Source: SR 2009a, p.5.6-1; RC 2010;

Generating Facilities

The solar electric generating facility would consist of a power block; 653-foot-high concrete solar receiver tower; liquid salt circulation and storage system; 10,000-gallon diesel storage tank; and up to 17,500 solar tracking mirrors in a circular array around the receiver tower, covering approximately 1,410 acres. The power block would include the central receiver tower, storage tanks, steam turbine, air cooled condenser, transformers, heat exchangers, power block buildings, and other ancillary equipment. In addition to the main power generating facility, the site would include administrative buildings and parking lot, main warehouse with laydown area, onsite access roads, and

detention ponds, which would be located along the outside perimeter of the solar array; and the tie-in switchyard and transmission lines. The tallest facilities would be the solar receiving tower at 653 feet AGL and the cooling and transmission towers, which would be approximately 120 feet in height. Buildout coverage on the site (final footprint) would be about 55% (1,410 acres), including mirror fields, access roads, and buffer areas outside the fenceline. (See **Land Use Figures 2 and 3.**)

Facility Infrastructure

Infrastructure for the facility would require a one-mile extension of an existing 12 kV distribution line from an existing pole, located just south of SR 62 and about 175 feet east of the project boundary. The line would provide power for construction, and would serve the administration buildings during both construction and operation. Solar photovoltaic (PV) panels may also be installed on building rooftops and open ground surface areas, to power some lighting and other miscellaneous electrical loads. Lighting would be restricted to only what is necessary for security and emergency purposes, with directional shielding to avoid glare onto SR62 and surrounding properties, and to minimize nighttime backscatter illumination. The entire facility, including heliostat fields, would be surrounded by a security fence, with a controlled access gate at the SR62 entry point to the facility.

Raw water would be drawn from an existing onsite well and two new on-site wells and would be used for plant operations and as the source of potable water for construction activities (SR 2009a, p.2-5). The well pumps would deliver water to a large raw water storage tank with a capacity of up to 840,000 gallons. The plant may include a potable water treatment system to treat raw water to potable quality water for personnel health, safety, and sanitary uses by operational staff around the facility, at the applicant's discretion. However, raw water pumped directly from the existing wells meets state drinking water standards for potability, without additional filtration or treatment. If installed, the treatment system would be sized to accommodate a maximum of 47 permanent operations and maintenance personnel, consuming a maximum of 150 gallons of water per day. (See **Water Resources** section for further information.)

Sanitary wastewater treatment for day use by the construction workers would be provided by a temporary dump station, with both black and grey water holding tanks and/or portable toilets. Treatment of the wastewater generated during construction would be accomplished via an on-site septic system (appropriately sized septic tank and leach field) or by contract pumping of the holding tanks/portable toilets by a licensed service company. Once construction is completed, the holding tanks/portable toilets would be removed and septic tank/leach field, if installed, would be removed or abandoned in place. (See **Waste Management** section for further information.) Wastewater treatment for the plant during plant operations (kitchen and sanitary facilities) would include a septic tank and leach field. Solid wastes during both construction and plant operations would be trucked off-site for recycling and disposal.

Transmission Lines

The project would require construction of a generation tie-line to connect the generating facility switchyard with the existing Western Parker-Blythe 161 kV transmission line. Transmission line towers would consist of a light-duty steel or concrete monopole

structure. Each tower would stand between 85-115 feet tall, with a structural base approximately 30 inches in diameter, and a line span of 500-700 feet between towers, or nine towers per mile. The line would extend from the southeastern corner of the proposed project site, and run southeasterly for approximately 10 miles, to the new substation at the point of interconnection with the Western transmission line. The transmission line corridor would cross both public and private lands. The project applicant has applied for a 150-foot wide right-of-way (ROW) grant from BLM for that portion of the generation tie-line and associated structures that would be constructed on or cross BLM-managed public lands. The new substation footprint would cover an area of about nine acres, also within the proposed BLM ROW. The route follows an existing road (Rice Valley Road), which would be used for construction access and access to the switchyard, thus limiting additional ground disturbance. Approximately 4.6 miles of new, unpaved access road would be constructed to connect to the 5.4 miles of existing road. This road would also be constructed primarily within the proposed BLM ROW. (SR 2009a, p.2-4) From the new interconnecting substation, telecommunications along Western's lines would be established in one of the following manners via: 1) replacing one of two existing overhead ground wires on the Parker-Blythe #2 transmission line with a fiber optic core overhead ground wire to either or both of Western's existing Parker and Blythe substations; 2) microwave (radio-frequency) transmission from either RSEP or the new substation to terminate at the Western's Blythe, Headgate Rock, or Black Point substations; or to an existing telecommunications site at Cunningham Mountain; or 3) power line carrier/broadband-over-power-line. All lines would be above-ground and installed on existing Western towers, within existing Western ROWs. Any portion of the proposed roads, transmission lines, and structures that would be constructed on or cross private lands would do so within that area designated in a recorded easement with the property owner.

Construction

During construction, several areas, on either side of the plant entrance road off SR62 and within the project site boundaries, would be used as construction laydown and parking areas. Trucks transporting construction equipment and materials would also use this entrance road for all deliveries. Access and deliveries along the transmission line route would use the existing or proposed extension to Rice Valley Road. All laydown and parking for transmission line and substation construction would occur within the proposed substation footprint, recorded easements, or BLM ROW.

Construction of the generating facility is expected to begin in the first quarter of 2011 and continue for approximately 30 months, with as many as 438 workers on-site between months 8 and 20. Construction activities would generally occur from 5 a.m. until 7 p.m., six days a week, but could be extended to a 24-hour, 7-day schedule to meet scheduling demands or accommodate weather or worker availability. (SR 2009a, pp.2-37, 2-38) Construction of site access roads and utility infrastructure would be among the first construction activities occurring on the site.

Temporary Construction Facilities

Temporary construction facilities would include construction staging areas; employee parking areas; shop buildings, including an office trailer with electrical, telephone, and internet service; sanitary facilities; guard shack; portable batch plant; on-site dumpsters;

fencing; and a temporary 10,000 gallon above-ground storage tank to supply diesel during construction of the facility. The temporary batch plant would include cement storage and a batching operation where the cement, water, and aggregate would be proportioned and mixed, and would be located in the temporary laydown area or in the heliostat field on the existing concrete pad (see **Land Use Figure 2**). Construction equipment would be staged near the location of active work and several areas within the footprint of the solar field would also be used to store materials during the construction process. Temporary sanitary facilities for use by construction personnel would be located throughout the site and would be sized and located in accordance with OSHA requirements. A temporary septic system would also be installed to service the construction trailers.

The AFC includes reference to establishing a temporary construction workforce RV park on-site. However, this project component has been eliminated at the applicant's request.

Operations

RSEP plans to begin operations during the third quarter of 2013. The project is expected to employ up to 47 full-time employees and would operate year-round, seven days a week, 24 hours a day.

Project Closure and Decommissioning

According to the AFC, the solar generating facility is expected to have an operational lifespan of 30 years. If economically and technologically viable, it may continue to operate beyond that time. However, at any point during operation, temporary or permanent closure of the solar facility could occur. Temporary closure might be a result of necessary maintenance, hazardous weather conditions, or damage due to a natural or manmade disaster. Permanent closure could result from damage that is beyond repair, adverse economic conditions, or other significant reasons. Both temporary and permanent closures would require the project owner to submit a contingency plan or decommissioning plan to the BLM and Energy Commission for review and approval, prior to implementing any closure (except for emergency response). Either plan would include measures to ensure compliance with applicable LORS and protection of public health and safety requirements and the environment. These would include shutdown/restart procedures, removal/ storage of equipment and materials, site restoration, and potential decommissioning alternatives. (See **Joint Agency General Conditions**.)

Surrounding Area

The proposed project site is located in the northeastern portion of unincorporated Riverside County, approximately 15 miles west of Vidal Junction and 3 miles east of the abandoned town of Rice. The San Bernardino County line is just north of SR 62, which is immediately adjacent to the project's northern boundary. The habitat is represented by southwestern basin and range topography, characterized by numerous, generally north-south oriented mountain ranges alternating with valleys and alluvial plains. Desert pavement is common and is often well-developed and present in broad patches. Species richness and plant density are generally low to moderate (approximately 5-15%

cover) and is characterized by Sonoran creosote bush scrub and desert wash woodlands. Elevations range between 700 and 1600 feet above mean sea level. Soils range from loose-sandy to coarse-sandy loams on the bajadas and valley floors to cobbles, boulder outcrops, and talus on the mountain slopes. The rugged desert landscape within and surrounding the project area provides a range of scenic values. The BLM recognizes these visual values as a definable resource on public lands and an important recreation experience, and manages them accordingly. Rainfall amounts are minimal (approximately 3.7 inches annually) and are typically restricted to the winter months; however, amounts may vary from one to five inches per year. Areas may also receive scattered heavy rainfall during summer thunderstorms. Summer temperatures frequently exceed 100 degrees Fahrenheit and night frosts are common in winter months.

As noted in Alternative 1 Setting above, the project site boundaries adjoin and overlap the previous site of Camp Rice to the east, with some private land directly to the south, and public lands surrounding the remainder of the site. Much of the surrounding land is managed by BLM, which allows livestock grazing and a variety of recreational activities on the Class M multi-use lands. The land surrounding the project footprint, excluding Camp Rice and the former Rice AAF, is relatively undisturbed desert. There are no residences or commercial developments, other than the Iron Mountain Pumping Station (IMPS), within visual range of the project site or surrounding desert lands.

Access to the site is along SR62, a two-lane state highway (also known as Aqueduct Road and Twenty-nine Palms Highway) that bounds the project site to the north, and provides a direct route between Vidal Junction, to the east, and Twenty-nine Palms to the west. SR177 intersects SR62 approximately 17 miles west of the project site and connects to Desert Center and Interstate 10 (I-10) to the south. The Arizona and California Railroad (ARZC) shortline parallels SR62 at the project site and extends nearly 300 miles between Matthie, Arizona and Cadiz, California, with a 50-mile southern branch to Ripley.

The Colorado River Aqueduct (Aqueduct) also parallels SR62 to the north of the project site. The Aqueduct is a 242-mile (389-kilometer) water conveyance operated by the Metropolitan Water District of Southern California (MWD). It impounds water from the Colorado River at Lake Havasu on the California-Arizona border and carries it west across the Mojave and Colorado deserts to the east side of the Santa Ana Mountains, and is one of the primary sources of drinking and irrigation water for southern California. (WIKI 2010b) The closest Aqueduct pumping facility is at Iron Mountain, about 10 miles northeast and visible from the project site. Originally built around 1930, the Iron Mountain Pumping Station (IMPS) also includes the Colorado River Aqueduct airstrip, a private strip used exclusively by MWD. The Aqueduct is fenced and public access is prohibited. Despite its close proximity, water from the Aqueduct is not available to serve the proposed project.

The area surrounding the project site also played an important role during WWII as part of the infantry and artillery DTC/C-AMA. In addition to Camp Rice and the Rice AAF, the 3d Armored Division used Camp Iron Mountain and Camp Granite, at the SR 62/177 intersection, about 17 miles west of the project site, from 1942-44. Camp Iron Mountain was designated as an Area of Critical Environmental Concern (ACEC) for its cultural

significance in 1980, and is perhaps the best known and certainly the best preserved of all the training camps. Despite the ravages of time, a contour map, many rock mosaics, two alters, and numerous rock alignments along roads and walkways have survived. The area has been fenced to provide protection from vehicular traffic and both Camp Iron Mountain and Camp Granite are visible to the north and south of SR 62, respectively. (See **Cultural Resources and Native American Values** section for additional information.)

Maps indicate that Rice, approximately three miles northwest, in unincorporated San Bernardino County, is the closest community to the project site. It is actually a vacant townsite, with only the remnants of a demolished gas station and an infamous “shoe fence”⁶ to mark its location. There are no longer any residents in town, but the railroad siding at Rice is still used by the Arizona and California Railroad. (WIKI 2010c)

The closest services to the project site are at Vidal Junction, approximately 13 miles to the east, at the SR 62/95 intersection. The small community, consisting of a mobile home park, several gas stations, and a California agricultural inspection station, provides limited services for those traveling to the Colorado River resort areas of Parker and Lake Havasu, Arizona, and Laughlin, Nevada. The closest towns with full services are Earp, California and Parker, Arizona, on SR62, approximately 17 miles west of Vidal Junction. The larger towns of Blythe and Twenty-nine Palms are about 65 miles south and 75 miles to the west, respectively.

Agricultural Lands and Rangelands

Agricultural Lands

The proposed project site is located on previously disturbed, privately owned, desert lands and along a 10-mile, 150-foot-wide corridor on vacant, BLM-managed, multiple use class M public lands. Grazing of sheep in the Colorado Desert has occurred continuously since the mid-1800's. However, with the exception of limited grazing for domestic sheep on a public lands grazing allotment, there is no current or historical use of the project lands for agricultural purposes.

Most of the transmission line corridor, proposed interconnection substation location, and surrounding 74,740 acres of BLM-managed lands, is part of the Rice Valley (Keoughs) Rangeland Grazing Allotment #CA06001, held by Lava Lake Land & Livestock, LLC (see **Land Use Figure 4**). The current Rice Valley allotment allows intermittent grazing of sheep on the ephemeral rangeland within the allotment boundaries between March 1 – April 30 of each year, provided sufficient ephemeral forage is available. Sheep are allowed in bands of up to 1,000 adults, with an approximately equal number of lambs, not to exceed a total of 2,000 animals. Based on past use, there would be from 2000 to 3000 sheep using the allotment during a typical grazing season, depending on ephemeral forage availability. Sheep are required to graze in a loose or dispersed pattern and are only allowed to move through an area once during the grazing season. Ranchers generally allow the sheep to graze in any one area for only a few days at a time. Bedding and watering sites must be changed daily and new bedding or watering

⁶ Formerly the Rice Shoe Tree (which burned in 2003), visitors to the area have been hanging old shoes on the old tamarisk tree, and now, after the fire, a make-shift fence there, for many years.

sites must be at least one-quarter mile from any previous site. In 2005, ephemeral production met the 200 pounds per acre (lb/acre) BLM threshold requirement in the entire allotment. Forage analysis was over 3900 pounds/acre. The proposed project site for the primary facilities is not part of the Rice Valley grazing allotment. The current allotment is effective through January 30, 2018.

Wild Horse and Burro Herd Management

The Wild Free-Roaming Horses and Burros Act (Public Law 92-195) was adopted on December 15, 1971. It protects wild horses and burros within designated territories on both United States Forest Service (USFS) and BLM lands, while ensuring their populations are managed to maintain or restore a thriving ecological balance. California's free roaming wild horses and burros range over 7.1 million acres of public land and an additional 2.3 million acres of privately-owned property. There are 33 herd areas (HAs) and 22 herd management areas (HMAs) within the state, primarily in southern California. In Arizona, the BLM manages two wild horse herds, totaling approximately 200 head, in the Cerbat Mountains, northwest of Kingman, and between the Cibola Wildlife Refuge and the U.S. Army's Yuma Proving Ground. In addition, the BLM manages close to 1,600 head of wild burros roaming public lands in seven other herd management areas and three herd areas. Herd areas are geographic areas where wild horse or burro populations were found at the passage of the Wild Horse and Burro Act in 1971. Herd management areas are locations within the herd areas where wild horses and burros populations are actively managed, taking into consideration the natural resource balance, and other uses, such as livestock grazing and recreation.

There are seven HAs and four HMAs within 50 miles of the proposed project site (see **Land Use Figure 5**). The closest, the Chemehuevi HA and HMA, begins approximately 10 miles northeast of the eastern project boundary. This area is located in eastern San Bernardino County and encompass 79,000 acres in an area extending from seven miles south of Needles to the Parker Dam, and from U.S. 95 eastward to the Colorado River. However, there are no HAs or HMAs within or immediately adjacent to the proposed project site or transmission corridor.

Recreation and Wilderness

The proposed project site is located in the southern Colorado Desert, just west of the Arizona border. The California desert attracts millions of visitors to a wide spectrum of recreational opportunities annually. The project site and surrounding area are within a two-hour drive of Palm Springs; Lake Havasu City, Arizona (and the Lake Havasu Recreational Area); and Las Vegas, Nevada.

Recreation

The primary project site is located entirely on privately owned lands, with no recreational facilities or public access. The transmission lines and interconnecting substation are located primarily on BLM-managed public lands. Those portions of the project site that are situated on publicly-owned lands are subject to the BLM's California Desert Conservation Area Plan (CDCA) and Northern and Eastern Mojave Desert Management Plan (NECO), which encompasses over five million acres of BLM-administered public lands in San Bernardino, Riverside, and Imperial counties. Both CDCA and NECO

address land use and conservation of resources within their boundaries. The transmission corridor, substation, and surrounding lands, with the exception of two small privately-owned parcels, are classified as Multiple Use Class - Moderate (MUC-M). This land use designation allows a multitude of public uses, including livestock grazing, mining operations, railroads and landing strips, electrical generating facilities, and recreation.

However, despite the availability of land for public recreation and access, this part of California is very isolated and sparsely populated, with few developed recreational areas. Lack of water, services, and lodging; sparse vegetation; extreme summer heat; and mostly level topography present few opportunities or incentives for hunting, bird watching, hiking, or OHV use. Points of interest in the general vicinity are limited to the remains of the WWII training camps, rock initials and murals along the railroad berms, a few historic markers, and the infamous Shoe Tree at the deserted Rice townsite. The number of visitors does increase, somewhat, during wet spring seasons, when wildflowers are in abundance.

Although there are few attractions in the immediate project area, there are a variety of public and private recreation areas and resorts available within 100 miles of the project. These extend along both sides of the Colorado River, from Blythe to Lake Havasu and Parker, Arizona, about 35 miles east of the project site. Attractions include the River Island State Park; Parker Dam, the world's deepest dam; Headgate Rock Dam; and Lake Havasu, another 40 miles north, which provides the location for a wide variety of water sports and Lake Havasu City, with its British-themed tourist attractions and the famous London Bridge.

There are also eleven designated wilderness areas within 50 miles of the project site (see Wilderness section below).

Joshua Tree National Park

Sixty miles southwest of the project site (and just 20 miles east of the Desert Center Alternative location), is the Joshua Tree National Park. Established in 1994 and managed by the National Park Service, the park offers almost 200,000 acres of parkland for public recreation, not including almost 600,000 acres of wilderness lands. Straddling the San Bernardino/Riverside County border, the park includes parts of both the Mojave and Colorado Deserts, with the Little San Bernardino Mountains extending along the southwestern edge of the park. The park encompasses some of the most interesting geologic displays found in California's deserts. Rugged mountains of twisted rock and exposed granite monoliths share the landscape with arroyos, playas, alluvial fans, bajadas, pediments, desert varnish, granites, aplite, and gneiss. It is named for the Joshua tree forests native to the area.

Resident birds, such as the greater roadrunner, cactus wren Gambel's quail, red-tailed hawk, American kestrel, Cooper's hawk, and prairie falcon share the park with both winter and summer migrant and transient species, including the sage sparrow, cedar waxwing, American robin, northern oriole, western bluebird, several species of warblers, northern harrier, osprey, and Swainson's hawk. Reptiles also reside here, including desert tortoise, at least 18 species of lizards, and 25 varieties of snakes. Although the

vegetation appears limited during the hot summer months, winter rains bring abundant displays of wildflowers in early spring. In the Mojave Desert area, Joshua Trees dominate, with pinion pine, California juniper and scrub oak in the stony outcrops. Habitats of Creosote bush scrub, ocotillo, desert Saltbush, and mixed scrub, including Yucca and Cholla cactus are found in the Colorado Desert areas of the park.

There are nine established campgrounds in the park, although only two provide water and flush toilets. Backcountry camping is also permitted. The park is extremely popular with rock climbers, hikers, and photographers. There are no special regulations for off-road vehicle use on any open park road, but there is no off-road vehicle access.

Motorized Vehicle Access

In 1983, the BLM amended the CDCA's Motorized Vehicle Access element to conform to the requirements of the agency's OHV regulations (43 CFR 8342.1). The objectives of those regulations are to protect the resources of the public lands, promote the safety of all users of those lands, and minimize conflicts among the various uses of those lands. Questions regarding permitted uses of MUC lands and the designation and use of existing trails were addressed in this amendment.

For MUC-M lands, the amendment allowed OHV access on all existing trail routes to continue unless it is determined that use on specific routes needs to be further restricted. An "existing" route is defined as one with a minimum width of two feet and established before approval of the 1980 CDCA, with significant surface evidence of prior vehicle use. It also set standards for the use of OHVs in desert washes, indicating that navigable washes in "washes open zones" would be considered "existing routes" as a class, rather than individually, and available for motorized vehicle use, unless such use was specifically restricted by route designations of "limited" or "closed". For sand dunes and dry lakes, it was determined that the unique geography of these areas precluded delineation of individual trail routes. Therefore, significant sand dunes and dry lakes within the CDCA were designated either "open" or "closed" to vehicle use, regardless of the MUC designation. (BLM 2003) There are only three identified OHV routes in the vicinity of the project site, none of which cross the project site. Rice Valley Road, which would parallel the proposed transmission line connecting to the WESTERN line, is occasionally used by vehicles, including OHVs, but does not lead to any established destination. It is also a relatively straight, level road, with little to attract the more adventurous OHV user.

Rice Valley Dunes

Rice Valley Dunes, on the northern edge of the Rice Valley Wilderness, is about four miles south of the project site. This area contains approximately 3,770 acres of low sand dunes and was originally designated specifically for OHV use. However, in 2002, BLM determined the area was under-utilized by the OHV users (basically no use in 20 years) and of more important for its high-value habitat. It was closed permanently as part of the NECO amendment to the CDCA in 2002.

Wilderness

The California Desert Protection Act of 1994 designated 69 wilderness areas in

southern California and directed that they be administered by the BLM, pursuant to the Wilderness Act of 1964. Wilderness land in California and Arizona is administered by the BLM, the U.S. Forest Service (USFS), and the National Park Service (NPS). According to the federal Wilderness Act, a designated Wilderness Area is defined as an area of undeveloped federal land which is protected and managed to preserve its natural conditions and retain its primeval character and influence, without permanent improvements or human habitation. Wilderness areas have four primary characteristics:

- Generally appear to have been affected primarily by the forces of nature, with the imprint of man's work substantially unnoticeable;
- Contain outstanding opportunities for solitude or a primitive and unconfined type of recreation;
- Include at least five thousand acres of land or is of sufficient size as to make practicable its preservation and use in an unimpaired condition; and
- Have ecological, geological, or other features of scientific, educational, scenic, or historical value. (US Code 1964).

There are eleven designated wilderness areas within 50 miles of the project site. These include the Rice Valley, Riverside Mountains, Turtle Mountains, Old Woman Mountains, Cadiz Dunes, Sheephole Valley, Big Maria Mountains, Joshua Tree, Palen/McCoy, and Whipple Mountains Wildernesses in California; and the Gibraltar Mountain Wilderness in Arizona (see **Land Use Figure 5**). Allowed recreational uses generally include hiking, backpacking, rock climbing (subject to restrictions), kayaking, canoeing, rafting, horse packing and riding, rockhounding, photography, and primitive camping. Hunting, fishing, and non-commercial trapping are allowed, consistent with state and local laws. Mechanized or motorized vehicles are not permitted, including bicycles, but horses are allowed. Wilderness areas are not developed, but are available to the public and provide places for solitude and quiet contemplation. Access to the wilderness areas is readily available on existing public roads, although four-wheel drive is recommended in some areas. Vehicles are only allowed on established roads or can be parked outside the wilderness boundary, which is set back approximately 30 feet from unmaintained dirt roads and 300 feet from paved roads. Permits are generally required for commercial or organized activities. Private lands may lie within wilderness areas and may only be used with permission of the owner(s).

Land Use Table 3 describes wilderness areas, areas of critical environmental concern, and natural resource areas easily accessible from the project area.

**LAND USE Table 4
Wilderness Areas**

Wilderness Area	Jurisdiction/ Mgmt	Approximate Distance from Project Site	Acreage*	Use Restrictions
Big Maria Mountains	BLM	12 mi SE	45,384	
Cadiz Dunes	BLM	45 mi NW	21,298	
Gibraltar Mountains (Arizona)	BLM	45 mi E	18,790	No private lands within the Wilderness boundary.
Joshua Tree	NPS	30 mi W	594,502	
Old Woman Mountains	BLM	27 mi NW	183,538	Access to this wilderness requires four-wheel drive vehicles. The wilderness boundary was drawn around five non-wilderness corridors, which provide vehicle access to the interior of the wilderness area.
Palen/McCoy	BLM	8 mi SW	259,009	
Rice Valley	BLM	6 mi S	41,777	
Riverside Mountains	BLM	12 mi SE	24,004	
Sheephole Valley	BLM	35 mi W	194,861	
Turtle Mountains	BLM	3 mi N	182,641	
Whipple Mountains	BLM	30 mi NE	79,861	

Sources: WILD; BLM 2010(d)

* Approximate

Big Maria Mountains Wilderness

The Big Maria Mountains Wilderness begins approximately 12 miles southeast of the proposed project site. The terrain varies from gently sloping bajadas to numerous rough, craggy peaks and steep canyons. The northern boundary lies south of a major drainage known as Big Wash and the eastern edge parallels SR95 and the Colorado River. Foxtail cactus and California barrel cactus are the predominate vegetation in the landscape and a burro deer herd forages the habitat along the Colorado River. The mountains reach an elevation of 3,379 feet above sea level (ASL) and are home to the Eagle Nest Mine.

Cadiz Dunes Wilderness

The Cadiz Dunes Wilderness, approximately 45 miles northwest of the project site, in San Bernardino County, encompasses a major portion of the Cadiz Dune system and desert shrub lowlands just east of the dunes. These small dunes were formed by north winds pushing sands off the Cadiz Dry Lake. Due to the remote location these dunes, they had very little OHV use prior to their designation as wilderness. The pristine nature of the dunes and the beautiful spring display of unique dune plants have made the area a favorite for photographers. Borrego milkvetch occurs in the sand dunes and is listed by the California Native Plant Society as rare and endangered in California. Wildlife is

typical for the Mojave Desert; including coyote, black-tailed jackrabbits, ground squirrels, kangaroo rats, quail, roadrunners, rattlesnakes, and several species of lizards. The El Paso Natural Gas Pipeline passes the northeast side of the dunes and is adjacent to the Wilderness boundary. The Atchison Topeka and Santa Fe Railroad tracks are within 30 feet of the Wilderness boundary.

Gibraltar Mountain Wilderness

The Gibraltar Mountain Wilderness includes the western end of the Buckskin Mountains and is about 10 miles northeast of Parker, in La Paz County, Arizona. The area, from Giers Mountain in the north to Gibraltar Mountain in the south, consists of rugged volcanic rock, dissected by deep, sandy washes and rocky canyons. The vegetation includes creosote bush, cholla, barrel cactus, and paloverde, and is home to desert bighorn sheep. The eroded volcanic tuff beds contain many alcoves and caves and are a favorite with photographers, hikers, and rock-climbing enthusiasts.

Joshua Tree Wilderness

The Joshua Tree Wilderness was established in 1976 and contains approximately 594,502 acres. The area is bordered by the Sheephole Valley Wilderness and the Pinto Mountains Wilderness to the north, and is managed by the National Park Service (NPS). It makes up nearly 75% of the Joshua Tree National Park. The lower, drier Colorado Desert dominates the eastern half of the park and is home to creosote bushes, ocotillo, and the "jumping" cholla cactus. The slightly more cool and moist Mojave Desert covers the western half of the park. There is also a third ecosystem within the park: five fan-palm oases, located where surface or near-surface water is accessible. Bighorn sheep frequent the mountainous slopes, along with eagles. Lizards, tarantulas, rattlesnakes, coyotes, jackrabbits, bobcats, kangaroo rats, and burrowing owls populate the lower elevations. Twisted rock formations and granite monoliths provide a fascinating geologic display in the desert landscape.

Old Woman Mountains Wilderness

The Old Woman Mountains Wilderness, about 30 miles northwest of the project, consists of bajadas, extensive flat aprons of alluvium, and the massive, fault-lifted Old Woman Mountains with elevations that range from 800 feet in the drainage bottoms to over 5300 feet at the top Old Woman Peak. The mountains take their name from a granite monolith resembling the figure of an old woman, known as the Old Woman Statue. They are also the site of the Old Woman Meteorite, discovered in 1975, the largest meteorite found in California and the second largest in the United States. The wilderness falls within a transition zone between the Lower Colorado and Mojave deserts and encompasses many different habitat types. Creosote bush scrub dominates the lower elevations, shifting into mixed desert scrub at middle elevations, with juniper-pinyon woodland at the higher elevations. The dry washes are characterized by catclaw acacia, cheesebush, desert lavender, little-leaf ratany, and desert almond. Wildlife is typical for the Mojave Desert and includes a permanent population of bighorn sheep, mule deer, bobcat, cougar, coyote, black-tailed jackrabbit, ground squirrels, kangaroo rats, quail, chuckar, roadrunners, rattlesnakes, and several species of lizards. Numerous raptor species can also be found in the area, including prairie falcons, red-tailed hawks, golden eagles, Cooper's hawks, American kestrels, and several species of

owls. The washes and canyons, with at least 24 springs and seeps, provide good habitat for several species of songbirds. The bajadas provide excellent desert tortoise habitat; 49,683 acres of the wilderness area have been designated as critical habitat for the threatened desert tortoise.

Palen/ McCoy Wilderness

The Palen-McCoy Wilderness, just southwest of the project site, was established in 1994 and contains five distinct desert mountain ranges: the Palen, McCoy, Granite, Little Maria, and Arica, separated from each other by broad, sloping bajadas. An intricate array of washes in the valley between the Palen and McCoy Mountains are forested in ironwood and paloverde trees. The wash woodlands provide habitat for burro deer, bobcats, coyotes, gray foxes, kit foxes, mountain lions, rabbits, mice, kangaroo rats, and numerous species of birds. The area is rarely visited, but old four-wheel-drive tracks that lead into the mountains make access for hikers relatively easy.

Rice Valley Wilderness

The broad, flat plains of Rice Valley and the northwestern tip of the steep and rugged Big Maria Mountains lie within the borders of the Rice Valley Wilderness, located immediately south of the private land adjacent to the project site. A system of small dunes rise 30 to 40 feet above the surface and form a long, narrow band running through the middle of the valley floor. The valley is part of a massive sand sheet which extends from Cadiz Valley through Ward Valley, representing a part of one of the largest dune systems in the California Desert. Beyond the mountains is a wilderness of sand.

Riverside Mountains Wilderness

The Colorado River parallels the eastern edge of the Riverside Mountains Wilderness, which adjoins the Rice Valley Wilderness to the east, about 12 miles southeast of the interconnection substation and east end of the project linears. The landscape varies from gently sloping bajadas to steep, rugged interiors, with washes emerging from canyons to divide the bajadas below. Numerous peaks in the Riverside Mountains give this small range a rough, craggy appearance. Two sensitive plant species, the foxtail cactus and California barrel cactus, can be found in this wilderness area. A small herd of burro deer also live among the Riverside range.

Sheephole Valley Wilderness

The Sheephole Valley Wilderness is an ideal representation of the basin and range topography typical to the Mojave Desert. The Sheep Hole Valley, beginning about 35 miles west of the project site, sits between the granitic boulder-strewn Sheep Hole and Calumet Mountains. At the valley's lowest point, there are two small dry lake beds. Sand dune formations can be found at the southwest end of the Sheep Hole range and northeastern portion of the Calumets. The dominant vegetation is creosote bush scrub that gradually changes into a mixed desert scrub at higher elevations. Salt-tolerant plants are found around the dry lake beds and California's rare and endangered Borrego milkvetch occurs in the sand dunes. Wildlife includes bighorn sheep, the threatened desert tortoise, coyote, black-tailed jackrabbits, ground squirrels, kangaroo

rats, quail, roadrunners, rattlesnakes, and several species of lizards. The wilderness area is bordered to the south by SR 62 and the Joshua Tree Wilderness.

Turtle Mountains Wilderness

The Turtle Mountains Wilderness encompasses a diverse, scenic landscape, ranging from broad bajadas to highly eroded volcanic peaks, spires, and cliffs. The southern tip of the wilderness area begins about three miles north of the project site. Much of the Turtle Mountain range has been designated as a National Landmark in recognition of its exceptional natural values. The wilderness is located in an ecological transition zone between the Mojave and Sonoran Deserts. Dominant vegetation consists of the creosote bush-bur sage and the palo verde-cactus shrub ecosystems.

Colorado/Sonoran microphylla woodlands can be found in the washes. Wildlife species include desert tortoise, bighorn sheep, coyote, black-tailed jackrabbits, ground squirrels, kangaroo rats, quail, roadrunners, golden eagles, prairie falcons, rattlesnakes, and several species of lizards. Approximately 73,000 acres in the northwestern and northeastern portions of the wilderness are designated critical desert tortoise habitat. The area is a favorite for rock hounding hobbyists and is nationally known for chalcedony deposits, a form of quartz, known as "Mopah Roses".

Whipple Mountains Wilderness

The Whipple Mountain Wilderness, southeastern California, contains the east-west oriented Whipple Mountains, with a low angle fault separating the pale green formations of the western side from the striking brick-red, steeply carved volcanics of the eastern side. The present-day landform of the Whipple Mountains is a series of sub-parallel ridges trending northwest to southeast, cut at right angles by a large wash which bisects the entire range. These linear ridges mark the tops of tilted crustal blocks lying in the hanging wall of an extensive detachment fault, and the range as a whole comprises one of the best exposed and most studied metamorphic core complexes in the world. Landforms are diverse and vary from sloping valley floors and washes to steep-walled canyons, domed peaks, natural bridges, and eroded spires.

The Sonoran creosote bush scrub and Sonoran thorn forest are the two major vegetative associations present within the wilderness area. Dominant vegetation is creosote bush scrub, palo verde, ironwood, smoke tree, and numerous species of cacti. Wildlife species include bighorn sheep, mule deer, wild burros, coyote, black-tailed jackrabbits, ground squirrels, kangaroo rats, quail, roadrunners, owls, the threatened desert tortoise, and several species of rattlesnakes and lizards. The Whipple Mountains provide superior nesting and foraging habitat for a number of raptors, including prairie falcons, golden eagles, red-tailed hawks, and Cooper's hawks. The mountains are home to many mines, including the Independence Mine and Bessie Mine.

Activities within the wilderness area include hiking, horseback riding, hunting, camping, rock hounding, photography, and backpacking. Whipple Wash is a popular hiking location and wilderness access. Motorized access to the boundary of the wilderness is only possible from the north-east side by way of a powerline access road, accessible to high-clearance, four-wheel-drive vehicles only.

ASSESSMENT OF IMPACTS/ENVIRONMENTAL EFFECTS AND DISCUSSION OF MITIGATION

Agricultural Lands and Rangelands

Would the proposed project result in the conversion of Farmland⁷ to non-agricultural uses?

None of the lands within the proposed project site, including solar fields, generating facility, or linears, have been mapped by the California Department of Conservation, Farmland Mapping and Monitoring Program (FMMP 2009c). Riverside County has not identified the project site as Farmland of Local Importance. Therefore, the project would not result in the conversion of Prime Farmland, Unique Farmland, Farmland of Statewide Importance, or Farmland of Local Importance to non-agricultural use. No impact during any phase of the project.

Would the proposed project conflict with existing agricultural zoning, agricultural use, or a Williamson Act contract, or result in the rezoning of agricultural lands?

The privately-owned parcels of the proposed project site are zoned W-2-10 (Controlled Development Area, 10-acre minimum parcel size), which permits agricultural uses, including the grazing of livestock on parcels of one acre or more. However, this zoning district also supports a wide variety of non-agricultural permitted uses, including residential, commercial, and recreational developments; churches; schools; and public utilities. Conditional uses are even more extensive and include airports, dune buggy parks, lumber mills, race tracks, and mining operations. Agriculture is not given priority over any other kind of permitted or conditionally permitted use. All elements of the proposed project are permitted uses in the W-2 zoning district [RC 2009a, §15.1(e)(2)]. Therefore, either or both uses are consistent with the Riverside County zoning code.

As noted in the AFC, Section 5.6.1.2, none of the privately-owned project lands or surrounding properties are currently in agricultural use, classified as Farmland, or subject to a Williamson Act contract. Lands under BLM management are not eligible for inclusion under the Williamson Act.

Therefore, there is no conflict with any Williamson Act contract (no impact) or the Riverside County zoning designations or permitted uses. Surrounding parcels are also zoned W-2-10 and no element of the proposed project would require or result in the rezoning of these properties.

⁷ Prime Farmland, Unique Farmland, Farmland of Statewide Importance, or Farmland of Local Importance, as defined in FMMP 2004, p.6.

Would the proposed project involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural uses or forest land to non-forest use or cause rezoning of forest land, timberland, or timberland zoned "Timberland Production (TPZ)"? (CEQA)

As noted above, the project site, including the proposed substation and linears, does not contain and would not result in the conversion of designated Farmland to non-agricultural uses. Likewise, there is no timberland⁸ or timberland zoned TPZ within 100 miles of the project vicinity, so no impact to timberland would occur. The wash woodlands of the Palen-McCoy Wilderness, Sonoran thorn forest in the Whipple Mountains Wilderness, and Joshua trees of the Joshua Tree Wilderness qualify as forest land⁹. However, all are protected within wilderness area boundaries and are sufficient distant from the proposed project site to preclude any impact. No Impact.

Would the project disrupt activities or substantially reduce the agricultural resource value of established federal rangelands within the California Desert Conservation Are? (NEPA)

Agriculture, excluding grazing, is not a permitted use within any BLM lands designated for multiple use. However, livestock grazing has been and continues to be a significant use of renewable resources on public land in the California Desert. The Federal Land Policy and Management Act (FLPMA) and the Public Rangelands Improvement Act of 1978 recognize livestock grazing as a principal use for the production of food and fiber. However, agricultural uses, except for livestock grazing and uses grandfathered in at the time of adoption of CDCA and the NECO amendment, are not allowed on any of the MUC lands (BLM 1999, Table 1). Electric generation facilities, including transmission lines, are permitted on land with this classification after NEPA requirements are met.

The only agriculturally-related activity that currently occurs on any portion of the proposed project site is the grazing of sheep, consistent with the Rice Valley (Keoughs) Rangeland Grazing Allotment permit and BLM MUC-M designation. The substation site and all but two small sections of the proposed transmission line corridor are within this grazing allotment. Construction of the proposed transmission lines could interfere with the use of and/or access to a portion of the existing allotment area for the duration of construction (up to three grazing seasons). The project would also eliminate close to 75 acres of forage existing within the proposed transmission corridor and substation footprint for the life of the project. (Approximately 5.4 miles of the transmission line corridor would be along the existing Rice Valley Road. This portion of the grazing allotment is already disturbed.) However, the allotment encompasses approximately 74,740 acres. Condition of Certification **Land-4** requires construction within the grazing allotment boundaries to occur outside the established annual grazing window. This

⁸ "Timberland" means land, other than land owned by the federal government and land designated by the board as experimental forest land, which is available for, and capable of, growing a crop of trees of any commercial species used to produce lumber and other forest products, including Christmas trees. Commercial species shall be determined by the board on a district basis after consultation with the district committees and others. (PRC §4526)

⁹ "Forest land" is land that can support 10% native tree cover of any species, including hardwoods, under natural conditions, and that allows for management of one or more forest resources, including timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, and other public benefits. [PRC §12220(g)]

would avoid access issues for allotment holders, as roads and herd access would not be blocked. However, loss of forage area in existing locations within the transmission corridor and substation footprint cannot be avoided. Therefore, the project would not substantially disrupt agricultural activities or substantially reduce the agricultural resource value of established federal rangelands within the CDCA.

Recreation and Wilderness

Would the proposed project increase the use of existing neighborhood and regional parks or other recreational facilities, such that substantial physical deterioration of the facility would occur or be accelerated, or require the construction or expansion of recreational facilities that might have an adverse physical effect on the environment?

There are no existing or planned neighborhood, county, or regional parks, or other recreational facilities, within 35 miles of the proposed project site. Recreational facilities within an hour's drive of the site are limited to seven public parks and a public municipal golf course in Blythe, along with private resorts and RV parks along the Colorado River. Although there are approximately 1,650,000 acres of publicly-accessible wilderness lands within a 100-mile radius of the project site, there are no developed recreational facilities within these areas.

Workers at the site would commute to and from their permanent place of residence daily or reside temporarily in Blythe, Needles, or other towns within 1-2 hours commute or at RV parks along the Colorado River. It is unlikely that any of these workers would visit the surrounding wilderness areas at the end of a shift. Visits during off-duty hours would be consistent with normal visitor counts and impacts. Therefore, there would be no measurable impact to recreational facilities during construction.

The project would employ a permanent operational workforce of 47 people. Assuming that all employees relocate from outside the area with an average of three people per family, approximately 141 people would be added to population of Blythe; Parker, Arizona; and one or more of the small area communities of Vidal, Vidal Junction, Big Springs, Midland, or Desert Center. If all resided in Blythe, with an estimated population of 22,178 in 2007 (WIKI 2010e), this would equate to less than a 1% increase in the population. A permanent population increase of less than 1% is not considered a substantial amount of growth and is consistent with normal projected growth for the area. Spread over the surrounding communities, the potential impact to any single recreational facility, or cumulatively to multiple facilities within the area, would be further reduced.

Therefore, the project would not substantially affect existing neighborhood and regional recreational facilities or result in the need for new or expanded facilities. Impacts would be less than significant under CEQA. (Please refer to refer to the **Socioeconomic & Environmental Justice** section for further discussion.)

Would the proposed project directly or indirectly disrupt activities in established federal, state, or local recreation and/or wilderness areas? (NEPA)

According to the Recreation Element of the CDCA Plan, "...lands managed by the Bureau are especially significant to recreationists" (BLM 1980). When establishing the CDCA, Congress stated that "the use of all California desert resources can and should be provided for in a multiple use and sustained yield management plan to conserve these resources for future generations and to provide present and future use and enjoyment, particularly outdoor recreation uses.. (underline added for emphasis)" (FLPMA, Section 601). This direction was intended to apply to all desert lands under BLM management and jurisdiction within the CDCA boundaries until such time as they pass out of federal control. For this reason, the CDCA, as a whole, must be considered an established federal recreation area, although the availability of recreational facilities or activities allowed within each land classification may vary.

The project, if approved, would result in the temporary, intermittent loss of access or delays along approximately 5.4 miles of the existing Rice Valley Road and a permanent loss of the recreational use of approximately nine acres of publicly-owned, BLM-managed lands, classified MUC-M, within the footprint of the interconnecting substation. Rice Valley Road does not provide access to any established recreational areas or public use sites that have historical usage. Given the limited interference with access along Rice Valley Road, from SR 62 to the end of the existing dirt road; and the scarcity of recreational users in the area, any disruption of recreational activities would be extremely limited and would require no mitigation. Likewise, removal of three isolated acres of undeveloped land from recreational access, in an area with over 1.6 million acres of multi-use recreational and wilderness lands, would have a negligible effect on activities in the area. The substation location does not provide and would not prevent access to, any established recreational areas and has no history of local or regional recreational use.

As noted in the Recreation Setting above, Rice Valley Dunes, on the northern edge of the Rice Valley Wilderness, is about four miles south of the project site. Although this area was originally designated for OHV use, it was permanently closed in 2002 to protect valuable habitat. Therefore, the project would have no impact on recreational activities at this site. There are currently no established OHV use areas within 35 miles of the proposed project site and no authorized open OHV areas on BLM lands within Riverside County.

There are also 11 designated wilderness areas within 50 miles of the project site. The intent of wilderness areas is to preserve these undeveloped lands in their natural condition, without the noticeable imprint of human development, and retain the primeval character, solitude, ecological, and scenic features of the area (US Code 1964). The closest areas, Turtle Mountains Wilderness (two miles to the north) and Rice Valley Wilderness (three miles to the south), are not accessed from the project site and access would not be restricted during project construction or operation.

The fact that non-wilderness activities or uses can be seen or heard from locations within a wilderness area does not, of itself, preclude these activities or uses up to the

wilderness area boundaries. Congress did not intend for the designation of wilderness areas to lead to the creation of protective perimeters or buffer zones around these areas. (USC 1994) However, this does not mean that introduction of these activities or uses have no effect on visitor activities or the wilderness experience. Two of the components defining a wilderness area require a general appearance of nature's handiwork, without the noticeable imprint of man, and outstanding opportunities for solitude or a primitive and unconfined type of recreation (see Wilderness discussion above). The visitor's wilderness experience may still be degraded by the intrusion of noise, lights, and other activities occurring in close proximity to the wilderness boundaries.

Skyglow is the illumination of the night sky. The most common cause is artificial light sources, which accumulates as a glowing dome over the lighted area, decreasing the visibility of stars and other natural sky phenomena and disturbing the natural nighttime landscape. Depending on the contrast between the lighted area and surrounding land, the glow can be seen for miles. (WIKI 2010f) Increased illumination of the valley landscape would occur as a result of the proposed project (see lighting discussion below), especially during the approximately 30-month construction period. Dark sky conditions that currently exist on the desert floor, and as viewed from the surrounding wilderness areas, would be effectively erased during construction and noticeably diminished during the operational life of the project. Recreational activities directly related to nighttime observations, such as stargazing and sky interpretation, would be affected within several miles of the project site.

Noise during both construction and operation would be audible from the areas closest to the site, especially during the evening hours. Construction of the generating facility is expected to begin in the first quarter of 2011 and continue for approximately 30 months. Construction activities would generally occur from 5 a.m. until 7 p.m., six days a week, but could be extended to a 24-hour, 7-day schedule to meet scheduling demands or accommodate weather or worker availability. (SR 2009a, pp.2-37, 2-38) As noted above, up to 300 RVs may provide housing on the site for the duration of construction, contributing to increased noise levels during all hours of the day and night. Normal ambient noise levels for remote and wilderness areas generally average approximately 25-40 dBA (USC 1998; BLM/MWD 2001, Vol. 1, Section 5). Although construction noise averages around 89 dBA L_{eq} at 50 feet from the noise source, project construction noise would attenuate to 40-45 dBA at a distance of about two miles, even without consideration of reductions due to topography (see **Noise** section for further discussion, proposed conditions of certification, and determination of residual impact). This is the distance to the closest wilderness boundary. Therefore, although there could be intermittent incidents of noise that would be heard within the surrounding wilderness areas, it is extremely unlikely that the ambient noise at even the nearest noise-sensitive land uses (i.e., Turtle Mountains Wilderness and Rice Valley Wilderness) would be increased by more than 5 dBA as a result of project activities. Sounds would be more noticeable from higher elevations, which may be used by visitors on wilderness lands. The increase in ambient noise levels, though less than substantial, may still degrade the wilderness experience for some visitors.

The remaining residual impacts to general recreational use of the federal recreational and wilderness lands within and around the proposed project site would be:

- Temporary delays or loss of access along Rice Valley Road during transmission line construction (up to 30 months in duration).
- Loss of approximately three acres of MUC-M recreational land for the operational life of the project (30± years).
- Degradation of the “dark sky” conditions in the valley by construction lighting and installation of on-site security and operational lighting.
- A limited increase in the ambient noise levels and intermittent louder noise incidents on lands surrounding the project site and in portions of at least five designated wilderness areas during the construction phase of the project.

Would the proposed project substantially reduce the scenic, biological, cultural, geologic, or other important resource value of federal, state, local, or private recreational facilities or wilderness area? (NEPA)

Scenic Impacts

Preservation of the scenic attributes of California’s deserts is a prime objective of the CDCA. Although there are no recreational facilities or wilderness areas within the proposed project footprint, part of the recreational aspects of the BLM-managed desert lands or a wilderness experience is the scenic quality of the surroundings, as well as the undeveloped nature of the views within and from the wilderness areas. The site and the facilities of the proposed project (particularly the generating facilities) would be highly visible from various locations along SR62 and at least five wilderness areas, located within 15 miles of the project site (Turtle Mountains, Rice Valley, Big Maria Mountains, Riverside Mountains, and Palen-McCoy Wildernesses). The 653-foot solar tower would be the highest point of reference within the valley, outside of the surrounding mountains, and a glowing focal point during the daytime, when the solar energy is focused on the collection area at the top of the stack. The power plant and surrounding 1,410 acres of solar troughs would present a visual, obviously manmade intrusion on the existing uninterrupted desert vista. Although similar to lake or heat shimmer when viewed from a distance, the geometric lines of the solar array and presence of the central solar tower would emphasize the manmade aspects of the facilities.

Increased illumination of the valley landscape would also occur as a result of the proposed project, including lighting from construction, vehicle movement, and security occurring 24 hours a day, 7 days a week. This would occur in an area that previously had no lighting, except for an occasional passing car on SR 62. Dark sky conditions that currently exist in the area would be substantially degraded during construction. Some visual degradation would continue even after construction is completed, as security and operational lighting would still be necessary to accommodate the facility’s 24-hour schedule. Additionally, the scenic aspects of the existing, broad sweep of an uninhabited desert floor, as viewed from the surrounding wilderness areas, would be permanently erased. NPS, a branch of the Department of the Interior, has identified unimpeded visibility of the night sky as a scenic vista that touches almost every aspect of what is essential to keeping a park whole. Light pollution can cross boundaries and degrade the natural lightscape of parks and wilderness areas. (NPS 2010)

Significant, unavoidable visual impacts, resulting from construction of the project at the

proposed site, would substantially reduce the visual quality and character of the existing federal recreation (multiple use) lands and scenic views from surrounding wilderness areas. Additionally, it is not known if the project would ultimately prove to be consistent with the applicable BLM Visual Resources Management (VRM) Class(es), as BLM has yet to complete the VRM analysis for the project area. The project would also contribute to both local and regional cumulative visual effects. (See **Visual Resources** section for further discussion, proposed conditions of certification, and determination of residual impact.)

Biological Impacts

Construction of the project could result in impacts to the biological resource value of the proposed project site and surrounding areas, significantly affecting vegetation, habitat, and special status species. However, full implementation of the recommended conditions of certification would prevent a substantial level of impact. (See **Biological Resources** section for further discussion, proposed conditions of certification, and determination of residual impact.)

Cultural Impacts

The proposed project would be constructed on the site of the former Rice AAF and a portion of the former Camp Rice. The sites retain integrity of association as important components in the DTC/CAMA. Both sites appear to be eligible for listing on the National Register of Historic Places under Criterion A and C, and the California Register of Historic Places under Criterion 1 and 3, as contributing resources to a cultural landscape district. The draft multiple property form for DTC/CAMA as a cultural landscape district has been submitted to and is under review by the BLM. (TN 55813, #84-86, p.128) Construction of the project on the proposed site would effectively eliminate the Rice AAF, but would not substantially impact the historic integrity of the Camp Rice site, except as it relates to the connectivity of the two facilities and their relationship within the cultural landscape. (See **Cultural Resources** section for further discussion, proposed conditions of certification, and determination of residual impact.)

The agricultural resources of the affected public recreation lands would not be substantially affected (see Agricultural and Forestland discussion above) and a similar level of access to recreational and wilderness lands would be maintained. No other important resource value, except as discussed above, would be substantially affected.

Would the proposed project directly, indirectly, or cumulatively affect the wilderness qualities of size, naturalness, or outstanding opportunities for solitude or primitive and unconfined recreation of a wilderness area or wilderness study area; or change the characteristics of a wilderness study area, such that it would not contain the qualities necessary for it to be considered for future designation as wilderness?

The project site does not contain or abut any wilderness area or wilderness study area. However, five wilderness areas are in close proximity to the proposed project site (within a 15-mile radius). Part of the wilderness experience is the scenic quality and undeveloped nature of the views within and from the wilderness areas. As noted above, the project would be obvious from portions of the wilderness areas facing the Rice Valley, and both noise and light from the project, especially during construction, would impinge on visitors to those areas. Also, unlike many wilderness areas that are heavily forested, these are primarily a wilderness of rock and sand, offering little except distance and terrain to deflect or insulate the visitor from light and sound. The intensity of these manmade intrusions on the individual visitor is, of course, subjective, but would affect the overall naturalness and solitude essential to the wilderness experience. Therefore, the project would indirectly and cumulatively affect the wilderness qualities of naturalness and solitude. Impacts would not be substantial as distance from the project site would significantly reduce the intensity of the impacts (see additional discussion of Wilderness conditions above).

Land Use Compatibility and LORS Compliance

As required by California Code of Regulations (20 CCR 1744), Energy Commission staff must evaluate the proposed project in its entirety, including information provided by the project applicant in the AFC (and any amendments), project design, site location, and operational components, to determine if it would conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project, or that would normally have jurisdiction over the project except for the Energy Commission's exclusive authority. The Energy Commission must also determine whether the project is consistent with all applicable federal, state, regional, and local laws, ordinances, regulations, and standards (LORS) [PRC §25523(d)(1)] or make specific findings that a project's approval is justified despite its nonconformity (PRC §25525).

Consistent with the requirements of CEQA and NEPA, Energy Commission staff also evaluates the project's compatibility with and impacts on existing and approved uses and surrounding communities. The land use compatibility of a project is also intrinsically tied to its effects on historic land uses and environment of the surrounding area. While mentioned in this section, these issues are addressed in detail in other sections of this document.

LAND USE COMPATIBILITY

The project's generating facility and solar field would be sited entirely on privately owned lands, with access off SR 62, subject to an encroachment permit from Caltrans. The interconnection substation and most of the transmission lines for the project would be sited on BLM-managed public lands, except for the transmission line connection at the generating site and two short segments of the transmission line that cross private

land along the transmission line corridor. The generating site would normally be subject to Riverside County jurisdictional authority, except for the Energy Commission's exclusive authority. The transmission line corridor and interconnection substation are under federal (BLM) jurisdiction and subject to the CDCA/NECO area plan. Approval and issuance of a ROW from BLM would require an amendment to CDCA/NECO Plan. Both BLM and the Energy Commission consider the Riverside County General Plan land use designations, zoning, other plan/policy restrictions, and existing uses on surrounding properties to evaluate the compatibility of the project and incorporate conditions and restrictions to ensure the project would not result in a significant adverse impact to land uses in the area. (See LORS Compliance below for further discussion.)

The property within and around the project site is a combination of public and private undeveloped desert lands in Riverside and San Bernardino counties and is currently used for recreation, limited grazing, wildlife habitat, public utilities and services, and open space. The Aqueduct, ARZC shortline, and SR62 parallel the project's northern boundary. The area is ringed by mountainous wilderness areas and the closest residence is about 15 miles from the project site. Construction of the generating facility, including the heliostat field, would affect about 1,410 acres of private lands and the transmission line corridor and substation would encompass approximately 10 linear miles (150 foot-wide corridor) or about 99 acres, primarily on BLM-managed public lands. All existing vegetation, landforms, and drainage, within the footprint of the generating facility and substation would be permanently altered.

Public access and use of the BLM-managed lands for agriculture (grazing), recreation, or other purposes would be disrupted during construction and prohibited within the substation area for the operational life of the project. Both the generating facility and the interconnection substation would be completed fenced, including exclusionary fencing to prevent access by desert tortoise and other wildlife, with controlled access to the generating facility off SR 62. Access to the transmission line and substation would also be from SR62, via Rice Valley Road, which would be extended about 4.6 miles. However, access along that route would be unrestricted once construction is complete.

Generating facility parcels, surrounding private properties, and private holdings along the transmission line corridor are currently zoned W-2-10 (Controlled Development Area, 10-acre minimum parcel size), with an OS-R (Open Space – Rural) Riverside County General Plan land use designation. These designations allow a wide variety of uses, including structures and the pertinent facilities necessary and incidental to the development and transmission of electrical power and gas, such as hydroelectric power plants, booster or conversion plants, transmission lines, pipelines, and other related infrastructure (RC 2009a, §15.1). BLM-managed lands are designated MUC-M, which also allows a wide variety of uses, including mining, livestock grazing, recreation, and energy and utility development, balanced with requirements to conserve desert resources and mitigate damaged to those resources caused by the allowed uses (BLM 1999, p.13). These lands also have a Riverside County General Plan land use designation of OS-R, but the federal agency retains jurisdiction.

Would the proposed project directly or indirectly divide an established community or disrupt an existing or approved land use?

Divide an Established Community

The proposed project site is extremely isolated and is not part of or adjacent to any established community or residential area. It is surrounded by BLM-managed public lands, interspersed with a few, privately-owned parcels. The closest area with any services is Vidal Junction, a small community about 15 miles east of the proposed project site. Other towns in the general vicinity are Parker, about 35 miles east, on the California/Arizona border; Blythe and Needles, approximately 65 miles south and north, respectively; Desert Center, a bit over 50 miles to the southwest; and Twenty-nine Palms, off SR 62, about 75 miles to the west. Access to all existing facilities in the area (e.g., Iron Mountain Mine, the Aqueduct, utility corridors) is directly off of SR 62 and would not be dependent on or impeded by the proposed project. No impact.

Compatibility with Existing or Approved Land Uses

Agricultural Use

Implementation of this project could temporarily disrupt access to a portion of the Rice Valley (Keoughs) Rangeland Grazing Allotment and remove approximately 130 acres of forage from the same allotment. However, this is equivalent to less than 1% of the available forage on the 74,740 acres of allotment land, which would not jeopardize the continued use or viability of the allotment. Additionally, condition of certification **LAND-4** would significantly reduce access impacts by restricting construction along Rice Valley Road to periods outside the allotment grazing window. There are no other agricultural uses on parcels surrounding the proposed project site and the size of the four parcels that would make up the site contain sufficient acreage to buffer surrounding private properties from impacts that would adversely affect future livestock or agricultural production. As noted in the Agriculture and Rangeland discussion above, agricultural uses, except for grazing, are not permitted on BLM-managed MUC-M lands. Impacts to existing or permitted agricultural uses would be less than significant.

Residential Use

Privately-owned properties surrounding the project site are undeveloped and, except for the Rice AAF and Camp Rice areas, relatively undisturbed desert lands. The project would not physically intrude on, block access to, or interfere with any existing or permitted use, nor would it prevent future residential development in the area. Although the existing zoning and land use designations for the surrounding properties permit residential development, scarcity of public services and infrastructure, combined with the remoteness of the area, would probably preclude any significant increase in residential density in the foreseeable future. The project would not significantly impact the use of the adjacent lands for residential purposes.

Sensitive Receptors

A proposed siting location may be considered inappropriate if it would produce a new source of pollution, health or safety hazard, or excessive noise exposure to a sensitive receptor or sensitive land use. From a land use perspective, sensitive receptor sites are those locations where people who would be more adversely affected by pollutants,

toxins, noise, dust, or other project-related health or safety issue are likely to live or gather. Children, those who are ill or immune-compromised, or the elderly are generally considered more at risk from environmental pollutants. Therefore, schools, along with day-care facilities, hospitals, nursing homes (including long-term and mental care facilities), and residential areas, are considered to be sensitive receptor sites for the purposes of determining a potentially significant environmental impact. Depending on the applicable code, close proximity is defined as “within 1000 feet” of a school (California Health & Safety Code §§42301.6-9) or within 0.25 miles of a sensitive receptor, under CEQA. Proximity is not necessarily the deciding factor for a potentially significant impact, but is the threshold generally used to require further evaluation. However, the closest sensitive receptor site is about 15 miles away (residences at Vidal Junction). Therefore, the project would not introduce a new source of pollution or hazard within close proximity to a sensitive receptor or have a significant health- or safety-related impact at any existing sensitive receptor location.

In addition to the sensitive receptor sites identified above, there are also sensitive land use areas that may be adversely impacted by light, noise, and other pollutants. The Riverside County General Plan (RCGP) identifies certain areas and uses as particularly sensitive to noise and require them to be protected by restricting noise-producing land uses or requiring noise buffers to reduce the potential impacts. The intent, as noted in the RCGP, is to “protect noise-sensitive land uses from noise emitted by outside sources and prevent new projects from generating adverse noise levels on adjacent properties.” Noise-sensitive land uses include all facilities identified above, residences, libraries, and passive recreation uses¹⁰ (RC 2008, p.N-5). As defined, part or all of state and national parks, local and regional conservation areas, and federal wilderness areas qualify as sensitive land use areas. As indicated above, the remoteness of the proposed project site prevents impacts to sensitive receptors, including permanent residences and libraries. However, the site is surrounded by five federal wilderness areas, with some boundaries within two miles of the project site. With average construction noise around 89 dBA and noise from steam blows and pile driving at 100-130 dBA at 50 feet from the source, it is likely that construction noise would be audible in the wilderness areas closest to the project site. Normal ambient noise levels for remote and wilderness areas generally average approximately 25-40 dBA (USC 1998; BLM/MWD 2001, Vol. 1, Section 5). As noted in the **Noise** section of this document, general construction noise would attenuate below 40-45 dBA at a distance of about two miles, even without consideration of reductions due to topography. As a result, it is unlikely that the ambient noise levels at even the nearest noise-sensitive land uses (i.e., Turtle Mountains Wilderness and Rice Valley Wilderness) would be increased by more than 5 dBA as a result of project activities. For pile driving and other intermittent activities, noise levels are expected to attenuate to about 72 dBA at 15 miles from the source, so these noises may be clearly audible in nearby areas, especially if construction occurs at night.

¹⁰ A passive recreation area is generally an undeveloped space or environmentally sensitive area that requires only minimal visitor facilities and services, directly related to health and safety. Activities do not significantly impact natural, cultural, scientific, or agricultural values. The quality of the environment and “naturalness” of an area is the focus of the recreational experience in a passive recreation area.(USL 2010)

However, the temporary, intermittent nature of these noise bursts would not permanently increase the ambient noise levels in the wilderness areas and, although it may still degrade the wilderness experience for some visitors, would not represent a significant impact to these noise-sensitive locations.

Natural Resource Uses

For the proposed project (Alternative 1), there are biological project-specific resource impacts that relate directly to existing and permitted land uses. Combined with SR 62, the Aqueduct, and the ARZC shortline berm and tracks, the proposed project expands the existing northern migration barrier for wildlife and farther south toward the Rice Valley Dunes. Also, as noted above, at least 1,410 acres of existing relatively undisturbed desert habitat would be subject to continuous disruption of vegetation and complete exclusion of the majority of the wildlife in the vicinity, including the threatened desert tortoise. The project would also result in continued disruption and degradation of the areas beneath the transmission corridors for the life of the project.

However, Energy Commission staff concludes that with implementation of recommended conditions of certification **BIO-1** through **BIO-28**, the solar generator site, generator tie-line, and interconnector substation contributions to cumulative significant impacts to biological resources would not be cumulatively considerable. Staff has not determined potential cumulative significance of project impacts along the Western Parker-Blythe 161-kV OPGW Transmission Line, pending additional biological data. Therefore, the project is considered consistent with the existing and future natural resource use of these lands. (See **BIOLOGICAL RESOURCES** section for additional information.)

