland, OR aboutpossibly re_opening the FFTF nuclear reactor, and although I had to depart earlyand so was unable to comment at the meeting, I would like to offer some commentsby email, (and this was the email address I found provided in your literature).

I would first like to thank the DOE for their efforts in creating a calm andcoherent meeting for the discussion to take place, and I was quite sorry to seethat all other attendees did not respect their efforts. I would also like to saythat, as a person residing in Portland, OR, I do highly support the reopening ofthe FFTF: it seems the most cost efficient alternative, and I do not feel that its operation would jeopardize my safety or living conditions in any way.

Thank you for your time!

_Kristina Lestik

I support the restart of the FFTF Reactor Facility at Hanford to meet the national needs for medical isotopes and other peaceful nuclear materials. The FFTF is the most economical, safe, and environmental friendly method available to meet these needs.

Thank you,

Randy Black

On page S_2 of the PEIS cost study there's an interesting sentence:

"The programmatic decisions to be made in connection with the NIPeIS are the responsibility of the DOE Office of Nuclear Energy, Science and Technology"

How does that sentence fit with the idea that the Secretary of Energy will make the final decision before leaving office? Will the decision be made at the level of the Secretary, or at the level of the Nuclear Energy program office?

Bill

575-1

Response to Commentor No. 575

575-1: The sentence identified by the commentor was paraphrased from Section 1.3 of the Draft NI PEIS that inadvertently resulted in altering the intended meaning of the sentence. That sentence reads, "The programmatic decisions reached in association with this NI PEIS will address isotope production and civilian nuclear energy research and development missions which are the responsibility of the DOE Office of Nuclear Energy, Science and Technology." In response to the commentor, it is the Secretary of Energy who will make the decision with respect to the alternatives presented in this NI PEIS to accomplish the stated mission objectives. Decisions made will be published in the Record of Decision no sooner than 30 days after publication of the EPA Notice of Availability for this NI PEIS.

August 30, 2000

Ms. Colette E. Brown
 US Department of Energy
 19901 Germantown Road
 Germantown, MD 20874
 Via E_mail

Dear Ms. Brown

I would like to make the following comments on the Draft PEIS for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions? [DOE/EIS 03100 July 2000]:

1) The choice of the alternatives is strongly dependent on the projected isotope usage and the projected level of isotope use is at variance with other recent projections of use. Also, it is contradictory to the recent DOE decision to terminate the production of stable isotopes by the Y₁₂ calutrons some of which are necessary as feedstock to a radiation facility. The calutrons were said to be shut down due to lack of product demand. The PEIS should be augmented to explain these apparently contradictory courses of action.

2) In the absence of the stable isotopic feedstock from the calutrons, there should be some discussion in the PEIS of alternative feedstocks, their availability and their cost.

576-1

Response to Commentor No. 576

- 576-1:** DOE notes the commentor's concern. The calutrons at Oak Ridge National Laboratory produce electromagnetically enriched stable isotopes. These isotopes, in turn, are used to produce radioisotopes that are used for medical applications. Only Russia has a similar, large-scale facility with this capability. Although the ORNL calutron facilities have only operated intermittently over the past several years, DOE's existing stable isotope inventory is extensive and will supply the projected five-year demand for most stable research isotopes. DOE is currently in the process of designing a new stable enrichment unit whose capacity could be altered in the future to meet increases in demand.
- 576-2:** PEIS Section 2.3.1.1.3 and the separate cost report both state that there would be no cost for this German MOX fuel. The fuel would be reconfigured into assemblies suitable for irradiation at FFTF before shipment to the United States. The only cost attributed to the German MOX fuel is its transportation from a U.S. port to FFTF. PEIS Appendix J, Section J.3.6 discusses the history, availability, compatibility, and conversion of the unused German SNR-300 MOX fuel, which is currently in storage at Dounreay, Scotland.
- 576-3:** A determination of whether or not the wastes generated from the processing of neptunium-237 targets exhibit a hazardous waste characteristic under the Resource Conservation and Recovery Act would be made after its generation. If the waste is considered mixed waste, it will be managed in accordance with both the applicable hazardous waste and radioactive waste requirements. The Waste Isolation Pilot Plant (WIPP) has a RCRA permit and can accept mixed and nonmixed transuranic waste for disposal, not high-level radioactive waste.
- 576-4:** The facilities and locations evaluated in this NI PEIS, and for which costs are presented in the Cost Report, represent a range of reasonable alternatives for accomplishing the specified missions. Under Alternative 2, DOE's use of existing irradiation facilities (e.g., HFIR and ATR) as currently configured to accomplish the specified mission requirements would be limited by the requirement that such use would be on a not-to-interfere basis so as to not impact existing and ongoing research and isotope production activities at the facilities. However, as discussed in Volume 1, Sections 2.5.3 and 2.6.1, HFIR and ATR could not fully meet the projected long-term needs for medical isotope production and nuclear research and development, with or without adding the plutonium-238

Commentor No. 576: Alfred A. Brooks (Cont'd)

3) There is anticipated use of the German MOX fuel for the FFTF but there is no discussion of the methods, facilities and costs of preparing suitable FFTF fuel elements clad in stainless steel from the German supplies. At the same time the problems of the disposal of the mixed high level wastes resulting from the presence of chromium in the stainless steel which is classified as a hazardous material not eligible for WIPP disposal. These questions should be addressed in the PEIS.

576-2

4) After these questions are resolved, the PEIS should contain a total cost comparison of meeting as much as possible of the projected needs by fully utilizing the capacity of the enhanced HFIR and the ATR (with the installation of a hydraulic loader similar to HFIR). This cost should be compared to the cost of starting up FFTF and its associated chemical processing facilities including the full costs of contaminating new buildings and refurbishing old equipment. This comparison will shed light on the advisability of committing to the larger projected demands at this time.

576-3

576-4

I believe that it will be very important to base any comparison to the total life cycle costs of the possible alternatives and to clearly define the stability of any feed stocks that are not entirely within our control. I strongly favor utilizing inexpensive foreign sources as long as there is some certainty of their reliability. Thank you for providing the opportunity of making comments on this proposal.

Sincerely,
Alfred A. Brooks

Men are never so likely to settle a question rightly as when they discuss it freely." _ Thomas Babbington, Lord Macaulay
Southey's Colloquies on Society (1830)

"The only thing necessary for evil to prevail is for good men to do nothing." _ Edmund Burke (attributed)

Response to Commentor No. 576

production mission or with power level upgrades. As discussed in Section 2.3.1.2 of this NI PEIS, a rabbit system has been proposed for ATR to be used to enhance the production of commercial quantities of short-lived radioisotopes. However, no decision has been made on this upgrade, which would be paid for by the ATR privatization contractor and not DOE. Therefore, this possible enhancement does not affect the evaluation of current facility capabilities for meeting mission requirements and has not been considered in the Cost Report.

The neptunium-237 inventory is sufficient to support the plutonium-238 production requirement over 35 years, as evaluated in this NI PEIS. Availability of feedstock for currently envisioned medical, research, and industrial isotope production has been considered (see Appendix C of the NI PEIS), with the costs of procuring feedstock for isotope target fabrication included in the annual operating costs of the alternatives as compiled in the Cost Report.

DOE could purchase plutonium-238 from Russia to satisfy its responsibility to supply NASA with the necessary fuel to support future space exploration missions. Under the current contract set to expire in 2002, the United States is authorized to purchase up to 40 kilograms of plutonium-238, with the total available for purchase in any one year limited to 10 kilograms. However, DOE does not stockpile large quantities of Russian plutonium-238 long in advance of needs due to the additional processing, at an additional cost of approximately 1/3 of the original cost of production, that would be required to remove decay products that occur following extended storage of the material. To date, DOE has purchased approximately 9 kilograms of plutonium-238 under this contract. Future purchases from Russia would require the negotiation of a new contract with Russia.

Re: Public Comment on Draft Programmatic Environmental Impact
Statement(PEIS) re: Department of Energy?s (DOE) Plan to
Expand Production ofPlutonium 238 (Pu 238) for Future Space
Missions

Dear Ms. Brown,

I am writing on behalf of Nevada Desert Experience, a non_profit,
faith_based, anti_nuclear organization that has existed for 20 years,
and that has a readership of about 4,500 people around the nation
andthe world.

Although we are primarily concerned with the ongoing underground
?subcritical? nuclear tests that are being conducted at the Nevada
TestSite as well as the above_ground ?subcritical? tests being done
at theLos Alamos National Laboratory, we are also a part of the
Abolition 2000Global Network to Abolish Nuclear Weapons and the
US Campaign to AbolishNuclear Weapons, both of which oppose
the entire nuclear cycle,including nuclear power. We believe that all
nuclear technology,including nuclear power/fuel, is inherently
dangerous, posing anunacceptable risk to all life on the planet.

Response to Commentor No. 577

Commentor No. 577: Sally Light (Cont'd)

We at Nevada Desert Experience ask that DOE consider only non_nuclear technologies for powering future space missions/projects for the following reasons, among others:

1. The production of nuclear power is a messy operation that endangers the workers, the environment and the public health & safety. This was documented in the 1980s by the General Accounting Office (GAO) in a film the GAO produced as a report to Congress on the conditions inside US nuclear facilities nationwide. Technology used to produce nuclear power/fuel has not become safer since that film report was produced, and, certainly, no substantive ground has been gained since then as to how to deal adequately with the problems of the safe handling of radioactive materials in general.
2. The rockets that are used to launch space technology have an unacceptably high failure rate ? 10% or more ? so that using nuclear power as fuel, especially since the US intends to expand the number of such launches, raises the risk of widespread radioactive contamination in the case of rocket failure. Remember, all isotopes of Plutonium are so deadly that a single speck inhaled will lodge in the lung tissue where it will stay, emitting powerful alpha radiation, and the individual is very likely to develop cancer at sometime in his/her life. Radioactive impacts are now known to not only cause cancer, but also cause genetic mutations and genomic instability ? so a single rocket failure could be responsible for a worldwide plutonium exposure that will have devastating results.
3. The PEIS names three possible DOE facilities for the production of Pu238: Oak Ridge, Hanford and INEEL, all of which are already extremely contaminated Nuclear Weapons Complex sites. It would be better to develop non_nuclear technology (e.g., solar_powered fuel source) in an entirely new, uncontaminated facility, while seeing to the environmental cleanup of these three labs, and others (see #4 below).

577-1

577-2

Response to Commentor No. 577

577-1: The commentor's opposition to nuclear technology for space applications is noted. DOE also notes the commentor's interest in alternative energy sources, although issues of research and development of alternative energy sources are beyond the scope of this NI PEIS. The missions to be addressed in this PEIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development, can currently only be met using nuclear reactor or accelerator technologies.

577-2: DOE notes the commentor's opposition to NASA's use of nuclear materials for space missions, concern for the adequacy of ongoing cleanup activities, and concern over the use of nuclear power in space based weapons. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. None of the DOE missions stated in the NI PEIS are defense- or weapons-related.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. DOE activities associated with this program would not impact the schedule or available funding for existing cleanup activities at proposed sites for implementation of the nuclear infrastructure alternatives.

Commentor No. 577: Sally Light (Cont'd)

4. The costs associated with the expanded Pu 238 production are too exorbitant to be reasonable. Historically, environmental cleanup of contaminated sites (including sites contaminated by radioactive wastes) has always been extremely underfunded in the US. For instance, the cleanup budget for Lawrence Livermore National Laboratory (LLNL) has usually been a mere 1% of LLNL's total budget ? the other 99% has gone for weapons work ? and this is just one such example of DOE's priority setting over the years. DOE would do better by developing non_nuclear technology for space launch fuel needs, and use the saved funding for cleanup of its labs, many of which are Superfund sites (i.e., ranked as among the most contaminated in the nation).

577-3

5. We are concerned about the future uses of nuclear power in space. We have in our possession the document signed by the Joint Chiefs of Staff, "Vision 2020," which clearly shows the goal of using nuclear power to gain military control of the planet from space, as well as being in the business of space_based warfighting. If space_based technology must happen, it should be non_nuclear based, and it should be for peaceful purposes.

577-2

We hope that you will give serious attention to these comments. If there are any questions, please do not hesitate to reach me at my home (510) 527_2057, or by return email.

Sincerely,

Sally Light
Executive Director
Nevada Desert Experience

Commentor No. 578: Tanja Winter

From: Tanja Winter[SMTP:TANJA@CTS.COM]
Sent: Saturday, September 02, 2000 8:01:12 PM
To: INFRASTRUCTURE_PEIS, NUCLEAR
Subject: no plutonium in space
Auto forwarded by a Rule

Colette E. Brown, U.S. Department of Energy,
Dear Ms. Brown,

Urge you NOT allow expansion of plutonium production for future space missions. The danger to population and the planet are too great to proceed. No further NASA flights should be permitted until alternative fuels replace plutonium.

578-1

NASA is not doing enough to develop alternative (solar) power sources for space missions. European Space Agency (ESA) has now developed high efficiency solar cells for deep space missions.

The plutonium production/fabrication process for space nuclear power missions has recently led to several worker contamination accidents. An expansion of production will only worsen this problem.

578-2

Expanding the number of launches of nuclear powered space devices from Cape Canaveral on rockets with 10% failure rates will only increase the possibility of a deadly mishap.

578-1

The massive cost of expanded production of plutonium-238 can not be justified at a time when DoE admits it needs over \$300 billion to clean up existing problems at DoE facilities.

578-3

The military should not be promoting the use of nuclear power in space for space-based weapons technology. Using nuclear power for space war will have severe environmental implications for life on Earth. Department of Energy should not be involved in weapons production.

578-4

Tanja Winter, 8315 Paseo Del Ocaso, La Jolla, CA 932037

Response to Commentor No. 578

- 578-1:** DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions, although issues such as NASA research priorities are beyond the scope of this NI PEIS. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. None of the missions stated in the NI PEIS are defense- or weapons-related.
- 578-2:** Plutonium-238 processing facilities can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Sections 4.2-4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from plutonium-238 processing, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that the radiological and nonradiological risks associated with plutonium-238 processing would be small.
- 578-3:** DOE notes the commentor's opinion and concern about funding available for cleanup at DOE facilities.
- 578-4:** DOE notes the commentor's concern over the use of nuclear power in space-based weapons. The scope of this NI PEIS is limited to analysis of alternatives to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238 for NASA missions, and civilian nuclear energy research and development. None of these DOE missions is defense- or weapons-related.

 Cc: Sidney J. Goodman; Global Network Against Weapons &
 Nuclear Power in Space
 Subject: Stop making more Plutonium 238
 Auto forwarded by a Rule

To: Collette E. Brown

Too much has been risked already by using Plutonium_238 in space missions. Further production of this deadly poison must be halted.

NASA isn't doing what it should to develop alternative energy sources for space missions. It has fallen behind the European Space Agency in this respect.

Contamination accidents with Pu_238 have already happened. The only way to end further incidents is to stop further usages.

An increased number of space missions using PU_238, increases the probability that the unthinkable widespread contamination will really happen.

The cost of these missions is not justified. Using several cheap smaller probes (like we did for the Mars Explorer mission), instead of fewer expensive large probes, is stupid.

Further PU_238 missions increase the probability of space based nuclear warfare. The horror of it all is incomprehensible.

NASA has told outrageous lies in their assurances that the unthinkable widespread dispersion of PU_238 can never occur. Officials who participated in this fraud should be imprisoned.

581-1

581-2

Response to Commentor No. 581

581-1: DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions, although issues such as NASA research priorities are beyond the scope of this PEIS. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. Plutonium-238 sources are used only when they enable the mission or enhance mission capabilities.

Potential health and safety impacts associated with normal operations, facility accidents, and transportation as a result of the proposed production of plutonium-238 are relatively low and are discussed in detail in Chapter 4 of Volume 1 and appendixes H, I, and J of Volume 2 in the Final NI PEIS. For over 30 years, radioisotope power systems have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. However, potential health and safety impacts associated with future launches of spacecraft utilizing plutonium-238 are not within the scope of the NI PEIS analysis, but would be addressed in the specific NEPA documentation prepared by NASA in support of such missions.

581-2: DOE notes the commentor's opposition to NASA's use of nuclear materials for space missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. None of the missions stated in the NI PEIS are defense- or weapons-related.

Commentor No. 581: Sidney J. Goodman (Cont'd)

One bad accident, which is waiting to happen, will justify a widespread demand for huge cuts in the NASA budget. I will participate in that demand.

581-2
(Cont'd)

Angrily,

Sidney J. Goodman, P.E., M.S.M.E.

 Sent: Sunday, September 03, 2000 3:41:02 PM
 To: INFRASTRUCTURE_PEIS, NUCLEAR
 Subject: Hanford and FFTF restart
 Auto forwarded by a Rule

Dear Ms. Brown:

It is scandalous that DOE would consider restarting FFTF and producing moreradioactive materials when they have yet to deal with the serious hazardsposed by Hanford's status as the EPA's biggest Superfund site. Containersare already leaking into the environment, endangering local residents aswell as people across the country through contamination of agriculturalareas and the Columbia River and salmon runs. The recent fire at Hanford is further proof of the dangers lurking, as well as the contempt for publicand worker health exemplified by DOE's initial denials of any radiation'sescaping into the environment during the fires.

I demand that DOE responsibly clean up the radioactive contamination andput the health of the public and the environment first, and not create anymore deadly isotopes.

Marcy Stamper

582-1

582-2

Response to Commentor No. 582

582-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

582-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The proposed activities delineated in the NI PEIS would not have an impact on Hanford cleanup activities. The potential health and environmental impacts associated with operation of the Hanford facilities during normal operations and from postulated accidents are presented in Section 4.3 of the draft NI PEIS. All impacts to human health and to ecological resources would be small in the immediate area and negligible at all distant locations.

No radioactive materials were "released" in the Hanford Wildfires of 2000. Wildfires did resuspend some materials already in the environment. The resuspended materials were low, slightly above natural background levels. The low levels required several days of analysis to quantify.

No food or water restrictions are in place outside the Hanford Reservation as a result of Hanford activities.

DOE worker and public health and safety are of paramount and primary importance to DOE.

Colette E. Brown
 U.S. Department of Energy
 NE_50, 19901 Germantown Road,
 Germantown, MD 20874_1290

Dear Mr. Brown,

Peace this day! I am writing about my concerns for the ongoing use and investigation into possible sources for nuclear energy for missions to space. It seems that there are other alternatives which are not being considered with enough seriousness.

My understanding is that it is possible to develop alternative solar power sources for missions to space, and that in fact, highly efficient solar cells for deep space missions have been developed by the European Space Agency (ESA). In this age of global cooperation it seems to our advantage to collaborate with the Europeans on such technology. This would be more cost effective and also eliminate the possibility of worker contamination accidents and help reduce our existing difficulty with how to deal with the long term effects upon our environment around nuclear energy, production and waste.

With the current rate of 10% failure rate on rockets from Cape Canaveral, it seems that we are playing with fire to expand the number of launches that will be nuclear powered. Possible mishaps, as you know have irreversible consequences and are not good for the future of your program or our planet.

Response to Commentor No. 583

583-1

583-1: DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions, although issues such as NASA research priorities are beyond the scope of this NI PEIS. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. None of the missions stated in the NI PEIS are defense- or weapons-related.

Commentor No. 583: Joan M. Brown (Cont'd)

Finally the cost of expanded production of plu_238 cannot be justified at a time when DoE admits it needs over \$300 billion to clean_up existing waste problems at facilities.

583-2

Thank you for your consideration of these concerns. I would very much like to hear your responses.

Sincerely,

Joan Brown, osf

To: INFRASTRUCTURE_PEIS, NUCLEAR
Subject: Do Not Restart Hanford's Fast Flux Reactor
Auto forwarded by a Rule

Dear Collette Brown/Secretary Richardson,

Please accept the following as public comments incorporated into the formal administrative record and taken into consideration when adopting the final record of decision on the Draft Environmental Impact Statement on the Nuclear Infrastructure EIS.

Restarting FFTF is absolutely unacceptable. More waste is a cruel joke considering the stalled progress on the waste already at Hanford. FFTF maintenance has already gobbled up \$100 million in clean_up money and distracted from desperately needed clean_up. Tank wastes are already seeping towards OUR Columbia River. More wastes must not be added to those tanks. Clean_up must be the only priority.

By the way, you have done only an incomplete study and are asking for comments. You have not told us how you will deal with non-proliferation issues or additional waste from FFTF. Should FFTF be restarted, that decision will be illegal under Federal law and will be overturned! Do the right thing, shut down FFTF now and save the future of the Columbia River!

Sincerely,
Mark Wahl
Langley, WA

Response to Commentor No. 584

- 584-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.
- 584-2:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford and protection of the Columbia River. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected. If the decision is made to shutdown the FFTF, then cleanup dollars will be needed to deactivate the facility, which could impact the overall Hanford cleanup schedule.

Regarding the migration of contaminants to the Columbia River, the Hanford Site has a comprehensive waste minimization and pollution prevention program in place as summarized in Section 3.4.11.8 that would govern any proposed site activities. More specific to the proposed activities presented in the NI PEIS, FFTF is located approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to the groundwater. Analyses presented in Chapter 4 of the NI PEIS (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4) indicate that there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of the existing Hanford facilities in support of the proposed activities. Also, no water quality impacts would be expected as a result of permanent deactivation of FFTF (Section 4.4.1.2.4). Finally, no waste would be added to the Hanford waste tanks as a result of FFTF restart or operation.

||
|| 584-3
|| 584-4
|| 584-3
|| 584-5

Commentor No. 584: Mark Wahl (Cont'd)

Response to Commentor No. 584

- 584-3:** DOE prepared a separate Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. DOE mailed this document to about 730 interested parties on September 8, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Nuclear Infrastructure Nonproliferation Impact Assessment in Appendix Q in the Final NI PEIS.
- 584-4:** Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.
- 584-5:** See response to comment 584-1. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

I am a former Fluor Hanford employee who worked at FFTF for 10 years. I can speak from experience about the facility. FFTF should be restarted for production of medical isotopes and NASA space craft power isotopes. The facility is in excellent condition and has many more years of useful life. It would be a terrible waste of resources and potential benefits to shut it down.

The employees I associated with have excellent safety awareness and take ownership in their work. The two employees who were recently fired for falsification of records are an exception and do not represent the attitude and work ethic of the majority.

To the PEIS team at DOE...

"Isotopes: An Answer for Cancer"

For once, let's not let politics stand in the way of progress. We've listened long enough to a very vocal minority which has offered yearsof emotional opposition to recommissioning the Fast Flux Text Facility.We need now to listen to the more reasoned and caring voice of themajority and heed the scientific evidence in support of a life_savingmission for the FFTF... the production of radiopharmaceuticals

587-1

587-1: It is DOE policy to encourage public input on matters of regional, national and international importance as part of its commitment to facilitate a public participation process that is open and unbiased.

We've already invested in the FFTF and we have a tremendous opportunityto turn this legacy of the cold war into a life_saving asset. There isno reason to abandon that investment or to conduct further studies Noequivalent facility exists anywhere else in the United States. No othercity has people with the knowledge and technological depth held by ourscientific community.

587-2

587-2: DOE notes the commentor's opinion. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

Please stop the studies and the procrastination, turn away from thosefew voices crying "wolf." Commission the FFTF now to produce thoselife_saving radiopharmaceuticals. It is paid for, it is clean, it is safe, and it can be a continuing asset to this community and the nation...a positive image for nuclear energy and the Departmentof Energy.

587-3

587-3: DOE notes the commentor's support for Alternative 1, Restart FFTF.

For the record, I was employed by the Atomic Energy Commission and its successors from October 1947 until June 1978 and was directly involvedin the administration of the design and construction of the FFTF.

588-1**Response to Commentor No. 588**

588-1: DOE notes the commentor's opposition to the use of nuclear materials for space missions and the placement of nuclear weapons in space. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. None of the missions stated in the NI PEIS are defense- or weapons-related.

 Subject: Draft PEIS for FFTF
 Auto forwarded by a Rule

I am in favor of restarting the FFTF for our citizens needs in the areas of medical isotope research and treatment and the production of energy sources such as Pu238. The Draft PEIS on restart presents no show stoppers, shows that restart is the quickest solution, and that the economics of scale are positive. Further, based on current experience, building a new source to offset the foreign and marginal supply will be fraught with delays just as the decision about the FFTF has lingered. In this case, an immediate tool is much better than a promised tool.

It is ironic that the small but vocal anti_FFTF people change their tune when a family member suddenly needs dread disease diagnostic and treatment tools possible through medical isotopes. Such changes to seeking the facts rather than following the anti's emotions makes it obvious that there is a need for my government to support the basic research leading to general availability of such resources.

The availability of new medical tools will directly reduce the cost of Medicare treatments and indirectly reduce personal and family suffering found with many existing and ineffective methods.

Please consider immediate restart a favorable solution to our country's needs.

Sincerely
 Gary L. Troyer

 To: INFRASTRUCTURE_PEIS, NUCLEAR
 Subject: FFTF Restart at Hanford
 Auto forwarded by a Rule

04 September 2000

Secretary of Energy
 U.S. Department of Energy
 19901 Germantown Road
 Germantown, MD 20874

Dear Mr. Secretary,

This letter and an associated email sent to the DOE itemize my concerns over the restart of the FFTF at Hanford. I have been involved, or a close observer of the operations at the Hanford Reservation since the Tri-Party Agreement was signed in 1989. I am an ex-physicist and I understand the technical aspects of reactors, nuclear waste, radioisotope production, etc.

In the Tri-Party Agreement DOE agreed, in a legally binding document, to clean up the nuclear waste at Hanford and to fund this cleanup as required. In addition, in 1995 DOE promised (also in a legal document—the Hanford Cleanup Agreement) that the FFTF would be shut down and the funds used to keep this facility in a restart state would be used in the cleanup effort. DOE is now in violation of this agreement as well and proposes to be in permanent violation by restarting the FFTF. Furthermore, DOE now admits that its current budget and target budgets for the next six years are too low to meet the Clean-Up Agreement, yet would spend in excess of \$400M in the restart of a facility that is not needed.

602-1

Response to Commentor No. 602

602-1: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to “ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use.” The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

DOE notes the commentor’s concerns over the restart of FFTF and the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. A Tri-Party Agreement change was made to place the milestones for FFTF’s permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Public meetings were held on this formal milestone change. The proposed activities delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

The U.S. Congress funds Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM). Congress also funds FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

602-2: DOE notes the commentor’s opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF. DOE also notes the commentor’s concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental

Commentor No. 602: Frank Hammond (Cont'd)

The majority of citizens of the State of Washington want the FFTF shut down permanently and want DOE to get on with the cleanup. I recently attended one of the hearings regarding The Programmatic Environmental Impact Statement (PEIS). I have carefully considered the reasons why DOE wants to restart FFTF and based on the evidence available from all sources there are no valid reasons to restart FFTF or to retain it for future use. The major arguments DOE is using are discussed below.

602-2

NASA has stated (in an official NASA report) that they have no need to purchase Pu-238 for the specific space mission used to justify FFTF restart.

602-3

The FFTF will be used for research and commercial production of radioisotopes. However, DOE is ignoring its own committee's recommendations. The Subcommittee for Isotope Research and Production Planning, in its report stated "The FFTF will not be a viable source of research radioisotopes". An adequate supply of research radioisotopes is available from Canada and as far as commercial applications are concerned it is questionable that a Government Agency should be in the business of selling commercial quantities of medical radioisotopes. In addition, there are less expensive alternatives to providing commercial quantities of radioisotopes by the design of facilities that are specifically built to produce these isotopes and possibly this type of facility could be built by one or a consortium of companies for that purpose.

602-4

More than 11 years after the original Tri-Party Agreement was signed, the most dangerous wastes (those in the 200 Area) are still in leaking tanks. The Single Shell Tanks are still around and the contents of radioactive and toxic waste they contain are leaking into the soil. It may already be too late to avoid the contamination of the Columbia River from the waste that may have leaked into the groundwater. All of the other cleanup efforts at Hanford are minor in comparison to this task. Yet DOE says they have no solution at this

602-5

Response to Commentor No. 602

restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

602-3: A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

602-4: The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the

Commentor No. 602: Frank Hammond (Cont'd)

time. I have discussed this situation with two distinguished (retired) professors of chemical engineering one a former department chair and the other a former department chair and dean of his engineering school. They claim that this problem can be solved and that DOE has ignored a solution. I am convinced that DOE does not really want to clean up the Hanford wastes but would rather work on more "exciting" projects such as FFTF restart.