Cultural/Historic Uses

The land surrounding the project site is a particularly rich cultural area with respect to relatively recent military history. As noted in Setting above, the project site played an important role during WWII as part of the infantry and artillery DTC/C-AMA. Ten camps were established throughout southern Nevada, Arizona, and California to prepare troops for combat in North Africa. Well-known for its association with its first Commanding General, Major General George S. Patton Jr., the center was the largest military training ground in the history of military maneuvers. Construction of the proposed project would result in removal of the almost all of the remains of Rice AAF, along with a small portion of the adjacent Camp Rice. Removal of the Rice AAF would disrupt the historic integrity of the Camp Rice site, as it relates to the connectivity of the two facilities and their relationship within the DTC/C-AMA cultural landscape. However, full implementation of conditions of certification **CUL-1** and **CUL-11** would reduce the impacts to a less than significant level under CEQA. Therefore, the project would be considered consistent with the existing and future use of these cultural resources. (See **Cultural Resources and Native American Values** section for more information.)

Airports

The proposed project would be located on the site of the Rice Airport (formerly Rice AAF), a closed and abandoned airfield about three miles east of the Rice townsite. The site is approximately 50 miles northeast of the Desert Center Airport; 35 miles west of Avi Suquilla Airport in Parker, Arizona; 65 miles from the Blythe Airport; and about 60

miles south of the Needles Airport in San Bernardino County. The closest airstrip to the project site is at the Iron Mountain Pumping Plant, a private, unattended airstrip approximately seven miles northeast, that is owned by the Metropolitan Water District of Southern California. There are no public or private airports within two miles of the project site. The proposed project would have no impact on the operation of any airport.

Recreational Use

The proposed location for the project's generating facility is on private land with no public access or existing recreational use. Although zoned to allow a wide variety of uses, there is no indication that recreational development is being considered in the foreseeable future at this location or on nearby privately owned lands. Adjacent public multi-use recreational lands offer recreational opportunities, along with a multitude of other allowed uses, including livestock grazing, mining operations, railroads and landing strips, and electrical generating facilities. Given the scarcity of recreational users in the area, any disruption of recreational activities on public multi-use lands would be extremely limited and would require no mitigation.

There are also 11 designated wilderness areas within 50 miles of the project site. These areas are not developed, but are available to the public and provide places for solitude and quiet contemplation. It is these areas, especially those closest to the project site, (i.e., Turtle Mountains and Rice Valley Wildernesses), that may experience some disruption of the existing recreational use with construction of the proposed project. Light and noise generated by the project, especially during construction, would have the potential to degrade the wilderness experience for some visitors. Dark sky conditions that currently exist on the desert floor, and as viewed from the surrounding wilderness areas, would be degraded during construction and throughout the operational life of the project. Recreational activities such as stargazing and sky interpretation would be affected within several miles of the project site. However, given the limited recreational uses in the surrounding areas, the impact to recreational use would be considered less than significant.

Land Uses following Closure and Decommissioning

Once constructed and in operation, the proposed project has an estimated life of at least 30 years. The industrial use currently proposed would then be considered an existing use in an area that will probably continue to be bounded by public recreation and natural resource lands. Given the limited infrastructure and distance from any major urban area, significant residential or commercial development is unlikely.

Construction of the proposed project in any configuration, at the preferred or any alternative location, would result in the complete disruption of the existing ecosystem and habitat within the facility footprint, conditions that would have been maintained for the life of the project. Appropriate rehabilitation of the site would need to be revisited to determine consistency with land uses existing at the time of closure. A return to the drainages and topography that existed at the time of construction may not be appropriate and could, in fact, result in unacceptable impacts to surrounding properties. Additionally, the microbial crusts would be destroyed during construction and operational maintenance would prevent reestablishment, precluding rapid revegetation and grazing potential on the land for many years following closure. However, the

required Closure and Decommissioning Plan includes a provision for rehabilitation of the site to be consistent with land uses existing at the time of closure. This would reduce any land use consistency issues to a minimum and would not substantially disrupt land uses in the surrounding area. Less than significant impact.

Would the proposed project directly or indirectly induce substantial population growth in an area?

As noted above, most of the land surrounding the project site is publicly owned, with a few undeveloped private parcels interspersed throughout the area. The closest residences are about 15 miles east, at the outskirts of Vidal Junction. Construction workers would either commute from temporary residences in Blythe; Needles; Earp; Parker; Arizona; and a number of very small communities within an hour or so of the site; or commute from their permanent home daily. Although construction would take about 30 months, it is unlikely that any of these temporary workers would permanently relocate to the project area.

Approximately 47 permanent employees would be hired for the long-term, operational phase of the project and would need to reside as close as possible to the project site. Given the lack of local residences, this would mean that approximately 150 people could be added to the population of the five larger towns indicated above and a few small communities in the surrounding area (about 33,000 people). This would be population increase of less than 0.005%, assuming none currently reside locally, and would not result in substantial population growth for the area, significantly impact existing public facilities, or require the construction of new public facilities or additional public services. (See **Socioeconomics and Environmental Justice** section for additional discussion.)

Would the proposed project conflict with any applicable habitat conservation plan, natural community conservation plan, or biological opinion?

BLM-managed public lands in the project vicinity are subject to the California Desert Conservation Area (CDCA) Plan, as amended by the Northern and Eastern Colorado Desert Coordinated Management Plan (NECO). The transmission line corridor and substation would be located primarily on BLM-managed lands classified as MUC-M. There are no Areas of Critical Environmental Concern (ACEC) within the proposed ROW or affected by the proposed project and the CDCA plan is not a habitat or natural community conservation plan, although it contains some elements of both. A biological opinion has not been issued for this project. Therefore, there is no applicable habitat conservation plan, natural community conservation plan, or biological opinion for this project. No impact.

LORS COMPLIANCE

Would the proposed project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction, or that would normally have jurisdiction, over the project adopted for the purpose of avoiding or mitigating environmental effects?

As required by California Code of Regulations (CCR) Title 20, Section 1744, Energy

Commission staff evaluates the information provided by the project owner in the AFC (and any amendments), project design and operational components, and siting to determine if elements of the proposed project would conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project, or that would normally have jurisdiction over the project except for the Energy Commission's exclusive authority. This includes all applicable federal, state, and local laws, ordinances, regulations, and standards, including those adopted by Riverside County. From a CEQA perspective, the analysis places particular emphasis on any environmental effect that may be avoided or mitigated by conformity with the applicable LORS. NEPA also requires consideration of the project's consistency with applicable federal, state, and local LORS requirements and restrictions.

Federal

California Desert Conservation Area (CDCA) Plan, as amended by NECO

The CDCA Plan is a comprehensive, long-range plan for public California Desert lands, including a portion of the project site. All project sites and alternatives are located within the CDCA boundaries; however, CDCA restrictions only apply to public lands.

The NECO Plan amended CDCA as follows:

1. Established regional standards for public land health and set guidelines for grazing management.
2. Established two Desert Wildlife Management Areas (DWMAs), encompassing about 1.75 million acres, to be managed as Areas of Critical Environmental Concern (ACECs) for the recovery of the desert tortoise.
3. Established the Southern Mojave and Sonoran Wildlife Habitat Management Areas (WHMAs) for bighorn sheep, totaling over one million acres, and 13 multi-species WHMAs, total over a half million acres.
4. Combined Herd Management Areas (HMAs) for wild horses and burros and adjusted the Appropriate Management Levels.
5. Designated routes of travel for vehicle access to BLM lands within the NECO plan area.
6. Identified priorities for potential acquisition of private lands and disposal/sale of public lands.
7. Provided access to resources for economic and social needs.
8. Incorporated 23 wilderness areas established by the 1994 California Desert Protection Act into the CDCA.

From a federal (NEPA) perspective and in accordance with federal regulations relating to Public Lands (CFR 2001 & 2008), FLPMA, Public Rangelands Improvement Act; Farmland Protection Policy Act (FPPA); and National Management Strategy for Motorized Off-Highway Vehicle Use on Public Lands, all project actions on public lands

must be in conformance with applicable land use plans for public lands administered by BLM. CEQA also requires projects be consistent with all applicable federal, state, and local LORS. These include the CDCA Plan, as amended by the NECO. Any proposals or actions determined not to be in conformance with these plans would require a land use plan amendment.

Use of BLM-managed public lands for other than casual use requires approval of a right-of-way grant. Casual use is generally defined as activities that do not unduly disturb the surface or require extensive removal of vegetation, and usually occur only once or intermittently. The grant authorizes rights and privileges for a specific use of the land for a specified period of time, and includes conditions to protect resource values and other existing or compatible uses. The project would require a BLM ROW for project-related structures and activities, specifically for the proposed transmission line corridor and substation footprint. Condition of certification **LAND-3** requires the project owner to obtain an ROW grant from BLM for any project elements proposed for public lands, prior to the start of construction. In addition, although the CDCA Plan allows the construction of solar power plant projects and electric transmission facilities within MUC-M lands, after compliance with NEPA, it also requires that new projects, not currently included within the plan, be added through the Plan Amendment process. Therefore, this SA/DEIS also acts as the mechanism for analyzing the potential impacts of adding the RSEP facility to the Plan. The Plan Amendment decision would be part of the BLM Record of Decision for the issuance of a right-of-way grant, and would occur after publication of the Final EIS.

The CDCA Plan also requires that new transmission facilities be located within appropriately designated corridors, as required by Section 368 of the Energy Policy act of 2005, to ensure that additional corridors for oil, gas, and hydrogen pipelines and electricity transmission and distribution facilities on Federal land are promptly identified and designated. However, the project's proposed transmission line connection corridor does not meet requirements for Section 368 designation. (BLM 2009e) Therefore, BLM will accommodate the need for the proposed energy transport corridor through its normal land use planning and amendment process, which provides the standard procedure for designating corridors or allowing transmission lines outside designated corridors as the need arises.

The Recreation Element of the CDCA Plan specifies that "...lands managed by the Bureau are especially significant to recreationists" (BLM 1980). Congress also specified, when the CDCA was adopted, that "the use of all California desert resources can and should ... provide present and future use and enjoyment, particularly outdoor recreation uses..." (FLPMA, Section 601). As noted in the Recreation discussion above, the proposed project would have a negligible impact on the availability of and access to BLM-managed, publicly-owned recreational lands. With approval of the transmission line ROW and the proposed CDCA plan amendment, the project would be considered consistent with the recreational requirements of the CDCA, as amended by NECO.

Impacts to agricultural uses and rangeland would also be less than significant, with full implementation of condition of certification **LAND-4** (see Agriculture and Rangelands discussion above). Residual impacts of the proposed project would include an adverse impact on the Wilderness experience for visitors to several of the Wilderness areas

surrounding the project site, but would have no direct impact to resources within Wilderness boundaries (see Wilderness discussion above).

The BLM's approval of a CDCA plan amendment for the transmission line element of the project; and balance of multiple use priorities, combined with mitigation provided by the proposed conditions of certification listed above, would make the project consistent with the CDCA Plan, as amended by NECO.

State

Public Resources Code §25529

This section of the Warren Alquist Act is intended to preserve public access to areas of recreational, scenic, or historic value. For power projects proposed in such areas, a condition of certification to establish and maintain such a public access and use area is required by the Energy Commission as part of the licensing process. Direct project-related impacts to the historic significance of the Rice AAF would be significant and would be mitigated, in part, by the development of a Historic Interpretive Area adjacent to the remaining Camp Rice location. This area would be acquired and maintained by the project owner. (See condition of certification **CULT-11**.) As a result, the project would be consistent with the requirements of PRC §25529.

Local

The proposed power plant and solar field would be sited entirely on privately-owned lands in unincorporated Riverside County and are, therefore, subject to the land use LORS of Riverside County. The proximity of the San Bernardino County line (immediately north of SR62 and the northern project boundary) and the LORS applicable to adjacent lands within that county must also be considered. The transmission line corridor and substation site is under federal (BLM) jurisdiction and subject to the CDCA and NECO area plans. Riverside County jurisdictional authority would only apply to project elements situated on private lands. The proposed project is consistent with the applicable federal, state, and local LORS, except as discussed below.

Riverside County General Plan (RC 2008)

The Riverside County 2003 General Plan (GP), as amended through December 2008 (excluding the Housing Element), designates both the project site and surrounding BLM lands as Open Space/Rural (OS-RUR) (see **Land Use Figure 5**). Privately owned properties surrounding the project site in Riverside County also have an OS-RUR designation. Riverside County GP policies related to the proposed project site and adjacent lands are included in the Land Use Element (Chapter 3), Multipurpose Open Space Element (Chapter 5), and Noise Element (Chapter 7).

Land Use Element

General Land Use Policies

LU 4.1 - 4.3 require new developments be located and designed to visually enhance (not degrade) the character of the surrounding area. The proposed project must comply

with applicable design standards, building codes, and land use regulations. It must also mitigate noise, odor, lighting, and other impacts on surrounding properties; implement energy-efficient design features and water conservation measures, including drought tolerant landscaping and drought-conscious irrigation systems; include design-appropriate signage; design parking lots and structures to be functionally and visually integrated and connected; provide safe and convenient vehicular access. In addition, the project must preserve natural features, such as unique natural terrain, drainage ways, and native vegetation, wherever feasible, particularly where they provide continuity with more extensive regional systems (4.1); maintain structures and landscaping to a high standard of design, health, and safety (4.2); and create programs to ensure historic preservation (4.3). Condition of certification **LAND-5** would require compliance with all land use, building, and other applicable general plan policies and municipal code standards in the design and construction of the proposed project, to the extent feasible. Additional conditions of certification in various sections of this document address compliance for drainage, health and safety; noise, and natural and cultural resource protection.

There are other requirements within these policies that do not apply to the proposed project, due primarily to its remote location and the absence of other commercial, industrial, or residential development in the area. For example, the land surrounding the proposed project site, with the exception of the adjacent Camp Rice, is almost exclusively undeveloped desert landscape. Extensive landscaping, sidewalks, bicycle routes, public art, and other requirements designed to enhance an urban environment would be inappropriate in the project setting.

As discussed in LU 6.1/6.2 below, this is a highly visible, industrial facility that would be placed in a previously undeveloped desert area. As noted in the **Visual Resources** section of this document, even with all staff-recommended conditions of certification, the project would have significant and unavoidable adverse visual impacts. This is not consistent with the requirements of LU 4.1

Policy LU 5.1 requires that the development not exceed the ability of the county to adequately provide supporting infrastructure and services, such as libraries, recreational facilities, transportation systems, and fire, police, and medical services. Because of the project's remote location, the demands on county services would be minimal.. Highway access to the site is along SR62, with connecting state and U.S. highway access to the surrounding communities of Blythe, Desert Center (I-10), Twenty-Nine Palms, Needles, and Parker, Arizona. There is no public transit serving the proposed project site. (See **Traffic & Transportation** section for further information.) The project has incorporated safety features that are designed for onsite fire/life/safety response, but would also be subject to the Riverside County Development Impact Fees (see Ordinance 659 discussion below), which are designed to allow the County to construct/acquire the needed public facilities to support development and preserve open space, wildlife, and their habitats (see **LAND-6**). The project may have an adverse impact on emergency response times due to its distance from normal service areas. The extent of that impact and availability of sufficient mitigation to reduce the potential impact has not yet been determined. Therefore, staff cannot make a determination regarding consistency of the project with this policy at this time.

Policy LU 6.1/6.2 – Policy LU 6.1 requires the project to be designed to insure compatibility with surrounding uses and consistency with any applicable land use designations and Area Plans. As noted above, condition of certification **LAND-5** would require compliance with all land use, building, and other applicable general plan policies and municipal code standards in the design and construction of the proposed project, to the extent feasible. However, potential significant and unavoidable impacts to visual resources make the project inconsistent with this policy.

Policy LU 6.2 directs development of public, educational, religious, and utility uses established to serve the surrounding community to specific locations where these activities would normally be compatible. However, as power generated by this facility would not be used locally, this policy does not apply.

Policy LU 9.1 requires that new development contribute their fair share to fund infrastructure and public facilities, such as police and fire facilities. As noted in Policy LU 5.1 above, the project would be subject to Riverside County's Development Impact Fee (DIF). Condition of certification **LAND-6** requires payment of the county's DIF prior to occupancy of the proposed facilities and would, therefore, be consistent with the requirements of this policy.

Scenic Resource policies (LU 13.1 through 13.8; OS 21.1 and 22.1)

Riverside County places great importance on preservation of its abundant natural visual resources. The intent of these policies is to conserve significant scenic resources along designated or eligible scenic highways for future generations and to manage development along scenic highways and corridors so as not to detract from the area's scenic quality or prevent future designation of eligible highways. Policy requirements apply to both designated and eligible scenic highway corridors.

SR62, the primary access route for the proposed project, is identified by Caltrans as eligible for scenic highway status from its I-10 intersection at Whitewater, through Riverside and San Bernardino counties, to the Arizona state line (Caltrans 2010c). This includes that section of SR62 that forms the northern boundary of and provides access to the proposed project site. The cited Land Use policies require projects to:

- Preserve and protect outstanding scenic vistas and visual features for the enjoyment of the traveling public (LU 13.1);
- Incorporate riding, hiking, and bicycle trails and other compatible public recreational facilities within scenic corridors (LU 13.2);
- Ensure that the design and appearance of new landscaping, structures, equipment, signs, and grading are compatible with the surrounding scenic setting (LU 13.3);
- Allow a minimum 50-foot setback from the edge of the highway right-of-way is required for new development (LU 13.4);
- Require new or relocated electric or communication distribution lines, which would be visible from scenic highways, to be placed underground. (LU 13.5);
- Prohibit offsite outdoor advertising displays that are visible from scenic highways (LU 13.6);

- Require that the size, height, and type of on-premise signs visible from scenic highways be the minimum necessary for identification. The design, materials, color, and location of the signs must blend with the environment, utilizing natural materials where possible (LU 13.7);
- Avoid the blocking of public views by solid walls (LU 13.8);
- Identify and conserve the skylines, view corridors, and outstanding scenic vistas within Riverside County (OS 21.1);
- Design developments within scenic highway corridors to balance the objectives of maintaining scenic resources with accommodating compatible land uses (OS 22.1).

Signs, landscaping, and most project buildings would be finished to blend with the surrounding landscape, to the extent feasible. The Historic Interpretive Area (required by condition of certification **CULT-11**) would provide the traveling public with an access area designed to divert the focus from the plant's visual impact and highlight the unobscured vistas and historic elements adjacent to the project location. Although this General Plan policy only requires a minimum 50-foot setback, condition of certification **BIO-21** would require the project maintain a minimum 100-foot setback between the road shoulder of SR62 and the project's temporary security fence, to allow east-west wildlife passage alongside the highway and to minimize road mortality during project construction. The permanent project footprint would be set back approximately 500 feet from the southern edge of the SR62 ROW. Condition of certification **LAND-7** would require the project owner to underground all permanent communication and electric distribution lines serving the project. Lines serving the temporary construction trailer may be installed above ground, but must be removed following closure of this facility once construction is complete. Project design and Energy Commission conditions of certification would ensure consistency with the majority of the scenic highway policy requirements. Condition of certification **LAND-9** would require the use of native, drought-resistant landscaping plantings along the entrance, northern boundary fencing, and visitor viewing area to maintain the character of and help to blend the facility's visible presence along SR62 with the undeveloped natural contours of the site. The project has no sound walls that would block public views and high-walled power block structures would be placed nearly one-half mile from the highway. Development of riding, hiking, bicycle trails or other public recreational facilities, other than the historic viewing area, would be inappropriate in this remote area. However, as noted in the **Visual Resources** section and LU 6.1/6.2 above, the proposed power stack is visually incompatible with the surrounding scenic setting. For this reason, the project is not consistent with the requirements of the General Plan scenic highways policies LU 13.1, 13.3, and OS 21.1.

Policy LU 14.7 requires the county to ensure that no structures or activities encroach upon or adversely affect the use of navigable airspace. As noted in the impacts discussion of aviation and military operations in the **Traffic and Transportation** section of this document, the proposed solar power tower would encroach into navigable airspace and has the potential to significantly impact military testing and operations conducted along three low-level military training routes. However, full implementation of conditions of certification **TRANS-2, TRANS-7, TRANS-8, and TRANS-9**, would ensure consistency with this land use policy.

Open Space/Rural (OS-RUR) Land Use Designation policies (LU 20.1 – 20.6)

The OS-RUR General Plan land use designation applies specifically to the private lands identified as the proposed project site. This designation is applied to remote, privately owned, open space areas with limited access and a lack of public services. (RC 2008) The project is consistent with policy requirements for adequate utility, water, septic capacity, and circulation (LU 20.3) and condition of certification **LAND-1** would require the four parcels identified as the project site to be consolidated into a single parcel (LU 20.5). However, as identified in the Land Use Compatibility discussion above, the structures proposed for this project would not maintain the character of or blend with the undeveloped natural contours of the site, as required by LU 20.1 and LU 20.2. Given the industrial nature of the proposed project, it also would not be possible to avoid an unvaried, unnatural, or manufactured appearance to the facility or adverse impact to the open space and rural character of the surrounding area (LU 20.2; LU 20.4). There are also no county programs or incentives that would allow this project to maintain or enhance the open space/rural character of the surrounding area (LU.6). Therefore, the proposed project would not be consistent with OS-RUR land use policies LU 20.1, 20.2, and 20.4.

Eastern Riverside County Desert Areas (Non-Area Plan)

Most areas in Riverside County are located within a specific Area plan boundary. However, there are some lands in the eastern portion of the County, including the project site, which are not located within an Area plan. These areas are generally characterized by expansive, primarily undeveloped desert and mountainous areas, with a variety of geographic features, including flat desert valleys, rolling sand dunes, stark hillside and mountain ranges, and lush riparian corridors along the Colorado River. Some of the more prominent natural features and land uses located here include several clustered mountain ranges surrounding the project site, including the Little Maria, Palen, Big Maria, and Riverside Mountains. The Colorado River Aqueduct is adjacent to and parallels the project's northern boundary.

Land Use policy LU-30.1 is intended to preserve the unique and spectacular open space character of this desert region and maintain those existing rural and mineral resource lands uses of these areas. While the proposed project would not preclude use of existing or future use of the mineral resources (see discussion below) or rural uses in the project vicinity, it would visually impact the open space character of the surrounding area and affect the quality of the wilderness experience in the adjacent wilderness areas. Therefore, the proposed project is not consistent with the intent of LU 30.1.

Multipurpose Open Space Element

This element identifies the conditions and actions necessary to protect and preserve the County's natural resources, agriculture, and open space areas; provide effective management of mineral resources; preserve and enhance cultural resources; and provide recreational opportunities for the citizens of Riverside County.

Water Conservation

Policy OS 2.2 requires developers to decrease stormwater runoff by reducing pavement in developed areas and to include permeable parking bays and porous parking lots, with bermed rainwater detention basins. As noted in the **Soil & Water** section of this

document, the proposed project would result in an increase in impervious area within power block areas and from on-site access roads. However, the size of these new impervious areas, compared to the total site acreage, is quite limited and is not expected to significantly increase either the volume or rate of stormwater discharge. Consistent with this policy, areas around the powerblock (**SOIL&WATER-1**) and, as required by condition of certification **LAND-8**, on-site access roads, visitor and construction worker parking, and portions of the construction laydown area would be surfaced with rock/gravel, decomposed granite, or similar material to provide a level, all-weather surface, minimize dust, and provide a permeable surface to facilitate drainage. Three lined, 5-acre evaporation ponds would also be constructed at the south end of the project site to contain all process blowdown and stormwater drainage from the central power block (SR 2009a).

Policy OS 2.3 encourages the use of native, drought-resistant landscaping plantings. In addition, as noted in the Scenic Highways discussion above, SR 62, eligible for scenic highway status, extends along the northern boundary of the project site. Although the AFC does not propose landscaping for the proposed project (SR 2009a), condition of certification **LAND-9** would require the use of native, drought-resistant landscaping plantings along the entrance, northern boundary fencing, and visitor viewing area, consistent with OS 2.3 and requirements for the project to maintain the character of and blend with the undeveloped natural contours of the site. Additionally, conditions of certification **BIO-11, BIO-12, and BIO-13** would require restoration of the desert landscape in all temporarily disturbed areas outside the final project footprint to pre-project grade and conditions, including the logistics/lay down areas, generator tie-line transmission tower sites, pull sites, areas where underground infrastructure was installed, temporary access roads, and construction worker parking areas.

With the implementation of the proposed design features and recommended conditions of certification, the project would be consistent with the requirements of General Plan Policy OS 2.2 and OS 2.3.

Groundwater Recharge

Three General Plan Open Space policies address the need to protect groundwater recharge areas: (1) Policy OS 4.3 requires that adequate aquifer water recharge areas be preserved and protected; (2) Policy OS 4.4 requires a project to incorporate natural drainage systems into the development, where appropriate and feasible; and (3) Policy OS 4.5 requires a project to retain stormwater at or near the rainfall location for percolation into the groundwater tables, to conserve it for future uses and mitigate flooding. Conditions of certification **SOIL&WATER-1** and **LAND-8** would require permeable paving surfaces. The proposed project design includes three on-site evaporation ponds (SR 2009a) and natural drainage conditions would be preserved, to the extent feasible (see **Soil & Water** section). The project would, therefore, be consistent with Open Space policies OS 4.3, 4.4, and 4.5.

Mineral Resources

Mineral extraction makes an important contribution to Riverside County's economy. The non-renewable characteristic of mineral deposits necessitates the careful and efficient development of mineral resources to prevent the unnecessary waste of these deposits

due to careless exploitation and uncontrolled urbanization. To protect the availability of these resources for future generations, Policy OS 14.2 restricts the development of incompatible land uses within the impact area of existing or potential surface mining areas. The project site is designated Mineral Resource Zone 4 (MRZ-4). These are areas where there is not enough information available to determine the presence or absence of mineral deposits. Surrounding properties have not been mined and there is no indication that there are sufficient mineral resources to justify mining them in the foreseeable future. However, several operating and closed mines and mineral prospects are within five miles of the proposed project boundaries. These have produced a number of industrial minerals, primarily manganese, borates, clay, and talc. No active mines are known to have existed within the proposed project boundaries (USGS 2008a). As noted in the **Geology, Paleontology, and Minerals** section of this document, until the existence and structural orientation of an ore body is proven, the probability of the presence of economically recoverable mineral reserves beneath the property is considered to be very low. Location of the project at the proposed site is, therefore, consistent Policy OS 14.2.

Noise Element

The Noise Element of the General Plan is closely related to the Land Use Element because of the effects that noise has on sensitive land uses. Noise-producing land uses must be compatible with adjacent land uses in order for the Land Use Plan to be successful. There would be no sensitive receptors within 15 miles of the project site once operations commence. The closest sensitive land uses would be at two wilderness areas, approximately 2-5 miles from the project boundaries. Although construction noise from the project could impact the wilderness experience at these locations, the noise would attenuate significantly at that distance and would generally be within Policy N 4.1 limitations (45 dBA/10-minute L_{eq} between 10:00 p.m. and 7:00 a.m. and 65 dBA/10-minute L_{eq} between 7:00 a.m. and 10:00 p.m). Exceedances, such as steam blows, would be temporary in nature, rarely extending beyond a few minutes. (See **Noise** section of this document for additional information.)

Riverside County Municipal Code

Ordinance 348, as amended through 348.4647 - Riverside County Land Use Ordinance

This Ordinance includes the planning and land use regulations for the unincorporated areas of Riverside County and identifies the process to initiate, implement, amend, and enforce these regulations.

Article XV, §§15.1 and 15.2 Controlled Development Areas (W-2) Zoning District

The proposed project site, two private parcels within the transmission line corridor, and surrounding privately owned parcels are currently zoned W-2-10 (10-acre minimum). Structures and the facilities necessary and incidental to the development and transmission of electrical power and gas, including power plants and transmission lines, are permitted uses within a W-2 zoning district. The proposed project site meets the minimum lot size. However, certain project elements, including the steam generating building, solar receiver tower, and transmission line towers, would exceed the maximum height of 75 feet for buildings and 105 feet for other structures. A variance is required

for structures exceeding these maximum heights [RC 2009a, §15.2(a)]. Variances may be granted when the strict application of this ordinance deprives such property of privileges enjoyed by other property in the vicinity that is under the same zoning classification, because of special circumstances applicable to a parcel of property, including size, shape, topography, location, or surroundings [RC 2009a, §18.27(a)]. In this case, the circumstances requiring structures that exceed the maximum heights are unrelated to the parcels that make up the project site. They are, instead, related to the functionality and operational requirements of the proposed project. As a result, the findings required to justify approval of a variance cannot be made. Therefore, the project would normally be inconsistent with the W-2 zoning district standards. However, approval of the project design, including elements exceeding the normal height restrictions of the W-2 zoning district, consistent with the requirements of a Riverside County Public Use Permit (normally subject to approval of the Riverside County Planning Commission, if not for the Energy Commission's exclusive authority) would provide consistency with the standards for the W-2 zoning district.

Article XV, §15.200 Natural Assets (N-A) Zoning District

Most of the transmission line corridor and the connection substation would be sited on BLM-managed public lands. These lands carry a county zoning designation of N-A. Public utility substations are a permitted use on lands zoned N-A, with plot plan approval, and public utilities are permitted in all zoning districts (see §18.29 below). However, Riverside County zoning regulations only apply to those portions of the project that would occur on private lands within county jurisdiction. The proposed project locations do not contain any private lands zoned N-A. Therefore, N-A zoning district requirements do not apply to this project.

Article XVIII, §18.12 Off-Street Vehicle Parking and Landscaping

The purpose of this section of the Riverside zoning code is to provide sufficient off-street parking and loading spaces for all land uses and to assure the provision and maintenance of safe, adequate, and well-designed off-street parking facilities.

Construction (Parking)

During construction, temporary parking areas would be developed at the project site, adjacent to the construction trailers and laydown areas. These would accommodate day workers, company vehicles, and visitors. As the site would be closed to the public, these visitors would normally include company officials, inspectors, and those making deliveries to the site. Areas will also be provided for larger trucks off-loading materials and equipment and for construction equipment used on-site. As Riverside County code does not specify the number of parking spaces required during construction, condition of certification **LAND-8** would require an area set aside to accommodate one parking space for each daily-commute employees (based on the average number of daily workers on-site during work months 8-20), one space for each company vehicle, and one commuter vanpool space for every 20 employees. In addition, three visitor spaces would be required immediately adjacent to the main construction office (trailer), including one handicapped van-accessible space, with provisions to allow accessibility to and into the main construction office. Because of the lengthy construction period (up to 30 months), this condition of certification would also require a compacted all-weather

surface of rock, decomposed granite, or similar material on all temporary parking areas and striping of the employee, visitor, and company vehicle parking spaces.

Operations (Parking)

The proposed project is a public utility use and is, therefore, required by code to provide one parking space for every two employees and one space for each vehicle kept in conjunction with the proposed use (i.e., company vehicles). Additionally, loading spaces for delivery of materials and equipment would also be required. Condition of certification **LAND-8** requires the project owner to construct the required parking and loading spaces, including at least one handicapped van-accessible parking space immediately adjacent to the site office, consistent with requirements of this code section and the Americans with Disabilities Act (ADA). A Parking Plan must be completed and approved, and construction of the parking areas completed prior to the start of plant operations.

Full implementation of the recommended conditions of certification would ensure the project is consistent with county parking requirements.

Landscaping

Condition of certification **LAND-9** would require the project owner to provide and implement an approved Landscape Plan, consistent with the requirements of this code and General Plan Policies 2.2 and 2.3 (see General Plan discussion above).

Article XVIII, §18.29 Public Use Permits

“Public utilities” is one of several uses permitted in any zone classification, provided a public use permit is granted by Riverside County. This includes transmission lines and electric generating plants, even if identified as permitted uses within the specific zoning district (CEC 2010a). An application for this use permit requires submission of much the same information included in an AFC and considered by the Energy Commission as part of the licensing process. As with §18.33 (see below), it must be determined that the project would not be detrimental to the health, safety or general welfare of the community for the permit to be approved. This would normally require approval of the Riverside County Planning Commission, if not for the Energy Commission’s exclusive authority. As identified in this SA/DEIS, Energy Commission staff has recommended numerous conditions of certification to ensure that there would be no significant health, safety, or welfare impacts during either construction or operation of this project. There is no “surrounding community” at this remote location; the closest permanent residence is approximately 15 miles away at Vidal Junction. Adjacent properties are undeveloped desert and there are no foreseeable developments proposed for these areas. The footprint of the proposed project would not envelope the entire acreage of the project site. The remaining undeveloped land would surround and provide a sufficient buffer between the facilities and adjacent privately-owned properties, significantly reducing the potential for the project to impact uses permitted by current zoning. Condition of certification **LAND-5** would require the project to follow Riverside County municipal and building code requirements. Proposed project design and conditions of certification would protect public health, safety, and welfare, and the usability of adjacent properties. The project is, therefore, consistent with the requirements for a public use permit.

Article XVIII, §18.33 Setback Adjustments and Temporary Use of Land

The section of the Riverside County code applies to the proposed project because temporary use of the land (project site) during the construction of public utilities would occur for more than six months. For the proposed project, this would include the presence and use of the construction trailers, RV camp, and construction laydown area, all located outside the proposed project's final footprint. This would also normally require approval of the Riverside County Planning Commission, if not for the Energy Commission's exclusive authority. However, it is the Energy Commission's intent to maintain consistency with local LORS to the extent feasible. For approval of an extended temporary use, it must be determined that, as in §18.29 above, the continued use would not be detrimental to the health, safety, or general welfare of the community or property in the vicinity of the project site, particularly as it relates to points of vehicle ingress and egress; the need for landscaping, fencing, or walls; restoration of the property to a natural appearance following completion of construction; and an established timeline for work completion and any required conditions [§18.33(f)].

The construction timeline for this project would be approximately 30 months. Conditions of certification **LAND-8**, **LAND-9**, and **BIO-1**, **12**, and **13** would require permeable surfacing of all temporary access roads and parking spaces; and specifically address rehabilitation of all temporary use areas with either restoration of the desert landscape or approval and implementation of an approved landscape plan. The project encroachment onto SR62 would provide both construction and operations access at an existing, though undeveloped, access point, and would be constructed to CalTrans specifications. Condition of certification **TRANS-1** would include a construction Traffic Control Plan that would protect existing roadway access and use. Condition of certification **TRANS-3** would require the project owner to repair any construction damage to public roadways to pre-project conditions. The project's interior access roads would be constructed consistent with Riverside County road requirements. Proposed project design and conditions of certification would protect public health, safety, and welfare, and the usability of adjacent properties. Therefore, the extended temporary uses of the project site would be consistent with the normal requirements for county approval.

Riverside County Ordinance 457.102 Building & Construction Code

Riverside County Building and Construction Code would apply to all construction outside federal lands and to construction on federal lands, to the extent that the standards do not conflict or override state and federal requirements. As noted in the AFC (SR 2009a), the project is designed to meet all required building and construction standards, to the extent feasible, and would meet or exceed all standard applicable building permit requirements. Federal public lands pursuant to a ROW grant under FLPMA Section 501, 43 USC 1761, are required to comply with State "siting, construction, operation, and maintenance" standards that are more stringent than equivalent Federal standards. However, the U.S. Court of Appeals for the Ninth Circuit has held that the Federal government has the right to exercise its authority to grant ROWs for facilities, consistent with FLPMA, free of any regulatory interference by local agencies. No county building permit would be required for any construction on federally managed public lands. Condition of certification **LAND-5** would require compliance with all applicable Riverside County zoning standards and building and municipal code

requirements, except as specifically noted in this section or other related sections of this document.

Riverside County Ordinance 460.151, §18.7 (Merging of Contiguous Parcels)

This ordinance allows the merger of four or fewer contiguous parcels under common ownership, without reverting to acreage, with approval of the Riverside County Planning Director and payment of the applicable processing fees. Approval of the merger application requires the following findings:

- The parcels to be merged are, at the time of merger, under common ownership and written consent has been obtained from all record owners.
- The parcel as merged would be consistent with the zoning of the property.
- The parcel as merged would not conflict with the location of any existing structures on the property.
- The parcel as merged would not be deprived access as a result of the merger.
- Access to the adjoining parcels would not be restricted by the merger.
- No new lot lines would be created through the merger.
- The existing right-of-way shall not be altered. Any alteration shall be accomplished through a separate vacation process.

The proposed project site currently consists of four contiguous parcels and would all be owned by the project owner(s) of record. All parcels are zoned W-2-10 and no zoning amendment is requested. There are no structures on any of the subject parcels and access would not be restricted to the subject or any adjoining parcels. No new lot lines would be created and existing right(s)-of-way would not be altered. Therefore, all findings for approval can be met.

Therefore, to avoid the construction of buildings across property lines and ensure compliance with the provisions of the Riverside County Zoning Ordinance, a condition of certification (**LAND-1**) would require the merger of these properties into a single parcel under common ownership, consistent with the requirements of this section of county code.

Riverside County Ordinance 659, as amended through 659.8 (Development Impact Fees)

As identified in this ordinance, it is necessary to require all new development bear its fair share of the cost to provide the public facilities and services, acquire and maintain the open space and wildlife and habitat protection, and address the impacts caused by such development. The Development Impact Fee (DIF) was created for that purpose. Fees have been established based on the service demands of various areas within the county. The AFC proposed project site is in the Desert Center-CV Center DIF area. Fees would be based on Commercial development at \$12,367 per acre, as established by the August 20, 2009 fee schedule. With renewable energy projects requiring an unusually large amount of acreage, DIF calculations would not include the acreage for the solar fields. Acreage calculations would include all power block facilities and all primary paths of travel leading to production plant area, including access roads, but not

solar field maintenance roads (CEC 2010a,b). Condition of certification **LAND-6** would require the project owner to pay the required DIF prior to the start of operations, consistent with Riverside County requirements for large-scale renewable energy projects, or enter into a development agreement, or similar agreement, with the County of Riverside in lieu of the development impact fee. The applicant has agreed to this requirement (GB 2010c).

Riverside County Ordinance 859, as amended through 859.2 (Water Efficient Landscape Requirements)

The water-efficient landscape requirements contained in this Ordinance apply to all new and rehabilitated landscapes associated with commercial or industrial uses, which require a discretionary permit and/or approval. The proposed project would require a public use permit, height variance, parcel merger, and approval of temporary extended use. Therefore, it would be subject to the requirements of this Ordinance. Condition of certification **LAND-8** would require approval and implementation of a Landscaping Plan, consistent with this ordinance. However, given the project's remote location and lack of available municipal water sources, use of recycled water would not be required.

Riverside County Airport Land Use Compatibility Plan (2004)

The Riverside County Airport Land Use Compatibility Plan (ALUCP), adopted by the Riverside County Board of Supervisors in October 2004, contains general compatibility criteria applicable to all airports within Riverside County, as well as specific requirements for individual airports. There are no operational airports addressed in the ALUCP that would be impacted by construction of the project at the proposed (Alternative 1) location, any related variations to that site (Alternatives 2 and 4), or Alternative 5, the No Project alternative. Although aerial photos of the proposed project site still show the outlines of the Rice Airport (Rice AAF), the site was abandoned as an active field at some point between 1955-58 and was no longer depicted on the Los Angeles Aeronautical Sectional Chart for the area from March 1958 forward (ARPT 2009a). The ALUCP no longer includes the Rice Airport. (See discussion in Alternative 3 – North of Desert Center for plan applicability at that project site.)

Cumulative Land Use, Recreation, and Wilderness Effects

As noted in other sections, the impacts of a project are not analyzed in a vacuum, either individually within a project or without consideration of other land use changes that have or may occur in the same vicinity. Incremental, project-specific impacts that may not be substantial on their own may, when combined with other project-related impacts or similar impacts from other projects, result in a substantial and cumulatively significant effect on current and future land use in the project vicinity.

In particular, under the CDCA and NECO land use plans, development and conservation are both priorities for public lands surrounding the project area and management for multiple use and sustained yield is emphasized. Projects proposed throughout these areas encompass a wide range of uses, including energy production and transmission, livestock grazing, mineral extraction, recreation, and conservation of

special status species and their habitats. As a result, the consequences of these uses may overlap, resulting in impacts that cumulatively exceed the effects of individual projects.

GEOGRAPHIC SCOPE OF ANALYSIS

The geographic scope of the project's land use, recreational, and wilderness cumulative impact is divided into three areas:

- A Incremental, project-specific impacts analyzed within this document that contribute to or result in a substantial change or significant impact to land use and/or recreation in the immediate project area.
- B Local area, defined as along SR62, between SR177 to the west and SR95 to the east, within a radius of approximately 25 miles of the proposed project site and the general confines of the Rice and Ward Valleys, Colorado River, and surrounding mountain ranges (Old Woman, Turtle, Whipple, and Riverside Mountains; and Rice Valley and Palen/McCoy Wilderness areas).
- C Regional area, defined as within the California Desert District (CDD), primarily in the area managed by the BLM's Palm Springs-South Coast District office and within a radius of approximately 75 miles.

There are two Wilderness Areas that could be directly affected by the proposed project and 13 Wilderness Areas, several ACECs, and Joshua Tree National Park that could be affected by the cumulative impacts of renewable energy and other foreseeable projects in the regional area.

Local Area

The project site is in the Rice Valley, in the northeastern corner of Riverside County and immediately south of SR62. It is southeast of the BLM Iron Mountain Solar Energy Study Area and within the BLM lands that are being analyzed for solar development in the U.S. Department of Energy (DOE) and BLM programmatic EIS (see **Cumulative Figure 2**). Bounded by five mountain ranges, the lands surrounding the project area are geologically isolated from other portions of the CDD and present a relatively distinct land area for the purposes of analyzing local CEQA and NEPA cumulative impacts.

There are a total of eight solar energy projects proposed or in progress on approximately 187,844 acres¹¹ of BLM-managed public lands, within a radius of approximately 25 miles from the project site. The DOE and BLM are also analyzing public lands along SR 62, SR 171, I-10, and north into San Bernardino County, including the location of the proposed project's transmission lines and interconnection substation, for compatibility with future solar development, as part of the Solar Energy Development Programmatic EIS (DOE/BLM 2010a). Portions of these lands are also included in the BLM's Riverside Solar Study Area (see **Cumulative Impacts Figure 2**). The only wind project proposed in the general vicinity was withdrawn in July 2010 [see

¹¹ Acreage reflects the total area being investigated in the current applications submitted to BLM. The final ROW should be significantly less, consistent with the final project footprint, following completion of construction.

Land Use Appendix B].

In addition, there are three Colorado River Aqueduct Rehabilitation projects that are not energy-related, but have the potential to impact current and future land uses. (See **Land Use Appendix C**)

Regional Area

From a regional perspective, the project area is located in the southeastern portion of the California Desert District (CDD), an area containing approximately 11 million acres of public lands in portions of Kern, Inyo, Los Angeles, Riverside, San Bernardino, Orange, Imperial, and San Diego counties. While the geology of the area generally isolates the Rice site, project impacts to the overall availability of conservation areas, impacts to individual species, availability of undeveloped lands and resources, wilderness access, and recreational use within the larger CDD must be considered. In addition to the projects identified within the local area, there are 35 additional solar projects proposed over more than 492,219 acres of public lands and three wind projects on 21,293 acres of public lands (as of August 2, 2010), within a radius of 75 miles from the project site (see **Land Use Appendix B** and **Cumulative Figure 2**).

Even more renewable energy projects are proposed on public lands in surrounding counties, from Indio, Twenty-Nine Palms, and Needles to the eastern California border; and into the states of Nevada and Arizona (see **Land Use Appendix B**), along with the 24 tracks of public lands in six western states, including over one million acres in southern California, that are being studied as suitable for solar development. However, while the Rice project would add to the projected acreage for renewable energy projects expected in the California desert, the proposed project location and surrounding topography would limit its potential contribution to desert-wide cumulative effects.

Cumulative conservation benefits were considered as part of the NECO amendment process, including the need to accommodate military use; agricultural use, including livestock grazing; existing and proposed highways, rail lines, and communities; recreation; wildfire protection; mining; and renewable energy projects. It was realized that these uses would need to co-exist with protection for state and federal parkland, wilderness, wild horse and burro herd areas, and critical habitat. Large areas of the CDCA, including the region around the proposed and alternative project sites, have been set aside for multiple uses, determined, primarily, by the availability of the predominant resource(s) and sensitivity of the natural and cultural surroundings. Additionally, there are privately owned parcels throughout the region with development potential that may contribute to cumulative regional impacts.

There are also at least 36 non-energy-related current and foreseeable projects affecting land use and resources in the region, including three major master planned communities and 20 smaller residential developments; and a proposed 941,000-acre, federally protected national monument area (see **Land Use Appendix C**).

AGRICULTURE LANDS AND RANGELANDS

Local Agriculture

Local privately-owned parcels in the project vicinity are generally undeveloped desert

lands, devoid of residences or other improvements. Although the zoning for much of the private land allows agricultural uses, there is no agricultural activity in the Rice Valley area, other than seasonal livestock grazing, and no irrigated farmland within the project boundaries or surrounding properties.

Agriculture, excluding grazing, is not a permitted use within any BLM lands designated for multiple use. Agricultural use of public lands in the local project area is limited to grazing within the Rice Valley (Keoughs) Rangeland Grazing Allotment. This allotment encompasses 74,740 acres of BLM-managed public lands, located south of SR62 and surrounding the private land parcels that make up the proposed generating facility site (see Agricultural Lands discussion above). The project site is located on the northern edge of the Rice Valley allotment and would only intrude into the grazing area along the transmission corridor and at the site of the interconnection substation. The impacts to the Rice Valley allotment identified in the project analysis include: (a) the potential for construction activities to interfere with access to those portions of the allotment that are currently accessed along Rice Valley Road for approximately 30 months or up to three grazing seasons; and (b) elimination of up to 75 acres of forage along the proposed transmission line corridor and footprint for the substation for the life of the project. Impacts to access would be avoided with implementation of recommended condition of certification **LAND-1**. The loss of up to 75 acres of grazing allotment land would need to be included in the projected cumulative loss of available grazing land for the region. It would not, however, fragment the existing allotment or contribute to the fragmenting of any other established grazing allotment or agricultural use in the project vicinity.

The only other agricultural activity in the local project area is the Lazy Daisy Rangeland Grazing Allotment (CA09076). The Lazy Daisy allotment allows seasonal grazing of up to 266 cattle on 451,617 acres of BLM-managed public lands and 37,567 acres of private land. This grazing allotment is not expected to be impacted by the proposed project or the numerous proposed solar and wind projects in the project vicinity. None of the currently pending or approved renewable energy projects are within the allotment boundaries. It is also located well north of the BLM Solar Energy Study Area and includes or is adjacent to several Areas of Critical Environmental Concern (ACEC) and desert tortoise critical habitat.

Therefore, the project would contribute to any cumulative loss of access to agricultural grazing lands. It would not, however, result in fragmentation or obstruction of future agricultural uses in the local area. The loss of approximately one-quarter of 1% of the public grazing land within a 25-square mile area would have a minimal impact on the availability of public grazing land and would not significantly contribute to a loss of local grazing resources.

Regional Agriculture

There are no other rangeland grazing allotments and very little agricultural activity within the regional area identified for this project, although most of the public land in Nevada is committed to seasonal grazing allotments. The Ford Dry Lake Rangeland Grazing/Pasture Allotment, along the I-10 corridor about 20 miles west of Blythe, was cancelled in 2007, due to its proximity to occupied Bighorn Sheep range in the Palen Mountains. Some irrigated agriculture, including alfalfa fields and orchards, occurs in areas along

the Colorado River, along with jojoba and palm plantations north of Desert Center. Although some of the current and foreseeable projects in the region may result in the conversion of agricultural lands to non-agricultural uses or impact available water resources currently used for irrigation, the proposed project would not result in or contribute to the loss of any of these types of agricultural uses.

Rangelands

With the exception of the rangeland grazing allotments identified in the Agricultural discussions above, the proposed project would have no impact on BLM rangeland use or management. Although there are several herd and herd management areas in the regional vicinity, the project would not interfere with established or proposed access or uses. Therefore, the proposed project's overall contribution to cumulative agricultural and rangeland impacts would be less than significant. Residual impacts include the loss of up to 130 acres of grazing resources.

RECREATION AND WILDERNESS

Recreation

The primary project site is located entirely on privately owned lands, with no recreational facilities or public access. The transmission lines and interconnecting substation, however, are located primarily on BLM-managed public lands. The project would result in the temporary, intermittent loss of access or delays along approximately 5.4 miles of the existing Rice Valley Road and a permanent loss of the recreational use of approximately nine acres of publicly-owned, BLM-managed lands, classified MUC-M, within the footprint of the interconnecting substation. As noted in **Land Use Appendices B and C**, there are at least 38 other renewable projects proposed or approved on surrounding BLM-managed public lands, with the potential to impact more than 500,000 of the 1.6 million acres of multi-use recreational and wilderness lands in the region. The nine acres of MUC-M land, of limited recreational value, that would be lost as a result of the project would have a de minimus effect on the cumulative losses that could result from construction of the existing and foreseeable renewable energy projects.

Although the proposed project would bring over 400 construction workers to the project site for up to 30 months, the remoteness of the proposed project site and intensity of the work schedule would preclude most workers from making use of the limited recreational opportunities in the project area. While some of these workers may visit the surrounding wilderness areas, their impact would be negligible. It is unknown whether the construction schedules for any of the other projects in the local vicinity would overlap with the proposed project timeline, but as with this project, the distance from any developed recreational opportunities would effectively limit cumulative worker impacts, even if many of the projects are developed on a concurrent timeline.

As noted in the Recreation analysis above, addition of the 47 permanent employees and their families to the area once the project is in operation would result in a permanent increase of less than 1% of the population in Blythe. Spread over the surrounding communities, the potential impact to any single recreational facility, or cumulatively to multiple facilities within the area, would be further reduced. Therefore,

the project would not substantially affect existing neighborhood and regional recreational facilities or result in the need for new or expanded facilities. Assuming a similar number of permanent employees at each of the known and foreseeable renewable energy projects, this would equate to a population increase of approximately 5,000-6,000 people over the next few years. Other non-energy projects, including several major residential developments and master-planned communities, could add an additional 35,000-40,000 residents to the region, especially in the areas around Blythe. Therefore, the proposed project would contribute less than 0.01% of the cumulative population growth and use of recreational facilities anticipated for the region.

Also, although recreation is a priority on public lands, use of lands in the local area, with the exception of the designated Wilderness Areas, have no developed facilities and little to no recreational use. In fact, Rice Dunes, a designated OHV area about 12 miles south of the proposed project site, was closed in 2002 for lack of use. There are no plans for recreational development in the local area.

Therefore, the proposed project's overall contribution to local and regional cumulative recreational impacts would be less than significant.

Wilderness

There are 11 designated wilderness areas in the local project vicinity and more than 25 wilderness areas, several ACECs, and the Joshua Tree National Park within a 75-mile radius of the proposed project site. Neither the project nor other existing or foreseeable projects would occur within the wilderness, ACEC, or national park boundaries. Direct impacts to access and visual/scenic resources, noise and light pollution, and increased visitation (resource use), as well as indirect impacts to natural and cultural resources, may result from one or more of the proposed projects. The proximity of wilderness and other environmental sensitive areas to the solar study areas and both public and private lands proposed for development increases the likelihood of adverse impacts. Information to make a determination of the extent of these potential impacts is not available at this time, but could be cumulatively substantial. Noise and visual/scenic impacts are not expected to physically impact the availability of resources within the boundaries of these protected areas, but could affect a visitor's wilderness experience. These impacts, however, are not measurable, as they are based on individual perceptions, sensitivities, and expectations.

The proposed project would not contribute to any cumulative access impact or contribute measurably to increased visitor resource use. (See **BIOLOGICAL** and **CULTURAL RESOURCES** sections for natural and cultural cumulative impacts.)

LAND USE COMPATIBILITY

Scenic Resources

Preservation of the scenic attributes of California's deserts is a prime objective of the CDCA and Riverside County General Plan. SR62, which runs east-west from Earp and Vidal Junction to Twenty-nine Palms, and ends at I-10, just west of Palm Springs, is eligible for listing as a scenic highway. Riverside County LORS require that a highway eligible for listing be treated "as if" it is a designated scenic highway. This includes

avoiding visual impacts to existing scenic elements and vistas and any other impacts that might prevent future scenic highway designation. Staff's analysis had determined that the proposed project would result in significant, unavoidable visual and scenic impacts to the SR62 corridor.

All solar projects are similar in general design, with one or more solar collector fields, a central generating facility, transmission lines, and one or more interconnection substations. Facility stack heights vary, depending on the solar/generating process, and range from under 100 feet to central stacks exceeding 650 feet agl. The number of stacks also varies, from a single central stack to four or more stacks arranged in series. Transmission line towers are generally 90-120 feet tall. In total, most solar facilities occupy between 1,000-5,000 acres, not including transmission line corridors, although areas three to five times the final project footprint are often initially requested in the ROW applications to allow flexibility in final project placement or to allow for future expansion or more than one facility.

In addition to the RSEP, there are seven large solar projects proposed within 25 miles of the proposed project site. Due to the topography of the area, all of these projects would be visible from SR62. Almost 130,000 acres have been identified in the BLM ROW applications for these projects, most within four miles of the highway. There is also additional acreage available within the surrounding BLM Iron Mountain Solar Energy Study Area and BLM lands being analyzed for future solar development immediately adjacent to the SR62 scenic corridor. This increases the potential for additional project impacts to the scenic resources in this area. As with the proposed project, it is reasonable to assume that the other projects proposed for this area would have similar project-related impacts to the scenic resources of the area, although the visual impact of the projects may vary by degree. The construction of each proposed project would extend the visual impact along the north side of SR62 for over 25 miles. The addition of the RSEP would further extend the visual intrusion eastward along SR62, as well as impact the scenic vista to the south of SR62 and into the previously undisturbed Rice Valley. This would contribute substantially to the significant and unavoidable cumulative impact to the scenic resources along an eligible state scenic highway.

Scenic resources and the quality of scenic vistas can also be adversely impacted by the introduction of artificial light sources. There are four large-scale solar projects proposed within 10 miles of the proposed project site, within the Ward Valley. This area is immediately north of the Palen/McCoy Wilderness and along the eastern and southern foothills of the Turtle Mountain and Old Woman Mountain Wilderness Areas. Like the proposed project site, these areas have little residential or commercial development and are generally without any significant sources of artificial light. Project-related impacts could combine with existing and foreseeable projects to substantially increase light pollution in the area, especially if construction timelines coincide. The proposed project would not only contribute to the cumulative lighting of the Ward Valley area, but extend the light pollution eastward into Rice Valley. Existing dark sky conditions would be substantially degraded by both construction and on-site security and operational lighting. Areas used for astronomical viewing and sky interpretation would be particularly impacted. Overlapping construction schedules would intensify the cumulative effect. Therefore, although glare shields and other conditions of certification

have been recommended to reduce lighting impacts (see **VISUAL RESOURCES** section of this document), the proposed project would still contribute significantly and unavoidably to the cumulative impact to existing scenic, dark sky conditions throughout the Rice and Ward Valleys.

Future Land Use and Development

Land surrounding the local area is both publicly and privately owned. BLM-managed public lands are generally designated for multiple use, with the permitted uses determined by the environmental sensitivity of the resources. Most of the land proposed for solar development in the project area is designated MUC-M, which allows a multitude of uses, including grazing, recreation, and electric generating facilities. However, development of solar facilities on these lands precludes their use for any other purpose for the life of the project (generally 30-40 years). Residual alterations to the land may continue far beyond that time frame. Therefore, it should be assumed that any changes to the land and its resources within the project footprint would be permanent.

Lands in the local project area are currently undeveloped, relatively undisturbed desert. There is no residential or commercial development in the local area, and existing industrial activities are confined to the Iron Mountain Mine, Iron Mountain Pumping Station, and California Aqueduct. Although the zoning for most of the privately owned land allows both residential and commercial development, the distance from urban areas, non-existent local customer base, and lack of access to public services, including timely emergency and police response, makes any foreseeable significant development highly unlikely. However, the presence of one or more renewable energy projects would not preclude residential or commercial development, consistent with applicable zoning requirements. Therefore, use of either public or private lands for renewable energy projects would have a less than significant impact on future land use and development, either individually or cumulatively.

CEQA LEVEL OF SIGNIFICANCE

Under the proposed project (Alternative 1):

- Impacts to agriculture would be less than significant with implementation of **LAND-4**.
- Impacts to recreation would be less than significant.
- No impacts to timberlands and impacts to wilderness areas would be less than significant.
- The proposed project would result in significant, unavoidable visual and scenic impacts to the SR62 scenic corridor.
- There are no airports or airstrips within five miles of the proposed project site and the project would have no impact on any airport operations.
- The proposed project would be consistent with existing and permitted agricultural, residential, sensitive receptors, and recreational land uses with the implementation of **LAND-2, 3, 4, and 5**. However, it would be inconsistent with existing and permitted scenic land uses due to significant, unavoidable impacts to visual/scenic resources (see **VISUAL RESOURCES** sections of this SA/DEIS).

- Consistency with federal and state LORS would be ensured with implementation of **LAND 1-4, 5; and CULT-11**.
- Implementation of **LAND-1 and 3-9; BIO-3, 11-13, and 21; CULT-11; SOIL&WATER-1; and TRANS 1-3 and 7-9** would ensure consistency with many of the local LORS, to the extent feasible. However, the proposed project would still be inconsistent with a number of Riverside County General Plan policies and zoning requirements (see **LAND USE APPENDIX A**).
- Project-specific loss of grazing land use and access would not contribute significantly to any cumulative agricultural or rangeland impact.
- The proposed project's overall contribution to local and regional cumulative recreational impacts would be less than significant.
- Use of either public or private lands for renewable energy projects would have a less than significant impact on future land use and development in the project area, either individually or cumulatively.
- The addition of the RSEP would further extend the visual intrusion along SR62, as well as impact the scenic vista to the south of SR62 and into the previously undisturbed Rice Valley. This would contribute substantially to the significant and unavoidable cumulative impacts to the scenic resources along an eligible state scenic highway.
- Although glare shields and other conditions of certification have been recommended to reduce lighting impacts (see **VISUAL RESOURCES** section of this document), the proposed project would still contribute significantly and unavoidably to the cumulative impact to existing scenic and dark sky conditions throughout the Rice and Ward Valleys.
- Significant, unavoidable project-specific visual/scenic resource impacts could potentially contribute to cumulatively significant, unavoidable temporary and/or permanent impacts, especially if most of the proposed solar and wind projects within the local or regional area are actually constructed. Simultaneous or overlapping timelines would further exacerbate the temporary construction-related impacts.

NEPA COMPLIANCE

Under Alternative 1:

- The effects on the agricultural resource value of established federal rangelands within the California Desert Conservation Area are minor, both locally and regionally and would not contribute to the substantial loss or fragmentation of existing grazing allotments or future grazing opportunities.
- The effects on recreational activities and resources would be temporary and relatively minor from both a local and regional perspective. Limited loss of access to the MUC-M lands along the existing 5.4-mile length of Rice Valley Road would occur during construction of the transmission line and interconnection substation at the connection point with the Western 161/230kV transmission corridor.
- The effects on recreational use of established Wilderness areas and public access to those resources would be limited to noise and visual intrusion on the wilderness

experience during project construction. Wilderness resources would not be impacted.

- Project activities at all phases of construction, operation, and closure would conform with BLM plans, policies, and procedures, through approval of the ROW application and implementation of the NEPA and CDCA Amendment process. Staff has also proposed condition of certification **LAND-3** that, if fully implemented, would ensure consistency with applicable federal (BLM) land use requirements.
- If all the proposed renewable energy projects currently licensed or pending on BLM lands along SR 62 and in the Rice and Ward Valleys are actually constructed, the loss of multiple use lands would equal nearly 1/3 of the 1.6 million acres of public lands in that area. Substantial cumulative impacts to biological, cultural, and visual resources would be unavoidable.

PROJECT ALTERNATIVES

The setting and existing conditions detailed above apply to the proposed project (Alternative 1) and Alternatives 2, 4, and 5. Project differences are noted in the general description of each alternative. The Setting and Existing Conditions section is not repeated for Alternatives 2, 4, and 5. Recommended conditions of certification apply to the proposed project and all other alternatives unless otherwise noted. The assessment of impacts that are identical to the proposed project (Alternative 1) will be noted, but are not repeated.

Staff's analysis of the proposed project's consistency with applicable federal, state, and local land use LORS is presented in **LAND USE Table 6**, and applies to the proposed project and all alternatives. The Land Use compatibility discussion as presented in the proposed project (Alt. 1) above also applies to Alternatives 2 and 4. As with the setting and existing conditions, project differences are noted in the general description of the alternative. Setting, existing conditions, and land use compatibility will be discussed in greater detail for Alternative 3, as this project site is more than 50 miles from the proposed project.

Land use alternatives to the proposed project (Alternative 1), as identified in the following table, are analyzed below:

**LAND USE Table 6
Project Alternatives**

	Proposed Alternative	Acres	MW	Federal Nexus
1	Proposed Project	1,410 acres + 10.0 mile long transmission line corridor	150	Yes
2	Reduced Acreage (same site location)	1,270 acres + 10.0 mile long transmission line corridor	~148	Yes
3	North of Desert Center (alternate location), includes realignment and reconductoring of existing SCE 161/230kV line.	1,410 acres + 4.6 mile long transmission line corridor	150	Yes
4	Rice Valley Road Transmission Line	1,410 acres + 13.9 mile long transmission line corridor	250	Yes
5	No Project/No Action	0	0	No

Alternative 2 (Reduced Acreage)

The RSEP Reduced Acreage Alternative would be located on the same project site as the proposed project, but would have a 7.2% smaller footprint. Although the overall heliostat field distance from the central tower would be reduced, the number of heliostats would remain the same. The generating facility would occupy about 1,270 acres instead of the 1,410 acres required for the proposed project. The receiver location would remain the same, with the edges of the field contracting towards the center. The plant footprint of the Reduced Acreage Alternative is shown in **Alternatives Figure 2**. The site layout, height of the solar tower and receiver, transmission interconnection to Western’s Parker-Blythe transmission line, and setback from SR62 would be the same as the proposed project. The generation output would be reduced by approximately 2 MW.

Similar to the proposed project, the Reduce Acreage Alternative would transmit power to the grid through the planned substation, to be located adjacent to Western’s Parker Blythe 161/230 kV transmission line.

The Reduced Acreage Alternative would eliminate about 140 acres of the proposed project footprint. Additionally, the Reduced Acreage Alternative would allow the applicant to contribute clean, renewable energy to help meet the State’s energy goals, while minimizing impacts to the desert environment. A limited acreage alternative was suggested in scoping comments.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

From a land use perspective, the Reduced Acreage Alternative would have comparable impacts to the proposed project. While the footprint of the generating facilities would be reduced, it would not affect the land use and zoning designations, visual impact of the site on scenic resources or the SR62 eligible scenic highway corridor, impacts to military operations, or impacts on surrounding property uses. It also would not resolve any of the inconsistencies with the Riverside County General Plan or zoning

ordinances. The extent of impacts to agriculture, recreation, and wilderness would remain unchanged, as the footprint and use of BLM-managed public lands would remain the same as the proposed project. All conditions of certification recommended for the proposed project would also apply to this alternative.

Cumulative Land Use Effects

As with Alternative 1, the project would have a less than significant/substantial cumulative effect on agriculture or rangeland uses; recreation; and future land use and development. However, it would also contribute substantially to the cumulative significant, unavoidable impacts to scenic resources along an eligible state scenic highway; and existing scenic vistas and dark sky conditions throughout the Rice and Ward Valleys.

CEQA LEVEL OF SIGNIFICANCE

Under Alternative 2:

- Land Use, Recreation, and Wilderness impacts would be identical to those identified for the proposed project (Alternative 1).

NEPA COMPLIANCE

Under Alternative 2:

- Land Use, Recreation, and Wilderness effects, including residual effects after implementation of the proposed mitigation (conditions of certification), would be identical to those identified for the proposed project (Alternative 1).

ALTERNATIVE 3 (NORTH OF DESERT CENTER)

SETTING

The North of Desert Center Alternative would also be a 150 MW solar thermal facility located on approximately 2,643 acres of land, with a footprint consistent with the proposed project. The generating facilities and solar field would be located on the west side of SR177 (Desert Center - Rice Road), approximately 1.6 miles north of I-10. This alternative would be sited primarily on private land, intermixed with small parcels of public lands through the central and eastern portion of the site (see **Land Use Figure 6**). The existing SCE 161-kV transmission line (from the Blythe-2 substation to the Eagle Mountain-1 substation) that traverses the alternative site would be realigned to roughly follow the site boundary. A new 0.125-mile transmission line alignment and substation would interconnect to the realigned SCE line at the eastern site boundary. The boundaries and transmission realignment for this alternative are illustrated in **Alternatives Figure 2**. The land is generally flat, with remnants of prior agricultural activity still present on the site. The elevation is between 500 and 700 feet ASL. There are no existing structures. There are also no developed roads into or through the site, although the SCE maintenance dirt, access road for the existing transmission line, in very poor condition, roughly bisects the property and connects SR177 to Kaiser Road. The site would be accessed directly off of SR 177.

Surrounding Area

The North of Desert Center Alternative site is located in the Upper Chuckwalla Valley, between the Joshua Tree National Park and Wilderness and Eagle Mountain to the north and west, Palen/McCoy Wilderness Area to the northeast, and Chuckwalla Mountains to the south. Immediately adjacent to and including portions of the BLM Riverside East Solar Study Area (**Land Use Figure 7**), the Alternative 3 site is on the northern edge of the Desert Center community. It is within the Colorado Desert of Riverside County, a subsection of the Sonoran Desert. The topography of the Chuckwalla Bench is a great dissected bajada (coalesced fans of sediment eroded from nearby mountains) that flow, almost without slope, away from the Chuckwalla Mountains to the southern horizon. Sparse creosote and bursage with Mojave yucca grew on flats and low mesas, interspersed with arid desert pavement.

Desert Center, as it currently exists, is a small unincorporated town of about 962 residents, not including the “snowbird” population of Lake Tamarisk Desert Resort. Services include a post office, public library, Caltrans and SCE maintenance yards, , gas station, market, a café, a couple of small motels and mobile home parks, and the newly established Chuckwalla Valley Raceway (WIKI 2010g). Individual residences sparsely dot the area around the proposed project site, including several within a quarter mile of the project boundaries. Once a small, but thriving waypoint between Blythe and Indio, Desert Center declined until the early 1940s, when the Army established the Desert Center Army Air Field about one mile north of town to support the DTC/C-AMA. It was a sub-base of San Bernardino Army Air Field and served several installations in the area. After the base closed in 1944, and the Kaiser Steel Eagle Mountain Mine closed in the late 1980s, the town’s population declined to its present population.

The small resort community of Lake Tamarisk is located about two miles north of the Desert Center/I-10 exit, off Kaiser Road (CR R2), and less than one mile from the proposed alternative site’s southwestern boundary. The development includes about 150 single family lots/residences, a 55-Plus member-owned RV park with 150 spaces, a nine-hole regulation golf course and lake, clubhouse and management office, small public water system, and wastewater treatment plant. The development is not built out. Many owners are seasonal residents and RV spaces are also rented to transient visitors.

The Desert Center Airport (formerly Desert Center Army Air Field), located immediately across SR177 from the North of Desert Center Alternative site, closed as a public airport in 1992, although up to 150 aircraft per year continued to land there through at least 2004. The airport recently reopened as a private airfield, in conjunction with the airport’s conversion to the Chuckwalla Valley Raceway. The 400-acre, members only racing facility will, on completion, have three auto/motorcycle tracks, a clubhouse and restaurant, garages at all track locations, viewing stands, and on-site RV overnight dry camping facilities. The Raceway opened its first track in April 2010, with plans to construct the remaining tracks and facilities over the next 5-10 years. The airfield’s original runway configuration will remain available for private use, by permission only. (ARPT 2010a; CVR 2009)

The Kaiser Steel Eagle Mountain Mine is located approximately eight miles northwest of

the project boundary. The mine closed in the late 1980s, but is currently under consideration as the Eagle Mountain Landfill Project (Riverside County Specific Plan 305;), a 4,654-acre Class III non-hazardous municipal solid waste landfill see **LAND USE APPENDIX C**). Renovation and repopulation of the Eagle Mountain Townsite, a tiny community adjoining the mine (Riverside County Specific Plan 306) and currently closed to the public, is also proposed as part of that project. Although the project has received approval from the Riverside County Board of Supervisors and BLM and most of its permitting is complete, it is on hold pending the resolution of litigation.

The Desert Lily Preserve Area of Critical Environmental Concern (ACEC) is located approximately four miles northeast of the alternative project site, on the east side of SR177. The 2,031-acre preserve was established in 1994 as part of the California Desert Protection Act. The northern portion of the Chuckwalla Desert Wildlife Management Area (DWMA) ACEC, which contains BLM Category I desert tortoise habitat, extends to within one-half mile of the Alternative site's southwestern boundary. The 7,726-acre Alligator Rock and 24,400-acre Palen Dry Lake ACECs, both of which were created to protect archaeological and paleontological resources of the area, are eight miles south and ten miles east of the project site, respectively.

The Colorado River Aqueduct (Aqueduct) extends from north to south along the Upper Chuckwalla Valley, from the Eagle Mountain Pumping station, about eight miles northwest of the project site. The Aqueduct is fenced and public access is prohibited. Despite its close proximity, water from the Aqueduct is not available to serve this Alternative.

Agriculture and Rangeland

The North of Desert Center Alternative is composed largely of private properties, but also includes undeveloped state and federal lands. Nearly 90% of the land proposed for this Alternative is disturbed by past and current agricultural operations. The remaining landscape consists of desert washes, sandy dunes, and lower alluvial fan sediments. Major water sources are limited to the Colorado River, which lies approximately 50 miles east of the alternative site, and water within the Chuckwalla Valley Basin. However, when rainwater exceeds evaporation and occasional flooding occurs, Palen Lake (approximately 12 miles east-northeast of the alternative) will fill, creating a temporary water source for the area. Agricultural uses, except for grazing, are prohibited on BLM-managed MUC lands. Agricultural uses are permitted on unclassified lands, unless specifically prohibited on a site-specific basis (CDCA, p.147). Electric generation plants may also be allowed on unclassified lands after NEPA requirements are met.

The only remaining lands within 20-40 miles of the North of Desert Center Alternative site that are designated for agriculture (AG) by the Desert Center Area Plan are either completely or mostly within the boundaries of the project site. Of the 974 acres designated for agriculture in the plan area, there are approximately 84 acres currently in production, all within or immediately adjacent to the site. The remainder of the AG lands, as well as most of the remaining parcels within the project boundaries, both public and private, appear to have been used previously for agriculture, but have been fallow for some time. Deteriorating furrows, dead vegetation, and irrigation tubing are

still present on the site. Surrounding agricultural uses include a small palm tree nursery, to the east of SR177 and northeast of the project site.

Wilderness and Recreation

Recreation

There are no recreational facilities on the North of Desert Center Alternative property. Those portions of the project site that are situated on publicly-owned lands are subject to the CDCA and NECO. BLM-managed public lands within the project boundaries and in the general vicinity, except for those within the Chuckwalla DWMA and Desert Lily Preserve ACECs, are classified as MUC-M or unclassified. The MUC-M land use designation allows a multitude of public uses, including livestock grazing, mining operations, railroads and landing strips, electrical generating facilities, and recreation. As noted with the proposed project, availability of the land for recreation is a primary mandate that applies to all desert lands under BLM management and jurisdiction within the CDCA boundaries, including unclassified lands, until such time as they pass out of federal control.

Palen/McCoy Dunes, approximately eight miles northeast of this Alternative project site, no longer allows OHV use. In fact, there are no “open” riding areas on BLM-managed public lands in Riverside County. However, the access road for the existing SCE transmission line corridor, that bisects the project site and crosses BLM land, is identified on regional public access maps as a 4-wheel drive/OHV green sticker access road.

The Chuckwalla Valley Raceway, a 400-acre, members-only racing facility, constructed on the old Desert Center airport property, is located immediately across SR177 from this Alternative project site. The raceway will, on completion, have three auto/motorcycle tracks, a 10,000 square foot clubhouse and restaurant, 120 garages at all three track locations, 1,800 gallon fuel farm, viewing stands, and on-site RV overnight dry-camping facilities, and will serve as the winter home to the Allen Berg Premier Open Wheel Racing School. The Raceway opened its first track in April 2010, with plans to construct the remaining tracks and facilities over the next 5-10 years. The airfield’s original runway configuration will remain available for private use, by permission only. The facilities will be open year-round, but the most heavily attended activities will occur on weekends and holidays. (ARPT 2010a; CVR 2009)

Joshua Tree National Park

In October 1994, Congress changed the status of the Joshua Tree National Monument to a national park. The 792,600-acre Joshua Tree National Park is managed by the National Park Service. Approximately 75% of the park is designated as a wilderness area. Straddling the San Bernardino County/Riverside County border, the park includes parts of two deserts, the higher Mojave Desert and lower Colorado Desert, each with an ecosystem whose characteristics are determined primarily by elevation. The Little San Bernardino Mountains run through the southwest edge of the park. The higher, slightly cooler, and wetter Mojave Desert is the special habitat of the Joshua tree; extensive stands occur throughout the western half of the park. Five fan palm oases also dot the park, indicating those few areas where water occurs naturally at or near the surface.

Recreational activities available at the park include backpacking, camping, mountain biking, rock climbing, geologic tours, birding, horseback riding, and stargazing (WIKI 2010i; NPS 2010b).

Wilderness

The North of Desert Center Alternative site is surrounded by wilderness areas, BLM-managed multiple use public lands, and Joshua Tree National Park.

**LAND USE Table 6
Wilderness Areas (North of Desert Center Alternative)**

Wilderness Area	Jurisdiction/ Mgmt	Approximate Distance from Project Site	Acreage*	Allowed Uses** Hiking, backpacking, climbing, kayaking, canoeing, rafting, horse packing, primitive camping

** No motorized equipment or mechanical transport allowed, except wheelchairs

*** Proposed boundary; designation currently under legislative consideration

Chuckwalla Mountains Wilderness

The 84,614-acre Chuckwalla Mountains Wilderness Area was designated by Congress in 1994, and is managed by the BLM, California Desert District. The wilderness includes most of the Chuckwalla Mountains, a range that spans approximately 40 miles and runs in a generally northwest-to-southeast direction. The wilderness is bordered by I-10 and the town of Desert Center to the north, and by the Bradshaw Trail and the Chocolate Mountains Aerial Gunnery Range to the south. Bighorn sheep, deer, wild burros, birds of prey, snakes, foxes, and coyotes make the area their home, and the Chuckwalla Bench on the southern flank of the bajada region range has been designated an ACEC for the threatened desert tortoise. Recreational activities within this area include hiking, camping, and rock scrambling. Motorized travel is only allowed on established roads.

Orocopia Mountains Wilderness

The Orocopia Mountains Wilderness Area was established in 1994 and is located east of the Coachella Valley and the Mecca Hills Wilderness Area, west of the Chuckwalla Mountains, and south of I-10. The Meccacopia Jeep Trail bisects the Orocopia Mountains and Mecca Hills Wilderness Areas; however, vehicles must stay on established roads. Mechanized or motorized vehicles are not permitted in the wilderness. The Orocopia Mountain range runs in an east-west direction and is approximately 18 miles long. The Chocolate Mountains lie to the southeast. Bighorn sheep, burro deer, desert tortoise and many small upland game species live among the

mountains. The spiny-leaved Orocopia sage, Alverson's foxtail cactus, Orcutt's woody aster, and the Mecca aster grow in washes, on stony slopes, and in the plentiful gypsum soils. The terrain has been shaped by the movements of the San Andreas Fault over millennia. Historic and prehistoric resources abound, including fossilized remains of prehistoric animals and traces of Native American trade routes to the coast. The area was also used by NASA to train the Apollo astronauts for its moon landing missions.

(See Wilderness section of the proposed project analysis for information regarding the Joshua Tree and Palen/McCoy Wilderness Areas.)

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Agriculture and Rangeland

Would the proposed project result in the conversion of Farmland¹² to non-agricultural uses?

None of the lands within the proposed alternative project site, including solar fields, generating facility, or linears, have been designated as Prime Farmland, Unique Farmland, or Farmland of Statewide or Local Importance by the California Department of Conservation, Farmland Mapping and Monitoring Program (FMMP) or Riverside County. As with the proposed project (Alternative 1), FMMP soil mapping has not occurred in this portion of Riverside County. Because soil mapping and farmland designations are not available, the land evaluation and site assessment (LESA) model could not be used to assess impacts to agriculture and a Farmland Conversion Impact Rating could not be assigned for this site (FPPA 2010). However, soils at the North of Desert Center Alternative site include primarily Rositas and Carsitas series with an average 2% slope (see **SOILS & WATER** section). In other parts of Riverside County, such as the Palo Verde area, Rositas fine sand soils on 0-2% slopes and Rositas silty clay loam on 0-2% slopes are considered Prime Farmland and Rositas gravelly loamy sand on 0-2% slopes meet the requirements for Farmland of Statewide Importance (FMMP 2009d). The amount of agricultural land that would be lost would vary, based on the final placement of the project footprint.

Nevertheless, despite the potential for Farmland to exist in the project area, the project would not result in the conversion of Prime Farmland, Unique Farmland, Farmland of Statewide Importance (as shown on the maps prepared pursuant to FMMP), or Farmland of Local Importance to non-agricultural use. No impact during any phase of the project.

Would the proposed project conflict with existing agricultural zoning, agricultural use, or a Williamson Act contract?

The Alternative project site would also be located on approximately 2,643 acres, with a 1,410-acre project footprint. Over 900 acres of the site has a Riverside County General Plan designation of Agriculture (AG) and is zoned Light Agriculture, 20 acre minimum parcel size (A-1-20). The A-1 zoning district is primarily intended to designate areas as main resource production zones, classify them for general farming and ranching

¹² Prime Farmland, Unique Farmland, Farmland of Statewide Importance, or Farmland of Local Importance, as defined in FMMP 2004, p.6.

practices, and assign such uses as the primary emphasis for the areas. Residential and other uses are placed in a position of secondary importance, when compared to the production of food and fiber. However, other uses are allowed and public utility facilities are permitted with approval of the project plot plan [§13.1(b)(5)]. All but 84 acres designated A-1 within or immediately adjacent to the Alternative project site are currently fallow, with no indication of recent agricultural use.

The remaining privately-owned parcels within the project boundaries have a land use designation of Open Space Rural (OS-RUR) and are zoned Controlled Development Area, 10-acre minimum parcel size (W-2-10) or Natural Assets (N-A). Publicly-held lands are also designated as OS-RUR and zoned N-A.

W-2-10 zoning permits agricultural uses, including the grazing of livestock on parcels of one acre or more, but also permits residential, commercial, and recreational developments; churches; schools; and public utilities. Agriculture is not given priority over any other kind of permitted or conditionally permitted use. All elements of the proposed project are permitted uses in the W-2 zoning district [RC 2009a, §15.1(e)(2)]. Both the proposed project and existing agricultural uses are consistent with the Riverside County zoning code.

N-A zoning permits single-family residences, but limits agricultural use to tree and field crops, apiaries, and the grazing of no more than two head of livestock per acre. Public utility substations are a permitted use in this zoning district, with plot plan approval, but the larger, electrical generation facilities are not. Privately-held parcels with this designation in the project area are generally undeveloped, except for scattered private single-family residences. N-A zoning permits public utility substations in this zoning district, with plot plan approval, but the larger, electrical generation facilities are not permitted, even with a conditional use permit. However, “public utilities” is one of several uses permitted in any zone classification, provided a public use permit is granted by Riverside County (see Article XVIII, §18.29 below). This includes transmission lines and electric generating plants. As the Energy Commission licensing process is equivalent to the Riverside County Planning approval process for a Public Use Permit, and considering the Energy Commission’s exclusive authority, certification of the project would ensure consistency with this ordinance.

Although public lands also carry an N-A zoning designation, they are only subject to state or federal jurisdiction and are not bound by Riverside County land use and zoning LORS for these properties. Agricultural uses, except for livestock grazing and uses grandfathered in at the time of adoption of CDCA and NECO amendment, are not allowed on any of the MUC lands (CDCA, Table 1, Multiple Use Class Guidelines, p.15). Agricultural uses are permitted on unclassified lands, unless specifically prohibited on a site-specific basis (CDCA, p.147). Electric generation plants may also be allowed on land with these classifications after NEPA requirements are met. There are no grazing allotment or grandfathered grazing uses within or adjacent to the proposed Alternative project site. Therefore, there would be no impact to agricultural uses on public lands.

The county’s GIS mapping system indicates that there are three Agricultural Preserves in the immediate project vicinity, containing more than 900 acres of land zoned A-1 (Chuckwalla 1, 2, and 3; see **Land Use Figure 10**). However, there is some question as

to the validity of that mapping, as both the county Planning Department and the GIS mapping indicate there are no Williamson Act contracts currently in place on any of these lands. Use of lands within an agricultural preserve or under a Williamson Act contract for a large-scale renewable energy project would not be consistent with the Williamson Act requirements to protect and preserve current and future agricultural land and uses. Use of this project site for the proposed project would eliminate the use of most or all of the areas identified as the Chuckwalla #2 and #3 Agricultural Preserves for agricultural purposes. Condition of certification **LAND-11** would require the project owner to remove said parcels from contract through cancellation, or provide proof that no contract exists, prior to the start of construction. This would avoid any impact to lands under Williamson Act contract. Only existing zoning restrictions would then apply. Public lands are not eligible for inclusion under the Williamson Act.

Construction of the proposed project at this alternative location would also result in the elimination of part or all of the 84 acres currently in agricultural production and all future agricultural uses within the 1,410-acre project footprint for the life of the project. This would include approximately 900 acres with a land use designation of AG (Agriculture). This has the potential to eliminate almost the entire acreage designated AG (974 acres) in the 185,270 acres of the Desert Center Area Plan (RC 2008b), as well as most of the regional area. There are no other lands designated AG for 40 miles to the east and 20 miles to the north, south, and west of the project site. It should be noted, however, that only about 10% of that land is currently in agricultural production and none of the land has been designated as Farmland, as defined by the FMMP. Also, although not specifically designated AG, over 175,000 acres within the Plan area are designated as OS-RUR, which has compatible zoning districts that allow limited agricultural use, including trees and orchards. The viability of any agricultural use outside the project footprint following completion of construction is unknown at this time. Considering the level of existing agricultural use, the project's impact would be less than significant.

Would the proposed project involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural uses or forest land to non-forest use? (CEQA)

As noted above, construction of the proposed project at this Alternative site would not result in the conversion of designated Farmland to non-agricultural uses. Likewise, there is no timberland¹³ or timberland zoned TPZ within 100 miles of the project vicinity, so no impact to timberland would occur. The wash woodlands of the Palen-McCoy Wilderness and Joshua trees of the Joshua Tree Wilderness qualify as forest land¹⁴. However, all are protected within wilderness area boundaries and are a sufficient distant from the proposed project site to preclude any measurable effect. No Impact.

¹³ "Timberland" means land, other than land owned by the federal government and land designated by the board as experimental forest land, which is available for, and capable of, growing a crop of trees of any commercial species used to produce lumber and other forest products, including Christmas trees. Commercial species shall be determined by the board on a district basis after consultation with the district committees and others. (PRC §4526)

¹⁴ "Forest land" is land that can support 10% native tree cover of any species, including hardwoods, under natural conditions, and that allows for management of one or more forest resources, including timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, and other public benefits. [PRC §12220(g)]

Would the project disrupt activities or substantially reduce the agricultural resource value of established federal rangelands within the California Desert Conservation Area. (NEPA)

As noted above, there are no grazing allotments or grandfathered grazing uses within or adjacent to the proposed Alternative project site. Therefore, the project would not substantially disrupt agricultural activities or substantially reduce the agricultural resource value of established federal rangelands within the CDCA.

Wilderness and Recreation

Would the proposed project increase the use of existing neighborhood and regional parks or other recreational facilities, such that substantial physical deterioration of the facility would occur or be accelerated, or require the construction or expansion of recreational facilities that might have an adverse physical effect on the environment?

There are no existing or planned neighborhood, county, or regional parks; or other developed recreational facilities within 40 miles of the proposed project site. Recreational facilities within an hour's drive of the site include backcountry hiking and camping in the four surrounding wilderness areas and activities within Joshua Tree National Park. There are nine established campgrounds in the park, although there are only two with water and flush toilets. The park also maintains several hiking and nature trails, including a 35-mile segment of the California Riding and Hiking Trail; and a Geology Motor Self-Guided Tour for visitors with four-wheel drive vehicles (OHVs are allowed, but only on park roads. Off-road access is not allowed).

. There are recreational facilities in both Blythe (50 miles to the east; see proposed project (Alternative 1) analysis above) and the Indio/Palm Springs area, about 50 miles to the west. However, the recreational use by workers commuting daily from Blythe or cities to the west would not be an increase in the baseline recreational use of the area.

As with the proposed project (Alternative 1), the project would employ a permanent operational workforce of 47 people. Assuming that all employees relocate from outside the area with an average of three people per family, approximately 141 people, would be added to population of Desert Center, or the larger communities of Blythe and Indio/Palm Springs. There are no recreational facilities to impact in Desert Center and none are planned in the foreseeable future. Spread over the surrounding communities, the potential impact of even 144+ new residents to any single recreational facility, or cumulatively to multiple facilities within the area, would be negligible.

Some of the workers and their families may chose to become members of the new Chuckwalla Valley Raceway. However, this is a new facility, with approved planned expansion through 2020 (based on maximum membership totals), that is actively recruiting new members. No impact.

Therefore, the project would not substantially affect existing neighborhood and regional recreational facilities or result in the need for new or expanded facilities. Less than significant impact under CEQA. (Please refer to refer to the **Socioeconomic & Environmental Justice** section for further discussion.)

Would the proposed project directly or indirectly disrupt activities in established federal, state, or local recreation and/or wilderness areas? (NEPA)

There are no state or local established recreation areas in the project area. This Alternative site would include some areas of BLM-managed MUC-M public lands that could be used for recreation, as well as a number of other uses, including the proposed renewable energy project. This Alternative would result in the elimination of the existing SCE transmission maintenance road alignment, an identified 4-wheel drive/OHV green sticker access road, from SR177 to the Kaiser Road intersection. Construction of the proposed project at this site would require realignment of the existing SCE transmission line within the project boundaries. As required by condition of certification **LAND-12**, the maintenance access road along the new transmission line alignment would be outside the fenced project area and, once completed, would take the place of the existing transmission line road and would be open to the public. There would be, however, a period of up to 30 months when public access to this route would not be available. The number of recreational users in the area or frequency of use on this road is unknown at this time, but the limited population in the area, condition of the road, and absence of any established recreational destination at either end of this route generally indicates that any disruption of recreational activities would be extremely limited. However, as this is a published public access route between two established public roads, so it is likely that at least a minimal level of inconvenience would occur for some users.

There would also be a permanent loss of the recreational use of all publicly-owned, BLM-managed MUC-M and unclassified lands within the final ROW for the life of the project. As with the access road discussed above, it is difficult to determine the amount of use these public lands receive as they are interspersed with privately-held parcels and access is limited. There are also few places to park along any of the public roads that provide access to this site and the condition of the transmission line access road limits access to vehicles with 4-wheel drive. Local websites indicate the area has seasonal value for its floral displays and dark-sky conditions. However, these uses are not specific or limited to this site, but include the entire Upper Chuckwalla Valley. Unlike the proposed project site (Alternative 1), this area is not relatively undisturbed desert land. The site is located less than two miles north of Desert Center and less than a mile from the community of Lake Tamarisk. There is also other commercial development and lands zoned for commercial development across from and immediately adjacent to the site. Therefore, while the project, if sited at this location, would contribute to an increase in skyglow and noise in the general vicinity, it would not prevent access to or substantially disrupt activities in established federal, state, or local recreation or wilderness areas.

The remaining residual impacts to general recreational use of the federal recreational and wilderness lands within and around the proposed project site would be:

- Loss of access along the SCE transmission line road from SR177 to Kaiser Road during transmission line relocation and construction (up to 30 months in duration).
- Loss of recreational use on MUC-M and unclassified land within the project footprint for the operational life of the project (30± year).
- Increased ambient lighting in the Upper Chuckwalla Valley, contributing to the degradation of the “dark sky” conditions in the valley.

- A limited increase in the ambient noise levels and intermittent louder noise incidents on lands surrounding the project site and in portions of at least four designated wilderness areas during the construction phase of the project, adversely affecting the wilderness experience for some visitors.

Would the proposed project substantially reduce the scenic, biological, cultural, geologic, or other important resource value of federal, state, local, or private recreational facilities or wilderness area? (NEPA)

As noted in the **Visual Resources** section of this document, siting the proposed project at this alternative location would result in substantial nighttime light pollution and degrade the scenic character and vistas from Joshua Tree National Park and the Chuckwalla Mountains Wilderness Area, even if conditions of certification recommended by Energy Commission staff are fully implemented. NPS has identified unimpeded visibility of the night sky as a scenic vista that touches almost every aspect of what is essential to keeping a park whole. Significant, unavoidable visual impacts, resulting from construction of the project and on-going operational lighting, especially when considered in concert with additional proposed projects, would substantially reduce the visual quality and character of the existing federal recreation (multiple use) lands and scenic views from surrounding wilderness areas, although less severe than the proposed project.

Would the proposed project directly, indirectly, or cumulatively affect the wilderness qualities of size, naturalness, or outstanding opportunities for solitude or primitive and unconfined recreation of a wilderness area or wilderness study area; or change the characteristics of a wilderness study area, such that it would not contain the qualities necessary for it to be considered for future designation as wilderness?

As with the proposed project, there are wilderness areas in close proximity to the proposed project site (within a 20-mile radius). Part of the wilderness experience is the scenic quality and undeveloped nature of the views within and from the wilderness areas. As noted above, the project would be obvious from portions of the wilderness areas facing the Upper Chuckwalla Valley, and both noise and light from the project, especially during construction, would impinge on visitors to those areas. The intensity of these manmade intrusions on the individual visitor is, of course, subjective, but would affect the overall naturalness and solitude essential to the wilderness experience. Therefore, the project would indirectly and cumulatively affect the wilderness qualities of naturalness and solitude. Impacts would not be substantial as would result from the proposed project, but would still have a primarily indirect impact. It would not, however, affect any wilderness study area as none exist in the vicinity of this site.

Land Use Compatibility and LORS Compliance

Land Use Compatibility

Would the proposed project directly or indirectly divide an established community or disrupt an existing or approved land use?

Divide an Established Community

The North of Desert Center Alternative project site is located just north of Desert Center, to the west of SR177, a two-lane state highway. There are a few businesses (market, bar, café, and the Chuckwalla Valley Raceway) on the SR177 frontage adjacent to and across from the proposed project site. However, the project would not block access to these commercial properties or intrude into the boundaries of the Desert Center Community Development Area. There is no established community north of the project site that would become isolated with its construction. No impact.

Compatibility with Existing or Approved Land Uses

Residential Use

Scattered rural residences are located within 100 feet of the boundaries of North of Desert Center Alternative site. These include a small mobile home park across SR177, single family residences on small acreage parcels to the north, and several single family residences to the south. In addition, the eastern edge of the Lake Tamarisk Resort development is approximately one-half mile southwest of the project boundaries. The project would not physically intrude on, block access to, or interfere with any existing or permitted use, nor would it prevent future residential development outside the project boundaries. Although the existing zoning and land use designations for the surrounding properties permit residential development, scarcity of public services and infrastructure probably precludes any significant increase in residential density in the foreseeable future. The project would not significantly impact the use of the adjacent lands for residential purposes and would be considered compatible with existing and permitted residential uses.

Sensitive Receptors

There are no schools, hospitals, or other sensitive receptors, except for residences, within at least 10 miles of the alternative project site. However, the closest residence is only 100 yards from the project boundary and there are at least 90 residences and an equal number of RVs with full-time or seasonal residents within a mile of the proposed project. However, the **Public Health** section of this document indicates that the project would not cause any significant adverse health effects or have a significant health or safety-related impact at any existing sensitive receptor location.

In addition to the sensitive receptor sites identified above, there are also sensitive land use areas that may be adversely impacted by light, noise, and other pollutants. The Riverside County General Plan (RCGP) identifies certain areas and uses as particularly sensitive to noise and require them to be protected by restricting noise-producing land uses or requiring noise buffers to reduce the potential impacts. Noise-sensitive land

uses include all facilities identified above, residences, libraries, and passive recreation uses¹⁵ (RC 2008, p.N-5). In addition to the residences identified above, there is a public library in Desert Center, approximately 1.6 miles north of the project site and four federal wilderness areas within five miles of the project site. With average construction noise around 89 dBA and noise from steam blows and pile driving at 100-130 dBA at 50 feet from the source, construction noise would definitely be audible in the nearby residences and library and, to a lesser degree, in the wilderness areas closest to the project site. However, as noted in the proposed project analysis above, general construction noise would attenuate to 40-45 dBA at a distance of about two miles, even without consideration of reductions due to topography. Therefore, it is unlikely that the ambient noise levels at even the nearest Wilderness Areas would be increased by more than 5 dBA as a result of project activities. It is also expected that the project would increase the ambient noise levels for residences nearest the project site, especially during construction. For pile driving and other intermittent activities, noise levels are expected to attenuate to about 72 dBA at 15 miles from the source, so these noises may be clearly audible in nearby areas, especially if construction occurs at night. However, the temporary, intermittent nature of these noise bursts would not permanently increase the ambient noise levels. (See the **Noise** section for further analysis). The project would be considered compatible with existing and permitted sensitive receptor locations in the area.

Natural Resources

As noted in the **Biological Resources** section of this document, the desert tortoise has moderate potential to occur in Sonoran creosote bush scrub habitat in the southwestern portion of the North of Desert Center Alternative site, in the desert dry wash woodland to the west, and Sonoran creosote bush scrub immediately south of the woodland. This habitat area is connected to more undisturbed habitat to the west, with no impediment to movement between the site and desert tortoise critical habitat in the Chuckwalla DWMA ACEC, approximately 0.9 miles west of this site. Since these areas would be impacted by the alternative project, there is high potential for the project to result in substantial impacts to desert tortoise, including loss or disruption of east-west connectivity due to disturbances on either side of the wash. Take during construction is also likely to occur. Definitive conclusions about the magnitude of potential adverse impacts to biological resources were not made for this site, due to the absence of site-specific survey and project design information. However, development of a solar project at the North of Desert Center Alternative site would impact fewer biological resources, compared to the proposed project site, because the site is primarily fallow agricultural land, whereas development at the proposed project site would occur primarily on land supporting native vegetation and habitat. With sufficient mitigation, the project would be compatible with existing natural resource use at this location.

¹⁵ A passive recreation area is generally an undeveloped space or environmentally sensitive area that requires only minimal visitor facilities and services, directly related to health and safety. Activities do not significantly impact natural, cultural, scientific, or agricultural values. The quality of the environment and "naturalness" of an area is the focus of the recreational experience in a passive recreation area.(USL 2010)

Cultural/Historic Uses

The area surrounding the project site has a rich archaeological and historical past. The Riverside County Paleontological Sensitivity map designates the northeastern portion of the project site as an area of high potential/sensitivity. The area directly across from the project site, now in use by the Chuckwalla Valley Raceway, was the Desert Center Army Air Field, an element of the DTC/C-AMA during its WWII training mission. The town of Desert Center was founded in 1921 and the Kaiser Steel Eagle Mountain Mine, eight miles northwest of the project site, was one of the largest open-pit iron mining operations in the world until it closed in the late 1980s. However, it is not expected that project construction on this alternative site would result in a significant impact to historic or archaeological resources or prevent their future use. The project would be compatible with existing cultural resource uses.

Airports

The proposed project would be located across SR177 from the Chuckwalla Valley Raceway (formerly Desert Center Airport). The airport was never formally closed, but operations seldom exceeded 150 per year after 2004. In 2009, the airport was purchased by the owners of the Chuckwalla Valley Raceway. The remaining runway (Rwy. 5/23), a 4,200-foot asphalt strip, has been repaired and will serve as a private landing field for Raceway members and its owners. Raceway representatives have indicated that the standard approach/departure for the airfield, designated CN64 by the FAA (formerly L64), will be on a heading of 230 degrees (Rwy 23), direct or with a left turn away from the project stack and solar heliostat field, should it be constructed. Aircraft landing or departing to the northeast (Rwy. 5) will use a direct or right turn departure. Entry into the pattern from either direction would be on the southeast side of the field to avoid overflight of the race tracks. There is no published instrument procedure for this airport. There is the potential for glare from the solar mirrors to affect pilots arriving or departing this airfield. However, as this is a private field and not a party to this project application, the Energy Commission does not have jurisdiction and cannot require the airport owner or project applicant to make any changes to field operations. Conditions of certification **TRANS-7, 8, and 9** would provide the information necessary for pilots to see and avoid potential project-related aviation hazards (see **Traffic and Transportation** section for additional discussion of aviation impacts).

Recreational Use

Although zoned to allow a wide variety of uses, there is no indication that recreational development is being considered in the foreseeable future on privately-owned lands within the project site. The Chuckwalla Valley Raceway, referenced above, does have plans to expand beyond the existing track and would increase recreational options at the facility over the next 5-10 years. Public multi-use recreational lands on the project site and in the vicinity, while allowing a variety of recreational opportunities on the MUC-M and unclassified lands, also show no indication of current or future recreational development. The project would be generally compatible with existing recreational uses in the area. It would preclude the recreational use of lands within the project footprint for the life of the project. However, given the current level of recreational use, this would apparently result in little or no disruption of recreational activities in the area and would require no mitigation.

The fact that non-wilderness activities or uses can be seen or heard from locations within a wilderness area does not, of itself, preclude these activities or uses up to the wilderness area boundaries. However, this does not mean that introduction of these activities or uses have no effect on visitor activities or the wilderness experience. Light and noise generated by the project, especially during construction, would have the potential to degrade the wilderness experience for some visitors. Dark sky conditions that currently exist on the desert floor, and as viewed from the surrounding wilderness areas, would be degraded during construction. The project would also contribute to the cumulative skyglow in the area during the operational life of the project. Recreational activities such as stargazing and sky interpretation would be affected, but the extent if this effect is unknown at this time. The project's operational lighting and noise would be consistent with Riverside County commercial standards and performance requirements and compatible with planned development in the Desert Center area.

Public Utilities

The Southern California Metropolitan Water District (MWD) has two underground water distribution pipelines that extend through or immediately adjacent to this alternative project site (see **Land Use Figure 8**). The density and placement of the solar heliostat field could preclude access to these pipelines for repair and maintenance. If the project footprint can be situated to avoid the MWD water pipelines and associated ROWs, the project would be compatible with this public utility use. However, if any facilities would encroach on these utility ROWs in such a way as to disrupt or preclude continued use, the project would not be considered compatible without an agreement with MWD that would ensure the project owner would take actions to alleviate the conflict.

Land Uses following Closure and Decommissioning

Once constructed and in operation, the proposed project has an estimated life of at least 30 years. The industrial use currently proposed would then be considered an existing use in an area. However, given the limited infrastructure and distance from any major urban area, significant residential or commercial development is unlikely. Construction of the proposed project in any configuration, at the preferred or any alternative location, would result in the complete disruption of the existing ecosystem and habitat within the facility footprint, conditions that would have been maintained for the life of the project. Appropriate rehabilitation of the site would need to be revisited to determine compatibility with land uses existing at the time of closure. The required Closure and Decommissioning Plan includes a provision for rehabilitation of the site to be compatible with land uses existing at the time of closure.

Would the proposed project directly or indirectly induce substantial population growth in an area?

As noted above, the Desert Center area is sparsely populated, with little, if any, population growth in the last 30 years. Construction workers would not be expected to permanently relocate, despite the lengthy construction period. They would either commute from temporary lodgings in the Blythe or the Indio/Palm Springs area or commute daily from their permanent residence. Of the approximately 47 permanent employees (less than 150 people, including families) that would be hired for the long-term, operational phase of the project, a few might relocate to the Desert Center area.

However, given the lack of schools, commercial areas, other work opportunities, and urban amenities; and relative ease of access to larger cities along I-10 to the east and west, substantial growth in the Desert Center area is unlikely in the foreseeable future. (See **Socioeconomics and Environmental Justice** section for additional discussion.) Less than significant impact.

Would the proposed project conflict with any applicable habitat conservation plan, natural community conservation plan, or biological opinion?

There are no ACECs within the proposed ROW and the CDCA plan is not a habitat or natural community conservation plan, although it contains some elements of both. A biological opinion has not been issued for this project. Therefore, there is no applicable habitat conservation plan, natural community conservation plan, or biological opinion for this project.

LORS COMPLIANCE

Would the proposed project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction, or that would normally have jurisdiction, over the project adopted for the purpose of avoiding or mitigating environmental effects?

Same as proposed project discussion (Alternative 1) except as noted below.

Land Use Table 7

LORS that apply only to the North of Desert Center Alternative

<p><u>Riverside County General Plan (2003), as amended through December 2008</u></p> <p>- Agriculture (AG) Land Use Designation</p>	<p>The Riverside County General Plan provides policy direction for the entire unincorporated portion of the County and for 19 sectors of the County in the form of Area Plans. A large portion of the eastern desert area of the County, including the project site, is not covered by area plans and thus falls under direction of the countywide policies.</p> <p>The Agriculture land use designation has been established to help conserve productive agricultural lands within the County. Areas designated for Agriculture generally lack an infrastructure that is supportive of urban development.</p>
<p><u>Riverside County Desert Center Area Plan</u></p>	<p>The Plan provides a Land Use Plan, statistical summaries, and local policy direction for Desert Center and the surrounding area through 2020.</p>
<p><u>Riverside County Zoning Ordinance #348, amended through Ord. #348.4647 (August 20, 2009)</u></p> <p>Article XIII, §§13.1 and 13.2 Light Agriculture (A-1) Zoning District</p>	<p>This title is adopted to promote and protect the public health, safety, and welfare through the orderly regulation of land uses throughout the unincorporated area of Riverside County; provide economic and social advantages resulting from an orderly planned use of land resources; and encourage and guide development consistent with the Riverside County General Plan.</p> <p>The A-1 zoning district is primarily intended to designate areas as main resource production zones, classify them for general farming and ranching practices, and assign such uses as the primary emphasis for the areas. Residential and other uses are placed in a position of secondary importance, when compared to the production of food and fiber.</p>
<p><u>Riverside County Code, Ordinance 460.151, §§18.1-18.6 (Reversion to Acreage)</u></p>	<p>Establishes criteria and provides a means to merge more than four contiguous parcels.</p>
<p><u>Riverside County Code, Ordinance 448 (as amended through 448.A) Airport Operations (2000)</u></p>	<p>This ordinance establishes airport operating areas and regulates height standards and limits within those areas.</p>
<p><u>Riverside County Code, Ordinance 509 (as amended through 509.2) – Agricultural Preserves</u></p>	<p>Designates suitable areas of the County of Riverside as agricultural preserves, pursuant to the California Land Conservation Act of 1965 (GC § 51200, et seq.), to be devoted to agricultural and compatible uses.</p>
<p><u>Riverside County Airport Land Use Compatibility Plan (ALUCP); 2004</u></p>	<p>The intent of the ALUCP to promote compatibility between airports in Riverside County and the land uses that surround them. It sets compatibility criteria applicable to local agencies, in their preparation or amendment of land use plans and ordinances, and landowners (including special districts, other local government entities, and private parties) in their design of new development.</p>

State

Public Resources Code §25529

This does not apply to the North of Desert Center Alternative.

Local

Riverside County General Plan (RC 2008)

The Riverside County 2003 General Plan (GP), as amended through December 2008 (excluding the Housing Element), designates both the project site and surrounding lands as Open Space/Rural (OS-RUR) and Agriculture (AG) (see **Land Use Figure 9**). OS-RUR land use designation is discussed in the proposed project (Alternative 1) above.

Land Use Element

General Land Use Policies

Condition of certification **LAND-5** would also apply to this Alternative, as would conditions of certification in various sections of this document that address compliance for drainage, health and safety; noise, and natural and cultural resource protection.

As with the proposed project, there are requirements within these policies that are not applicable, due primarily to its rural location and the absence of significant commercial, industrial, or residential development in the area. For example, the land within and surrounding the proposed project site is almost exclusively disturbed, fallow, agricultural land. The site is also some distance from any community or urban area. Sidewalks, bicycle routes, and public art are non-existent. Extensive landscaping and other requirements designed to enhance an urban environment would be inappropriate in the project setting.

As discussed in LU 6.1/6.2 below, this is a highly visible, industrial facility that would be placed in a generally undeveloped desert area. As noted in the **Visual Resources** section of this document, even with all staff-recommended conditions of certification, the project would have significant and unavoidable adverse visual impacts. This is not consistent with the requirements of LU 4.1. Although visual impacts would be less at this location than at the proposed project site, they would still be significant. Therefore, the project would not be consistent with LU 4.3 at this location.

Policy LU 5.1 requires that the development not exceed the ability of the county to adequately provide supporting infrastructure and services, such as libraries, recreational facilities, transportation systems, and fire, police, and medical services. As with the proposed project site, the demands on county services in this area would be minimal. An onsite worker camp would provide basic utility, water, and wastewater treatment facilities. Construction workers would either commute to the project site on a daily basis or live onsite during the work week and return home on their days off. Although the surrounding area offers the opportunity for wilderness recreation, these are not developed areas or under county jurisdiction (see Recreation discussion above). Highway access is along SR 177, with close proximity to the I-10 interchange, connecting the site to the surrounding communities of Blythe and the Indio/Palm Springs area. There is no public transit serving the proposed project site. (See **Traffic & Transportation** section for further information.) The project has also incorporated safety features that are designed for onsite fire/life/safety response, but would also be subject to the Riverside County Development Impact Fees (see Ordinance 659 discussion below), which are designed to allow the County to construct/acquire the

needed public facilities to support development and preserve open space, wildlife, and their habitats (see **LAND-6**). Therefore, the project would be consistent with LU 5.1. Development of the project at this alternative site would have less of an adverse impact on emergency response times than the proposed project site due to its proximity to I-10

Policy LU 6.1– Policy LU 6.1 requires the project to be designed to insure compatibility with surrounding uses and consistency with any applicable land use designations and Area Plans. As noted above, condition of certification **LAND-5** would require compliance with all land use, building, and other applicable general plan policies and municipal code standards in the design and construction of the proposed project, to the extent feasible. However, potential significant and unavoidable impacts to visual resources make the project inconsistent with this policy, although to a lesser degree than the proposed project site.

Policy LU 8.2 must protect environmental resources, as specified in the General Plan Multipurpose Open Space Element (Chapter 5) and all applicable federal and state LORS, including CEQA, NEPA, and the Clean Water and Clean Air Acts. Although the project would be consistent with applicable Multipurpose Open Space Element policies, there is the potential for significant and unavoidable impacts to biological resources and substantial residual impacts under NEPA. Therefore, the project may not consistent with this policy.

Policy LU 9.1 requires that new development contribute their fair share to fund infrastructure and public facilities, such as police and fire facilities. As noted in Policy LU 5.1 above, the project would be subject to Riverside County's Development Impact Fee (DIF). Condition of certification **LAND-6** requires payment of the county's DIF prior to occupancy of the proposed facilities and would, therefore, be consistent with the requirements of this policy.

Scenic Resource policies (LU 13.1 through 13.8; OS 21.1 and 22.1)

These policies do not apply to the North of Desert Center Alternative location. There are no eligible or designated scenic highways in the vicinity of this site.

Policy LU 14.7 requires the county to ensure that no structures or activities encroach upon or adversely affect the use of navigable airspace. As noted in the impacts and mitigation discussion of aviation and military operations of the **Traffic and Transportation** section of this document, the proposed solar power tower would encroach into navigable airspace and has the potential to adversely affect arrivals/departures at the Desert Center Airport and significantly impact military testing and operations conducted along two low-level military training routes above this project site. However, full implementation of conditions of certification **TRANS-2, TRANS-7, TRANS-8, and TRANS-9** would ensure consistency with this land use policy.

Agriculture (AG) Land Use Designation and policies (LU 16.2 and 16.4)

The Agriculture (AG) land use designation is intended to protect agricultural uses by allowing only those uses and intensities that are compatible with agriculture (LU 16.2) within the County. These include row crops, nurseries, citrus groves and vineyards, dairies, ranches, poultry and hog farms, and other agricultural-related activities. Areas

designated AG generally lack an infrastructure that is supportive of urban development. This designation applies to more than 900 acres within the 2643-acre North of Desert Center Alternative site boundaries. While the proposed project would preclude agricultural use of the lands within the project footprint, including lands with an AG designation, it would not disrupt existing or prevent future agricultural uses outside the project boundaries. Parcels within the project boundaries with an AG designation also have a zoning designation of A-1. The A-1 zoning designation is considered consistent with the AG General Plan land use designation and permits public utility facilities on parcels with an A-1 zoning. Therefore, the project would be consistent with LU 16.2.

LU 16.4 encourages conservation of productive agricultural lands and seeks to preserve prime agricultural lands for high-value crop production. Most of the agricultural lands within this project site have been fallow for some time, with only 84 acres currently in limited agricultural production. The location also is not designated as Farmland by the FMMP. The project is consistent with the intent of this policy.

Riverside County Desert Center Area Plan

The Desert Center Area Plan (DCAP) is part of the Riverside County General Plan and is intended to address issues specific to the development of Desert Center and the surrounding area (see **Land Use Figure 8**). DCAP policies that apply to the proposed project at this Alternative site include land use designations, which are the same for this location as the General Plan land use designations discussed above; and policies governing agricultural preservation; light pollution; vehicular circulation; open space; and hazards, such as fire. The proposed Alternative project site is not subject to policies for the Desert Center, Lake Tamarisk, and Desert Center Airport Influence Areas, or the Specific Plan No. 306 for the Eagle Mountain Townsite.

DCAP Policy 4.1 requires development to protect farmland and agricultural resources by adhering to the General Plan Agricultural Resources section of the Multipurpose Open Space and Land Use Elements, and provisions of the AG land use designation. As noted in the General Plan discussion above, this Alternative would be consistent with all applicable General Plan agricultural policy requirements.

DCAP Policy 5.1 requires projects to use outdoor lighting fixtures that minimize the effect of the lighting on the nighttime sky and wildlife habitat areas, except as necessary for security reasons. Condition of certification **VIS-2** requires all permanent exterior lighting and all temporary construction lighting such that a) lamps and reflectors are not visible from beyond the project site, including any off-site security buffer areas; b) lighting does not cause excessive reflected glare; c) direct lighting does not illuminate the nighttime sky, except for required FAA aircraft safety lighting; d) illumination of the project and its immediate vicinity is minimized as to times of use and extent, and e) the plan complies with local policies and ordinances. With implementation of this condition of certification, the project would be consistent with this policy.

DCAP Policy 6.2 requires county roadways to be maintained consistent with the Level of Service (LOS) standards described in the General Plan Circulation Element. As discussed in the **Traffic and Transportation** section of this document, traffic associated with this Alternative would not increase the conditions along SR177 in the

project area above LOS 'C', consistent with General Plan Circulation policy C 2.1. It was also noted that traffic from either construction or operations would not impact the performance standards of I-10, with the freeway continuing to operate at LOS A before and during peak hours of operation or construction. Therefore, this Alternative would be consistent with this policy requirement.

DCAP Policy 10.2 encourages efforts to limit off-road vehicle (OHV) use within the Desert Center Area Plan boundaries. While the project would not proactively address OHV use in the area, the project site would be fenced and would preclude any OHV activities currently occurring on the site. This project Alternative is, therefore, consistent with this policy requirement. However, as required by condition of certification **LAND-12**, public vehicular access and continued connectivity would be maintained along the SCE transmission line corridor.

DCAP Policy 11.1 requires developers to protect life and property from wildfire hazards through adherence to the Fire Hazards section of the General Plan Safety Element. As noted in the **Worker Safety and Fire Protection** section of this SA/DEIS, the agencies have determined that project design; compliance with all LORS, including the Riverside County Fire Protection Ordinance, if applicable; and the recommended conditions of certification **WORKER SAFETY 1, 2, and 6** (and **LAND-5**), would be adequate to ensure compliance with all applicable LORS, consistency with General Plan Safety Element policy S 5.1; and to assure protection from all fire hazards. Condition of certification **TRANS-1** would ensure adequate emergency access would be maintained. This Alternative would, therefore, be consistent with this policy.

DCAP Policy 12.1 requires developers to protect public health and safety from seismic-related incidents through adherence to the Seismic Hazards section of the General Plan Safety Element. As noted in the **Geology, Paleontology, and Minerals** section of this document, similar seismic design criteria would be required for the North of Desert Center Alternative site as the proposed project, in accordance with a design-level geotechnical report and 2007 California Building Code (CBC) standards. Adequate Impacts due to seismic hazards and soil conditions, such as subsidence, would be addressed by compliance with the requirements and design standards of the CBC, consistent with appropriate design parameters determined through a site-specific evaluation by a Certified Engineering Geologist or Geotechnical Engineer. As discussed in the **Hazardous Materials Management** section of the SA/DEIS, this Alternative site is located in a seismically active region of California. Energy Commission staff have determined that tank failures during seismic events are not likely and do not represent a significant risk to the public. CBC seismic requirements for the construction and design of buildings and vessels storing hazardous materials would be required to meet the appropriate seismic requirements. Therefore, this project Alternative would be consistent with this policy.

The North of Desert Center Alternative would, therefore, be consistent with all applicable DCAP policies.

Multipurpose Open Space Element

This element identifies the conditions and actions necessary to protect and preserve the

County's natural resources, agriculture and open space areas; provide effective management of mineral resources; preserve and enhance cultural resources; and provide recreational opportunities for the citizens of Riverside County.

Water Conservation

Policy OS 2.2 requires developers to decrease stormwater runoff by reducing pavement in developed areas and to include permeable parking bays and porous parking lots, with bermed rainwater detention basins. Consistent with this policy, areas around the powerblock (**SOIL&WATER-1**) and, as required by conditions of certification **LAND-8**, on-site access roads and parking pads for the visitor parking, construction worker parking, and portions of the construction laydown area would be surfaced with rock/gravel, decomposed granite, or similar material to provide a level, all-weather surface, minimize dust, and provide a permeable surface to facilitate drainage. Three lined, 5-acre evaporation ponds would also be constructed at the south end of the project site to contain all process blowdown and stormwater drainage from the central power block (SR 2009a).

Policy OS 2.3 encourages the use of native, drought-resistant landscaping plantings. Condition of certification **LAND-10** would require the use of native, drought-resistant landscaping plantings along the entrance and boundary fencing along SR177, consistent with General Plan policy OS 2.3 and requirements for the project to maintain the character of and blend with the undeveloped natural contours of the site. Additionally, conditions of certification **BIO 11-13** would require restoration of all temporarily disturbed areas outside the final project footprint to pre-project grade and conditions, including the logistics/lay down areas, generator tie-line transmission tower sites, pull sites, areas where underground infrastructure was installed, temporary access roads, and construction worker parking area(s).

With the implementation of the proposed design features and conditions of certification **SOIL&WATER-1**, **LAND-8**, **LAND-10**, and **BIO 11-13**, the project would be consistent with the requirements of General Plan Policy OS 2.2 and OS 2.3.

Groundwater Recharge

Three General Plan Open Space policies address the need to protect groundwater recharge areas: (1) Policy OS 4.3 requires that adequate aquifer water recharge areas be preserved and protected; (2) Policy OS 4.4 requires a project to incorporate natural drainage systems into the development, where appropriate and feasible; and (3) Policy OS 4.5 requires a project to retain stormwater at or near the rainfall location for percolation into the groundwater tables, to conserve it for future uses and mitigate flooding. Conditions of certification **SOIL&WATER-1**, and **LAND-8** would require permeable paving surfaces. The proposed project design includes three on-site evaporation ponds (SR 2009a) and natural drainage conditions would be preserved, to the extent feasible (see **Soil & Water** section). The project would, therefore, be consistent with Open Space policies OS 4.3, 4.4, and 4.5.

Mineral Resources

To protect the availability of these resources for future generations, Policy OS 14.2 restricts the development of incompatible land uses within the impact area of existing or potential surface mining areas. As with the proposed project site, this alternative site is designated Mineral Resource Zone 4 (MRZ-4). These are areas where there is not enough information available to determine the presence or absence of mineral deposits. Although the closed Kaiser Steel Eagle Mountain Mine is within eight miles of the proposed site boundaries, no active mines are known to have existed within or adjacent to the proposed project boundaries (USGS 2008a). As noted in the **Geology, Paleontology, and Minerals** section of this document, until the existence and structural orientation of an ore body is proven, the probability of the presence of economically recoverable mineral reserves beneath the property is considered to be very low. Location of the project at the proposed site is, therefore, consistent Policy OS 14.2.

Noise Element

The Noise Element of the General Plan is closely related to the Land Use Element because of the effects that noise has on sensitive land uses. Noise-producing land uses must be compatible with adjacent land uses in order for the Land Use Plan to be successful. There would be sensitive receptors (residences) within 100 yard of the project boundary. The closest sensitive land uses would also be the residences, along with at least four wilderness areas within five miles of the project boundaries. Although construction noise from the project could impact the wilderness experience at these locations, the noise would attenuate significantly at that distance and would generally be within Policy N 4.1 limitations Exceedances, such as steam blows, would be temporary in nature, rarely extending beyond a few minutes. Because exposure of the limited number and dispersed location of the sensitive receptors (residences) in the area, intermittent nature, and temporary, abet extended construction period, impacts would be considered less than significant. (See **Noise** section of this document for additional information.)

Riverside County Municipal Code

Ordinance 348, as amended through 348.4647 - Riverside County Land Use Ordinance

This Ordinance includes the planning and land use regulations for the unincorporated areas of Riverside County and identifies the process to initiate, implement, amend, and enforce these regulations.

Article XIII, §§13.1 and 13.2 Light Agriculture (A-1) Zoning District

There are three blocks of privately-owned parcels within the North of Desert Center Alternative site that are zoned A-1. The A-1 zoning district is primarily intended to designate areas as main resource production zones, classify them for general farming and ranching practices, and assign such uses as the primary emphasis for the areas. Residential and other uses are placed in a position of secondary importance, when compared to the production of food and fiber. However, other uses are allowed and public utility facilities are permitted with approval of the project plot plan [§13.1(b)(5)]. Plot plans would normally be approved by the Riverside County Planning Director, except for the Energy Commission's exclusive authority. The licensing process requires

information consistent with Riverside County's plot plan requirements and its certification process stand in lieu of county approval. If certified by the Energy Commission, the project would be consistent with the A-1 zoning requirements.

Article XV, §§15.1 and 15.2 Controlled Development Areas (W-2) Zoning District

A number of the privately-owned parcels within the North of Desert Center Alternative site are zoned W-2-10 (10-acre minimum). Structures and the facilities necessary and incidental to the development and transmission of electrical power and gas, including power plants and transmission lines, are permitted uses within a W-2 zoning district. The proposed project site meets the minimum lot size. However, certain project elements, including the steam generating building, solar receiver tower, and transmission line towers, would exceed the maximum height of 75 feet for buildings and 105 feet for other structures. A variance is required for structures exceeding these maximum heights [RC 2009a, §15.2(a)]. As with the proposed project, the circumstances requiring structures that exceed the maximum heights are unrelated to the parcels that make up the project site. They are, instead, related to the functionality and operational requirements of the proposed project. As a result, the findings required to justify approval of a variance cannot be made. Therefore, the project would be inconsistent with the W-2 zoning district standards.

Article XV, §15.200 Natural Assets (N-A) Zoning District

N-A zoning permits public utility substations in this zoning district, with plot plan approval, but the larger, electrical generation facilities are not permitted, even with a conditional use permit. However, "public utilities" is one of several uses permitted in any zone classification, provided a public use permit is granted by Riverside County (see Article XVIII, §18.29 below). This includes transmission lines and electric generating plants. As the Energy Commission licensing process is equivalent to the Riverside County Planning approval process for a Public Use Permit, and considering the Energy Commission's exclusive authority, certification of the project would ensure consistency with this ordinance. Although public lands also carry an N-A zoning designation, they are only subject to state or federal jurisdiction and are not bound by Riverside County land use and zoning LORS for these properties.

Article XVIII, §18.12 Off-Street Vehicle Parking and Landscaping

Off-street parking and landscaping requirements would be the same for this Alternative site. Full implementation of conditions of certification **LAND-8**, **LAND-9**, **LAND-10**, and **BIO 11-13** would ensure the project is consistent with county parking and landscaping requirements.

Article XVIII, §18.29 Public Use Permits

"Public utilities" is one of several uses permitted in any zone classification, provided a public use permit is granted by Riverside County. This includes transmission lines and electric generating plants, even if identified as permitted uses within the specific zoning district (CEC 2010a). As with the proposed project, the recommended conditions of certification would ensure that there would be no significant health, safety, or welfare impacts during either construction or operation of this project at this location. Condition of certification **LAND-5** would require the project to follow Riverside County municipal

and building code requirements. Proposed project design and conditions of certification would protect public health, safety, and welfare, and the usability of adjacent properties. The project is, therefore, consistent with the requirements for a public use permit.

Article XVIII, §18.33 Setback Adjustments and Temporary Use of Land

The section of the Riverside County code applies to this Alternative because temporary use of the land (project site) during the construction of public utilities would occur for more than six months. As with the proposed project site, conditions of certification **LAND-8**, **LAND-10**, and **BIO 11-13** would require permeable surfacing of all temporary access roads, and parking spaces; and specifically address rehabilitation of all temporary use areas with either restoration of the desert landscape or approval and implementation of an approved landscape plan. The project encroachment onto SR 177 would provide both construction and operations access at an existing, though undeveloped, access point, and would be constructed to CalTrans specifications. Condition of certification **TRANS-1** would include a construction Traffic Control Plan that would protect existing roadway access and use. Condition of certification **TRANS-3** would require the project owner to repair any construction damage to public roadways to pre-project conditions. The project's interior access roads would be constructed consistent with Riverside County road requirements. Proposed project design and conditions of certification would protect public health, safety, and welfare, and the usability of adjacent properties. Therefore, the extended temporary uses of the project site would be consistent with the normal requirements for county approval.

Riverside County Ordinance 457.102 Building & Construction Code

Riverside County Building and Construction Code would apply to all construction outside federal lands and to construction on federal lands, to the extent that the standards do not conflict or override state and federal requirements. Condition of certification **LAND-5** would require compliance with all applicable Riverside County zoning standards and building and municipal code requirements, except as specifically noted in this section or other related sections of this document.

Section 1(C) indicates that no building permit shall be issued for any structure if construction would violate the provisions of any state law or county ordinance. Condition of certification **GEN-1** (see **FACILITY DESIGN** section of this document) would require the project owner to design, construct, and inspect the project in accordance with the 2007 California Building Standards Code (CBSC), or the latest edition in effect when initial project engineering designs are submitted for review. However, there are a number of publicly-owned parcels interspersed among those held privately. Merger of the publicly and privately owned parcels is not an option. The conceptual layout plan for the project shows the potential for structures and equipment to be constructed across private parcel lines and federal and state/county jurisdictional boundaries. Construction across property lines is inconsistent with existing zoning and building requirements. Therefore, unless the project could be designed and sited in such a way as to avoid construction of project structures or elements across property lines or in violation of zoning setback requirements, this Alternative would be inconsistent with this ordinance.

Riverside County Ordinance 460.151, §§18.1-18.6 (Reversion to Acreage)

As with the proposed project, the Alternative 3 project site currently consists of multiple privately owned, contiguous parcels, under a number of different owners. The Energy Commission requires all parcels within a project footprint (other than publicly owned lands) be merged into a single parcel, owned or leased by the project owner(s) of record. As there are more than four contiguous parcels, this would require approval of a subdivision tract map to revert all parcels to acreage, then merge them into a single parcel. Dedications or offers of dedication which have not been accepted by Riverside County are unnecessary for the present or prospective public uses and would be vacated or abandoned by the reversion to acreage. At the time of the request, all parcels would be owned by the project owners; there would be no conflict of interest. There are no structures on any of the subject parcels and access would not be restricted to the subject property or any adjoining parcels. Dedications necessary for a logical street pattern for access to any lands not proposed for reversion or as may be necessary for drainage or utilities would be retained. Therefore, all findings for approval can be met and the project would be consistent with this ordinance.

Section 18.7 (Merging of Contiguous Parcels) would not apply to this Alternative site as the proposed project footprint would encompass well in excess of four contiguous parcels.

Riverside County Code, Ordinance 509 (as amended through 509.2) – Agricultural Preserves

Ordinance 509 allows the County of Riverside to establish suitable areas as agricultural preserves, pursuant to the California Land Conservation Act of 1965 (Government Code Section 51200, et seq.; the Williamson Act), to be devoted to agricultural and compatible uses. The county's GIS mapping system indicates that there are three Agricultural Preserves within or immediately adjacent to the boundaries of this Alternative site (Chuckwalla 1, 2, and 3; see **Land Use Figure 10**). This project would eliminate most or all of the area identified as the Chuckwalla #2 and #3 Agricultural Preserves. Elimination of the agricultural uses on this land for the life of the project would not be consistent with the Williamson Act requirements to protect and preserve current and future agricultural land and uses. However, there is some question as to the validity of that mapping, as both the county Planning Department and the GIS mapping indicate there are no Williamson Act contracts currently in place on any of these lands. If the Agricultural Preserve designation is correct, the project would be inconsistent with this Ordinance, as electric utility facilities are only permitted if operated by a public agency or mutual water company, not a private entity. Condition of certification **LAND-11** would require the project owner to remove said parcels from contract through cancellation, or provide proof said contract does not exist, prior to the start of construction. This would ensure consistency with this county ordinance.

Riverside County Ordinance 659, as amended through 659.8 (Development Impact Fees)

As with the proposed project, this Alternative site is in the Desert Center-CV Center DIF area. Fees would be based on Commercial development at \$12,367 per acre, as established by the August 20, 2009 fee schedule. Acreage calculations would include all power block facilities and all primary paths of travel leading to production plant area, including access roads, but not solar fields or solar field maintenance roads (CEC 2010a,b). Condition of certification **LAND-6** would require the project owner to pay the required DIF prior to the start of operations, consistent with Riverside County requirements for large-scale renewable energy projects, or enter into a development agreement, or similar agreement, with the County of Riverside in lieu of the development impact fee. The applicant has agreed to this requirement (GB 2010c).