FFTF will only add more radioactive waste to that which we already have. Do not restart FFTF. I could say much more and in more depth but this letter would turn into a book. Thanks for taking the time to read this.

Sincerely,

Frank Hammond

Response to Commentor No. 602

use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

DOE's production and sale of radioisotopes fall into two categories, "commercial" and "research," and both types of isotope production are considered under the proposed actions. Commercial radioisotopes are those that are produced in large, bulk quantities and sold to pharmaceutical companies or distributors, or to equipment or sealed source manufacturers. Examples of commercial radioisotopes produced by DOE include strontium-82 and germanium-68 for medical applications, and iridium-192 and californium-252 for industrial applications. DOE only produces commercial isotopes when there is no U.S. private sector capability or when foreign sources do not have the capacity to meet U.S. needs reliably. In contrast, research radioisotopes are typically produced and sold in small quantities in response to specialty orders from researchers preparing experiments in the field of medicine, with small quantities of these radioisotopes also purchased by industrial researchers. Because small-quantity production of research isotopes is not financially attractive to private-sector producers and is generally not undertaken, DOE attempts to provide all research radioisotopes that are requested, subject to production capability, inventory, and financial constraints. As successful application of a specific research isotope is established, the production and sales of that radioisotope may shift from research to commercial status. In recent years, over 95 percent of DOE's sales of radioisotopes by dollar volume were commercial and 5 percent have been for research. Additional discussion of how DOE's isotope program fits into the overall U.S. and foreign isotope production capabilities was incorporated into Section 1.2.1 of Volume 1.

602-5: See response to 602-2. This NI PEIS addresses wastes produced for each alternative, as well as cumulative impacts related to waste production. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. Discussion of, or resolution of, concerns related to the remediation of existing waste are beyond the scope of this EIS and do not enter into the decision process.

Commentor No. 602: Frank Hammond (Cont'd)

Response to Commentor No. 602

602-6: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to wastes generated by other Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposal) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

My sister died a couple of years ago from breast cancer. I don't know if any isotope from the FFTF could have helped her or not, but I wish it had been there to try.

I've lived all my life in the Tri_Cities with the exception of the 20 years I spent in the Air Force. I was here when the government released all the radiation from Hanford. I may even suffer from those releases because I do have hypothyroidism. But I don't hold anything against the facility. I did what it had to at the time with the knowledge it had.

I am concerned about the political aspect of all that is surrounding the start or non_start of the FFTF. I want common sense and economical factors considered upmost, not rhetoric. We need the isotopes. The people here should be deciding, not Olympia, not Portland or Salem.

Thank you,

Paul Bailey

Cc: globalnet@mindspring.com%internet
Subject: PLU_238
Auto forwarded by a Rule

We do not have a need in this country to produce any more PLU_238. Remember, the earth does not belong to you, it is borrowed from future generations. If you make an attempt to manufacture this, you will have a lot of supporters rallying against it, and it will not be acceptable or allowed. We will blow this thing wide open. Why don't you take a vote from every American citizen on this issue and then go from there. You are not letting the American people decide on what's best for them. And they have the right to know for one thing, as well as decide on whether or not this is feasible. I live near the Oakridge plant, and believe me they have enough problems, without the PLU_238 problem..

I, along with several others urge you to drop this matter at this time, and move further no more.

604-1

604-2

604-1

Response to Commentor No. 604

604-1: DOE notes the commentor's opposition to enhancing its existing nuclear facility infrastructure to support production of plutonium-238 for use in future NASA space exploration missions. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions; no viable alternative to using plutonium-238 to support these missions currently exists. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

604-2: DOE notes the commentor's views and opposition to the production of plutonium-238. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the environmental impact analysis of DOE's proposed alternatives for meeting mission requirements. In preparing the Final NI PEIS, DOE carefully considered comments received from the public. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

 Auto forwarded by a Rule

Last year, in an effort to refine a diagnosis of a pre_cancerous breast condition, my physician recommended I have a scan originally designed to diagnose heart disease. (This scan's results were curiously found to show evidence not only of women's heart disease, but also highlighting areas of previously unsuspected active breast cancer growth.)

Specifically, I was given 24.8 mCi of Technetium_99m. As the technician was preparing the injection, I asked about the source of the isotope. I was told it came from the only functioning source available to clinics in our area....Canada. And that I was lucky that the plant hadn't been shut down recently, so the Tri_City supply was adequate at that time. And that there had been many times, and would be again, when the test I had been urged to have could not be offered due to the unavailability of the isotope.

As a second generation Hanford worker, I have been concerned about the continued funding not only of the programs once so critical to our national defense, but also the development of the benefits of the "peaceful atom" touted since my childhood years in Richland. The matchless FFTF deserves to continue its long history of versatile technical excellence.

Add this to the long list of messages of support for the continued funding and development of isotope production at Hanford's Fast Flux Test Facility.

Sincerely,
 Laura J. Anderson

As a citizen from Virginia, it is my belief that the FFTP reactor should be utilized in order to provide us the important services that it was created to do. One of the major purposes for returning this reactor to operation is to make medical isotopes to support the growth of this strong anti_cancer medical technology and provide better treatment opportunities to cancer patients. How could one justify not utilizing this reactor, if only for this purpose (we know that FFTP provides more than medical isotopes)?

The opposition to this effort claims that there is no need for the DOE to expend these funds. I think that there is a real need to not waste this facility, and to promote the general health of the public at the same time. This is the largest of DOE's test and irradiation services reactors and the production of isotopes and support tests are unavailable from other reactors.

I thank you your time to hear my view on this matter. It is an important issue that cannot be dismissed quickly. I believe the advantages of starting up this site more than outweigh the disadvantages. Please take this into consideration.

Sincerely,

Monica Floyd

I get tired and distraught by legislation that is based on sentimentality and/or fear mongering. It is time for those in charge to stand up for those things that obviously will be of benefit to our society. The restart of the FFTF certainly falls into the category of items items maligned by the ignorance of mob rule.

The knee_jerk reactions of the antinuclear crowd is reminiscent of such things as race hatred (recent) and witch hunting (ca. 1600) now hopefully overcome. It would seem that it is human to look for and embrace ideas on which to blame our ills, regardless of the truth or logic involved, and the complete absense of proof of responsibility.

Consider the facts:

Safety: There has never been a serious harmful event connected with the operation and maintenance of the FFTF __ or any other Fast Flux Reactor.

Recall: The philosophy of the FFTF was basically a machine that produces more fuel than it burns. President Carter quashed the building of a prototype facility out of fear that was engendered by advisors he had gathered around him. However, France and Japan have used Our technology to build and operate fast flux reactors that safely and economically have produced power for over a decade.

613-1**613-2****613-3****Response to Commentor No. 613****613-1:** DOE notes the commentor's views.**613-2:** Comment noted.

613-3: DOE notes the commentor's views. Chapter 4 , Volume 1 of the NI PEIS provides an estimate of waste generation and potential human health impacts associated with each of the alternatives proposed for the production of medical, industrial and research isotopes. Any additional wastes generated in support of these missions would be managed in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws, regulations, and appropriate DOE orders.

613-4: DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

613-5: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 613: Marshall W. Cook (Cont'd)

Now: We do not argue for the obvious long term benefits of power production (whose time will most certainly arrive), but for the solution of an immediate humanitarian cause ___ that of producing isotopes for medical purposes.

**613-3
(Cont'd)**

PLEASE: Do your homework. Try to understand the need for isotopes, observe the outstanding safety record of the FFTF and its ilk (a thousandfold safer than fossil fuel energy production) and recognize the very minimal production of waste material.

WHEN: Are we going to stop making bad decisions based on unfounded hysteria?

613-4

WE NEED THIS REACTOR. WE WANT IT TO OPERATE RIGHT HERE IN OUR BACKYARD. THE PEOPLE OF THIS NATION NEED WHAT IT CAN PRODUCE.

Please see attached paper by Dr. William E. Schenewerk of ParsonsEngineering, Pasadena, Calif. Dr. Schenewerk discusses global population growth and energy demand, atmospheric CO2 levels and global warming.

He cites the need for strong deployment of nuclear power to prevent globalwarming due to greenhouse effect.

In his scenario, breeder reactor technology plays a central role in providing energy for the future.

Hence, Dr. Schenewerk believes that FFTF should be retained to test and develop fuels for advanced breeder reactors.

 Sent: Tuesday, September 05, 2000 8:53:28 PM
 To: INFRASTRUCTURE_PEIS, NUCLEAR
 Subject: replace plu_238_fueled radioisotope power systems
 Auto forwarded by a Rule

Dear Colette E. Brown, U.S. Department of Energy,

I think it has been demonstrated well enough that nuclear energy is a very dangerous toy; let's not make any more of it. My reasons for stopping the development of plu_238 are as follows:

- 1) NASA is not doing enough to develop alternative (solar) power sources for space missions. European Space Agency (ESA) has now developed high_efficiency solar cells for deep space missions.
- 2) The plutonium production/fabrication process for space nuclear power missions has recently led to several worker contamination accidents. An expansion of production will only worsen this problem.
- 3) Expanding the number of launches of nuclear powered space devices from Cape Canaveral on rockets with 10% failure rates will only increase the possibility of a deadly mishap.
- 4) The massive cost of expanded production of plu_238 can not be justified at a time when DoE admits it needs over \$300 billion to clean_up existing problems at DoE facilities.
- 5) The military is promoting the use of nuclear power in space for space_based weapons technology. Using nuclear power for space war will have severe environmental implications for life on Earth.

Thank you,

Loren Wieland, BS MA
 19021 Acorn Road, Fort Myers, FL., 33912

Response to Commentor No. 615**615-1**

615-1: DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions, although issues such as NASA research priorities are beyond the scope of this NI PEIS. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. None of the missions stated in the NI PEIS are defense- or weapons-related.

615-2

615-2: Plutonium-238 processing facilities can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Sections 4.2-4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from plutonium-238 processing, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that the radiological and nonradiological risks associated with plutonium-238 processing would be small.

615-1**615-3**

615-3: DOE notes the commentor's opinion and concern about funding available for cleanup at DOE facilities.

615-4

615-4: DOE notes the commentor's concern for the use of nuclear power in space-based weapons. None of the missions stated in the NI PEIS are defense- or weapons-related.

Commentor No. 616: Robert J. Rohnet

Response to Commentor No. 616

Draft PEIS Comment Form

You have all the constructive evidence you asked. Now is time to do the RIGHT thing. You have the responsibility to provide for the people of the UNITED STATES a reliable, diverse, and cost-effective supply of essential isotopes. People are dying and can't must they suffer with cancer when the capability to produce life saving medical isotopes already exists in the US. The FFTF has the capacity, utilities and power capability to run P.H. all the requirements you asked.

I agree that the DOE has performed badly at the hardware cleanup mission. The FFTF is the shadow, start and end of a very few examples of the very best that DOE could do. Don't throw that away. It is built and fixed for and restarting it would cost less than any other alternative.

Do not be misled by the very vocal but minority group of activists that spend disingenuous and generate fear in people who's only fault is not being properly educated on the facts.

You know what the facts are. Please take the moral courage to act upon them. I support restart of the FFTF. I also support providing for the US people. Thank you.

Re: Support for restart of the Fast Flux Test Facility

Dear Ms. Brown,

Benton County would like to restate its long-standing support for the restart and continued operation of the Department of Energy's Fast Flux Test Facility (FFTF) at the Hanford Site.

With the multi-billion dollar facility, its support and service infrastructure, a uniquely-skilled labor force, and community support already in place, restart of the FFTF is the only reasonable and prudent use of taxpayer dollars in pursuit of the missions stated by the DOE in the draft *Nuclear Infrastructure Programmatic Environmental Impact Statement* of July 2000.

Construction costs for a new facility comparable to the FFTF would be prohibitive, and such an alternative is not even under consideration. Therefore, only operation of the FFTF can provide the DOE and the Nation with the broadest range of research, development, and production capabilities, including but not limited to:

- Medical and industrial isotope production;
- Plutonium²³⁸ isotope production for NASA civilian space missions (US Pu²³⁸ supplies are currently purchased from Russia);
- Fuels, assemblies, and flux research for civilian nuclear energy applications;
- Advanced reactor, materials, and waste transmutation research and development;
- Commercial light water reactor lifetime extension research.

Operation of the Fast Flux Test Facility could provide 500-1000 family-wage jobs for the Tri-Cities area in the immediate term, with greater potential opportunities in the future. This high-level employment boost would be beneficial to the economic stability of our community as other Hanford-related employment continues to decline. Furthermore, potential support and spin-off industries would lend favorably to the long-term viability and diversification of our region's economy.

Contrary to the fears of underinformed detractors, renewed operation of the FFTF *would not*....

- generate any new quantities of high-level waste;
- support any military or weapons production programs;
- detract from or divert funding from existing Hanford Site remediation programs – the budgets and appropriations are completely separate.

Response to Commentor No. 619

619-1

619-1: DOE notes the commentors' support for Alternative 1, Restart FFTF and opposition to the remaining action alternatives.

Commentor No. 619: Benton County Board of County Commissioners (Max E. Benitz, Jr., Chairman; Leo Bowman; Claude Oliver) (Cont'd)

Based on the facility's availability, capacity for multi-product missions, demonstrated technology, cost effectiveness, minimal environmental impact, and excellent safety record, it is clear that restart of the FFTF is the only logical choice for the DOE to meet its stated objectives.

The Fast Flux Test Facility and its necessary support infrastructure are already in place and have a safe, efficient, and effective operating record (1980-1992). Restart costs for this facility are minimal when compared to construction of a new facility. Moreover, alternatives calling for construction of new "accelerator" facilities, or the use of other existing facilities will not avail the DOE of the full range of research and production capabilities afforded by the FFTF. It is pointless and imprudent to mothball or decommission such an underutilized national asset and investment of public capital when so many community, scientific, and industrial benefits can be derived from its use.

We believe that when the DOE carefully weighs its alternatives, restart of the FFTF will be the obvious choice for meeting the Department's research, development, and production objectives in the 21st Century. Thank you for the opportunity to comment on this matter.

Sincerely,

Ms. Colette Brown
U.S. Department of Energy
19901 Germantown Road
Germantown, Maryland 20874

Dear Ms. Brown:

Plans to restart the Fast Flux Test Facility at Hanford, Washington for the production of tritium to enhance the destructive power of nuclear bombs have disastrous implications and are, frankly, insane, for the following reasons:

1) The radioactive contamination at Hanford, now documented in ground water heading for the Columbia River, is an ecologic nightmare with profound health implications for countless citizens of the Pacific Northwest. As a head and neck cancer surgeon having treated many radiation induced cancers and myself a survivor of a radiation induced thyroid tumor I can assure you that the public health implications of this contamination are potentially catastrophic, and to inflict this risk on our citizenry is unconscionable.

2) Restarting the FFTF will add enormously to the radioactive load at Hanford due both to the end products and the incoming load. The urgent necessity is to decontaminate Hanford as quickly as possible, not increase the contamination.

3) Costs of keeping the FFTF at the ready plus its operation will inevitably lead to a depletion of desperately needed clean-up funds. The first priority at Hanford, using all available funds, must be clean-up. Diversion of funds to produce more radioactive waste is outrageous.

4) Committing the FFTF to a mission for which it was not designed is widely recognized to pose unacceptable risks of a meltdown with devastating release of radioactive material.

5) More tritium is not needed by our military. Continuing disarmament agreements and recycling existing tritium will provide more than sufficient material for over 30 years. In addition, higher killing power for our bombs is hardly necessary.

6) Production of medical radioisotopes can hardly justify the continuing deterioration of perhaps the most contaminated site on the planet. These isotopes are readily available from other sources.

I urge you to come down hard on the side of shutting down the FFTF and keeping intact the milestones for cleaning up and closing down Hanford.

Thank you for your help in this vitally important issue for the people of the Pacific Northwest.

Sincerely,

Robert Stagman, M.D.

Response to Commentor No. 620

620-1: DOE notes the commentor's views. However, the purpose of the NI PEIS is to evaluate the environmental impacts of a range of reasonable alternatives to maintaining and enhancing DOE's existing nuclear facility infrastructure to support production of isotopes for medical, research, and industrial uses; production of plutonium-238 for use in future NASA space exploration missions; and U.S. nuclear research and development needs for civilian application. No component of the proposed action is for the purpose of producing tritium, nor is it for the purpose of supporting any other defense or weapons-related mission.

620-2: DOE notes the commentor's concerns regarding the migration of contaminants to the Columbia River. FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

620-3: FFTF restart would not impact the schedule or available funding for existing cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram funds designated for Hanford cleanup, regardless of the alternative(s) selected. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a

Commentor No. 620: Robert G. Stagman (Cont'd)

Response to Commentor No. 620

safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE Orders. As discussed in Section 4.3.1.1.13 of the PEIS, the waste generated as a result of FFTF operations is very small compared to wastes generated by other Hanford activities.

- 620-4:** See response to 620-2. The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.
- 620-5:** FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.
- 620-6:** The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements.

Although other manufacturers produce medical isotopes, DOE remains the key provider for a large number of isotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

Commentor No. 620: Robert G. Stagman (Cont'd)

Response to Commentor No. 620

Potential environmental, health, and safety impacts associated with the proposed action are relatively low, and are discussed in detail in Chapter 4 of Volume 1 and associated appendixes in the Final NI PEIS.

620-7: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

Commentor No. 621: Charlie Bryan

 Germantown, MD 20874
 Attn: NE PEIS

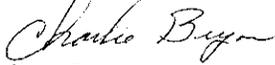

Dear Ms. Brown:

I am writing to urge the restart of the FFTF reactor in Richland Washington for the purpose of generating medical isotopes.

I have lived in the Richland area for about 50 years and have not suffered any adverse effects from the Hanford Energy works. I am concerned about the cleanup efforts staying on track.

I am convinced that the FFTF reactor will generate a minimal amount of waste, but please make plans for its disposal prior to startup.

Thank you for your time and attention.

Charlie Bryan

 Richland, WA 99352

621-1

621-2

621-3

Response to Commentor No. 621

- 621-1:** DOE notes the commentor's support for Alternative 1, Restart FFTF.
- 621-2:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- 621-3:** Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this NI PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Section 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

RE: Support for restart of the Fast Flux Test Facility

Dear Ms. Brown:

Grant County would like to make clear its unwavering support for restart of the Department of Energy's Fast Flux Test Facility (FFTF) at the Hanford Site.

With the multi-billion dollar facility and support infrastructure already in place, restart of the FFTF is the only reasonable, fair, and prudent use of taxpayer dollars in pursuit of the missions stated by the DOE in the draft Nuclear Infrastructure Programmatic Environmental Impact Statement of July 2000.

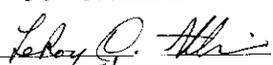

Based on the facility's availability, capacity for multi-product missions, demonstrated technology, cost effectiveness, minimal environmental impact, existing infrastructure and skilled labor force, and excellent safety record, it is clear that restart of the FFTF is the only logical choice for the DOE to meet its stated objectives.

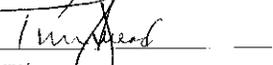

There is overwhelming support in Grant County and throughout the Mid-Columbia region for the reuse of this incomparable national asset. We are excited about both the economic benefits restart could bring to our area, and about the contributions our community can make toward meeting national and global needs in isotope research and production.

We believe that when the DOE carefully weighs its alternatives, restart of the FFTF will be the obvious choice for meeting the Department's research, development, and production objectives in the 21st Century. Thank you for the opportunity to comment on this matter.

Sincerely,

 _____, Chairman

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

I lost my father 23 years ago to bone cancer which had metastasized from prostate cancer. He was 66 years old at the time and in good health otherwise. His father had also suffered from prostate cancer a generation earlier.

If isotope therapy had been available to my father when the prostate cancer was first detected, he would have been alive today to enjoy his retirement with my mother. Instead, our family has a hole that can never be filled. All we can do is refresh our memory of him by recounting family traditions. But, we can also hope that other families, including my progeny, are spared these devastating events by taking advantage of technology.

Because of this medical history and concern for my health in the future, I have even stronger impetus to suggest that the FFTF is the answer to cost-effective medical isotope production for the U.S. I have worked at the FFTF as an engineer from its construction days. I am proud of the facility and the integrity and knowledge of the people that operate and maintain it. I recognize that the DOE will be barraged with unfounded and ill-informed objections to its operation. I must trust the Secretary to finally base his FFTF restart decision on technical and fiscal merits and ignore the ignorant rhetoric.

I strongly support the use of the FFTF for isotope production and other needs for which it is uniquely qualified.

 Sept. 1, 2000

Collette Brown

Office of Space and Defense Power Systems (NE-52)
 U.S. Department of Energy
 19901 Germantown Road
 Germantown, Maryland 20874

Dear Ms Brown,

I am still enraged after all these years that the Department of Energy has neither cleaned up Hanford of radioactive waste nor shut down FFTF, so that no more nuclear waste will be endangering the Columbia River and all of us here in Washington and Oregon.

The Hanford Public Interest Network of seven organizations has revealed the USDOE Hanford officials have covered up Plutonium releases twice in three years. We must get that reactor shut down for all time. I understand that if needed, there are cheaper + safer ways to obtain this dangerous material. Plus this quote from the Subcommittee of Research and Planning - "The FFTF will not be a viable source of ~~research~~ ^{research} radioisotopes."

PLEASE SHUT IT DOWN!

Sincerely,

Frieda S. Walworth

Response to Commentor No. 625

625-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

625-1

DOE did not cover up release information on the two referenced events (assumed to be PFP event and the year 2000 wildfires at Hanford). The very low levels involved took several days to quantify. DOE reported information as it became available.

625-2

625-2: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.

625-3

625-3: The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production

625-2

Commentor No. 625: Frieda S. Walworth (Cont'd)

Response to Commentor No. 625

of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production.” In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

The United States currently purchases approximately 90 percent of its medical radioisotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Commentor No. 626: Fred Miller

Draft PEIS Comment Form

The draft PEIS is woefully inadequate. It ignores numerous issues and key information. It ignores nuclear proliferation issues entirely. It ignores the possibility of a shipboard fire involving plutonium release into a port city, which could render that city uninhabitable. It ignores the possibility of using Pu-238 from DoD sources such as RTGs from warheads dismantled under the START treaty. It ignores an assessment of the need for Pu-238 or of the suitability of FFTF to produce medical isotopes. It ignores the lack of a suitable geologic repository for spent fuel and DOE's failure to create such a repository by its own deadline. This makes the "temporary" storage facility a permanent repository, de facto. It ignores Hanford and DOE's history of covering up problems, lying to the public, misappropriating cleanup and safety funds and persecuting whistle blowers. In effect, this history makes all safety and environmental and cost estimates unreliable. It ignores the cost of, and risks associated with, the ultimate decommissioning of the reactor, except in the case of not reopening the reactor. It ignores the effect of competition for cleanup dollars and cleanup resources when FFTF is operating and when it is being cleaned up. It is consistently biased in favor of restarting FFTF. It is consistently biased in favor of production; it is absurdly optimistic about DOE performance.

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Response to Commentor No. 626

626-1: The NI PEIS is adequate. This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR Parts 1500 through 1508 and 10 CFR Part 1021), respectively. DOE prepared a separate Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Pursuant to CEQ regulations (40 CFR 1505.1.e), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. DOE mailed this document to about 730 interested parties on September 8, 2000. The report was made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Nuclear Infrastructure Nonproliferation Impact Assessment in Appendix Q in the Final NI PEIS.

626-2: Alternative 1 does postulate that DOE might decide at some point to import mixed oxide fuel from Europe to fuel FFTF. At this time, however DOE has not proposed to import this fuel through any specific port. If DOE ultimately decides to import fuel from Europe, it would perform a separate NEPA analysis to select a port. This review would address all relevant potential impacts of overseas and inland water transportation, shipboard fires, package handling, land transportation, as well as safeguards and security associated with the import of SNR-300 mixed oxide fuel through a variety of specific candidate ports on the east and west coasts. It would consider all public comments, including local resolutions, concerning the desirability of bringing mixed oxide fuel into the proposed alternative ports.

In the event that DOE decides to enhance its nuclear infrastructure, it would not expose any population to high, unacceptable risks under any alternative. Any transportation activities that would be conducted by DOE would comply with U.S. Nuclear Regulatory Commission and U.S. Department of Transportation regulations. Associated transatlantic shipment would comply with International Atomic Energy Agency requirements. In Section J.6.2, DOE reviewed the potential maximum impacts from the marine transportation of mixed oxide fuel from Europe to a representative military port, Charleston, South Carolina, and overland transportation to Hanford. Also in that section, a bounding analysis demonstrates that the maximum potential radiological risks to the

Commentor No. 626: Fred Miller (Cont'd)

Response to Commentor No. 626

surrounding public from mixed oxide fuel shipments would be extremely small (e.g., less than 1 chance in a trillion for a latent cancer fatality per shipment from severe accidents at docks and in channels and less than 1 chance in 50 billion for a latent cancer fatality per shipment from overland highway accidents).

DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual rate of growth of medical isotope use is consistent with the Expert Panel findings. Section 1.2.1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who

Commentor No. 626: Fred Miller (Cont'd)

Response to Commentor No. 626

might consider its use for isotope production.” In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

DOE has taken the Expert Panel and NERAC report recommendations under consideration in developing the range of alternatives evaluated in the NI PEIS. These reports were made available to the public at the NI PEIS public information centers and on the Internet at www.nuclear.gov.

- 626-3:** Small plutonium-238 fueled radioisotope thermoelectric generators (RTGs) are used to power electronic systems on some strategic weapons. Some of the strategic weapons have become surplus due to strategic arms reductions. Although the exact configuration of these RTGs is classified, the amount of plutonium-238 in each unit is relatively small and the assay of the plutonium-238 is unacceptable (too low) for use in RTGs advanced radioisotope power systems, or radioisotope heater units for NASA spacecraft. Therefore, it is not a viable source for consideration in the NI PEIS.
- 626-4:** A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000, letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Commentor No. 626: Fred Miller (Cont'd)

Response to Commentor No. 626

The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

626-5: The NI PEIS assumes, for the purposes of analysis, that Yucca Mountain Nevada, would be the final disposal site for DOE's high-level radioactive waste and spent nuclear fuel. As directed by the U.S. Congress through the Nuclear Waste Policy Act, as amended, Yucca Mountain is the only candidate site currently being characterized as a potential geologic repository for high-level radioactive waste and spent nuclear fuel. DOE has prepared a separate EIS, "Draft Environmental Impact Statement for a Geologic Repository for the Disposal of Spent Nuclear Fuel and High Level Radioactive Waste at Yucca Mountain, Nye County, Nevada" (DOE/EIS-0250D, July 1999), which analyzes the environmental impacts from construction, operation and monitoring, related transportation, and eventual closure of a potential geological repository. Spent nuclear fuel would be stored above ground in an interim storage facility at Hanford until the availability of a geologic repository.

626-6: Comment noted.

Commentor No. 626: Fred Miller (Cont'd)

Response to Commentor No. 626

626-7: Decommissioning FFTF, including associated costs and cleanup, is not within the scope of the NI PEIS. Before decommission activities were undertaken, DOE would prepare the appropriate environmental reviews to address the associated environmental impacts. Cost assessments would also be prepared.

DOE remains committed to cleaning up the Hanford Site independent of ultimate decision on FFTF. The amounts of wastes associated with decommissioning FFTF would be small. The schedule for cleaning up these other wastes would not be affected if FFTF were restarted.

Deactivation of FFTF is not part of implementing Alternative 1, restart FFTF. Deactivation of FFTF is part of implementing Alternatives 2, 3, 4, and 5 and including the cost of FFTF deactivation in the implementation costs for these alternatives is appropriate. The Cost Report was structured to identify the implementation costs of the various alternatives so the Secretary of Energy would have this information along with other data for consideration.

626-8: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Commentor No. 626: Fred Miller (Cont'd)

Response to Commentor No. 626

626-9: DOE has analyzed each environmental resource area in a consistent manner across all the alternatives to allow for a fair comparison among the various alternatives. DOE made every effort to obtain, analyze, and disclose all required information to make a decision on expanding nuclear infrastructure.