Riverside County Ordinance 859, as amended through 859.2 (Water Efficient Landscape Requirements)

The water-efficient landscape requirements contained in this Ordinance apply to all new and rehabilitated landscapes associated with commercial or industrial uses, which require a discretionary permit and/or approval. The proposed project would require a public use permit, height variance, parcel merger, and approval of temporary extended use. Therefore, this Alternative would also be subject to the requirements of this Ordinance. Condition of certification **LAND-10** would require approval and implementation of a Landscaping Plan, consistent with this ordinance. However, given the project's remote location and lack of available municipal water sources, use of recycled water would not be required.

Riverside County Airport Land Use Compatibility Plan (2004)

The Riverside County Airport Land Use Compatibility Plan (ALUCP), adopted by the Riverside County Board of Supervisors in October 2004, contains general compatibility criteria applicable to all airports within Riverside County, as well as specific requirements for individual airports. The Desert Center Airport, known during WWII as the Desert Center Army Airfield, is located directly across SR 177 from the proposed Alternative 3 project site. The airport is privately owned by the developers of the Chuckwalla Valley Raceway and only available for use by members and guests. Activity levels should remain consistent with flight operations prior to 2004 (i.e., no more than 2,300 operations annually). There is no tower or published instrument approach/departure routes. The airspace above the Desert Center Airport is uncontrolled and air traffic control has no authority or responsibility for flights below 1,200 feet AGL within this airspace. There is no master plan for the Desert Center Airport. Standard direct departures from the single remaining runway are to the southwest (heading of 230 degrees), into prevailing winds, and would remain outside the proposed project site. The airport is not lighted and is only available during daylight hours. The entire project site, including the central tower, would be outside all airport compatibility zones and the airport area of influence boundary (see **Land Use Figure 11**). **TRANS-7** would require the solar tower to be lighted, consistent with the FAA requirements for Obstruction Marking and Lighting (FAA 2007), requirements in response to FAA 7460 Finding of No Significant Hazard (FAA 2009c), Air Force Aviation Safety-Flight Safety Flash 09-01 (USAF 2009), and FAA Safety Alert for Operators

(SAFO) 09007 (FAA 2009a). **TRANS-8** would require pilots to be advised of the location of the proposed solar tower through issuance of a temporary Notice to Airmen (NOTAM) that would be superseded by a permanent notation of the tower's location on the applicable aviation charts for the Desert Center Airport and surrounding airspace. (RC 2004, p.3-16) Therefore, this project alternative would be consistent with requirements of the Riverside County ALUCP and the existing airport use.

Cumulative Land Use, Recreation, and Wilderness Effects

GEOGRAPHIC SCOPE OF ANALYSIS

The geographic scope of the project's land use, recreational, and wilderness cumulative impact for this Alternative is divided into three areas:

- A Incremental, project-specific impacts analyzed within this document that contribute to or result in a substantial change or significant impact to land use and/or recreation in the immediate project area.
- B Local area, defined as from I-10, south of Desert Center, within a radius of approximately 15 miles of the proposed project site and the general confines of the Upper Chuckwalla Valley, surrounding mountain ranges (Palen/McCoy, Chuckwalla, and Orocopia Mountains/Wilderness Areas); and Joshua Tree National Park and Wilderness Area.
- C Regional area, defined as within the California Desert District (CDD), primarily in the area managed by the BLM's Palm Springs-South Coast District office, the Riverside East Solar Study Area, and along the I-10 corridor from Chiriaco Summit to Blythe.

There are four Wilderness Areas that could be indirectly affected by the proposed project and six Wilderness Areas, several ACECs, and Joshua Tree National Park/Wilderness that could be affected by the cumulative impacts of renewable energy and other foreseeable projects in the regional area.

Local Area

The project site is approximately 1.6 miles north of Desert Center and I-10, in the Upper Chuckwalla Valley of Riverside County. It is immediately adjacent to and includes a portion of the BLM Riverside East Solar Energy Study Area and BLM lands that are being analyzed for solar development in the U.S. Department of Energy (DOE) and BLM programmatic EIS (see **Cumulative Impacts Figure 2**). Bounded by four mountain ranges, the lands surrounding the project area are geologically isolated from other portions of the CDD and present a relatively distinct land area for the purposes of analyzing local CEQA and NEPA cumulative impacts.

There are a total of ten solar energy projects proposed or in progress on approximately 57,247 acres¹⁶ of BLM-managed public lands, within a radius of approximately 15 miles from the project site. One wind project is also proposed on 3,500 acres, within eight

¹⁶ Acreage reflects the total area being investigated in the current applications submitted to BLM. The final ROW should be significantly less, consistent with the final project footprint, following completion of construction.

miles of this site (see **Land Use Appendix B**).

In addition, six projects that are not energy-related, but have the potential to impact current and future land uses, are located within 10 miles of the project site. (See **Land Use Appendix C**)

Regional Area

In addition to the projects identified within the local area, there are 17 additional solar projects proposed over more than 425,000 acres of public lands and two wind projects on almost 18,000 acres of public lands (as of August 2, 2010), within a radius of 50 miles from the project site. The DOE and BLM are also analyzing public lands along SR 62, I-10, SR177, and north into San Bernardino County for compatibility with future solar development, as part of the Solar Energy Development Programmatic EIS (DOE/BLM 2010a). Portions of these lands are also included in the BLM's Riverside East Solar Study Area. (See **Land Use Appendix B** and **Cumulative Impacts Figure 2**)

Even more renewable energy projects are proposed on public lands in surrounding counties, from Indio, Twenty-Nine Palms, and Needles to the eastern California border; and into the states of Nevada and Arizona (see **Land Use Appendix B**), along with the 24 tracks of public lands in six western states, including over one million acres in southern California, that are being studied as suitable for solar development.

There are also at least 36 non-energy-related current and foreseeable projects affecting land use and resources in the region, including three major master planned communities and 20 smaller residential developments in and around the City of Blythe (see **Land Use Appendix C**).

AGRICULTURE LANDS AND RANGELANDS

Local Agriculture

Local privately-owned parcels in the project vicinity are generally moderate to large acreage parcels (20 acres or larger) that are either undeveloped desert lands, devoid of residences and other structures, or single family ranchettes. Although the zoning for much of the private land allows agricultural uses, there is little agricultural activity in the Upper Chuckwalla Valley area, other than a palm nursery and a small jojoba farm. Construction of the project at this site would eliminate most or all of the remaining 974 acres of AG-designated lands in the Upper Chuckwalla Valley, or within 20-40 miles of the project site. There are no grazing allotments on public land in this area. The project would not add to any local cumulative loss of grazing land, Prime Farmland, or Farmland of State or Local Importance in the Upper Chuckwalla Valley.

Regional Agriculture

There are no rangeland grazing allotments and very little agricultural activity within the regional area identified for this Alternative. As mentioned in the proposed project (Alternative 1), the Ford Dry Lake Rangeland Grazing/ Pasture Allotment, along the I-10 corridor about 20 miles west of Blythe, was cancelled in 2007, due to its proximity to occupied Bighorn Sheep range in the Palen Mountains. Some irrigated agriculture,

including alfalfa fields and orchards, occurs in areas along the Colorado River. Although some of the current and foreseeable non-energy-related projects in the region (see **Land Use Appendix C**) may result in the conversion of agricultural lands to non-agricultural uses or impact available water resources currently used for irrigation, this Alternative would not result in or contribute to the loss of any of these types of agricultural uses.

Rangelands

Although there are several herd and herd management areas in the regional vicinity, the project would not interfere with established or proposed access or uses. Therefore, this Alternative would have no impact on cumulative agricultural and rangeland impacts.

RECREATION AND WILDERNESS

Recreation

As noted in the Recreation discussion above, there are no established recreational areas within 20-40 miles of the project site. The closest recreation areas are in the Joshua Tree National Park, the City of Blythe, and the Indio/Palm Springs area. Construction workers from this project or the limited number of permanent employees are not expected to contribute substantially to the demand on local or regional recreational facilities. However, as noted in **Land Use Appendices B and C**, there are at least 20 other renewable projects proposed or approved on surrounding BLM-managed public lands, with the potential to affect more than 500,000 of the 1.6 million acres of multi-use recreational and wilderness lands in the region, either through direct impacts to the recreational resources or by increasing the number of visitors using the recreational facilities and wilderness areas. There are also at least 36 non-energy-related current and foreseeable projects with the potential to impact recreational resources, including impacts from increased population growth in and around the City of Blythe. This project would add proportionally, but not substantially, to the cumulative recreational impacts of those local and regional projects. Therefore, the proposed project's overall contribution to local and regional cumulative recreational impacts would be less than significant.

Wilderness

There are four designated wilderness areas in the local project vicinity and more than 13 wilderness areas, several ACECs, and the Joshua Tree National Park/Wilderness within a 75-mile radius of the Alternative project site. Neither the project nor other existing or foreseeable projects would occur within the wilderness, ACEC, or national park boundaries. Direct impacts to access and visual/scenic resources, noise and light pollution, and increased visitation (resource use), as well as indirect impacts to natural and cultural resources, may result from one or more of the proposed projects. The proximity of the wilderness and other environmental sensitive areas to the solar study areas and both public and private lands proposed for development increases the likelihood of adverse impacts. Information to make a determination of the extent of these potential impacts is not available at this time, but could be cumulatively substantial. Noise and visual/scenic impacts are not expected to physically impact the availability of resources within the boundaries of these protected areas, but could affect

a visitor's wilderness experience. These impacts, however, are not measurable, as they are based on individual perceptions, sensitivities, and expectations. The proposed project would not contribute to any cumulative access impacts or contribute substantially to increased visitor resource use.

LAND USE COMPATIBILITY

Scenic Resources

All solar projects are similar in general design, with one or more solar collector fields, a central generating facility, transmission lines, and one or more interconnection substations. Facility stack heights vary, depending on the solar/generating process, and range from under 100 feet to central stacks exceeding 650 feet agl. The number of stacks also varies, from a single central stack to four or more stacks arranged in series. Transmission line towers are generally 90-120 feet tall. In total, most solar facilities occupy between 1,000-5,000 acres, not including transmission line corridors, although areas three to five times the final project footprint are often initially requested in the ROW applications to allow flexibility in final project placement or to allow for future expansion or more than one facility.

In addition to the RSEP, there are thirty large renewable energy projects proposed within 40 miles of this Alternative project site. Due to the topography of the area, most of these projects would be visible from I-10 and at least 10 would be visible from SR177. Over 500,000 acres have been identified in the BLM ROW applications for these projects, most in undeveloped desert areas, bounded by more than 13 mountainous wilderness areas, and within five miles of a state highway. There is also additional acreage available within the surrounding BLM Riverside East Solar Energy Study Area and BLM lands being analyzed for future solar development. This increases the potential for additional project impacts to the scenic resources in this area. As with the proposed project, it is reasonable to assume that the other projects proposed for this area would have similar project-related impacts to the scenic resources of the area as the proposed project, although the visual impact of the projects may vary by degree. The construction of each project would extend the visual impact along the north side of I-10 for over 50 miles, from Blythe to the Chiriaco Summit. Projects proposed for the Upper Chuckwalla Valley would be visible for up to 10 miles along SR177, north of I-10. Projects are also proposed along both sides of I-10 within 10 miles of Blythe. This Alternative would contribute substantially to the significant and unavoidable cumulative impacts to the scenic resources along the I-10 corridor, and especially in the Upper Chuckwalla Valley.

The cumulative impact to existing dark sky conditions, especially in the Upper Chuckwalla Valley by artificial light sources from the proposed projects would be substantial. There are ten large-scale solar projects proposed within 10 miles of the North of Desert Center project site. Like the proposed project site, these areas have little residential or commercial development and are generally without any significant sources of artificial light. Project-related impacts could combine with existing and foreseeable projects to substantially increase light pollution in the area, especially if construction timelines coincide. The proposed project would not only contribute to the cumulative lighting of the Upper Chuckwalla Valley area, but extend the light pollution

eastward into the Palen/McCoy Wilderness and west toward the Joshua Tree National Park/Wilderness. Existing dark sky conditions would be substantially degraded by both construction and on-site security and operational lighting. Areas used for astronomical viewing and sky interpretation would be particularly impacted. Overlapping construction schedules would intensify the cumulative effect. Therefore, although glare shields and other conditions of certification have been recommended to reduce lighting impacts (see **VISUAL RESOURCES** section of this document), this Alternative would still contribute significantly and unavoidably to the cumulative impact to existing scenic, dark sky conditions throughout the Upper Chuckwalla Valley and along the I-10 corridor.

Future Land Use and Development

It is difficult to determine if the influx of renewable energy projects in and around the Desert Center area would encourage or discourage local growth, but would probably result in a measurable, if not substantial, increase in both residential and commercial development. Commercial developments, such as the Chuckwalla Valley Raceway and the Eagle Mountain Landfill Project would also bring additional development to the area. The existing Lake Tamarisk residential development still has buildable lots, a number of homes for sale, and sufficient infrastructure to accommodate a reasonable level of growth. The Eagle Mountain Townsite project intends to restore and repopulate the historic Eagle Mountain Townsite. There are also a great many moderate to large-acre residential parcels available in and around Desert Center. While the project would occupy a large number of acres, it is not expected to contribute measurably to the need for rezoning or land division. It could, combined with the other proposed projects in the area, have a cumulatively considerable impact on the type of commercial and industrial development that is attracted to the area.

Land surrounding the local area is both publicly and privately owned. BLM-managed public lands are generally unclassified or designated for multiple use, with the permitted uses determined by the environmental sensitivity of the resources. Most of the public land proposed for solar development in the project area is managed by BLM and designated MUC-M, which allows a multitude of uses, including grazing, recreation, and electric generating facilities. However, development of solar facilities on these lands precludes their use for any other purpose for the life of the project (generally 30-40 years). Residual alterations to the land may continue far beyond that time frame. This project, combined with the other proposed projects in the area, could have a cumulatively considerable impact on the availability of and access to existing public multiple-use lands.

Therefore, use of either public or private lands for renewable energy projects, in the Desert Center area, could have a substantial cumulative impact on future land use and development.

CEQA LEVEL OF SIGNIFICANCE

Under the proposed project (Alternative 3):

- Impacts to agriculture, recreation, and wilderness would be less than significant, both individually and cumulatively.
- No impacts to timberlands.

- The project would have a less than significant impact on airport operations at the Desert Center Airport, with implementation of **TRANS 2 and 7-9**.
- The proposed project would be compatible with existing and permitted agricultural, residential, sensitive receptors, noise, aviation and military use, and recreational land uses with the implementation of **LAND 2, 3, 5, and 12; and TRANS 7-9**. However, it would be incompatible with existing and permitted natural and scenic land uses due to significant, unavoidable impacts to biological, and visual/scenic resources (see **BIOLOGICAL AND VISUAL RESOURCES** sections of this SA/DEIS).
- Consistency with federal and state LORS would be ensured with implementation of **LAND 1-3, 5; and CULT-11**.
- Implementation of **LAND 1-3, 5-8, and 10-12; BIO-3, 11-13, and 21; CULT-11; SOIL&WATER-1; and TRANS 1-3 and 7-9** would ensure consistency with many of the local LORS, to the extent feasible. However, the proposed project would still be inconsistent with a number of Riverside County General Plan policies and county ordinances (see **LAND USE APPENDIX A**).
- Use of either public or private lands for renewable energy projects would have a less than significant impact on future land use and development in the project area, either individually or cumulatively.
- The addition of the RSEP (Alternative 3) would further extend the visual intrusion along I-10 and SR177, as well as impact the scenic vista along I-10 and in the Upper Chuckwalla Valley. This would contribute substantially to the significant and unavoidable cumulative impacts to the scenic resources.
- Although glare shields and other conditions of certification have been recommended to reduce lighting impacts (see **VISUAL RESOURCES** section of this document), the proposed project would still contribute significantly and unavoidably to the cumulative impact to existing scenic and dark sky conditions throughout the Upper Chuckwalla Valley.
- Significant, unavoidable project-specific biological and visual/scenic resource impacts could potentially contribute to cumulatively significant, unavoidable temporary and/or permanent impacts, especially if most of the proposed solar and wind projects within the local or regional area are actually constructed. Simultaneous or overlapping timelines would further exacerbate the temporary construction-related impacts.

NEPA COMPLIANCE

Under Alternative 3:

- The effects on the agricultural resource value of established federal rangelands within the California Desert Conservation Area are minor, both locally and regionally and would not contribute to the substantial loss or fragmentation of existing grazing allotments or future grazing opportunities.
- The effects on recreational activities and resources would be temporary and relatively minor from both a local and regional perspective. Limited loss of access to

the MUC-M lands along SCE transmission line access road would occur during the realignment .

- The effects on recreational use of established Wilderness areas would be limited to noise and visual intrusion on the wilderness experience during project construction. Wilderness resources would not be impacted.
- Project activities at all phases of construction, operation, and closure would conform with BLM plans, policies, and procedures, through approval of the ROW application and implementation of the NEPA and CDCA Amendment process. Staff has also proposed condition of certification **LAND- 3** that, if fully implemented, would ensure consistency with applicable federal (BLM) land use requirements.
- If all the proposed renewable energy projects currently licensed or pending on BLM lands along SR 177, I-10, and in the Upper Chuckwalla Valley are actually constructed, the loss of multiple use lands would equal nearly 1/3 of the 1.6 million acres of public lands in that area. Substantial impacts to biological, cultural, and visual resources would be unavoidable.

ALTERNATIVE 4 (RICE VALLEY ROAD TRANSMISSION LINE)

The SR62/Rice Valley Road Transmission Line Alternative would interconnect to Western's 161/230-kV Parker-Blythe transmission line at the same location as the proposed project transmission line, but would use a different transmission line route to make that connection. With this alternative, the transmission line would exit the proposed plant site just east of the main plan entrance and follow the south side of State Route 62 approximately 3.8 miles east to the junction of Rice Valley Road. It would then follow the existing Rice Valley Road for approximately 10 miles to the proposed substation location and the interconnection point with Western's Parker-Blythe transmission line. The SR 62/Rice Valley Road Transmission Line Alternative route is illustrated in **Alternatives Figure 4**.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

From a land use perspective, the solar generating facility, whether set on the proposed or reduced acreage footprint, would be identical to the proposed project, with comparable impacts. All recommended conditions of certification would still apply. The alternative transmission line route, however, would result in the following changes to land use impacts of the proposed project.

Agriculture and Rangeland

Approximately 60 fewer acres of the Rice Valley grazing allotment would be impacted by Alternative 4. However, this Alternative would also require construction along the entire length of Rice Valley Road, increasing the potential for access along this road to be delayed or blocked. This is an important access route for the Rice Valley grazing allotment. Therefore, condition of certification **LAND-4** would still apply to ensure adequate access to this allotment during the seasonal grazing period. Less than significant impact with implementation of **LAND-4**.

Land Use Compatibility

Impacts to the SR62 scenic corridor would be increased as a result of this Alternative. With Alternatives 1 and 2, the project's significant visual impacts to the scenic corridor were limited to the plant footprint. Alternative 4 would extend those visual impacts (transmission line towers and lines) along the southern side of SR62 for an additional 3.8 miles, disrupting views of the Rice Valley scenic vista and historic Camp Rice. This would add to the already significant, unavoidable project-related scenic and visual impacts identified in Alternatives 1 and 2. It would also increase impacts to historic Camp Rice, resulting in a determination of significant and unavoidable cultural resource impacts.

Cumulative Land Use Effects

As with Alternatives 1 and 2, the project would have a less than significant/substantial cumulative effect on agriculture or rangeland uses; recreation; and future land use and development. However, it would contribute substantially to the cumulative significant, unavoidable impacts to scenic resources along an eligible state scenic highway and existing scenic vistas and dark sky conditions throughout the Rice and Ward Valleys.

CEQA LEVEL OF SIGNIFICANCE

Under Alternative 4:

- Recreation and Wilderness impacts would be identical to those identified for the proposed project (Alternative 1).
- Impacts to Agriculture and Rangelands would still be less than significant, but there would be less of a loss of forage acreage with this Alternative.
- All other impacts would be the same as for the proposed project, except that impacts to historic Camp Rice would also be considered significant and unavoidable.

NEPA COMPLIANCE

Under Alternative 4:

- Land Use, Recreation, and Wilderness effects, including residual effects with implementation of the proposed mitigation (conditions of certification), would be identical to those identified for the proposed project (Alternative 1).

ALTERNATIVE 5

The No Action alternative is the only alternative that must be analyzed in an EIS that does not respond to the purpose and need for the action. With Alternative 5, the No Project/No Action Alternative, the proposed action would not be undertaken; the project would not be built on the proposed or any identified alternative site. Unless BLM implements an amendment to the CDCA Plan, the public lands on which the project transmission lines and substation is proposed would continue to be managed within BLM's framework of a program of multiple use and sustained yield, and the maintenance of environmental quality in conformance with applicable statutes, regulations, policies, and land use plans. The site of the proposed generating facilities would remain in private ownership, subject to applicable Riverside County LORS.

The No Project Alternative under CEQA and the No Action Alternative under NEPA define the scenario that would exist if the proposed Rice Solar Energy Project were not constructed. The CEQA Guidelines state that “the purpose of describing and analyzing a ‘no project’ alternative is to allow decision makers to compare the impacts of approving the proposed project with the impacts of not approving the proposed project” (Cal. Code Regs., tit. 14 § 15126.6(i)). The No Project analysis in this SA/Draft EIS considers existing conditions and “what would be reasonably expected to occur in the foreseeable future if the project were not approved...” [Cal. Code Regs, tit. 14 § 15126.6(e)(2)]. Under NEPA, the No Action Alternative is used as a benchmark of existing conditions by which the public and decision makers can compare the environmental effects of the proposed action and the alternatives.

If the No Project/No Action Alternative were selected, the construction and operational impacts of the proposed Rice Solar Energy Project would not occur. There would be no project-related site alterations, no loss of resources or disturbance of approximately 1,500 acres of desert habitat, no loss of historically significant locations or other impacts to cultural resources, no visual impacts along SR62 or to the Rice Valley, no need for alterations to military training activities, and no installation of power generation and transmission equipment as a result of this project. There also would be no contribution to the cumulative adverse visual, biological, cultural, recreational, transportation, and scenic impacts that may accompany the development of other proposed and foreseeable projects in the local and regional area. However, the projected plant output of 100-150 megawatts of power also would not be added to the regional electrical grid or available to meet the state’s renewable energy requirements.

Both county and BLM land use designations and requirements would be expected to remain generally consistent with existing LORS and, although the RSEP project would not be constructed, the lands on which it is proposed would still be available for future development, including uses similar to the proposed project.

SETTING AND EXISTING CONDITIONS

The land use setting for the No Project/No Action Alternative is the same as that identified for the proposed project site and associated linear facilities.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

With the No Project /No Action Alternative, no project-related impacts would occur and, therefore, no mitigation is justified.

CEQA LEVEL OF SIGNIFICANCE

Under the No Project/No Action alternative, future land use impacts to the proposed project site and area are likely to be similar as those currently occurring under the existing conditions in the area. Existing issues of development, growth, recreational impact, loss of agricultural land, and climate change would not be altered or disrupted by any project-related impacts. No impact.

NEPA COMPLIANCE

As with the CEQA Level of Significance discussed above, existing issues and concerns

would continue without the influence of any project-related impacts. As no physical project-related changes have occurred to the environment to date, there would be no recommended mitigation or need for remediation and no residual effects.

PROPOSED CONDITIONS OF CERTIFICATION

Should the Energy Commission approve the project and the BLM approve the ROW, the following measures are recommended as conditions of certification and approval. Staff recognizes that BLM's parallel process for resolving adverse effects is somewhat different from the CEQA process. Staff therefore recommends that BLM incorporate the following conditions of certification or their equivalent into the RSEP ROW and associated plan documents to ensure that the project's impacts to land use, recreation, and wilderness are mitigated in a way that meets both federal and state requirements.

LAND-1: The project owner shall adjust the boundaries of all parcels or portions of parcels that constitute the Rice Solar Energy Project site, identified in the project Application for Certification (AFC) as Riverside County Assessor's Parcel Numbers 801-070-003, 801-070-004, 801-100-005, and 801-100-006, excepting all project elements within the Bureau of Land Management (BLM)-approved, project-related Rights-of-Way (ROWs) and linear easements, or other independent ROWs or privately held easements, as necessary to merge all properties into a single parcel, under single control and ownership, in accordance with provisions and procedures set forth in the County of Riverside's Ordinance #460.151; Ordinance #348, §§15.1 and 15.2; and the Comprehensive General Plan of Riverside County.

Verification: At least 30 days prior to the start of site preparation and construction, the project owner shall submit evidence to the Energy Commission Compliance Project Manager (CPM), indicating approval of the parcel merger by Riverside County. The submittal to the CPM shall include evidence of compliance with all conditions and requirements associated with the approval of the Certificate of Parcel Merger by the county, including a copy of the recorded deed or Record of Survey and the "Notice of Lot Line Adjustment". All parcels must be under common ownership at the time of merger.

LAND-2 The project owner shall obtain a recorded easement from all affected private property owners, authorizing the use of those portions of privately-owned lands that would be impacted by construction and operation of any project-related utility lines or pipelines, transmission line alignments, corridors, access roads, and/or the proposed interconnection substation. Temporary access for surveys may occur before the permanent easement(s) is recorded, provided permission to access the property is obtained from the owner or owner's designated representative prior to entering the property.

Verification: At least 30 days prior to the start of construction activities on any private lands, including delivery of materials, the project owner shall provide a copy of a recorded easement to the CPM on any affected properties. The project owner shall also provide copies of any access agreements with the property owner(s) and advise the CPM and property owner(s), in writing, of any intended entry onto private lands for

surveys or other site evaluations at least three days prior to entry. Copies of all correspondence regarding rights of entry shall also be provided to the CPM within 10 days of receipt.

LAND-3 The project owner shall obtain a Right-of-Way Grant (ROW Grant) from the Bureau of Land Management (BLM), authorizing use of those portions of BLM-managed public lands that would be impacted by utility lines or pipelines, transmission line alignments, corridors, access roads, and/or the proposed interconnection substation footprint. An approved Plan of Development shall be made a part of the right-of-way grant. Any relocation, additional construction, or use that is not in accordance with the approved Plan(s) of Development and Energy Commission licensing and certification requirements shall not be initiated without the prior written approval of BLM's Authorized Officer and the CPM.

Verification: At least 30 days prior to the start of construction and prior to any Notice to Proceed with construction issued by BLM's Authorized Officer and the CPM, the project owner shall provide BLM's Authorized Officer (AO) and the CPM with documentation of the following:

1. BLM's ROW Grant and final approved Plan of Development.
2. The bond satisfactory to BLM's AO.
3. Certification that the project owner acknowledges the project's development and all applicable construction, operation, maintenance, and closure activities shall be conducted in conformance with the approved Plan of Development and Energy Commission licensing requirements (and any subsequent amendments), and within the approved ROW boundaries, for the life of the project.

LAND-4 Activities blocking or limiting access to Rice Valley Road, or construction within the boundaries of the Rice Valley (Keoughs) Rangeland Grazing Allotment (#CA06001), shall not occur during the established seasonal grazing period, currently March 1 – April 30 of each year. No open trenches or construction materials that could endanger livestock shall be accessible within the allotment boundaries. Activities, such as surveys, that would not interfere with or endanger grazing livestock are exempt from this condition.

Verification: At least 30 days prior to the start of each allotted grazing season, the project owner shall provide BLM's AO and the CPM with a copy of the construction workplan, confirming cessation of construction activities and implementation of any site protection needed for the duration of the grazing season. Site visits for verification are at the discretion of BLM and the CPM.

LAND-5: The project owner shall ensure that all project-related facilities on private lands, including temporary construction parking and laydown area(s), are constructed and operated in compliance with all applicable Riverside County land use laws, ordinances, regulations, and standards, including zoning and building code requirements, except as noted in this document.

The project owner shall submit a development plan to the Riverside County Planning

Department in sufficient time to review for substantial conformance and comment, and to the Energy Commission's CPM for review and approval prior to the proposed start of construction. The development plan shall include all elements normally required for review and permitting of a similar project, including site plan, structural dimensions, design and exterior elevation(s), and proof of any required permits. The project owner shall pay applicable Planning Department fees, if any, for review of the plan.

Verification: At least 90 calendar days prior to the start of construction, including any grading or site remediation on the power plant project site or its associated easements, the project owner shall submit the proposed development plan to the Riverside County Planning Department to review for substantial conformance with county regulations and comment, and to the CPM for review and approval. The project owner shall also provide the CPM with copies of the transmittal letter to Riverside County and any associated correspondence.

At least 30 calendar days prior to the start of construction, the project owner shall provide copies of any comment letters received from the local jurisdiction, along with any changes to the proposed development plan, to the CPM for review and approval.

LAND-6: Prior to the start of commercial operation, upon final inspection, or with issuance of a certificate of occupancy, as required by the County of Riverside, the project owner shall pay the required development impact fee (DIF) for the project area to the County of Riverside, in accordance with Riverside County Ordinance 659 (as amended through 659.8), as it applies to large scale renewable energy projects. Alternately, the applicant may enter into a development or similar agreement with the County of Riverside that, in the county's opinion, meets the DIF requirements of this ordinance. Fees shall be based on the Desert Center-CV Center Commercial development rate of \$12,367 per acre, as established by the August 20, 2009 fee schedule. DIF acreage calculations shall include all power block facilities and all primary paths of travel, on the project site, leading to production plant area(s), including access roads, but not solar fields or solar field maintenance roads.

The project owner shall submit a copy of the receipt or comparable document demonstrating payment of the DIF or a copy of the approved development or similar agreement with the County of Riverside and a letter from the County stating that said agreement meets the county's DIF requirements to the CPM prior to the start of commercial operation.

Verification: At least 30 days prior to the start of commercial operation, the applicant shall submit to the CPM a copy of the receipt or comparable document demonstrating payment of the DIF or a copy of the approved development or similar agreement with the County of Riverside and a letter from the County stating that said agreement meets the county's DIF requirements.

LAND-7: The project owner shall ensure that all permanent telephone and electric transmission lines serving the project site, located within or immediately adjacent to the SR62 highway corridor, shall be installed underground for the entire length from the existing service connection to the on-site facilities. Temporary service lines installed in rights-of-way that preclude underground utility installation shall be exempt from this requirement.

Verification: The project owner shall provide the CPM of proof of underground utility installation, either as a copy of the final inspection or photos, prior to the start of commercial operations.

LAND-8: The project owner shall submit a Parking Plan for construction parking to the CPM for review and approval prior to the start of construction. The Construction Parking Plan shall be consistent with Riverside County parking requirements for space size and circulation, and shall meet the following requirements:

- One parking space for each daily-commute employee, based on an average of the number of workers expected to be on-site between months 8-20.
- One space for each company vehicle
- One commuter vanpool space for every 20 employees
- Three visitor spaces immediately adjacent to the main construction office (trailer), including one handicapped van-accessible space, with provisions to allow accessibility to and into the main construction office.
- A compacted all-weather surface of rock, decomposed granite, or similar material shall be installed on all temporary parking areas.
- Striping of the employee, visitor, and company vehicle parking spaces. If surface materials preclude use of striping, the project owner shall ensure vehicles are parked in a manner that maintains adequate circulation patterns and provides adequate square footage to accommodate the required number of parking spaces, consistent with Riverside County parking requirements.

The project owner shall also submit a Parking Plan to the CPM for review and approval for the operational phase of the project, prior to the start of commercial plant operation. The Operations Parking Plan shall be consistent with Riverside County parking requirements for space size and circulation, and shall meet the following requirements:

- One parking space for every two employees
- One space for each vehicle kept in conjunction with project operations (i.e., company vehicles).
- One commuter vanpool space
- Loading spaces for delivery of materials and equipment, consistent with county requirements
- At least one handicapped van-accessible parking space immediately adjacent to the site office, consistent with requirements of the Riverside County code and the Americans with Disabilities Act (ADA), with adequate ADA access to and into the operations office.

Verification: At least 90 days prior to the start of construction, the project owner shall submit a Construction Parking Plan to the CPM for review and approval. The plan shall include all specified elements identified in condition of certification **LAND-8** and be consistent with Riverside County parking requirements for space size and circulation.

At least 30 days prior to the start of construction, the project owner shall advise the

CPM of the completion of the construction elements of the Construction Parking Plan. Either a site visit or area photography shall be used to verify compliance, at the CPM's discretion.

At least 90 days prior to the start of commercial operation, the project owner shall submit an Operations Parking Plan to the CPM for review and approval. The plan shall include all specified elements and be consistent with Riverside County parking requirements for space size and circulation.

At least 30 days prior to the start of commercial operations, the project owner shall advise the CPM of the installation and completion of the Operations parking requirements. Either a site visit or area photography shall be used to verify compliance, at the CPM's discretion.

LAND-9^{*}: The project owner shall submit a Landscaping Plan for the entrance, northern and Historic Interpretive Area (see condition of certification **CULT-11**) of the plant site to the CPM for review and approval prior to the start of commercial operations. The Plan shall also incorporate avoidance and minimization measures consistent with the Revegetation, Weed Management, and Special-Status Plant Remedial Action Plans (see conditions of certification **BIO-10-12**); and the restoration and revegetation plan for the staging and buffer areas (see condition of certification **VIS-3**).

The project owner shall use proper design fundamentals to reduce the visual contrast to the characteristic landscape, including the following:

- Use native, drought-resistant landscape plantings.
- Retain existing rock formations, vegetation, and drainage, unless significantly altered by construction activities.
- Avoid soil types that generate strong color contrasts.
- Retain as much of the existing vegetation as possible.
- Use natural, self-weathering materials and chemical treatments on surfaces to reduce color contrast.
- Reduce the amount of disturbed area and blend the disturbed areas into the characteristic landscape. Place native or compatible soil, brush, rocks, and natural debris over disturbed areas and irrigation piping.

Verification: At least 90 days prior to the start of commercial operation, the project owner shall submit a Landscaping Plan for the entrance and Historic Interpretive Area of the plant site to the CPM for review and approval. The plan shall include a timeline for installation and continued maintenance and shall be consistent with all requirements listed in condition of certification **LAND-9**; the Revegetation, Weed Management, and Special-Status Plant Remedial Action Plans of conditions of certification **BIO-10-12**; and the **VIS-3** restoration and revegetation plan for the staging and buffer areas.

Implementation of the Landscaping Plan shall commence to later than 30 days following CPM approval. The project owner shall provide quarterly progress reports to the CPM, including photographic documentation, until landscaping installation is complete.

Landscaping shall be maintained and annual reports of landscaping condition and maintenance shall be provided to the CPM for the life of the project.

‡ This condition of certification would only apply to the proposed project (Alternative 1), Alternate 2, and Alternate 4.

LAND-10*: The project owner shall submit a Landscaping Plan for the entrance, boundary fencing along SR177, administrative office, and visitor parking area of the plant site to the CPM for review and approval prior to the start of commercial operations. The Plan shall also incorporate avoidance and minimization measures consistent with the Revegetation, Weed Management, and Special-Status Plant Remedial Action Plans (see conditions of certification **BIO-10-12**); and the restoration and revegetation plan for the staging and buffer areas (see condition of certification **VIS-3**).

The project owner shall use proper design fundamentals to reduce the visual contrast to the characteristic landscape, including the following:

- Use native, drought-resistant landscape plantings.
- Retain existing rock formations, vegetation, and drainage, unless significantly altered by construction activities.
- Avoid soil types that generate strong color contrasts.
- Retain as much of the existing vegetation as possible.
- Use natural, self-weathering materials and chemical treatments on surfaces to reduce color contrast.
- Reduce the amount of disturbed area and blend the disturbed areas into the characteristic landscape. Place native or compatible soil, brush, rocks, and natural debris over disturbed areas and irrigation piping.

Verification: At least 90 days prior to the start of commercial operation, the project owner shall submit a Landscaping Plan for the entrance, northern boundary fencing, and visitor viewing area of the plant site to the CPM for review and approval. The plan shall include a timeline for installation and continued maintenance and shall be consistent with all requirements listed in condition of certification **LAND-9**; the Revegetation, Weed Management, and Special-Status Plant Remedial Action Plans of conditions of certification **BIO-10-12**; and the **VIS-3** restoration and revegetation plan for the staging and buffer areas.

Implementation of the Landscaping Plan shall commence to later than 30 days following CPM approval. The project owner shall provide quarterly progress reports to the CPM, including photographic documentation, until landscaping installation is complete. Landscaping shall be maintained and annual reports of landscaping condition and maintenance shall be provided to the CPM for the life of the project.

* This condition of certification would only apply to the North of Desert Center Alternative site.

LAND-11*: The project owner shall cancel any existing County of Riverside Agricultural Preserve designations and/or Williamson Act contracts on any parcels

within the proposed project footprint prior to the start of construction or provide proof that such land use designations or contracts have previously been removed or do not exist. This applies to all affected parcels identified in **Land Use Appendix D** or in County of Riverside records as Chuckwalla Agricultural Preserves 1, 2, and 3.

Verification: At least 10 days prior to the start of construction, the project owner shall provide the CPM with proof of cancellation of any existing Agricultural Preserve designations and/or Williamson Act contracts on any parcels within the proposed project footprint or written verification from the County of Riverside and/or California Department of Conservation that there are no existing contracts on the project lands.

* This condition of certification would only apply to the North of Desert Center Alternative site.

LAND-12*: The project owner shall realign the existing Southern California Edison (SCE) transmission line and access road, consistent with the proposed SCE transmission line reroute, as depicted in **Alternatives Figure 2**. The new access road segment shall be constructed consistent with existing route conditions, along with any signage necessary for public safety, as determined by BLM and SCE. The project owner shall post signs at the intersections of the existing SCE transmission maintenance road with SR177 and Kaiser Road, advising the public that the road will be closed to public access during the transmission line realignment process. Following completion of the realignment and construction of a new transmission line maintenance road within the ROW for the new transmission line corridor, signs at the intersections of the road with SR177 and Kaiser Road shall be removed. The new route segment shall remain open to public use, consistent with existing access conditions. The project owner shall refrain from restricting public access along the transmission line maintenance access road, except as specifically directed by SCE.

Verification: At least 15 days prior to the closure of the existing SCE transmission line maintenance road, the project owner shall post signs at the intersections of the maintenance road with SR177 and Kaiser Rd., indicating the date that the road will be close to public use and estimated length of closure. Barriers shall be placed across the primary access points at the start of construction. The project owner shall submit photos of the signage to the CPM within 3 days of installation and photos of the barriers in the monthly compliance report.

Within 10 days from the completion of the transmission line realignment and maintenance road construction, the project owner shall remove all signs and any barriers preventing public access to the completed maintenance road. Should SCE direct the project owner to block or otherwise prevent public use of this green sticker access road, the project owner shall inform the CPM and BLM within 3 days of their receipt of SCE direction and provide copies of any related correspondence.

At least 30 days prior to the start of commercial operations, the project owner shall advise the CPM, SCE, and BLM of the completion of the SCE transmission line realignment, including required access. Either a site visit or area photography shall be used to verify compliance, at the CPM's discretion.

* This condition of certification would only apply to the North of Desert Center Alternative site.

CONCLUSIONS

Energy Commission staff has determined the following concerning the proposed project, based on analyses cited in other sections of this document and consideration of the uses, land use designations for the project site and surrounding locations, applicable land use laws, regulations, ordinances, and standards; and implementation of proposed conditions of certification:

1. Construction and operation of the proposed overhead transmission line route and substation require the BLM's approval of an Amendment to the California Desert Conservation Area Plan and issuance of a Right of Way grant. With the BLM's approval, the project would be consistent with the CDCA Plan.
2. Impacts to agriculture would be less than significant with implementation of **LAND-4**. The proposed project would not result in the conversion of Farmland or forest land to non-agricultural uses. It also would not conflict with any agricultural zoning or existing Williamson Act contracts.
3. There is no habitat conservation plan approved by the U.S. Fish and Wildlife Service, or a natural community conservation plan approved by the California Department of Fish and Game that would be impacted by the proposed project.
4. The proposed project would have no measurable impact on existing neighborhood and regional parks or other recreational facilities.
5. The proposed project would not directly and indirectly disrupt activities in an established federal, state, or local recreation area.
6. The project is not located in or adjacent to a designated federal wilderness area or wilderness study area, nor would it impact wilderness area resources or qualities.
7. The proposed project would result in both project-specific and cumulative significant, unavoidable visual and scenic impacts to the SR62 scenic corridor.
8. The proposed project does not divide the physical arrangement of an established community.
9. There are no airports or airstrips within five miles of the proposed project site and the project would have no impact on any airport operations.
10. The proposed project would be consistent with existing and permitted agricultural, residential, sensitive receptors, noise, and recreational land uses with the implementation of **LAND-2, 3, 4, and 5**. However, it would be inconsistent with existing and permitted scenic land uses due to significant, unavoidable impacts to visual/scenic resources (see **VISUAL RESOURCES** sections of this SA/DEIS).
11. Consistency with federal and state LORS would be ensured with implementation of **LAND 1-4, 5; and CULT-11**.
12. Implementation of **LAND-1 and 3-9; BIO-3, 11-13, and 21; CULT-11; SOIL&WATER-1; and TRANS 1-3 and 6-8** would ensure consistency with many of

the local LORS, to the extent feasible. However, the proposed project would still be inconsistent with a number of Riverside County General Plan policies (see **LAND USE APPENDIX A**).

13. Project-specific loss of grazing land use and access would not contribute significantly to any cumulative agricultural or rangeland impact.
14. The proposed project's overall contribution to local and regional cumulative recreational impacts would be less than significant.
15. Use of either public or private lands for renewable energy projects would have a less than significant impact on future land use and development in the project area, either individually or cumulatively.
16. The addition of the RSEP would further extend the visual intrusion along SR62, as well as impact the scenic vista to the south of SR62 and into the previously undisturbed Rice Valley. This would contribute substantially to the significant and unavoidable cumulative impacts to the scenic resources along an eligible state scenic highway.
17. Although glare shields and other conditions of certification have been recommended to reduce lighting impacts (see **VISUAL RESOURCES** section of this document), the proposed project would still contribute significantly and unavoidably to the cumulative impact to existing scenic and dark sky conditions throughout the Rice and Ward Valleys.
18. Significant, unavoidable project-specific visual/scenic resource impacts could potentially contribute to cumulatively significant, unavoidable temporary and/or permanent impacts, especially if most of the proposed solar and wind projects within the local or regional area are actually constructed. Simultaneous or overlapping timelines would further exacerbate the temporary construction-related impacts.
19. Staff has determined there would be a significant, immitigable impact to scenic values of both public and private lands surrounding the project site, including BLM-managed public lands designated for multiple use (see **Visual Resources**). There would also be a significant, but mitigable impact to historic resources potentially eligible for the National Register of Historic Places (Camp Rice and Rice Army Airfield), although portions of these resources are located on private lands (see **Cultural Resources and Native American Values**).
20. The potential CEQA impacts associated with "Land Use and Planning," "Agriculture and Forest Resources" and "Wilderness and Recreation" with the implementation of Alternatives 2 or 4 are anticipated to be similar to the proposed project. Alternative 3 would have similar impacts, but to a lesser degree in the areas of rangeland grazing and visual impact.

APPENDIX A
Project Compliance with Applicable Land Use LORS

Applicable LORS	Basis for Consistency	Consistent with LORS?				
		Alt. 1 Preferred Project	Alt. 2	Alt. 3	Alt. 4	Alt. 5 No Project
Federal						
<u>California Desert Conservation Area (CDCA) Plan, 1980 as Amended by NECO; 1999.</u>	Applicable only to public lands. Full implementation of recommended conditions of certification LAND-3 (impacts to rangeland grazing) and LAND-4 (BLM ROW for transmission line corridor and substation) would ensure consistency with the CDCA multiple use mandates; and conservation and protection requirements for agriculture, rangeland, and recreation.	Yes	Yes	Yes	Yes	N/A
<u>Code of Federal Regulations, Title 14 Aeronautics and Space, Part 77 Objects Affecting Navigable Airspace (14 CFR 77/FAR Part 77)</u>	FAA Form 7460 has been filed, as required for objects over 200 feet in height, and a "Determination of No Hazard to Navigation" has been received. Conditions of certification TRANS-2 and TRANS-7 would ensure the filing of additional required documentation, noticing to pilots, and installation of appropriate stack lighting.	Yes	Yes	Yes	Yes	N/A
State						
<u>Government Code §§65940 and 65944</u>	Consultation has occurred among applicant, military liaison, and staff. Conditions of certification TRANS-2, TRANS-7, TRANS-8 and TRANS-9 have been recommended to mitigate impacts to military operations in special use airspace.	Yes	Yes	Yes	Yes	N/A
<u>Public Resources Code §25000 (Warren-Alquist Act)</u>	Condition of certification CUL-11 would require the project owner to establish and maintain a public use/viewing area related to the historic Rice AAF/Camp Rice, present within and immediately adjacent to the proposed project site.	Yes	Yes	N/A	N/A	N/A

Applicable LORS	Basis for Consistency	Consistent with LORS?				
		Alt. 1 Preferred Project	Alt. 2	Alt. 3	Alt. 4	Alt. 5 No Project
Local						
Riverside County General Plan (2003), as amended through December 2008	Applicable only to non-federal lands. Lead agency actions would be consistent with applicable county policies and procedures throughout the project's licensing process.					
<i>GP: Chapter 3 – Land Use Element (LU3)</i>	<i>Policies in the Land Use Element are intended to concentrate future growth and reduce sprawl; protect the County's diverse environmental resources and open space systems; provide multi-modal transportation systems that are integrated into the community; make efficient use of infrastructure, services, and resources; and ensure "consistently high" development standards. See below for project consistency with individual policies and land use designations.</i>					
LU3 – Policies LU 4.1, 4.2, and 4.3	<p>Condition of certification LAND-5 would require compliance with all land use, building, and other applicable general plan policies and municipal code standards in the design and construction of the proposed project, to the extent feasible. Additional conditions of certification in various sections of this document address compliance for drainage, noise, and natural and cultural resource protection. Extensive landscaping, sidewalks, bicycle routes, public art, and other requirements designed to enhance an urban environment would be inappropriate in the project setting. However, the project would have significant and unavoidable adverse visual impacts.</p> <p>Proposed project design; LAND-5, along with conditions of certification in the Public Health, Worker Safety, and Soil & Water sections of this document, would ensure public health and safety.</p> <p>Construction of the proposed facility at this location would result in the elimination of the historic Rice AAF and a small portion of the adjacent Camp Rice. However implementation of conditions of certification CUL-1 and CUL-11 would reduce the impacts to a less than significant level.</p>	No	No	No	No	N/A
		Yes	Yes	Yes	Yes	N/A
		Yes	Yes	N/A	Yes	N/A

LU3 – Policy 5.1	The project has incorporated safety features for onsite fire/life/safety response. Condition of certification LAND-6 would also require the project owner to pay the Riverside County Development Impact Fees, which are designed to allow the County to construct/acquire the needed public facilities to support development and preserve open space, wildlife, and their habitats. Although the project may have an adverse impact on emergency response times, due to its distance from normal service areas, an agreement between the applicant and County of Riverside establishes compensation that would reduce any potential impacts to fire/safety to a less than significant impact (see Worker Safety and Fire Protection section).	TBD	TBD	TBD	TBD	N/A
LU3 – Policies 6.1/6.2	Condition of certification LAND-5 would require compliance with all land use, building, and other applicable general plan policies and municipal code standards in the design and construction of the proposed project, to the extent feasible. However, potential significant and unavoidable impacts to visual resources have been identified.	No	No	No	No	N/A
	Power generated by this facility would not be used locally; therefore, LU 6.2 does not apply to this project.	N/A	N/A	N/A	N/A	N/A
LU3 – Policy LU 8.2	The project would be consistent with applicable Multipurpose Open Space Element policies (see below). However, there is the potential for significant and unavoidable biological impacts at the Desert Center Alternative site.	Yes	Yes	Unk	Yes	N/A
LU3 – Policy LU 9.1	Condition of certification LAND-6 requires payment of the county's DIF prior to occupancy of the proposed facilities.	Yes	Yes	Yes	Yes	N/A
LU3 - Scenic Resource policies (LU 13.1 through 13.8; OS 21.1 and 22.1)	Project design and conditions of certification BIO-21, LAND-5, 9, and LAND-10 would address all structural, landscaping, and setback requirements. Condition of certification CULT-11 would provide a Historic Interpretive Area. The project has no solid walls that would block public views and development of riding, hiking, bicycle trails or other public recreational facilities, other than the historic viewing area, would be inappropriate in this remote area. However, the proposed power stack is visually incompatible with the surrounding scenic setting.	No	No	Yes (not a scenic hwy)	No	N/A

LU3 – Policy LU 14.7	Although the proposed solar power tower would encroach into navigable airspace, conditions of certification TRANS-2 and 7-9 would prevent significant adverse impacts to navigable airspace.	Yes	Yes	Yes	Yes	N/A
Open Space/Rural (OS-RUR) Land Use Designation policies (LU 20.1 – 20.6)	Public utilities, including both generating plants and transmission lines, are a permitted use on lands designated OS-RUR. Project design and conditions of certification in other sections of this document would ensure adequate utility, water, septic capacity, and circulation (LU 20.3). Condition of certification LAND-1 would require parcel merger (LU 20.5). However, the structures would not maintain the character of or blend with the undeveloped natural contours of the site (LU 20.1 and LU 20.2); avoid an unvaried, unnatural, or manufactured appearance or adverse impact to the open space and rural character of the surrounding area (LU 20.2; LU 20.4). There are also no county programs or incentives that would allow this project to maintain or enhance the open space/rural character of the surrounding area (LU.6).	No	No	No	No	N/A
LU3 - Agriculture (AG) Land Use Designation	Previous and existing agricultural uses on property; compatible zoning designation	N/A	N/A	Yes	N/A	N/A
LU3 - Eastern Riverside County Desert Areas (Non-Area Plan) – Policy 30.1	The project would not preclude use of existing or future use of the mineral resources or rural uses in the project vicinity. However, it would visually impact the open space character of the surrounding area and affect the quality of the wilderness experience in the adjacent wilderness areas.	No	No	N/A	No	N/A
<i>GP: Chapter 5 – Multipurpose Open Space Element</i>	<i>This element identifies the conditions and actions necessary to protect and preserve the County's natural resources, agriculture and open space areas; provide effective management of mineral resources; preserve and enhance cultural resources; and provide recreational opportunities for the citizens of Riverside County.</i>					
LU5 – Water Conservation (OS 2.2 and OS 2.2)	Project design and conditions of certification SOIL&WATER-1 and LAND-8 would address permeable surfaces and bermed rainwater detention basins (OS 2.2). Conditions of certification LAND-8 , LAND-9 , LAND-10 , and BIO 11-13 would require the use of native, drought-resistant landscaping and site remediation.	Yes	Yes	Yes	Yes	N/A
LU5 – Groundwater Recharge (OS 4.3, OS 4.4, and OS 4.5)	Conditions of certification SOIL&WATER-1 and LAND-8 would require permeable paving surfaces. Project design includes three on-site evaporation ponds and retention of natural drainage conditions, to the extent feasible.	Yes	Yes	Yes	Yes	N/A

LU5 – Mineral Resources (OS 14.2)	The project area is designated MRZ-4. As the existence of an ore body has not been proven, the probability of the presence of economically recoverable mineral reserves beneath the property is considered to be very low. Therefore, no mineral-related development restrictions apply.	Yes	Yes	Yes	Yes	N/A
<i>GP: Chapter 7 – Noise Element</i>	<i>The Noise Element of the General Plan is closely related to the Land Use Element because of the effects that noise has on sensitive land uses. Noise-producing land uses must be compatible with adjacent land uses in order for the Land Use Plan.</i>					
<u>Desert Center Area Plan</u>		N/A	N/A	Yes	N/A	N/A
<u>Riverside County Zoning Ordinance #348, amended through Ord. #348.4647 (August 20, 2009)</u>	This Ordinance includes the planning and land use regulations for the unincorporated areas of Riverside County and identifies the process to initiate, implement, amend, and enforce these regulations.					
Zoning - Article XV, §§15.1 and 15.2 Controlled Development Areas (W-2) Zoning District	Structures and the facilities necessary and incidental to the development and transmission of electrical power and gas, including power plants and transmission lines, are permitted uses within a W-2 zoning district and the site meets minimum lot size. However, certain project elements, including the steam generating building, solar receiver tower, and transmission line towers, would exceed the maximum height of 75 feet for buildings and 105 feet for other structures. The circumstances requiring the taller structures are related to the functionality and operational requirements of the proposed project. Therefore, findings required to justify approval of a variance cannot be made. However, Energy Commission approval of a project design plan, consistent with the requirements for approval of a Riverside County Public Use Permit, would provide consistency with the W-2 zoning district requirements.	Yes	Yes	Yes	Yes	N/A
Zoning - Article XV(b), §§15.200 and 15.201 Natural Assets (N-A) Zoning District	Although the BLM-managed public lands have been designated N-A by Riverside County, the county does not have jurisdiction over state or federal public lands. For Alt. 3, N-A zoning allows public utilities with Public Use Permit (Energy Commission siting process is equivalent to county approval process).	N/A	N/A	Yes	N/A	N/A

Zoning – Article XVIII, §18.12 Off-Street Vehicle Parking and Landscaping	Conditions of certification LAND-8 would ensure adequate temporary construction parking and consistency with county parking requirements. A Parking Plan must be completed and approved, and construction of the parking areas completed prior to the start of plant operations. Conditions of certification LAND-9 and LAND-10 would require implementation of an approved Landscape Plan, consistent with the requirements of this code and General Plan Policies 2.2 and 2.3..	Yes	Yes	Yes	Yes	N/A
Zoning – Article XVIII, §18.29 Public Use Permits	Condition of certification LAND-5 would require the project to follow Riverside County municipal and building code requirements, to the extent feasible. Proposed project design and conditions of certification would protect public health, safety, and welfare, and the usability of adjacent properties and Energy Commission licensing process would ensure consistency with this section of the zoning code.	Yes	Yes	Yes	Yes	N/A
Zoning - Article XVIII §18.33 Setback Adjustments and Temporary Use of Land	Conditions of certification LAND-8 , LAND-9 , LAND-10 , and BIO-10 would meet all requirements for access roads, parking, and site rehabilitation. Condition of certification TRANS-1 would protect existing roadway access and use. Condition of certification TRANS-3 would ensure repair of any construction damage to public roadways.	Yes	Yes	Yes	Yes	N/A

<u>Riverside County Code, Ordinance 457.102 (Building Codes & Fees)</u>	The project design would meet all required building and construction standards, to the extent feasible, and would meet or exceed all standard applicable building permit requirements. Condition of certification LAND-5 would require compliance with all applicable Riverside County zoning standards and building and municipal code requirements, except as specifically noted in this or other related sections of this document.	Yes	Yes	Yes	Yes	N/A
<u>Riverside County Code, Ordinance 460.151, §18.7 (Merging of Contiguous Parcels)</u>	Condition of certification LAND-1 would require the merger of privately-owned parcels into a single parcel under common ownership.	Yes	Yes	Yes	Yes	N/A
<u>Riverside County Code, Ordinance 509 (as amended through 509.2) – Agricultural Preserves</u>	There is some question whether there are any Agricultural Preserves within or adjacent to the Alt. 3 project site. Condition of certification LAND-11 would require proof that no Agricultural Preserve or Williamson Act contract exists for any land within the project site boundaries.	N/A	N/A	Yes	N/A	N/A
<u>Riverside County Ordinance 659, as amended through 659.8 (Development Impact Fees)</u>	Condition of certification LAND-6 requires payment of the County DIF prior to the start of operations or enter into a development agreement, or similar agreement, with the County of Riverside in lieu of the DIF. The applicant has agreed to this requirement.	Yes	Yes	Yes	Yes	N/A
<u>Riverside County Ordinance 859, as amended through 859.2 (Water Efficient Landscape Requirements)</u>	Conditions of certification LAND-9 and LAND-10 would require approval and implementation of a Landscaping Plan, consistent with this ordinance. However, given the project's remote location and lack of available municipal water sources, use of recycled water would not be required.	Yes	Yes	Yes	Yes	N/A
<u>Riverside County Airport Land Use Compatibility Plan (ALUCP); 2004</u>	Desert Center Airport is no longer a public airport. Conditions of certification TRANS-2 and TRANS-9 would ensure consistency with the ALUCP and existing airport use.	N/A	N/A	Yes	N/A	N/A

APPENDIX B(1)
Current and Foreseeable Solar Energy Projects – Public Lands
Local Area (Proposed Project / Alternative 1)

Type of Project	BLM Serial Number	Applicant/Holder	Acres	MW	Geographic Area	Status of Application*
Solar	CACA49002	Leopold Company, LLC	35,200 (8,000 actual)	100-250 at each of 5 plants (500-2,500)	Ward Valley, N of Hwy 62, about 30 miles west of the California/Arizona border; within the Iron Mtn Solar Study Area; approx. 5 mi NW of the proposed project site	Project Name: Ward Valley Actual project size: 5 plants @ 1,600 acres each
Solar	CACA49006	Boulevard Associates, LLC	12,160	250	Killbeck; 15 miles N of Hwy 62, about 70 miles W of the California/ Arizona border; approx. 25 mi NW of the proposed project site	
Solar	CACA49007	Boulevard Associates, LLC	52,480	Unknown	Ward Valley, along Hwy 62, about 35 miles west of the California/Arizona border; within the Iron Mtn Solar Study Area; approx. 20 mi W of the project site.	
Solar Parabolic Trough	CACA49008	Boulevard Associates, LLC	35,200	500	Cadiz Lake; N of Hwy 62, about 65 miles W of the California/Arizona border; approx. 25 mi W of the proposed project site	CSP Trough
Solar	CACA49702	Bull Frog Green Energy, LLC	23,004	500	Big Maria Vista, about 15 miles S of Hwy 62 and the proposed project site and 15 miles W of the California/Arizona border; Riverside East Solar Study Area	Revised POD rcvd 5/18/09

Type of Project	BLM Serial Number	Applicant/Holder	Acres	MW	Geographic Area	Status of Application*
Solar	CACA50504	Ausra CA III, LLC	27,000	Unknown	Ward Valley, along Hwy 62, about 30 miles west of the California/Nevada border; approx. 7 mi WNW of the proposed project site, in the Iron Mtn Solar Study Area	
Solar	CACA50505	Ausra CA III, LLC	14,000	Unknown	Iron Mtn, along Hwy 62, about 45 miles west of the California/Arizona border and 12 mi NW of the proposed project site; partially within the Iron Mtn Solar Study Area	
Solar	CACA50506	Ausra CA III, LLC	16,000	Unknown	Danby Lake, about 10 miles N of Hwy 62; about 20 mi NW of the proposed project site and 60 miles west of the California/Arizona border	
		TOTAL ACREAGE AND MEGAWATTS	187,844**	1,750-3,750**		

Source: BLM 2010(b)

* All applications are pending unless otherwise noted.

** Totals are estimates, based on ROW applications with BLM and available data. Data for projected MW production is particularly limited. Actual acreage used where available. This is only the acreage on BLM-managed public lands. Initial land totals in ROW applications are generally 2-10 times greater than final ROWs, to allow for alternative facilities placement. Private lands are not included in these totals.

APPENDIX B(2)
Current and Foreseeable Solar Energy Projects – Public Lands
Local Area (North of Desert Center Alternative / Alternative 3)*

Type of Project	BLM Serial Number	Applicant/Holder	Acres	MW	Geographic Area	Project Information*
Solar PV	CACA048649	Desert Sunlight Holdings LLC	19,516	500		Project Name: Desert Sunlight
Solar PV	CACA48808	Chuckwalla Solar 1 LLC	4,082	200	Immediately N of I-10 and about 60 miles W of the California/ Arizona border; Riverside East Solar Study Area	Project Name: Chuckwalla; Revised POD 9/15/09

* Local Area projects for North of Desert Center Alternative (Alt. 3)

APPENDIX C
Other Current and Foreseeable Projects – Local and Regional Area

Type of Project	Project Name	Applicant/ Agency	Project Description	Location	Status of Project
Public Utility Maintenance & Repair*	(3) Colorado River Aqueduct Rehabilitation Projects	Metropolitan Water District of Southern California	Repair delivery line expansion joints (applies to proposed project site/Alt. 1 only)	Iron Mountain Pumping Plant; approx. 18 miles NW of the proposed project site	Work in progress; scheduled for completion in February 2011
Public Utility Expansion	North Baja Pipeline Expansion Project	California State Lands Commission	Construction of: (a) up to 80 miles of buried natural gas pipeline and associated facilities; (b) 46 miles of lateral natural gas pipeline w/assoc. facilities from main gas pipeline to IID El Centro Generating Station; and (c) Blythe Energy Interconnect Lateral Facilities	El Centro to Blythe to Ehrenberg, AZ	Both Phase I & II completed, except for ongoing revegetation and monitoring
Public Utility Communication	Wiley Well Communication Tower (part of the Public Safety Enterprise Communication System)	Riverside County	Expansion of communication site to provide voice and data transmission capabilities to field personnel	East of Wileys Well Road, just S of I-10; approx. 8 mi W of Blythe	Final EIR published in August 2008
Commercial Recreation**	Chuckwalla Valley Raceway	Matt Johnson (Private Developer)	Commercial Racetrack (auto & motorcycle); three tracks, clubhouse, garages, private airstrip (previously Desert Center Airport).	On-site w/Desert Center Airport; directly across SR177 from N of DC/ Alt.3 site; approx. 7 mi N of I-10.	First track opened in April 2010; construction of remaining facilities to be phased through 2020.
Solid Waste Facility**	Eagle Mountain Landfill Project (Riverside County Specific Plan 305)	Mine Reclamation Corp. Kaiser Eagle Mountain Inc.	4,654-acre Class III non-hazardous municipal solid waste landfill; up to 20,000 tons of waste per day for 50 years Renovation and repopulation of the Eagle Mountain Townsite (Riverside County Specific Plan 306)	Approximately 10 mi N of I-10 and Desert Center; 8 mi NW of SR177 and the N of DC/Alt 3 site.	Approved by Riverside County BOS In litigation; project on hold

Type of Project	Project Name	Applicant/ Agency	Project Description	Location	Status of Project
Commercial Utility	Intake Shell	Shell Oil	Reconstruction of a Shell facility	Intake & Hobson Way – City of Blythe	Demolition occurred in 2008; reconstruction in process; completion expected in 2010
2 Commercial Projects	Agate Road Boat & RV Storage; Subway Restaurant & Motel	Various	Construction and operation of a boat & RV storage facility; public restaurant and transient lodging (motel)	City of Blythe	Approved by BOS
17 Residential Development Projects	<ul style="list-style-type: none"> • Vista Palo Verde • Van Weelden • Sonora South • Ranchette Estates • Irvine Assets • Agate Senior Housing • Chanslor Village • St. Joseph's Investments • Edgewater Lane • Chanslor Place (Phases II-IV) • Cottonwood Meadows • Mesa Bluffs Villas (Phase IV) • Palo Verde Oasis (Phase IV) 	Various	Construction of at least 1,000 single and multi-family residential units	City of Blythe	Approved Construction dates vary by phase and project
3 Residential Development Projects	<ul style="list-style-type: none"> • River Estates at Hidden Beaches • The Chanslor Place (Phase I) • Mesa Bluffs Villas (Phases I-III) 	Various	Construction of at least 262 single family residential units	City of Blythe	Under Construction

Type of Project	Project Name	Applicant/ Agency	Project Description	Location	Status of Project
Land Use Plan	Crescent Shores Specific Plan	Allegra Properties	746+ acre Master Plan Resort Community w/5,414 residential units, 539,534 sq ft of commercial/mixed use, and 18-hole golf course. Possible on-site wastewater treatment plant.	City of Blythe, along the Colorado River	Application pending; EIR in progress
Land Use Plan	Riverway Ranch Specific Plan			City of Blythe	Approved, but development on hold; property in foreclosure
Land Use Plan**	Specific Plan 306 – Eagle Mountain Townsite	Mine Reclamation Corp. Kaiser Eagle Mountain Inc.	Master-planned reconstruction and repopulation of 12 Townsite Planning Areas (428.5 acres) w/432 residential units, 54 acres of commercial and manufacturing, and 181 acres of recreation and open space.	Approx. 8 mi NNW of Desert Center	Approved by Riverside County BOS In litigation
Land Use Plan	Mojave Trails National Monument	BLM (Multiple public and private lands)	Establish a 941,000-acre, federally protected national monument area.	An area extending from I-15, east of Barstow, along SR 66 to just west of Needles, between the Mojave National Preserve and Twenty-Nine Palms Marine Corps Base	Senate Bill 2921 introduced in December 2009 In hearings w/Committee on Energy & Natural Resources as of May 20, 2010

Type of Project	Project Name	Applicant/ Agency	Project Description	Location	Status of Project
Land Use Plan**	BLM Renewable Energy Study Areas	BLM	Solar energy zone designation; 24 tracks of public lands that are being studied as suitable for solar development	NW of proposed project site in San Bernardino County; along the I-10 corridor between Desert Center and Blythe; and along SR 177, N of Desert Center	Preliminary DOE/BLM EIS in progress.
Water Storage	Chuckwalla Groundwater Storage Program (Aquifer Storage and Recovery)	Southern California Metropolitan Water District (SCMWD)	Feasibility investigation of the Upper Chuckwalla Groundwater Basin for a groundwater storage program in the two valleys located in the Mojave Desert, near the Julian Hinds and Eagle Mountain Pumping Plants. Spreading facilities and extraction wells would also be constructed during implementation of the full-scale project.	Beneath and immediately NW of the proposed North of Desert Center Alternative site.	In progress at the Julian Hinds location. Funded for Eagle Mountain.
Land Use Plan**	Paradise Valley Specific Plan	Glorious Land Company	Master Planned community; 4 villages of 5,262 acres, with 11,558 residential units; 1,435,263 sq ft of commercial space; 1,595,193 sq ft of business park; 1,263,844 sq ft of institutional space; resort (1,164,728 sq ft); recreation/golf course (658 acres); and 2020 acres of open space.	Site is situated on both sides of I-10, immediately S of Joshua Tree National Park; approx. 30 mi west of Desert Center	Environmental Review in progress (EIR)z

LAND USE

NOISE AND VIBRATION

Testimony of Geoff Lesh and Shahab Khoshmashrab

SUMMARY OF CONCLUSIONS

The U.S. Bureau of Land Management (BLM), Western Area Power Administration (Western) and Energy Commission staff (staff), hereafter jointly referred to as agencies, have reviewed the Rice Solar Energy Project (RSEP or proposed project) in accordance with the requirements of the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA).

With respect to CEQA, staff concludes that the RSEP can be built and operated in compliance with all applicable noise and vibration laws, ordinances, regulations, and standards and, if built in accordance with the mitigation measures/conditions of certification proposed below, would produce no significant adverse noise impacts on people within the affected area, either direct, indirect, or cumulative.

The mitigation measures/conditions of certification serve as recommendations by staff for the Energy Commission to consider in its decision to lessen impacts below a level of significance and to assure the project conforms to LORS in accordance with the CEQA requirements for the Energy Commission's analysis. The identification of relevant and reasonable mitigation measures also conforms to NEPA requirements for BLM's and Western's analysis that can be considered in its Record of Decision.

INTRODUCTION

The construction and operation of any power plant creates noise, or unwanted sound. The character and loudness of this noise, the times of day or night that it is produced, and the proximity of the facility to sensitive receptors combine to determine whether the facility would meet applicable noise control laws and ordinances and whether it would cause significant adverse environmental impacts under CEQA. In some cases, vibration may be produced as a result of power plant construction practices, such as blasting or pile driving. The groundborne energy of vibration has the potential to cause structural damage and annoyance.

The purpose of this analysis is to identify and examine the likely noise and vibration impacts from the construction and operation of the RSEP and to recommend procedures to ensure that the resulting noise and vibration impacts would be adequately mitigated to comply with applicable laws, ordinances, regulations, and standards (LORS) and to avoid creation of significant adverse noise or vibration impacts. For an explanation of technical terms and acronyms employed in this section, please refer to **Noise Appendix A** immediately following.

METHODOLOGY AND THRESHOLDS FOR DETERMINING ENVIRONMENTAL CONSEQUENCES

CALIFORNIA ENVIRONMENTAL QUALITY ACT

The California Environmental Quality Act (CEQA) requires that significant environmental impacts be identified and that such impacts be eliminated or mitigated to the extent feasible. Section XI of Appendix G of CEQA Guidelines (See Cal. Code Regs., tit. 14, Section 15063) sets forth some characteristics that may signify a potentially significant impact. Specifically, a significant effect from noise may exist if a project would result in:

1. exposure of persons to, or generation of, noise levels in excess of standards established in the local General Plan or noise ordinance or applicable standards of other agencies;
2. exposure of persons to or generation of excessive ground-borne vibration or ground-borne noise levels;
3. substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project; or
4. substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project.

The Energy Commission staff, in applying item 3 above to the analysis of this and other projects, has concluded that a potential for a significant noise impact exists where the noise of the project plus the background exceeds the background by 5 dBA or more at the nearest sensitive receptor. A change in level of at least 5 dB is required before any noticeable change in community response would be expected.

Staff considers it reasonable to assume that an increase in background noise levels up to 5 dBA in a residential setting is insignificant; an increase of more than 10 dBA is considered significant. An increase between 5 and 10 dBA should be considered adverse, but may be either significant or insignificant, depending on the particular circumstances of the case.

Factors to be considered in determining the significance of an adverse impact (as defined above) include:

1. the resulting combined noise level;¹
2. the duration and frequency of the noise;
3. the number of people affected;

¹ For example, a noise level of 40 dBA would be considered quiet in many locations. A noise limit of 40 dBA would be consistent with the recommendations of the California Model Community Noise Control Ordinance for rural environments and with industrial noise regulations adopted by European jurisdictions. If the project would create an increase in ambient noise no greater than 10 dBA at nearby sensitive receptors, and the resulting noise level would be 40 dBA or less, the project noise level would likely be insignificant.

4. the land use designation of the affected receptor sites; and
5. public concern or controversy expressed at workshops or hearings or in correspondence.

Noise impacts due to construction activities are usually considered to be insignificant if:

- the construction activity is temporary;
- use of heavy equipment and noisy activities are limited to daytime hours; and
- all industry-standard noise abatement measures are implemented for noise-producing equipment.

Staff uses the above method and threshold to protect the most sensitive populations, including the minority population.

National Environmental Policy Act

National Environmental Policy Act provides no specific standards or thresholds for noise and vibration, but instead, it defers to state/local requirements. This analysis ensures project compliance with those requirements.

Laws, Ordinances, Regulations, and Standards

**Noise Table 1
Laws, Ordinances, Regulations, and Standards**

Applicable Law	Description
Federal (OSHA): 29 U.S.C. § 651 et seq.	Protects workers from the effects of occupational noise exposure.
State (Cal/OSHA): Cal. Code Regs., tit. 8, §§ 5095–5099	Protects workers from the effects of occupational noise exposure.
Local Riverside County General Plan - Noise Element Riverside County Noise Ordinance	Establishes acceptable noise levels. Limits hours of noisy construction.

FEDERAL

Under the Occupational Safety and Health Act of 1970 (29 USC § 651 et seq.), the Department of Labor, Occupational Safety and Health Administration (OSHA) has adopted regulations designed to protect workers against the effects of occupational noise exposure (29 CFR § 1910.95). These regulations list permissible noise exposure levels as a function of the amount of time during which the worker is exposed (see **NOISE Appendix A, Table A4** immediately following this section). The regulations further specify a hearing conservation program that involves monitoring the noise to which workers are exposed, assuring that workers are made aware of overexposure to noise, and periodically testing the workers' hearing to detect any degradation. There are no federal laws governing off-site (community) noise.

The only guidance available for evaluation of power plant vibration is guidelines published by the Federal Transit Administration (FTA) for assessing the impacts of groundborne vibration associated with construction of rail projects. These guidelines have been applied by other jurisdictions to assess groundborne vibration of other types of projects. The FTA-recommended vibration standards are expressed in terms of the “vibration level,” which is calculated from the peak particle velocity measured from groundborne vibration. The FTA measure of the threshold of perception is 65 VdB,² which correlates to a peak particle velocity of about 0.002 inches per second (in/sec). The FTA measure of the threshold of architectural damage for conventional sensitive structures is 100 VdB, which correlates to a peak particle velocity of about 0.2 in/sec.

STATE

California Government Code section 65302(f) encourages each local governmental entity to perform noise studies and implement a noise element as part of its General Plan. In addition, the California Office of Planning and Research has published guidelines for preparing noise elements, which include recommendations for evaluating the compatibility of various land uses as a function of community noise exposure. The State land use compatibility guidelines are listed in **Noise: Table 2**.

Noise Table 2
Land Use Compatibility for Community Noise Environment

LAND USE CATEGORY	COMMUNITY NOISE EXPOSURE - Ldn or CNEL (db)							
	50	55	60	65	70	75	80	
Residential - Low Density Single Family, Duplex, Mobile Home								
Residential - Multi-Family

Auditorium, Concert Hall, Amphitheaters								
Sports Arena, Outdoor Spectator Sports								
Playgrounds, Neighborhood Parks								
Golf Courses, Riding Stables, Water Recreation, Cemeteries								
Office Buildings, Business Commercial and Professional								

² VdB is the common measure of vibration energy.

As noted above, CEQA identifies criteria that may be used to determine the significance of identified impacts. A significant impact is defined by CEQA as “a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project” (Cal. Code Reg., tit. 14 (hereinafter State CEQA Guidelines) Section 15382).

In comparison, NEPA states that “‘Significantly’ as used in NEPA requires considerations of both context and intensity...” (40 CFR 1508.27). Therefore, thresholds serve as a benchmark for determining if a project action will result in a significant adverse environmental impact when evaluated against the baseline. NEPA requires that an Environmental Impact Statement (EIS) is prepared when the proposed federal action (project) as a whole has the potential to “significantly affect the quality of the human environment.”

Criteria for determining significance in this section are based on Appendix G of the CEQA Guidelines (CCR 2006) and performance standards or thresholds identified by the Energy Commission staff. In addition, staff’s evaluation of the environmental effects of the proposed project on land uses (i.e., those listed below) includes an assessment of the context and intensity of the impacts, as defined in the NEPA implementing regulations 40 CFR Part 1508.27. NEPA provides no specific standards or thresholds for noise and vibration, but instead, it defers to state/local requirements. This analysis ensures project compliance with those requirements. No further NEPA required analysis is warranted.

Effects of the proposed project on noise and vibration (and in compliance with both CEQA and NEPA) have been determined using the thresholds listed below in **Direct Impacts and Mitigation**.

PROPOSED PROJECT

SETTING AND EXISTING CONDITIONS

The proposed RSEP would be constructed on a 2,560 acre project parcel site located in Riverside County near the junction of SR 62 and Blythe-Midland Road, and near the remains of the abandoned town of Rice, California. The nearest occupied residence is approximately 15 miles northeast at the rural crossroads community of Vidal Junction, California. The nearest town is Parker, Arizona (population 3,181) approximately 32 miles east. A residential settlement is located at the Metropolitan Water District of Southern California’s Iron Mountain Pumping Plant, approximately 17 miles west.

The site is primarily on previously disturbed private land (RSEP 2009a, AFC pg. ES-4). Existing use adjacent to the proposed project site consists of undeveloped open space uses to the east, south, and west. Along the northern boundary of the site, State Route 62, the California Aqueduct, and the Arizona-California Railroad run parallel to the site (RSEP 2009a, AFC § 5.72.1)

The ambient noise regime in the project vicinity consists of aircraft traffic, highway traffic, wind and wildlife.

Ambient Noise Monitoring

There are no noise-sensitive receptors³ within 15 miles of the project site (RSEP 2009a, AFC § 5.7.2.2). The Energy Commission's siting regulations only require ambient noise measurements when it is likely that operational or construction noise from a project will increase the ambient noise levels at nearby noise sensitive receptors. Given that there are no noise-sensitive receptors located within fifteen miles of the project site, and that the ambient noise regime in the surrounding area includes highway traffic and aircraft traffic, it is extremely unlikely that the ambient noise at the nearest noise sensitive receptor (more than fifteen miles away from the project site) would be low enough that attenuated project noise would cause a 5 dBA increase in the ambient noise level. Thus, staff agrees with the applicant that ambient noise monitoring is not required.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

DIRECT IMPACTS AND MITIGATION

Noise impacts associated with the project can be created by short-term construction activities and by normal long-term operation of the power plant.

Construction Impacts and Mitigation

Construction of RSEP is expected to occur over a period of approximately 30 months (RSEP 2009a, AFC pg. ES-6).

Compliance with LORS

Construction of an industrial facility such as a power plant is typically noisier than permissible under usual noise ordinances. In order to allow the construction of new facilities, construction noise during certain hours of the day is commonly exempt from enforcement by local ordinances.

The Applicant has predicted that there will be no noise impacts due to project construction on the nearest sensitive receptors (RSEP 2009a, AFC § 5.7.3.2, Table 5.7-4). Assuming an average construction noise of 89 dBA L_{eq} at 50 feet from the noise center (the upper range of noise levels for construction equipment), project construction noise would attenuate to 25 dBA at the nearest noise receptors, 15 miles away.

There are no LORS that limit construction noise levels for the project. The Riverside County Code restricts noisy construction work to daytime hours when a project is within one-quarter mile of a noise-sensitive receptor. Given the distance between the proposed project site and the nearest noise sensitive receptor, this limitation does not apply. No limit on construction hours needs to be enforced for the RSEP project to mitigate for noise impacts.

³ A noise-sensitive receptor, also referred to as a sensitive noise receptor, is a receptor at which there is a reasonable degree of sensitivity to noise (such as residences, schools, hospitals, elder care facilities, libraries, cemeteries, and places of worship).

CEQA Impacts

Power Plant Site

To evaluate construction noise impacts, staff compares the projected noise levels to the ambient levels. Since construction noise typically varies continually with time, it is most appropriately measured by, and compared to, the L_{eq} (energy average) metric.

Ambient noise levels were not measured because there are no noise-sensitive receptors within 15 miles of the project site. Aggregate construction noise would attenuate to less than 25 dBA at a distance of 15 miles from the project site, which is generally considered to be very quiet. Given the lack of receptors in the vicinity of the project site, staff considers the noise impacts due to construction activity to be insignificant.

In the event that actual construction noise should annoy nearby residents, staff proposes Conditions of Certification **NOISE-1** and **NOISE-2**, which would establish a public notification process to notify nearby residents of the project construction and operation, and a Noise Complaint Process that would require the applicant to resolve any complaints regarding project noise.

The nearest wilderness area, Turtle Mountains Wilderness Area, is located north of the project site. The nearest boundary of the wilderness area is approximately 2.3 miles from the proposed project's most-northern fenceline. The applicant predicts an average construction noise level of 89 dBA L_{eq} at 50 feet. This would result in roughly 41 dBA L_{eq} at the nearest edge of the wilderness area. A level of 41 dBA does not typically cause annoyance. Given that construction will be temporary and human activities in the preserve are for limited, short-term durations, staff believes the construction impact would be less than significant.

Linear Facilities

Linear facilities include new electrical transmission lines interconnecting to the transmission system to the southeast of the project site. The transmission lines would extend past the project site boundaries and would not pass close to noise-sensitive receptors (RSEP 2009a, AFC Figure 3.1-1).

Steam Blows

Typically, the loudest noise encountered during construction, inherent in building any project incorporating a steam turbine, is created by the steam blows. After erection and assembly of the feed water and steam systems, the piping and tubing that comprises the steam path has accumulated dirt, rust, scale and construction debris such as weld spatter, dropped welding rods and the like. If the plant were started up without thoroughly cleaning out these systems, all this debris would find its way into the steam turbine, quickly destroying the machine.

In order to prevent this, before the steam system is connected to the turbine, the steam line is temporarily routed to the atmosphere. High pressure steam is then raised in a heat recovery steam generator (HRSG) or a boiler and allowed to escape to the atmosphere through the steam piping. This flushing action, referred to as a steam blow, is quite effective at cleaning out the steam system. A series of short steam blows,

lasting two or three minutes each, is performed several times daily over a period of two or three weeks. At the end of this procedure, the steam line is connected to the steam turbine, which is then ready for operation.

These steam blows can produce noise as loud as 129 dBA at a distance of 50 feet. This would attenuate to approximately 65 dBA at the receptors fifteen miles from the project site, only based on attenuation due to distance. This predicted level does not account for additional attenuation due to air and ground absorption, and topography; attenuation due to these factors can be considerable over the long distance of fifteen miles.

Because any impact at the receptors located fifteen miles away would be temporary (two to three weeks), would not be a part of the project's normal operation, and would last only two to three minutes at a time, staff concludes that steam blows would likely not cause a significant impact. In the event that actual steam blow noise should annoy nearby residents, staff proposes Conditions of Certification **NOISE-1** and **NOISE-2**, which would establish a public notification process to notify nearby residents of the project construction and operation, and a Noise Complaint Process that would require the applicant to resolve any complaints regarding project noise.

Pile Driving

The applicant does not explicitly state that pile driving would be necessary for construction of RSEP. However, staff has analyzed the potential noise impacts of pile driving in case it is found necessary during the construction process. If pile driving is required for construction of the project, the noise from this operation could be expected to reach 100 dBA at a distance of 50 feet (RSEP 2009a, AFC Table 5.7.2). Pile driving noise would thus be projected to reach a level of 36 dBA at the sensitive receptors fifteen miles from the project site. Additionally, this activity would be temporary. Thus, impacts due to pile driving, if it should occur, would not be significant. In the event that actual pile driving noise should annoy nearby residents, staff proposes Conditions of Certification **NOISE-1** and **NOISE-2**, which would establish a public notification process to notify nearby residents of the project construction and operation, and a Noise Complaint Process that would require the applicant to resolve any complaints regarding project noise.

Vibration

The only construction operation likely to produce vibration that could be perceived off site would be pile driving, should it be employed. Vibration attenuates rapidly; it is likely that no vibration would be perceptible at any appreciable distance from the project site. Staff therefore believes there would be no significant impacts from construction vibration.

Worker Effects

The applicant has acknowledged the need to protect construction workers from noise hazards and has recognized those applicable LORS that would protect construction workers (RSEP 2009a, AFC § 5.7.3.2.3). To ensure that construction workers are, in fact, adequately protected, staff has proposed Condition of Certification **NOISE-3**, below.

Operation Impacts and Mitigation

The primary noise sources of RSEP include the steam turbine generator, air-cooled condenser, and various pumps and fans (RSEP 2009a, AFC § 5.7.3.3.3; Table 5.7-7). Staff compares the projected noise with applicable LORS. In addition, staff evaluates any increase in noise levels at sensitive receptors due to the project in order to identify any significant adverse impacts.

Common noise mitigating factors included in solar thermal generating facilities include:

- metal acoustical steam turbine enclosure; and
- 15-foot high solar mirror heliostats surrounding the power block.

Compliance with LORS

The applicant performed full noise modeling of project operation. The modeling results indicate that the maximum noise level attributable to RSEP operation at Vidal Junction, the nearest sensitive receptor (15 miles from the project site) is estimated to be 4 dBA. The facility noise level at Vidal Junction may be higher than 4 dBA under certain atmospheric conditions, but would still be low enough to be insignificant. The operational noise from RSEP would therefore be unnoticeable to residents of Vidal Junction. The maximum facility fenceline noise level is estimated to be 49 dBA and will occur at the south fenceline of the RSEP facility (RSEP 2009a, AFC § 5.7.3.3.3; Table 5.7-8).

The nearest boundary of the wilderness area is approximately 2.3 miles from the proposed project's most-northern fenceline. The applicant predicts an operational noise level of no more than 49 dBA L_{eq} at the project fenceline. This would result in roughly 28 dBA L_{eq} at the nearest edge of the wilderness area. A noise level of 28 dBA does not cause annoyance and is well within the acceptable LORS limit.

Project operating noise would thus comply with the standard set by the Riverside County General Plan (60 dBA CNEL at the nearest receptor).

CEQA Impacts

Power plant noise is unique. Essentially, a power plant operates as a steady, continuous, broadband noise source, unlike the intermittent sounds that comprise the majority of the noise environment. As such, power plant noise contributes to, and becomes part of, the background noise level, or the sound heard when most intermittent noises cease. Where power plant noise is audible, it will tend to define the background noise level. For this reason, staff compares the projected power plant noise to the existing ambient background (L_{90}) noise levels at the affected sensitive receptors. If this comparison identifies a significant adverse impact, then feasible mitigation must be incorporated in the project to reduce or remove the impact.

In many cases, a power plant will be intended to operate around the clock for much of the year. As a solar thermal generating facility, RSEP would operate only during the daytime hours, typically up to 16 hours per day during the summer (with fewer hours during the fall, winter, and spring), when sufficient solar insolation is available (RSEP 2009a pg. ES-10). Typically, daytime ambient noise consists of both intermittent and

constant noises. The noise that stands out during this time is best represented by the average noise level, or L_{eq} . Thus, staff normally compares a project's daytime noise levels to the daytime ambient L_{eq} levels at the project's noise-sensitive receptors.

As noted above, there are no sensitive receptors within 15 miles of the project site. The applicant has predicted that project operational noise levels would attenuate to less than an unnoticeable 4 dBA at a distance of fifteen miles from the project site, which would attenuate further at greater distances.

In the event that actual operational noise should annoy nearby residents, staff proposes Conditions of Certification **NOISE-1** and **NOISE-2**, which would establish a public notification process to notify nearby residents of the project construction and operation, and a Noise Complaint Process that would require the applicant to resolve any complaints regarding project noise.

Tonal Noises

One possible source of disturbance would be strong tonal noises. Tonal noises are individual sounds (such as pure tones) that, while not louder than permissible levels, stand out in sound quality. The applicant plans to avoid the creation of annoying tonal (pure-tone) noises by balancing the noise emissions of various power plant features during plant design. Given the lack of noise-sensitive receptors within the vicinity of the project, tonal noises would not be expected to cause annoyance.

Linear Facilities

The electrical interconnection line would not pass by any noise-sensitive receptors and would thus not be expected to have any effects. Additionally, noise effects from electrical interconnection lines typically do not extend beyond the right-of-way easement of the line and thus are generally inaudible to any nearby receptors.

Vibration

Vibration from an operating power plant could be transmitted by two chief means; through the ground (groundborne vibration) and through the air (airborne vibration).

The operating components of the RSEP project consist of a high-speed steam turbine generator and various pumps and fans. All of these pieces of equipment must be carefully balanced in order to operate; permanent vibration sensors are attached to the turbine and generator. Based on experience with numerous previous projects employing similar equipment, Energy Commission staff believes that groundborne vibration from RSEP would be undetectable at distances greater than a few hundred feet from the power block. Given that there are no receptors within fifteen miles of the project, vibration would not have an impact on any receptors.

Airborne vibration (low frequency noise) can rattle windows and objects on shelves and can rattle the walls of lightweight structures. None of the project equipment is likely to produce low frequency noise; this makes it highly unlikely that RSEP would cause perceptible airborne vibration effects.

Worker Effects

The applicant has acknowledged the need to protect plant operating and maintenance workers from noise hazards and has committed to comply with applicable LORS (RSEP 2009a, AFC § 5.7.6.1.2). To ensure that plant operation and maintenance workers are, in fact, adequately protected, Energy Commission staff has proposed Condition of Certification **NOISE-4**, below.

FACILITY CLOSURE

In the future, upon closure of RSEP, all operational noise from the project would cease, and no further adverse noise impacts from operation of RSEP would be possible. The remaining potential temporary noise source is the dismantling of the structures and equipment and any site restoration work that may be performed. Since the noise would be similar to that caused by the original construction, it would likely cause no noise impacts given the remote location of the project. Any noise LORS that are in existence at that time would apply. Applicable conditions of certification included in the Energy Commission decision would also apply unless modified by the Energy Commission.

CEQA LEVEL OF SIGNIFICANCE

For the purposes of CEQA compliance, the significance of construction and operating noise impacts of the proposed project at the nearest sensitive receptors has been determined.

Construction Impacts

As discussed in detail in section C.10.4.2 above (under the subsection entitled “Construction Impacts and Mitigation”), there are no noise-sensitive receptors within fifteen miles of the project that would be impacted by construction noise; the impacts due to construction noise are considered insignificant.

Operation Impacts

As discussed in detail in section C.10.4.2 above (under the subsection entitled “Operation Impacts and Mitigation”), power plant noise levels are predicted to be less than 4 dBA L_{eq} at a distance of fifteen miles from the project site during daytime operation, which would not result in an increase over ambient noise. No change in ambient noise at any sensitive receptor at night would result from plant operation. Thus, operation noise impacts of the project would be insignificant.

REDUCED ACREAGE ALTERNATIVE

The Reduced Acreage Alternative would be 7.2% smaller than the proposed project. It would be located in the same 2,560-acre square-shaped parcel within the larger 3,324-acre ownership property as the proposed project. Although the overall heliostat field distance from the central tower would be reduced, the number of heliostats would remain the same. The heliostat field (plus the evaporation pond and administration areas) would occupy about 1,270 acres instead of the 1,370 acres required for the proposed project. The receiver location would remain the same, with the edges of the field contracting towards the center. The heliostat footprint of the Reduced Acreage Alternative is shown in **Alternatives Figure 2**. The site layout, 653-foot total height of

the solar tower and receiver, and transmission interconnection to Western's Parker-Blythe transmission line would be the same as the proposed project. The generation output would be reduced by approximately 2 MW.

Setting and Existing Conditions

Based on the alternative description above, the setting for the Reduced Acreage Alternative would be the same as for the proposed project. As the reduced project footprint would not result in a change to the overall site location as analyzed for the RSEP, this alternative would have the same noise environment and noise-sensitive receptors as those described above associated with the proposed RSEP.

Assessment of Impacts and Discussion of Mitigation

Staff's methods of analysis and conclusions as related to **Noise and Vibration** would remain unchanged. This alternative would be built and would operate in a manner consistent with industry norms for noise and vibration emissions, and there would be no change in potential environmental impacts.

NORTH OF DESERT CENTER ALTERNATIVE

The North of Desert Center Alternative would be a 150 MW solar thermal facility located on approximately 2,643 acres of land. It is located along Desert Center Rice Road (State Route 177) east of Kaiser Road, north of Oasis Road, and approximately 1.6 miles north of I-10. The North of Desert Center Alternative is primarily private land with smaller sections of BLM land in the eastern portion of the site. It is largely fallow agricultural land. An existing SCE 161-kV transmission line traverses the alternative site. The boundaries of the North of Desert Center Alternative are illustrated in **Alternatives Figure 3**.

The North of Desert Center Alternative would require an approximately 4.6-mile transmission interconnection. The transmission interconnection would exit the site and proceed southeast for approximately 2.5 miles. The transmission line would then turn directly south for approximately 2.1 miles and enter the proposed Red Bluff Substation from the north.

The North of Desert Center Alternative would allow the applicant to contribute clean, renewable energy to help meet the State's energy goals, while minimizing impacts to the desert environment.

Setting and Existing Conditions

The plant configuration at the North of Desert Center Alternative site would be similar to the proposed project, resulting in similar noise and vibration impacts.

Assessment of Impacts and Discussion of Mitigation

Staff's methods of analysis and conclusions as related to **Noise and Vibration** would remain unchanged.

The nearest residential receptor would be approximately 1/4-mile from the property line of this alternative site. Assuming an average construction noise of 89 dBA L_{eq} at 50 feet from the noise center (the upper range of noise levels for construction equipment), construction noise would attenuate to roughly 30-50 dBA (depending on where at the site the activities occur). A construction noise level of 30 dBA is extremely low and would not cause annoyance. A construction noise of 50 dBA, in a rural environment similar to this site, may cause annoyance depending on the duration of construction activities. However, due to the temporary nature of construction, especially at a location close enough to cause this level of noise, and because construction would likely be limited to occur during the daytime hours, the impact would not likely be significant.

The operational noise levels would likely be similar to the original project because the same technology would be employed. Assuming an operational noise level of 60 dBA at 400 feet (RSEP 2009a, AFC Figure 5.7-1), the project noise level at the nearest residential receptor would be roughly 25 dBA L_{eq} . This level of noise is not considered loud, even in a quiet rural environment, and is well below the county's limit of 60 dBA CNEL, or 53 dBA L_{eq} . This alternative would likely be built and operated in a manner consistent with industry norms for noise and vibration.

SR 62/RICE VALLEY ROAD GENERATION TIE LINE ALTERNATIVE

The SR 62/Rice Valley Road Generation Tie Line Alternative would interconnect to Western's 161-kV/230-kV Parker-Blythe transmission line at the same location as the proposed project transmission line. This alternative generation tie line would exit the proposed solar facility at the northeast corner and follow State Route 62 approximately 4.5 miles east to the junction of Rice Valley Road. It would then trend south to follow the unpaved Rice Valley Road for 4.0 miles to its juncture with the applicant's proposed new generation tie line alignment and continue southeast for 5.4 miles along the proposed alignment to Western's Parker-Blythe transmission line. The SR 62/Rice Valley Road Generation Tie Line Alternative route is illustrated in **Alternatives Figure 4**.

The SR 62/Rice Valley Road Transmission Line Alternative is evaluated in this SA/DEIS because it would:

1. Avoid the permanent loss of 13.4 acres of foraging and cover habitat for plant and animal species, including the state and federally listed threatened desert tortoise.
2. Avoid the creation of a new 4.6 mile vehicle access route between the proposed solar facility and the proposed junction of the new transmission line access road with the existing Rice Valley road. The proposed new vehicle access route would necessitate additional enforcement and maintenance to prevent unauthorized off-road vehicle access, propagation of new, unauthorized vehicle routes, and consequent habitat damage, soil erosion, and vehicle disturbance.

Setting and Existing Conditions

The noise and vibration impacts of this transmission line alternative would be similar to the proposed project, resulting in similar noise and vibration impacts.

Assessment of Impacts and Discussion of Mitigation

Staff's methods of analysis and conclusions as related to **Noise and Vibration** would remain unchanged. This alternative would be built and would operate in a manner consistent with industry norms for noise and vibration, and would have similar impacts as the proposed project.

NO PROJECT/NO ACTION ALTERNATIVE

No Project and No Action on RSEP transmission line application and interconnection request. No CDCA land use plan amendment.

Under this alternative, the proposed Rice Solar would not be approved by the Energy Commission; BLM would not approve the transmission line application and would not amend the CDCA Plan; and Western would not approve the interconnection request. As a result, no solar energy project would be constructed on the project site, BLM would continue to manage the land encompassing the transmission line consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended, and Western would continue to operate the Parker Blythe Transmission Line under current conditions.

Because there would be no amendment to the CDCA Plan and no solar project approved for the site under this alternative, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site. As a result, no impacts would result from this alternative related to **Noise and Vibration**. In the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects might or might not have impacts in other locations.

CUMULATIVE IMPACT ANALYSIS

Geographic Extent

The geographic scope for considering cumulative noise impacts on sensitive receptors for this project consists of the region immediately surrounding any identified receptors. There are no noise-sensitive receptors within fifteen miles of the project site, the fact of which inherently precludes the possibility for cumulative noise impacts from the project.

COMPLIANCE WITH LORS

RSEP construction and operations would conform to all applicable noise and vibration LORS.

NOTEWORTHY PUBLIC BENEFITS

The proposed project would not result in any noteworthy public benefits with respect to noise and vibration.

CONCLUSIONS

Staff concludes that RSEP, if built and operated in conformance with the proposed conditions of certification below, would comply with all applicable noise and vibration LORS and would produce no significant adverse noise impacts on people within the project area, directly, indirectly, or cumulatively with respect to CEQA.

PROPOSED CONDITIONS OF CERTIFICATION/MITIGATION MEASURES

The following mitigation measures/conditions of certification serve as recommendations by staff for the Energy Commission to consider in its decision to lessen impacts below a level of significance and to assure the project conforms to LORS in accordance with CEQA requirements for the Energy Commission's analysis. The identification of relevant and reasonable mitigation measures also conforms to NEPA requirements for BLM's and Western's analysis that can be considered in its Record of Decision.

NOISE-1 At least 15 days prior to the start of ground disturbance, the project owner shall notify all residences and businesses, if any, within three miles of the project site boundaries and one-half mile of linears, by mail or other effective means, of the commencement of project construction. At the same time, the project owner shall establish a telephone number for use by the public to report any undesirable noise conditions associated with the construction and operation of the project and include that telephone number in the above notice. If the telephone is not staffed 24 hours per day, the project owner shall include an automatic answering feature, with date and time stamp recording, to answer calls when the phone is unattended. This telephone number shall be posted at the project site during construction in a manner visible to passersby. This telephone number shall be maintained until the project has been operational for at least one year.

Verification: Prior to ground disturbance, the project owner shall transmit to the Compliance Project Manager (CPM) a statement, signed by the project owner's project manager, stating that the above notification has been performed and describing the method of that notification, verifying that the telephone number has been established and posted at the site, and giving that telephone number.

NOISE COMPLAINT PROCESS

NOISE-2 Throughout the construction and operation of RSEP, the project owner shall document, investigate, evaluate, and attempt to resolve all project-related noise complaints. The project owner or authorized agent shall:

- Use the Noise Complaint Resolution Form (below), or a functionally equivalent procedure acceptable to the CPM, to document and respond to each noise complaint;
- Attempt to contact the person(s) making the noise complaint within 24 hours;

- Conduct an investigation to determine the source of noise related to the complaint;
- Take all feasible measures to reduce the noise at its source if the noise is project related; and
- Submit a report documenting the complaint and the actions taken. The report shall include: a complaint summary, including final results of noise reduction efforts, and if obtainable, a signed statement by the complainant stating that the noise problem is resolved to the complainant's satisfaction.

Verification: Within five days of receiving a noise complaint, the project owner shall file a copy of the Noise Complaint Resolution Form with the CPM, documenting the resolution of the complaint. If mitigation is required to resolve a complaint, and the complaint is not resolved within a three-day period, the project owner shall submit an updated Noise Complaint Resolution Form when the mitigation is implemented.

NOISE-3 The project owner shall submit to the CPM for review and approval a noise control program and a statement, signed by the project owner's project manager, verifying that the noise control program will be implemented throughout construction of the project. The noise control program shall be used to reduce employee exposure to high noise levels during construction to comply with applicable OSHA and Cal/OSHA standards.

Verification: At least 30 days prior to the start of ground disturbance, the project owner shall submit to the CPM the noise control program and the project owner's project manager's signed statement. The project owner shall make the program available to Cal/OSHA upon request.

NOISE-4 Following the project's first achieving a sustained output of 90% or greater of rated capacity, the project owner shall conduct an occupational noise survey to identify the noise hazardous areas in the facility.

The survey shall be conducted by a qualified person in accordance with the provisions of Title 8, California Code of Regulations sections 5095–5099 and Title 29, Code of Federal Regulations section 1910.95. The survey results shall be used to determine the magnitude of employee noise exposure.

The project owner shall prepare a report of the survey results and, if necessary, identify proposed mitigation measures that will be employed to comply with the applicable California and federal regulations.

Verification: Within 30 days after completing the survey, the project owner shall submit the noise survey report to the CPM. The project owner shall make the report available to OSHA and Cal/OSHA upon request.

NOISE APPENDIX A FUNDAMENTAL CONCEPTS OF COMMUNITY NOISE

To describe noise environments and to assess impacts on noise sensitive area, a frequency weighting measure, which simulates human perception, is customarily used. It has been found that “A-weighting” of sound intensities best reflects the human ear’s reduced sensitivity to low frequencies and correlates well with human perceptions of the annoying aspects of noise. The A-weighted decibel scale (dBA) is cited in most noise criteria. Decibels are logarithmic units that conveniently compare the wide range of sound intensities to which the human ear is sensitive. **NOISE Table A1** provides a description of technical terms related to noise.

Noise environments and consequences of human activities are usually well represented by an equivalent A-weighted sound level over a given time period (L_{eq}), or by average day and night A-weighted sound levels with a nighttime weighting of 10 dBA (L_{dn}). Noise levels are generally considered low when ambient levels are below 45 dBA, moderate in the 45 to 60 dBA range, and high above 60 dBA. Outdoor day-night sound levels vary over 50 dBA depending on the specific type of land use. Typical L_{dn} values might be 35 dBA for a wilderness area, 50 dBA for a small town or wooded residential area, 65 to 75 dBA for a major metropolis downtown (e.g., San Francisco), and 80 to 85 dBA near a freeway or airport. Although people often accept the higher levels associated with very noisy urban residential and residential-commercial zones, those higher levels nevertheless are considered to be levels of noise adverse to public health.

Various environments can be characterized by noise levels that are generally considered acceptable or unacceptable. Lower levels are expected in rural or suburban areas than would be expected for commercial or industrial zones. Nighttime ambient levels in urban environments are about seven decibels lower than the corresponding average daytime levels. The day-to-night difference in rural areas away from roads and other human activity can be considerably less. Areas with full-time human occupation that are subject to nighttime noise, which does not decrease relative to daytime levels, are often considered objectionable. Noise levels above 45 dBA at night can result in the onset of sleep interference effects. At 70 dBA, sleep interference effects become considerable (U.S. Environmental Protection Agency, Effects of Noise on People, December 31, 1971).

To help the reader understand the concept of noise in decibels (dBA), **NOISE Table A2** illustrates common noises and their associated sound levels, in dBA.

NOISE Table A1
Definition of Some Technical Terms Related to Noise

Terms	Definitions
Decibel, dB	A unit describing the amplitude of sound, equal to 20 times the logarithm to the base 10 of the ratio of the pressure of the sound measured to the reference pressure, which is 20 micropascals (20 micronewtons per square meter).
Frequency, Hz	The number of complete pressure fluctuations per second above and below atmospheric pressure.
A-Weighted Sound Level, dBA	The sound pressure level in decibels as measured on a sound level meter using the A-weighting filter network. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the frequency response of the human ear and correlates well with subjective reactions to noise. All sound levels in this testimony are A-weighted.
L ₁₀ , L ₅₀ , & L ₉₀	The A-weighted noise levels that are exceeded 10%, 50%, and 90% of the time, respectively, during the measurement period. L ₉₀ is generally taken as the background noise level.
Equivalent Noise Level, L _{eq}	The energy average A-weighted noise level during the noise level measurement period.
Community Noise Equivalent Level, CNEL	The average A-weighted noise level during a 24-hour day, obtained after addition of 4.8 decibels to levels in the evening from 7 p.m. to 10 p.m., and after addition of 10 decibels to sound levels in the night between 10 p.m. and 7 a.m.
Day-Night Level, L _{dn} or DNL	The Average A-weighted noise level during a 24-hour day, obtained after addition of 10 decibels to levels measured in the night between 10 p.m. and 7 a.m.
Ambient Noise Level	The composite of noise from all sources, near and far. The normal or existing level of environmental noise at a given location.
Intrusive Noise	That noise that intrudes over and above the existing ambient noise at a given location. The relative intrusiveness of a sound depends upon its amplitude, duration, frequency, and time of occurrence and tonal or informational content as well as the prevailing ambient noise level.
Pure Tone	A pure tone is defined by the Model Community Noise Control Ordinance as existing if the one-third octave band sound pressure level in the band with the tone exceeds the arithmetic average of the two contiguous bands by 5 decibels (dB) for center frequencies of 500 Hz and above, or by 8 dB for center frequencies between 160 Hz and 400 Hz, or by 15 dB for center frequencies less than or equal to 125 Hz.

Subjective Response to Noise

The adverse effects of noise on people can be classified into three general categories:

- Subjective effects of annoyance, nuisance, dissatisfaction.
- Interference with activities such as speech, sleep, and learning.
- Physiological effects such as anxiety or hearing loss.

The sound levels associated with environmental noise, in almost every case, produce effects only in the first two categories. Workers in industrial plants can experience noise effects in the last category. There is no completely satisfactory way to measure the subjective effects of noise or of the corresponding reactions of annoyance and dissatisfaction, primarily because of the wide variation in individual tolerance of noise.

One way to determine a person's subjective reaction to a new noise is to compare the level of the existing (background) noise, to which one has become accustomed, with the level of the new noise. In general, the more the level or the tonal variations of a new noise exceed the previously existing ambient noise level or tonal quality, the less acceptable the new noise will be, as judged by the exposed individual.

With regard to increases in A-weighted noise levels, knowledge of the following relationships can be helpful in understanding the significance of human exposure to noise.

1. Except under special conditions, a change in sound level of 1 dB cannot be perceived.
2. Outside of the laboratory, a 3-dB change is considered a barely noticeable difference.
3. A change in level of at least 5 dB is required before any noticeable change in community response would be expected.
4. A 10-dB change is subjectively heard as an approximate doubling in loudness and almost always causes an adverse community response (Kryter, Karl D., The Effects of Noise on Man, 1970).

Combination of Sound Levels

People perceive both the level and frequency of sound in a non-linear way. A doubling of sound energy (for instance, from two identical automobiles passing simultaneously) creates a 3-dB increase (i.e., the resultant sound level is the sound level from a single passing automobile plus 3 dB). **NOISE Table A3** indicates the rules for decibel addition used in community noise prediction.

NOISE Table A3 Addition of Decibel Values	
When two decibel values differ by:	Add the following amount to the larger value
0 to 1 dB	3 dB
2 to 3 dB	2 dB
4 to 9 dB	1 dB
10 dB or more	0
Figures in this table are accurate to ± 1 dB.	

Source: Architectural Acoustics, M. David Egan, 1988.

Sound and Distance

Doubling the distance from a noise source reduces the sound pressure level by 6 dB.

Increasing the distance from a noise source 10 times reduces the sound pressure level by 20 dB.

Worker Protection

OSHA noise regulations are designed to protect workers against the effects of noise exposure and list permissible noise level exposure as a function of the amount of time to which the worker is exposed, as shown in **NOISE Table A4**.

NOISE Table A4
OSHA Worker Noise Exposure Standards

Duration of Noise (Hrs/day)	A-Weighted Noise Level (dBA)
8.0	90
6.0	92
4.0	95

PUBLIC HEALTH AND SAFETY

Testimony of Obed Odoemelam, Ph.D.

SUMMARY OF CONCLUSIONS

Bureau of Land Management (BLM), Western Area Power Administration (Western), and Energy Commission staff (staff) (hereafter jointly referred to as agencies) have analyzed the potential public health and safety risks from the construction and operation of the proposed Rice Solar Energy Project (RSEP). With respect to the California Environmental Quality Act (CEQA), staff concludes that the proposed project would not cause any significant adverse cancer or short- or long-term noncancer health effects from the project's toxic air contaminants (TACs). The agencies' analysis of potential health impacts uses a conservative health-protective methodology that accounts for impacts on the most sensitive individuals in a given population, including newborns and infants. According to the results of the agencies' health risk assessment, these TACs of concern would be emitted from the proposed facility at levels that would not contribute significantly to morbidity or mortality of residents in the area.

INTRODUCTION

The agencies have evaluated potential public health and safety risks associated with the proposed RSEP's construction, operating and decommissioning activities. This Staff Assessment/Draft Environmental Impact Statement (SA-DEIS) meets the Energy Commission's responsibility to comply with the California Environmental Quality Act (CEQA) and BLM's and Western's responsibility to comply with the National Environmental Policy Act (NEPA). The purpose of this staff Assessment is to determine if emissions of toxic air contaminants (TACs) from the proposed Rice Solar Energy Project (RSEP) would have the potential to cause significant adverse public health and safety impacts or to violate standards for public health protection. If potentially significant health and safety impacts are identified, staff would evaluate mitigation measures to maintain such impacts below levels of insignificance.

In addition to the analysis in this Public Health and Safety Section that focuses on potential health effects of the toxic air contaminants, other potentially significant impacts of RSEP's construction and operation are considered elsewhere in this document as listed and briefly described below:

- Air Quality - evaluates the expected air quality impacts from the emissions of criteria air pollutants from both the construction and operation of the proposed facility. Criteria air pollutants are defined as air contaminants for which the state and/or federal governments have established ambient air quality standards to protect public health;
- Hazardous Materials Management - evaluates the potential impacts on public and worker health from accidental releases of hazardous materials;
- Socioeconomics and Environmental Justice - evaluates project-induced changes on community services including law enforcement and hospitals;

- Soil and Water Resources – evaluates the potential for the Rice Solar Energy Project to cause contamination of soil and water resources, to exacerbate flooding, and to cause adverse effects to water supply in consideration of other existing users and projected needs;
- Traffic and Transportation – evaluates potential effects on roads used during project construction and operation, effects on traffic, and the potential for project-related glare to cause a health or safety hazard;
- Transmission Line Safety and Nuisance – evaluates potential effects associated with proposed transmission lines accounting for both the physical presence of the lines and the physical interactions of their electric and magnetic fields. The potential effects include aviation safety, interference with radio-frequency communication, audible noise, fire hazards, hazardous shocks, nuisance shocks, and electric and magnetic field (EMF) exposure.
- Worker Safety and Fire Protection - assess the worker safety and fire protection measures proposed by the applicant including determining whether the project would have any adverse impacts on fire protection and emergency medical services that are also relied upon by the public; and
- Waste Management - evaluates issues associated with wastes generated from the proposed project construction and operation including ensuring that wastes would be managed in an environmentally safe manner.

METHODOLOGY AND THRESHOLDS FOR DETERMINING ENVIRONMENTAL CONSEQUENCES

This analysis of proposed project's effects is intended to assess with respect to CEQA and NEPA the potential for significant environmental impacts and identify the measures to maintain such impacts below the applicable health and safety criteria. Under NEPA, impacts are evaluated considering context, duration and intensity. A significant impact is defined under CEQA as "a substantial, or potentially substantial, adverse change in any of the physical conditions within the area potentially affected by the project" (State CEQA Guidelines Section 15382). Thus under CEQA, thresholds serve as benchmarks for determining if a proposed action would result in a significant adverse environmental impact when evaluated against the baseline. Thresholds for determining significance in this section are based on Appendix G of the CEQA Guidelines (CCR 2006) and performance standards or thresholds identified by the agencies.

This **Public Health** section of the agencies' assessment focuses on the toxic emissions to which the public could be exposed during project construction and routine operation. Following the release of these toxic contaminants into the air or water, people may come into contact with them through inhalation, dermal contact, or ingestion via contaminated food or water. The air pollutants for which no ambient air quality standards have been established are called noncriteria pollutants. Unlike criteria pollutants such as ozone, carbon monoxide, sulfur dioxide, or nitrogen dioxide, noncriteria pollutants have no ambient (outdoor) air quality standards that specify levels considered safe for everyone.

Since noncriteria pollutants do not have specific air quality standards, a health risk assessment is normally used to determine if individuals might be exposed to those types of pollutants at unhealthy levels. The risk assessment process consists of the following steps:

- Identification of the types and amounts of hazardous substances that the Rice Solar Energy Project could emit to the environment;
- Estimation of the worst-case concentrations of project emissions in the environment using dispersion modeling;
- Estimation of the amounts of pollutants that people could be exposed to through inhalation, ingestion, and dermal contact; and
- Characterization of potential health risks by comparing worst-case exposures to safe standards based on known health effects.
- The agencies rely on the expertise of the California Environmental Protection Agency (Cal/EPA) Office of Environmental Health Hazard Assessment (OEHHA) to identify contaminants that are known to the state to cause cancer or other noncancer toxicological endpoints and to calculate the toxicity and cancer potency factors of these contaminants. The agencies also rely upon the expertise of the California Air Resources Board and the local air pollution control districts to conduct ambient air monitoring of toxic air contaminants and on the state Department of Public Health to conduct epidemiological investigations of the impacts of pollutants on communities. It is not within the purview or the expertise of the agencies to duplicate the expertise and statutory responsibilities of these agencies.

In the initial assessment stage, a screening-level risk assessment is performed using simplified assumptions that are intentionally biased toward protection of public health. That is, an analysis is designed that would likely overestimate public health impacts from exposure to project emissions. In reality, it is likely that the actual risks from the power plant in question would be much lower than the risks as estimated using the screening-level assessment. The numerical risks from this assessment are obtained from a process that assumes conditions that would lead to the highest or worst-case pollutant exposures. The related conservative steps include:

- using the highest levels of pollutants that could be emitted from the plant;
- assuming weather conditions that would lead to the maximum ambient concentration of pollutants;
- using the type of air quality computer model which predicts the greatest plausible impacts;
- calculating health risks at the location where the pollutant concentrations are estimated to be the highest;
- assuming that an individual's exposure to cancer-causing agents occurs continuously for 70 years; and
- using health-based standards designed to protect the most sensitive members of the population (i.e., the young, elderly, and those with respiratory illnesses).

A screening-level risk assessment would at a minimum include the potential health effects from inhaling hazardous substances from direct exposure. Some facilities may also emit certain substances that could present a health hazard from indirect exposure through noninhalation pathways of exposure (OEHHA 2003, Tables 5.1, 6.3, 7.1). When these substances are present in facility emissions, the screening-level analysis would include the following additional exposure pathways: soil ingestion, dermal exposure, and mother's milk (OEHHA 2003, p. 5-3).

The risk assessment process addresses three categories of health impacts: acute (short-term) health effects, chronic (long-term) noncancer effects, and cancer risk (also long-term). Acute health effects result from short-term (one-hour) exposure to relatively high concentrations of pollutants. Acute effects are temporary in nature and include symptoms such as irritation of the eyes, skin, and respiratory tract. Chronic health effects are those that arise as a result of long-term exposure to lower concentrations of pollutants. The exposure period is considered to be approximately from 12% to 100% of a lifetime, or from 8 to 70 years (OEHHA 2003, p. 6-5). Chronic health effects include diseases such as reduced lung function and heart disease.

The analysis for noncancer health effects compares the maximum project contaminant levels to safe levels called *Reference Exposure Levels*, or RELs. These are amounts of toxic substances to which even sensitive individuals can be exposed without suffering any adverse health effects (OEHHA 2003, p. 6-2). These exposure levels are designed to protect the most sensitive individuals in the population, such as infants, the aged, and people suffering from illnesses or diseases which make them more sensitive to the effects of toxic substance exposure. The Reference Exposure Levels are based on the most sensitive adverse health effects reported in the medical and toxicological literature and include margins of safety that address the uncertainties associated with inconclusive scientific and technical information and is meant to provide a reasonable degree of protection against hazards that research had not yet identified at the time of the review. Each margin of safety is designed to prevent pollution levels that have been demonstrated to be harmful, and also prevent exposure to lower pollutant levels that may pose an unacceptable risk of harm, even if the risk has not precisely been identified as to nature or degree. Health protection is assumed if the estimated worst-case exposure is below the relevant reference exposure level. In such a case, an adequate margin of safety would be assumed to exist between the predicted exposure and the estimated dose for toxicity.

Exposure to multiple toxic substances may result in health effects that are equal to, less than, or greater than effects resulting from exposure to the individual chemicals. Only a small fraction of the thousands of potential combinations of chemicals have been tested for the health effects of combined exposures. In conformity with the California Air Pollution Control Officers Association (CAPCOA) guidelines, the health risk assessment assumes that the effects of each substance are additive for a given organ system (OEHHA 2003, pp. 1-5, 8-12). Other mechanisms may operate in cases of multiple exposures where the actions may be synergistic or antagonistic (that is where the effects would be greater or less than the sum, respectively). For these types of substances, the health risk assessment could underestimate or overestimate the risks.

For carcinogenic substances, the health assessment considers the risk of developing cancer and assumes that continuous exposure to the cancer-causing substance would occur over a 70-year lifetime. The risk that is calculated is therefore, not meant to project the actual expected incidence of cancer, but rather as a theoretical upper-bound number based on worst-case assumptions. Cancer risk is expressed in terms of chances of cancer per million and is a function of the maximum expected pollutant concentration, the probability that a particular pollutant will cause cancer (called *potency factors* and established by OEHHA), and the length of the exposure period. Cancer risks for each of the identified carcinogens are added together to yield the total cancer risk. The conservative nature of these screening-level assumptions means that actual cancer risks from project emissions would be considerably lower than those estimated.

The screening-level analysis is performed to assess worst-case public health risks associated with the proposed project. If this analysis predicts a risk that would be less than significant, further analysis would not be necessary. However, if risks were to be identified as above the significance level, then further analysis, using more realistic site-specific assumptions, would be performed to obtain a more accurate assessment of potential public health risks in question.

Significance Criteria

The agencies assess the health effects of exposure to toxic emissions based on the impacts on the maximally exposed individual. This is a person hypothetically exposed to project emissions at a location where the highest ambient impacts were calculated using worst-case assumptions, as described above. As described earlier, noncriteria pollutants are evaluated for short-term (acute) and long-term (chronic) noncancer health effects, as well as cancer (long-term) health effects. The significance of project health impacts is determined separately for each of the three categories.

Acute and Chronic Noncancer Health Effects

Staff assesses the significance of noncancer health effects by calculating a *hazard index*, which is a ratio obtained by comparing exposure from facility emissions to the reference (safe) exposure level. A ratio of less than 1.0 signifies that the worst-case exposure is below the safe level. The hazard indices for all the toxic substances with the same type of health effect are added together to yield a Total Hazard Index. The Total Hazard Index is calculated separately for acute and chronic effects. A Total Hazard Index of less than 1.0 indicates that cumulative worst-case exposures would be less than the reference exposure levels. Under these conditions, health protection from the project would be assumed likely, even for sensitive members of the population. In such a case, staff would presume that there would be no significant noncancer project-related public health impacts.

Cancer Risk

The agencies rely upon regulations implementing the provisions of Proposition 65, the Safe Drinking Water and Toxic Enforcement Act of 1986, (Health & Safety Code, §§25249.5 et seq.) for guidance in establishing a significance level for cancer risks. Title 22, California Code of Regulations section 12703(b) states that “The risk level which represents no significant risk shall be one which is calculated to result in one excess case of cancer in an exposed population of 100,000, assuming lifetime exposure.” This

level of risk is equivalent to a cancer risk of 10 in one million, which is also written as 10×10^{-6} . An important point to be noted for perspective is that the Proposition 65 significance level applies separately to each cancer-causing substance, whereas staff determines significance based on the total risk from all cancer-causing chemicals. Thus, the manner in which the significance level is applied by staff is more conservative (health-protective) than that applied by Proposition 65. The significant risk level of 10 in one million is consistent with the level of significance adopted by many California air pollution districts. In general, these air districts would not approve a project with a potential cancer risk exceeding 10 in one million.

As noted earlier, the initial risk analysis for a project is typically performed at a screening level, which is designed to overstate actual risks, so that health protection can be ensured. The agencies' analysis also addresses potential impacts on all members of the population including the young, the elderly, and individuals with existing medical conditions that may make them more sensitive to the adverse effects of toxic air contaminants, and any minority or low-income populations that are likely to be disproportionately affected by impacts mainly because of their location relative to the source. To accomplish this goal, the agencies use the most current acceptable public health exposure levels set to protect the public from the effects of airborne toxics. When a screening analysis shows cancer risks to be above the significance level, refined assumptions would likely result in a lower, more realistic risk estimate. If after refined assumptions, the potential risk from the facility were to be found to exceed the significance level of 10 in one million, the agencies would recommend appropriate measures to reduce the risk to less than significant. If, after all risk reduction measures have been considered, a refined analysis still identifies a cancer risk of greater than 10 in one million, staff would deem such a risk to be significant and would not recommend project approval, and BLM and Western would consider this risk in their decision.

LAWS, ORDINANCES, REGULATIONS, AND STANDARDS

PUBLIC HEALTH AND SAFETY Table 1
Laws, Ordinances, Regulations, and Standards (LORS)

<u>Applicable Law</u>	<u>Description</u>
Federal	
Clean Air Act section 112 (Title 42, U.S. Code section 7412)	This act requires new sources that emit more than 10 tons per year of any specified Hazardous Air Pollutant (HAP) or more than 25 tons per year of any combination of HAPs to apply Maximum Achievable Control Technology.
State	
California Health and Safety Code section 25249.5 et seq. (Proposition 65)	These sections establish thresholds of exposure to carcinogenic substances above which Prop 65 exposure warnings are required.

California Health and Safety Code section 41700	This section states that “no person shall discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health, or safety of any such persons or the public, or which cause, or have a natural tendency to cause injury or damage to business or property.”
California Public Resource Code section 25523(a); Title 20 California Code of Regulations (CCR) section 1752.5, 2300–2309 and Division 2 Chapter 5, Article 1, Appendix B, Part (1); California Clean Air Act, Health and Safety Code section 39650, et seq.	These regulations require a quantitative health risk assessment for new or modified sources, including power plants that emit one or more toxic air contaminants (TACs).
Local	
Mojave Desert Air Quality Management District (MDAQMD) Rule 1320	Requires a review of new or modified sources of toxic air contaminants and preparation of related risk assessment. A permit would not be issued if the risk were greater than 10 in one million or the hazard index were greater than 1.0. It also requires the use of the best available controls for air toxics (T-BACT).

PROPOSED PROJECT

SETTING AND EXISTING CONDITIONS

This section describes the environment in the vicinity of the proposed project site from the public health perspective. Characteristics of the natural environment, such as meteorology and terrain, affect the project’s potential for causing impacts on public health. An emissions plume from a facility may affect elevated areas before lower terrain areas due to a reduced opportunity for atmospheric mixing. Consequently, areas of elevated terrain can often be subjected to increased pollutant impacts. Also, the types of land use near a site influence the surrounding population distribution and density, which, in turn, affect public exposure to project emissions. Additional factors affecting potential public health impacts include existing air quality, existing health concerns, and environmental site contamination.

SITE AND VICINITY DESCRIPTION

The proposed project would be located on a 2,560-acre lot within a 3,324-acre privately-owned parcel which is the site of the former Rice Army Airfield in an undeveloped part of eastern Riverside County immediately south of State Route (SR) 62. There are no nearby residences as the nearest ones are at Vidal Junction, approximately 15 miles to the northeast. Blythe is approximately 40 miles to the south. Lands in this part of the

Mojave Desert are managed predominantly by the Bureau of Land Management (BLM) but the proposed site is private land as noted and thus not under the jurisdiction of BLM. However most of the lands in its vicinity are managed by BLM and are used as transportation corridors, are open spaces, or are used for resource conservation (RS 2009a, pp. 5.1-1, 5.6-1 and 5.9-1). There are no sensitive receptors in the vicinity of the project site given the general absence of areas of habitation (RS 2009a, Section 5.9-1 and Figure 5.6-1).

The site is relatively flat and is at an elevation of 850 feet above sea level. Topography of the surrounding area varies in elevation with a collection of mountain ranges dissected by long broad valleys many with dry lake beds. Many of these mountain ranges rise from 1,000 feet to 4000 feet above the valley floor (SR 2009a, p. 5.1-1).

METEOROLOGY

Meteorological conditions, including wind speed, wind direction, and atmospheric stability, affect the extent to which pollutants are dispersed into ambient air as well as the direction of pollutant transport. This, in turn, affects the level of public exposure to emitted pollutants and associated health risks. When wind speeds are low and the atmosphere is stable, for example, dispersion is reduced, and localized exposure may be increased.

Riverside County is characterized by a high desert climate where summers are hot and dry, winters are moderate with low precipitation, and temperature inversions are strong. Winds generally blow from the west and southwest resulting in a general west-to-east flow across the landscape (SR 2009a, pp. 5.1-1 and 5.1-2).

Atmospheric stability is a measure related to turbulence, or the ability of the atmosphere to disperse pollutants due to convective air movement. Mixing heights (the height above ground level through which the air is well mixed and in which pollutants can be dispersed) are lower during mornings due to temperature inversions and increase during the warmer afternoons. Staff's **Air Quality** section presents more detailed meteorological data.

EXISTING AIR QUALITY

The proposed site is within the jurisdiction of the Mojave Desert Air Quality Management District (MDAQMD). By examining average toxic air contaminants' concentrations from representative air monitoring sites with cancer risk factors specific to each contaminant, lifetime cancer risk can be calculated to provide a background risk level for inhalation of air toxics in the ambient air. The resulting risk estimate is assessed for perspective by comparing it with the noted overall lifetime cancer risk for the average individual in the United States which is about 1 in 3, or 333,000 in one million.

The nearest California Air Resources Board (CARB) air toxics monitoring station that actively reports values is located on Mission Boulevard in Riverside, approximately 65 miles southwest of the project site. Using the 2008 air toxics data, the CARB calculated an upper-bound background cancer risk of 104 in one million for the project area (CARB 2009). The pollutants, 1, 3-butadiene and benzene, emitted primarily from mobile

sources, were reported to accounted together for about half of the total risk. The risk from 1, 3-butadiene was about 22 in one million at Riverside, while the risk from benzene was about 30 in one million. Formaldehyde accounts for about 20% of the 2008 average calculated cancer risk based on air toxics monitoring results, with a risk of about 21 in one million. Formaldehyde is emitted directly from vehicles and other combustion sources. The risk from hexavalent chromium was about 23 in one million, or ~22% of the total risk. Fifty-one percent of hexavalent chromium in California is emitted from stationary sources with activities such as chrome plating, welding, spray painting, and leather tanning, while mobile sources such as jet aircrafts and ships contribute about 38%.

The use of reformulated gasoline, beginning in the second quarter of 1996, as well as other toxics reduction measures, have led to a decrease of ambient levels of toxics and associated cancer risk during the past few years in all areas of the state and the nation. For example, in the San Francisco Bay Area, cancer risk was 342 in one million based on 1992 data, 315 in one million based on 1994 data, and 303 in one million based on 1995 data. In 2002, the most recent year for which data is available, the average inhalation cancer risk decreased to 162 in one million (BAAQMD 2004b, p. 12).

EXISTING PUBLIC HEALTH CONCERNS

When evaluating a new project, the agencies often conduct a detailed study and analysis of existing public health issues in the project vicinity. This analysis is prepared in order to identify the current incidence of respiratory diseases (including asthma), cancer, and childhood mortality rates within the population located near the proposed project. Assessing existing health concerns in the project area would provide staff with a basis for evaluating the significance of any additional health impacts from the proposed RSEP while allowing evaluation of the adequacy of any proposed mitigation. Because of the very low population density of the project area, and the absence of unusual health issues within a 6-mile radius of the site as noted by the applicant (RS 2009a, Section 5.9-1), the agencies did not find it necessary to conduct further analysis regarding existing health status.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Proposed Project - Construction Impacts and Mitigation

Potential risks to public health during construction may be associated with exposure to toxic substances in contaminated soil disturbed during site preparation, as well as diesel exhaust from heavy equipment operation. Criteria pollutant impacts from the operation of heavy equipment and particulate matter from earth moving are examined in staff's **Air Quality** analysis.