Section 2.7.3 of Volume 1 discusses the relative mission effectiveness of Alternatives 1, 2, 3, and 4 in achieving the goals of the three missions evaluated in this NI PEIS (i.e., medical and industrial isotope production, plutonium-238 production for space missions, and nuclear energy research and development for civilian applications). However, mission effectiveness is only one factor in DOE's decision. Other factors include environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives. All of the alternatives will be considered prior to issuance of the Record of Decision.

Ms. Colette Brown
DOE Office of Space & Defense Power Systems, NE-50
19901 Germantown Road
Germantown, MD 20874-1290

Subject: Draft Programmatic Environmental Impact Statement for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the United States, including the Role of the Fast Flux Test Facility, DOE/EIS-0310D, dated July 2000

Dear Ms. Brown:

DOE is to be commended for recognizing its responsibility to the people of the United States for an adequate supply of medical and industrial radioisotopes and for its comprehensive look at the various alternatives for meeting that responsibility.

We believe Alternative 1, Restart of FFTF, is the best and only assured alternative in meeting this responsibility.

We are disturbed by the apparent weight given to vocal groups here in the Northwest who use only rhetoric rather than scientific logic in their arguments. We find little value in exaggerated comments given only to confuse and frighten those unfamiliar with nuclear technologies. We would hope that DOE would sort through such rhetoric, do the right thing in meeting its responsibility and not just listen to who makes the most noise.

I spent my career in the nuclear industry with a number of those years coordinating safety research to show that a fast reactor like FFTF could be operated without undue risk. It was my personal goal to be part of a national initiative that would ensure that this country had an adequate energy supply through the breeder program without the disturbing reliance we see today upon foreign oil and the environmental impacts of fossil fuel power plants. We've seen that initiative wane away through the lack of forthright government leadership, coupled with an uninformed and confused public.

Let us not lose this opportunity to take the right initiative for an assured supply of medical, industrial and space power radioisotopes through full FFTF utilization.

Very truly yours,

James W. & LaVina Hagan
2171 Crestview
Richland, WA 99352

Response to Commentor No. 627

627-1

627-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

627-2

627-2: It is DOE policy to encourage public input on matters of regional, national and international importance as part of its commitment to facilitate a public participation process that is open and unbiased. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

627-1

Commentor No. 629: Kathryn Roberg

Response to Commentor No. 629

Draft PEIS Comment Form

I attended the public hearing - Reckless - Aug 31 -
 AGAINST START-up of FFTF! I am highly dis-
 turbed about the "push" for restart FFTF -

629-1

629-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

My reasons:
 Lack of adequate verifiable cases of ACTUAL
 Cancer cures from use of radioisotope therapy. Does
 this warrant a restart of a Nuclear "hot" reactor!

629-2

629-2: DOE notes the commentor's views regarding the potential use of FFTF for enhancing DOE's existing nuclear facility infrastructure. In ongoing clinical testing, therapeutic radioisotopes have proven effective in treating cancers and other illnesses while minimizing adverse side effects, making their use an attractive alternative to traditional chemotherapy and radiation treatments.

Nasa has informed USDOE on May 22, 2000 that
 "Nasa headquarters no longer has identifiable planned
 requirement for Small Radioisotope Thermoelectric
 Generators (SRTG) power systems - How can a
 Nuclear Reactor have a justifiable start-up?"

629-3

629-3: The May 22, 2000, correspondence from NASA to DOE identifies that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Hanford has a horrendous clean up to do
 before anything else starts up! How can
 the DOE justify adding to the already
 over-flow stock pile of nuclear waste!

629-4

629-4: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

We are destroying this world! What a
 SINK

Subject: DRAFT Programmatic EIS Including the Role of the Fast Flux Test Facility

Dear Ms. Brown:

On behalf of the Council on Radionuclides and Radiopharmaceuticals (CORAR), we are pleased to provide our comments on the above subject. CORAR is a North American trade association composed of representatives from the major manufacturers and distributors of radiopharmaceuticals, radioactive sources, and research radionuclides used in all 50 States of the United States for therapeutic and diagnostic applications, and for environmental, industrial and biomedical research and quality control.

CORAR appreciates the substantial work that the DOE has put into developing this notice. The EIS covers the many issues concerned with the operation of the FFTF. However, one key component, that is not part of the EIS, is the fiscal viability of the FFTF after the FFTF has been restarted. It is stated in a number of places in the EIS that one mission of the FFTF is to produce radionuclides for commercial and research use. At the same time in the EIS, justification for the FFTF to produce these radionuclides is based on a 1997 Frost & Sullivan market study entitled "FFTF Medical Isotopes - Market Study (2001-2020)". Based on current commercial and research usage of radionuclides, the assumptions and market projections presented in this market study were extremely optimistic and are no longer valid. Consequently, any business plan that includes revenue to the FFTF from the sale of commercial and research radionuclides based on the very optimistic assumptions and projections of the 1997 Frost and Sullivan market study will not be achievable.

CORAR strongly recommends that the DOE obtain an updated market research study prior to developing any FFTF business plan that intends to include any revenues to the FFTF from the sale of commercial and research radionuclides.

Respectfully yours,

Roy W. Brown
 Chairman, CORAR

630-1

Response to Commentor No. 630

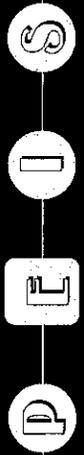

- 630-1:** DOE notes the commentor's concerns. DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

7/12/00

**Commentor No. 634: Jerome Delvin,
Washington State Representative**

**FAST FLUX FACILITY ENVIRONMENTAL IMPACT STATEMENT HEARINGS
AUGUST 31, 2000
BEST WESTERN TOWER INN
RICHLAND, WASHINGTON**

COMMENTS BY: REPRESENTATIVE JEROME DELVIN

- I strongly urge the Department of Energy (DOE) to adopt alternative 1 of the Draft Programmatic Environmental Impact Statement (EIS) which would reactivate the Fast Flux Test Facility (FFTF) and use it to produce medical and industrial isotopes, support space fuel needs and assist with nuclear research.
- The draft EIS prepared by DOE has identified a clear need for additional reactor capacity, capacity that can be readily provided by the FFTF. Use of the FFTF will create the greatest and most efficient use of current resources for our national research and medical isotope needs. The present cost of building a comparable facility would exceed \$2.5 billion. We are currently expending between \$35 - 40 million annually to maintain the FFTF facility. Taxpayers would be best served by putting this facility to work for both the federal government and for the economy of Central Washington.
- With the need for medical isotopes projected to increase dramatically America finds itself increasingly dependent on overseas facilities to meet its needs. Radioactive isotopes are frequently used to treat cancer and it is important that we develop a domestic facility for the production of these isotopes. Identified uses of the FFTF noted on the EIS would produce 1,000 high paying jobs and would likely translate into many more jobs providing a healthy boost to the local economy.
- In recent comments to the Spokane Chamber of Commerce executives of Hollister-Stier Laboratories, the area's chief biotech lab, noted that the Inland Northwest has the ingredients to spawn a world-class biotechnology industry. The Tri-City's convenient location to Puget Sound biotech companies, University of Washington research facilities, and the growing biotech presence of Spokane will allow isotope production here to spur a technology park environment that can spur further industrial development and help close economic development gaps between Eastern Washington and the Puget Sound region.

634-1

634-2

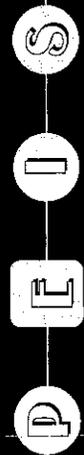

Response to Commentor No. 634

- 634-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.
- 634-2: It is possible that restarting FFTF for the stated missions could result in an influx of new business. The socioeconomic impacts of each alternative were evaluated in the PEIS. DOE acknowledges that some secondary impact is reasonably foreseeable, but the nature and extent of such economic growth is speculative at this time.

Commentor No. 635: Denelle Friar

Commentor No. 636: Marjorie Worthington

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

Thank you for providing one more opportunity for citizen input in this process. Having attended DOE budget hearings over a period of several years, having sent letter after letter to the office of the DOE, with no apparent response to any of the concerns raised, I find myself shocked and saddened at finding that nothing has changed the DOE's agenda, to restart the FFTF reactor.

636-1

*Reasons given for the \$6 million cost per year of maintaining the FFTF on standby have varied, but whatever the reasons cited (and I have strong objections to the validity of any one of them), the effect has been to PRE-EMPT concerted efforts to CLEAN UP TOXIC WASTE THAT IS LEAKING INTO GROUNDWATER THAT DRAINS INTO THE COLUMBIA RIVER. Why is the Tri-Party Agreement being ignored? Why are the citizens of this area - those most affected by the mess of toxic waste not being listened to? Why should a government agency, with no direct constituency to answer to, continue to assert jurisdiction that denies the right of citizens in this area to live in a safe environment? None of the projects proposed by DOE, however couched in lofty terms purporting to be in the public interest is worth honoring the rule we learned in kindergarten: **There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:** *Own up your own mess!**

636-3

7/12/00

Response to Commentor No. 636

- 636-1:** The purpose of this NI PEIS is to evaluate the environmental impacts of reasonable alternatives to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238 for NASA space missions, and nuclear research and development. As evaluated under Alternative 1 in this NI PEIS, FFTF would be restarted to accomplish these nondefense-related missions. Other unrelated nuclear energy and defense-related considerations are beyond the scope of this NI PEIS. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.
- 636-2:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected. DOE is fully committed to honoring this agreement.
- 636-3:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. A Tri Party Agreement change was made to place the milestones for FFTF's permanent deactivation in abeyance until the DOE reaches a decision on whether the facility will be used to meet mission needs. Prior Public meetings were held on this formal milestone change.

The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE).

**past experience makes a question this area*
How could the public hearing format and materials be improved? _____

Was the public hearing helpful to you? *Yes, it clarified my own long-held convictions! As I listened to the public comments (as well as those of elected officials) it became very clear to me that proponents of FFE are not even in one way or another connected with - or buying into the arguments of the "military and industrial complex" against which Dwight Eisenhower warned.*

Please continue on the other side if you run out of space. Please return your completed evaluation form to the registration desk or mail or fax to the address below.

636-1

THANK YOU - YOUR FEEDBACK IS IMPORTANT TO US

Public comment on Nuclear Infrastructure Draft Programmatic
Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

*If seems to me this
business is potentially very
hazardous and should therefore
be abandoned.*

R.J.

Name Richard Johnson

Address 91731 Smith Lake Rd

City, state Warrenton Or Zip 97146

Response to Commentor No. 639

639-1

639-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

639-2

639-2: The environmental impacts associated with restart of the FFTF during normal operations and from postulated accidents are presented in Section 4.3 of the NI PEIS. The impacts to humans and also to the biosphere (air, water, and land) are shown to be small. No fatalities among workers or in the general public would be expected over the full 35-year operational period.

**Public comment on Nuclear Infrastructure Draft Programmatic
Environmental Impact Statement (NI PEIS)**

I am opposed to restart of the Fast Flux Test Facility reactor because:

*I am opposed to the basic "missions" of the
D.O.E. - I don't want to support production
of rocket fuel, medical isotopes or more
research! The D.O.E. hasn't even finished
cleaning up their mess at Hanford and they
want to upstart a portion of it? Cleaning
up Hanford should be your #1
mission!! Thank-you.*

Address Henry Mansfield
1904 SE Pine St.
City, state Portland, OR Zip 97214

Response to Commentor No. 640

- 640-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 640-2:** DOE notes the commentor's views. However, it should be noted that the production of rocket fuel is not in the scope of the NI PEIS. The production of plutonium-238 for use as a fuel in radioisotope power systems that provide on-board electrical service for NASA spacecraft used for deep space exploration is one of the needs addressed in the Final NI PEIS.
- 640-3:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
- The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Commentor No. 641: Michael H. Harburg

874/1298

Dear Ms. Brown, Aug 30, 2000
I oppose the restart of the Fast Flux
Test Facility Reactor.

This Nuclear Weapons program has
not hurt a single enemy (thank goodness)
but has caused cancer & disease in
1,000s of Americans! I have a friend who
die of M.S because she grew up near
Hartford! Stop the Reactor please
Sincerely, *[Signature]*

641-1

641-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

641-2

641-2: As described in Section 1.2 of Volume 1, the nuclear infrastructure missions are unrelated to the national defense. Neither nuclear weapons nor components for nuclear weapons would be produced under the nuclear infrastructure alternatives (Section 2.5 of Volume 1). Sections 4.3 through 4.6 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of a range of reasonable alternatives, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with each of these alternatives would be small.

641-1

Commentor No. 642: John E. Madsen (Cont'd)

Response to Commentor No. 642

which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

645-1

645-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

645-2

645-2: DOE notes the commentor's opposition to nuclear weapons and the use of nuclear energy. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. The DOE missions to be addressed in this PEIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development, can currently only be met using nuclear reactor or accelerator technologies. None of the DOE missions stated in the NI PEIS are defense- or weapons-related.

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

The leaking, highly-toxic waste spreading from Hanford Nuclear Reservation into our lives is unacceptable, as is the failure to clean ^{waste} up. Adding yet more waste from restarting the FFTE cannot be justified.

Name Duncan Baruch
Address 4502 SW Pasadena St
City, state Portland, OR Zip 97219

Response to Commentor No. 646

- 646-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
 - 646-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.
 - 646-3: As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous wastes. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is small in comparison to wastes generated by other Hanford activities. It is DOE's policy that all wastes be managed (i.e., treated, stored and disposal) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.
- The NI PEIS addressed the environmental impacts due to the treatment storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

*The Hanford groundwater is already
thoroughly contaminated with radioisotopes
& other toxins, endangering the Columbia River
& all its downstream users. Restarting FFTF
will only add to that contamination & risk.*

Name Wm E Morton FID
Address 755 SW 84 Ave
City, state Portland, OR Zip 97225

648-1

648-2

Response to Commentor No. 648

648-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

648-2: DOE notes the commentor's concern regarding the existing cleanup mission at Hanford and the risk of contamination to the Columbia River. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

No food or water restrictions are currently in place outside the Hanford Reservation as a result of Hanford activities.

Commentor No. 649: Monica Maynard

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

(1) I believe the money should be spent on cleaning up Hanford.
(2) The reactor is not needed, as there are alternatives for medical isotope generation

Name DAVID BERGER
Address 9275 SW 8th Drive
City, state Portland, OR Zip 97219

Response to Commentor No. 652

652-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

652-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. The stated missions delineated in the NI PEIS would not have an impact on Hanford cleanup activities.

The U.S. Congress funds Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM). Congress also funds FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N 3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

652-3: See response to 652-1. Although a few radioisotopes can be produced by separating them from existing stockpiles of transuranic materials or other long-lived radioisotopes, the two primary means for producing radioisotopes are through the use of nuclear reactors or particle accelerators. DOE has evaluated as alternatives in the NI PEIS the use of a new research reactor or a new accelerator for medical isotopes production.

City, state St Helens OR Zip 97051

653-1

653-2

Response to Commentor No. 653

- 653-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 653-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

It is DOE's policy that all wastes be managed (i.e., treated, stored, and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders. No food or water restrictions are currently in place outside the Hanford Reservation as a result of Hanford activities.

Commentor No. 991: Marc Garland

My name is Marc Garland and I live in Washington, DC.

I've recently been doing research in reactor production of medical isotopes at the University of Maryland, particularly studying the production capabilities of the High Flux Isotope Reactor at Oak Ridge and the Fast Flux Test Facility at Hanford. My analysis of the capabilities of these reactors leads to the conclusion that both should be important components of the Department of Energy's isotope production strategy. Other reactor alternatives being considered by DOE are not truly alternatives at all; they are inferior options.

There are several reasons why FFTF and HFIR provide superior capabilities relative to conventional water-cooled nuclear reactors. The primary advantage these reactors possess is their neutron flux. As seen in this graph of neutron energy versus neutron flux, the FFTF and HFIR flux spectra have significant epithermal, fast, and high energy components. This is not the case for conventional thermal reactors which have essentially zero flux in these regions. This is significant because many medically important isotopes have large production cross sections in the epithermal region. For these isotopes it should be noted that FFTF's flux can be tailored to match the absorption resonances of the target isotopes in the epithermal region to dramatically increase production. Further, the fast and high energy neutrons allow the production of certain isotopes via reactions that can not occur in conventional water-cooled reactors. For example, Cu-67 can be produced with a very high specific activity by taking advantage of energetic neutrons. Cu-67 is typically produced by the absorption of a neutron by Cu-66. However, that reaction produces ~~if~~ Cu-67 that is contaminated by many other isotopes of copper which results in a low specific activity since Cu-67 can't be chemically separated from its other isotopes. In FFTF and HFIR, a Zn-67 target can absorb a neutron and eject a proton to become Cu-67 which can then be chemically separated from the zinc target to produce a very high specific activity product. As seen in this graph of reaction probabilities, the neutron-proton reaction requires an energetic neutron and essentially does not occur at all in conventional water-cooled reactors. Another advantage related to flux is the overall substantial flux level. Both reactors have much higher total fluxes than conventional water-cooled reactors which provides the ability to produce high specific activity isotopes in neutron capture reactions.

A second advantage, at least as far as FFTF is concerned, is the available target volume. FFTF's substantial volume enables the production of substantial quantities of medical isotopes; a capability that will not otherwise be available to meet future projected demand for medical isotopes.

A third advantage has to do with the fact that these reactors exist. It is much easier to assess the production capabilities and associated costs of a reactor with an operating and production history than for a reactor that has only been scratched out on the back of a napkin. The cost of construction of a new, unique reactor such as a 50 or 100 MW TRIGA reactor and estimates of its production capabilities and associated cost are very speculative. Relying on such an alternative (and again, such a reactor is not really an adequate alternative) introduces significant risk in cost, schedule, capabilities, and even the possibility that it would never be completed as has been the case with previously planned production facilities.

I would also like to address the interpretations of the report issued by the Nuclear Energy Research Advisory Committee on isotope production. Some critics have said that the report concludes that FFTF is not needed for isotope production. That is false. The report only addresses production of research isotopes, concluding that FFTF is not needed for that purpose, but should be considered for the production of clinical quantities of isotopes. Without trying to cast aspersions on the authors of that report since I have a tremendous amount of respect for them, I believe that report was flawed in several respects. One respect arises from the fact that none of the people on the subcommittee have a background in reactor production of isotopes. The negative consequences of that were dramatically illustrated by the report's completely incorrect analysis of production of I-131. It concluded that production of I-131 by fissioning U-235 (as is done at the Maple reactors in Canada) results in a higher specific activity than production by neutron absorption by Te-130. My calculations show that Te-130 absorption produces a much higher specific activity than can be achieved through fission production and Nordion's product literature confirms that. I also disagree with the reports conclusion that FFTF is not a viable source of research isotopes. As I have said previously, there are certain isotopes that only FFTF and HFIR could produce. Further, the business model presented by the director of the Pacific Northwest National Laboratory to NERAC last summer

Response to Commentor No. 991

991-1: DOE considered a wide range of reactor alternatives for the NI PEIS, which are presented in Chapter 2 of Volume 1. Section 2.5 presents those reactor alternatives that are analyzed in the PEIS, while Section 2.6 presents those considered and dismissed. All reactor alternatives considered in the document were carefully developed, fully analyzed, and are considered true alternatives. These alternatives are not considered inferior when compared to one another or to other non-reactor alternatives.

991-2: DOE recognizes the high energy neutron flux spectrum of the FFTF and HFIR reactors as compared to the neutron flux energy spectrum of other nuclear reactor designs and the desirability of this higher energy flux in producing certain radioisotopes. In addition, DOE is aware of the available irradiation volumes for each alternative analyzed in the EIS. The high energy accelerator alternative could also theoretically provide a high energy neutron flux for radioisotope production but the current design and size of the accelerator evaluated in the NI PEIS does not support this. The operational status of FFTF and HFIR, along with their relatively higher energy flux spectrum and large irradiation volumes, will be considered in the DOE decision making process.

991-3: DOE notes the commentor's opposition to Alternative 4, Construct New Research Reactor. A separate Cost Report was prepared to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. DOE believes cost uncertainties are addressed sufficiently in this report to support the decision-making process.

991-4: DOE notes the commentor's views. The Nuclear Energy Research Advisory Committee (NERAC) was established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. The members of the NERAC Subcommittee for Isotope Research & Production Planning were selected based upon their expertise and experience in the production, processing, distribution, and application of stable and radioactive isotopes in the biological and physical sciences, and in medicine. The members included basic and clinical scientists, administrators, and users of isotopes from academia, industry, and the federal government, with several possessing a background in reactor production of isotopes.

Commentor No. 991: Marc Garland (Cont'd)

provided for the supply of isotopes to researchers at low cost. There is no evidence that the subcommittee's report considered that business model; indeed, there is no evidence that the subcommittee performed any analysis of costs of the alternatives.

In conclusion, the Department of Energy must take advantage of FFTF and HFIR to be able to supply researchers with the broad range of isotopes that will be required to develop the most effective therapeutic radiopharmaceuticals and to provide the capacity to offer those treatments to the entire patient population following FDA approval. The volume of FFTF is required for those purposes and the availability of HFIR to produce research quantities of short-lived isotopes during FFTF routine shutdowns is necessary to assure uninterrupted supplies for researchers.

Thank you for the opportunity to provide input for this important decision.

991-4
(Cont'd)

991-5

Response to Commentor No. 991

The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities. As stated in the Final Report, the Subcommittee had reviewed the FFTF business plan and intended to submit their observations and suggestions in a separate document. The discussion of Iodine-131 production referred to by the commentor is not presented in the Final Report.

991-5: DOE notes the commentor's support for Alternative 1, Restart FFTF, with the use of HFIR to supplement FFTF during routine shutdown.

Commentor No. 992: Ernest S. Chaput Economic Development Partnership

Fred E. Humes
Director

**Statement for the Record
DRAFT Programmatic Environmental Impact Statement
Expanded Civilian Nuclear Energy Research and Development
September 6, 2000**

My name is Ernest S. Chaput and I represent the Economic Development Partnership of Aiken and Edgefield counties, South Carolina. We appreciate the opportunity to provide comments on this significant strategic document that will govern the future course of important Department of Energy (DOE) nuclear infrastructure programs.

For the past three years the Partnership has aggressively pursued the promise of current research in new nuclear medicine procedures. We have been equally concerned about the disruptions and missed opportunities caused by a medical isotope supply situation characterized as inadequate, unreliable and too costly. Our involvement first began by proposing that a private-sector isotope production capability be established as part of DOE's earlier proposed Accelerator Production of Tritium facility. DOE did not select the APT concept as the nation's next tritium source; however we have continued to monitor the status of nuclear medicine research, promote the promise of new nuclear medicine procedures and support the need for new isotope production capability.

An accurate and reliable forecast of market demand for individual isotopes is essential to assessing the adequacy of current and proposed medical isotope production capabilities. We recently contracted with a nationally renowned firm with specific expertise in the pharmaceutical industry to conduct a medical isotope market forecast for the period 2007/2008. The demand forecast assessment is currently in progress, and we will use its results, together with other data, to determine the extent that new isotope production capacity might be commercially feasible.

Our independent evaluations to date and assessments of other available data are consistent with, and further documents, the widely held beliefs that new nuclear medicine procedures:

- offer the potential for diagnostic and treatment procedures where none exist today .
- and
- increase treatment efficacy, reduce undesirable side effects, reduce costs, and increase patient quality of life.

Unfortunately, in many instances, this promise is being thwarted because (1) the right isotope needed for medical efficacy is not available, or (2) if the right isotope is available its supply is sufficiently unreliable or too expensive to discourage a 7 to 10 year commitment to conduct research and clinical trials. We have identified instances of new

Response to Commentor No. 992

Commentor No. 992: Ernest S. Chaput (Cont'd)
Economic Development Partnership

radiopharmaceuticals being abandoned in the latter stages of clinical trials because cost-effective isotopes are not available to support a clinical market. These are not new findings - similar statements have been made by many individuals in the profession and by respected peer review groups.

Therefore, I come today to provide comment and suggestions on those portions of the subject Draft Programmatic Impact Statement (DPFIS) that will affect the supply of medical isotopes for both research and clinical uses. In summary, our comments are four-fold:

- There are additional needs for both reactor-produced and accelerator-produced isotopes. In all instances, reliability of supply must be increased and less costly production cycles must be established. || 992-1
- DOE has the opportunity to utilize many existing DOE and other facilities to optimally allocate its limited budgetary resources in support of its total nuclear infrastructure mission, including isotope production, production of Plutonium 238 for space missions and nuclear energy R&D for civilian applications. The Fast Flux Test Facility (FFTF) should not be restarted because it: (1) is not part of a cost-effective program strategy. (2) can only support a portion of the mission need and (3) its budget requirements will adversely impact all other parts of DOE's nuclear energy mission, including production of medical isotopes. || 992-2
- DOE should take advantage of the activities and facilities associated with the proposed Advanced Accelerator Applications program by designing and integrating their state-of-the-art capabilities into the medical isotope production and other nuclear energy programs. || 992-4
- The Draft PEIS document contains several significant inaccuracies and structural deficiencies that must be corrected prior to issuance of the Final PEIS. Analysis and conclusions contained therein must be examined and modified accordingly. || 992-5

Specific comments, conclusions and recommendations follow.

Production of Medical Isotopes

To date we have identified 60 nuclear medicine procedures active in FDA clinical trials using nineteen different isotopes. Two-thirds of the proposed procedures are therapeutic and one-third are diagnostic. This data supports the general belief that future growth in nuclear medicine will be in therapeutic applications, resulting in the need for a somewhat different suite of isotopes which are available in large quantities. Some of the proposed procedures (especially diagnostic procedures) use isotopes that are readily available and generally affordable, such as Mo-99/Tc-99, F-18 and I-131. However, many procedures, most notably therapeutic, use isotopes that are not currently available in large quantities || 992-1

Response to Commentor No. 992

- 992-1: DOE notes the commentor's views. For the purposes of analyses in the NI PEIS, a representative set of isotopes was selected on the basis of the recommendations of the Expert Panel, medical market forecasts, reviews of medical literature, and more than 100 types of ongoing clinical trials that use radioisotopes for the treatment of cancer and other diseases. These isotopes are listed in Table 1-1, along with a brief description of their medical and/or industrial applications. Unlike Table C-1, which lists representative isotopes that could be produced at FFTF, the isotopes listed in Table 1-1 include both reactor- and accelerator- produced isotopes. Isotopes in Table C-1 were used to evaluate the health impacts that would result from implementation of the alternatives described in Section 2.5 of Volume 1. The absence of any specific isotope from the Table 1-1 should not be interpreted to mean that it would not be considered for production under the proposed action. Rather, these isotopes are a representative sample of possible isotopes which could be produced, and DOE expects that the actual isotopes and specific amounts produced as a result of the proposed action would vary from year to year in response to the focus of clinical research and the specific market needs occurring at that time.
- 992-2: DOE has set forth a number of alternatives, including the use of existing DOE facilities, in the NI PEIS that evaluate the use of a wide range of DOE and private (CLWR) facilities in order to accomplish its stated mission requirements. The relative costs of these alternatives were considered in a separate Cost Report.
- 992-3: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 992-4: As discussed in Section 2.8 of Volume 1, DOE plans to work over the next two years to establish a conceptual design for an Advanced Accelerator Applications facility.
- 992-5: This NI PEIS has been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR 1500 through 1508 and 10 CFR 1021, respectively). DOE has made every effort to obtain and evaluate all of the information it needs to make a decision on expanding civilian nuclear energy research and development and isotope production missions in the United States.

Commentor No. 992: Ernest S. Chaput (Cont'd) Economic Development Partnership

and usually have high cost. Lack of availability and high cost is impacting progress in pre-clinical trial research and formal clinical trial programs. In some instances, availability and cost issues have resulted in abandonment of development efforts, with additional efforts likely to be abandoned in the future.

In addition to procedures in clinical trial, researchers have identified many other isotopes as necessary to their pre-clinical trial discovery and basic development efforts. Based upon literature reviews and personal contacts, we estimate that approximately twenty additional isotopes are important for or actively used in pre-clinical trial activities.

When both clinical trial and pre-clinical trial activities are considered, our data indicates that substantial quantities at low cost are needed for about forty different isotopes. Some of the isotopes are available from commercial sources and some are being produced "in-house," but the majority will, at least initially, look to DOE as an isotope supplier. In general terms, one-third of the forty isotopes are uniquely produced in accelerators (to include cyclotrons), one-fourth are unique to reactors, twenty percent can be produced in both reactors and accelerators and about ten percent are recovered from fission products.