For the proposed and similar projects, site disturbances would occur during construction from excavation, grading, and earth moving activities. Such activities have the potential to adversely affect public health through various mechanisms, such as the generation of airborne dust, from material being carried off site through soil erosion, and from uncovering and dispersal of buried hazardous substances. The Phase I Environmental Site Assessment conducted for the project's 3,324-acre site in 2008 identified several "Recognized Environmental Conditions" (RECs) per the American Society for Testing

and Materials Standards (ASTM) definition (SR 2009a, pp. 5.14-1 through 5.14-3, and Appendix 5.14A). These locations of potentially significant toxic contamination were reported to be from past military activities at the site when it was used during World War II as an Army training camp and airfield. The Phase II assessment and evaluation of available records showed that most of the mitigation measures applied during post-war construction activities had been adequate to minimize the toxic contaminations suggested by the presence of the RECs (SR 2009a, p. 5.14-3) meaning that there would be minimal likelihood of uncovering contamination at significant levels. The agencies have identified and staff has recommended two Waste Management Conditions of Certification (**Waste-1** and **Waste-2**) requiring a registered professional engineer or geologist to be available during soil excavation and grading. This requirement should be adequate to ensure the proper handling and disposal of any contaminated soil. The reader could refer to staff's **Waste Management** section for a more detailed analysis.

Operation of construction equipment results in air emissions from diesel-fueled engines. Such diesel emissions are generated from sources such as trucks, graders, cranes, welding machines, electric generators, air compressors, and water pumps. Diesel exhaust includes criteria pollutants such as nitrogen oxides, carbon monoxide, sulfur oxides, and a complex mixture of thousands of gases and fine particles. These particles are primarily made up of aggregates of spherical carbon particles coated with organic and inorganic substances. Diesel exhaust contains over 40 substances that are listed by the U.S. Environmental Protection Agency (U.S. EPA) as hazardous air pollutants and by the California Air Resources Board (ARB) as toxic air contaminants.

Exposure to diesel exhaust may cause both short- and long-term adverse health effects. Short-term effects can include increased coughing, labored breathing, chest tightness, wheezing, and eye and nasal irritation. Long-term effects can include increased coughing, chronic bronchitis, reductions in lung function, and inflammation of the lung. Epidemiological studies also strongly suggest a causal relationship between occupational diesel exhaust exposure and lung cancer.

Based on a number of health effects studies, the Scientific Review Panel on Toxic Air Contaminants recommended a chronic reference exposure level (see discussion of reference exposure levels in Method of Analysis section above) for diesel exhaust particulate matter of 5 micrograms of diesel particulate matter per cubic meter of air ($\mu\text{g}/\text{m}^3$) and a cancer unit risk factor of $3 \times 10^{-4} (\mu\text{g}/\text{m}^3)^{-1}$ (SRP 1998, p. 6).¹ The Scientific Review Panel did not recommend a value for an acute Reference Exposure Level since available data in support of a value was deemed insufficient. On August 27, 1998, ARB listed particulate emissions from diesel-fueled engines as a toxic air contaminant and approved the panel's recommendations regarding health effect levels.

Construction of RSEP is expected to take place over a period of 30 months. The applicant (SR 2009a, p. 5.1-10 through 5.1-12, 5.1-23, and Appendices 5.1A, 5.1C, and 5.1E) has presented the daily and annual maximum emissions of criteria pollutants including fugitive dust and diesel exhaust emissions from construction equipment and

worker vehicles. The applicant did not estimate the health risks resulting from construction activities due to the short duration of this phase (SR 2009a, p. 5.9-8). Staff agrees with the applicant's reasoning and did not conduct a quantitative assessment of construction impacts on public health given the absence of residences within the six-mile radius of potentially significant impacts. Furthermore, staff has found numerous times that impacts from construction vehicle diesel emissions are invariably less than significant even when there are close-in receptors. Also, as noted earlier, assessment of chronic (long-term) health effects assumes continuous exposure to toxic substances over a significantly longer time period (typically of from 8 to 70 years) and would be of limited usefulness for the relatively short (30-month) construction period expected for this project. Please refer to the **Worker Safety and Fire Protection** section of the SA-DEIS for an assessment of potential health and safety effects to RSEP workers.

Additionally, mitigation measures are proposed by both the applicant and Energy Commission staff to reduce the maximum calculated PM10 and PM2.5 emissions and thus reduce the potential impacts even further. These mitigation measures can be found in the **Air Quality** section of this document and include the use of extensive fugitive dust and diesel exhaust control measures. The fugitive dust control measures are assumed to result in 90% reductions of particulate matter emissions. To further mitigate potential impacts from particulate emissions during the operation of diesel-powered construction equipment, the Energy Commission staff recommends the use of ultra-low sulfur diesel fuel and Tier 2 or Tier 1 California Emission Standards for Off-Road Compression-Ignition Engines or the installation of an oxidation catalyst and soot filters on diesel equipment. The catalyzed diesel particulate filters are passive, self-regenerating filters that reduce particulate matter, carbon monoxide, and hydrocarbon emissions through catalytic oxidation and filtration. The degree of particulate matter reduction is comparable for both mitigation measures in the range of approximately 85–92%. Such filters will reduce diesel emissions during construction and reduce any potential for significant health below levels of significance.

Proposed Project - Operational Impacts and Mitigation

Emissions Sources

The stationary emissions source of potential concern at the RSEP would be two diesel-powered emergency generators and two diesel-powered emergency fire water pumps each of which would be operated for only 30 minutes or less per week for testing and maintenance (SR 2009a p. 5.9-3). **PUBLIC HEALTH Table 2** lists the main toxic emissions potentially emitted from operating these diesel engines and the facility's wet surface air cooler (WSAC). Each TAC has a toxicity value together with a Reference Exposure Level established by OEHHA, which is used to calculate short-term and long-term noncancer health effects, and cancer unit risk as published in the OEHHA Guidelines (OEHHA 2003).

**Public Health Table 2 Types of Health Impacts and Exposure Routes
Attributed to Toxic Emissions***

**Biphenyl has no established risk factors or RELs.

Emissions Levels

Once potential emissions are identified, the next step would be to quantify them by conducting a “worst case” analysis. Maximum annual emissions are required to calculate cancer and chronic (long-term) noncancer health effects. Diesel particulate matter (DPM) emissions for the diesel emergency engine were calculated based on emission factors obtained from the vendor. DPM emissions from diesel-fueled delivery trucks were estimated using ARB’s EMFAC2007 model. The next step in the health risk assessment process is to estimate the ambient concentrations of toxic substances. This is accomplished by using a screening air dispersion model and assuming conditions that result in maximum impacts. The applicant’s screening analysis was performed using the AERMOD model. Ambient concentrations were used in conjunction with Reference Exposure Levels and cancer unit risk factors to estimate health effects that might occur from exposure to facility emissions. Exposure pathways, or ways in which people might come into contact with toxic substances, include inhalation, dermal (through the skin) absorption, soil ingestion, consumption of locally grown plant foods, and mother’s milk.

The above method of assessing health effects is consistent with OEHHA’s Air Toxics Hot Spots Program Risk Assessment Guidelines (OEHHA, 2003) referred to earlier and results in the following health risk estimates.

Impacts

The applicant’s screening health risk assessment for the project resulted in an acute Hazard Index (HI) of 0.125 and a chronic HI of 0.013 at the point of maximum impact

(PMI). The worst-case individual cancer risk was calculated to be 0.089 in one million at the PMI. All three PMIs were located on the boundaries of the project site (SR 2009a, p.5.9-8). As **PUBLIC HEALTH Table 3** shows, both the acute and chronic hazard indices and the maximum cancer risk are below the level of significance, indicating that no long-term or short-term cancer or non-cancer health effects are expected.

PUBLIC HEALTH Table 3
Operation Hazard/Risk at Point of Maximum Impact: Applicant Assessment

Type of Hazard/Risk	Hazard Index/Risk	Staff's Significance Level	Significant?
ACUTE NONCANCER	0.125	1.0	No
CHRONIC NONCANCER	0.013	1.0	No
INDIVIDUAL CANCER	0.089 in one million	10.0 in one million	No

Source: SR 2009a p.5.9-8, Table 5.9-3

Staff is in agreement with the applicant's modeling approach and has validated the applicant's findings regarding the numerical public health risk estimate expressed in terms of the hazard index for each non-carcinogenic pollutant or a cancer risk for estimated levels of the carcinogenic pollutants.

Since there are no residential areas within the area potentially impacted by the proposed project's toxic emissions, there would be no environmental justice concerns related to minority or poverty status. Furthermore, staff's evaluation has established that no significant health and safety impacts would result anywhere in the immediate project area meaning that the issue of environmental injustice from significant impacts would not arise during operations.

FACILITY CLOSURE AND DECOMMISSIONING

Closure of the proposed RSEP (whether temporary or permanent) would follow a closure plan prepared by the applicant and designed to minimize public health and environmental impacts. Permanent closure would presumably occur 40 years after the start of operation unless the project remains economically viable. Decommissioning procedures would be similar to construction activities and safeguards, would have to be consistent with all applicable LORS, and would be subject to Energy Commission approval before implementation. Staff expects that impacts on public health from the closure and decommissioning process would represent a fraction of the impacts associated with the construction or operation of the proposed RSEP and would therefore be below levels of significance.

REDUCED ACREAGE ALTERNATIVE

The Reduced Acreage Alternative would be a project with a site 7.2% smaller than the site for the proposed facility and located in the same 2,560-acre square-shaped parcel

within the larger 3,324-acre private property proposed for the project. Although the overall heliostat field distance from the central tower would be reduced, the number of heliostats would remain the same. The heliostat field (plus the evaporation pond and administrative building areas) would occupy about 1,270 acres instead of the 1,370 acres required for the project. The receiver location would remain the same with the edges of the contracting towards the center. The heliostat footprint for the Reduced Acreage Alternative is shown in **Alternatives Figure 2**. The site layout, the 653-foot total height of the solar tower and receiver and transmission interconnection to the Parker-Blythe transmission line would remain the same as for the proposed project. The generating capacity would be reduced by approximately 2 MW.

As with the proposed project, the power from the Reduced Acreage Alternative would be transmitted to the Western power grid through the planned Western Parker-Blythe 161-kV transmission line. This Reduced Acreage Alternative is evaluated because its use would eliminate about 100 acres of the site proposed for the proposed RSEP, thus reducing potential impacts on ephemeral washes, the habitat for the desert tortoise, and the historic Rice Airfield.

SETTING AND EXISTING CONDITIONS

The general setting and existing conditions would remain as described in the **Setting and Existing Conditions** subsection, although the land requirements would be proportionately reduced to reflect the smaller project size. Locations of laydown areas may also vary.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Potential risks to public health during construction may be associated with exposure to toxic substances in contaminated soil disturbed during site preparation, as well as diesel exhaust from heavy equipment operation. Best management practices as applied for the proposed project would apply for the Reduced Acreage Alternative, and would avoid significant adverse effects. During operation, the Reduced Acreage Alternative is likely to result in reduced emissions which would slightly decrease the cancer risk and chronic and acute hazard indices predicted for the proposed 150-MW project. Considering the public health analysis for the proposed project has identified that the cancer risk and chronic and acute hazard indices are already far below their respective levels of significance at the points of maximum impact, there would be no substantive difference between the public health impacts from the proposed project and the Reduced Acreage Alternative.

CEQA LEVEL OF SIGNIFICANCE

As with the proposed project, staff considers compliance with applicable LORS to be sufficient to ensure that no significant public health impacts would result from the construction, operation, and decommissioning of the Reduced Acreage Alternative.

NORTH OF DESERT CENTER ALTERNATIVE

The North Desert Center Alternative would be a 150-MW solar facility located on approximately 2,643 acres. It would be located along Desert Center Rice Road (State

Route 177) east of Kaiser Road, north of Oasis Road, approximately 1.6 miles north of I-10. The North Desert Center Alternative is primarily private land with smaller sections of BLM land in the eastern portion of the site. It is largely fallow agricultural land. An existing Southern California Edison (SCE) 161-kV transmission line that traverses this alternate site would be realigned to roughly follow the site boundary. A new 0.125-mile transmission line (along Osborne Avenue) and a substation would interconnect the realigned SCE line at the northeastern boundary of the site. The boundaries of the North Desert Center Alternative are shown in **Alternatives Figure 3** along with the realigned SCE line. This alternative is evaluated because its use would reduce impacts on the cultural resources in the areas around the historic Rice Army Airfield.

Since the North Desert Alternative would have the same generating capacity as the proposed project, there would be no substantive difference between the emissions and health risks from operating either the proposed project or this alternative.

Setting and Existing Conditions

The general setting and existing conditions for the North of Desert Center site would generally be similar to the proposed project in terms of meteorology and terrain, being a gently sloping site and within the same general region for temperature, precipitation and wind elements. The primary distinction for the North of Desert Center site is that it would be closer to an existing population, in which the nearest existing housing subdivision would be approximately one mile away, and there would be an existing racetrack across the road from the North of Desert Center site.

Assessment of Impacts and Discussion of Mitigation

Since the North of Desert Center Alternative would have the same generating capacity as the proposed project, it would result in similar types of public health and safety issues from construction, operation and decommissioning as for the proposed project. Since the assessment for the proposed project considered a PMI at three locations along the project boundary and concluded that the project would not cause long-term or short-term cancer or non-cancer health effects, the North of Desert Center site would result in similar effects at its project boundary, and would not pose a health risk for nearby populations beyond the project boundary.

CEQA Level of Significance

As with the proposed project, staff considers compliance with applicable LORS to be sufficient to ensure that no significant public health impacts would result from construction, operation and decommissioning of the North of Desert Center Alternative.

SR 62/RICE VALLEY ROAD GENERATION TIE LINE ALTERNATIVE

The SR/62 Rice Valley Road Alternative would interconnect to Western's 161-kV/230-kV Parker-Blythe #1 transmission line at the same location as proposed for the project's transmission line. This alternative line route would exit the proposed solar facility at the northeast corner and follow State Route 62 for approximately 4.5 miles east to the junction of Rice Valley Road. It would then trend southwards to follow the unpaved Rice Road Valley Road for over 9.5 miles to the connection point at the Western's Parker-

Blythe transmission line. The route of the SR 62/Rice Valley Road Generation Tie Line Alternative is shown in **Alternatives Figure 4**.

Since the use of this line alternative would not affect the emissions from facility operations, there would be no difference in the emissions of the pollutants considered in this analysis. The only possible difference would be in the emissions from construction of the longer transmission line. Since such construction is usually temporary and with usually mitigated emissions, there would be no substantive difference in the public health impacts from building and operating the proposed line on the SR 62/Rice Valley Road Alternative route. Since either line would be designed and operated according to the Western guidelines which comply with existing LORS, the resulting field and nonfield impacts would be below levels of significance.

NO PROJECT/NO ACTION ALTERNATIVE

No Project / No Action on the Application for the Rice Solar Energy Project and no amendment of the CDCA land use plan

Under this alternative, the proposed Rice Solar Energy Project would not be approved by the CEC, BLM and Western, and BLM would not amend the CDCA Plan for the area. As a result, no solar energy project would be constructed on the project site and BLM would continue to manage the area to be traversed by the proposed project generation tie line in ways consistent with the existing land use designations in the CDCA Land Use Plan of 1980, as amended.

The results of the No Project/No Action Alternative would be the following:

- The impacts of the proposed project would not occur. However, the land the proposed project transmission line would pass would become available to other uses that are consistent with BLM's land use plan, including another renewable energy projects.
- The benefits of the proposed project in displacing fossil fuel-fired generation and reducing the associated greenhouse gas emissions from gas-fired generation would not occur. Both State and Federal law support the increased use of renewable power generation.

If the proposed project is not approved, renewable projects would likely be developed on other sites in San Bernardino County, the Mojave Desert, or in adjacent states as developers strive to provide renewable power that complies with utility requirements and State/Federal mandates. For example, there are dozens of other wind and solar projects that have applications pending with BLM in the California Desert District. Under the No Project/No Action alternative, public health impacts at the proposed project site and area would be similar to those currently occurring under the existing conditions in the area. Given that there would be no significant change over the existing conditions, the public health impacts of the No Project/No Action alternative would be less than significant.

CUMULATIVE IMPACTS AND MITIGATION

In reference to the past, existing and future foreseeable projects identified in the Cumulative Scenario section, no potential operators have requested permission for development that would produce significant amounts of the toxic pollutants of concern in close enough proximity to the proposed project that the impacts could overlap and be cumulatively significant. Staff has identified the Ward Valley Project (at a site of approximately 5 miles to the northwest) as potentially adding to total area background levels as would existing area sources. Such area-wide additions could be seen as contributing to the existing background levels, thereby adding to the normal background cancer and noncancer impacts of concern in this analysis. The present approach to regulating these TACs is to ensure that further additions to background from identifiable sources are maintained within levels regarded as less than significant.

As previously noted, the maximum impact locations for RSEP and similar sources would be the spots where pollutant concentrations would theoretically be highest. Even at these three locations on the proposed project boundary, staff does not expect any significant RSEP-related changes in lifetime cancer risk to any individual given the calculated maximum incremental cancer risk of 0.089 in one million which staff regards as not contributing significantly to the previously noted average lifetime risk of 330,000 in one million. The worst-case long-term non-cancer health impacts (reflected by the chronic index of 0.13) is well below staff's significance level of 1.0 at the maximum impact location suggesting an insignificant contribution to the incidence of the area's noncancer health symptoms from cumulative toxic exposures, meaning that RSEP's impacts would be cumulatively insignificant regarding health effects. Staff does not recommend mitigation for RSEP other than the applicant's proposals whose efficiency is reflected in the insignificant risks from the projected emission levels. The cumulative impacts from emissions of the project's criteria pollutants are addressed in the **Air Quality** section.

COMPLIANCE WITH LORS

The toxic pollutant-related cancer and noncancer risks from RSEP's construction, operation and decommissioning reflect the effectiveness of the control measures proposed by the applicant for the emission sources of concern to staff. Since these risk estimates are far below the significance levels in the applicable LORS, staff concludes that the related operational plan would comply with these LORS.

NOTEWORTHY PUBLIC BENEFITS

It is noteworthy that a solar electric generating facility such as the proposed RSEP would emit significantly less TACs to the environment per unit of generated power than other energy sources available in California such as natural gas or biomass, thereby reducing the health risks that would otherwise occur with these non-renewable energy sources. At the same time, the proposed RSEP would provide much needed electrical power to California residences and businesses, and would contribute to electric reliability. Electrical power is not only necessary to maintain a functioning society, but also benefits many individuals who rely on powered equipment for their health (such as

dialysis equipment and temperature control equipment). For example, it is documented that during heat waves in which elevated air-conditioning use causes an electrical blackout, hospitalizations and deaths attributable to heat stroke are increased.

PROPOSED MITIGATION MEASURES/CONDITIONS OF CERTIFICATION

Staff's proposed Conditions of Certification meet the Energy Commission's responsibility to comply with the California Environmental Quality Act and serve as recommendations for the Energy Commission to consider in its decision to avoid or reduce the severity of impacts to less than significant and to assure conformance with LORS. The identification of relevant and reasonable mitigation measures also conforms to National Environmental Policy Act (NEPA) requirements for U.S. Bureau of Reclamation's (BLM's) and Western Area Power Administration's (Western's) analysis that can be considered in its Record of Decision. In the area of Public health and Safety, no conditions of certification or mitigation measures have been identified as being necessary or are proposed.

CONCLUSIONS

Staff has analyzed the potential public health risks associated with construction and operation of the proposed Rice Solar Energy Project and does not expect any significant adverse cancer or long-term health effects on any members of the public from project's toxic emissions with respect to CEQA. The agencies' analysis of potential health impacts uses a conservative health-protective methodology that accounts for impacts on the most sensitive individuals in a given population, including newborns and infants. The results therefore provide assurance that the projected emissions would not contribute significantly or cumulatively to morbidity or mortality in the area.

SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE

Testimony of Kristin Ford

SUMMARY OF CONCLUSIONS

The U.S. Bureau of Land Management (BLM), Western Area Power Administration (Western) and Energy Commission staff (staff), hereafter jointly referred to as agencies, have reviewed the Rice Solar Energy Project (RSEP or proposed project) in accordance with the requirements of the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA). With respect to CEQA, staff concludes that construction and operation of the Rice Solar Energy Project (RSEP) would not cause significant direct or cumulative adverse socioeconomic impacts on the study area's housing, schools and parks. Staff also concludes that the project would not induce substantial growth or concentration of population, substantial increases in demand for housing or public services, or displace a large number of people.

INTRODUCTION

The agencies' socioeconomic impact analysis evaluates the project's induced changes on existing population and employment patterns, and community services. Staff discusses the estimated impacts of the construction and operation of the Rice Solar Application for Certification (AFC) on local communities, community resources, and public services, and provides a discussion of the estimated beneficial economic impacts of the construction and operation of the proposed project. Laws, Ordinances, Regulations, and Standards

Socioeconomics Table 1 contains socioeconomic laws, ordinances, regulations, and standards (LORS) applicable to the proposed project.

**Socioeconomics Table 1
Laws, Ordinances, Regulations, and Standards (LORS)**

California Education Code, Section 17620	The governing board of any school district is authorized to levy a fee, charge, dedication, or other requirement for the purpose of funding the construction or reconstruction of school facilities.
California Government Code, Sections 65996-65997	Except for a fee, charge, dedication, or other requirement authorized under Section 17620 of the Education Code, state and local public agencies may not impose fees, charges, or other financial requirements to offset the cost for school facilities.
California Revenue and Taxation Code Section 70-74.7	Property taxes are not assessed on solar facilities. Assembly Bill 1451 extended the current property tax exclusion for new construction of solar energy systems to January 1, 2017.

PROPOSED ACTION ALTERNATIVE/PROPOSED PROJECT

SETTING

The project would be located in an unincorporated area of eastern Riverside County, adjacent to State Route (SR) 62, near the junction of SR 62 and Blythe-Midland Road, near the abandoned town of Rice, California. The project site is primarily comprised of creosote bush-sage desert scrub with few areas of disturbance where foundations or concrete from airfield runways and hardstands remain (SR2009a, 5.6-1).

The project site would be located on a 1,410-acre fenced area, within a larger 2,560-acre parcel. The proposed project site is surrounded by private land to the southwest, with public lands managed by the Bureau of Land Management to the east, west, and north. The nearest town is Parker, Arizona (population 3,181) approximately 32 miles east (SR2009a, ES-4). Needles, in San Bernardino County, is approximately 65 miles northeast; Blythe, in Riverside County is 40 miles south; and Twentynine Palms in Riverside County, is 75 miles west of the project site (SR2009a ,1-7).

DEMOGRAPHIC SCREENING

The agencies' demographic screening is designed to determine the existence of a minority or below-poverty-level population or both within a six-mile area of the proposed project site. The demographic screening process is based on information contained in two documents: *Environmental Justice: Guidance Under the National Environmental Policy Act* (Council on Environmental Quality, 1997) and *Final Guidance for Incorporating Environmental Justice Concerns in EPA's Compliance Analyses* (Council on Environmental Quality, 1998). The screening process relies on Year 2000 U.S. Census data to determine levels of minority and below-poverty-level populations.

MINORITY POPULATIONS

According to *Environmental Justice: Guidance Under the National Environmental Policy Act*, minority individuals are defined as members of the following groups: American Indian or Alaskan Native; Asian or Pacific Islander; Black, not of Hispanic origin; or Hispanic. A minority population is identified when the minority population of the potentially affected area is greater than 50 people.

For the RSEP, the total population within the six-mile radius of the proposed site is five persons and the total minority population is one person or about 20% of the total population (see **Socioeconomics Figure 1**).

BELOW-POVERTY-LEVEL POPULATIONS

The agencies normally identify below-poverty-level population within the six-mile radius using Year 2000 U.S. Census block group data. However, for this project the poverty data would be inaccurate for the six-mile radius because the census block groups are so large that they include persons well beyond the six-mile radius and therefore, would misrepresent the poverty data within the six-mile radius.

ASSESSMENT OF IMPACTS

METHOD AND THRESHOLD FOR DETERMINING SIGNIFICANCE

The socioeconomic resource areas evaluated by staff are based on Appendix G of the California Environmental Quality Act (CEQA) Guidelines and shown in **Socioeconomics Table 2**. Staff's assessment of impacts on population, housing, emergency medical services, police protection, schools, and parks and recreation, are based on professional judgments, input from local and state agencies, and the industry-accepted two-hour commute range for construction workers. Typically, substantial long-term relocation due to employment of people from regions outside the study area would have the potential to result in significant adverse socioeconomic impacts. Criteria for subject areas such as utilities, fire protection, water supply, and wastewater disposal are analyzed in the **Reliability, Worker Safety and Fire Protection**, and **Water Resources** sections of this document.

**Socioeconomics Table 2
CEQA Environmental Checklist Form**

	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
POPULATION AND HOUSING —Would the project:				
A. Induce substantial population growth in a new area, either directly or indirectly.				X
B. Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?				X
C. Displace substantial numbers of people, necessitating construction of replacement housing elsewhere?				X
PUBLIC SERVICES —Would the project:				
D. Result in substantial adverse physical impacts associated with the provision of new or physically altered government facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services: Emergency medical services Police protection Schools Parks Other public facilities				X X X X X
RECREATION—Would the project:				
Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?				X
Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?				X

DIRECT/INDIRECT IMPACTS AND MITIGATION

Induce Substantial Population Growth

For the purpose of this analysis, the agencies define “induce substantial population growth” as workers permanently moving into the project area because of project construction and operation, thereby encouraging construction of new homes or extension

of roads or other infrastructure. To determine whether the project would induce population growth, the agencies analyze the availability of the local workforce and the population within the region. The agencies define “local workforce” as the Riverside and San Bernardino Metropolitan Statistical Areas (MSAs). MSAs are made up of one or more counties and have at least one urbanized area of 50,000 or more in population. The County of La Paz, Arizona is located approximately 20 miles east of the project site. According to the Arizona Department of Commerce, Research Administration, La Paz County is not part of a metropolitan statistical area.

Socioeconomics Table 3 shows the historical and projected populations of the study area.

**Socioeconomics Table 3
Historical and Projected Populations**

Area	2000 Population	2010 Population	2020 Population
Riverside County	1,545,387	2,239,053	2,904,848
San Bernardino County	1,710,139	2,177,596	2,581,371
Parker, Arizona	3,140	3,417	3,688
La Paz County	19,715	22,632	25,487

Socioeconomics Table 4 shows that the total labor by skill in the Riverside and San Bernardino County MSAs is more than adequate to provide construction labor for the RSEP.

Source: Employment Development Department, Labor Market Information (http://www.labormarketinfo.edd.ca.gov), AFC for Rice Solar Energy Project, October 2009		

In 2006, The Arizona Workforce Informer (<http://www.workforce.az.gov>) indicated the number of construction laborers employed in the “Utility System Construction” industry was 2,376 persons (6.2% of total employment for occupation in Arizona); “Nonresidential Construction” industry was 1,419 persons (3.7% of total employment for

occupation in Arizona), which indicates that labor by skill in La Paz county is more than adequate to provide construction labor for the RSEP.

The applicant estimates construction would begin in the first quarter of 2011 and last through the third quarter 2013 (30 months total). As shown in Table 5.10-11 in the AFC, the number of construction workers would range from a minimum of 29 in the first month to a maximum of 438 in the twelfth month of construction. The peak construction site workforce level is expected to occur between months 8 and 20 (SR2009a, 2-37). The average amount of peak construction staff between the peak months would be 349 persons.

The project would require 47 full-time operation employees; most workers are expected to commute to the project site from communities in Riverside/San Bernardino Counties, California and La Paz County, Arizona.

Staff concludes that the construction and operation workforce would not induce substantial growth or concentration of population and the RSEP would not encourage people to permanently move into the area. The RSEP would have no direct or indirect impact on substantial population growth in a new area.

Housing Supply

When considering potential socioeconomic impacts of workers required for RSEP construction, staff considered information provided in the AFC and current California Department of Finance data for the Riverside/San Bernardino/Ontario MSA as presented in **SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 4**. During preparation of this analysis, staff reviewed Energy Commission staff's Socioeconomic analysis for the Blythe Solar Power Project (BSPP). The analysis includes information from the Building and Trades Council of San Bernardino and Riverside Counties that construction workers within San Bernardino and Riverside counties regularly commute 2-hours each direction daily for work (BTC 2010). Based on these data sources, staff concludes the majority of construction workers will come from within this regional study area.

Staff assumes that because data indicates the workforce would likely come from within the regional study area, it is speculative to quantify if and in what numbers construction workers may permanently relocate from the regional study area to the RSEP local area for a limited duration construction job. As discussed in the AFC, the applicant anticipates that very few, if any, of the workers employed during the construction phase of the RSEP would be expected to permanently relocate to the area as a result of this project and would only temporarily relocate during the workweek (SR2009a, 5.10-18). To evaluate the potential for impacts, staff assumes that up to 15% of construction workers could seek local lodging in the RSEP local area during the workweek. It should be noted that this is an average weekly assumption and would be a temporary and fluctuating demand on local lodging. Based on this assumption, it is possible that during the peak construction month, up to 66 workers could seek local lodging.

As reported by the U.S. Census Bureau Census 2000 and stated in the AFC, housing stock for Riverside County in 2009 was 755,338 housing units with 6,952 housing units

in the city of Twentynine Palms. The Department of Finance data for population and housing showed that there were 99,037 housing units in the city of Riverside in 2009. Housing units include; single-family, multi-family, and mobile home residences.

Hotel/Motel. There are approximately 242 hotels/motels with 22,664 rooms in Riverside County to accommodate workers who may choose to commute to the project site on a work week basis (SR2009a, 5.10-19).

Data compiled by Smith Travel Research for hotels, motels, and bed and breakfast inns (B&Bs) with 15 or more rooms identified 19 hotels with a total of 878 rooms (GSEP2009a, p. 5.8-5), located with approximately 40 miles of the RSEP.

Fifty-seven hotels with a total of 8,285 rooms were identified in Indio, Palm Desert, Indian Wells, and Rancho Mirage. A total of 129 hotels with 7,541 rooms were identified in the communities (GSEP2009a, p. 5.8-6) of Desert Hot Springs, Palm Springs, and Needles.

Housing Vacancy. As stated in the AFC, in Table 5.10-5 vacancy rates for Blythe in 2008 was 16.11%, Riverside County in 2008 was 13.18%, San Bernardino County in 2008 was 11.63%, Parker, Arizona in 2000 was 8.0%, and La Paz County from 2005 to 2007 was 42.7% (SR2009a, 5.10-4). Based on the housing vacancy data above, there are approximately 101,930 available housing units in Riverside County and about 880 housing units in Blythe (SR2009a, 5.10-23). In addition, there are about 6,600 housing units available in La Paz County.

Campground/RV Parks. Lake Tamarisk Desert Resort, a privately owned RV park located in the town of Lake Tamarisk, would provide nightly, weekly, monthly and dry docking for RVs.

Conclusion. Based on the availability of short-term housing in the vicinity of RSEP, when compared to the maximum temporary peak demand of up to 66 workers potentially seeking local housing during the workweek, staff concludes that construction of the proposed project would not temporarily induce substantial growth or concentration of population and construction of the RSEP would not encourage people to permanently relocate to the area due to the temporary construction employment.

Displace Existing Housing and Substantial Numbers of People

The Rice Solar Energy Project would be located within a larger, private holding of 3,324 acres. There are six assessor's parcel numbers (APNs) that make up the ownership property. Within this ownership property, the RSEP would be located within a new square-shaped parcel (project parcel) that would be created by merging four current different assessor's parcels, each of them a discrete section (square mile) of land, resulting in a single 2,560-acre parcel (SR2009a, 1-7). The project and facility site would be a 1,410-acre fenced area within the project parcel (SR2009a, 5.6-1,). The proposed project site consists of private land within unincorporated Riverside County. The RSEP site is surrounded by private land to the southwest and public lands managed by the BLM to the east, west, and north (SR2009a, 5.6-2).

Within one mile of the RSEP site there are no schools, churches, childcare facilities, parks, recreation centers, historic areas, mines or quarries. There are no occupied or inhabited structures within a mile of the project site. The nearest residences are at Vidal Junction, approximately 15 miles northeast (SR2009a, 5.6-1).

The project and facility site within the project parcel, interconnection substation site, and generator tie-line are designated by the Riverside County General Plan as Open Space-Rural. Land uses within one mile of the proposed project parcel are designated by the Riverside County General Plan as Open Space-Rural. The proposed RSEP project parcel is zoned Controlled Development Zone-minimum 10 acre (W-2-10). The generator tie-line route and interconnection substation location are zoned Natural Assets (N-A) (SR2009a, 5.6-6). In addition, the proposed project is located in the Desert Center Area Plan, which rural desert designation allows for renewable energy uses including solar, geothermal and wind energy uses, as well as associated uses required to develop and operate these renewable energy sources (SR2009a, 5.10-28).

The proposed power plant would be located on private land. No inhabited structures or residences are located within a mile of the site. There would be no displacement of existing housing or a need to construct replacement housing.

Result in Substantial Physical Impacts to Government Facilities

As discussed under the subject headings below, the RSEP would not cause significant impacts to recreation facilities or schools. Fire protection impacts, including; service ratios, response times, or other performance objectives relating to emergency medical services is further analyzed in the **Worker Safety and Fire Protection** section.

Emergency Medical Services

The project site is within the Riverside County Fire Department's jurisdiction (<http://www.rvcfire.org>). The closest fire stations are located in La Paz County, Arizona and San Bernardino County, California. There is a mutual aid agreement with these counties upon request and availability. The mutual aid agreement does not include first response; therefore, response from neighboring counties is not guaranteed (SR2009a, 5.10-13). The first responding fire station is Lake Tamarisk Fire Station (#49) located on 43880 Lake Tamarisk, Desert Center, California 92239. The response time for the first responder is 30 minutes with one engine and three paramedic-trained personnel. Based on the nature of the emergency situation, Blythe Fire Station (#43) and Blythe Air Base Fire Station (#45) can be mobilized, with response times ranging from 45 to 60 minutes. Air ambulance services from Mercy Air Ambulance based in Banning, California can be mobilized with a response time of 45 minutes. Depending on availability, the PHI Air Medical based in Lake Havasu City, Arizona can be mobilized in 30 minutes (SR2009a, 5.10-13).

Jason Neuman, Captain of the Strategic Planning Division, Riverside County Fire Department, in a May 4, 2010 letter, (Riverside 2010b) states the response time for Lake Tamarisk Fire Station (#49) would be one hour after dispatch, and Blythe Fire Station (#43) would be approximately one hour, 15 minutes. Captain Jason Neuman further states the proposed project would have a cumulative adverse impact on the Fire Department's ability to provide an acceptable level of service. These impacts would

include an increased number of emergencies and public service calls due to the proposed presence of structures, traffic and hazardous materials storage. The cumulative adverse impact on response time is further analyzed in the **Worker Safety and Fire Protection** section of this document. Condition of Certification **WORKER SAFETY-7** would require funding for Riverside County Fire Department shared with funding from other solar energy developers to build and staff a new fire station and ensure that the Rice Solar Power Project would create a less than significant impact to Emergency Medical Services.

The applicant has proposed there would be onsite fire protection systems which are designed to protect personnel and limit property loss and plant downtime from fire or explosion (SR2009a, 2-46). The proposed project would use the following emergency systems; steam turbine oil areas water spray system, fire hydrants/hose stations, and fire extinguishers (SR2009a, 2-46).

In addition, the applicant states in the **Worker Health and Safety** section of the AFC (SR2009a, 5.16-17) if hazardous materials were involved in the incident, Lake Tamarisk Fire Station 49 would be the first onsite, requesting additional resources from the Riverside County Fire Department and the Riverside County Hazardous Materials Emergency Response (HazMat) Team. The program is a joint agency team staffed by the Riverside County Department of Environmental Health (RCDEH) Hazardous Materials Management Division (HMMD) and Riverside County Fire/California Department of Forestry. This team would respond to incidents involving hazardous materials, 24 hours per day and seven days a week.

For emergency services, trauma patients would be transported to Desert Regional Medical Center, which is located in Palm Springs, California, approximately 127 miles from the project location. For burn injuries, patients would be transported to Arrowhead Regional Medical Center in Colton, California, which is 180 miles from the project location. The two hospitals are designated as Level II trauma centers and patients can be transported by air ambulance. La Paz Regional Hospital is located approximately 23 miles from the project site in Parker, Arizona. The La Paz Regional Hospital has an emergency room, but no trauma center (SR2009a, 5.10-14).

As discussed in AFC Section 2.0 - Project Description, Section 5.16 - Worker Health and Safety, and Section 5.5 - Hazardous Materials Handling, the RSEP would be designed to meet all applicable standards to reduce the risk of an accidental hazardous materials release and operate in a manner that complies with safety standards and practices to provide a safe workplace for plant personnel. In addition, a hazardous materials risk management plan would include all information necessary to allow fire-fighting and other emergency response agencies to plan and implement safe responses to fires, spills, and other emergencies.

The applicant's proposed safety procedures and employee training would minimize potential unsafe work conditions and the need for outside emergency medical response. Along with any necessary conditions of certification which is further analyzed in the **Worker Safety and Fire Protection** section of this document, staff concludes that with the Condition of Certification, **WORKER SAFETY-7**, the emergency medical services

provided the by the above mentioned agencies would be adequate during construction and operation.

Law Enforcement

As stated in the AFC and verified by staff (www.riversidesheriff.org), the proposed project is located with the Riverside County Sheriff's Department's (RCSD) jurisdiction. The RCSD serves several small cities and unincorporated areas within Riverside County. The Colorado River Station, nearest to the project location, provides service to the unincorporated area from Red Cloud Road on the west, to the Arizona state line on the east, and county line to county line on the north and south. The Colorado River Station is located approximately 41 miles from the project site with two deputies routinely onsite. The response time from the Colorado River Station to an emergency located at the project site would be approximately forty-five minutes if the deputies were not located at the station (SR2009a, 5.10-13).

The California Highway Patrol (CHP) is the primary law enforcement agency for state highways and roads. Services include law enforcement, traffic control, accident investigation and the management of hazardous material spill incidents. The nearest CHP office is located approximately 42 miles from the project site in Blythe, California.

In comparison to residential or commercial developments, power plants do not attract large numbers of people and thus require little in the way of law enforcement. Because of this factor and the proposed onsite safety and security measures, staff concludes that the existing law enforcement resources would be adequate to provide services to the RSEP during construction and operation.

Project operation would not result in significant demands being made on public services or facilities. The RCSD has not expressed any concerns about a need for increased services during plant operations (SR2009a, 5.10-25).

Education

The project site is located within the boundaries of the Desert Center Unified School District (SR2009a, 5.10-11). The district includes one school in the district, Eagle Mountain School, which has classes from kindergarten to eighth grade. Eagle Mountain School is located in Desert Center, which is located 62 miles from the proposed RSEP site. The current enrollment is fourteen students, and has the capacity for 140 students (SR2009a, 5.10-12). Students from ninth to twelfth grade attend Palo Verde High School (in the Palo Verde Unified School District) in Blythe, California, approximately 40 miles from the project site.

Due to the commuting habits of construction workers, staff does not expect any construction workers to relocate their families to the area. Staff does not expect a significant adverse impact to the schools from construction of the proposed project.

A total of 47 operation workers are needed to operate the RSEP. As previously stated, the applicant expects to hire the operation workforce from within the area. If all 47 operation workers relocate within the Desert Center Unified School District, an average

family size of 3.059 persons per household in Riverside County (SR2009a, 5.10-24) would result in the addition of approximately 50 children to the local schools. This would constitute approximately 5% increase in school enrollment for the two schools closest to the project. Given the capacity for students in the two above mentioned schools, staff does not expect a significant adverse impact from the possible addition of 50 school children.

As previously noted in **Socioeconomics Table 1**, other than the requirement authorized under Section 17620 of the Education Code, the Energy Commission cannot impose developer fees to mitigate the cost of school facilities. Because the project is proposed on BLM-administered lands, school impacts fees would not be applicable.

Given the small number of students who potentially could relocate to schools within the DCUSD, staff does not expect the construction or operation of the project to have a significant adverse impact on schools.

Increase the Use of Existing Recreation Facilities

The Riverside County Regional Park and Open-Space District (<http://www.riversidecountyparks.org>) maintains a variety of regional parks, nature and historic centers and recreation centers. Regional recreational facilities include thirteen parks, which are used for a variety of activities, such as picnicking, fishing, hiking/equestrian trails, barbecues, softball, soccer, overnight camping, and passive recreation. Additional amenities include; historic centers, museums, wildlife areas, and nature centers/reserves.

The Chuckwalla Valley Raceway is currently under construction on 400 acres of the Desert Center Airport property. The Chuckwalla Valley Raceway is a motor raceway operation. The multiphase project includes three road courses, a large garage enclosed field area, recreational vehicles hook-ups and a private airstrip. Private memberships and “track day” rentals are to be available. The raceway opened for business in early April 2010.

Given the labor force and two hour commuting time within Riverside and San Bernardino counties, staff does not expect employees to relocate permanently to the project area. The construction and operation workforce would not have a significant adverse impact on parks and recreation.

REDUCED ACREAGE ALTERNATIVE

The Reduced Acreage Alternative would have a 10% smaller heliostat field. It would be located in the same 2,560-acre square-shaped parcel within the larger 3,324-acre ownership property as the proposed project. Although the overall heliostat field distance from the central tower would be reduced, the number of heliostats would remain the same. The heliostat field (plus the evaporation pond and administration areas) would occupy about 1,270 acres instead of the 1,410 acres required for the proposed project. The receiver location would remain the same, with the edges of the field contracting towards the center. The heliostat footprint of the Reduced Acreage Alternative is shown in **Alternatives Figure 2**. The site layout (e.g. administration/shop building and

evaporation ponds), the height of the solar tower and receiver, and the transmission interconnection to Western's Parker-Blythe #2 transmission line would be the same as the proposed project. The generation output would be reduced by approximately 2 MW.

SETTING AND EXISTING CONDITIONS

Like the proposed project, the Reduced Acreage Alternative would be located in Riverside County; therefore the historical/projected population would be the same as described above in **Socioeconomics Table 3**.

Assessment of Impacts and Discussion of Mitigation

The environmental justice/demographic screening for the Reduced Acreage Alternative would be the same as the proposed project. Construction workers would commute from surrounding areas. Population growth and housing supply would be the same as the proposed project. Construction workers would have approximately 242 hotels/motels with 22,664 rooms in Riverside County for accommodations on a work-week basis (SR2009a, 5.10-19).

The applicant has proposed that there would be onsite fire protection systems designed to protect personnel and limit property loss and plant downtime from fire or explosion (SR2009a, 2-46). The proposed project would use the following emergency systems; steam turbine oil areas water spray system, fire hydrants/hose stations, and fire extinguishers (SR2009a, 2-46). Fire protection, including the applicant's proposed onsite Fire Protection and Prevention Plan, is analyzed in the **Worker Safety and Fire Protection** section of this document. There would no significant adverse impacts to the housing, schools, and parks. Condition of Certification **WORKER SAFETY-7** would require funding for Riverside County Fire Department and ensure that the Reduced Acreage Alternative would create a less than significant impact to Emergency Medical Services.

Gross public benefits including capital costs, construction and operation payroll, sales taxes, would be less than the benefits from the proposed project. Section 73 of the California Revenue and Taxation Code allows a property tax exclusion for certain types of solar energy systems installed between January 1, 1999 and December 31, 2016. As such, the property tax income for the Reduced Acreage Alternative would not be expected to increase significantly from the proposed project.

NORTH OF DESERT CENTER ALTERNATIVE

The North of Desert Center Alternative would be a 150 MW solar thermal facility located on approximately 2,643 acres of land, located along Desert Center Rice Road (State Route 177), east of Kaiser Road, north of Oasis Road, and approximately 1.6 miles north of I-10. The North of Desert Center Alternative is primarily private land with smaller sections of BLM land in the eastern portion of the site. It is largely fallow agricultural land. The existing Southern California Edison (SCE) 161-kV transmission

line that traverses the alternative site would be realigned. A new 0.125-mile transmission line and substation would interconnect to SCE's line at the northeast boundary of the site. The boundaries of the North of Desert Center Alternative are illustrated in **Alternatives Figure 2**.

The proposed RSEP would be located on the historic Rice Army Airfield, which also serves as habitat for desert tortoise. The proposed RSEP would narrow an existing corridor for wildlife movement, alter ephemeral streams, and could alter sand movement through the site.

SETTING AND EXISTING CONDITIONS

The North of Desert Center Alternative would be located in Riverside County, approximately 47 miles driving distance (west on Highway 62 and then south on Highway 177) from the proposed project. The historical and projected population of Riverside County would be the same as described above in **Socioeconomics Table 3**.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

For the North of Desert Center Alternative, the total population within the six-mile radius of the proposed site is 171 persons and the total minority population is 20 persons or about 12% of the total population (see **Socioeconomics Figure 2**). As with the proposed project, the census geography for this alternative would not give an accurate count of the below-poverty population.

Construction workers would commute from the surrounding counties of San Bernardino, Imperial, San Diego, Orange (California) and La Paz (Arizona). Population growth and housing supply would be the same as the proposed project. Construction workers would have approximately 242 hotels/motels with 22,664 rooms in Riverside County for accommodations on a work-week basis (SR2009a, 5.10-19). The North of Desert Center Alternative would be similar to the proposed project because the location is similar in distance to accommodations.

The North of Desert Center Alternative would be located along Desert Center Rice Road, approximately 1.6 miles north of I-10. Surrounding land uses include commercial, agriculture land uses, and the small community of Lake Tamarisk, an unincorporated town of 150 people, with one school, two churches and a fire station. Chuckwalla Valley Raceway, a member-only road course racing facility is located adjacent to the North of Desert Center Alternative. The Chuckwalla Valley Raceway is currently in the first of seven construction periods. The Chuckwalla Valley Raceway would provide the following amenities to members at full build-out: a private airport that members could fly-in and race; an 18,000 gallon fueling station; and overnight dry camping. Lake Tamarisk Desert Resort, a privately owned RV park located in the town of Lake Tamarisk, five miles of the alternative would provide nightly, weekly, monthly and dry docking for RVs.

The applicant states in the Project Description section of the AFC (SR2009a, 2-46) there would be onsite fire protection systems which are designed to protect personnel and limit property loss and plant downtime from fire or explosion. The proposed project would use the following emergency systems; steam turbine oil areas water spray system, fire hydrants/hose stations, and fire extinguishers (SR2009a, 2-46). Fire

protection, including the applicant's proposed onsite Fire Protection and Prevention Plan, is analyzed in the **Worker Safety and Fire Protection** section of this document.

The North of Desert Center Alternative would be located closer to schools and hospitals than the proposed project. The closest school and fire station would be located within the town of Lake Tamarisk, approximately 5 miles from the North of Desert Center Alternative. Hospitals that offer trauma services to patients would be closer than the proposed project, with approximately 72 miles in Palm Springs, and 121 miles in Colton. Law enforcement and emergency response would be located about 50 miles from the site, in the town of Blythe, and about 54 miles from the site in Indio/Palm Desert, respectively. Similar to the proposed project, the North of Desert Center Alternative would not create significant adverse impacts to housing, schools, and parks. Condition of Certification **WORKER SAFETY-7** would require funding for Riverside County Fire Department and ensure that the Reduced Acreage Alternative would create a less than significant impact to Emergency Medical Services.

Gross public benefits including capital costs, construction and operation payroll, sales taxes, would be similar to the benefits of the proposed project. Section 73 of the California Revenue and Taxation Code allows a property tax exclusion for certain types of solar energy systems installed between January 1, 1999 and December 31, 2016. The North of the Desert Center Alternative would be located on approximately 2,643 acres of land in comparison to the proposed project's approximate 1,410 acres of land. The additional acreage could allow for additional property taxes for Riverside County. Although the North of the Desert Center Alternative would be primarily located on non-federal land, there are smaller sections of BLM land in the eastern portion of the site. The BLM-managed lands would be exempt from property tax.

SR 62/RICE VALLEY ROAD GENERATION TIE LINE ALTERNATIVE

The SR 62/Rice Valley Road Generation Tie Line Alternative would interconnect to Western's 161-kV/230-kV Parker-Blythe #2 transmission line at the same location as the proposed project transmission line. This alternative generation tie line would exit the proposed solar facility at the northeast corner and follow State Route 62 approximately 4.5 miles east to the junction of Rice Valley Road. It would then trend south to follow the unpaved Rice Valley Road for 4 miles to its juncture with the applicant's proposed new generation tie line alignment and continue southeast for 5.4 miles along the proposed alignment to Western's Parker-Blythe #2 transmission line. The SR 62/Rice Valley Road Generation Tie Line Alternative route is illustrated in **Alternatives Figure 3**.

The SR 62/Rice Valley Road Generation Tie Line Alternative is evaluated in this SA/DEIS because it would:

1. Avoid the permanent loss of 13.4 acres of foraging and cover habitat for plant and animal species, including the state and federally listed threatened desert tortoise.
2. Avoid the creation of a new 4.6 mile vehicle access route between the proposed solar facility and the proposed junction of the new transmission line access road with the existing Rice Valley road. The proposed new vehicle access route would necessitate additional enforcement and maintenance to prevent unauthorized off-

road vehicle access, propagation of new, unauthorized vehicle routes, and consequent habitat damage, soil erosion, and vehicle disturbance.

SETTING AND EXISTING CONDITIONS

The SR 62/Rice Valley Road Generation Tie Line Alternative would be located at the same location as the proposed project generation tie line in Riverside County. The alternative generator tie-line would use existing roadways that would increase the use of public lands because it would require a longer route that would cross federal land managed by the BLM and state land managed by the State Lands Commission. The increase in length of the generator tie line, to 15.4 miles from 11.0 miles would increase the capital cost of the alternative \$4.5 million, not including additional costs for easements, land purchase options, BLM land leasing fees, additional environmental permitting studies, etc. Generation revenue would slightly diminish as attributed to power line losses over the increased length of the conductor (CH2MHill 2010d).

The SR 62/Rice Valley Road Generation Tie Line Alternative demographic characteristics would be similar to the proposed project, because the project parcel would remain the same. The SR 62/Rice Valley Road Generation Tie Line Alternative would take the most direct path to the interconnection point with the Parker-Blythe #2 transmission line.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

The environmental justice/demographic screening for the SR 62/Rice Valley Road Transmission Line Alternative would be the same as the proposed project. Construction workers would commute from surrounding areas. Population growth and housing supply would be the same as the proposed project. Construction workers would have approximately 242 hotels/motels with 22,664 rooms in Riverside County for accommodations on a work-week basis (SR2009a, 5.10-19). The SR 62/Rice Valley Road Transmission Line Alternative would be the same as the proposed the project and the there would be no displacement of housing or substantial numbers of people. In addition, there would no significant adverse impacts to housing, schools, and parks. Condition of Certification **WORKER SAFETY-7** would require funding for Riverside County Fire Department and ensure that the Reduced Acreage Alternative would create a less than significant impact to Emergency Medical Services.

Gross public benefits including capital costs, construction and operation payroll, sales taxes, would increase from the benefits of the proposed project. Section 73 of the California Revenue and Taxation Code allows a property tax exclusion for certain types of solar energy systems installed between January 1, 1999 and December 31, 2016. As such, the property tax income of the SR 62/Rice Valley Road Transmission Line Alternative would not be expected to increase significantly from the proposed project.

NO PROJECT/NO ACTION ALTERNATIVE

No Project and No Action on Rice Solar Energy Project transmission line application and interconnection request. No CDCA land use plan amendment.

Under this alternative, the proposed Rice Solar Energy Project would not be approved by the Energy Commission; BLM would not approve the transmission line application and would not amend the CDCA Plan; and Western would not approve the interconnection request. As a result, no solar energy project would be constructed on the project site, BLM would continue to manage the land encompassing the transmission line consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended, and Western would continue to operate the Parker Blythe Transmission Line under current conditions.

Because there would be no amendment to the CDCA Plan and no solar project approved for the site under this alternative, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site. As a result, no socioeconomic impacts from the proposed project would occur and the benefits of capital costs, construction and operation payroll, sales taxes and property taxes of the proposed project would not occur. In the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations.

CUMULATIVE IMPACTS

A project may result in significant adverse cumulative impacts when its effects are “cumulatively considerable.” Cumulatively considerable means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, or the effects of probable future projects (Title 14, California Code of Regulations, section 15130). Cumulative socioeconomic impacts could occur when more than one project has an overlapping construction schedule that creates a demand for workers that cannot be met by the local labor force, resulting in an influx of non-local workers and their dependents. Operational cumulative socioeconomic impacts could occur when the development of multiple projects significantly impacts the population of an area thus resulting in a housing shortage, change in local employment conditions, and an increased demand on public services.

The **Cumulative Scenario** section provides detailed information on the potential cumulative solar and other development projects in the project area. Together, these projects comprise the cumulative scenario, which form the basis of the cumulative impact analysis for the proposed project. In summary, these projects are:

- Renewable energy projects on BLM, State, and private lands, as shown on **Cumulative Figure 1** and in **Cumulative Tables 1A, 1B, and 2**. Although not all of those projects are expected to complete the environmental review processes, or be funded and constructed, the list is indicative of the large number of renewable projects currently proposed in California.

- Future foreseeable projects in the Rice Valley area as well as future foreseeable projects in the eastern Riverside County area as shown on **Cumulative Impacts Figure 2** and as listed in **Table 3**.

These projects are defined within a geographic area that has been identified by the CEC and BLM as covering an area large enough to provide a reasonable basis for evaluating cumulative impacts for all resource elements or environmental parameters. Most of these projects have, are, or will be required to undergo their own independent environmental review under CEQA and/or NEPA. Even if the cumulative projects described in the Cumulative Scenario Section have not yet completed the required environmental processes, they were considered in the cumulative impacts analyses in this document.

Geographic Extent of Cumulative Impact Analysis

The area of cumulative effect for socioeconomic resources is Riverside and San Bernardino Counties, CA. The analysis of cumulative effects considers a number of variables including geographic (spatial) limits, time (temporal) limits, and the characteristics of the resource being evaluated. The geographic scope of cumulative impact analysis is based on the workforce boundaries of the cumulative development projects. While it is possible that the geographic scope of cumulative effects will extend beyond these two counties, with some workers potentially coming from adjacent counties beyond a two-hour commute radius of the proposed RSEP site, due to the similar nature of skill set required by the workforce during construction activities, as well as the number of proposed cumulative renewable energy projects, it is not anticipated that the geographic scope for cumulative impact analysis extends beyond the scope of the direct and indirect effects of the proposed action.

Effects of Past and Present Projects

A wide variety of past and present development projects contribute to the cumulative conditions for socioeconomics. As noted above in the “Setting and Existing Conditions” subsection, past development has further urbanized the area and increased population, housing, and employment conditions. As shown in the AFC, from 2000 to 2008 the population of Riverside County increased by 3.8% and San Bernardino County by 2.3% (SR2009a, 5.10-2). This is an example of the steady growth rate that has occurred throughout the regional study area. As a result, past and present residential, commercial, and industrial development has contributed to the overall socioeconomic growth within the study area.

Effects of Foreseeable Projects

Reasonably foreseeable projects that could contribute to the cumulative effects scenario depend on the extent of resource effects, but could include projects in the immediate Rice Valley area as well as other large renewable projects in the California, Nevada, and Arizona desert regions. The projects in California are illustrated in **Cumulative Figures 1, and 2**. As shown in the map and table, there are a number of projects in the immediate area around Rice Solar Energy Project whose impacts could combine with those of the proposed project. As shown on **Cumulative Figure 1** and in **Table 1A**, solar and wind development applications for use of BLM land have been submitted for

approximately 1 million acres of the California Desert Conservation Area, Table 1B, solar and wind development applications that have been submitted for State and private lands in the California Desert that has requested ARRA funding, and **Table 2**, existing projects in the Rice Valley area as well as existing projects in the eastern Riverside County area.

As shown in **Cumulative Scenario Table 3**, Future Foreseeable Projects in the Rice Valley area and Eastern Riverside County, ID# B, SolarReserve has submitted a Plan of Development (POD) to BLM proposing the Ward Valley project; a solar thermal power plant located approximately 5 miles northwest of RSEP. The Ward Valley project proposes a total of three concentration solar power facilities with a potential for two additional facilities. Each of the five potential power plants in the project would be capable of producing approximately 500 gigawatt-hours (GWh) of renewable energy annually for each facility, each with a nominal net generation capacity of 100-250 megawatts (MW). RSEP would produce approximately 450,000 megawatt hours (MWh) of renewable energy annually, with a nominal net generating capacity of 150 MW. As shown in Table 5.10-11 in the RSEP AFC, the number of construction workers would range from a minimum of 29 in the first month to a maximum of 438 in the twelfth month of construction. In addition, the project would require 47 full-time operation employees. Assuming a 150 MW solar power project would require 438 construction workers and approximately 47 operation workers, in a worst case scenario, if all five proposed Ward Valley power plants project produced 150 MW, the Ward Valley power plant would require 2,190 construction workers and 235 operation workers. However, the SolarReserve does not plan to file an AFC for the Ward Valley project in the near term. The Ward Valley project would not result in significant adverse cumulative socioeconomic impacts because staff does not consider this project in conjunction with the effects of other probable future projects. SolarReserve has stated it does not plan to file an AFC for the Ward Valley project in the near term and the construction schedule for the Ward Valley project is undetermined at this time.

In addition, as seen in **SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 5**, if construction of the Ward Valley project was determined to be needed in the probable future, there would be a sufficient number of construction workers for cumulative construction needs.

In addition, all cumulative projects identified in **SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 5** would be expected to draw on the large regional construction workforce in and Riverside/San Bernardino/Ontario MSA, and as shown the MSA offers sufficient regional labor by skill set to staff all projects from within the regional study area. As indicated by **SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 5**, cumulative development of these projects in a worst-case scenario of overlapping peak period months could result in the influx of 1,777 construction workers seeking local lodging within the area as a result of the large renewable energy projects being constructed. Staff finds this scenario unlikely due to construction scheduling and time requirements, and notes that this assumption does not account for workers doubling up in local lodging situations. The 1,777 construction workers seeking local lodging could impact Blythe, Twentynine Palms (California and Parker (Arizona) motel accommodations. There are approximately 242 hotels/motels with 22,664 rooms in Riverside County (SR2009a, 5-10-19) to accommodate workers who may choose to

commute to the project site on a workweek basis. While staff acknowledges that cumulatively workers seeking short-term temporary housing during the workweek to avoid commuting from their homes in the regional study area could increase housing demand and population in the local area, the extent of these impacts is unknown and speculative.

Based on the availability of local housing it is assumed that ample temporary short-term housing is available for these workers from a cumulative perspective. Therefore, staff concludes that cumulative project construction within the RSEP local study area would not significantly impact the population projections or require the need for new or expanded housing within the local study area. Furthermore, as staff concludes that all workers would come from within the regional study area, with up to 15% of these workers potentially seeking short-term temporary housing during the workweek locally, cumulative construction activities would not require the need for new or expanded public services (police, schools, recreation, hospitals) serving the local study area, as no permanent population increase would occur. Staff concludes construction of the RSEP would not contribute to adverse cumulative socioeconomic impacts.

SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 5
Cumulative Project Construction Employment Needs

Local Housing Need⁸	501	573	492	55⁹	93	63	1,777	--	--

Notes: ¹ The “Construction Laborers” category was used; ² The “Plumbers, Pipefitters, and Steamfitters” category was used; ³ The “Machinists” category was used; ⁴ The “Supervisors, Construction and Extraction Workers” category was used; ⁵ The “Helpers- Construction Trades” category was used; ⁶ Includes: insulators, painters, teamsters, and ‘Solar Field Craft’. The solar field craft workers include an estimated five solar field installation crews, with each crew including a Foreman, Equipment Operators, Laborers, Electricians, Ironworkers, Carpenters, Masons, and Pipefitter/Welders; ⁷ Includes Teamsters, Heliostat Assembly Craft, Construction Staff, Subcontractors, and Technical Advisors; ⁸ Assumes 50% of workers will chose to stay locally; ⁹ On-site worker camp is provided for RSEP, providing housing for up to 300 trailers. It is assumed that 75% of the 219 workers seeking local lodging will chose to stay within the local work camp. ¹⁰ The Calico Solar Project AFC, Table 5.10-10 has the following disciplines as Electricians, Ironworkers, Laborers and Operators and Sun Catcher Electricians, Sun Catcher Ironworkers, Sun Catcher Laborers and Sun Catcher Operators For purpose of the above table, the two disciplines have been added together. Source: Solar Millennium 2009a, b, c, d, and e.

In addition, short-term construction-related spending activities of the RSEP project are expected to have cumulative economic benefits for the study area (refer below to **SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 5**). The cumulative benefits would increase when revenues accrued as a result of the proposed RSEP are combined with spending, and any local revenues accrued as a result of current and future reasonably foreseeable cumulative development projects.

Operation. SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 6 presents the most recently published data (Year 2006-2016 projections) on labor force characteristics for the cumulative regional study area pertaining to electrical energy project operational labor skill sets and compares those to major cumulative projects located near the RSEP along the I-10 corridor, including the PSPP, GSEP, and the CSP. As shown in **Table 6**, these cumulative projects are expected to result in a total of 232 workers permanently relocating to the local study area.

Based on the most recently published vacancy rates for the local study area (refer to **SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 5**), adequate permanent housing units are available to these operational employees who may choose to relocate locally to proposed cumulative development projects. Therefore, the RSEP is not expected to contribute cumulatively to a required need for new housing in the area. The BSPP, PSPP and CSP would not pay a school impact fee; however, the GSEP would pay a school impact fee. Staff concludes that any new cumulative demand on schools by permanent relocations to the local study area would be met through the payment of property taxes, which contribute to local public safety, school, and recreational facility funding. As hospitals are private supply and demand based facilities, it is assumed that the cumulative increase in local population can be adequately served by local study area emergency medical facilities. Based on these conclusions, staff finds that operation of the proposed RSEP would not contribute cumulatively to an increase in the local population or require the need for new or expanded law enforcement, school, recreational, or emergency medical facilities or staff levels within the RSEP regional or local study areas.

Please refer to the **Worker Safety and Fire Protection** section of this report for a detailed discussion of cumulative impacts to fire protection services. Please refer to the **Land Use, Recreation, and Wilderness** section of this document for further analysis of cumulative recreation impacts.

In addition, the long-term operation-related spending activities of the RSEP project are expected to have cumulative economic benefits for the study area (refer below to **SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 6**). The cumulative benefits would increase when revenues accrued as a result of the proposed RSEP are combined with spending, and any local revenues accrued as a result of current and future reasonably foreseeable cumulative development projects.

COMPLIANCE WITH LORS

Staff has considered the state laws, ordinances, regulations and standards as identified in **Socioeconomics Table 1** and has found no significant adverse socioeconomic impacts.

NOTEWORTHY PUBLIC BENEFITS

Noteworthy public benefits include the direct, indirect, and induced impacts of a proposed power plant. For example, the dollars spent on or resulting from the construction and operation of the RSEP would have a ripple effect on the local economy. This ripple effect is measured by an input-output economic model. The model relies on a series of multipliers to provide estimates of the number of times each dollar of input or direct spending cycles through the economy in terms of indirect and induced output, or additional spending, personal income, and employment. The typical input-output model used by economists and the one used for this analysis by the applicant is the IMPLAN model. IMPLAN multipliers indicate the ratio of direct impacts to indirect and induced impacts.