In this regard, your DPEIS is significantly deficient and misleading. Appendix C, page C-3 includes Table C-1 Representative Candidate Medical Isotopes. Table C-1 is described as "medical isotopes that are evaluated in this programmatic environmental impact statement," and "representative considering current and future . . . demand . . ." DOE's Nuclear Energy Research Advisory Committee (NURAC), Subcommittee for Isotope Research and Production Planning (April, 2000) and the DOE funded Expert Panel: Forecast Future Demand for Medical Isotopes (September, 1998) have identified a total of 26 medical isotopes as being important for the development, testing and production of new nuclear medicine procedures. (The NURAC Subcommittee has endorsed the recommendations of the Expert Panel report). This is an important baseline because both of these reviews included personages with world renown reputations in nuclear medicine research and the commercial radiopharmaceutical industry. Therefore it is disappointing that DOE did not include almost one-half (12 of 26) of the specific isotopes identified by these recognized experts in Table C-1. Furthermore, it is especially troublesome that all of the missing isotopes are not suited for reactor-based production, but rather require use of cyclotrons, accelerators or separation from existing stocks of fission products or fissile materials. We believe that these omissions result in a significant distortion in the demand for medical isotopes and calls into question the credibility of the entire body of medical isotope-related analysis in this DPEIS. Table C-1 and related analysis must be revised to include the isotopes recommended by DOE's own expert advisors as well as other isotopes that are being actively used in medical research, including clinical trials.

The final PEIS should also be restructured to include a new and separate alternative to construct and operate a small accelerator to meet only medical isotope and nuclear energy R&D needs, excluding the Plutonium 238 mission. The DPEIS currently includes only one alternative for new accelerators, totaling \$1.1 Billion for construction of the irradiation source. In this alternative, accelerator size and cost are dictated solely by

992-1
(Cont'd)

992-6

Response to Commentor No. 992

992-6: Section 2.5.4 of Volume 1 of the Draft NI PEIS discussed that the Record of Decision can select any alternative or combination of alternatives or elements of alternatives. The low-energy accelerator for the production of medical and industrial isotopes in combination with Alternative 2 for the production of plutonium-238 was used as an example in the discussion. It is not unrealistic to assume that the Record of Decision would consider the low-energy accelerator for the production of medical and industrial isotopes if the No Action Alternative with the procurement of Russian plutonium-238, or Alternative 5 in combination with the procurement of Russian plutonium-238 element from the No Action Alternative, or Alternative 2 was selected.

Some DOE facilities were considered and dismissed as reasonable alternatives because surplus capacity at these was not available on a continuous basis. For example medical isotopes will be produced at the Los Alamos Neutron Science Center Linear Accelerator Isotope Production Facility. The Isotope Production Facility will be run as a parasitic load when the accelerator is in operation for other missions. It would not be cost effective to run the accelerator for only the medical isotope mission. The Sandia Annular Core Research Reactor is operated on a campaign basis by the primary user of the facility. While there may be periods during the year when this reactor could be available for the production of isotopes, these periods are not available consistently throughout the year and therefore this reactor could not support the production of a constant and reliable supply of medical and industrial isotopes.

Commentor No. 992: Ernest S. Chaput (Cont'd)
Economic Development Partnership

production requirement for the Plutonium 238 mission. Data internal to the DPEIS states that an accelerator sized to meet only medical isotope needs will cost \$35 Million. DOE has several options for meeting the Pu 238 mission, but has only one option for providing additional accelerator-based isotope production – that being construction of a small new accelerator. It is unrealistic to expect that the currently identified option would be used for production of medical isotopes if Pu 238 production were to be met by a reactor or procurement option. The final PEIS should include a separate option for DOE to construct and operate a small accelerator for isotope production independent of programmatic decisions for production of Pu 238 for the space mission.

We further recommend that DOE fully fund its existing accelerator and reactor-based medical isotope production facilities. Existing accelerators should be provided additional operating funds so that they are available throughout the year. DOE should also either complete funding for the Sandia Annular Core Research Reactor (ACRR) privatization effort or reassume its operation as a DOE operated facility. These are all low-cost steps which can increase, in the short run, the availability of medical isotopes.

We also strongly recommend that DOE take advantage of the potential for production of medical isotopes in the new accelerator facilities proposed by Congress as part of the Advanced Accelerator Applications (AAA) program. The AAA concept offers the potential for cost-sharing a large capable accelerator complex which should result in the lowest cost and fastest means of achieving new medical isotope production capacity.

Optimally Allocate Available Resources

DOE is currently facing severe budget shortfalls and this situation will not improve in the near future. Therefore, it is important for DOE to allocate its nuclear energy R&D and isotope production funding in the most cost-effective manner. Allocating \$314 Million for the restart of the FFTF facility is not a cost-effective use of scarce DOE and taxpayer funds.

Analysis of the data included in the DPEIS indicates that DOE has many options for meeting the defined nuclear energy mission and that options are available for meeting all missions for considerable less than the \$385 Million associated with FFTF restart. For example, the following scenario will meet all missions, with total construction costs being less than \$100 Million and annual operating costs of less than \$50 Million.

- Use commercial light water reactors for production of Pu 238
- Construct a small accelerator to produce medical isotopes
- Fully fund and use available DOE and other reactors to produce medical isotopes (including ATR, HFIR, ACRR and non-DOE facilities such as MURR).
- Use the unique capabilities of ATR to conduct nuclear fuels and advanced reactor development activities

992-6
(Cont'd)

992-7

Response to Commentor No. 992

992-7: DOE notes the commentor's concern and his proposed preferred alternative consisting of elements from Alternative 2 (Use Only Existing Operational Facilities) and Alternative 3 (Construct New Accelerator(s)). As indicated in the NI PEIS, the Record of Decision can select implementation of elements from one or more alternative evaluated in the NI PEIS.

Commentor No. 992: Ernest S. Chaput (Cont'd) Economic Development Partnership

In addition to lowest cost, this scenario will result in less environmental impact than FFTF restart. Facilities and capabilities associated with the proposed Advanced Accelerator Applications program will serve to further enhance mission performance in a cost-effective manner.

Other factors that argue against the restart of FFTF include:

- Restart of FFTF, by itself, will not meet all DOE mission requirements. Specifically, FFTF cannot meet the increased need for medical isotopes unique to accelerator production.
- ATR is more suited to development and testing of thermal reactor fuel than FFTF
- The cost estimate for FFTF restart must be viewed with considerable skepticism. As compared to the cost estimates for other alternatives, there is essentially no project description or estimate detail and justification in the DPEIS. Is the estimate based on detailed design and has it been subjected to external independent review? We also note that modifications to nuclear facilities have demonstrated the highest potential for cost overruns and schedule slippage
- Restarting the FFTF reactor will present an unaffordable financial commitment to DOE's nuclear energy programs, resulting in further degradation and losses in the non-FFTF infrastructure – especially programs and facilities essential to the production and separation of medical isotopes

It is also noted that the April, 2000 NURAC Subcommittee report recommended that FFTF not be considered as a viable long-term source of research isotopes.

Integrate the Advanced Accelerator Applications Program into the Nuclear Energy Program

Integration of the facilities and capabilities associated with the proposed Advanced Accelerator Applications program into DOE's nuclear energy activities can significantly enhance mission performance in a cost-effective manner. In addition to legislative mandates for APT backup technology, transmutation of spent nuclear fuel and waste, material science and other advanced accelerator applications, AAA facilities can also support production of medical isotopes, many nuclear energy R&D requirements and, depending on accelerator size, production of Pu 238.

A major potential facility mission is its use as an irradiation source for the large-scale commercial production of medical isotopes, such as proposed for the APT project. Such a private-public partnership would further DOE's privatization objectives, minimize facility construction and operating costs and provide revenues back to DOE. By cost sharing with other internal DOE programs and with external public and private organizations, DOE has the unique opportunity to obtain and operate a multi-faceted and highly capable state-of-the-art research and production facility in the most cost-effective manner.

992-4

992-8

992-9

992-1

992-4

Response to Commentor No. 992

- 992-8:** The ability of each alternative to meet mission objectives is one of the factors that will be evaluated by DOE in its decision making process. Each radioisotope production technology, including FFTF and accelerators has unique advantages and disadvantages relative to their specific designs. The development and testing of thermal reactor fuel, which would be more suitable for the ATR, is only one factor in the assessment of each alternative.
- 992-9:** DOE notes the commentor's view. DOE has confidence in the FFTF restart cost estimate. Restart of FFTF will result in a significant increase in the domestic infrastructure available to support the production of medical isotopes.

Commentor No. 992: Ernest S. Chaput (Cont'd)
Economic Development Partnership

Correction of DPEIS Structural Deficiencies and Inaccuracies

This section summarizes the structural deficiencies and data inaccuracies included in the DPEIS that must be corrected before issuance of the final PEIS.

1. The programmatic justification for production of medical isotopes (Table C-1) must be corrected to include all isotopes (1) recommended by DOE's NURAC advisory committee and (2) those involved in active medical research, including clinical trials. If DOE chooses to not include these isotopes in the final PEIS, the rationale for that decision should be included therein.
2. A separate alternative be established for construction and operation of a small accelerator for production of medical isotopes. Absent a new alternative, cost and impacts of meeting individual missions are not easily ascertained and the management decision process is not consistent with DPEIS alternatives.
3. The cost of FFTF deactivation must be included in all programmatic alternatives considered in the final PEIS, or in no alternative. FFTF deactivation will occur at some point in time, whether the facility is restarted or not. To only include it in the non-FFTF restart alternatives is to provide an unwarranted and erroneous reduction in the total cost of the FFTF restart option.
4. The cost estimate for a large accelerator associated with production of Pu 238 should be reexamined in light of engineering development advances and design activities which have occurred since the referenced 1997 APT Conceptual Design Report. APT preliminary design is now over fifty percent complete. Project cost estimates have been examined by three Congressional review teams and DOE's Independent Cost Evaluation (ICE) team. The most recent review was completed this summer. All reviews support the project estimate and contingency allowance. Accordingly, inclusion of \$457 Million in excess contingency in the Alternative 3 cost estimate is not supported and should be removed from the cost estimate. Table S-4 in the "Cost Report for Alternatives" document should be revised accordingly. In a similar vein, we recommend that the estimating basis for FFTF restart be reexamined to assure that the proper level of contingency is included.
5. Programs and Facilities associated with the proposed Advanced Accelerator Applications program should be included in the final PEIS. This initiative has a significant potential for providing solutions to nuclear energy mission needs, and its inclusion will enhance the likelihood that the final PEIS will be consistent with DOE management options.

Thank you for the opportunity to provide comments on your Draft Programmatic Environmental Impact Statement.

Response to Commentor No. 992

992-1

992-6

992-10

992-11

992-4

992-10: The cost of deactivating FFTF is presented separately in the cost tables of the Cost Report and can be considered separately and subtracted from the combined estimated costs. Deactivation of existing facilities (FFTF, ATR, and HFIR) is not part of the proposed action addressed by the NI PEIS and was therefore not included in the Cost Report. As described in Section 2.5 of the NI PEIS, FFTF would be deactivated if other facilities were utilized for the production of isotopes. Deactivation of FFTF costs were therefore estimated for the Cost Report and included in the combined estimated costs of Alternatives 2, 3, 4, and 5. DOE has provided the summary of the Cost Report in Appendix P in the Final NI PEIS.

992-11: DOE acknowledges that development of the Accelerator Production of Tritium (APT) described in Conceptual Design Report LA-UR-97-1329 April 15, 1997), has progressed. However, with two exceptions, the estimated cost and contingency allowances assigned to system components of the APT were accepted for the high-energy accelerator system considered in Alternative 3 of the NI-PEIS Cost Report. The exceptions, as noted on page A-2 of the Cost Report, were the contingencies used for the target/blanket system and the accelerator system itself. The inclusion of additional contingency factors in the Cost Report reflects the difference between the two accelerator's spallation targets, uranium for the production of plutonium-238 (NI PEIS) and tungsten for the production of tritium (APT). In any event, the target blanket systems for these accelerators have not been tested under full scale production conditions. Although not identified in the Cost Report, the estimated FFTF restart costs (Alternative 1) from Hanford included contingency factors.

Re: Draft Programmatic Environmental Impact Statement for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions in the United States, Including the Role of the Fast Flux Test Facility

Dear Ms. Brown:

We appreciate the opportunity to comment on the subject document. As we have previously stated in writing, we fully support making the U.S. self-sufficient in supplying a critical element of the nation's deep-space program by establishing a domestic capability to produce Plutonium-238 (Pu-238). We also endorse planning for the increased demand for medical and industrial isotopes to support scientific research and activities associated with the development of nuclear power for civilian use.

In our review of the subject document, however, we feel that inadequate consideration has been given to the use of commercial light water reactors (CLWRs), possibly because of a lack of familiarity with their design and operation. This concern is particularly borne out in the discussion of Alternative 2 - Use Only Existing Operational Facilities. We cite page S-18 as an example.

"Modification of CLWRs to enable online insertion and retrieval of targets for the medical and industrial isotope production missions was evaluated and dismissed as a reasonable alternative. This decision was made because the required facility modifications would be significant and would include penetrations into the reactor vessel and, potentially, the containment vessel. Additional facility modifications would be required to enable loading of the targets into a shielded cask for transport to a processing facility. Performing these modifications would require a

Response to Commentor No. 993

- 993-1:** DOE notes the commentor's support for the nuclear infrastructure missions described in Section 1.2 of Volume 1.
- 993-2:** While the commentor is correct in stating that existing Westinghouse pressurized water reactors have a moveable incore flux mapping system that could be used to produce medical radioisotopes, other operational considerations would limit the usefulness of this method. During the fuel cycle, technical specifications require a minimum frequency for incore flux mapping to ensure that axial and radial power peaking factor limits are not exceeded. These periodic (i.e., usually on a monthly frequency) incore flux mapping operations would require that any medical isotope targets in the thimble tubes be removed and replaced by the flux detectors. For radioisotopes requiring a longer incore irradiation time, each removal and replacement process would require repetitive handling of radioisotopes with commensurate shielding and worker doses. In addition, the incore flux detector is a small cylinder that moves axially within the thimble tube. To produce the desired quantities of medical and industrial radioisotopes, much longer target rods would need to be inserted into the thimble tubes. The presence of these long neutron absorbing radioisotope producing targets in the fuel assembly center thimble tubes would affect the power and neutron flux distribution within reactor core fuel assemblies since a strong neutron absorber would be placed into a normally empty thimble tube. The utility would need to calculate revised peaking factors to demonstrate that technical specification peaking limits are not exceeded. Such peaking factors would be affected by the specific target material for radioisotope production, location in the core, and the time dependent production of radioisotopes with its commensurate change in neutron absorption during a core cycle. Short half-life radioisotopes require on site processing to separate the desired radioisotope from the target material and other radioisotopes that may have been produced during incore irradiation. Commercial light water reactors do not possess this separation capability. The handling of radioactive targets after removal from the bottom of the reactor vessel would involve a system that shields the targets, loads them into an appropriate shielded container and transports the container outside containment. This would require design modifications to the compartment below the reactor vessel and frequent access by utility staff to this relatively high radiation area during operation. The commentor is correct in identifying an error on EIS page B-14 regarding standard fuel cycle length. This error has been corrected in the final PEIS. A typical CLWR fuel cycle length of 18 months is correctly identified in PEIS Volume 1, Section 2.3.1.4.

Letter to Ms. Colette Brown
 September 5, 2000
 Page 2 of 2

extended refueling outage (with a resulting loss of power generation revenue to the CLWR owner) and could potentially extend subsequent maintenance or refueling outages to inspect, test and maintain the insertion and retrieval system, reactor vessel penetrations, and potential containment vessel penetrations. In the event that CLWRs are used for medical isotope production, the selection of isotopes to be produced would be limited to those with relatively long half-lives because there are no CLWR sites with facilities for processing irradiated targets."

Many of the existing pressurized water reactors in the United States include systems that could be used to support short-term irradiation of medical isotopes. Specifically, the moveable flux mapping system in Westinghouse units could deliver a medical-isotope target to the reactor core and retrieve the target after an appropriate length of irradiation. Penetrations into the reactor vessel and the fundamental system to perform these operations already exist at many nuclear reactors. Further, an extended refueling outage would not be required and the shipment of the irradiated targets from a commercial LWR would be no more of an issue than similar shipments from other facilities.

Another example of an incorrect statement can be found on page B-14 that states that "fuel assemblies . . . are rotated at about 180 day intervals . . ." Standard fuel cycles for most operating CLWRs extend from 18 to 24 months at which intervals fuel-shuffle patterns are executed. Such erroneous statements indicate a need for further study of the CLWR option.

Framatome has discussed the production of medical and industrial isotopes and Pu-238 with several utilities. Florida Power Corporation remains interested in the Pu-238 effort, while Entergy has expressed an interest in studying the production of medical and industrial isotopes. Using these existing facilities should be the least expensive means of producing these isotopes because the cost of operations of these units is currently absorbed through sales of electrical output. We strongly urge that DOE perform an appropriate cost-benefit analysis for using CLWRs, if not as the main source of isotope production, at least as a backup.

Very truly yours,

TA Coleman

993-3

993-4

this is stated correctly elsewhere in the report.

we have not completed our review of the Cost Report for Alternative 2 presented in the Draft PEIS (Just received several days ago)

Response to Commentor No. 993

993-3: DOE notes that there are nuclear power utilities that are interested in studying the production of medical and industrial isotopes and plutonium 238 in their operating reactors. Options 4, 5, and 6 of Alternative 2, Use Only Existing Operational Facilities, will be given equal consideration among the other alternatives and options during DOE's decision process. A summary of Mission effectiveness for Alternatives 1 through 4 is provided in Section 2.7.3 of Volume 1.

993-4: DOE notes the commentor's view on using CLWRs as an irradiation source for the production of medical and industrial isotopes and plutonium-238.

The CLWR is considered a reasonable alternative for the plutonium-238 production mission. As indicated in Volume 1, Section 2.6.1, CLWRs were considered and dismissed as a reasonable alternative for the production on medical isotopes. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Estimated costs for the range of reasonable alternatives evaluated in the NI PEIS are presented in the Cost Report, and are summarized in Volume 2, Appendix P, of the Final NI PEIS.

Commentor No. 994: Raphael S. Daniels

Draft PEIS Comment Form

I would like to see the question of longer term storage of Np-237 at SRS to address resource it requires several options.

994-1

Response to Commentor No. 994

994-1: The management of neptunium-237 at SRS (including stabilization and storage) was fully analyzed in the final environmental impact statement, "Interim Management of Nuclear Materials" (DOE/EIS-0220, October 20, 1995), and further discussed in subsequent Records of Decision, the last of which was published in the Federal Register of Friday, November 14, 1997 (page 61099). If DOE decides not to retain this neptunium-237 inventory for possible future plutonium-238 production, then the material management strategies discussed in these documents would be implemented.

Hi. I am calling in regards to Colette Brown's message and information given out to me onrequest. This is regarding the current issues of your nuclear waste carelessness. I would just liketo say that you shouldn't start that reactor until it's safe for operations. Thank you.

996-1

996-2

Response to Commentor No. 996

-
- 996-1:** DOE notes the commentor's concern regarding radioactive waste management. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.
- 996-2:** FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

998-1

998-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 999: Angel Kelly

NI PEIS Toll-Free Telephone

9/6/00

Angel Kelly
503_231_4114

I am calling because I am looking at the summary of the PEIS. It seems like there are so many unanswered questions, and in particular, with regard to accidents and cleanup and stuff. It just doesn't seem very clear to me. I am not in favor of this project moving forward. I believe I am in favor of Alternative 5.

999-1

999-2

I am not in favor of new development of nuclear research and nuclear energy in the northwest or any part of the country.

999-3

I think that DOE should prioritize cleanup and containment of leaking waste as their number one priority. I think they have an obligation to do that before they start anything else. Thank you.

999-4

Response to Commentor No. 999

- 999-1:** The commentor's concern about the clarity of the accident and waste cleanup presentations in the NI PEIS is noted. The impacts from postulated accidents in facilities associated with nuclear infrastructure operations are presented in Volume 1, Chapter 4, "Environmental Consequences." Detailed discussions and calculational methodologies are given in Volume 2, Appendix I, "Evaluation of Human Health Effects from Facility Accidents." The management of wastes generated as the result of nuclear infrastructure operations is also discussed in Chapter 4, along with potential impacts to the environment.
- 999-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF.
- 999-3:** DOE notes the commentor's views. Information on the need for nuclear energy research and development is provided in Section 1.2.3 of Volume 1.
- 999-4:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Commentor No. 1000: Anonymous

NI PEIS Toll_Free Telephone

9/6/00

This message is in care of Colette Brown. Just calling as a concerned citizen of the state of Washington. The nuclear reactor here should not be restarted for obvious reasons, such as public safety.

1000-1

There was plutonium released into the air after the recent fire. There has already been people downwind of Hanford getting cancer, and the Columbia River already has nuclear waste in it.

1000-2

We don't feel that it is a very good idea to restart this nuclear reactor. In fact, it is crazy because we know medical isotopes, that is what they are called, will not cure cancer. They may help cure cancer in some way, but Hanford is not a good place to make them. There are other capacities besides a nuclear facility that are safer to make it, which should be the first priority, and there is not as much of a need as NASA expressed in the letter openly stating they don't need isotopes as they did before. Please do not restart this.

1000-1

1000-3

There will be a lot of people calling as well. I wish you would take their concerns into consideration. Your job first is safety and second to make money. Actually it should be about 20th on your list, but I am sure that it what it is second.

1000-4

1000-5

Do not restart the FFTF nuclear reactor.

1000-1

Response to Commentor No. 1000

1000-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF. Included in the NI PEIS are the results of analyses that show that the risks associated with operating the FFTF are very small.

1000-2: With regard to the Hanford wildfire of 2000, the DOE Richland Operations Office, the State of Washington Department of Health, and U.S. Environmental Protection Agency performed environmental monitoring on and around the Site to assess potential radiological impacts. The wildfire did not cause a release of radioactive materials from any Hanford facilities but did result in resuspension of radioactive materials which were already in the environment. The very low levels of radioactive materials that were resuspended were slightly above natural background levels and required several days of analysis to quantify. Information on this event has been made available to the public and can be accessed at <http://www.Hanford.gov/envmon/indes.html>. This site also provides a link to information on the independent offsite air monitoring that was conducted by the U.S. Environmental Protection Agency.

As discussed in Section 3.4.9.3 of Volume 1, the question of whether residents in the Hanford area are subject to elevated cancer rates is unresolved. Existing studies and data suggest that cancer mortality rates in counties adjacent to the Hanford Site are not elevated. Prevailing winds at the Hanford Site blow toward Grant County, Washington from the south (14.2 percent of the time) and south-southwest (11.5 percent of the time) directions. Hence, Grant County would be expected to bear a major burden of wind borne contamination from the Hanford Site. However, if an excess cancer mortality risk is present in Grant County, it was too small to be identified at the county-level of resolution in the survey and available National Cancer Institute data discussed in Section 3.4.9.3. Epidemiological studies in Benton and Franklin counties provided no conclusive evidence of elevated congenital defects in the two counties.

As discussed in Section 4.3 of Volume 1, implementation of the alternatives described in Section 2.5 would not be expected to have a significant impact on the Columbia River. There are no radiological liquid effluent pathways to the Columbia River from FFTF.

1000-3: DOE notes the commentor's opposition to restarting FFTF for enhancing its existing nuclear facility infrastructure. In ongoing clinical testing,

Commentor No. 1000: Anonymous (Cont'd)

Response to Commentor No. 1000

therapeutic radioisotopes have proven effective in treating cancers and other illnesses while minimizing adverse side effects, making their use an attractive alternative to traditional chemotherapy and radiation treatments. Although a few radioisotopes can be produced by separating them from existing stockpiles of transuranic materials or other long-lived radioisotopes, the two primary means for producing radioisotopes is through the use of nuclear reactors or particle accelerators.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Although research to identify other potential fuel sources to support these space exploration missions has been conducted, no viable alternative to using plutonium-238 has been established. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Without an assured domestic supply of plutonium-238, DOE's ability to support future NASA space exploration missions may be lost.

A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000, letter to DOE that the plutonium-238 needed for large RTG may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and

Commentor No. 1000: Anonymous (Cont'd)

Response to Commentor No. 1000

need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

- 1000-4:** In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.
- 1000-5:** The health and safety of workers and the public is a priority of the nuclear infrastructure program, regardless of which approach is chosen. Operation of the facilities would comply with applicable Federal, State, and local laws and regulations governing radiological and hazardous chemical releases.

 Subject: Fast Flux Test Facility
 Auto forwarded by a Rule

Hello!

I just wanted to share my thoughts on the restart of FFTF. I FULLY support the restart of FFTF. As an employee of Hanford, I know the Hanford Project is currently in cleanup mode. I STRONGLY feel the Hanford area needs a mission once again. We NEED a mission here to keep our many talented people here, working to better our future. Hanford and the surrounding community has already lost many, many talented people since the mission of production days. In the not so distant past, Hanford and its workers have developed countless revolutionary products and ideas that have benefited the private sector as well as the Government. It would be a sin to abandon all that has been accomplished as a result of the Hanford Project.

I don't want to sound like I am praising nuclear weapons and such, but what I am commending is all the team work, projects, ideas, that were results of the Hanford Project. So much was accomplished by many very talented people that were united by the Hanford area. FFTF is "the mission" that will keep it all together. FFTF is very capable of doing almost any task that it will be assigned. It is the mission to keep the great people we have, working together, bettering our future for many years to come.

Thanks for allowing me to provide feedback on this very important issue.

Dear Secretary Richardson:

Over 1500 people die of cancer each day. The Fast Flux Test Facility is our nation's newest, most versatile reactor capable of producing large quantities of high quality medical isotopes for treating cancer, arthritis and other diseases.

We already face isotope shortages for research and treatment. Human clinical trials for breast cancer were cancelled due to a unavailability of Cu_67. Last year, the Seattle area faced shortages for the isotope "seed" treatment for prostate cancer.

The FFTF is desperately needed to produce isotopes for the treatment of bone pain associated with cancer. If you have ever witnessed a family member or a friend with terminal cancer with excruciating bone pain, you know what a God_send pain relief from medical isotopes are. This type of isotope cannot be produced in an accelerator__it must be produced in a reactor.

Restarting the FFTF will save lives and enable us to utilize cutting_edge technologies for the 21st century.

I implore you to make the right decision for the citizens of our nation. RESTART the FFTF!!! The life you save may be that of a family member, a friend, or your own.

Dear HQ DOE

My family and I strongly support Alternative #1, the restart of the FFTF for the production of medical and commercial isotopes, the production of Pu_238 and for nuclear research. I am a cancer patient survivor. If the option of medical isotopes had been available, I could have avoided some extremely painful radiation treatments. Moreover, in 1989 my wife died of large cell lymphoma and left me a widower with two children aged 2 and 5 (she was 36 when she died). The research and isotopes available today could have saved her life. Let's not let even more people die because some radical environmentalists prefer ideology over science. Restarting FFTF means saving lives. Let's get on with it!

Sincerely,

Dave Lemak, cancer survivor

Auto forwarded by a Rule

Dear Sir,

I am sending this message to register my position regarding restart of the Fast Flux Test Facility Reactor near Richland, Washington on the Hanford Reservation. I believe it should be restarted to provide medical isotopes badly needed for treatment of cancer victims. Perhaps, there are additional missions that the FFTF could be used for as well. For example, production of Uranium 238 for use by NASA.

Having reviewed other options for production of medical isotopes, the FFTF is clearly the best alternative for production of medical isotopes for the next few decades. Thus it should be restarted.

Steve Chastain

1007-1

Response to Commentor No. 1007

1007-1: DOE notes the commentor's support for Alternative 1, Restart FFTF. The commentor should note that plutonium-238, not uranium-238, fuels radioisotope power systems.

Nuclear Infrastructure Programmatic Environmental Impact
 Statement Draft PEIS Comment Sept 6, 2000

The Fast Flux Test Facility, FFTF is the most flexible option.
 It can meet all specified elements for isotope production, nuclear_
 based research and development program for the future.