Staff reviewed the results of the IMPLAN model and found them to be reasonable considering data provided by the applicant as well as data obtained by staff from governmental agencies, trade associations, and public interest research groups. RSEP owners would employ workers and purchase supplies and services for the life of the project. Employees would use salaries and wages to purchase goods and services from other businesses. Those businesses make their own purchases and hire employees, who also spend their salaries and wages throughout the local and regional economy. This effect of indirect (jobs, sales, and income generated) and induced (employees' spending for local goods and services) spending continues with subsequent rounds of additional spending, which is gradually diminished through savings, taxes, and expenditures made outside the area.

For purposes of this analysis, direct impacts were said to exist if the project resulted in permanent jobs and wages; indirect impacts if jobs, wages, and sales resulted from project construction; induced impacts from the spending of wages and salaries on food, housing, and other consumer goods, which in turn create jobs. Indirect and induced economic impacts from construction would take place over 30 months, from the first quarter of 2011 to the fourth quarter 2013. Indirect and induced economic impacts from operation would begin in the first quarter of 2011. All indirect and induced operation impacts would result from annual operations and maintenance expenditures. All construction and operation impacts would take place within Riverside, San Bernardino and La Paz counties. The economic benefits of the proposed project, as required by the Energy Commission regulations and resulting from the IMPLAN model are shown below in **Socioeconomics Table 6**.

Table 6, RSEP Economic Benefits (2009 dollars)	
Fiscal Benefits	
Estimated annual property taxes	Riverside County Assessor's Office would assess the non-solar project components once construction is completed.
State and local sale taxes: Construction	\$20,092,800 (\$16,905,000/Riverside County, \$3,187,800/La Paz County)
State and local sale taxes: Operation	Approximately \$35,000
School Impact Fee	N/A
Non-Fiscal Benefits	
Total capital costs	\$750 to 850 million
Construction Payroll	\$102 million
Annual Operations and Maintenance	
Construction materials and supplies	\$241.5 million (\$193.2 million/Riverside County, \$48.3 million/La Paz County)
Operations and maintenance supplies	\$400,000
Direct, Indirect, and Induced	
Estimated Direct	
Construction	280 jobs (average for 30 months); 438 peak
Operation	47 full-time positions
Estimated Indirect	
Construction Jobs	954
Construction Income	\$38.04 million
Operation Jobs	1
Operation Income	\$66,310
Estimated Induced	
Construction Jobs	352
Construction Income	\$14.15 million
Operation Jobs	16
Operation Income	\$616,200

PROPERTY TAX

California Revenue and Taxation Code Section 73 excludes the new construction of active solar energy systems from the definition of "new construction" for property tax reassessment purposes. California Assembly Bill (AB) 1451 extends the current property tax exclusion for new construction of solar energy systems to January 1, 2017.

Upon expiration of AB 1451, Riverside County will be responsible for assessing the RSEP's property value. As stated in the AFC, Riverside County is developing a methodology to assess property values on renewable energy projects. (SR 2009a).

For Fiscal Year 2010, the property tax rate for the project site is 1.04507%. At this time, staff cannot determine the exact amount of property taxes RSEP will generate. However, the additional property tax revenues would have a beneficial impact on the county.

PROPOSED CONDITIONS OF CERTIFICATION/MITIGATION MEASURES

Staff proposes no conditions of certification.

CONCLUSIONS

The U.S. Bureau of Land Management (BLM), Western Area Power Administration (Western) and Energy Commission staff (staff), hereafter jointly referred to as agencies, have reviewed the Rice Solar Energy Project (RSEP or proposed project) in accordance with the requirements of the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA). With respect to CEQA, staff concludes that construction and operation of the Rice Solar Energy Project (RSEP) would not cause significant direct or cumulative adverse socioeconomic impacts on the study area's housing, schools and parks. Staff also concludes that the project would not induce substantial growth or concentration of population, substantial increases in demand for housing or public services, or displace a large number of people.

SOIL AND WATER RESOURCES

Testimony of Mike Conway and Abdel-Karim Abulaban, Ph.D., P.E.

SUMMARY OF CONCLUSIONS

U.S. Bureau of Land Management (BLM), Western Area Power Administration (Western) and Energy Commission staff (staff), and hereafter jointly referred to as agencies, evaluated the proposed Rice Solar Energy Project (RSEP) and have identified potential impacts to soil and water resources associated with RSEP construction, operation, and decommissioning. Where potential impacts have been identified, mitigation measures/conditions of certification have been identified that could lessen the impacts and would assure the project conforms with laws, ordinances, regulations and standards (LORS). The mitigation measures/conditions of certification serve as recommendations by staff to lessen impacts below a level of significance and to assure the project conforms to LORS in accordance with the California Environmental Quality Act (CEQA) requirements for the Energy Commission's analysis. The identification of relevant and reasonable mitigation measures also conforms with National Environmental Policy Act (NEPA) requirements for BLM's and Western's analysis.

Staff's conclusions with respect to CEQA are as follows:

- The limited data available for analysis of the Rice Valley Groundwater Basin indicate the proposed use of groundwater would not significantly impact groundwater levels in the basin, the basin balance, or quality of groundwater in the basin. Given the limited data staff has proposed Condition of Certification **SOIL&WATER-6** to establish pre-construction and project related groundwater quality and groundwater elevation levels that can be quantitatively compared against observed and simulated levels from project pumping to ensure there are no impacts to the groundwater basin as a result of project pumping.
- The proposed method of sanitary wastewater disposal by a septic system and leach field would have no significant impacts provided the requirements of Condition of Certification **SOIL&WATER-8** are met.
- The proposed project will not significantly increase or decrease erosion rates within its watershed, if Condition of Certification **SOIL&WATER-1** and **-3** are implemented as proposed during construction and operation. Staff sought input and guidance from the State Water Resources Control Board (SWRCB) to develop these Conditions.
- The SWRCB developed waste discharge requirements for the disposal of industrial wastewater in evaporation ponds. Staff proposes that the Applicant comply with these requirements as proposed in Condition of Certification **SOIL&WATER-2**.
- The proposed on-site drainage management design would perform adequately to protect against significant soil loss and any potential impacts would be mitigated if Condition of Certification **SOIL&WATER-1** is implemented as proposed.
- Based on the elements of the proposed project submitted by the applicant to date, staff believes the project would comply with all applicable federal, state, and local

laws, ordinances, rules, and standards (LORS) with the adoption of the recommended conditions of certification.

- Based on the elements of the proposed project submitted by the applicant to date, staff believes that construction and operation of the project would not result in immitigable project-specific direct or indirect or cumulative significant impacts to soil or water resources with the adoption of the recommended conditions of certification.
- According to the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (Map #06065C0575G, 2008), the site of the proposed facility is not within the 100-year floodplain; therefore, Department of Energy (DOE) will not include a floodplain assessment in the Environmental Impact Statement (EIS) as described in the DOE Regulations for Compliance with Floodplain and Wetland Environmental Review Requirements (10 CFR Part 1022).

The state has expressed a strong interest in developing its solar energy resources. However, the construction and operation of solar energy facilities requires the use of water, which state policy also protects. The Energy Commission must balance the state's interest in promoting solar energy development with its interest in conserving and protecting the state's water resources.

INTRODUCTION

This section of the Preliminary Staff Assessment (PSA) analyzes potential impacts to soil and water resources from the construction, operation and decommissioning of the Rice Solar Energy Project (RSEP). The agencies have evaluated soil and water resources impacts associated with the proposed RSEP's construction, operating and decommissioning activities. This Staff Assessment/Draft Environmental Impact Statement (SA-DEIS) meets the Energy Commission's responsibility to comply with the California Environmental Quality Act and BLM's and Western's responsibility to comply with the National Environmental Policy Act.

LAWS, ORDINANCES, REGULATIONS, AND STANDARDS

The following federal, state, and local environmental LORS were established for the Rice project and similar facilities to ensure the best and appropriate use and management of both soil and water resources. Additionally, the requirements of these LORS are specifically intended to protect human health and the environment. The potential for project compliance with these LORS is a major component of staff's determination regarding the significance and acceptability of the RSEP with respect to the use and management of soil and water resources.

SOIL & WATER Table 1
Laws, Ordinances, Regulations, and Standards (LORS)

Federal LORS	
<p>Title 33, United States Code (U.S.C.), Section 1251 et seq. — Federal Water Pollution Control Act (commonly called the Clean Water Act)</p>	<p>The Clean Water Act (CWA) established a broad national program for protecting water quality and regulating discharges of waste and pollutants into waters of the United States. It provides authority for establishment of water quality standards and waste discharge limits for point source discharges (such as those from industrial facilities, sewage treatment plants, and storm water). The act also prohibits discharges of pollutants without a permit or other authorization and allows authorized states to implement provisions of the act in lieu of the United States Environmental Protection Agency (U.S. EPA). Key CWA provisions include:</p> <ul style="list-style-type: none"> • Section 401 - Water Quality Certification requirement for federally permitted activities (such as construction) that may result in discharges to surface waters and wetlands. • Section 402 - National Pollutant Discharge Elimination System (NPDES) permit program for point source discharges (including storm water). • Section 404 – Permit program addressing discharges of dredge or fill materials into surface waters and wetlands. This section is implemented by the United States Army Corps of Engineers (U.S. ACE).
<p>Title 42, U.S.C., Section 6901, et seq. — Solid Waste Disposal Act of 1965 (as amended and revised by the Resource Conservation and Recovery Act of 1976, et al)</p>	<p>The Solid Waste Disposal Act, as amended and revised by the Resource Conservation and Recovery Act (RCRA), established requirements for the management of solid wastes (including hazardous wastes), landfills, underground storage tanks, and certain medical wastes. The law seeks to protect human health and the environment (including surface and groundwater) from improper management and disposal of waste and associated contaminants.</p>
<p>United States Department of the Interior, Bureau of Land Management, Northern and Eastern Colorado Desert Coordinated Management Plan (approved December 2002)</p>	<p>The Northern and Eastern Colorado Desert Coordinated Management Plan establishes standards, guidelines, and special area designations to address and help resolve issues of resource demands, use conflicts, and environmental quality on public lands in the area. BLM's multiple use mandate requires the plan to address a very broad spectrum of</p>

	resources and uses. The plan also incorporates provisions and designations established by the 1994 California Desert Protection Act.
State LORS	
California Constitution, Article 10, Section 2, and California Water Code (CWC), Section 100	These laws require that the water resources of the state be put to beneficial use to the fullest extent possible and that the waste, unreasonable use or unreasonable method of use of water be prevented. The laws also require that conservation of such water be exercised with a view to the reasonable and beneficial use of the water in the interest of the people and for the public welfare.
CWC, Sections 4999 - 5009	Requires groundwater users in Counties of Riverside, San Bernardino, Los Angeles, and Ventura to report groundwater extractions of 25 acre-feet per year or more to the State Water Resources Control Board (SWRCB).
CWC, Division 7, Section 13000 et seq. — Porter-Cologne Water Quality Control Act	The Porter-Cologne Water Quality Control Act (Porter-Cologne) was established to protect the water quality and beneficial uses of waters of the state. The law gives broad authority to the SWRCB and nine Regional Water Quality Control Boards (RWQCBs) to establish water quality standards and discharge prohibitions, issue waste discharge requirements, and implement provisions of the federal Clean Water Act. Under Porter-Cologne, “waters of the state” include both surface and groundwaters.
CWC, Sections 13240, 13241, 13242, 13243, & Water Quality Control Plan for the Colorado River Basin – Region 7 (Basin Plan)	The Basin Plan establishes the beneficial use designations and water quality objectives for surface water and groundwater in the Colorado River Basin Region. It also describes implementation plans and measures necessary to achieve standards and ensure compliance with both regional and statewide water quality plans and policies; and acts as the comprehensive water quality planning document for the Colorado River Basin Region.
CWC, Section 13260	Requires persons proposing to discharge waste that could impact the quality of waters of the state to file a report of waste discharge with the appropriate RWQCB.
CWC, Section 13550	This section of Porter-Cologne establishes that the use of potable domestic water for non-potable uses (including industrial use) is a waste or an unreasonable use of the water if recycled water is available and meets the following conditions: the quality and quantity of the reclaimed water are suitable for the use; the cost is reasonable; the use is not detrimental to

	public health; and the use will not impact downstream users or biological resources.
CWC, Sections 231 and 13700 et seq.	Section 231 and Division 7, Chapter 10 of the Water Code establish the authority for development and implementation of minimum water well standards for the state. Minimum standards for the construction and destruction of water wells are established in Bulletins 74-81 and 74-90, California Well Standards, by the California Department of Water Resources (DWR). A well completion report must be filed with DWR for each well that is constructed, reworked, or destroyed.
Title 17, California Code of Regulations (CCR), Division 1, Chapter 5	This chapter of the CCR addresses the requirements for backflow prevention and cross connections of potable and non-potable water lines.
Title 22 , CCR, Division 4 — Environmental Health	Title 22, Division 4 is implemented by the California Department of Public Health (CDPH) (formerly known as the California Department of Health Services). The regulations address requirements for drinking water standards, water treatment and operator certification, and water recycling criteria. Section 64431 establishes the public drinking water maximum contaminant levels (MCLs), including an MCL for nitrate of 45 mg/L (equivalent to 10 mg/L for nitrate as nitrogen). Section 64449 establishes secondary drinking water standards, including a recommended total dissolved solids (TDS) level of 500 mg/l, with an upper limit of 1,000 mg/l, and a short term level of 1,500 mg/l. Article 3 also requires monitoring of potable water wells defined as non-transient, non-community water systems (serving 25 people or more for more than six months).
Title 23, CCR, Division 3 — SWRCB and RWQCBs	These regulations implement provisions of the CWC and the Porter-Cologne Water Quality Control Act. Among other things, the regulations address water rights, implementation of the federal Clean Water Act, discharges to land, underground tanks, and waste discharge requirements/NPDES permits.
Title 27, CCR, Division 2, Solid Waste, Subdivision 1, Consolidated Regulations for Treatment, Storage, Processing or Disposal of Solid Waste.	These regulations address both the California Integrated Waste Management Board (CIWMB) and SWRCB requirements for solid waste/wastewater management units.
SWRCB Water Quality Order No. 2009-0009-DWQ	The SWRCB regulates storm water discharges associated with construction projects to protect water quality throughout the state. Effective July 1, 2010, Order No. 2009-0009-DWQ will supersede Order 99-08-DWQ and implement

	NPDES General Permit No. CAS000002 for storm water discharges associated with construction activity affecting areas greater than or equal to one acre. Those subject to the order can qualify for the permit if they meet the criteria, prepare and implement an acceptable Storm Water Pollution Prevention Plan (SWPPP) and other assessments as necessary, and file with the SWRCB all necessary Permit Registration Documents [including a Notice of Intent (NOI)] prior to beginning construction.
Warren-Alquist Act, Public Resources Code, Section 25500 et seq.	This law gives the California Energy Commission authority to certify the construction and operation of thermal electric power plants 50 megawatts (MW) or larger. The Energy Commission certification is in lieu of any permit required by state, regional, or local agencies, and federal agencies to the extent permitted by federal law (Pub. Resources Code, section 25500). The Energy Commission must review power plant applications for certification to assess potential environmental and public health and safety impacts, potential measures to mitigate those impacts (Pub. Resources Code, section 25519), and compliance with applicable governmental laws and standards [Pub. Resources Code, section 25523(d)].
Local LORS	
Title 8, Riverside County Code, Chapter 8.16 – Blowing Sand Control Regulations, Section 8.16.010 et seq.	These regulations require implementation of wind erosion controls and protections during excavation and ground disturbance on properties with sand or sandy loam soil.
Title 8, Riverside County Code, Chapter 8.124 – Sewage Discharges, Section 8.124.010 et seq.	This code section establishes the requirements and standards for the design, installation, and maintenance of onsite wastewater treatment systems (OWTS), including septic tanks and leach lines. CWC section 13282 allows RWQCBs to authorize local public agencies to issue permits and regulate OWTS. The Riverside County Department of Environmental Health implements the County Code OWTS provisions.
Title 13, Riverside County Code, Chapter 13.20 – Water Wells (section 13.20.010 et seq.)	These regulations establish the minimum well standards and permitting requirements for the construction, operation, and destruction of ground water wells within Riverside County. Wells subject to the regulations include individual domestic water wells, community water supply wells, agriculture wells, exploration holes, and monitoring wells.
Title 15, Riverside County Code, Buildings	These chapters of the County Code set forth

and Construction, Chapters 15.04 (General Provisions, Administration and Enforcement), 15.12 (Uniform Building Code) and 15.24 (Uniform Plumbing Code).	building, grading, erosion/sediment control, storm water management, and septic system plumbing requirements for all construction within Riverside County, unless otherwise specifically exempted or excluded.
State Policies and Guidance	
State Water Resources Control Board Resolution No. 68-16	The “Antidegradation Policy” mandates that: 1) existing high quality waters of the State are maintained until it is demonstrated that any change in quality will be consistent with maximum benefit to the people of the State, will not unreasonable affect present and anticipated beneficial uses, and will not result in waste quality less than adopted policies; and 2) requires that any activity which produces or may produce a waste or increased volume or concentration of waste and which discharges or proposes to discharge to existing high quality waters, must meet WDRs which will result in the best practicable treatment or control of the discharge necessary to assure that: a) a pollution or nuisance will not occur and b) the highest water quality consistent with maximum benefit to the people of the State will be maintained.
SWRCB Resolution No. 75-58 — Water Quality Control Policy on the Use and Disposal of Inland Waters Used for Power Plant Cooling (adopted June 19, 1975).	This SWRCB policy specifically addresses the use of inland waters for power plant cooling. The policy states that fresh inland waters should only be used for power plant cooling if other sources or other methods of cooling would be environmentally undesirable or economically unsound. The policy establishes a general hierarchy for cooling water whereby the lowest quality water reasonably available is to be utilized for evaporative cooling processes. It also includes cooling water discharge prohibitions.
SWRCB Resolution No. 88-63 —Sources of Drinking Water Policy	This policy states that all surface and groundwaters of the state are considered to be suitable, or potentially suitable, for municipal or domestic water supply, and should be designated as such by the RWQCBs, with the exception of certain waters (such as contaminated sources or process wastewaters).
State Water Resources Control Board Resolution No. 2005-0006	Adopts the concept of sustainability as a core value for State Water Board programs and directs its incorporation in all future policies, guidelines, and regulatory actions.
State Water Resources Control Board Resolution No. 2008-0030	Requires sustainable water resources management such as low impact development (LID) and climate change considerations, in all

	future policies, guidelines, and regulatory actions. Directs Regional Water Boards to “aggressively promote measures such as recycled water, conservation and LID Best Management Practices where appropriate and work with Dischargers to ensure proposed compliance documents include appropriate, sustainable water management strategies.”
The 2003 California Energy Commission <i>Integrated Energy Policy Report (IEPR)</i>	The 2003 <i>IEPR</i> was developed and adopted pursuant to Public Resources Code sections 25301 and 25302. It includes a water and wastewater policy stating that the Energy Commission will approve the use of fresh water for cooling purposes by power plants it licenses only where alternative water supply sources and alternative cooling technologies are shown to be “environmentally undesirable” or “economically unsound.” In addition, the policy states that the Energy Commission will also require that zero-liquid discharge technologies be used to manage project wastewater unless such technologies are shown to be “environmentally undesirable” or “economically unsound.”

Method and threshold for determining significance

This section provides an evaluation of the expected direct, indirect, and cumulative impacts to soil and water resources that would be caused by construction, operation, and maintenance of the project. Staff’s analysis of potential impacts consists of a description of the potential effect, an analysis of the relevant facts, and application of the threshold criteria for significance to the facts. If mitigation is warranted, staff provides a summary of the applicant’s proposed mitigation and a discussion of the adequacy of the proposed mitigation. If necessary, staff presents additional or alternative mitigation measures and refers to specific conditions of certification related to a potential impact and the required mitigation. Mitigation is designed to reduce the effects of potential significant project impacts to a level that is less than significant.

Impacts leading to soil erosion or depletion or degradation of water resources, including beneficial uses, are among those staff believes could be most potentially significant soil and water resource issues associated with the proposed project. The thresholds of significance for these issues are discussed below.

Soil Resources

Staff evaluated the potential impacts to soil resources including the effects of construction and operation activities that could result in erosion and downstream transportation of soils and the potential contamination of soil and water resources. There are extensive regulatory programs in effect designed to prevent or minimize these types of impacts. These programs are effective, and absent unusual circumstances, an applicant’s ability to identify and implement BMPs to prevent erosion

or contamination is sufficient to ensure that these impacts would be less than significant. In addition, soils would be protected by the development and implementation of grading plans and a DESCP. Should these assumptions and calculations be inaccurate, the consequences of modified sedimentation and erosion rates may be significant. Staff has proposed conditions of certification that would mitigate these potential impacts. The LORS and policies presented in **Soil & Water Table 1** were used to determine the threshold of significance of project impacts with respect to CEQA.

Water Resources

Staff evaluated the potential of the project's proposed water use to cause a substantial depletion or degradation of groundwater resources, including beneficial uses. Staff considered compliance with the LORS and policies presented in **Soil & Water Table 1** and whether there would be a significant California Environmental Quality Act (CEQA) impact. Compliance with LORS and policies includes the Energy Commission's and State Water Resources Control Board's policy against using freshwater for power plant cooling unless other sources or other methods of cooling would be environmentally undesirable or economically unsound.

To evaluate if significant CEQA impacts to soil or water resources would occur, the following criteria were used. Where a potentially significant impact was identified, staff or the applicant proposed mitigation to ensure the impacts would be less than significant.

- Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding or substantial erosion or siltation on or offsite?
- Would the project create or contribute runoff water that would exceed the capacity of existing or planned storm water drainage systems or provide substantial additional sources of polluted runoff?
- Would the project place within a 100-year flood hazard area structures that would impede or redirect flood flows?
- Would the project violate any water quality standards or waste discharge requirements?
- Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?
- Would the project contribute to any lowering of groundwater levels in the groundwater wells of other public or private water users?
- Would the project contribute to any lowering of the groundwater levels such that protected species or habitats are affected?
- Would the project cause substantial degradation to surface water or groundwater quality?

PROPOSED ACTION ALTERNATIVE/PROPOSED PROJECT

SETTING AND EXISTING CONDITIONS

The RSEP project would be located near the town of Rice in the eastern portion of California's Colorado Desert, along the northern edge of Riverside County. The proposed project's transmission line construction would occur in a portion of federal land administered by the Bureau of Land Management (BLM). Water resources in the proposed project's vicinity are extremely limited and vegetation sparse. Due to these limitations, there is a need for a higher degree of water use management (SR 2009a).

The proposed project would be developed on a shallow alluvial fan below the Turtle Mountains in Rice Valley. The Rice Valley extends across the Riverside and San Bernardino County line and is bound by the Big and Little Maria Mountains in the south and the Riverside Mountains in the east. The Rice Valley is hydraulically connected to both the Ward Valley to the northwest and the Vidal Valley to the northeast. Precipitation in the surrounding mountains provides the Rice Valley with water. Surface water runoff of mountain precipitation flows through washes and infiltrates into the alluvium-filled valley. The Rice Valley is topographically closed and is an area of internal drainage, with no perennial streams (USGS 1963).

The Rice Valley is approximately 355 square miles in size (DWR 1963). No permanent residents inhabit the valley. The RSEP project would be located on the site of the former Rice Army Airfield, which was abandoned between 1954 and 1958. The proposed project footprint is expected to total 1,410 acres and to utilize a configuration similar to that of the airfield in terms of drainage and disturbed areas (SR 2009a).

The valley floor ranges in elevation between 675 feet in the valley center and 1,000 feet above sea level at the mountain fronts. Mountain peaks surrounding the valley range from 2,000 to 5,866 feet above sea level (DWR 2004). The proposed project is sited near the toe of the alluvial fan that extends from the Turtle Mountains where annual rainfall is approximately four inches. The proposed project is not within an Alquist-Priolo zone. The closest identified fault is approximately 65 miles from the site. Ground rupture is unlikely at the proposed project site (SR 2009a).

Groundwater recharge to the Rice Valley is likely a result of mountain-front infiltration of precipitation. A lesser to negligible amount of recharge is expected to result from infiltration on the valley floor. Direct recharge from rainfall on the valley floor is substantially less than the potential rate of evapotranspiration and potential for soil moisture retention. Another component of recharge to the valley could also be underflow from the Ward Valley, northwest of the Rice Valley (SR 2009a).

PROPOSED PROJECT DESCRIPTION

The RSEP project would be a 150-MW capacity solar electric generating system that would be constructed between the spring of 2011 and October 2013. The design incorporates 17,500 tracking heliostats that concentrate solar radiation onto a tower-mounted receiver. The solar field would cover 1,410 acres, including the 80-acre power block in the center of the array. Each heliostat would be approximately 24 feet high and 28 feet wide, while the central receiver tower would be 653 feet tall. The solar

technology proposed by the applicant allows solar energy to be captured and retained in a liquid salt heat transfer fluid. When needed, electricity is generated by routing the hot salt through a series of heat exchangers to produce steam. The steam is then used to generate electricity in a steam turbine cycle. The project also proposes to use an air-cooled condenser to minimize water use. Three lined 5-acre evaporation ponds would contain all process blowdown and storm water drainage from the central power block (SR 2009a).

Construction would also include a 10-mile generator tie-line that would trend southeast from the project to where it could connect to the Western Area Power Administration, Parker-Blythe No. 2 transmission line. The tie-line would be constructed across land managed by BLM (SR 2009a).

A summary of the proposed project's project water uses is contained in **SOIL & WATER Table 2** below.

**SOIL & WATER Table 2
RSEP Projected Water Uses**

Water Use	Average Daily Use (gpm)¹	Annual Use (AFY)²
Heliostat Mirror Wash	51	31
Steam Cycle Makeup	52	31
Potable Water	5	3
Other uses including wet surface air cooler (WSAC), service water, quench water	62	38
Average Use Total	170	103
Margin for other uses	25	15
Total Plant Consumption	195	118
Maximum Annual Use	--	150
Wastewater Discharge		
Service water	5	--
WSAC blowdown	27	--
Hydrostatic test water	*	--
Average discharge to evap. ponds	32	~20

Storm Water and Drainage

In reference to **Soil & Water Resources Figure 1 – RSEP Proposed Drainage Plan**, the proposed project would utilize a drainage design similar to that of the former Rice Airfield. Runoff received from the north of State Route (SR) 62 would be diverted outward and away from the site's eastern boundary by re-establishing the 1940s-era diversion dike. Onsite runoff would only be contained in areas where rainwater could be

¹ Gallons per minute

² Acre-feet per year, based on 3286 hours of operation per year .

* A volume of approximately 6 million gallons will be used during hydrostatic testing. Wastewater discharge facilities shall be operational, and monitoring networks must be installed prior to discharge.

exposed to contaminants. The solar field runoff would be allowed to discharge freely with minimal concentration. Runoff generated between SR-62 and the site would be conveyed around the site's perimeter by a natural bottom channel (SR 2009a).

The existing storm water flow across the proposed project is generally from north to south, across the toe of an alluvial fan originating in the Turtle Mountains. Storm water is conveyed across the site through an extensive network of ephemeral drainages with an average slope length of 2%. All drainage in the Rice Valley flows toward the valley's topographic low point, Rice Valley dry playa. During major storm events, the ephemeral washes can flow for periods of a few hours to 24-hours with the possibility of flash floods and mass wasting. The ephemeral drainages are expected to be determined non-jurisdictional features by the Army Corps of Engineers under Section 404 of the Clean Water Act (USACE2009), but are still expected to be considered waters of the State (SR 2009a). For further discussion on the jurisdictional determination, please refer to the **Biological Resources** section.

The proposed project is sited within a previously modified drainage shed and would be constructed in the same location as the Rice Army Airfield. Directly north of the proposed location and north of SR-62 is a railroad currently owned by the Arizona and California Railroad Co. This section of railroad originally owned by Santa Fe Railroad was built no later than the early 1900s. Diversion dikes built to capture runoff from the Turtle Mountains, channel water beneath the railroad tracks. In the late 1930s, the Colorado Aqueduct was constructed immediately up gradient of the railroad. The aqueduct required its own set of dikes to channel water above the siphoned section of the canal. In its present-day state, these current dikes capture all runoff up-gradient of SR-62 and channel it across the road to the south (SR 2009a) and on to the project site.

The Rice Municipal Airport was acquired by the U.S. Army in 1942 and is presumed to have utilized the drainage system currently in place. Water generated up-gradient of the site, in the Turtle Mountains, is conveyed by two diversion dikes to around the airfield. These dikes are not currently functioning, due to a lack of maintenance since the airfield was abandoned. After the dikes were breached, it is presumed that the historical natural drainage network re-established itself. The most hydraulically significant drainages on site are those crossing SR-62 adjacent to the project. Two road crossings at SR-62, convey all drainage generated up gradient of the site through or around the project (SR 2009a).

The proposed project is located in Federal Emergency Management Agency (FEMA) Zone D, which is classified as an area with a possible but undetermined flood hazard (Map #06065C0575G, 2008). A flood hazard analysis has not yet been conducted by FEMA for this area, so the applicant completed a Conceptual Drainage Study. The proposed project is not within a 100-year floodplain (SR 2009a). Therefore, DOE will not include a floodplain assessment in the EIS as described in the DOE Regulations for Compliance with Floodplain and Wetland Environmental Review Requirements (10 CFR Part 1022).

Soil Erosion Due to Water and Wind

Construction activities can adversely impact soil resources by increasing soil erosion, soil compaction, loss of soil productivity, and disturbance of soils crucial for supporting vegetation and water dependant habitats. Activities that expose and disturb the soil leave soil particles vulnerable to detachment by wind and water. Soil erosion results in the loss of topsoil and increased sediment loading to nearby receiving waters. The magnitude, extent, and duration of those impacts would depend on several factors, including the proximity of the RSEP site to surface water and dunes, the soil types affected, and the method, duration, and time of year of construction activities. Prolonged periods of precipitation, or high intensity and short duration runoff events coupled with earth disturbance activities can result in on-site erosion. In addition, high winds during grading and excavation activities can result in wind borne erosion leading to increased particulate emissions that adversely affect air quality.

The proposed project would discharge toward the Rice Valley dry playa, which has no direct connection to a perennial stream or other navigable waters or permanent water source such as a lake or spring and do not qualify as jurisdictional features subject to regulation under the federal Clean Water Act. Soil loss from the proposed project is not expected to have a significant impact on sensitive surface waters subject to regulation under the federal Clean Water Act, because these waters are likely not present.

Development activities, including compaction associated with vehicle access, grading (in limited areas), and removal of vegetation, would generally result in reduced soil infiltration rates and an increase in the volume and velocity of runoff associated with storm events. If used, soil binders would also tend to reduce the soil infiltration rates. Erosion rates are closely associated with runoff and infiltration rates, which could be affected by land disturbance activities.

The dominant soils present on site are sand-sized grains and extremely susceptible to wind erosion. Wind erosion is likely the most significant agent of sediment transport in the region. Dune migration in the region depends on aeolian transport (SR 2009a).

Project Water Supply

Groundwater is the primary natural water supply to the Rice Valley region. The test wells developed at the site indicate groundwater occurs within an upper unconsolidated Holocene and underlying unconsolidated to semi-consolidated Pliocene alluvial unit within the valley. The upper alluvium, described as ranging between 80 and 630 feet below ground surface (bgs), contains clay to sand grains, and is dominated by finer grains. The lower alluvium occurs between 630 and 810 feet bgs and contains clay, sand, and gravel, and is dominated by coarser grains. The Rice Valley may also contain a marine to brackish sequence known as the Bouse Formation, below the lower Pliocene alluvial unit. Its presence is inferred through various studies of adjacent groundwater basins. Two known water-bearing zones were identified by the applicant, the upper unconfined aquifer, less than 400 feet bgs, and the lower confined aquifer, more than 600 feet bgs (SR 2009a).

Transmissivity within the lower alluvial water-bearing unit, estimated from well tests, is approximately 5,000 gallons per day per foot (gpd/ft), drawing up to 89% from 625 to

785 feet bgs (WP, 2009). The storage capacity on the California side of the valley of the Rice Valley groundwater basin is estimated to be between 125,000 and 2,280,000 acre-feet (af) (DWR, 2003). Various reports indicate that groundwater level trends in the basin are stable and that the basin is not in overdraft and groundwater storage has remained stable for the period of record (SR 2009a).

The natural groundwater quality varies widely, but is characterized as sodium chloride-sulfate or sodium chloride-bicarbonate (DWR 2003). Between July 2008 and August 2009, the applicant conducted a site-specific investigation of two wells, Rice #1 and Rice #2. Based on the groundwater investigation, total dissolved solids (TDS) in the project vicinity ranges from 662 to 3,540 milligrams per liter (mg/l) (SR 2009a).

The applicant has proposed to pump groundwater from one of two onsite wells for all potable water and plant operation needs. Computer modeling by the applicant of the potential impacts associated with the use of groundwater was based on both construction pump rates and also operations pump rates, assuming 750 AF of water use during the 30-month construction period and 118 AFY during the 30-year life of the project.

Groundwater will be treated onsite through a multiple step process including multimedia filters utilizing a coagulant, reverse osmosis, and electro-deionization. Prior to treatment, the expected physical and chemical composition of the water reaching the ground surface is presented below in **Soil and Water Table 2**. These estimates represent the best quality water that could be drawn from the onsite well and are based on the applicant's onsite groundwater investigation (SR 2009a).

SOIL & WATER Table 2
Expected Groundwater Quality

Parameter	Concentration
Total Dissolved Solids (TDS)	880 mg/L
Hardness as CaCO ₃	142 mg/L
Copper	<0.011 mg/L
Iron	<0.064 mg/L
Chlorides	508 mg/L
Specific Conductance	2,010 µS/cm
pH	8.3

Source: (SR 2009a).

Note: mg/L = milligrams per liter; µS/cm = microsiemens per centimeter.

WASTEWATER

Both domestic/sanitary wastes and industrial process wastewater would be generated by construction and operation of the proposed RSEP. During construction, sanitary wastes would be managed using portable toilets and showers, with collected wastes trucked offsite for disposal. A temporary septic tank and leach field may also be used near the construction trailers and crew parking and housing areas.

During operation, the RSEP would manage domestic/sanitary wastes through the use of two separate septic systems: one located near the facility's main entrance that would service the administration building and workshop; and one located within the facility power block that would be connected to the control and operations building. Industrial process wastewaters generated during facility operation and water collected in equipment drains within the power block would be discharged to three five-acre, lined evaporation ponds located at the southern end of the project site, just outside the heliostat field. A system of floor drains, hub drains, sumps, and piping would collect containment area wash down and storm water from facility areas within the power block. Water from these areas would be collected and then routed to a wastewater collection system with an oil/water separator. Effluent from the oil/water separator would then be discharged to the evaporation ponds (SR 2009a).

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Construction of the proposed project would include soil excavation, grading, installation of utility connections, and the use of groundwater. Groundwater use would primarily be for dust suppression and hydrostatic testing of the proposed project's piping connections. Potential impacts to soils related to increased erosion or release of hazardous materials are possible during construction. Potential storm water impacts could result if increased runoff flow rates and volume discharge from the site were to increase flooding and sedimentation downstream. Water quality could be impacted by discharge of hazardous materials released during construction. Project water demand could affect the quantity of available groundwater. Potential construction related impacts to soil, storm water, and water quality or quantity, including the Applicant's proposed mitigation measures and staff's proposed mitigation measures are discussed below.

Operation of the proposed project could lead to accelerated soil erosion and increased storm water runoff. The project's operation could also lead to potential water quality and water supply impacts. Soils may be potentially impacted through erosion or the release of hazardous materials used in the operation of the proposed project. Storm water runoff from the project could result in potential impacts if increased runoff flow rates and volumes discharged from the project increase erosion of the soil and increase downstream flooding. Water quality could be impacted by discharge of eroded sediments from the project or discharge of hazardous materials released during operation. Water supply used for plant processes, heliostat mirror washing, and fire protection could lead to potential quantity or quality impacts to Rice Valley groundwater resources. Potential impacts to water quality and water supply and the potential acceleration of soil erosion and increased storm water runoff related to the operation of

the project, including the applicant's proposed mitigation measures and staff's proposed mitigation measures, are discussed below.

Storm Water and Drainage

The proposed project would be located near the toe of an alluvial fan that originates in the Turtle Mountains. Storm water runoff either percolates into the soil of the alluvial fan or is conveyed through the alluvial fan wash channels or as sheet flow across the fan. Several project features would contribute to the potential for increased water erosion, including earth displacement, the long duration for construction, and changes to the properties of the soil. Construction of the proposed project would change natural drainages, remove natural vegetation and soil structure, add small amounts of impervious areas to the site, and could cause an increase in storm water runoff (SR 2009a).

To support the final design parameters for design of the drainage system for the project, the applicant conducted an onsite investigation of the hydrology of the project area and computer modeling of the storm flows. The applicant initially characterized existing runoff and flows using the Soils Conservation Service (SCS) methodology, similar to that utilized in the Riverside County Hydrology Manual, and utilized the Bentley Pondpack to design the onsite detention basin. The applicant provided further analysis in response to staff's data requests regarding drainage conveyance, and utilized Bentley Flowmaster to calculate flows in the site's east and west diversion channels. The applicant utilized soil data available through the Natural Resource Conservation Service (NRCS), and precipitation data from the National Oceanic Atmospheric Administration (NOAA) Precipitation Frequency Atlas. The potential storm water capture area for the project was determined by the applicant to be 4,568 acres. Peak flows from each of the sub-watersheds within the drainage was determined to range from 1.8 cubic feet per second (cfs) to 622 cfs. **SOIL&WATER Table 3** below summarizes the pre-and post-construction flow conditions within the proposed site's vicinity. The peak flow was calculated from the 100-year, 24-hour event (SR 2009a).

SOIL & WATER Table 3
Change in Storm Water Runoff and Peak Flow Volume

Sub-Area	Area (acres)	Peak Discharge (cfs) Pre-Const.	Peak Discharge (cfs) Post-Const.
1	1,472	563	563
2	2,398	622	622
3	9.9	1.8	1.8
4	98	10	10
5	89	9.78	9.78
6	186	17.7	17.7
7	212	15.2	15.2
8	103	9.9	9.2
9 (Project Site)	1369	91	91

Source: (SR 2009a).

Storm water flow volume and velocity are affected by surface infiltration rate and the roughness of the flow surface. Construction, operation, and decommissioning of the proposed project may modify the infiltration rate through several processes, including earthmoving, compaction, and use of dust suppressants.

On-site Drainage

While the proposed project would minimize disturbance of vegetation during construction and operations, long-term response of vegetation to the site development is difficult to predict. Onsite drainage is that generated within Sub-Area 9, described in **SOIL & WATER Table 3** above. This drainage area includes the entire solar field. All drainage will collect at the south end of the project in a shallow 30-acre detention facility. This unlined basin will allow for discharge through either infiltration or through a discharge pipe at the lower end of the basin. The function of the discharge pipe would be to maintain the pre-developed discharge rate for the 100-year, 24-hour storm. This pipe would allow the basin to discharge at a maximum rate of 91 cubic feet per second (cfs). The project would result in an increase in impervious area within Sub-Area 9, from construction of an administration building, a warehouse, power block areas, and a perimeter road. These new impervious areas are not expected to increase either volume or rate of discharge from this sub-area significantly because their acreage is small compared to the overall site, except the powerblock, which will be protected with gravel mimicking existing site conditions. On-site activities such as maintenance in the solar field are expected to have a minor affect on soil compaction and soil infiltration capacity. The increase in flow is expected to be insignificant because all onsite water will be captured within the on-site detention basins and discharged at a rate no greater than 91 cfs. The Applicant's proposal to capture sediment on-site also provides reassurance that industrial contaminants, if generated within the heliostat field, will not be transported off-site.

Staff believes that the detention of on-site flows would result in a less than significant modification of local hydrology when compared to the volume and velocity of storm water that flows from the Turtle Mountains. Onsite storm water would be collected in on-site detention basins, with a capacity of approximately 30 acre-feet. The detention basin would return all design storm flows to their pre-project runoff rate via discharge through a pipe.

The applicant submitted a Drainage Erosion and Sediment Control Plan (DESCP) in the original AFC and a revised version in a data response 4-27-10 (Docket TN 56445) that includes Best Management Practices (BMPs) that reduce the potential for on-site contaminants coming into contact with storm water. The draft DESCP also describes the use of the detention basin described above. Staff concludes the proposed on-site drainage management design would protect upstream and downstream resources and any potential impacts would be mitigated if Condition of Certification **SOIL&WATER-1** is implemented as proposed.

Off-site Drainage

As proposed, the graded project site would be left in a natural state and slope towards the south with a slope of approximately 2%. Two proposed earthen-bottomed and soil cemented drainage channels intercept storm water run-on from the northern site boundaries and convey it around the project through the channels. The proposed outlet

structures would allow for a transition of flow to its original velocity and depth. The eastern diversion channel could handle flows between 659 and 1,460 cubic feet per second (cfs) depending on the channel bottom width, 30 to 600 feet wide. The western diversion channel could handle flows between 16 and 47 cfs, with bottom widths 5 to 15 feet. Designed site drainages convey the 100-year storm. Grading plans propose to use soil cement as necessary to ensure channel and drop structure stability. Staff agrees that soil cement will be necessary to protect all channel banks and drop structures, given the proposed velocities and slope lengths. Soil cement would also be necessary to prevent headward erosion at the north end of the channel that receives flow.

Staff's analysis concurs with the Applicant's conclusion that sediment loss or gain would be minor. The proposed drainage diversion allows a historically similar volume of water and sediment conveyance to and around the site perimeter. Storm water entering the diversions from upstream areas is already saturated with sediment and has limited ability to acquire more sediment.

Proposed drainage channels may be subject to scour and erosion, which could alter their hydraulic capacity or functionality or create erosion towards the solar field. The RSEP project would alter natural storm water drainages but is not expected to significantly alter sediment migration patterns within the drainage area if a maintenance program is implemented. Maintenance of drainage channels and diversions is required to ensure peak flood flows are routed away from the solar field. Staff believes the applicant should be required to develop and implement a channel maintenance program, which will ensure that the project's channels perform at design capacity throughout the life of the project. Condition of Certification **SOIL&WATER-1 and -3** would require that the applicant identify activities and procedures needed to maintain the design capacity of the drainage features to avoid future potential on-site flood related impacts. Condition of Certification **SOIL&WATER-3** requires the project owner prepare a channel maintenance program and obtain Compliance Project Manager (CPM) approval prior to implementation. These conditions will require the applicant to identify activities and procedures needed to maintain the design capacity of the drainage features to avoid future potential flood related impacts.

Staff reviewed the applicant's hydrologic calculations in the Conceptual Drainage Plan and Data Responses to evaluate the off-site areas tributary to the RSEP. Historically storm water from off-site areas would form a braided channel network, south of SR-62. As proposed, the RSEP project would concentrate a portion of these flows to protect the property. The applicant proposes two diversion channels, along both east and west edges of the solar field. The minor washes intercepted by the diversions will return to their original discharge rate after discharging through a dissipation device at the south end of the project. Staff reviewed the applicant's drainage design drawings and assumptions and agrees that the proposed diversions adequately convey run-on around the project and will return flow to its upstream volume and flow rate prior to discharge, without affecting upstream or downstream resources.

Staff also assessed the potential for the proposed drainage design to cause impacts related to off-site flooding. Staff reviewed appropriate federal, state and local guidelines and specifications applicable to engineered channels. Staff used these criteria to examine the applicant's flood management plan and to provide comment on the

limitations and thresholds of the plan to avoid potential impacts. Staff concludes the proposed off-site drainage management design would perform adequately and any potential impacts would be mitigated if Condition of Certification **SOIL&WATER-1** and **-3** are implemented as proposed.

Soil Erosion Due to Water and Wind

Construction activities can lead to adverse impacts to soil resources including increased soil erosion, soil compaction, loss of soil productivity, and disturbance of soils crucial for supporting vegetation and ephemeral water dependant habitats. Activities that expose and disturb the soil leave soil particles vulnerable to detachment by wind and water. Soil erosion results in the loss of topsoil and increased sediment deposition downstream. To minimize the effects of construction to the soil the applicant proposes to remove only enough top soil to remove vegetation (SR 2009a).

The magnitude, extent, and duration of those impacts depends on several factors, including the exposure of the soils to water and wind, the soil types affected, and the method, duration, and time of year of construction activities. Prolonged periods of precipitation or high intensity and short duration runoff events coupled with earth disturbance activities, which can result in accelerated onsite erosion. High winds during grading and excavation activities can result in wind borne erosion leading to increased particulate emissions that adversely impact air quality. The implementation of appropriate erosion control measures would help conserve soil resources, protect downstream properties and resources, and protect air quality. Condition of Certification **AQ-SC3** in the **Air Quality** section requires an Air Quality Construction Mitigation Plan to prevent significant impacts from fugitive dust and wind erosion during construction. These prevention measures include: employing an on-site mitigation manager, limiting vehicle speed to 10 miles per hour during construction; requiring all unpaved roads and disturbed areas and linear construction sites to be watered as frequently as necessary during grading and stabilized thereafter with a non-toxic soil stabilizer or soil weighting agent to comply with the dust mitigation objectives; and establish performance standards for controlling fugitive dust and requirements for response should they be exceeded. The requirement to use soil weighting and bonding agents following grading would conserve freshwater by reducing the need for water as a means to control fugitive dust.

The Natural Resources Conservation Service (NRCS) classifies soils at the project site as almost entirely Rosaritos-Carrizo, which developed through both alluvial and aeolian processes. An on-site geotechnical investigation describes the soil characteristics similarly. The investigation included eight test borings up to 87 feet below ground surface and concluded that the site soils are primarily silty sand (SM). A sieve and hydrometer analysis concluded that the percentage of sand in the samples ranges between 55 and 91% by weight (SR 2009a).

These soils are primarily classified as hydrologic group A soils, which are expected to have rapid permeability rates and low(er) rates of runoff. The NRCS reports a soil erodibility factor K-factor of 0.10 to 0.24 for these soils, indicating a relatively low erodibility. These factors were used by the applicant to estimate soil loss. The Revised Universal Soil Loss Equation, version 2 (RUSLE2) was used to estimate potential soil

loss on site during both construction and operations. In its undisturbed state, the project area could lose approximately 21 tons/acre/year due to water erosion, during the proposed 30-month construction period. If the project applies effective sediment and erosion control BMPs during construction, soil loss could be approximately 1.12 tons/acre/year. The proposed project would have even lower rates of erosion during the operations phase of the project, because on-site storm water would be completely contained (SR 2009A).

Local soils are poorly consolidated and highly susceptible to wind erosion. After reviewing the applicant's analysis of projected soil loss rates, Staff performed its own analysis to estimate a worst-case scenario. Staff's predicted wind erosion rates are similarly high for the existing site condition and the construction phase. The estimated wind erosion rate for these phases is 315 tons/acre/year and 342 tons/acre/year, respectively.

The applicant proposes regular applications of dust palliatives and water that would reduce wind erosion. Reduced wind erosion would also result in reduced mirror damage due to sediment abrasion. If utilized during construction, regular water applications could reduce soil losses to 264 tons/acre/year. During operations, the proposed project expects to reduce wind erosion to 13 ton/acre/year (USDA 2010). Staff believes these BMP's would be sufficient to mitigate potential impacts from wind erosion.

SOIL & WATER Table 4
Soil Loss Estimates Due to Wind Erosion

Activity	Soil Loss, No BMPs (tons/acre/year)	Soil Loss, With BMPs (tons/acre/year)
Undisturbed (current condition)	315	-
Construction	342	264
Operations	342	13

Notes:

1. Estimates generated using USDA application WEPS 1.0
2. Estimates for "Soil Loss, With BMPs" assume water or other dust suppressant

A draft project grading plan and Storm Water Pollution Prevention Plan (SWPPP) was prepared by the applicant that includes Best Management Practices (BMPs) for wind and water erosion control during project construction. Though a SWPPP would not be applicable to the proposed project, it contains the necessary element of a Drainage, Erosion, and Sediment Control Plan (DESCP). All elements of the originally proposed SWPPP are contained in the revised DESCP submitted to staff in response to Data Request 121 and docketed 4-27-10 (CH2MHill 2010f). The implementation of appropriate control measures described in this plan would help conserve soil resources, maintain water quality, prevent accelerated soil loss, and protect air quality. The erosion and sedimentation control measures include applying water or soil binders to the roads in active construction and laydown areas; controlling speed on unpaved surfaces; installing stabilized entrances/exits; use of earthen berms, silt fences, or fiber rolls to control sedimentation; and preserving existing vegetation. During grading work, soil

would also be stabilized by maintaining sufficient water content to make it resistant to weathering and erosion by wind and water.

To reduce the impact of these development activities on infiltration, runoff, and erosion, the applicant proposes to implement BMPs to reduce the impact of development to less than significant. The goal of the applicant's proposed BMP implementation plan is to maintain the functions of the soil system while minimizing the risk of accelerated erosion and increased storm water runoff. Specific BMPs will be described in the applicant's final DESCP and required in Condition of Certification **SOIL&WATER-1**. The DESCP would include the applicant's construction phase and operations phase storm water quality protection measures. Staff worked with the State Water Resources Control Board (SWRCB), to ensure that Condition of Certification **SOIL&WATER-1** contains measures necessary to effectively protect the waters of the State. **SOIL&WATER-1** would require the Applicant to submit the final DESCP to the SWRCB for review and comment.

Transmission line construction would result in soil disturbance by vehicles and other equipment during installation. Use of construction BMPs in these areas is expected to control soil loss during construction and to mitigate potential impacts to air and downstream properties and resources. Soil erosion and loss of top-soil due to project activities could be substantial and would need to be mitigated. The proposed erosion and sedimentation control measures include: preserving the existing vegetation to the extent possible; wetting or using soil binders or weighting agents active construction and laydown areas; controlling speed on unpaved surfaces; and placing gravel in entrance ways. Staff recommends the development and implementation of specific BMPs to address transmission line construction within the Rice Valley. A DESCP prepared in accordance with Condition of Certification **SOIL&WATER-1** would ensure adequate BMPs are in place to mitigate otherwise undue erosion and loss of soil from transmission line construction activities..

Project Water Supply

Staff has analyzed the project's proposed groundwater use to determine if it would cause substantial depletion or degradation of local or regional groundwater quality and supply. Water for the proposed construction and operation phases of the project would be drawn from two onsite wells. One well is currently installed, another would be drilled early in the construction phase. The currently installed well, Rice 2, produces water representative of the proposed project supply. Groundwater will be processed through pretreatment and purified for use as boiler makeup water and for heliostat washing. Groundwater will also be used to a lesser extent for hydro-testing of the liquid salt system, fire suppression supply, and for domestic and sanitary uses. During plant operation, potable water would be supplied by onsite well water. Potable water would be used for drinking and sanitary uses. The estimated annual potable water demand during plant operation would be approximately 3 acre-feet or less. Groundwater from onsite wells would also be used to meet the project's construction water demands. Construction of the proposed project is expected to take 30 months. Water use during the grading phase of construction is supposed to be approximately 35 AF per month, while use during the remainder of the construction period would be approximately 24 AF per month. This equates to a rate of approximately 637 acre-feet per year (AFY) during

the first 10 months of construction and about 253 AFY during the remainder of the construction period. **Soil & Water Table 5** below presents a summary of the rate of water use during construction.

SOIL & WATER Table 5
Estimated Daily and Annual Construction Water Demands

Project Phase	Average Annual Construction Water Demand (AFY)	Water Supply Source
Months 0 - 12	420	Onsite Groundwater Wells
Months 13 - 30	240	

Source: (SR 2009a).

Note: Additional water could be used during construction for hydrostatic testing of the proposed project's piping.

The project also proposes to use groundwater during plant operations. A maximum consumptive use has been estimated at approximately 150 AFY, while the average use is expected to be approximately 118 AFY. Groundwater would be pumped at this rate for the 30-year life of the project and used for steam-cycle makeup, heliostat washing, liquid salt system testing during commissioning, boiler makeup, and for domestic uses. **Soil & Water Table 6** below summarizes the volume of water the project proposes to use for all power plant process and potable water needs during the operational life of the project (SR 2009A).

SOIL & WATER Table 6
Estimated Annual Operational Water Demands

Water Use	Water Source	Approximate Annual Use (AF)
Heliostat washing	Groundwater Wells	31
Steam cycle makeup	Groundwater Wells	31
Potable water	Groundwater Wells	3
WSAC, other service	Groundwater Wells	38
Margin	Groundwater Wells	15
Avg. Annual Consumption	--	118

Source: (SR 2009a).

Note: Based on 3,286 hours of operation per year.

Drinking Water Supply

The RSEP will provide drinking water for its employees during both construction and operation. Well water would need to be treated to meet the California Safe Drinking Water Act requirements, including those contained in Title 17 and Title 22 of the California Code of Regulations (CCR).

The RSEP would qualify as a Public Supply System by serving more than 25 people for more than 60 days. The RSEP is expected to employ 47 full-time employees during operations and many more during construction. The facility would also qualify as a nontransient noncommunity water system, serving 25 persons for over 6 months per year.

Senate Bill 1307 passed in 1997, which enabled California to implement the provisions of the federal Safe Drinking Water Act. The California Department of Public Health administers the state's authority. The California Department of Public Health has authority to delegate regulatory authority, over public water supplies serving 200 or fewer connections, to a local health officer authorized by the board of supervisors. The Riverside County Department of Environmental Health regulates all such projects in Riverside County, including the RSEP.

Staff recommends Condition of Certification **SOIL&WATER-9**, which would require the applicant to obtain a permit to operate a non-transient, non-community water system with the County of Riverside at least sixty (60) days prior to commencement of construction at the site. This condition would ensure that the applicant meets all provisions of Title 22, Section 3 to provide a suitable domestic water supply.

Impacts to Wells

Analysis of potential changes in groundwater levels from project pumping was necessary in order to evaluate whether there would be any impacts to other groundwater wells. Drawdown or a decrease in groundwater levels due to groundwater pumping can result in significant impacts when the pumping results in lower groundwater levels in nearby wells. These impacts can be both short- and long-term. Interference or drawdown can result in increased pumping lifts and declines in well productivity. Mitigation of these impacts could require costly modifications including the cost of lowering pumps, the cost of deepening a well, and well redevelopment costs. Substantial increases in pumping lift can also cause substantial increases in energy costs.

The magnitude of groundwater drawdown impact is controlled by five factors: (1) the rate of pumping; (2) the duration of pumping; (3) the depth of the well screens (water-intake depth of well); (4) aquifer parameters; and (5) aquifer boundary conditions. Aquifer parameters, such as specific yield and hydraulic conductivity, are controlled by layering and thickness of the water bearing materials such as gravel, sand, silt, and clay. The composition and flow characteristics of an aquifer can vary widely.

Rice Valley currently contains no known pumping. The Applicant provided a description of all wells within five miles of the project, but none are currently being pumped. The California DWR has very limited groundwater level data for the Rice Basin. No reliable record of water levels exists for the Rice Valley area. DWR data only spans a few years at a time. The most significant use of water within the basin may have been during the operation of the Rice Army Airfield. Staff was unable to determine the extent of pumping

during base operation. Many of the wells were completed prior to the construction of the airfield and have since collapsed. Groundwater extractions were estimated at 1 AFY in 1952.

The applicant ran a model to determine the drawdown in groundwater levels resulting from their activities. One of the fundamental assumptions made by the applicant to run the simulation model was that the aquitard separating the surface and deep aquifers terminates at the mountain fronts and that all the recharge from the mountain fronts, goes directly to the lower aquifer. Based on limited data from adjacent groundwater basins and regional geologic information, staff believes that this is an inaccurate representation of the geology of that aquifer and the adjacent aquifers. If the aquitard is not present by the mountain fronts that means that the upper and lower aquifers would be connected and that the potentiometric head in the lower aquifer would be about the same as the water table elevation in the upper aquifer. However, the limited data about static water elevation in the lower aquifer in applicant's well Rice #2 showed that the static elevation in the lower confined aquifer was about 90 feet lower than the water table elevation in the unconfined upper aquifer. The fact that there is such a great difference between the potentiometric head in the lower aquifer and the water table elevation in the upper aquifer suggests that the two aquifers are disconnected. Also, as discussed below in further detail, the geology of the area suggests that it is more likely that the aquitard extends along the mountain fronts, suggesting that the mountain front recharge in fact goes to the upper aquifer, not the lower one.

The assumption made by the applicant, that recharge from the mountain fronts feeds into the confined aquifer, is not a conservative one, and would result in underestimation of well drawdown. Staff performed computations using the Theis equation similar to what the applicant used to estimate drawdown caused by the pumping well. The Theis equation is a mathematical solution for calculating drawdown from two-dimensional radial flow to a point source in an infinite, homogeneous aquifer. However, staff removed the affects of the image wells that were used by the applicant to model recharge of the lower aquifer and estimated drawdowns from project pumping that are roughly double the applicant's estimates (approximately 3.53 ft vs. about 1.8 ft).

Staff was unable to identify any wells within the Rice Valley that were being used for beneficial purposes. As a result, the limited data available for characterization of the aquifer system in Rice Valley indicate the drawdown predicted would not have a significant impact on other groundwater users in the basin. Although the lack of any other current groundwater users in the basin indicate there is no potential for significant impacts due to lower groundwater levels, staff believes that given the limited data available for analysis of groundwater impacts it is important to protect limited and precious desert groundwater resources for further and future beneficial uses. Staff believes the applicant should be required to comply with Condition of Certification **SOIL&WATER -6**. This condition would require the applicant to monitor groundwater levels and evaluate whether there is any significant change in levels due to project pumping as predicted by the model and whether there would be affects to future users.

Basin Balance

Estimating groundwater recharge is critical to estimating the balance of groundwater available for development in a given basin without causing significant impacts to basin

storage. **Soil and Water Table 7** presents a summary of estimates of groundwater recharge in the Rice Valley. The estimates of recharge vary due to assumptions about the combined hydrologic and geographic constraints.

SOIL & WATER Table 7
Groundwater Recharge Estimates Summary

Method	Estimate Basis	Source	Estimated Groundwater Recharge (AFY)
Modified Hely and Peck ¹	Rainfall	Applicant	1,160
Unknown	Underflow*	DWR	500
Regional Data/Percentage ²	Rainfall	CEC Staff	468
Modified DWR ³	Underflow*	Applicant	394
Modified Maxey-Eakin ⁴	Rainfall	CEC Staff	159

*Documentation of estimation method is unavailable.

The United States Geological Survey (USGS) and DWR performed the most significant research within Rice Valley. A commonly referenced work in these historic studies was a comprehensive study of the Mojave and Colorado Desert water resources by David Thompson, published in 1929. Later studies by the USGS and DWR frequently cite this study as one of the few in the region. The Rice Valley is still poorly understood geologically. Limited information is available about the boundary conditions of the basin, making an assessment of underflow in and out of the basin difficult. DWR classifies the basin as having a poorly understood groundwater budget, "Type C" (DWR 2004, Bedinger et al.1989).

All recharge estimates for the Rice Valley assume steady-state-equilibrium within the groundwater basin. This assumes that basin inflows and outflows are in equilibrium. This condition is supported by steady groundwater levels recorded by the Department of Water Resources (DWR) between 1962 and 1983 (DWR 2004). This assumption makes it possible to determine basin recharge by quantifying basin inflows or outflows. It is therefore not necessary to differentiate between basin inflows from underflow, versus inflows from mountain-front recharge. Methods summarized in **Soil and Water Table 7** estimate recharge based on either an inflow or outflow condition.

Discharge of underflow can be estimated using equation $Q = (T)(I)(W)$, where Q is the discharge volume, T is transmissivity, I is water level gradient across basin boundaries, and W is the width of the boundary gap at the water table (Freiwald 1983). If a reasonable estimate of the basin's boundaries could be made, an estimate of underflow-outflow would also be a good estimate of basin inflows. Though some geophysical basin boundary information is available for the Rice Valley (Bedinger 1989), this data is not useful for constraining outflow conditions. Not only are there no cross-sections directly across or parallel to basin boundaries, but well data from either side of the boundary gaps are limited. The water levels most pertinent to assessing gradient across the basin boundaries date back as far as 1917 (DWR 1954), and were taken from wells that have since collapsed.

The Rice Valley is unlikely to have any significant outflows, other than through underflow. Because the Rice Valley basin contains no significant pumpers (1 AFY in 1952) (DWR 2004), and the central playa is dry and does not appear to be hydrologically connected to the groundwater table (SR 2009A), extraction and evapotranspiration are considered to be insignificant sources of outflow for the purposes of this assessment.

Following a comprehensive review of available sources, Staff assessed the two most reasonable locations for basin outflows, through the northeast Grommet gap, and through the southeast Big Wash gap (Thompson 1929). The National Research Council also considers these pathways possible, following an examination of connectivity between Ward Valley and the Colorado River (NRC 1995). Both gaps contain alluvial fill to a surface elevation of approximately 950 feet above mean sea level (amsl). A USGS cross-section across the SE gap indicates a possible obstruction to outflow due to a metamorphic basement. The same report indicates that groundwater in the Rice Valley moves primarily through the SE gap (Bedinger 1989). Staff is unable to reconcile this potentially conflicting information. With so little information available about possible underflow-outflow at this gap, Staff is unable to draw conclusions about outflow at the SE gap. No additional information was recovered in Staff's literature review regarding outflow quantities at this gap (Thompson 1929; DWR 1954, 1963; Hely and Peck 1969; Metzger et al. 1973; Bedinger 1989; Owen-Joyce and Wilson 1994; Owen-Joyce et al. 2000; Wiele et al. 2008; Leake et al. 2008).

The NE gap appears to contain alluvial fill as indicated in various USGS and DWR publications (DWR 1954, 1963; Thompson 1929; Bedinger 1989). Its alluvial depth is unknown. Cross-sections across this boundary are not available. The width of the basin gap, at the water table, is not known. After a review of maps and surface topography, Staff estimates the width of the NE gap at the water table to be between two to six miles (Wiele et al. 2008).

The well data necessary to determine a gradient across each of these gaps is limited. Thompson, 1929, indicated that a gradient of up to 10 feet per mile could be possible from Rice to Vidal through the NE gap. USGS well data suggests the gradient across the SE gap could be as great as 16 feet per mile towards the Colorado River. These gradients would only be representative of the valley's boundary conditions if subsurface conditions were continuous and un-obstructed by faulting, etc. In the absence of comprehensive subsurface geology and water level data across the gaps, Staff is reluctant to assign a gradient for underflow-outflow from Rice Valley (Thompson 1929; DWR 1954, 1963; Hely and Peck 1969; Metzger et al. 1973; Bedinger 1989; Owen-Joyce and Wilson 1994; Owen-Joyce et al. 2000; Wiele et al. 2008; Leake et al. 2008).