- a. It can be a dependable source of research isotopes for medical and industrial uses.
- b. It can produce plutonium_238 for use in advanced radioisotope power systems for future NASA space exploration missions.
- c. It can provide the Nation's nuclear research and development needs for civilian application.

The FFTF is the perfect solution because it was designed specifically as a testing facility and is well suited as a training facility for workforces in the future.

Without the FFTF the US is dependent on others such as Russia and Germany to meet our planned research and testing programs. In case of hostilities, these sources may not be available. The US should not have to rely on others for these critical needs.

The budget for restart of the FFTF should be totally separate from and must not affect the ongoing Hanford cleanup program. The budget must also include funds for eventual shutdown and clean up of the FFTF.at the end of its useful life.

1008-1**1008-2****Response to Commentor No. 1008**

- 1008-1:** DOE notes the commentor's support for Alternative 1, Restart FFTF.
- 1008-2:** The U.S. Congress funds the Hanford cleanup through the Office of the Assistant Secretary for Environmental Management (EM), and the FFTF through the Office of Nuclear Energy, Science and Technology (NE). The nuclear infrastructure missions described in Section 1.2 of Volume 1 would also be funded by NE, which has no funding connection to Hanford cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

Commentor No. 1008: Frank Allen (Cont'd)

Anti_nuclear activists who want to dismantle the FFTF should realize that more nuclear research will allow design of safer and more efficient nuclear power. In the long run safe nuclear power will reduce use of fossil fuels which will in turn reduce greenhouse gases and save lives in the production of fossil fuels. Far more lives have been lost in coal production for power plants than lives lost supporting nuclear power.

Frank Allen, Chemical Engineer

 Subject: Support Restart of FFTF
 Auto forwarded by a Rule

Dear Secretary,

As a nuclear professional, I strongly support the restart of FFTF. FFTF can produce and supply a large quantity of isotopes for treatment of cancer, heart disease and arthritis. It also will serve our nation's need for Pu_238 for space batteries, for "hardening" computer chips, and research for new non_proliferative fuels and transmuting our nation's plutonium wastes.

1009-1

Unfortunately, the decision to restart FFTF is mired in politics, with irrational and misguided allegations from the anti_nuclear community. I urge you to make this important decision to restart FFTF.

1009-2**1009-1**

James Fu

Response to Commentor No. 1009

1009-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

1009-2: Selection of facilities and site locations for accomplishing expanded civilian nuclear energy research and development and isotope production missions is not a political decision. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.

Auto forwarded by a Rule

Please restart FFTF. This facility is a valuable asset to our nation and should be used to generate medical isotopes and batteries for space exploration. I have worked at a Government production reactor (N Reactor) and at the FFTF reactor and they are not in the same league. FFTF was built and maintained to modern ASME Section III, Division II standards which is very similar to the requirements that commercial nuclear facilities were fabricated and operated under. I am quite confident that FFTF could easily satisfy NRC requirements and scrutiny that commercial operating reactors are subjected to.

 Subject: In Favor for the Start Up of FFTF
 Auto forwarded by a Rule

Ms. Colette E. Brown, U.S. Department of Energy,

It is my opinion that FFTF is a safe, state of the art facility. It would be such a waste to shut down this reactor. This facility will help keep the United States the leader of medical isotope technology and at the fraction of the cost. This facility will also be producing electrical power as a byproduct, something that is growing short in the Northwest. With all the advances in technology today, no one can say what other discoveries and developments could be achieved through the use of this facility. But WE must have this facility available for all this to happen. It is a shame that so many people are uninformed, or just plain ignorant of the many uses a facility like this could provide to the United States to the World.

Thank You,

Scott B. Johnston

 Auto forwarded by a Rule

Secretary Bill Richardson/Ms. Colette E. Brown,

I am a concerned citizen of Eastern Washington State. I truly believe the Fast Flux Test Facility (FFTF) located out side of Richland, WA on the Hanford_site, should be restarted for production of medical isotopes. As you are aware it can uniquely provide a wide variety of high grade isotopes, some of which cannot currently be produced in the U.S. At a minimum many our fellow citizens are ill with cancer and doctors need the products to help in curing or developing a cure for them.

So, lets use this operational facility to help the citizens of our country and those of the world. Please do not throw it away as the U.S. DOE has done with so many others projects (i.e., the Supercollider) at the direction of our political establishment just for the sake of political capital or in some cases lack of interest.

By golly, it may even pay for itself ___ if money for the sale if isotopes were applied to FFTF operations, payroll, and maintenance and kept out of the general fund (the politicians hands) imagine a government project actually allowed to operate as a real business.

Regards,

John Fleming

Response to Commentor No. 1015

1015-1

1015-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

1015-2

1015-2: DOE notes the commentor's views regarding revenues from isotope production in FFTF. The estimated costs of the range of reasonable alternatives are presented in the Cost Report, summarized in Appendix P of the Final NI PEIS. However, the Cost Report is not a cost-benefit analysis. While it is reasonable to believe that the benefits of medical isotopes are substantial, the purpose of this NI PEIS is to describe the nuclear infrastructure missions (Section 1.2 of Volume 1), a range of reasonable alternatives for satisfying the mission requirements (Section 2.5 of Volume 1), and the environmental impacts that would result from implementation of the alternatives. According to 40 CFR Section 1502.23, if a cost-benefit analysis exists, it must be reported and summarized in the NI PEIS.

 Subject: Fast Flux Test Facility Restart Proposal
 Auto forwarded by a Rule

Dear Sir:

Please consider this communication as part of the public comment on the proposal to restart the FFTF.

I strongly oppose any attempt to restart the FFTF at Hanford.

1021-1

The contamination problems at the Hanford site are HUGE enough without creating further waste by operating the FFTF.

1021-2

I urge the DOE to direct the maximum effort to control the existing plutonium contamination at Hanford, rather than adding to the problem with further reactor operations.

1021-3

Sincerely

Keith Reher
 Sammamish, WA

Response to Commentor No. 1021

1021-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1021-2: FFTF restart would not impact the schedule or available funding for existing cleanup activities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram funds designated for Hanford cleanup, regardless of the alternative(s) selected. As identified in Section 4.3.1.1.13 of the NI PEIS, the restart of FFTF would generate about 63 cubic meters of additional radioactive waste (e.g., solid low-level radioactive waste) annually, in addition to nonhazardous waste. This would account for about 2,205 cubic meters of additional radioactive waste to be generated over the 35-year period of nuclear infrastructure operations and is very small compared to waste generated by other Hanford activities. It is DOE's policy that all waste be managed (i.e., treated, stored, and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision.

1021-3: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are a high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Commentor No. 1022: Regina Hagen

 To: INFRASTRUCTURE_PEIS, NUCLEAR
 Subject: Comment to Draft NI PEIS
 Auto forwarded by a Rule

Dear Mrs. Brown,

I want to limit my comment to the Draft Nuclear Infrastructure Programmatic Environmental Impact Statement (Draft PEIS) to the planned production of plutonium-238. The Draft PEIS states, that this isotope is required "for use in advanced radioisotope power systems for future NASA space exploration missions". The Draft PEIS lists three of these missions: Pluto-Kuiper Express (7.4 kg), Europa Orbiter (3 kg) and Solar Probe (3 kg). In addition, approx. 0.3 kg Pu-238 are said to be needed for each of the NASA Mars Surveyor missions in RHUs.

1. I know that DoE is not responsible for the planning of NASA but rather supplies the isotope material requested by NASA for their missions. When investigating into the above listed missions, I found that there is contradictory information on the need for isotope power sources for two of these missions. For Europa Orbiter as well as Solar Probe, NASA departments have stated that those missions could be done by using solar panels instead of plutonium generators. (Pluto-Kuiper Express, however, can only be done if RTG or the new ARPS generators are used.)

2. The German company ASE in Heilbronn developed LILT solar cells for Rosetta, ESA's mission to comet Wirtanen. Their development manager, Dr. Strobl, has repeatedly confirmed that they could improve those cells to be used up to the distance of Saturn (cold environment with little light). One NASA department reported that solar cells are available to deal with the particular environment close to the sun (lots of light and very hot). Therefore, for two of the missions, not radioisotope power sources are required.

1022-1

Response to Commentor No. 1022

1022-1: Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Potential health and safety impacts associated with future launches of spacecraft utilizing plutonium-238 are not within the scope of the NI PEIS analysis, but would be addressed in the specific NEPA documentation prepared by NASA in support of such missions.

Commentor No. 1022: Regina Hagen (Cont'd)

3. Missions that can not be done solar should be left to the next generations. The dangers attached to the production cycle and the launch are not acceptable. The Draft PEIS says, that RTGs and RHUs have been used for more than 30 years. "These radioisotope power systems have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions." You do not, however, mention, that out of 71 US and Russian space missions that used RTGs or nuclear reactors, 10 had serious or even fatal problems. If you need more details, see my report "Nuclear Power Space Missions _ Past and Future" which may be found at <http://www.space4peace.org>. The failure rate is 1:7 _ not exactly safe and reliable. The problem is not the safety and reliability of the RTGs (and RHUs), but the failure rate of space launches and missions in general.

4. The production of plutonium_238 will always include the risk of hazards. Not long ago, eight workers were exposed to above_limit radiation doses in the course of RHU production. Plutonium production means that the production cycle would be taken up again, up to the point where huge amounts of radioactive wastes must be dealt with. Currently, there does not exist a safe method to deal with any kind of nuclear waste. And contamination of workers and the environment can never be fully avoided in the production cycle. History showed that the dangers related with the process have always been underestimated and downplayed.

5. The Draft PEIS states, that considerably less plutonium_238 has been purchased from Russia than would have been possible according to the appropriate contract (9 kg out of a maximum of 40 kg). "Larger individual quantities have not been purchased by DOE due to budget constraints." This is ridiculous. Considering the costs to take up again plutonium_production plus all costs that will result from it (including waste management), it is ridiculous to say that existing plutonium_238 was not purchased "due to budget constraints".

**1022-1
(Cont'd)**

1022-2

1022-3

1022-2

1022-4

Response to Commentor No. 1022

- 1022-2:** Plutonium-238 processing facilities can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Sections 4.2-4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from plutonium-238 processing, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that the radiological and nonradiological risks associated with plutonium-238 processing would be small.
- 1022-3:** DOE would not conduct any reprocessing to produce weapon-grade plutonium under any of the alternatives considered under this PEIS. The alternatives do include processing of target materials used to produce isotopes for medical and industrial uses, plutonium-238 for space missions, and nuclear materials research and development. Sections 4.3.1.1.13; 4.3.2.1.13; 4.3.3.1.13; and 4.4.3.1.13 were revised to clarify the waste management approach for waste resulting from processing of target materials for plutonium-238 production.
- 1022-4:** DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

Commentor No. 1022: Regina Hagen (Cont'd)

The nuclear legacy we leave to the next generations, for many thousands of years, is huge already. It is fully irresponsible to add to this burden for the sake of research space missions to the very deep space. I fully support space exploration _ as long as it is done sustainably. Nuclear energy is dangerous and must therefore not be used for space missions. Not for research missions, not for commercial missions, and not for military ones.

Sincerely
Regina Hagen

Regina Hagen
Teichhausstrasse 46
64287 Darmstadt
Germany

1022-5

Response to Commentor No. 1022

1022-5: DOE notes the commentor's opposition to NASA's use of nuclear materials for space missions and concern over the use of nuclear power in military and research missions. The DOE missions to be addressed in this NI PEIS, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development, can currently only be met using nuclear reactor or accelerator technologies. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch. None of the DOE missions stated in the NI PEIS are defense- or weapons-related.

September 10, 2000

Dear Dr. Brown

I am writing in support of stopping the nuclearization and weaponization of space. It is imperative that the Department of Energy cease its development of Plutonium-238 for future space missions. Why can't NASA work towards the development of environmentally benign sources for space missions? The European Space Agency (ESA) has now created high-efficiency solar cells for deep space missions, which is immanently safer than using Plutonium-238.

I am concerned that the plutonium production/fabrication process for space nuclear power missions has recently led to several worker contamination accidents. An expansion of production will only worsen this problem. Furthermore, extending the number of launches of nuclear powered space devices from Cape Canaveral on rockets with 10% failure rates will only increase the possibility of a deadly mishap.

The massive cost of expanded production of plu-238 can not be justified at a time when the Department of Energy admits it needs over \$300 billion to clean-up existing problems at its facilities.

The military is promoting the use of nuclear power in space for space-based weapons technology. It is time to take stock of the graveness of this situation. **Using nuclear power for space war will have severe environmental implications for life on earth.** Please do what you can to change this calamitous course towards destruction.

Thank you

Sincerely,

 Carol Thayer Cox

- 1025-3:** DOE notes the commentor's opinion and concern about funding available for cleanup at DOE facilities.
- 1025-4:** DOE notes the commentor's concern for the use of nuclear power in space-based weapons. The scope of this Nuclear Infrastructure PEIS is limited to analysis of alternatives to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development. The three missions are civilian nuclear energy missions and are not defense-related.

Subject: Comments on FFTF

(I support the restart of FFTF to produce the essential medical isotopes for cancer treatment. As a Pediatric Oncologist, I.....)

feel that this modality shows great promise in targeting specific tumors and leukemias while minimizing background toxicities.

Historical concerns regarding risks from background radiation can now be ameliorated by the use of molecular biology technologies to more specifically target cancer cells.

Only through effective research of new modalities of treatment can we hope to succeed in the therapy of diseases that heretofore have been beyond our clinical reach.

DRAFT PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT
(NI PEIS 03410D)

September 8, 2000

Colette E. Brown,
U.S. Department of Energy, NE-50,
19901 Germantown Road,
Germantown, MD 20874-1290

Dear Ms. Brown,

Keep Yellowstone Nuclear Free, a Jackson, Wyoming-based 501c3, has several comments for the record regarding the Nuclear Infrastructure Draft PEIS (NI PEIS 03410D). It is obvious from this Programmatic Environmental Impact Statement that the Department of Energy (DOE) nuclear program is searching desperately for a post-cold war mission. The premises for programmatic expansion seem based on a single "expert" panel's recommendation and a stated lack of institutional ability (or interest) to use existing DOE facilities and programs, operating at only 50% capacity (S-4). No compelling rationale is put forth for support of this expansion, or for how this expansion will avoid the missteps of the previous DOE nuclear programs.

The expressed primary need for this program and potential related-facilities at the Idaho National Engineering and Environmental Laboratory (INEEL) is the stated "...lack of alternative power sources for space missions." This basic premise, from which an entire expansion program hinges upon, is not supported by the facts:

NASA already has a well-developed electric battery fuel cell program. The European Space Agency has high-efficiency solar cells developed for deep space missions. Numerous private vendors, with existing agreements with NASA, also have suitable high-efficiency solar cells used for long-range probes.

Even if this premise was correct, the existing plutonium production/fabrication process has an egregious history, and even recently led to worker contamination. Further expansion of production will only worsen this problem and threaten the general public's safety from radioactive contamination.

Our own experience with the DOE's "management" of similar projects at INEEL is that this type of program leads to massive cost overruns, worker deaths, and a multi-generational legacy of radioactive contamination. It is hard to understand why the DOE is planning this massive expansion of plutonium-238 production when DOE admits it needs over \$300 billion to "clean-up" existing problems at these same facilities.

1027-1

1027-2

1027-3

1027-4

Response to Commentor No. 1027

1027-1: DOE notes the commentor's views. However, the purpose of the NI PEIS is to evaluate the environmental impacts of a range of reasonable alternatives to maintaining and enhancing DOE's existing nuclear facility infrastructure to support production of isotopes for medical, research, and industrial uses; production of plutonium-238 for use in future NASA space exploration missions; and U.S. nuclear research and development needs for civilian application.

DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual rate of growth of medical isotope use is consistent with the Expert Panel findings. Section 1.2.1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost-efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production

Commentor No. 1027: Erik Ringelberg (Cont'd) Keep Yellowstone Nuclear Free

KEEP YELLOWSTONE NUCLEAR FREE
P. O. BOX 4838 JACKSON, WY 83001 307-732-2040 www.yellowstonenuclearfree.com

The PEIS disingenuously ignores these *current* problems and the immense social resistance to the expansion of nuclear power and the consequent radioactive contamination. For example, the PEIS specifically mentions the supportive public commentary in Idaho Falls, ID. Notwithstanding that the EIS process is not a public vote by law, the use of "factory towns" whose primary income comes from the DOE as the source of public opinion is flawed at best and an abuse of the National Environmental Policy Act (NEPA). KYNF and the other plaintiffs of the KYNF et al. vs. Richardson settlement agreement have repeatedly requested that the DOE include other communities in its scoping process that face the direct environmental consequences of the DOE's radioactive contamination.

1027-5

In spite of the obvious bias of the respondents, the DOE identified from public commentary the same three issues KYNF has with this PEIS: increased radioactive waste production and the lack of effective cleanup, lack of justification for proposal, and cost issues. Nowhere in the PEIS are these issues addressed.

1027-6

1027-7 1027-5

A second set of NEPA issues also raised by the plaintiffs, and ignored again in the PEIS, are the use of very broad categories of alternatives and poorly described options within each category, and the selective recombination of alternatives/options without substantiation of the difference in impacts between combinations. It is virtually impossible to provide alternative technical analysis and substantive comment on each combination. This is particularly problematic since no "preferred alternative" has been identified until the "final". The net result of the DOE method of outlining alternatives is that reviewers are unable to make directed comments to the substance of the technical issues and have their comments rejected ("out of scope"), or oversimplified and responded to in vague generalities.

1027-5

For example, comments on the premise "...lack of alternative power sources for space missions.", although one of the main reasons put forth for the PEIS, are considered "out of scope" N4.1-2;N-8-9). The environmental impacts of not producing p-239 are in fact part (albeit minor, as it is clearly not a preferred alternative [see chapter 4.1] of the PEIS. This is a clear example of the abuse of the intent (if not the letter of the law) NEPA inherent in the document and the review of public comments.

For a different example of the defective nature of this document, Alternatives 2, 3, and 4 all involve the INEEL facility. Each alternative, and in fact, each option suite, has substantially different environmental and social impacts *specific to INEEL*. Unfortunately, the DOE uses a "generic site" approach, with the details to be parsed out in follow-up documents.

In the rare case where specific of potential impacts are discussed (in the environmental justice section), the analysis presents two conditions, well-distributed poverty and patchy minority population distribution for INEEL. Yet, the analysis states that essentially there are no potential additional environmental justice impacts. This is belied by the statement that the "estimates...could be noticeably influenced by assumptions..."(K-7). This is our point; the broad estimates and unsupported assumptions in boilerplate text render this document's "analysis" moot. The analyses all assume homogeneous dispersion of radioactive contamination, an idea refuted by *all* actual releases documented by the DOE at the site (pg. 24 INEL Historical Dose Evaluation [Vol.1], 1991).

1027-8

Even more disturbing is the failure to mention the risks and potential impacts of the *combination* of hazardous and radioactive emissions from this project, or the cumulative risk in combination with INEEL's other toxic emissions. Surely, since both radioactive and hazardous wastes are generated concurrently, there are at least additive and more likely multiplicative health effects from both operations and systems failures.

1027-9

Response to Commentor No. 1027

of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

DOE has taken the Expert Panel and NERAC report recommendations under consideration in developing the range of alternatives evaluated in the NI PEIS. These reports were made available to the public at the NI PEIS public information centers and on the Internet at www.nuclear.gov.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Under the No Action Alternative, DOE would continue to purchase plutonium-238 to meet the space mission needs for the 35-year evaluation period considered in the NI PEIS. However, DOE recognizes that any purchase beyond what is currently available to the United States through the existing contract would likely require negotiation of a new contract and may require additional NEPA review.

The May 22, 2000, correspondence from NASA to DOE identifies that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit

Commentor No. 1027: Erik Ringelberg (Cont'd)

Keep Yellowstone Nuclear Free

KEEP YELLOWSTONE NUCLEAR FREE

P. O. BOX 4838 JACKSON, WY 83001 307-732-2040 www.yellowstonenuclearfree.com

The sole technical detail that we can comment on is the estimated generation of **2,593,067 pounds of nuclear and hazardous waste** if INEEL is selected. This waste is completely unacceptable to Keep Yellowstone Nuclear Free and the people of this region who do not have an economic stake in this project.

We do not believe that the Draft PEIS contains enough detail and scope of information for us to make other substantive comments on the specifics on this program. It is our hope that a much more comprehensive examination of the known and potential environmental impacts of this program is provided in the Final PEIS.

Sincerely,

Erik Ringelberg
Executive Director

1027-10

1027-5

Response to Commentor No. 1027

reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires one-third less plutonium-238 as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000, letter to DOE that large RTGs be maintained as backup. Section 1.2.2 was revised to clarify plutonium-238 mission needs.

DOE's production and sale of radioisotopes fall into two categories "commercial" and "research" and both types of isotope production are considered under the proposed actions. Commercial radioisotopes are those that are produced in large, bulk quantities and sold to pharmaceutical companies or distributors, or to equipment or sealed source manufacturers. Examples of commercial radioisotopes produced by DOE include strontium-82 and germanium-68 for medical applications, and iridium-192 and californium-252 for industrial applications. DOE only produces commercial isotopes when there is no U.S. private sector capability or when foreign sources do not have the capacity to meet U.S. needs reliably. In contrast, research radioisotopes are typically produced and sold in small quantities in response to specialty orders from researchers preparing experiments in the field of medicine, with small quantities of these radioisotopes also purchased by industrial researchers. Because small-quantity production of research isotopes is not financially attractive to private-sector producers and is generally not undertaken, DOE attempts to provide all research radioisotopes that are requested, subject to production capability, inventory, and financial constraints. As successful application of a specific research isotope is established, the production and sales of that radioisotope may shift from research to commercial status. In recent years, over 95 percent of DOE's sales of radioisotopes by dollar volume were commercial and 5 percent have been for research. Additional discussion of how DOE's isotope program fits into the overall U.S. and foreign isotope production capabilities was incorporated into Section 1.2.1 of Volume 1.

1027-2: DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions, although issues such as NASA research priorities are beyond the scope of this PEIS. NASA establishes the need and requirements for space missions and undergoes a thorough

Commentor No. 1027: Erik Ringelberg (Cont'd)
Keep Yellowstone Nuclear Free

Response to Commentor No. 1027

NEPA evaluation for each launch. Plutonium-238 sources are used only when they enable the missions or enhance mission capabilities.

1027-3: Plutonium-238 processing facilities can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Sections 4.2-4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from plutonium 238 processing, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that the radiological and nonradiological risks associated with plutonium-238 processing would be small.

1027-4: DOE notes the commentor's concern over DOE's past management and safety practices and the adequacy of ongoing cleanup activities. DOE activities associated with this program would not impact the schedule or available funding for existing cleanup activities at candidate sites for implementation of the nuclear infrastructure alternatives.

The health and safety of workers and the public is a priority of the nuclear infrastructure program, regardless of which approach is chosen. Operation of the facilities would comply with applicable Federal, state, and local laws and regulations governing radiological and hazardous chemical releases.

1027-5: The purpose of this NI PEIS is to evaluate the environmental impacts of reasonable alternatives to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238 for NASA space missions, and nuclear research and development. Although beyond the scope of this NI PEIS, activities to remediate existing contamination at INEEL and at the other DOE sites under consideration are ongoing and independent of the expanded programs analyzed herein. However, public input is of immense importance to DOE as part of a policy of encouraging vigorous public participation on matters of regional, national and international importance. In doing so and in compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the environmental impact analysis of DOE's proposed alternatives for meeting the mission requirements, and gave equal consideration to all comments, regardless of how or where they were received. This has included holding scoping meetings in communities potentially subject to environmental, health, or economic impacts as well as in communities

Commentor No. 1027: Erik Ringelberg (Cont'd)
Keep Yellowstone Nuclear Free

Response to Commentor No. 1027

removed from any direct or indirect effects but that nevertheless have a substantial stakeholder interest in the stated missions being considered. Based on the scoping comments received, the scope of the NI PEIS was expanded in a number of areas as outlined in Section 1.4 of the NI PEIS.

The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site <http://www.nuclear.gov> and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS.

The Draft and Final NI PEIS have been prepared in accordance with the provisions of NEPA (42 U.S.C. 4321 et seq.) and the related CEQ and DOE implementation regulations (40 CFR 1500 through 1508 and 10 CFR 1021, respectively). DOE does not agree with the commentor's characterization that the alternatives and options presented are poorly described so as to dissuade substantive comment. The combination of alternatives and options were selected to provide a range of site locations and facilities for accomplishing the stated missions in accordance with NEPA guidelines. The presentation of environmental consequences for each alternative option enables clear differentiation between the alternatives and options on the basis of potential environmental and human health impacts. DOE's use of the generic site approach for Alternatives 3 and 4 was intended to "level the playing field" with regard to evaluating the relative merits of the accelerator and research reactor options in the absence of any existing sites' operational constraints. In doing so, this also results in bounding the assessment of environmental impacts.

- 1027-6:** The restart of FFTF or use of any of the other proposed alternative facilities would not impact the schedule or available funding for existing cleanup activities at Hanford, INEEL, or ORR. DOE notes the commentor's concern regarding waste generation. The NI PEIS

Commentor No. 1027: Erik Ringelberg (Cont'd)
Keep Yellowstone Nuclear Free

Response to Commentor No. 1027

addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

- 1027-7:** DOE notes the commentor's views. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its nuclear facility infrastructure for the purposes of addressing three primary needs: 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and for which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Purpose and need are discussed in Section 1.2 of the NI PEIS.
- 1027-8:** Figures K-2 and K-3 of Appendix K highlight block groups for which the percentage of minority and low-income residents, respectively, exceed the national percentages of minority and low-income persons residing in the Continental United States. Although the maps in Figures K-2 and K-3 emphasize areas with higher concentrations of minority and low-income residents, minority and low-income persons reside throughout the potentially affected area surrounding Idaho National Engineering and Environmental Laboratory. All persons potentially impacted by radiological releases under normal and accident conditions were included in the analyses.

As discussed in Section H.2.2.2 of Appendix H, the analyses did not assume homogeneous dispersion of radioactive contamination. Rather, the dispersion was estimated from averaged annual meteorological measurements at the candidate sites. The meteorological data include wind speed, direction, and stability class. As discussed in Volume 1,

Commentor No. 1027: Erik Ringelberg (Cont'd)
Keep Yellowstone Nuclear Free

Response to Commentor No. 1027

Section 2.7.1.1 of the NI PEIS, radiological impacts at the candidate sites are driven by the geographical dispersion of the surrounding populations and fabrication/processing activities, as well as meteorological conditions.

1027-9: The impacts to humans from hazardous chemical and radioactive emissions result in different types of adverse health effects which cannot be combined in a meaningful way. Conservatively, all radiation is assumed to increase the risk of cancer fatalities. In contrast, hazardous chemicals can be carcinogenic and/or noncarcinogenic and exposure need not be fatal. Health effects associated with exposure to carcinogenic chemicals are measured in terms of total cancers, both fatal and nonfatal. Noncarcinogenic chemicals have the potential to produce adverse toxic effects, but not cancer. The measure of health effects for these chemicals is the hazard quotient. If exposure to several of these noncarcinogenic chemicals occurs simultaneously, the hazard quotients are summed to give a Hazard Index. If the Hazard Index exceeds unity, adverse health effects may result.

Because of the differences in the types and characterizations of these health effects, the magnitudes of each type are presented separately in the NI PEIS, and are not combined. In general, one type of health effect dominates, and no combination is even necessary.

A detailed discussion of health effects associated with exposure to radiation is given in Section H.2.1.2 of the Draft NI PEIS; a detailed discussion of health effects associated with exposure to hazardous chemicals is given in Section H.3.

1027-10: DOE notes the commentor's concern regarding waste generation. The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed action for all alternatives and alternative options. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored, and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

Commentor No. 1027: Erik Ringelberg (Cont'd)
Keep Yellowstone Nuclear Free

Response to Commentor No. 1027

If INEEL were selected for the irradiation of targets and processing and fabrication of irradiated targets (plutonium-238), the total radioactive and hazardous waste generation over the 35-year period for nuclear infrastructure operations would be about 3,340 cubic meters. As shown in Section 4.8.2.4 of the NI PEIS, this would represent a small amount of additional waste in comparison to the INEEL's current site activities.

Leaving a message on the FFTF. As a physician, I am quite certain my profession is now on the verge of an exponential increase in the use of medical isotopes, especially for cancer therapy. Accordingly, I now strongly favor the reactivation of the FFTF reactor at Hanford, Washington, to minimize our dependency on importation of these isotopes. Although this may involve a short term loss, I am certain that it will lead to a very significant long term gain. Your consideration of this need will be greatly appreciated. Sincerely.

I am very disturbed at the possibility of getting into production of Pu_238. It is very dangerous stuff. If it is involved in space exploration, it poses many threats in terms of possible accidents with launches and so forth.

1029-1

Furthermore, we should be devoting our energy to developing the solar power. Europe does have and has been working on a satisfactory substitute, which is far safer.

1029-2

In no way should we expand and open up new plants to produce this. It is very dangerous also to the workers in those plants. I think it is absolutely essential that DOE not go ahead with oking this plan to expand plutonium production. Thank you.

1029-3

1029-4

1029-3

Response to Commentor No. 1029

1029-1: As used by NASA, plutonium-238 is encapsulated and shielded to minimize any hazards to personnel or to the environment, even in the event of a catastrophic launch accident or inadvertent earth re-entry. In addition, NASA prepares NEPA documentation prior to each of its deep space missions. The documentation evaluates radiological and other risks that could result from the entire mission. NASA uses radioisotope power systems only when they enable the mission or enhance mission capabilities.

1029-2: DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions, although issues such as NASA research priorities are beyond the scope of this PEIS. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch.

1029-3: DOE notes the commentor's opposition to expanding its existing nuclear facility infrastructure to support production of plutonium-238 for use in future NASA space exploration missions. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

1029-4: Plutonium-238 processing facilities can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Sections 4.2-4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from plutonium-238 processing, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that the radiological and nonradiological risks associated with plutonium-238 processing would be small.

Dear Ms. Brown,

We are writing to request that NASA be required to develop alternative (solar) power sources for space missions. The technology is workable and has been developed in Europe.

We strongly feel the current path of increased Plutonium production is not justified by the health risks to workers or the safety risks to the public at large. Nor is the astronomical costs of plu-238 which drains the economy for decades to come.

Please push forward a space program that our country can be proud of and will not increase possibilities for massive environmental pollution of our earth.

Sincerely,

Rochelle Becker

1033-1

1033-2

1033-1

Response to Commentor No. 1033

1033-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

1033-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

Response to Commentor No. 1039

1039-1: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to “ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use.” The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

1039-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF, and support for Alternative 5, Permanently Deactivate FFTF.

1039-3: DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings.

Commentor No. 1039: Jody Heatlie (Cont'd)

Response to Commentor No. 1039

The United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily Molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

- 1039-4:** FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

Commentor No. 1041: Daniel E. Peterson

Draft PEIS Comment Form

Since the death of our son Scott in 1975 we have followed events at Hanford with increased interest as public disclosure shed light on those of us who lived "down wind"

I have attended numerous hearings and I vote for alternative 5 - Deactivate FFFTF with no new mission. However I am convinced by 4 of Washington State's testimony there is no need for isotope production as Canada provides all US needs.

Any alternative proposed must not interfere with Hanford clean-up.

The attempt for Sen Gordon and John Corley to project Hanford FFFTF start up as quickly as ever research affords those of us who have lost family members to "down wind" Bill out.

Response to Commentor No. 1041

- 1041-1:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.
- 1041-2:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFFTF.
- 1041-3:** DOE notes the commentor's view. DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

The United States currently purchases approximately 90 percent of its medical isotopes from foreign producers, most notably Canada. However, Canada only supplies a limited number of economically attractive commercial isotopes (primarily molybdenum-99), and it does not supply research isotopes or the diverse array of medical and industrial isotopes

Commentor No. 1041: Daniel E. Peterson (Cont'd)

Response to Commentor No. 1041

considered in the NI PEIS. As such, reliance on Canadian sources of isotopes to satisfy projected U.S. isotope needs would not meet DOE's mission requirements.

Although other manufacturers produce medical isotopes, DOE remains the key provider for a large number of isotopes that are used in relatively small quantities by individual researchers at universities and hospitals. Section 1.2.1 of Volume 1 has been revised to clarify DOE's isotope production role and other producers' capabilities to fulfill U.S. isotope needs.

Commentor No. 1042: Roger A. Rohrbacher

1612 So. Dawes St.
 Kennewick, WA 99338
 September 1, 2000

Ms. Colette Brown
 DOE Office of Space & Defense Power Systems, NE-50
 19901 Germantown Road
 Germantown, MD 20874-1790

Dear Ms. Brown:

My reasons to restart and operate FFTF are as follows:

It is a low cost option for the U.S. to produce needed medical isotopes to diagnose and fight cancer and other diseases. It can produce a steady stream of different medical isotopes simultaneously. Lives can be saved by saving FFTF.

The FFTF has unique capabilities for international research. (I understand Japan is still interested.)
 a stream of high energy neutrons is a valuable tool.

It is a safe facility. During its previous years of operation it had an exemplary safety record - negligible radioactive emissions and effluents and extraordinarily low worker exposure to radiation.

Sincerely,
 Roger A. Rohrbacher

Mr. Roger A. Rohrbacher
 1612 S Dawes St
 Kennewick, WA 99338

Response to Commentor No. 1042

1042-1

1042-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

1042-2

1042-2: DOE notes the commentor's views regarding the use of FFTF to support international nuclear research and development. Researchers from many foreign countries use DOE's high-flux research reactors for materials testing and experimentation. These facilities have the capability to maintain a high density of neutrons in a given test volume for materials testing; shorten the time needed for such testing; tailor the neutron flux to simulate the different reactor types and conditions; and instrument the core for close monitoring of the test conditions. Although the NI PEIS analyzes the expansion of U.S. civilian nuclear research and development, it is anticipated that FFTF would play a role in the continuing international research conducted in the United States. As described in Section 1.2.3 of the NI PEIS, some specific areas of research identified are advanced reactor development including materials and nuclear fuel research for advanced terrestrial or space reactors and for the Accelerator Transmutation of Waste system.

1042-3

1042-3: The commentor's positions on restarting FFTF and the safety record at FFTF are noted. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

Commentor No. 1043: Clark B. McKee

16900 232nd Pl. SE
Monroe, WA 98272
425-788-5810
8/29/00

Colette E. Brown, NE-50
U.S. Department of Energy
Office of Nuclear Energy, Science and Technology
19901 Germantown Road, Room A-270
Germantown, MD 20874-1290

Dear Ms. Brown:

I am a newcomer to the issue of how to best meet the nation's needs for radioisotopes and Pu-238, and have not seen the full PEIS. However I did attend the 8/30/00 hearing in Seattle, and would like to offer some comments based on that experience, plus my ten years in quality assurance management for the FFTF during its design, construction, startup testing and initial operation (until 1981).

First, I believe, and am sure you will agree, that the final EIS should be based only on relevant facts and objective analysis. It was abundantly clear at the Seattle meeting that those opposed to FFTF restart were telling at least some falsehoods (e.g., adding waste to the underground storage tanks), distorting the PEIS, and trying to discredit the FFTF by linking it to other completely unrelated problems and incidents on the Hanford reservation. Politics may well be a factor in the Secretary's final decision but must be kept out of the EIS.

Second, and most important, there was no mention in the 8/15/00 summary of how each of the alternatives would affect the number of fatalities from those cancers and other diseases that can be treated with radioisotopes. The summary does include the numbers of fatalities expected from conducting each of the alternatives, but I'm sure that for alternatives 1, 3 and perhaps 4, the lives to be saved outnumber the added fatalities by many orders of magnitude. DOE has a moral obligation to maximize its contribution to public health and safety. In this case that means bringing major additional isotope production on line as soon as possible. And that would seem to favor FFTF restart because FFTF has the largest production capacity and can very likely be brought on line in a matter of months rather than years. The EIS must address this question, preferably quantitatively, but at least qualitatively. If it doesn't, DOE could legitimately be accused of not caring about the people whose lives might be saved with radioisotope treatment.

Third, for each alternative, what happens to the wastes from the associated processing facilities?

Finally, the following question should be asked about alternative 1 if it hasn't already: Based on FFTF's design, construction and operating history, can the plant be considered

Response to Commentor No. 1043

- 1043-1:** DOE notes the commentor's views on the necessity for reliance on objective, factual information as the basis for sound decisionmaking. DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and to providing ample opportunity for public comment on those actions. Selection of facilities and site locations for accomplishing expanded civilian nuclear energy research and development and isotope production missions is not a political decision. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.
- 1043-2:** No evaluation has been made in the NI PEIS of the health benefits associated with treating people with the radioisotopes produced under any of the alternatives assessed. The purpose of the PEIS is to determine the environmental impacts associated with each alternative being considered for implementation by DOE.
- 1043-3:** The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options, including the waste associated with processing and fabricating the irradiated targets. These discussions can be found in the Waste Management sections of Chapter 4 of Volume I. Waste minimization programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. The waste generated from any of the proposed alternatives in the NI PEIS will be managed (i.e., treated, stored and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.
- 1043-4:** DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 1043: Clark B. McKee (Cont'd)

safe to operate? For design and construction, my answer would be yes. The plant was designed to the highest standards and on the basis of extensive development testing. It was managed by people who had been either in the nuclear navy or in the Westinghouse divisions that supplied the nuclear navy. It was certified to the ASME Boiler and Pressure Vessel code. It received and passed an NRC operating license review (No license was issued, of course, because NRC has no jurisdiction over federal reactors.) And we had a quality assurance program then that was at least as rigorous as any in use at commercial nuclear power plants today.

I left Westinghouse shortly after operation began, so had little experience with that phase. I understand, however, that its operation was free of major incidents (and that the original concern about possible sudden reactivity insertions proved unfounded.) But there is certainly a wealth of audit reports, management assessments, etc., that could shed light on how safely it operated.

Looking toward the future, several factors strongly suggest that the FFTF would continue to be safe. One is the absence of corrosion in the vessels and heat transport system. Liquid sodium is non corrosive to the materials of construction and soaks up any oxygen that happens to get inside, in preference to the stainless steel. The system operates at low pressure, and emergency core cooling can be effected through natural convection alone. And the fact that two employees were recently fired for falsifying records shows that management remains committed to strong enforcement of the rules.

I hope these comments will be useful. Again, I would like to stress the need for the EIS to address the lifesaving potential for each of the alternatives.

Very truly yours,

Clark B. McKee

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

As someone who lives in the Portland area (the area that will be affected by Hanford activity), I vehemently oppose any effort by the DOE to re-open Hanford or build new reactors. I think the DOE should concentrate on cleaning up the nuclear waste that is already there. I believe if there are problems that need to be resolved that manufacturing plutonium-238 is not the answer. Medical isotopes that cause cancer is not necessary since cancer is caused by nuclear production. I do not care about NASA exploration. According to your report NASA does not even want your product, so please stop pushing this non-issue! Listen to the people. NO DONOR WANT HANFORD REOPENED EVER!!! NO YOU GET IT NOW!! PLEASE DO NOT IGNORE US PLEASE!!

1044-1

7/12/00

- 1044-1:** DOE notes the commentor's opposition to Alternative 1, Restart FTF, and Alternative 4, Construct New Research Reactor.
- 1044-2:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.
- 1044-3:** DOE notes the commentor's opposition to enhancing its existing nuclear facility infrastructure to support production of plutonium-238 for use in future NASA space exploration missions. A May 22, 2000, correspondence from NASA to DOE identified that NASA no longer has a planned requirement for small radioisotope thermoelectric generator (SRTG) power systems. This does not mean that NASA no longer requires DOE to provide the necessary plutonium-238 to support deep space missions. Rather, the suspension of SRTG development efforts was conducted in order to permit reprogramming of funds to support development of a new radioisotope power system based on a Stirling technology generator. This new radioisotope power system, referred to in the subject correspondence, requires 1/3 less plutonium as its fuel source. However, the Stirling technology is developmental and NASA has requested in a September 22, 2000 letter to DOE that the plutonium-238 needed for large RTGs may be maintained as a backup. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.
- 1044-4:** The commentor's concern about cancers caused by nuclear production is noted. Chapter 4 of Volume 1 and Appendixes H through J provide the results of the evaluation of potential health impacts that would be expected to result from implementation of any of the range of reasonable alternatives presented in the PEIS, including normal operations and a spectrum of accidents that included severe accidents. The environmental

Response to Commentor No. 1044

analysis showed that radiological and nonradiological risks associated with each of these alternatives would be small. Specifically at Hanford, over the 35-year operational period no fatalities would be expected among workers or in the general public in the vicinity of Hanford or at distant locations. See, for example, Sections 4.3.1.1.9, 4.3.2.1.9, and 4.3.3.1.9 in Chapter 4 and the Summary Tables in Chapter 2 of Volume 1 of the NI PEIS.

Additionally, the NI PEIS evaluated the maximum cumulative radiation exposure to the public from all reasonably foreseeable Hanford Site activities over the 35-year time-frame. As shown in Section 4.8, less than 1 additional latent cancer fatality would be expected to occur among the local population as a result of radiation exposure from 35 years of Hanford operations.

The annual doses to the public from the Hanford site and proposed NI PEIS activities above are insignificant. For perspective, the radiation dose the average American receives from natural sources is about 300 mrem each year. Based on the same 35 year time period used above, approximately 2,000 latent cancer fatalities would be expected among the same population as a result of this natural (non-Hanford related) radiation exposure. In that same 35 years, about 19,000 cancer fatalities from all causes (non radiological causes included) would also be expected in the same population.

1044-5

1044-5: DOE provided notice of scheduled public hearings in accordance with the requirements of CEQ and DOE regulations (i.e., 40 CFR Parts 1503.1 and 1506.6 and 10 CFR Part 1021.313, respectively). This included announcement of the hearings in the Federal Register as well as in the local media. In addition, copies of the Draft NI PEIS and/or the Summary (including the public hearing schedule) were sent to each individual or group listed to receive it at the address on record. Meeting notices were also sent to 6,459 organizations and individuals on the NI PEIS mailing list. Meeting minutes were mailed to 3,576 organizations and individuals in the States of Washington and Oregon.

Commentor No. 1045: Bruce K. Gagnon
Global Network Against Weapons and Nuclear Power
in Space

**Global Network Against Weapons
and Nuclear Power in Space**

September 5, 2000

Ms. Colette Brown
DoE
Office of Space & Defense Power Systems.
NE-50
19901 Germantown Rd.
Germantown, MD 20874

Dear Ms. Brown:

I am writing to give our organizational comments to DoE's Draft PEIS concerning the expansion of DoE facilities in order to produce plu-238 for future NASA space missions.

First it should be noted that NASA does not need nuclear power for deep space missions as the European Space Agency (ESA) has now developed high-efficiency solar cells for deep space. While NASA claims that this is not possible, in fact ESA will be sending a mission called Rosetta beyond Jupiter using such new technologies.

It is clear to us that NASA and DoE do not want to acknowledge the existence of such alternatives because it runs counter to plans to expand the use of nuclear power into space.

The expansion of the use of nuclear power into space will of course mean that there will be an exponential number of launches from Cape Canaveral in coming years on rockets with 10% failure rates. We did not see anything in the PEIS that acknowledged the growing risk to life on Earth in the event of a launch accident with nuclear devices on-board.

We are aware that very recently eight workers were contaminated at LANL while fabricating future space nuclear powered devices. We are also aware that prior to the Cassini launch there was an epidemic of contaminations at LANL while they fabricated the RTG's for that mission. It is obvious to us that the expansion of nuclear power production and fabrication for future space missions will only mean many more cases of contamination of workers and the local environment.

P.O. Box 90083 • Gainesville, FL 32607 • (352) 337-9274
globanet@mindspring.com • www.space4peace.org

Response to Commentor No. 1045

1045-1: DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions, although issues such as NASA research priorities are beyond the scope of this PEIS. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and conducts a thorough NEPA evaluation for each launch.

1045-2: The commentor's concerns about worker and environmental contamination are noted. Eight workers were exposed to plutonium-238 the Los Alamos National Laboratory on March 17, 2000. Their exposure to plutonium-238 was caused by a leaking pipe connection in a support system serving a glovebox. As a result of this accident, the Secretary of Energy ordered a series of actions to increase worker safety and health and to avoid further accidental exposures.

Plutonium-238 processing facilities can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Sections 4.2-4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from plutonium-238 processing, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that the radiological and nonradiological risks associated with plutonium-238 processing would be small.

Commentor No. 1045: Bruce K. Gagnon (Cont'd)
**Global Network Against Weapons and Nuclear Power
 in Space**

2

We know that the Pentagon is pushing NASA and DoE to expand nuclear power production for space. We know that the military has major plans for the use of nuclear power for space-based weapons and bases on the moon. Therefore we understand that the Pentagon must get the DoE to prepare the industrial infrastructure for this long-range program.

We also understand that the DoE has yet to undertake a serious clean-up of existing plutonium contamination at their facilities around the country. It is known that over \$300 billion is needed to complete such a clean-up program. Before DoE undertakes this new agenda for space nuclear power, which will only worsen the existing problem, we believe that you should spend our tax dollars on cleaning up the present mess!

The future of life on this planet is already under attack by past DoD and DoE nuclear activities. Now DoE, NASA and the Pentagon want us to fork over our hard earned dollars to move this nuclear nightmare into the heavens.

We strongly protest this proposed action and call upon DoE to pick the "No Action" alternative.

Sincerely,

Bruce K. Gagnon
 Coordinator

1045-4

1045-3

1045-5

Response to Commentor No. 1045

- 1045-3:** The commentor's concerns over the use of nuclear power in space-based weapons and other space-based facilities are noted, although issues such as these are beyond the scope of this NI PEIS. The nuclear infrastructure missions described in Section 1.2 of Volume 1 are unrelated to the national defense. Neither nuclear weapons nor components for nuclear weapons would be produced under the nuclear infrastructure alternatives described in Section 2.5. The scope of this NI PEIS is limited to analysis of alternatives to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development.
- 1045-4:** DOE notes the commentor's opinion and concern about funding available for cleanup at DOE facilities.
- 1045-5:** DOE notes the commentor's support for the No Action Alternative 1.

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

It is apparent from the PEIS that there is a need for both medical isotope production and Pu-238 production. I believe depending on other nations for our sources and needs is not prudent. I applaud DOE for heading in a direction of self-sufficiency.

I am particularly interested in the area of medical isotopes. Our country has been sadly lacking in this area. This is an area where DOE can help the individual, present treatment for cancer creates a great deal of suffering along with the drug. My six year old niece died from the cancer (ie, use of chemo therapy).

Of the choices provided I believe the start up of FFTF is by far the best.

It appears to be most effective (the facility already exists). It has the capability and capacity to provide all options of production. Minimal waste stream production. An adequate facility-like. A history of similar production capability. A proven safety record.

Both technically and costwise FFTF is the best option and should be restarted.

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Commentor No. 1051: Vicki Y. Eddy (Cont'd)

Response to Commentor No. 1051

August 30, 2000

Dear Ms. Brown,

I understand that I am to give my comments to you as I am asking for FFTF to be selected as the preferred alternative for Accomplishing Expanded Civilian Nuclear Energy Research and Development and Isotope Production Missions.

I have been working at FFTF for the last 13 years as a clerk. My position requires me to spend a great deal of time updating procedures in all areas of the plant. At FFTF we all undergo continuous safety training and the qualifications that are required for the work that we each do. We are very proud of our safety record, our work integrity and our ability to work together as a family from janitors up to plant managers.

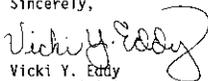

Under a lot of pressures during our years of being in standby mode, we have managed to keep our plant in top condition, think positively and have not compromised our safety standards. In spite of the reputation that our Hanford Area has inherited, we feel that we are the hope that may be able to overshadow that reputation and show that this Area can produce products that may someday help to erase the devastating effects of cancer and bone deteriorations. We have also shown that we are capable of many other missions in nuclear and industrial research.

We are not the liars or deceivers that environmental groups in Washington and Oregon are trying to make people believe. So many of those groups have instilled fear and uncertainty to uninformed people who chose not to take the time to look at the facts for themselves. We are not trying to "cover up" anything such as bomb production which is just one of the many fears that they are spreading.

My family moved to this area in 1950 and have lived here ever since except for the few years I was away. My children and grandchildren all live here. Our major commodities in this area are agriculture and vineyards, land development and our retirement communities. Do you think that I, as a mother and grandmother, would be working for a company that would bring devastation to my family, community or nation? If I felt that we were not one of the safest facilities that I could possibly be working in, then I would be the first to stand up and rally against it.

I can see only the good that we can do for our nation. And I hope that you can too.

Sincerely,

Vicki Y. Eddy
602 So. Rainier
Kennewick, WA 99336

1051-1

1051-1: DOE notes the commentor's support for Alternative 1, Restart FFTF. The purpose of this NI PEIS is to evaluate the environmental impacts of reasonable alternatives to fulfill the requirements of the proposed missions, which include the production of medical and industrial isotopes, the production of plutonium-238, and nuclear research and development. The Record of Decision for the PEIS will be based on a number of factors including environmental impacts, costs, nonproliferation issues, schedules, technical assurance, policy, and program objectives.

1051-2

1051-2: DOE notes the commentor's views and concerns.

1051-1

U.S. Department of Energy
19901 Germantown Road
Germantown, MD 20874

Dear Ms. Brown:

Concerning the NI PEIS alternatives, I am writing this letter in support of restarting the FFTF. This facility is capable of fulfilling the isotope production responsibilities of the Department of Energy under the Atomic Energy Act.

The PEIS states, "Of particular need over the longer term are dependable sources of research isotopes and reactor facilities providing high volume flux irradiation for nuclear fuels and materials testing". The FFTF is well positioned to quickly and reliably provide this research and development program. I agree that the nation must move forward in clinical medicine, scientific research, and industrial endeavors, and this already existing facility has a proven track record in reliability for this program.

Previous studies have noted inhibited growth in the use of radioisotopes to provide a better life for our citizens. We have drifted towards a reliance on foreign suppliers, which is detrimental to the best interests of our country. First, we place our country in the position of having to rely on a foreign entity, but more important we are funding jobs outside this country. We need to assure that we take steps to sustain our loyal workers.

I fully support the intent of the NI PEIS in trying to determine the best answer to filling the gaps in the DOE infrastructure. The decision that the DOE has to make is not an easy one. There are many complex science and technical issues that need to be addressed. Choosing an already existing facility that is the newest in the DOE complex with a replacement value of almost \$2 billion makes the most sense to me. For the reasons mentioned above, I urge you to consider restart of the FFTF as the best alternative.

Sincerely,

MICHAEL J. SULLIVAN
General President

MJS/tsl

Commentor No. 1055: Kim Burkland

To: Collette Brown, NE-50 8/31/2000
USDOE
19901 Germantown Rd.
Germantown, MD 20874

From: Kim Burkland
410 9th Street (POB 401)
Hood River, OR 97031

These are my written comments on the draft Environmental Impact Statement on FFTF Restart: As I have testified before, the USDOE should permanently shut down FFTF at Hanford. Please choose either Alternative 5 (1st choice) & shut down Hanford permanently or choose Alternative 2, an option that would also permanently shut down Hanford, but produce the medical isotopes and NASA's plutonium 238 at alternative sites.

First, the USDOE's compilations of prior public comment are extremely lacking and show your failure to listen to the public. The number of comments must be stated so that Secretary Richardson is very clear on where the people of the NW stand. Also failed to mention the FIVE city council resolutions against Hanford Restart.

1055-1

1055-2

Response to Commentor No. 1055

- 1055-1:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, or Alternative 2, Use Only Existing Operational Facilities.
- 1055-2:** While all comments received during the scoping periods for both the Plutonium-238 Production EIS and the NI PEIS are part of the Administrative Record for the NI PEIS, Section 1.4 of Volume 1 and Appendix N are intended to provide a summary of the issues and associated trends identified during the scoping process rather than a tabulation of comments by specific issue. It should be noted, however, that NEPA and CEQ regulations do not require an agency to include and respond to each scoping comment as is required for public comments on a Draft EIS. In preparing the NI PEIS, DOE carefully considered scoping comments received from the public. Any perceived discrepancy in the grouping of comments raising any one particular issue or set of issues is attributable to the manner in which they were originally categorized and counted. For example, a number of statements, letters, or resolutions signed by multiple persons, such as city council resolutions mentioned by the commentor, were received by DOE (both for and against FFTF restart) in response to the request for scoping comments. Each such comment document was considered and counted as a single comment in the NI PEIS comment tracking system. The Office of Nuclear Energy, Science and Technology works closely with the Office of the Secretary to keep him informed of the progress on the NI PEIS, including stakeholder input.
- 1055-3:** DOE notes the commentor's opposition to restarting FFTF for enhancing its existing nuclear facility infrastructure. DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production

Commentor No. 1055: Kim Burkland (Cont'd)

USDOE failed to demonstrate a compelling need ⁽¹⁾ for the:

- 1) production for space;
- 2) medical or research isotopes; and
- 3) nuclear energy research.

Not is there adequate justification for producing them all at one site or domestically.

Next, you must include the recommendations of the blue ribbon panel (subcommittee for isotope research and ^{production} planning) that advised against the use of FFTF for medical isotope production.

Next, you must include the demand estimates ^{from NASA} for plutonium 238. According to my sources, the USDOE estimates are artificially high and do not take into account the possibility to renegotiate a ^{current} contract with Russia.

Next, it is improper to release the draft EIS for public comment without the following information—

- 1) cost analysis of restart and all alternatives
- 2) studies of treatment of waste at all proposed sites; and
- 3) non-proliferation impacts from FFTF and the importation of its radioactive fuel from Europe - this may be a treaty violation!!

1055-3

1055-4

1055-5

1055-6

1055-7

1055-6

Response to Commentor No. 1055

activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. In addition, under the National Space Policy issued by the Office of Science and Technology Policy in September 1996, and consistent with DOE's charter under the Atomic Energy Act, DOE is responsible for maintaining the capability to provide the plutonium-238 needed to support these missions. There are approximately 9 kilograms (19.8 pounds) of plutonium-238 in the U.S. inventory available to support future NASA space missions. Based on NASA guidance to DOE on the potential use of radioisotope power systems for upcoming space missions, it is anticipated that the existing plutonium-238 inventory will be exhausted by approximately 2005. Under the No Action Alternative, DOE would continue to purchase plutonium-238 to meet the space mission needs for the 35-year evaluation period considered in the NI PEIS. However, DOE recognizes that any purchase beyond what is currently available to the United States through the existing contract would likely require negotiation of a new contract and may require additional NEPA review. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

In January 1997, President Clinton tasked his Committee of Advisors on Science and Technology (PCAST) to evaluate the current national energy research and development portfolio and to provide a strategy that ensures the United States has a program to address the Nation's energy and environmental needs for the next century. In its November 1997 report responding to this request, the PCAST Energy Research and Development Panel determined that restoring a viable

Commentor No. 1055: Kim Burkland (Cont'd)

All information listed on p. 2³ must be given adequate review time for the public. ^{that is released}

1055-8

Next, USDOE failed to adequately characterize the environmental impacts from FFTF restart. The following statement is a slap in the face to the EIS statement and must be revoked and replaced with actual information:

"Environmental impacts associated with the existing inventory of spent fuel at Hanford site are minimal"

1055-9

This statement is erroneous. More than 2100 tons of corroding spent fuel is swimming in aging water filled basins adjacent to the Columbia River and poses one of the largest problems for clean up with an estimated cost of more than \$1.6 billion.

Next, USDOE must include the cost of FFTF and all companion facilities decontamination and decommissioning in the restart - not just every other alternative.

1055-10

Next, the USDOE fails to assess all existing contaminant sources at Hanford.

1055-11

Next, the USDOE fails to assess the cumulative impact of additional waste from the proposed

Response to Commentor No. 1055

nuclear energy option to help meet our future energy needs is important and that a properly focused research and development effort to address the potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) was appropriate. The PCAST panel further recommended that DOE reinvigorate its nuclear energy research and development activities to address these potential barriers. Section 1.2.3 provides information on the nuclear energy research and development mission.

There is no requirement to conduct all of the proposed actions at one site. In the Record of Decision process, DOE could choose to combine components of several alternatives in selecting the most appropriate strategy. For example, DOE could select a low-energy accelerator to produce certain medical, research, and industrial isotopes, and an existing operating reactor to produce plutonium-238 and conduct nuclear research and development. Should FFTF be selected for restart in support of these missions, DOE expects it could utilize a 15-year supply of mixed-oxide fuel that would be available from Germany under favorable economic terms (i.e., no charge for the fuel).

1055-4: The conclusions presented in the NERAC Subcommittee for Isotope Research and Production Planning Final Report, April 2000 regarding the suitability of FFTF to produce research isotopes in a timely and cost-efficient manner were made in the context of the facility producing research isotopes as its sole mission. It would not be cost effective to restart FFTF for the singular purpose of producing small quantities of various research isotopes. However, sustained operation of FFTF for the production of larger quantities of both research and commercial isotopes would be viable if operated in concert with producing plutonium-238 and conducting nuclear energy research and development for civilian applications. As the NERAC report states: "In limited instances, the DOE possesses unique resources, e.g., the high flux of fast neutrons and large irradiation volume in FFTF, that could be utilized for the production of some radioisotopes, but is best suited for commercial interests who might consider its use for isotope production." In recognition of these constraints on its operational feasibility, the NI PEIS only evaluates the use of FFTF when coupled with the other stated missions. While some existing reactors may

Commentor No. 1055: Kim Burkland (Cont'd)

FFTF restart to the existing waste sources. (A)

1055-11

Next, USDOE fails to adequately assess alternatives such as subsidizing university reactors or buying time @ private facilities.

1055-12

Next, the NO action alternative (5) must include the complete shut down of FFTF - NOT maintaining it on standby.

Next, USDOE failed to address the conflict of interest in using PNNL's evaluations when they (the company) are a proponent of restart and stand to gain from it financially.

Next, USDOE fails to assess the legality of introducing new programs and wastes into the highly contaminated 306 e or 325 buildings at Hanford that would be used w/ FFTF restart.

1055-13

And, FINALLY, you must admit that the real reasons to restart FFTF are in a hidden agenda that includes preserving jobs and starting up new weapons research or classified missions.

This action will not be tolerated by the public!

Shut down FFTF permanently, Make actual CLEAN-UP the priority of the rule at the Hanford site.

1055-1

Comply with the law, do your job right, and listen to the people!

1055-14

Thank you for the opportunity to comment.
Kim Burkland

Response to Commentor No. 1055

possess the potential capability or capacity to support research isotope production, as suggested in the NERAC report, it is unlikely that reliable, increased production of these isotopes to support projected needs could be accomplished without impacting the existing missions of these facilities.

DOE has taken the Expert Panel and NERAC report recommendations under consideration in developing the range of alternatives evaluated in the NI PEIS. These reports were made available to the public at the NI PEIS public information centers and on the Internet at www.nuclear.gov.

1055-5: See response 1055-3. DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

1055-6: The costs and nuclear nonproliferation impacts of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment to provide additional pertinent information to the Secretary of Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. DOE mailed these documents to more than 730 interested parties on August 24 and September 8, 2000, respectively. Both reports were made available immediately upon release on the NE web site (<http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided summaries of the Cost Report and Nuclear Infrastructure Nonproliferation Impact Assessment in Appendixes P and Q, respectively, in the Final NI PEIS.

1055-7: The NI PEIS addressed the environmental impacts due to the treatment, storage, and disposal of the waste generated by the proposed actions for all alternatives and alternative options. Waste minimization

Commentor No. 1055: Kim Burkland (Cont'd)

Response to Commentor No. 1055

programs at each of the proposed sites are also addressed. These programs will be implemented for the alternative selected in the Record of Decision. It is DOE's policy that all wastes be managed (i.e., treated, stored, and disposed) in a safe and environmentally protective manner and in compliance with all applicable Federal and state laws and regulations and applicable DOE orders.

- 1055-8:** DOE notes the commentor's request for extension of the public comment period. The Council on Environmental Quality's (CEQ) "Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act" (40 CFR 1506.10(c)) require that a minimum of 45 days be allowed for public comment on the Draft NI PEIS. As stated in the Notice of Availability (65 FR 46443 et seq.), the public comment period began on July 28, 2000 and continued to September 18, 2000. In preparing the Final PEIS, DOE has assessed and considered both oral and written comments received on the Draft PEIS during the public comment period and has responded to these comments in the Final PEIS. Volume 3 of the NI PEIS contains public comments received on the NI PEIS and DOE responses to those comments. Moreover, late comments were considered to the extent practicable.
- 1055-9:** The discussion in the Summary and Section 4.8.3.5 of Volume 1 on the cumulative impacts for spent nuclear fuel management at Hanford was revised to clarify that the management of the existing spent nuclear fuel at Hanford results in a dose of less than 0.1 millirem per year of the maximally exposed member of the public. This dose is well within the DOE limits given in DOE Order 5400.5. As discussed in that Order, the dose limit from airborne emissions is 10 millirem per year, as required by the Clean Air Act; drinking water is 4 millirem per year, as required by the Safe Drinking Water Act; and the dose limit from all pathways combined is 100 millirem per year. DOE has committed to remove the spent nuclear fuel at Hanford for ultimate disposition in a geologic repository.
- 1055-10:** DOE assumes that the commentor is referring to deactivation, not decommission. Decommission costs were not included for any alternative. Deactivation of FFTF is not part of implementing

Commentor No. 1055: Kim Burkland (Cont'd)

Response to Commentor No. 1055

Alternative 1, FFTF Restart. Deactivation of FFTF is part of implementing Alternatives 2, 3, 4, and 5 and including the cost of FFTF deactivation in the implementation costs for these alternatives is appropriate. The Cost Report was structured to identify the implementation costs of the various alternatives so the Secretary of Energy would have this information along with other data for consideration.

1055-11: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Ongoing activities to remediate existing contamination at Hanford are high priority to DOE. The current inventory of wastes managed at the Hanford Site is identified in Section 3.4.11.1 of Volume 1. In addition, the generation rates of wastes associated with the NI PEIS options that use Hanford facilities are compared with the current waste generation rates at the site in Section 4.3 of Volume 1. As stated in Sections 4.3.1.1.13, 4.3.3.1.13, and 4.4.3.1.13, the generation rates of wastes at Hanford associated with the options that utilize either FFTF, FMEF and/or RPL/306-E would be much smaller than the current waste generation rates at the site. These volumes would also be small in comparison to the existing inventory at the site (Section 3.4.11.1, Volume 1). These comparisons were also made for the other options which involved INEEL and ORR facilities. As stated in Section N.3.2, implementation of the nuclear infrastructure alternatives would not divert or reprogram budgeted funds designated for Hanford cleanup, regardless of the alternative(s) selected.

1055-12: A number of facilities, including those already producing isotopes, were considered but were dismissed from further consideration (see Volume 1, Section 2.6). Among the reasons that some were dismissed was the

Commentor No. 1055: Kim Burkland (Cont'd)

Response to Commentor No. 1055

fact that they lacked sufficient neutron production capacity, were fully dedicated to existing missions, were not capable of steady-state neutron production, had insufficient power to sustain adequate steady-state neutron production, were unable to produce a constant, reliable source of neutrons due to dependency on operating schedules of their primary missions, are under construction with capacity fully dedicated to other planned mission, or have been permanently shut down. It should be noted that CLWRs were considered for plutonium-238 production, but were dismissed from further consideration for medical and industrial isotope production because facility modifications to produce isotopes with a short half life would be significant.

The No Action alternative is required under Council on Environmental Quality regulations (40 CFR 1502.14(d)). It provides a point of comparison for the action alternatives. The No Action Alternative generally represents the status quo; that is, it includes those actions that would normally take place without the proposed action. Since the status quo involves maintaining FFTF in standby and not its deactivation, it is not appropriate to include its deactivation as part of the No Action Alternative. Deactivation of FFTF is included as Alternative 5, Permanently Deactivate FFTF, and as part of Alternative 2, Use Only Existing Operational Facilities, Alternative 3, Construct New Accelerator(s), and Alternative 4, Construct New Research Reactor.

1055-13: PNNL is not preparing this PEIS, although it has offered technical comments on it. These comments have been evaluated by DOE and the contractor preparing the PEIS. PNNL has also previously provided technical and cost analyses on matters related to the FFTF, which have undergone independent scrutiny, and have helped confirm the need for the environmental review now being independently developed. PNNL's work does not present a conflict of interest. Ultimately, DOE has full control over the contents of the PEIS.

FFTF and any associated facilities remain subject to compliance with environmental laws regardless of its future operational status. All Hanford activities are conducted in accordance with the 1998 Tri-Party Agreement (Washington Department of Ecology, U.S. EPA, and the U.S.

Commentor No. 1055: Kim Burkland (Cont'd)

Response to Commentor No. 1055

Department of Energy), which sets milestones and schedules for cleanup and restoration on all parts of the site. In August 1999, these agencies agreed to temporarily suspend FFTF M-81 series milestones until a final decision is made on the future of the facility by the Secretary of Energy. If a decision is made to restart FFTF, these agencies have agreed to consider the Agreement's milestones deleted. Should a decision be made to continue with shutdown of FFTF, appropriate negotiations must be made to create an appropriate set of new TPA milestones and target dates within (120) days of receiving proposed changes. FFTF restart would not affect the schedule or availability of funding for existing cleanup activities.

The 306-E facility is not contaminated and is being proposed as a location to conduct activities that do not involve radioactive materials. While the 325 Building has a large inventory of radionuclides associated with ongoing activities at the facility, the building is not contaminated in worker accessible areas. Operations at the 325 Building are conducted in accordance with applicable federal and state regulations and appropriate DOE Orders.

The 300 Area Revitalization Plan (DOE 1999) provides for continued multi-program R&D operations in the 300 Area, including operation of various laboratories, office facilities, and services. It also provides for consolidation (but not complete elimination) of radiological operations, with support for Hanford Site facility transition and environmental restoration efforts. The plan does not require closure of the 325 and 306-E buildings as long as they are needed for active research projects. Operation of these facilities would not violate any existing agreements between DOE and stakeholders or other legal obligations, nor would it affect ongoing or planned environmental restoration and facility transition activities.

The need to restart FFTF is described in Chapter 1 of the Final PEIS. In Chapter 4, the socioeconomic impacts of restarting FFTF are described. The economic welfare of Hanford and all DOE sites is important to DOE. However, any economic impact is secondary to the proper expenditure of taxpayer dollars.

As discussed in Section 1.2 of Volume 1, plutonium-238 would be produced to support NASA's deep space missions. Plutonium-238 is not

Commentor No. 1055: Kim Burkland (Cont'd)

Response to Commentor No. 1055

used to produce nuclear weapons. All missions considered in the NI PEIS are for civilian purposes.

1055-14: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Commentor No. 1056: Ivan Green

2 Sep 2000

From: Ivan Green
 1212 NE 26th Ave Apt 8
 Portland OR 97232

To: Colette Brown, US DOE
 Subj: PEIS, FFTF Hanford

In 1989, the DOE signed the Tri-Party Agreement for cleanup of Hanford. What compelling need has now arisen?

- 1) Plutonium in space? Threat to all earthlings!
- 2) Nuclear power? Economically dead issue!
- 3) Medical isotopes? Yes, I heard compelling testimony, but long-term carcinogenic effects on all of us must override the few!
- 4) Unstated goals? Weapons?

I urge the choice of Alt 5 or Alt 2:
 No further development: cleanup the mess.

Ivan Green

Thanks for hearing at OMSI, Portland.

Response to Commentor No. 1056

1056-1: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

1056-2: DOE notes the commentor's views regarding the potential use of FFTF for expanding DOE's existing nuclear facility infrastructure. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs:

- 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;
- 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and
- 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. However, no component of the proposed action is for the purpose of supporting any defense or weapons related mission. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

1056-3: DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF, or Alternative 2, Use Only Existing Operational Facilities.

Commentor No. 1058: Anonymous

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

I would like for my elected officials to really 'educate' themselves about the FFTE and consider the facts over 'public pressure' in making your decision regarding the future of medical isotopes & the FFTE.

I am in favor of this very important health issue. Please keep the FFTE open for continued research projects. It is truly an asset to our nuclear infrastructure.

1059-1
1059-2

7/12/00

Response to Commentor No. 1059

- 1059-1:** DOE notes the commentor's views on the necessity for reliance on objective, factual information as the basis for sound decisionmaking. DOE is committed to providing the public with comprehensive environmental reviews of its proposed actions in accordance with NEPA, and to providing ample opportunity for public comment on those actions. DOE's Record of Decision for the NI PEIS will be based on a number of factors including environmental impacts, public input, costs, nonproliferation impacts, schedules, technical assurance, and other policy and programmatic objectives.
- 1059-2:** DOE notes the commentor's support for Alternative 1, Restart FFTE.

Commentor No. 1060: Nathan Koenig

Response to Commentor No. 1060

Draft PEIS Comment Form

I am thoroughly opposed to the re-start-up of the Hanford Nuclear Power Plant. The site needs to be cleaned up and no more nuclear power of any kind shall be generated at the plant.

1060-1

1060-2

1060-1: DOE notes the commentor's opposition to Alternative 1, Restart FTF; however, it should be pointed out that the FTF is a research reactor and not an electrical power generating facility.

1060-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

The FTF is not capable of producing power in the form of electricity. The proposed activity is to produce medical and industrial isotopes, produce plutonium-238 for NASA space missions, and for research and development.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

Commentor No. 1063: Marvin Lewis

NI PEIS Toll_Free Telephone

9/11/00

Marvin Lewis
3133 Fairfield Street
Philadelphia, PA 19136
215_676_1291

This is a comment for the record. Please don't send me any more paper. I have enough.

First of all, NASA is not doing enough to develop alternative, namely solar power sources for space missions.

1063-1

Two, we have some pretty nasty problems with worker contamination accidents at some of these production facilities. We don't need more.

1063-2

Third, expansion of the number of launches and nuclear power space vehicles from Cape Canaveral on rockets with noticeable failure rates, sometimes over 10 percent, will only increase the possibility of a deadly mishap, like a few pounds of this being smeared across Washington, D.C. and hopefully not Philadelphia because that is my address.

1063-3

The massive cost of expanded production of plutonium_238 cannot be justified at a time when DOE admits it needs over \$300 billion to clean up it's existing problems at DOE facilities.

1063-4

The military is promoting use of nuclear power in space for space_based weapons technology. Using nuclear power for space war will have severe environmental implications for life all over the earth, even though I am particularly worried about the U.S. because that is where I live.

1063-5

Response to Commentor No. 1063

1063-1: DOE notes the commentor's interest in the development of alternative energy sources for space missions, although issues such as NASA research priorities are beyond the scope of this Nuclear Infrastructure PEIS. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch.

1063-2: Plutonium-238 processing facilities can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Sections 4.2-4.6 of Volume 1 provide the results of the evaluation of potential health impacts that would be expected to result from plutonium-238 processing, including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that the radiological and nonradiological risks associated with plutonium-238 processing would be small.

1063-3: DOE notes the commentor's concern for NASA's use of nuclear materials for space missions.

1063-4: DOE notes the commentor's opinion and concern about funding available for cleanup at DOE facilities.

1063-5: DOE notes the commentor's concern for the use of nuclear power in space-based weapons. The DOE missions stated in this PEIS are not defense- or weapons-related.

Commentor No. 1063: Marvin Lewis (Cont'd)

This whole idea is stupid. The only reason for it is to make money for global corporations. You can say that the reasons are other things, but I don't have to believe you and I don't.

1063-6

Those are my comments, I hope you got them. I hope you got the flavor of them too. Namely, I don't like the whole idea of space_based weapons, specially plutonium in space, because it has a habit of coming back. And it might miss you and hit me, and I don't need that. Thank you.

1063-5

Response to Commentor No. 1063

1063-6: DOE notes the commentor's views. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs:

- 1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;
- 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and
- 3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

Commentor No. 1064: James O. Dittmer

Draft PEIS Comment Form

The FFTF must be restarted to provide an irradiation source to make nuclear medicine isotopes and Pu 238 for NASA so that deepspace probes can continue. Also the FFTF could be used for future irradiation mission that have not be identified. The USA has very limited nuclear irradiation facilities and any new reactor or accelerators would be very expensive and couldn't do what FFTF has and could continue to do. The staff and infrastructure is still in place at FFTF.

Nuclear medicine has made great strides with procedures that are so much less risk and with much greater success. I have had two personnel experiences with the use of ~~radio~~ isotopes used to detect potential blockages around the heart, and this method was less intrusive than angiogram method.

Response to Commentor No. 1064

1064-1

1064-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

Commentor No. 1065: Douglas J. McCarron
United Brotherhood of Carpenters and Joiners of America

UNITED BROTHERHOOD OF CARPENTERS AND JOINERS OF AMERICA

Douglas J. McCarron
General President

September 8, 2000

Colette E. Brown, NE-509
U.S. Dept. of Energy
19901 Germantown Road
Germantown, MD 20674

Dear Ms. Brown:

The official position of the United Brotherhood of Carpenters is in support of restarting the FFTF as outlined in the NI PEIS alternatives. The country needs the isotope production capabilities that are the responsibilities of the Department of Energy under the Atomic Energy Act.

The PEIS states, "Of particular need over the longer term are dependable sources of research isotopes and reactor facilities providing high volume flux irradiation for nuclear fuels and materials testing." This reactor built by our members is efficient and capable of supporting the research and development program. America must pursue clinical medicine, scientific research, and industrial endeavors, and FFTF has a proven track record in reliability for this program.

Studies have noted inhibited growth in the use of radioisotopes to provide a better life for our citizens. The health of our workers is at risk by a reliance on foreign suppliers, which is detrimental to the best interests of our country. This also means we are funding jobs outside this country. We need to be assured that DOE take the actions to ensure union members keep their operating and construction jobs.

Let's go forward under the NI PEIS in trying to determine the best answer to filling the gaps in the DOE infrastructure. The decision that the DOE has to make is not an easy one. There are many complex science and technical issues that need to be addressed. Choosing an already existing facility that is the newest in the DOE complex with a replacement value of almost \$2 billion makes the most sense to me. For the reasons mentioned above, I urge to consider restart of the FFTF as the best alternative.

Sincerely,

Douglas J. McCarron
GENERAL PRESIDENT

DJM/jb

Response to Commentor No. 1065

1065-1

1065-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

1065-2

1065-2: DOE NOTES the commentor's view. If DOE decides to enhance its nuclear infrastructure, this will reduce our reliance on foreign suppliers. However, it is not the intention of the DOE to become the sole supplier of domestic medical isotopes.

1065-1

Commentor No. 1066: Fred T. Matica

Draft PEIS Comment Form

NATURE HAS GIVEN US THE BEST NUCLEAR POWER PLANT, FIND AT A SAFE LOCATION — THE SUN AT 93 MILLION MILES IS FREE, CLEAN, REQUIRES NO MAINTENANCE & WILL OPERATE FOR BILLIONS OF YEARS TO COME! BUT DO USE CAUTION — SKIN CANCER, YOU KNOW!

SPACE PROGRAMS & ISOTOPES ARE WONDERFUL, BUT LETS FIRST SHOW HOW WE CAN SOLVE PROBLEMS ON EARTH USING THE "PAID-FOR" SPACE TECHNOLOGIES & PREVENT DISEASES RATHER THAN HAVING TO USE DANGEROUS SUBSTANCES TO "NUKE" TUMORS.

PLEASE COMPLY WITH THE "3 PARTY AGREE - / MENT & CLEANUP & SHUT DOWN HANFORD. I NO LONGER BELIEVE OR TRUST THE INTENTIONS OR ACTIONS OF THE D.O.E.

COLETTE, YOU DIDNT LOOK VERY GOOD AT THE PORTLAND MEETING. YOU ARE ON THE RECEIVING END OF A LOT OF HOSTILITY & IT IS TAKING ITS TOLL. PLEASE TAKE CARE OF YOURSELF. I WILL SAY A PRAYER FOR YOU.

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

1066-1

1066-1: DOE notes the commentor's interest in solar energy. Consistent with its mandates under the Atomic Energy Act, DOE is proposing this enhancement for the purposes of addressing three primary needs: 1) to support the increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee; 2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238 a fuel source that is required for deep space missions and for which the U.S. has no long-term, assured supply; and 3) to support civilian nuclear energy research and development in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio.

1066-2

1066-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Commentor No. 1067: Vera Dafoe

RE: DRAFT EIS FFTF

Dear Ms. Brown:

I want to register my strong objection to all alternatives in the Draft EIS wherein the FFTF would be started up.

In my opinion, the plan to re-start the nuclear reactor is insane. We seem to have a group of mad scientists operating the Department of Energy when they would even consider such a plan.

There is already massive, uncontrolled contamination at Hanford. The Department seems unable to clean it up before the whole mess leaks into the Columbia River.

The general public--and those in Oregon, in particular--does NOT want the reactor restarted.

I don't want it restarted.

Hanford is a disaster waiting to happen.

How many hearings, how many letters, how many phone calls will it take to get across that we do NOT want this restart?

I say NO!

No reactor startup.

Money and energy should be directed to cleaning the existing and dangerous waste that is already at Hanford.

Sincerely
Vera Dafoe
Vera Dafoe

Response to Commentor No. 1067

1067-1

1067-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1067-2

1067-2: DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

1067-1

1067-2

1067-1

1067-2

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

Commentor No. 1068: Vincent D. Dobbin

Draft PEIS Comment Form

Ms. Colette E. Brown, NE-50
U.S. Dept. of Energy
19901 Germantown Road
Germantown, MD 20874

Please - RESTART the FFTE Facility at Hanford!! Medical Isotopes are needed so badly, both for diagnostic procedures, & to treat & cure many of the cancers that are killing so many people! Building new reactors would take so many more years, and meanwhile we watch so many friends & relatives suffer from the cancers, chemotherapy & still do not live long!
The public deserves what the FFTE is able to provide!!

1068-1

1068-1: DOE notes the commentor's support for Alternative 1, Restart FFTE, and opposition to Alternative 4, Construct New Research Reactor.

There are several ways to provide comments on the Nuclear Infrastructure PEIS. These include:

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Commentor No. 1069: John E. Nolan

Response to Commentor No. 1069

411 Snyder Rd.
Richland, WA. 99352
September 6, 2000

Ms. Colette E. Brown
NE-50- Office of Nuclear Science
Energy and Technology
U.S. Department of Energy
19901 Germantown Road
Germantown, MD 20874

Dear Ms. Brown:

I hope someone reads these responses rather than just takes a head count of who is for or against. Nevertheless, for head count purposes I'm for the restart of FFTF.

However, the issue is bigger than the restart of the world's newest and best test reactor. The issue is basic to the purpose of the Department of Energy and the reason it exists to assure an energy supply for the United States of America. A reliable energy supply is vital for everyday living. It supports life as we know it, relieves drudgery, and lifts people out of poverty. Lack of energy can create havoc and disease in our cities.

DOE decisions should be based on scientific fact and not emotions — and be driven by the long term best interests of the citizens of our nation. Who in DOE will step forward and take those best interests seriously, and not be driven by the latest poll? Who will look at the long term needs and not today's snapshot? Who will look at the long term impact on taxpayers.

Today's snapshot of medical isotopes and P^{238} supply are valid reasons for restart; however, the ability of the USA to obtain reliable scientific data for energy supply decisions in the future should not be lost by abandoning this safe, versatile test reactor.

Sincerely yours,

John E. Nolan
RECIPIENT / DOE Distinguished Associate Award, April 1990

1069-1

1069-1: DOE policy encourages effective public participation in its decision making process. In compliance with NEPA and CEQ regulations, DOE provided opportunity to the public to comment on the scope of the NI PEIS and the environmental impact analysis of DOE's proposed alternatives. DOE gave equal consideration to all comments. In preparing the Final NI PEIS, DOE carefully considered comments received from the public.

1069-2

1069-2: DOE notes the commentor's support for Alternative 1, Restart FFTF.

1069-3

1069-3: DOE notes the commentor's view. DOE's Record of Decision for the NI PEIS will be based on scientific merit and a number of other factors including environmental impacts, costs, public input, nonproliferation concerns, program objectives and schedules.

1069-2

Commentor No. 1070: Brad Yazzolino

Ms. Colette Brown
 USDOE Office of Space & Defense Power SystemsNE-50
 19901 Germantown Road
 Germantown Maryland 20874-1290

Dear Agencies involved with the DOE/EIS-03100 of July 2000,

I think alternative #5 is the only reasonable alternative, and I am favor of it and only it.

As a Portland native I have been aware of the sad history of Hanford for many decades. I lived in Richland for a while in the early 50's. I remember the landscape there, the sagebrush hills are not at all barren, and not at all a wasteland. It teems with life. I have toured Hanford twice as a photographer, and I have seen the Columbia River shores there, I agree with the great number of fish biologists that say it is the absolutely the best salmon spawning habitat on the river.

Now that the Army Corps of Engineers and the present administration has Set aside Hanford reach as A National Monument, and said that they aren't going to breach any Snake River dams soon, then that just makes the 110 miles of river or so of rivershore near Hanford all the more precious. (If your milages differ slightly from mine, fine.. but don't forget to count both sides of the river and all that island shoreline too.)

I have been to a lot of these meetings on FFTF over the last few years and I agreed with the City of Portland City Council in September 1999 when they said "NO" to re-starting the FFTF. I commend all the Senators and Congresspeople who spoke up back then, and all of those who do so now, who still say NO to the re-start. To me the DOE is behaving like a petrified fossil with it's hand still on the steering wheel, and they, like Jesse Helms, and Slade Gorton, refuse to acknowledge the tide of history that we people, make with our lives everyday.

I think that the PEIS reveals that DOE and it's corporate friends still actually want to use the FFTF for tritium production, and other things such as the purpose that is stated on page D-16 of volume two of the PEIS, which says:

"There is particular interest in materials testing associated with extension of commercial nuclear power plant license renewals."

Well, I don't want to see old ready-to-die nuclear plants retrofitted with things cooked up in a re-sarted FFTF on the shores of our Columbia River. If FFTF is allowed to restart, in a while we'll learn that medical isotopes are only some of the things that it is "good" for.

Restarting this 20 year old liquid sodium cooled reactor in a area that has been so poisoned, and so desparately needs to focus on its difficult clean up mission is totally absurd, and most people outside of the DOE and the Tri-cities area see that.

Build a new medical isotope reactor somewhere else, somewhere nowhere near one of the largest rivers on the continent please, if you must, but do not re-start the FFTF! It is too expensive, the design is flawed and incomplete, the PEIS failed to include costs in a timely manner and the waste stream plan is inadequate and incomplete.

Brad Yazzolino
 6451 SE Morrison Ct
 Portland, OR 97215

1070-1

1070-2

1070-3

1070-4

1070-2

1070-5

1070-6

1070-7

1070-8

Response to Commentor No. 1070

1070-1: DOE notes the commentor's support of Alternative 5, Permanently Deactivate FFTF.

1070-2: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.

1070-3: DOE notes the commentor's opposition to the use of FFTF for the expansion of its nuclear facility infrastructure. Consistent with its mandates under the Atomic Energy Act, DOE seeks to maintain and enhance its infrastructure for the purposes of addressing three primary needs:

1) to support the need for increased domestic production of isotopes for medical, research, and industrial uses, as initially identified by a panel of experts in the medical field and reaffirmed by the Nuclear Energy Research Advisory Committee;

2) to support future NASA space exploration missions by re-establishing a domestic capability to produce plutonium-238, a fuel source that is required for deep space missions and which the U.S. has no long-term, assured supply; and

3) to support civilian nuclear research and development needs in order to maintain the clean, safe, and reliable use of nuclear power as a viable component of the United States' energy portfolio. Section 1.2 of Volume 1 was revised to clarify the purpose and need of the proposed action.

In January 1997, President Clinton tasked his Committee of Advisors on Science and Technology (PCAST) to evaluate the current national energy research and development portfolio and to provide a strategy that ensures the United States has a program to address the Nation's energy and environmental needs for the next century. In its November 1997 report responding to this request, the PCAST Energy Research and Development Panel determined that restoring a viable nuclear energy option to help meet our future energy needs is important and that a properly focused research and development effort to address the potential long-term barriers to expanded use of nuclear power (e.g., nuclear waste, proliferation, safety, and economics) was appropriate. The PCAST panel further recommended that DOE reinvigorate its nuclear energy research and development activities to address these potential barriers. Section 1.2.3 of Volume 1 provides information on the nuclear energy research and development mission.

Commentor No. 1070: Brad Yazzolino (Cont'd)

Response to Commentor No. 1070

1070-4: DOE was tasked by Congress in the Atomic Energy Act of 1954, as amended, to “ensure the availability of isotopes for medical, industrial, and research applications, meeting the nuclear material needs of other federal agencies, and undertaking research and development of activities related to development of nuclear power for civilian use.” The purpose of this PEIS is to determine the environmental and other impacts to accomplishing this mission from all reasonable existing and new DOE resources. The FFTF at the Hanford Site was one of several existing DOE resources that was assessed for this mission.

DOE notes the commentor’s opposition to Alternative 1, Restart FFTF, and concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Although the FFTF is 20 years old, it is DOE's newest reactor, it is in excellent condition and evaluations have been performed to show that it has sufficient life remaining to fully support the proposed 35 year mission.

1070-5: DOE notes the commentor's opinion.

1070-6: As discussed in Section 2.3.1.1, the design of the FFTF, as described in its Safety Analysis Report, was reviewed by both the U.S. Nuclear Regulatory Commission and the Advisory Committee for Reactor Safeguards prior to its operation. While some plant modifications would be made if DOE decides to restart the FFTF, the design of these modifications would be subjected to a rigorous review process. The analyses presented in the PEIS, which show very low risk associated with the operation of FFTF, reflect the changes needed to support the stated missions.

1070-7: The costs of proposed actions are not required by NEPA and CEQ regulations to be included in a PEIS. DOE prepared a separate Cost Report to provide additional pertinent information to the Secretary of

Commentor No. 1070: Brad Yazzolino (Cont'd)

Response to Commentor No. 1070

Energy so that he may make an informed decision with respect to the alternatives presented in the NI PEIS. Pursuant to CEQ regulations (40 CFR 1505.1(e)), agencies are encouraged to make ancillary decision documents available to the public before a decision is made. DOE mailed this document to about 730 interested parties on August 24, 2000. The report was made available immediately upon release on the NE web site <http://www.nuclear.gov>) and in the public reading rooms. DOE has also provided a summary of the Cost Report in Appendix P in the Final NI PEIS.

- 1070-8:** Management of wastes that would be generated under implementation of Alternative 1, Restart FFTF, is discussed in Section 4.3 of Volume 1 (e.g., see Section 4.3.1.1.13). Section 4.3.1.1.13 was revised to clarify that, the Hanford waste management infrastructure is analyzed in this PEIS for the management of waste resulting from FFTF restart and operation. This analysis is consistent with policy and DOE Order 435.1, that DOE radioactive waste shall be treated, stored, and in the case of low-level waste, disposed of at the site where the waste is generated, if practical; or at another DOE facility. However, if DOE determines that use of the Hanford waste management infrastructure or other DOE sites is not practical or cost effective, DOE may issue an exemption under DOE Order 435.1 for the use of non-DOE facilities (i.e., commercial facilities) to store, treat, and dispose of such waste generated from the restart and operation of FFTF. In addition, Sections 4.3.3.1.13 and 4.4.3.1.13 also address the potential impacts associated with the waste generated from the target fabrication and processing in FMEF and how this waste would be managed at the site.

DOE has developed a draft "Waste Minimization and Management Plan for FFTF" to incorporate pollution prevention and waste minimization practices in its consideration of the future of FFTF. If a decision were made to restart FFTF, this plan would be used to ensure that optimum opportunities are provided for characterizing potential waste streams, identifying source reduction and recycling strategies, evaluating disposition options, developing sustainable designs, and implementing effective management strategies.

Ms. Colette Brown, U S Department of Energy,
Office of Space and Defense Power Systems, NE-50,
19901 Germantown, Maryland 200874-1290

Nuclear Infrastructure PEIS Comment:

The United States Department of Energy is being encouraged to produce tritium in the Hanford FFFR reactor or in the TVA reactors. Lobbyists, potential tritium production contractors and that camp of politicians that will gain the most from their support in this election campaign are pushing this defense production with very little knowledge about the current stockpile and economic and nuclear future of US citizens.

In the early 1950's our nuclear warhead laboratories had perfected a warhead under 100 pounds weight that would yield 100 kilotons of blast. We were capable of producing a kiloton of blast with every pound of weight in a conventional plutonium uranium nuclear warhead. The two Japanese drops showed us that each kiloton of blast could cause 10,000 immediate and 20,000 total deaths over six months. We could have built our arsenal around 100 warheads of this simplicity and size and been able to create 200 million deaths without our fancy delivery and guidance systems. Perhaps a 1500 foot height detonation would be most efficient.

Terrorists could deliver the same warheads on foot, simply setting it to detonate at ground level. A ground level detonation would waste perhaps half of the blast but produce a great cloud of radiated dust which would travel around a world hemisphere.

Instead of such simplicity, we produced 70,000 nuclear and thermonuclear (hydrogen) warheads, having as many as 36,000 in the stockpile at one time. We absolutely had no need for more than 100 of that production and never utilized any tritium or thermonuclear ability. Total cost was \$4,400 per US citizen for each of 55 years or 58 billion dollars. We must stop grandizing weapons of mass destruction and reduce the world's stockpiles to common sense size. Any nation that has 100 warheads of an average two million civilian kill size needs a new congress and administrative staff if they are foolish enough to believe they are going to protect us from total annihilation.

This election let's put people in office that will do more than fill their pockets. Elect someone who knows that we don't need to spend one third of our defense money in a bloated irresponsible nuclear game. Lets make our world safer with a sensible stock pile size and no more tritium production and contamination.

Respectfully yours

R. Virgil Donovan
Former nuclear stockpile coordinator

Response to Commentor No. 1071

1071-1

1071-1: DOE notes the commentor's interest in eliminating or reducing the arsenal of nuclear weapons. Issues of nuclear weapons production, dismantlement of weapons, and elimination of weapons systems are beyond the scope of this Nuclear Infrastructure PEIS. The DOE missions addressed in this NI PEIS are civilian nuclear energy missions and are not defense-related.

Commentor No. 1071: R. Virgil Donovan (Cont'd)

January 24, 2000

Dear Editor:

According to the Brookings Institute study released by the government about two years ago the United States government has spent \$58 trillion dollars on nuclear warhead-oriented costs. This is over the 55 years since entering into such support and production. Figuring 240 million average US population during this time, that is \$4,400 cost per year, per individual US citizen.

Let's take a look at what a citizen has bought. In the 1940's, we dropped two warheads on Japan in a wartime situation. These two warheads yielded about 27 kilotons of explosive effect and killed 132,000 people immediately. About double that many losses occurred as a result of longer term deaths, radiation and eventual injury losses. That 27 kilotons of explosive power wiped out about 20,000 people per kiloton or let us say on average, one quarter of a million people.

In the early 1950s, we showed the world that we could produce 100 kilotons of yield from less than 100 pounds of atomic warhead. That little warhead which could be carried in a sack or suitcase was not big enough. We had to have a stockpile totally converted to thermonuclear strength in the 1960s potentially yielding 164 kilotons per warhead; further we required 36,000 of these at peak stockpile size

Figuring conservatively at one and a half million lives taken per warhead and total detonation we could annihilate 54 billion lives. There are only 6 billion persons in the world today. It would appear the American people bought nine times as much stockpile as they needed to wipe out everyone on earth. I believe the world would yield to our wishes if we only wiped out one third of the population. We have spent 27 times as much as we should have and that figures nothing for the loss of life due to residual radiation.

When are we going to put some politicians in office that can look out for our future? Those that have led us down this primrose path for the mighty warhead contractors should be turned out to pasture.

Respectfully yours,

R. Virgil Donovan
 Retired nuclear stockpile coordinator.

To whom it may concern:

This is an important time in the election process and one of us must insist those we elect President and Congress government has wasted our funds in many places and fi

More
ast, our
r places.

Under 55 years of government leadership, we have spent \$4,400 every year for everyone in the US on nuclear warheads, mostly thermonuclear (hydrogen warheads). We built 70,000 and kept 36,000 in the peak size stockpile (about a 22 times overkill). The costs above include the most advanced delivery, guidance and detonating systems; nothing in the way of hand delivery here.

This year our government has again stepped forward and launched the planning of 8 systems of what they call triggers by the Los Alamos laboratory. In truth, 8 complete new warheads are under design and each is a thermonuclear(hydrogen) requiring the continuous processing of large amounts of new tritium. The Department of Energy is already pushing for the conversion of a reactor for tritium production. Tritium has already contaminated large areas of nuclear production plants, surrounding lands, residential areas and threatens ground water.

The first 3200 warheads will be converted for the Navy beginning in 2004. In the past, the Navy has gotten about one third of the laboratory results and the Army and Air force gets about equal shares so we are looking at another tremendously oversized expensive production or conversion of 9600 thermonuclear warheads. We will certainly continue to have an unneeded 7 times overkill.

Do we have elected Congressmen that will do more than pork barrel with these wasteful programs?. Where is the presidential or congressional candidate that will do more than take a hand out on this and when do we see this \$4,400 per year cost- per- person go for more soldiers pay and conventional defense rather than continuous overbuild and clean- up of the never ending residual nuclear mess.

100 nuclear warheads requiring no tritium (hydrogen component) still capable of yielding 100 kilotons of blast can produce a kill of 200 million people. That's one third the population of both the US and Soviet nations (twice as much as would be necessary to subdue any two nations). We never want to see a total use of this much stockpile. The lives we could live would only be what the residual radiation and its results allows. Let's elect people that think and act on this.

Respectfully yours,

R. Virgil Donovan

Nuclear Infrastructure PEIS Comment:

I intend to attend the Richland, Washington comment session August 31 at the Best Western Conference Center. I hope to be able to present this letter as well as some of my thoughts at that presentation.

As you probably know I am a former administrative engineer for the Atomic Energy Commission which was many years back but that history had a lot of bearing on my thoughts. I was one of the engineers following the FFTF through preliminary and design stages prior to any construction. I transferred to Albuquerque Weapons Headquarters and was a coordinator in nuclear weapons production, transportation and storage until transferring to Rocky Flats in Colorado. I became the lump sum contract administrator for weapons facilities there until quitting in 1972 to become active trying to stop this political nonsense. As a Washington state citizen, I campaigned against Senator Henry Jackson seriously for two years before the 1980 election but gave up in the face of huge donations from the nuclear camp.

In 1966 and 67 the Atomic Energy Commission was at the peak of converting the total nuclear warhead stockpile from fission to fusion warheads and each weapon would the require a hydrogen component in addition to plutonium and uranium. The early fusion weapons used deuterium as a hydrogen component and it was thought that it was somewhat safer than tritium. However, the government had a large source of tritium as it was a byproduct of every reactor whether for weapons or power production. This information had simply been classified up till now but the political powers were able to convince our congress to make good use of that cheap illusive tritium instead of using a more stable deuterium? Naturally the politicians approved and we went forward to require more tritium than the approved power reactors were producing and even purchased foreign tritium.

Several other things happened in 1966 and 67. We were at the maximum warhead stockpile size of 33,000 and the Soviets were still only at 28,000. It mattered little that some 19,000 were strategic and the other 14,000 were of some smaller designation. What did matter to the other eleven coordinator's in our two offices at Albuquerque Operations Office were the stories we were hearing. The new Secretary of Defense was going to reduce the stockpile to under a limit of 2,400. It was rumored that only 400 of the stockpile could be used at maximum effectiveness

1071-1

Response to Commentor No. 1071

Commentor No. 1071: R. Virgil Donovan (Cont'd)

or triggered at around 1,000 feet above the ground or no one could live in the total fallout. Thus the secretary felt that it sufficient to provide 800 or twice the lethal amount of weapons to each one of his branches of the service. The Army, the Navy and the Air force would then require 2400 warheads so they would have nothing to fuss about. Secretary McNamara found a new position as the world bank chair almost immediately. After all, President Kennedy thought we needed more weapons at that time, just after the elections.

At the present time, President Clinton and the soviets have an agreement to reduce the number of warheads in each stock pile. At last count our 33,000 is down under 18,800 and their stockpile has shrunk semiyearly. How could we have possibly justified converting to more production of tritium when we can't even justify the use of tritium ?

We should be moving toward converting back to fission weapons. They are as large as we will ever use and require no tritium. We decided years ago that large fissionable weapons are not needed but we keep them up through constant rebuild and retrofit with unneeded ,continuing expense and contamination. We need to look at retiring and cleaning up the production of all nuclear weapons and stopping the upcoming potential holocaust, not just the FFTF.

Respectfully yours,

R. Virgil Donovan,
Retired nuclear stockpile coordinator

Re: **Support for restart of the Fast Flux Test Facility**

Dear Ms. Brown:

Franklin County would like to make clear its unwavering support for restart of the Department of Energy's Fast Flux Test Facility (FFTF) at the Hanford Site.

With the multi-billion dollar facility and support infrastructure already in place, restart of the FFTF is the only reasonable, fair, and prudent use of taxpayer dollars in pursuit of the mission stated by the DOE in the draft *Nuclear Infrastructure Programmatic Environmental Impact Statement* of July 2000.

Based on the facility's availability, capacity for multi-product missions, demonstrated technology, cost effectiveness, minimal environmental impact, existing infrastructure, skilled labor force, and an excellent safety record, it is clear that restart of the FFTF is the only logical choice for the DOE to meet its stated objectives.

There is overwhelming support in Franklin County and throughout the Tri-Cities area for the reuse of this incomparable national asset. We are excited about both the economic benefits restart could bring to our region, and about the contributions our community can make toward meeting national and global needs in isotope research and production.

Response to Commentor No. 1072

1072-1

NUCLEAR INFRASTRUCTURE PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

Draft PEIS Comment Form

I support restart of FFTF for production of medical isotopes and I support restart of the FFTF for production of medical isotopes and fuel for space applications.

I have cancer which is in remission and we ought to be making it easier for cancer research by treatment which I feel very strongly for because I have this cancer.

I also feel that if I could sum up of fuel some day in the future and that we need nuclear energy for the rest of this century going.

Germantown, MD 20874

Dear Ms. Brown:

I attended the PEIS meeting in Richland on Thursday, August 31, 2000 and was impressed with your presentation and with the public input. I offer the following comments.

The FFTF should be restarted for the three missions that are being considered. This should be done as rapidly as possible to support both cancer treatment and cancer treatment research. I believe that the FFTF has the capacity to produce medical isotopes for both treatment and research.

I hope that the safe operating history of the FFTF is an important part of the PEIS. The FFTF operated safely for about ten years with a very minimal effect on the environment.

Dr. Robert Shenter quoted a figure of 1500 cancer deaths per day. It would be of interest to estimate how many of those deaths would be averted by the use of medical isotopes produced by the FFTF.

The cancer occurrences per year should be used to estimate the following items:

a) the fraction of these cancers that could be treated with radioisotopes.

b) the percentage of successful treatments.

and c) the costs of treating these cancers.

If these calculations were done, these costs could be compared to the costs of conventional treatment. This would be a useful addition to the PEIS.

Sincerely,

Archie Wilcox, (retired Nuclear Engineer)

1075-1

1075-1: DOE notes the commentor's support for Alternative 1, Restart FFTF.

1075-2

1075-2: The operational history of FFTF (worker exposure data, annual radiological emissions, safety history and analysis) was used in the development of the human health impact assessment for all alternative options that included the restart of FFTF. DOE agrees that FFTF can be safely operated to support the nuclear infrastructure missions described in Section 1.2 of Volume 1. Section 4.3 of Volume 1 provides the results of the evaluation of potential health impacts that would be expected to result from implementation of Alternative 1 (which includes restart of FFTF), including normal operations and a spectrum of accidents that included severe accidents. The environmental analysis showed that radiological and nonradiological risks associated with restarting FFTF would be small.

1075-3

1075-3: No evaluation has been made in the NI PEIS of the health benefits or monetary costs associated with treating people with medical isotopes produced under any of the alternatives assessed. The purpose of the PEIS is to determine the environmental impacts associated with each alternative being considered for implementation by DOE.

Subject: PEIS On Expanded Production of PLU_238
Auto forwarded by a Rule

U.S. Department of Energy
NE_50, 19901 Germantown Rd.
Germantown, MD 20874_1290

Dear Ms. Brown:

The purpose of this message is to place on the public record my views for the draft Programmatic Environmental Impact Statement concerning the DoE plan to expand production of PLU_238 for future space missions.

My thoughts are summed up in three words: don't do it.

There are a variety of reasons to not expand production of PLU_238. Some of the more important considerations are listed below.

NASA should develop solar power sources for space missions before utilizing more nuclear material. The European Space Agency has already developed high_efficiency solar panels for deep space use, so we can too.

Rockets launched from Cape Canaveral have had a ten percent failure rate. Increasing the number of nuclear powered space devices placed on such unreliable launch vehicles will certainly increase the possibility of deadly accidents.

DoE has stated that it needs more than \$300 billion to clean_up existing problems at DoE sites. This should be accomplished__ to protect the public and the environment__before any funds are expended to exacerbate the clean_up back log by expanding production.

1077-1

1077-2

1077-3

Response to Commentor No. 1077

1077-1: DOE notes the commentor's opposition to the DOE production of plutonium-238 for use in future NASA space exploration missions. Section 1.2.2 of Volume 1 was revised to clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

1077-2: DOE notes the commentor's concern for NASA's use of nuclear materials for space missions and interest in the development of alternative energy sources for space missions, although issues such as NASA research priorities are beyond the scope of this PEIS. Through a Memorandum of Understanding with NASA, DOE provides radioisotope power systems, and the plutonium-238 that fuels them, for space missions that require or would be enhanced by their use. These radioisotope power systems have been used for almost 40 years, and have repeatedly demonstrated their performance, safety, and reliability in various NASA space missions. NASA establishes the need and requirements for space missions and undergoes a thorough NEPA evaluation for each launch.

1077-3: DOE notes the commentor's opinion and concern about funding available for cleanup at DOE facilities.

1077-4: DOE notes the commentor's concern for the use of nuclear power in space-based weapons, although issues such as the use of nuclear power sources in space-based weapons systems are beyond the scope of this Nuclear Infrastructure PEIS. The scope of this Nuclear Infrastructure PEIS is limited to analysis of alternatives to fulfill the requirements of the DOE missions, which include the production of medical and industrial isotopes, the production of plutonium-238, and civilian nuclear energy research and development. The three missions, including the production of plutonium-238 for civilian NASA space exploration missions, are civilian nuclear energy missions and are not defense-related missions.

Commentor No. 1077: Larry Egly (Cont'd)

Some of this expanded production will probably be used by the military for space_based weapons. This could have egregious effects on the earth and all of humankind.

1077-4

Thank you for adding by remarks to the public record.

Respectfully,
Larry Egly

Commentor No. 1078: William E. Schenewerk (Cont'd)

Re LA TIMES, Sunday 09032000

Lloyd J. Dumas's editorial is the typical anti_technology editorial that seems to appear on a regular schedule. The words "arrogance" (false superiority) and "solar energy" seems to be part of these editorials. After a large number of complaints, there is offered the crumbs of solar and wind energy. Sometimes we get offered hemp.

Wind energy had its day 200 years ago. Sail_powered ships are as fast as early steam_powered ships, under optimal wind conditions.

Today there are no sail_powered merchant ships. The 1998 California renewable energy production is half the 1988 California renewable energy production. A random visit to the Livermore CA wind_energy windmills will show: 1/3 running, 1/3 not running, and 1/3 in pieces.

The economics of solar energy is very bad. Base_loaded solar_thermal power generation is best done using ammonia_water distillation and recombination for energy storage. Energy storage cost is roughly 1/4 total cost. All energy storage methods lose roughly half the collected energy. As a result, any energy storage doubles collector area. Power production is roughly 50 W/m² of mirror, assuming cooling_water is available. Annual energy production is roughly 50 kWh/m² of mirror, using 250 sunny days, 6 hr/day and 70% plant availability. Materials to build a house cost over \$200/m². Tracking mirrors will cost at least as much, \$200/m².

Energy storage cost, based on mirror area, is \$50/m².

Resulting total cost is \$250/m², based on collector area. At 15% investment and maintenance cost, power costs is a rock_bottom 0.75 \$/kWh. This is 8 to 10 times the present cost of electricity.

This ratio has not improved in the last 30 years. Photo_voltaic solar gives up any potential advantage over solar_thermal by requiring batteries for energy storage. Storage battery plates crumble after a year of deep_cycle use.

For the last 30 years natural gas was by far the cheapest source of energy. Energy policy since 1974 is based on cheap natural gas.

Response to Commentor No. 1078

Commentor No. 1078: William E. Schenewerk (Cont'd)

Existing coal and nuclear plants were built before cheap natural gas arrived by pipeline.

Coal and nuclear plants had to charge \$0.10/kWh, largely to pay off high_interest loans. Until 2000, a jet airplane motor burning natural gas could sell power at \$0.05/kWh and make money. Regulated utilities charged roughly \$0.07/kWh to pay the average generation cost.

Everybody got amnesia over what happened when the phone company was broken up. Same cost and worse service. Now we get utility deregulation. The poor (sniff sniff) utilities got stuck with theatomic power plants and a few fossil plants. The nukes will be nearly paid off when deregulation is complete. The utilities, except

Los Angeles DWP, were denied the responsibility of power generation.

California gas_fired plants were scattered among independent power producers. Cheap natural gas was supposed to make everyone's utility bill decrease.

Now the party may be over. Expensive oil and natural gas arrived on the heels of utility deregulation. Gas_fueled airplane motors will have to charge \$0.10/kWh for electricity. Half this charge will be spent on natural gas at \$5/1000 ft³. Rising gas costs and the threat of price controls may cause investors to cancel planned generating capacity.

It gets worse. Global warming may be arriving sooner than expected.

We are looking down the teeth of an extinction event. Mosquitoes are already moving north, carrying pestilence. There is war, every 20 years or so, over dwindling oil reserves.

Failure to deploy at least 1800 atomic power plants by 2020 will guarantee global warming exceeds +3 Centigrade by 2100, with no end in sight. 28,000 breeder reactors are needed by 2080 to shut down fossil fuel consumption by 2080. This will hopefully stop global warming at +2.5 Centigrade. A new light water reactor is competitive at \$0.10/kWh electricity cost. Correct energy policy requires understanding machines, thermodynamics, resource production, radiation health effects and population dynamics.

William E. Schenewerk, Ph.D., P.E.

Dear Collette,

7-8-00

Please do not recommend a start-up of The FFTF at Hanford. Reactor operation would create so much more radioactive waste and we already have so much waste to deal with already. Let's solve the waste problems we already have at Hanford before we add to the problem.

The fire that occurred at Hanford a month ago shows how fragile and close to disaster that area is.

Please decommission the FFTF!

Laurie Pavey

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

I had to miss the public hearing.
Clean-up of nuclear waste should be of primary importance - and adding to that is reprehensible. There are plenty of plutonium sources, and I don't buy the medical isotope need. This is an old reactor and should be permanently shut down. I resent my tax dollars being spent on more nuclear waste. My worry is a radioactive Col. River.
Name Duane H. Freeborn

Response to Commentor No. 1146

- 1146-1:** DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
- 1146-2:** DOE notes the commentor's concerns regarding the existing cleanup mission at Hanford. Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington State Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

FFTF is approximately 4.5 miles from the Columbia River. There are no discharges to the river from FFTF and no radioactive or hazardous discharges to groundwater. As indicated in analyses presented in Chapter 4 of Volume 1 (e.g., Sections 4.3.1.1.4, 4.3.3.1.4, 4.4.3.1.4, 4.5.3.2.4, and 4.6.3.2.4), there would be no discernible impacts to groundwater or surface water quality at Hanford from operation of Hanford facilities that would support the nuclear infrastructure missions described in Section 1.2 of Volume 1.

- 1146-3:** DOE could purchase plutonium-238 from Russia; however, for supply reliability reasons and concern of nuclear nonproliferation, DOE's preference is to establish a domestic plutonium-238 production capability. Section 1.2.2 of Volume 1 was revised to further clarify the purpose and need for reestablishing a domestic plutonium-238 production capability to support NASA space exploration missions.

DOE has sought independent analysis of trends in the use of medical isotopes, and of its continuing role in this sector, consistent with its mandates under the Atomic Energy Act. In doing so, it established two expert bodies, the Expert Panel and the NERAC. In 1998, the Expert Panel, which convened to forecast future demand for medical isotopes, estimated that the expected growth rate of medical isotope use during the next 20 years would range from 7 to 14 percent per year for therapeutic applications, and 7 to 16 percent per year for diagnostic applications. These findings were later reviewed and endorsed by NERAC, established in 1999 to provide DOE with expert, objective advice regarding the future form of its isotope research and production activities. DOE has adopted these growth projections as a planning tool for evaluating the potential capability of the existing nuclear facility infrastructure to meet

Commentor No. 1146: Duane H. Freeborn (Cont'd)

Response to Commentor No. 1146

programmatic requirements. In the period since the initial estimates were made, the actual growth of medical isotope use has tracked at levels consistent with the Expert Panel findings. Section 1.2.1 of Volume 1 was revised to incorporate this information and to clarify DOE's role in fulfilling the U.S. research and commercial isotope production needs.

- 1146-4:** DOE notes the commentor's support for Alternative 5, Permanently Deactivate FFTF. The FFTF reactor was constructed and initiated operation in the mid 1980s, making it DOE's newest reactor. It has no structural flaws that would prevent safe operations. As stated in Volume 1, Section 2.3.1.1.2, several upgrades would be implemented if a decision to restart FFTF was made by DOE. These upgrades would improve efficiency and reliability, minimize waste, and conform to current industry standards. Throughout the life of FFTF, the FSAR has been maintained via approved change control and engineering change notices. All updates and revisions have had the required reviews and approvals. No deficiencies in the FFTF design, analysis, facility condition, or operations have been identified or recognized that would prevent FFTF from meeting the safety objectives and intent of commercial nuclear safety regulations for equivalent facilities. If the Record of Decision concludes that FFTF should be restarted, a Probabilistic Risk Assessment would be completed and a new FSAR would be prepared in accordance with applicable regulations. With planned plant upgrades, FFTF would be able to operate safely for the 35 year time period being considered in the NI PEIS.

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

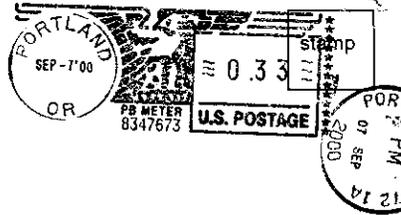

Not only is nuclear power a potential for
 stimulate the weapons of war, but the DOE
 would be going in the absolute opposite
 direction from the way they saved the
 at Hanford
 problem to solve is the disposal of spent fuel
 in 6 basins 450 yards from the Columbia River
 Name and the 178 tanks of waste. Perhaps
 54 million gallons of waste into the Columbia
 Address River with his cleanup in profit.
 City, state Alberta Gerould, 3438 N.E. Davis Rd. Portland, OR 97214

Response to Commentor No. 1147

- 1147-1: DOE notes the commentor's opposition to Alternative 1, Restart FFTF.
 - 1147-2: DOE notes the commentor's interest in reducing the arsenal of nuclear weapons, although issues of nuclear weapons production, dismantlement of weapons, and elimination of weapons systems are beyond the scope of this Nuclear Infrastructure PEIS.
 - 1147-3: Hanford tank waste and K Basin issues are not within the scope of this PEIS, as none of the alternatives considered would add to these waste volumes. Disposition of these wastes is the subject of the ongoing cleanup program at Hanford.
- 1147-3: Although beyond the scope of this NI PEIS, ongoing Hanford cleanup activities are high priority to DOE. Hanford Site environmental restoration activities are conducted in accordance with the Tri-Party Agreement (i.e., Washington Department of Ecology, U.S. Environmental Protection Agency, and the U.S. Department of Energy). This agreement specifies milestones and schedules for restoration of all parts of the Hanford Site. DOE is fully committed to honoring this agreement.

Public comment on Nuclear Infrastructure Draft Programmatic Environmental Impact Statement (NI PEIS)

I am opposed to restart of the Fast Flux Test Facility reactor because:

We have not solved the problem of disposing of highly toxic byproducts of nuclear reactors. I believe that other sources of energy are more safe for people and the environment until clean nuclear disposal is a reality.