A representative transmissivity across each boundary is also very difficult to determine. The Applicant's groundwater investigation indicates the transmissivities in the upper and lower aquifer are about 96 ft²/day and 5,000 ft²/day, respectfully. The difference in transmissivities is very large, which makes any determination of an underflow-outflow calculation subject to a large error. Staff's review of literature did not reveal any additional representative transmissivities within Rice Valley. Historic values documented in USGS and DWR documents are very limited (Thompson 1929; DWR 1954, 1963; Hely and Peck 1969; Metzger et al. 1973; Bedinger 1989; Owen-Joyce and Wilson

1994; Owen-Joyce et al. 2000; Wiele et al. 2008; Leake et al. 2008). The Applicant's Groundwater Investigation was most useful in providing an expected transmissivity value for the upper and lower aquifer, but Staff is still reluctant to assume a rate of ground water transmission across the basin's boundaries.

Staff chose to estimate groundwater recharge in the Rice Valley based on available studies of recharge in the Sonoran Desert Region (Bedinger 1989) and the Basin and Range geologic province (Maxey and Eakin 1949). The Sonoran Desert is widely considered to be less dry than the Mojave Desert and other areas west of 116 degrees latitude. Staff modeled rates of recharge based on empirical data derived from basin studies of similar climatic regions including basins north of Rice in Nevada and other basins within the Sonoran Desert (Bedinger 1989). Staff chose two methods for estimating recharge, both with very conservative assumptions. Staff's first method is the "Modified Maxey-Eakin" method. Staff's second method is the "Percentage" method. It is important to note however that historical documentation does not show the presence of a lower alluvial aquifer as discovered in the applicant's groundwater resources investigation. All historical data describes what the applicant refers to as the upper alluvial aquifer. Staff still decided to investigate recharge to the upper alluvial aquifer like previous studies of the region. The recharge of the upper alluvial aquifer may still provide some guidance on the general availability of water in the region.

Staff utilized precipitation data provided by the PRISM (PRISM 2006) precipitation model, a United States Department of Agriculture geospatial dataset. The PRISM model enabled Staff to bracket average annual precipitation zones for the years 1971-2000, within the Rice hydrologic unit. (Please see **Soil & Water Figure 2 – Precipitation Within the Watershed Recharging Rice Valley Groundwater Basin.**) The Applicant provided data derived from Hely and Peck, 1964, which was also considered by staff, but staff did not believe it was adequate for providing a worst-case estimate. Hely and Peck isohyets estimate a greater average annual rainfall rate than those provided by PRISM.

Staff's Modified Maxey-Eakin method uses a methodology utilized by Donovan and Katzer, 2000. Donovan and Katzer's method extrapolates recharge estimates for areas with very low annual precipitation, between 0 and 8 inches. Similarly, Avon and Durbin's 1994 study revealed a recharge rate of 1.1% in 0-8 inch annual rainfall zones (Avon and Durbin, 1994; Donovan and Katzer, 2000). Like Donovan and Katzer, staff's method applies a recharge percentage of about 0.01% to the 1-inch annual precipitation zone, 0.1% to the 3-inch zone, and 1.0% to the 6-inch zone. Staff's calculations using this method, are summarized in **SOIL & WATER Table 8**. Staff used the lower end of the range of data available for each region. This method agrees with the general principle that recharge occurs due to run-off from mountain slopes. The five, and seven-inch mountain zones are most likely to result in recharge along the mountain-front, where concentrated flow reaches the alluvial basin. The resulting estimate of 159 AFY is staff's lower bound estimate for possible recharge to Rice Valley.

Staff also estimated recharge based on conclusions of Metzinger, 1989, about recharge in the Sonoran Desert. Metzinger concluded that within the Sonoran Desert, recharge from mountain peaks is likely less than 6 mm and that recharge in the basins is likely less than 2 mm. This agrees with Staff's investigation of available literature and

documentation on the region (Thompson, 1929; DWR, 1954, 1963; Hely and Peck, 1969; Metzger et al., 1973; Bedinger, 1989; Owen-Joyce and Wilson, 1994; Owen-Joyce et al., 2000; Wiele et al., 2008; Leake et al., 2008). Staff also agrees with the conclusion that three times the volume of rain falling in the mountains is likely to become recharge, when compared with that falling in the basin valley floor. A study summarized by Metzinger, concluded that Basin and Range recharge varies between 0.7% and 7%. Staff applied the lower bound of this range, 0.7%, to the basin of Rice Valley, equivalent to 0.021 inches of recharge per year. An application of the 3:1 ratio for mountain to basin provides a rate of 0.063 inches per year going to recharge from the mountain peaks. The resulting recharge volume ratio is approximately 1.5 mm to 0.5mm, well within the range suggested by Metzinger of less than 6 mm to less than 2 mm. The resulting recharge using this method is 468 AFY. Staff's estimates are contained in **SOIL & WATER Table 9**.

Staff believes that both applicant-determined and staff-determined recharge estimates summarized in **SOIL & WATER Table 7** are reasonable and well supported by opportunities for underflow-outflow at the NE and SE basin boundary. Staff attempted to evaluate a worst-case scenario for groundwater recharge, by assuming that the lower bound averages for annual precipitation in each zone and by assuming minimal percentage of precipitation goes to recharge of the confined aquifer.

As was mentioned above, the applicant assumed that recharge from the mountain fronts feeds the confined aquifer, which is not a conservative assumption as it results in smaller drawdown in the aquifer. The only way the recharge from the mountain front can go into the lower aquifer is if the lower aquifer discharge point is lower than the standing water elevation in well Rice #2, and that would imply that the aquitard goes upward in the northeast direction such that the two aquifers remain separated. However, the water elevation in the Vidal aquifer, which is the likely receiver of any underflow outflow from Rice Valley is higher than the potentiometric head in Rice Valley's confined aquifer. Therefore, with the very limited geologic information at hand, and given the potentiometric head in the confined aquifer which is lower than the water table in the upper aquifer, staff believes that the only plausible explanation is that the bedrock underlying the confined aquifer slopes upward toward the boundary with Vidal Valley and intersects with the aquitard above, thereby terminating the confined aquifer at that boundary. Following this logic, staff further believes that the mountain front recharge goes into the surface aquifer and subsequently discharges into Vidal Valley, which is a very likely scenario given the fact that the water elevation in the Vidal Valley aquifer is slightly lower than the water table elevation in the upper Rice Valley aquifer.

In light of the foregoing, the only possible source for any water that would be extracted is aquifer storage. However, given the total volume pumped by the plant for the lifetime of the project of about 5,250 AF and the lowest estimates that could be found of the total storage volume of the Rice Aquifer, the applicant's use would not exceed 3% of total basin storage and would not cause an adverse impact on the stored volume of the aquifer.

Due to lack of information available about Rice Valley and the range of reasonable estimates for recharge to groundwater, staff proposes to limit groundwater use resulting from the proposed project. To ensure that the RSEP's water use is consistent with the

volume of groundwater use analyzed by staff, Condition of Certification **SOIL&WATER-5** would limit construction water use to average 420 AFY and operation water use to 150 AFY. Staff also points out that there are variations in the natural environment that could affect the results predicted by a groundwater model. To ensure that the predictive results of the groundwater model are representative of site conditions, staff recommends Condition of Certification **SOIL&WATER-6** which would require the project to establish a groundwater monitoring network and monitor and document groundwater use, groundwater levels, and groundwater level trends. This condition of certification would provide a baseline of groundwater elevations and groundwater elevation trend to identify potential future changes to groundwater elevations owing to the project's pumping.

Groundwater Quality

Water quality can be impacted by migration of low quality or contaminated water towards pumping wells and by sustained pumping of the groundwater basin. By providing a measure of water salinity, total dissolved solids (TDS) is a primary indicator of the natural quality of groundwater and is a measure of acceptance for the use of groundwater as a drinking water source. Water with TDS concentrations greater than 3,000 mg/l is generally considered undrinkable. In California, the recommended Secondary MCL or 'Consumer Acceptance Contaminant Level' for TDS is 500 mg/l, and upper and short term ranges can be 1,000 and 1,500 mg/l, respectively (DWR 2004).

The natural groundwater quality in the Rice Valley groundwater basin varies widely, but can be characterized as sodium chloride-sulfate or sodium chloride-bicarbonate (DWR 2004). Between July 2008 and August 2009, the applicant conducted a site-specific investigation of two wells, one screened in the upper alluvial aquifer, Rice #1, and the other in the lower confined aquifer, Rice #2. Based on the groundwater investigation, TDS in the project vicinity ranges from 662 to 3,540 milligrams per liter (mg/l). A three-day pump test of Rice #2, produced water ranging from 1,220 mg/L TDS at the beginning of the test to 885 mg/L TDS at the end of the test. The proposed project would likely draw water of a similar quality during both construction and operation. Based on the pump tests described in the AFC, the project would likely draw water from the lower alluvial aquifer of 885 mg/L TDS, or lower throughout the operational life of the project. A summary of the expected water quality from onsite production wells is contained in **SOIL & WATER Table 2**.

The upper alluvial aquifer contains water with TDS of approximately 3,000 mg/L as indicated from samples of Rice #1. The lower alluvial aquifer contains water with TDS of approximately 900 mg/L as indicated from pump tests of Rice #2. As discussed above the two units appear to be separated by a low permeability, confining layer that limits communication between the two aquifers based on the difference in hydraulic head. The standing water in Rice #1 is approximately 90 feet above the confined water in Rice #2. The contrast in water quality between the two aquifers may also suggest there is limited communication between the aquifers. Staff evaluated the potential increase in vertical gradient created by project pumping that may induce flow from the upper alluvial unit into the lower, through the confining zone. Staff calculated the increase in vertical gradient created by project pumping. The pumping would create an increased downward gradient from the upper alluvium towards the lower confined aquifer. The area across which the pumping could induce flow is equal to the area of the simulated cone of depression. Staff calculated the annual volume of flow that could be induced from the confining unit into the lower alluvial aquifer. Staff concluded that the confining unit is sufficiently thick, 150-300 feet, and of low enough hydraulic conductivity that induced flow of lesser quality water into the lower alluvial unit is negligible in volume. Assuming the aquatard has a storativity less than that of the lower aquifer (0.0001 assumed by applicant), the volume induced through the confining layer would be less than 5 AF/y. Staff computed the volume of stored water in the lower confined aquifer, within the Rice Valley groundwater basin and got a number very similar to DWR's

2,280,000 AF. Therefore, the proportion of water flow induced from the upper confining layer even if high in TDS would not cause significant degradation to the lower aquifer. In addition, as discussed above staff has shown that the assumptions about recharge to the lower aquifer are appropriate and drawdown could be significantly great, up to double those predicted by the applicant's model. These increases in drawdown could also change gradients in the basin and result in drawdown affects that cross basin boundaries or have a more widespread regional effect on the confined aquifer. Staff's review of the applicant's modeling indicates that drawdown from the proposed pumping could be much greater than that proposed by the applicant. Given staff's interpretation that there is likely a hydrogeologic connection of the confined aquifer with groundwater in the adjacent Ward Valley, project pumping could induce or increase flow from the Ward Valley. Staff also has not seen any other historical data on water quality for the aquifer system at the site other than what the applicant has provided. It is unknown how extensive the confined and overlying unconfined aquifer system is beyond the site wells because there is no subsurface data available. Project pumping could induce flow of an unknown quality from an unknown source outside the Rice groundwater basin. Due to the unknown nature and extent of the regional aquifer system, the unknown extent of the confining layer, the unknown distribution of water quality, the significantly higher drawdowns predicted by staff due to project pumping, and limited pumping data from adjacent groundwater basins, staff believes the applicant should be required to monitor the water quality to determine if there are any changes or potential impacts to future users of groundwater in Rice Valley or its adjacent basins. To further evaluate basin water quality and ensure no impacts to the basin water quality, Condition of Certification **SOIL&WATER-6** requires that the project monitor water quality in the on-site extraction wells, and collect water samples semi-annually and report the results annually to the Energy Commission.

Industrial Process Wastewater

The project proposes to use three five (5)-acre, double-lined evaporation ponds to manage the industrial wastewaters generated by the power block. Each brine pond would have an average design depth of at least six feet to allow for one foot of sludge build up, three feet of operational depth, and two feet of freeboard. The ponds would be constructed and lined as follows:

- a base layer consisting of either a geosynthetic clay liner (GCL) or 2 feet of onsite material with a hydraulic conductivity of less than 1×10^{-6} cm/sec;
- a secondary HDPE liner (minimum of 40 mil);
- a leak detection and removal system comprising a geonet and collection sump; and
- a primary 60 mil high density polyethylene (HDPE) liner at the surface of the ponds.

The wastewater to be discharged into the evaporation ponds is anticipated to be non-hazardous; however, it would contain pollutants which could exceed water quality objectives or affect the beneficial uses of ground water, if released. Therefore, the wastewater would be classified as a "designated waste." This classification would be consistent with CCR Title 27, Chapter 3, Subchapter 2, Article 2, Section 20210.

In California, discharges of wastes to land that may impact the beneficial uses of waters of the state, such as the proposed use of evaporation ponds for disposal of designated waste, would be regulated by the State and Regional Water Boards. The Colorado River Basin Regional Water Quality Control Board (CRBRWQCB) has jurisdiction over the area where the RSEP would be located. Normally the CRBRWQCB would evaluate the proposed discharge and issue Waste Discharge Requirements (WDRs) setting forth the conditions under which the discharge would be allowed. However, as noted previously, the Warren-Alquist Act (Pub. Resources Code § 25500) identifies the Energy Commission's power plant siting certification to be "in lieu of" any other state, local, and regional permits, including non-federal WDRs adopted by the CRBRWQCB.

In light of the in-lieu permit provisions, staff coordinated environmental review of RSEP project application materials (including a draft Report of Waste Discharge) with the State Water Board and CRBRWQCB. Water Board staff reviewed the project ROWD and the proposed waste discharge for compliance with waste management and water quality protection standards, and provided to the Energy Commission draft waste discharge requirements for the project evaporation ponds. These requirements are included in this staff assessment as Appendices B and C.

Appendix B presents the WDRs for the evaporation ponds, including information describing the environment and waters potentially impacted by the discharge, the anticipated waste streams, the proposed design of the ponds, and the discharge specifications, prohibitions, and provisions deemed necessary by the CRBRWQCB. The WDRs include requirements for implementation of a monitoring and reporting program (including development of a groundwater monitoring network). They also include a requirement for establishment of a bond or other financial assurance mechanism to be used by the Energy Commission for cleanup and remediation of any wastewater releases in the event that the project owner fails to perform that duty for whatever reason. Appendix C presents the required Monitoring and Reporting Program for the evaporation ponds. It establishes how and when the project would monitor the discharge and operation of the ponds to both document and prevent unauthorized releases of wastewater.

Staff concurs with the requirements set forth in Appendices B and C and, pursuant to the in-lieu permitting function of the Energy Commission's certification, proposes adoption of Condition of Certification **SOIL & WATER-2** requiring project compliance with the provisions of Appendices B and C. The requirements provided in Appendices B and C establish a comprehensive set of standards, specifications, and prohibitions that are designed to protect the waters of the state from any potential adverse impacts associated with onsite management of project wastewaters.

Domestic/Sanitary Wastewater

As noted previously, the RSEP would utilize two separate permanent septic systems (septic tanks and leach fields) to collect and treat all sanitary and domestic wastewater from sinks, toilets, showers, and kitchens located onsite. One system would be located

near the facility's main entrance and would service the administration building and workshop. The other system would be located near the control and operations building within the facility power block.

The use of septic tanks and leach fields for onsite treatment and disposal of domestic wastes is an established practice. However, improper construction and operation of these systems may adversely impact nearby surface and ground waters. To ensure protection of human health and the environment from improper disposal of sewage, Riverside County adopted Ordinance 650 (Chapter 8.124 of the Riverside County Code) establishing specific requirements for the discharge of sewage within the unincorporated areas of the County. Included in the requirements are soil percolation standards; minimum separation/set back distances to prevent impacts to groundwater and nearby water wells; and septic tank and leach field design, sizing and construction standards to ensure adequate capacity and proper treatment and disposal of the wastewaters. The County Code also requires persons constructing septic systems to apply for a permit for the construction and operation of the system.

In response to staff workshop inquiries, the applicant provided a Conceptual Septic System Design and Layout Memorandum for the RSEP (**CH2MHill 2010e**). While adjustments may be made to locations, sizing and soil substrate during final design of the system, the preliminary design and location plans provided are consistent with the established Riverside County Code requirements. The septic system to be located by the administration building would be sized to accommodate 66 fixtures, which would require use of a 2,750 gallon minimum volume septic tank. The second system to be located in the power block would be sized to accommodate 52 fixtures, which would require use of a 2,250 gallon septic tank. The applicant proposes to use the most conservative leach field design parameter of one square foot of leaching area per gallon of septic tank capacity. Therefore, the septic tank near the administration building would have a 2,750 square foot disposal field, and the power block system would have a 2,250 square foot disposal field. The County Code requires that septic systems be at least five feet above groundwater and eight feet above bedrock. Construction of the project septic systems would easily meet these criteria because the depth to groundwater in the project area is greater than 250 feet and the depth to bedrock is at least 800 feet. Given the site conditions and proposed design criteria for the RSEP, no significant adverse impacts to soil and water resources are anticipated from construction and operation of the project septic systems.

However, consistent with the CEC's in-lieu permit provisions, staff proposes adoption of Condition of Certification **SOIL&WATER-8** requiring compliance with the requirements of the County of Riverside Ordinance Code Title 8, Chapter 8.124 and the California Plumbing Code (California Code of Regulations Title 24, Part 5) for all project sanitary waste disposal facilities, such as septic systems and leach fields. Adoption of Condition of Certification **SOIL&WATER-8** would both ensure compliance with LORS and, through the protectiveness provided by the County regulatory standards, reduce potential impacts from project septic systems to a less than significant level.

Contaminated Soil and Groundwater

The applicant performed a Phase I and II Environmental Site Assessment (ESA) in 2009. The reports conclude that soils beneath the site are not significantly impacted with hazardous substances as a result of historical site activities.

Project Closure and Decommissioning

After the end of the project's useful life, it would be decommissioned as described in the AFC. The removal of the existing facility could cause substantial disturbance to soil and water resources and result in significant impacts. These impacts would be similar to impacts that could occur during construction.

To mitigate for any potential significant impacts associated with project closure, staff proposes **SOIL&WATER-10**, which would require the project owner to prepare a decommissioning plan that meets the requirements of the BLM. The plan would identify likely decommissioning scenarios and develop specific decommissioning plans for each scenario that will identify actions to be taken to avoid or mitigate long-term impacts related to water and wind erosion after decommissioning. Actions may include such measures as a decommissioning SWPPP, revegetation and restoration of disturbed areas, post-decommissioning maintenance, collection and disposal of project materials and chemicals, groundwater well abandonment, and access restrictions.

REDUCED ACREAGE ALTERNATIVE

The Reduced Acreage Alternative would be 7.2% smaller than the proposed project. It would be located in the same 2,560-acre square-shaped parcel within the larger 3,324-acre ownership property as the proposed project. Although the overall heliostat field distance from the central tower would be reduced, the number of heliostats would remain the same. The heliostat field (plus the evaporation pond and administration areas) would occupy about 1,270 acres instead of the 1,370 acres required for the proposed project. The receiver location would remain the same, with the edges of the field contracting towards the center. The heliostat footprint of the Reduced Acreage Alternative is shown in **Alternatives Figure 2**. The site layout, 653-foot total height of the solar tower and receiver, and transmission interconnection to Western's Parker-Blythe No. 2 transmission line would be the same as the proposed project. The generation output would be reduced by approximately 2 MW.

Similar to the proposed project, the Reduced Acreage Alternative would transmit power to the grid through the planned Western substation to be located adjacent to Western's Parker Blythe 161 kV transmission line.

The Reduced Acreage Alternative is evaluated in this SA/DEIS because it would eliminate about 100 acres of the proposed project footprint, reducing impacts to ephemeral washes, the loss of land considered habitat for the state and federally listed threatened desert tortoise and impacts to the historic Rice airfield. The Reduced Acreage Alternative would allow the applicant to contribute clean, renewable energy to

help meet the State's energy goals, while minimizing impacts to the desert environment. A limited acreage alternative was suggested in scoping comments.

Under the Reduced Acreage Alternative, the agencies would approve a facility with a 7.2% heliostat field reduction and not the 150 MW project that is proposed.

Setting and Existing Conditions

The setting for the Reduced Acreage Alternative is the same as for the proposed project except that the heliostat field would occupy 1,270 acres within the 1,370-acre footprint of the proposed project.

Assessment of Impacts and Discussion of Mitigation

The Reduced Acreage Alternative is unlikely to significantly change the impacts to soil and water resources or mitigation proposed by staff for Proposed Project.

NORTH OF DESERT CENTER ALTERNATIVE

The North of Desert Center Alternative would be a 150 MW solar thermal facility located on approximately 2,643 acres of land. It is located along Desert Center Rice Road (State Route 177) east of Kaiser Road, north of Oasis Road, and approximately 1.6 miles north of I-10. The North of Desert Center Alternative is primarily private land with smaller sections of BLM land in the eastern portion of the site. It is largely fallow agricultural land. An existing SCE 161-kV transmission line traverses the alternative site. The boundaries of the North of Desert Center Alternative are illustrated in **Alternatives Figure 2**.

The North of Desert Center Alternative would require an approximately 4.6-mile transmission interconnection. The transmission interconnection would exit the site and proceed southeast for approximately 2.5 miles. The transmission line would then turn directly south for approximately 2.1 miles and enter the proposed Red Bluff Substation from the north.

The Desert Center Alternative is evaluated in this SA/DEIS because it would reduce impacts to cultural resources; the RSEP is located on the historic Rice Army Airfield. The North of Desert Center Alternative would allow the applicant to contribute clean, renewable energy to help meet the State's energy goals, while minimizing impacts to the desert environment.

Setting and Existing Conditions

Soil and Water Resources

Soils in the North of Desert Center Alternative site include primarily Rositas and Carsitas series. Other soil series mapped for the North of Desert Center Alternative include Vaiva, Quilotosa, Hyder, Cipriano, and Cherioni (Soil Survey Staff 2009). These soils are generally formed in mixed alluvium and in sandy deposits blown from alluvium (CPUC 2006). Soil types include sandy to coarse sandy loam, fine sand, stony sand, very

gravelly coarse sand, and very stony coarse sand. Soils containing high percentages of fine sands and silt and that are low in density are generally the most erodible. These soil types generally coincide with soils such as young alluvium and other surficial deposits as within the alternative site (CPUC 2006). Approximately 3,000 acres of land on this alternative site would be disturbed by the construction.

The North of Desert Center Alternative site lies within the Chuckwalla Valley Groundwater Basin part of the Colorado River Hydrologic Region. The site is located on fallow agriculture land. A main wash crosses the northern section of the alternative site. This wash supports desert dry wash woodland and would be considered waters of the state under the jurisdiction of the CDFG and could potentially be considered waters of the U.S. under the jurisdiction of the ACOE. However, based on review of regional aerial photography, it does not appear that this wash is connected to any waters of the U.S. A focused delineation may be necessary to confirm that this is the case. Topography on the North of Desert Center Alternative site is relatively flat, with elevation ranging from approximately 500 to 700 feet above mean sea level, from the north to the south.

As with the proposed RSEP site, the North of Desert Center Alternative would use groundwater as the water supply.

Environmental Impacts

Soil Erosion Potential by Wind and Water. As discussed in the **Soils and Water** section of this SA/DEIS, construction activities can lead to adverse impacts to soil resources including increased soil erosion, soil compaction, loss of soil productivity, and disturbance of soils crucial for supporting vegetation and water-dependent habitats. Activities that expose and disturb the soil leave soil particles vulnerable to detachment by wind and water. Soil erosion results in the loss of topsoil and increased sediment loading to nearby receiving waters. Although access to the site would be from existing roads, construction of the solar fields would require substantial grading as in the proposed project. While the volume of earth movement required at the alternative site is unknown, the topography and slope of the North of Desert Center Alternative site are less severe than at the proposed RSEP site.

Being situated in a flat area downstream of a major desert wash, portions of the Desert Center Alternative would be subject to sediment deposition and flooding from large floods on crossing the site. This impact would primarily affect the project itself, but the adverse effect could be significant. It may not be possible to practically mitigate this impact except by mapping and avoiding the severe hazard areas, which would result in a smaller alternative.

As at the RSEP site, grading plans, a Storm Water Pollution Prevention Plan (SWPPP), and a Drainage Erosion and Sediment Control Plan (DESCP) could be required. Due to the flat terrain and existing disturbed condition of this site, the SWPPP and/or DESCP would likely be sufficient to mitigate soil erosion impacts to a level less than significant.

Project Water Supply. The North of Desert Center Alternative site would require the use of groundwater. It is unknown if there is sufficient groundwater available at the

North of Desert Center Alternative; however, the alternative site has supported irrigated agriculture in the past, primarily jojoba. The analysis of the applicants proposed water use at the RSEP site suggests that Colorado River water may be withdrawn from production wells over the life of the Project. At present, it is unclear when and if the US Bureau of Reclamation will promulgate regulations concerning the identifying users of Lower Colorado River water. The North of Desert Center Alternative conditions of certification would require that the Project owner assess the applicability of any regulations concerning use of Colorado River water.

Wastewater/Storm Water Quality. Storm water runoff from the site during construction and operation could have similar impacts as proposed for the proposed project. The site construction will require a SWPPP which will specify Best Management Practices (BMPs) to minimize or eliminate water contamination. Water quality impacts would likely not be significant.

Sanitary waste disposal would likely be through on-site facilities as for the proposed project. No significant adverse impact is anticipated.

Comparison to Proposed Project. The level terrain with minimal existing drainage ways on the North of Desert Center Alternative results no lessening of impacts to hydrology, water use and water quality, as compared with the proposed project. As with the RSEP, a finding by the U.S. Army Corps of Engineers of whether the ephemeral drainages on the North of Desert Center Alternative site are jurisdictional waters of the U.S. would be required. Without this determination, staff cannot determine whether the Project would comply with Section 404 of the Clean Water Act.

Assessment of Impacts and Discussion of Mitigation

The North of Desert Center Alternative is unlikely to change the impacts to soil and water resources or mitigation proposed by Staff for the Proposed Project.

SR 62/RICE VALLEY ROAD GENERATION TIE LINE ALTERNATIVE

The SR 62/Rice Valley Road Generation Tie Line Alternative would interconnect to Western Area Power Administration's (Western) 161-kV/230-kV Parker-Blythe No. 2 transmission line at the same location as the proposed project transmission line. This alternative generation tie line would exit the proposed solar facility at the northeast corner and follow State Route 62 approximately 4.5 miles east to the junction of Rice Valley Road. It would then trend south to follow the unpaved Rice Valley Road for 4.0 miles to its juncture with the applicant's proposed new generation tie line alignment and continue southeast for 5.4 miles along the proposed alignment to Western's Parker-Blythe No. 2 transmission line. The SR 62/Rice Valley Road Generation Tie Line Alternative route is illustrated in **Alternatives Figure 3**.

The SR 62/Rice Valley Road Generation Tie Line Alternative is evaluated in this SA/DEIS because it would:

1. Avoid the permanent loss of 13.4 acres of foraging and cover habitat for plant and animal species, including the state and federally listed threatened desert tortoise.
2. Avoid the creation of a new 4.6 mile vehicle access route between the proposed solar facility and the proposed junction of the new transmission line access road with the existing Rice Valley road. The proposed new vehicle access route would necessitate additional enforcement and maintenance to prevent unauthorized off-road vehicle access, propagation of new, unauthorized vehicle routes, and consequent habitat damage, soil erosion, and vehicle disturbance.

Setting and Existing Conditions

The SR 62/Rice Valley Road Generation Tie Line Alternative would not significantly change the setting or existing conditions previously described by Staff for the Proposed Project.

Assessment of Impacts and Discussion of Mitigation

The SR 62/Rice Valley Road Generation Tie Line Alternative is unlikely to change the impacts to soil and water resources or mitigation proposed by Staff for Proposed Project.

NO PROJECT/NO ACTION ALTERNATIVE

No Project and No Action on Rice Solar Energy Project transmission line application and interconnection request. No CDCA land use plan amendment.

Under this alternative, the proposed Rice Solar Energy Project would not be approved by the Energy Commission; BLM would not approve the transmission line application and would not amend the CDCA Plan; and Western would not approve the interconnection request. As a result, no solar energy project would be constructed on the project site, BLM would continue to manage the land encompassing the transmission line consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended, and Western would continue to operate the Parker Blythe Transmission Line under current conditions.

Because there would be no amendment to the CDCA Plan and no solar project approved for the site under this alternative, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site. As a result, none of the impacts to soil or water resources from the proposed project would occur. In the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations.

CUMULATIVE IMPACT ANALYSIS

Geographic Extent

If cumulative impacts to soil and water resources were to occur as a result of the proposed project, it would be either within the Rice Valley Groundwater Basin or within the Rice Valley Watershed or Sub-Watershed.

Existing Cumulative Conditions

There are currently no facilities or projects within the vicinity that significantly impact soil or water resources. The RSEP does not contribute significantly to the environmental condition of soil and water resources due to existing projects in the area.

Future Foreseeable Projects

No reasonable foreseeable project within the vicinity will cause an impact to soil or water resources. In combination with future foreseeable projects, RSEP would not cause a cumulative impact to soil and water resources in the area.

Overall Conclusion – Cumulative Impacts

No cumulative impacts to soil or water resources were identified by Staff.

COMPLIANCE WITH LORS

CLEAN WATER ACT

Staff has determined that the proposed project would satisfy the requirements of the SWQCB with the adoption of the following Conditions of Certification: 1) Development of the DESCP in accordance with **SOIL&WATER-1**; 2) Compliance with wastewater discharge requirements in accordance with **SOIL&WATER-2** and as specified in Appendix B and C. In addition, the applicant would be required to comply with California Department of Fish and Game's Streambed Alteration Agreement requirements in accordance with Conditions of Certification for Biological Resources.

SWRCB RESOLUTION 75-58, ENERGY COMMISSION'S 2003 INTEGRATED ENERGY POLICY REPORT, AND THE WARREN-ALQUIST ACT

The California Energy Commission, under legislative mandate specified in the 2003 *Integrated Energy Policy Report (IEPR)*, would approve the use of fresh water for cooling purposes by power plants it licenses only where alternative water supply sources and alternative cooling technologies are shown to be environmentally undesirable or economically unsound. SWRCB Resolution 75-78 states that fresh inland waters should only be used for power plant cooling if other sources or other methods of cooling would be environmentally undesirable or economically unsound. . The Warren-Alquist Act promotes all feasible means of water conservation. The proposed power plant includes a steam turbine using an air-cooled condenser, which achieves maximum water conservation associated with cooling. Therefore, the proposed project complies

with the requirements of SWRCB Resolution 75-78, the Energy Commission's 2003 Integrated Energy Policy Report (IEPR), and the Warren-Alquist Act.

NOTEWORTHY PUBLIC BENEFITS

Staff has not identified any noteworthy public benefits of the proposed project that are associated with soil and water resources.

RESPONSE TO AGENCY AND PUBLIC COMMENTS

No comments were received for the RSEP.

MITIGATION MEASURES/PROPOSED CONDITIONS OF CERTIFICATION

The following Conditions of Certification meet the Energy Commission's responsibility to comply with the California Environmental Quality Act and serve as recommendations for the Energy Commission to consider in its decision to avoid or reduce the severity of impacts to less than significant and to assure conformance with LORS. The identification of relevant and reasonable mitigation measures also conforms to National Environmental Policy Act (NEPA) requirements for U.S. Bureau of Reclamation's (BLM's) and Western Area Power Administration's (Western's) analysis that can be considered in their Records of Decision.

DRAINAGE EROSION AND SEDIMENTATION CONTROL PLAN

SOIL&WATER-1: Prior to site mobilization, the project owner shall obtain the CPM's approval for a site specific DESCOP that ensures protection of water quality and soil resources of the project site and all linear facilities for both the construction and operation phases of the project. This plan shall address appropriate methods and actions, both temporary and permanent, for the protection of water quality and soil resources, demonstrate no increase in off-site flooding potential, and identify all monitoring and maintenance activities. The project owner shall complete all engineering plans, reports, and documents necessary for the CPM to conduct a review of the proposed project and provide a written evaluation as to whether the proposed grading, drainage improvements, and flood management activities comply with all requirements presented herein. The plan shall be consistent with the grading and drainage plan as required by Condition of Certification **CIVIL-1** and shall contain the following elements:

Vicinity Map: A map shall be provided indicating the location of all project elements with depictions of all major geographic features to include watercourses, washes, irrigation and drainage canals, major utilities, and sensitive areas.

Site Delineation: The site and all project elements shall be delineated showing boundary lines of all construction areas and the location of all existing and proposed structures, underground utilities, roads, and drainage facilities. Adjacent property owners shall be identified on the plan maps. All maps shall be presented at a legible scale

Drainage: The DESCPC shall include the following elements:

- a. Topography. Topography for off-site areas to define the existing upstream tributary areas to the site and downstream to provide enough definition to map the existing storm water flow and flood hazard. Spot elevations shall be required where relatively flat conditions exist.
- b. Proposed Grade. Proposed grade contours shall be shown at a scale appropriate for delineation of on-site ephemeral washes, drainage ditches, and tie-ins to the existing topography.
- c. Hydrology. Existing and proposed hydrologic calculations for on-site areas and off-site areas that drain to the site; include maps showing the drainage area boundaries and sizes in acres, topography and typical overland flow directions, and show all existing, interim, and proposed drainage infrastructure and their intended direction of flow.
- d. Hydraulics. Provide hydraulic calculations to support the selection and sizing of the on-site drainage network, diversion facilities and BMPs.

Watercourses and Critical Areas: The DESCPC shall show the location of all on-site and nearby watercourses including washes, irrigation and drainage canals, and drainage ditches, and shall indicate the proximity of those features to the construction site. Maps shall identify high hazard flood prone areas.

Clearing and Grading: The plan shall provide a delineation of all areas to be cleared of vegetation and areas to be preserved. The plan shall provide elevations, slopes, locations, and extent of all proposed grading as shown by contours, cross-sections, cut/fill depths or other means. The locations of any disposal areas, fills, or other special features shall also be shown. Existing and proposed topography tying in proposed contours with existing topography shall be illustrated. The DESCPC shall include a statement of the quantities of material excavated at the site, whether such excavations or fill is temporary or permanent, and the amount of such material to be imported or exported or a statement explaining that there would be no clearing and/or grading conducted for each element of the project. Areas of no disturbance shall be properly identified and delineated on the plan maps.

Soil Wind and Water Erosion Control: The plan shall address exposed soil treatments to be used during construction and operation of the proposed project for both road and non-road surfaces including specifically identifying all chemical based dust palliatives, soil bonding, and weighting agents appropriate for use at the proposed project site that would not

cause adverse effects to vegetation; BMPs shall include measures designed to prevent wind and water erosion including application of chemical dust palliatives after rough grading to limit water use. All dust palliatives, soil binders, and weighting agents shall be approved by the CPM prior to use.

Project Schedule: The DESCPC shall identify on the topographic site map the location of the site-specific BMPs to be employed during each phase of construction (initial grading, project element construction, and final grading/stabilization). BMP implementation schedules shall be provided for each project element for each phase of construction.

Best Management Practices: The DESCPC shall show the location, timing, and maintenance schedule of all erosion- and sediment-control BMPs to be used prior to initial grading, during project element excavation and construction, during final grading/stabilization, and after construction. BMPs shall include measures designed to control dust and stabilize construction access roads and entrances. The maintenance schedule shall include post-construction maintenance of treatment-control BMPs applied to disturbed areas following construction.

Erosion Control Drawings: The erosion-control drawings and narrative shall be designed, stamped and sealed by a professional engineer or erosion-control specialist.

Agency Comments: The DESCPC shall include copies of recommendations from the County of Riverside and RWQCB, if applicable.

Monitoring Plan: Monitoring activities shall include routine measurement of the volume of accumulated sediment and scour in storm water diversions channels. The monitoring plan shall be part of the channel maintenance plan in Condition of Certification **SOIL&WATER-3**.

Verification: The DESCPC shall be consistent with the grading and drainage plan as required by Condition of Certification **CIVIL-1**, and relevant portions of the DESCPC shall be submitted to the chief building official (CBO) for review and approval. In addition, the project owner shall do all of the following:

1. No later than ninety (90) days prior to start of site mobilization, the project owner shall submit a copy of the DESCPC to Riverside County and the RWQCB for review and comment. The CPM shall consider comments received from Riverside County and RWQCB and approve the DESCPC.
2. During construction, the project owner shall provide an analysis in the monthly compliance report on the effectiveness of the drainage, erosion, and sediment control measures and the results of monitoring and maintenance activities.
3. Once operational, the project owner shall provide in the annual compliance report information on the results of storm water BMP monitoring and maintenance activities.

4. Provide the CPM with two (2) copies each of all monitoring or compliance reports.

WASTE DISCHARGE REQUIREMENTS

SOIL&WATER-2: The Project Owner shall comply with the requirements specified in Appendices B and C, and any updates to these Waste Discharge Requirements that may be required as the project design is refined. These requirements relate to discharges, or potential discharges, of waste that could affect the quality of waters of the state, and were developed in consultation with staff of the State Water Resources Control Board and/or the applicable California Regional Water Quality Control Board (hereafter "Water Boards"), for the discharge to evaporation ponds. It is the Commission's intent that these requirements be enforceable by both the Commission and the Water Boards. In furtherance of that objective, the Commission hereby delegates the enforcement of these requirements, and associated monitoring, inspection and annual fee collection authority, to the Water Boards. Accordingly, the Commission and the Water Board shall confer with each other and coordinate, as needed, in the enforcement of the requirements. The Project Owner shall pay the annual waste discharge permit fee associated with this facility to the Water Boards. In addition, the Water Boards may "prescribe" these requirements as waste discharge requirements pursuant to Water Code Section 13263 solely for the purposes of enforcement, monitoring, inspection, and the assessment of annual fees, consistent with Public Resources Code Section 25531, subdivision (c).

Verification: No later than sixty (60) days prior to any wastewater discharge, the RSEP project shall provide documentation to the CPM, with copies to the Colorado River Basin RWQCB, demonstrating compliance with the WDRs established in Appendices B and C, including any updates that may be required as the project design is refined. Any changes to the design, construction, or operation of the ponds shall be requested in writing to the CPM, with copies to the Colorado River Basin RWQCB, and approved by the CPM, in consultation with the Colorado River Basin RWQCB, prior to initiation of any changes. The RSEP project shall provide to the CPM, with copies to the Colorado River Basin RWQCB, all monitoring reports required by the WDRs, and fully explain any violations, exceedances, enforcement actions, or corrective actions related to construction or operation of the ponds, treatment units, or storm water system.

Channel Maintenance Program

SOIL&WATER-3: The project owner shall develop and implement a Channel Maintenance Program (Program) that provides long-term guidance to implement routine channel maintenance projects and to comply with **SOIL&WATER-1** in a feasible and environmentally-sensitive manner. The Program will be a process and policy document prepared by the project owner, reviewed by the CPM. The Channel Maintenance Program shall include the following:

- A. Purpose and Objectives – establishes the main goals of the program, of indefinite length, to maintain channels to meet their original design

capacity for flood protection and conveyance, and maintain groundwater recharge.

- B. Application and Use - The channel maintenance work area is defined as the RSEP engineered channels, typically extending to the top of bank, include access roads, and any adjacent property that the RSEP owns or holds an easement for access and maintenance. The program would include all channel maintenance as needed to protect the RSEP facilities and downstream property.
- C. Channel Maintenance Activities
 - 1. Sediment Removal - sediment is removed if it: (1) reduces the effective flood capacity, to less than the design discharge, (2) prevents appurtenant hydraulic structures from functioning as intended, and (3) becomes a permanent, non-erodible barrier to instream flows.
 - 2. Vegetation Management - manage vegetation in and adjacent to the channels to maintain hydraulic capacity. Vegetation management shall include control of invasive or nonnative vegetation.
 - 3. Bank Protection and Grade Control Repairs – Bank protection and grade control structure repairs involve any action by the project owner to repair eroding banks, incising toes, scoured channel beds, as well as preventative erosion protection. The project owner would implement instream repairs when the problem: (1) causes or could cause significant damage to the RSEP project; adjacent property, or the structural elements of the channels; (2) is a public safety concern; (3) negatively affects groundwater recharge; or (4) negatively affects the mitigation vegetation, habitat, or species of concern.
 - 4. Routine Channel Maintenance - trash removal and associated debris to maintain channel design capacity; repair and installation of fences, gates and signs; grading and other repairs to restore the original contour of access roads and levees (if applicable).
- D. Related Programmatic Documentation – the CPM will review and approve the Program documentation.
- E. Channel Maintenance Process Overview
 - 1. Program Development and Documentation – This documentation provides the permitting requirements for channel maintenance work in accordance with the conditions of certification for individual routine maintenance of the engineered channel without having to perform separate CEQA review or obtain permits.
 - 2. Maintenance Guidelines - based on two concepts: (1) the maintenance standard and (2) the acceptable maintenance condition, and applies to sediment removal, vegetation management, trash and debris collection, blockage removal, fence repairs, and access road maintenance.

3. Implementation – Sets Maintenance Guidelines for vegetation and sediment management. Maintenance Guidelines for sediment removal provide information on the allowable depth of sediment for the engineered channel that would continue to provide design discharge protection.
4. Reporting – the CPM requires the following reports to be submitted each year as part of the Annual Compliance Report:
 - a. Channel Maintenance Work Plan - Describes the planned “major” maintenance activities and extent of work to be accomplished; and
 - b. Channel Maintenance Program Annual Report – Specifies which maintenance activities were completed during the year including type of work, location, and measure of the activity (e.g. cubic yards of sediment removed).

Verification: At least 60 days prior to the start of any project-related site disturbance activities, the project owner shall coordinate with the CPM to develop the Channel Maintenance Program. The project owner shall submit two copies of the programmatic documentation, describing the proposed Channel Maintenance Program, to the CPM (for review and approval). The project owner shall provide written notification that they plan to adopt and implement the measures identified in the approved Channel Maintenance Program. The project owner shall:

1. Supervise the implementation of a Channel Maintenance Program in accordance with conditions of certification;
2. Ensure that the RSEP Construction and Operations Manager receive training on the Channel Maintenance Program;
3. As part of the RSEP Annual Compliance Report to the CPM, submit a Channel Maintenance Program Annual Report specifying which maintenance activities were completed during the year including type of work, location, and measure of the activity (e.g. cubic yards of sediment removed).

PROJECT GROUNDWATER WELLS

SOIL&WATER-4: Pre-Well Installation. The project owner shall construct and operate up to two on-site groundwater wells that produce water from the Rice Valley Groundwater Basin. The project owner shall ensure that the wells are completed in accordance with all applicable state and local water well construction requirements. Prior to the start of well construction activities, the project owner shall submit for review and comment a well construction packet in accordance with Riverside County Ordinance 682, containing the documentation, plans, and fees normally required for the county’s well permit, with copies to the CPM. The project shall not construct a well or extract and use groundwater until the CPM provides approval to construct and operate the well.

Post-Well Installation. The project owner shall provide documentation to the CPM that the well has been properly completed. In accordance with California's Water Code section 13754, the driller of the well shall submit to the DWR a Well Completion Report for each well installed.

Groundwater Well Abandonment. On property controlled by the project owner, the project owner shall protect groundwater resources by abandoning all groundwater wells that are constructed in such a manner that the screen interval of the well intercepts poor quality and better quality aquifer water. Alternatively, wells that are otherwise in good condition may be modified, if feasible, such that the screen interval does not cross connect zones of varying water quality. Groundwater wells shall be abandoned or modified in accordance with all applicable state and local water well abandonment or construction requirements, including the California Department of Water Resources Bulletins 74-81 & 74-90. Prior to the start of well construction activities, the project owner shall submit for review and comment, a well abandonment or modification packet to Riverside County in accordance with Ordinance 682 containing the documentation, plans, and fees normally required for the county's well abandonment permit, with copies to the CPM. The project shall not abandon or modify a well until the CPM provides approval.

Verification: The project owner shall ensure the Well Completion Reports are submitted and shall ensure compliance with all State and county water well standards and requirements for the life of the wells. The project owner shall do all of the following:

1. No later than 60 days prior to the use of groundwater for site construction , the project owner shall submit a Groundwater Monitoring and Management Plan to Riverside County for review and comment (see Condition of Certification **SOIL&WATER-6**).
2. No later than sixty (60) days prior to the abandonment and construction of the on-site groundwater wells, the project owner shall submit to the CPM a copy of the water well abandonment and construction packet submitted to the County of Riverside for review and comment.
3. No later than thirty (30) days prior to the construction of the on-site water supply wells, the project owner shall submit a copy of any written comments received from the Riverside County indicating whether the proposed well abandonment and construction activities comply with all county well requirements and meet the requirements established by the county's water well permit program.
4. No later than sixty (60) days after installation of each well at the project site, the project owner shall provide to the CPM copies of the Well Completion Reports submitted to the DWR by the well driller. The project owner shall submit to the CPM, together with the Well Completion Report, a copy of well drilling logs, water quality analyses, and any inspection reports.

5. During well construction and for the operational life of the well, the project owner shall submit two (2) copies to the CPM for review and approval any proposed well construction or operation changes. .
6. No later than fifteen (15) days after completion of the on-site water supply wells, including removal of drilling mud, the project owner shall submit documentation to the CPM confirming that well drilling activities were conducted in compliance with Title 23, California Code of Regulations, Chapter 15, Discharges of Hazardous Wastes to Land, (23 CCR, sections 2510 et seq.) requirements and that any on-site drilling sumps used for project drilling activities were removed in compliance with 23 CCR section 2511(c).

CONSTRUCTION AND OPERATIONS WATER USE

SOIL&WATER-5: The proposed project's use of groundwater for all construction activities shall not exceed an average rate of 420 acre-feet per year of construction. The proposed project's use of groundwater for all operations activities shall not exceed 150 acre-feet per year. Water quality used for project construction and operation will be reported in accordance with Condition of Certification **SOIL&WATER-6** to ensure compliance with this condition. Prior to the use of groundwater for construction, the project owner shall install and maintain metering devices as part of the water supply and distribution system to document project water use and to monitor and record in gallons per month the total volume(s) of water supplied to the project from this water source. The metering devices shall be operational for the life of the project.

Verification: Beginning six (6) months after the start of construction, the project owner shall prepare a semi-annual summary report of the amount of water used for construction purposes. The summary shall include the monthly water usage in gallons.

At least sixty (60) days prior to the start of construction of the proposed project, the project owner shall submit to the CPM a copy of evidence that metering devices have been installed and are operational.

The project owner shall prepare an annual summary report, which will include daily usage, monthly range and monthly average of daily water usage in gallons per day, and total water used on a monthly and annual basis in acre-feet. For years subsequent to the initial year of operation, the annual summary report will also include the yearly range and yearly average water use by source. For calculating the total water use, the term "year" will correspond to the date established for the annual compliance report submittal.

GROUNDWATER LEVEL AND QUALITY MONITORING AND REPORTING PLAN

SOIL&WATER-6: The project owner shall submit a Groundwater Level and Quality Monitoring and Reporting Plan to the CPM for review and approval. The Groundwater Level and Quality Monitoring and Reporting Plan shall provide a description of the methodology for monitoring background and site

groundwater levels and quality. Prior to project construction, monitoring shall commence to establish pre-construction base-line groundwater level conditions in the upper and lower aquifer and shall include pre-construction, construction, and project operation water use. The primary objectives for the monitoring is to ensure the project's water use is consistent with predicted drawdown in the lower aquifer, establish pre-construction and project related groundwater quality and groundwater elevation levels that can be quantitatively compared against observed and simulated levels near the project pumping well, and to avoid, minimize, or mitigate impacts to the Rice Valley groundwater basin storage.

Verification: The project owner shall complete the following:

1. At least six (6) weeks prior to construction, a Groundwater Level and Quality Monitoring and Reporting Plan shall be submitted to the CPM for review and approval before completion of Condition of Certification **SOIL & WATER-4**. The Plan shall include a scaled map showing the site and vicinity, existing well locations, and proposed monitoring locations (both existing wells and new monitoring wells proposed for construction). The map shall also include relevant natural and anthropogenic features (existing and proposed as part of this project). The plan also shall provide: (1) well construction information and borehole lithology for each existing well proposed for use as a monitoring well; (2) description of proposed drilling and well installation methods; (3) proposed monitoring well design; and, (4) schedule for completion of the work.
2. At least four (4) weeks prior to construction, a Well Monitoring Installation and Groundwater Level Network Report shall be submitted to the CPM for review and approval. The report shall include a scaled map showing the final monitoring well network. If applicable, it shall document the drilling methods employed, provide individual well construction as-builds, borehole lithology recorded from the drill cuttings, well development, and well survey results. The well survey shall measure the location and elevation of the top of the well casing and reference point for all water level measurements, and shall include the coordinate system and datum for the survey measurements. Additionally, the report shall describe the water level monitoring equipment employed in the wells and document their deployment and use.
3. As part of the monitoring well network development, all newly constructed monitoring wells shall be constructed consistent with State and Riverside County specifications.
4. At least four (4) weeks prior to beginning groundwater pumping for project construction, baseline groundwater quality and groundwater level monitoring data shall be reported to the CPM. The report shall include the following:
 - An assessment of pre-project groundwater levels in the upper and lower aquifer, a summary of available climatic information (monthly average temperature and rainfall records from the nearest weather station), and a comparison and assessment of water level data relative to the assumptions and spatial trends simulated by the applicant's groundwater model.

- An assessment of pre-project groundwater quality with groundwater samples analyzed for TDS, chloride, nitrates, major cations and anions, and oxygen-18 and deuterium isotopes. These analyses, and particularly the stable isotope data, can be useful for identifying partially evaporated water sources and assessing their contributions to the quality of water produced by wells.
 - The data shall be tabulated, summarized, and submitted to the CPM. The data summary shall include the estimated range (minimum and maximum values), average, and median for each constituent analyzed. The data shall also be analyzed using the Mann-Kendall test for trend to assess whether pre-project water quality trends, if any, are statistically significant.
5. During project construction and during project operations, the project owner shall semi-annually monitor the quality of groundwater and changes in groundwater elevations and submit data semi-annually to the CPM. The summary report shall document water level monitoring methods, the water level data, water level plots, and a comparison between pre- and post-project start-up water level trends as itemized below. The report shall also include a summary of actual water use conditions, monthly climatic information (temperature and rainfall), and a comparison and assessment of water level data relative to the assumptions and simulated spatial trends predicted by the applicant's groundwater model.
- Groundwater samples from all wells in the monitoring well network, which shall include production wells, shall be analyzed and reported semi-annually for TDS, chloride, nitrates, cations and anions, and oxygen-18 and deuterium isotopes. These analyses, and particularly the stable isotope data, can be useful for identifying partially evaporated water sources and assessing their contributions to the quality of water produced by wells.
 - Water quality and level trends shall be analyzed using the Mann-Kendall test for trend. Trends in the compliance data shall be compared and contrasted to pre-project trends, if any.
 - If no significant trends exist in the compliance data, or the data set is insufficient to assess trends, all water-supply well compliance data shall be pooled and contrast to the pre-project data set. If significant pre-project trends are identified, the compliance data can first be corrected to remove pre-project trends and then contrast to the pre-project data.
 - The contrast between pre-project and compliance mean or median concentrations shall be compared using an Analysis of Variance (ANOVA). A parametric ANOVA (for example, an F-test) can be conducted on the two data sets if the residuals between observed and expected values are normally distributed and have equal variance, or the data can be transformed to an approximately normal distribution. If the data cannot be represented by a normal distribution, then a nonparametric ANOVA shall be conducted (for example, the Kruskal-Wallis test). If a statistically significant difference is identified between the two data sets, the monitoring data are inconsistent with random

differences between the pre-project and baseline data indicating a significant water quality impact from project pumping may be occurring.

- If compliance data indicate the quality of the production water has changed by a statistically significant amount for three consecutive years and the constituent concentrations exceed Water Quality Objectives, the applicant shall supply the CPM and RWQCB with a report describing the exceedances.

GROUNDWATER PRODUCTION REPORTING

SOIL&WATER-7: The Project is subject to the requirement of Water Code Sections 4999 et. seq. for reporting of groundwater production in excess of 25 acre feet per year.

Verification: The project owner shall file an annual "Notice of Extraction and Diversion of Water" with the SWRCB in accordance with Water Code Sections 4999 et. seq. The Project Owner shall include a copy of the filing in the annual compliance report.

SEPTIC SYSTEM AND LEACH FIELD REQUIREMENTS

SOIL&WATER-8: The project owner shall comply with the requirements of the County of Riverside Ordinance Code Title 8, Chapter 8.124 and the California Plumbing Code (California Code of Regulations Title 24, Part 5) regarding sanitary waste disposal facilities such as septic systems and leach fields. The septic system and leach fields shall be designed, operated, and maintained in a manner that ensures no deleterious impact to groundwater or surface water. Compliance shall include an engineering report on the septic system and leach field design, operation, maintenance, and loading impact to groundwater. If a temporary septic system and leach field will be used for management of worker housing domestic and sanitary wastes or construction trailer areas, the project owner shall ensure that the system is designed, operated, and destroyed prior to facility operation, in accordance with County of Riverside requirements. Use of the permanent facility septic systems and leach fields for onsite disposal of domestic wastes generated from temporary worker housing or construction trailer areas is prohibited without prior approval from the CPM.

Verification: The project owner shall submit all necessary information and the appropriate fee to the County of Riverside to ensure that the project has complied with county sanitary waste disposal facilities requirements. Written assessments prepared by the County of Riverside regarding the project's compliance with these requirements must be submitted to the CPM for review and approval at least thirty (30) days prior to use of the septic systems. Any requests to use the permanent facility septic systems for onsite disposal of domestic wastes generated from temporary worker housing or construction trailer areas must be made at least ninety (90) days in advance of the proposed use and shall be accompanied by a complete technical assessment

demonstrating that the proposed use is consistent with the County of Riverside sanitary waste disposal facility requirements and would not cause the system to fail or exceed regulatory standards.

NON-TRANSIENT, NON-COMMUNITY WATER SYSTEM

SOIL&WATER-9: The Project is subject to the requirement of Title 22, Article 3, Sections 64400.80 through 64445 for a non-transient, non-community water system (serving 25 people or more for more than six months). In addition, the system will require periodic monitoring for various bacteriological, inorganic and organic constituents.

Verification: The project owner shall obtain a permit to operate a non-transient, non-community water system with the County of Riverside at least sixty (60) days prior to use of a domestic water supply at the site. In addition, the project owner shall submit to the CPM a monitoring and reporting plan for production wells operated as part of the domestic water supply system prior to plant operations. The plan will include reporting requirements including monthly, quarterly, and annual submissions.

The project owner shall designate a California Certified Water Treatment Plant Operator as well as the technical, managerial, and financial requirements as prescribed by State law. The project owner will supply updates on an annual basis regarding monitoring requirements, any submittals to the County of Riverside, and proof of annual renewal of the operating permit.

CLOSURE AND DECOMMISSIONING PLAN

SOIL&WATER-10: The project owner will prepare a decommissioning plan for the transmission line and substation that will meet the requirements of the BLM. The project owner shall identify likely decommissioning scenarios and develop specific decommissioning plans for each scenario that will identify actions to be taken to avoid or mitigate long-term impacts related to water and wind erosion after decommissioning. Actions may include such measures as a decommissioning SWPPP, revegetation and restoration of disturbed areas, post-decommissioning maintenance, collection and disposal of project materials and chemicals, and access restrictions.

Verification: At least sixty (60) days prior to the start of site mobilization or alternate date as agreed to with BLM, the project owner shall submit decommissioning plans to BLM for comment and the CPM for review and approval. The project owner shall amend these documents as necessary, with approval from the CPM, should the decommissioning scenario change in the future.

CONCLUSIONS

With the information provided to date, Staff determined that construction, operation, and decommissioning of the proposed project could potentially impact soil and water resources. Where Staff identified potential impacts, mitigation measures were proposed

to reduce identified impacts to levels that are less than significant. The mitigation measures, as well as specifications for LORS conformance, are included herein as conditions of certification. Conditions of Certification referred to herein serve the purpose of both the Energy Commission's Conditions of Certification for purposes of the CEQA and BLM's Mitigation Measures for purposes of the NEPA. With these mitigation measures implemented, the project would conform to all applicable LORS. Staff's conclusions based on analysis of the information submitted to-date are as follows:

1. The proposed project would be located at the toe of an alluvial fan where substantial storm water run-on could occur. Project-related changes to the alluvial fan hydrology however are less than significant. The applicant completed a hydrologic study, which modeled expected run-on and run-off changes that could occur because of the proposed project. Based on this work, Staff believes the risk from flooding to the proposed project or adjacent properties would be less than significant with the implementation of Condition of Certification **SOIL&WATER-3**. In addition, a DESCOP was developed by the Applicant to mitigate potential, project-related erosion and sedimentation impacts. With the implementation of Condition of Certification **SOIL&WATER-1**, Staff believes the erosion and sedimentation impacts from the proposed project would be less than significant.
2. The proposed project would use an air-cooled condenser for heat rejection and would recycle process wastewater from all plant equipment, including boilers and water treatment equipment, to the extent practicable. Recycling the wastewater would maximize reuse of process water and conserve freshwater. Use of this technology would substantially reduce water use and is consistent with water policy and the constitutional requirement that State water resources be put to beneficial use to the fullest extent possible.
3. Impacts to groundwater supply and quality would be less than significant. In the Rice Valley Groundwater Basin, there is no current groundwater pumping. Though precipitation patterns could vary over the 30-year life of the proposed project, the basin is expected to receive enough natural recharge to support the proposed project. To ensure that the project's proposed use of groundwater does not significantly impact groundwater basin storage, Staff proposes groundwater monitoring parameters and a reporting program as Condition of Certification **SOIL&WATER-6**, which would require the Applicant to compare project pumping with modeled impacts. Substantial changes to groundwater levels caused by the proposed project would be documented by this monitoring and reporting program in accordance with Condition of Certification **SOIL&WATER-6**.

SOIL AND WATER RESOURCES – APPENDIX B

WASTE DISCHARGE REQUIREMENTS – Rice Solar Energy Project Class II Disposal Facility, Riverside County

FINDINGS

1. Rice Solar Energy, LLC, a wholly owned subsidiary of Solar Reserve, LLC, a Delaware limited liability company with its principal place of business in Santa Monica, California, is hereafter referred to as “Discharger”. The Discharger proposes to construct, own, and operate a solar electrical generating plant (hereafter referred to as “facility”) on approximately 1,410 acre site in eastern Riverside County, California. The Rice Solar Energy Project (RSEP) uses solar thermal power generating technology incorporating solar tracking heliostats that reflect solar energy to a central receiver that is mounted on a tower. Except during initial melting and conditioning of the salt, no fossil fuels will be utilized in the solar-thermal power generation at the facility.
2. The project site is a privately owned parcel located in eastern Riverside County, California situated south of State Route 62 at milepost 109. The RSEP is within a larger owned parcel of 3,324 acres. Within this larger property, the RSEP is sited within a new square-shaped parcel that will be created by merging four different assessor’s parcels, resulting in a single 2,560-acre parcel. The project site will include an administration building, heliostat field with power block, and double-lined evaporation ponds totaling 1,410 acres surrounded by a security fence.
3. The project site is located in a very sparsely settled portion of the Colorado Desert, a sub region of the Sonoran Desert. The nearest residence and permanent settlement to the RSEP is Vidal Junction, which is 14.8 miles northeast at the junction of SR 62 and US Route 95. The nearest residence and permanent settlement to the west of the project site is the Iron Mountain Pumping Plant operated by the Metropolitan Water District of Southern California, where there are several residences. The Iron Mountain Pumping Plant is located 17.8 miles northwest of the RSEP site. The nearest town offering significant services to the RSEP is Parker, Arizona, located approximately 32.5 road miles to the east.
4. The project site is surrounded by private land to the west and north, and uninhabited public lands managed by the Bureau of Land Management (BLM) to the east and south. SR 62 and the Colorado River Aqueduct are located just north of the project site in San Bernardino County. There are sand dunes known as the Rice Valley Dunes to the south of the project site which formerly contained the Rice Valley Dunes Off-Highway Vehicle Recreation area.
5. The Discharger has filed an application for certification under the California Energy Commission’s (CEC) standard certification process. Project construction is planned

to begin in spring 2011 with an estimated construction period of 30 months. Facility operation is targeted for October 2013.

6. The CEC is the lead agency under the California Environmental Quality Act (CEQA) for all thermal power plants greater than 50 MW. The CEC's power plant licensing process is a CEQA-equivalent process. The RWD indicates that environmental review documents produced by the CEC staff are called the Preliminary Staff Assessment, which is similar to a draft Environmental Impact Report (EIR), and the Final Staff Assessment (FSA) which is like a Final EIR. The CEC licensing process is a 12-month process in which the CEC evaluates the application and formulates its decision on the project proponent's Application for Certification (AFC). The Discharger submitted the project's AFC in October 2009.
7. The Discharger submitted a Report of Waste Discharge/Joint Technical Document (hereafter collectively referred to as the RWD) with the California Energy Commission (CEC) and Colorado River Basin Regional Water Quality Control Board (Regional Board). CEC will coordinate reviews and approvals with the regulatory agencies to ensure that the proposed project meets the California Environmental Quality Act (CEQA) requirements. This includes obtaining waste discharge requirements (WDRs) from staff of the CRBRWQCB. The CEC will certify this project and will include these WDRs as conditions of certification in accordance with the Warren-Alquist Act³. These WDRs are not being proposed by staff of the Regional Board to its Board for consideration and adoption at this time. After the CEC certifies the project, these WDRs may be re-issued by the Board of the Regional Board under Section 13263 of the Water Code without substantive amendments if deemed appropriate for enforcement, annual fee collection, inspection and monitoring, and related purposes, but any action of the Board of the Regional Board to re-issue these WDRs under Section 13263 of the Water Code must be consistent with the Warren-Alquist Act, including without limitation the non-reviewability provision of subdivision (c) of Section 25531 of the Public Resources Code.
8. RSEP Process: The RSEP technology will generate power from the sunlight by focusing energy from a field of mirrors known as heliostats to a central receiver. Molten Salt is circulated through tubes in the receiver, which collects energy gathered from the sun. The heated salt is then routed to an insulated storage tank where it is stored with minimum energy loss. The salt has a melting temperature of 450° F. Salt is a heat storage medium that retains thermal energy over time. Once

³ The Warren-Alquist State Energy Resources Conservation and Development Act is the authorizing legislation for the California Energy Commission. The Act is codified as Public Resources Code (PRC), Section 25000 et seq.. PRC Section 25500 establishes the Commission's authority to certify all sites and related facilities for thermal power plants with power ratings of 50 megawatts or more. The section further declares that "the issuance of a certificate by the commission shall be in lieu of any permit, certificate, or similar document required by any state, local or regional agency, or federal agency to the extent permitted by federal law, for such use of the site and related facilities, and shall supersede any applicable statute, ordinance, or regulation of any state, local, or regional agency, or federal agency to the extent permitted by federal law."

the salt is melted to a liquid form during construction, it will remain heated and in a liquid state throughout the facility's operating life.

On any given operating day, when sunrise begins, the receiver is filled with 550° F cold salt and is preheated by incremental redirection of small numbers of heliostats onto the receiver panels. As the sun rises above the horizon, the full array of heliostats are directed onto the receiver, and salt temperature begins to rise. Salt flow through the receiver is recirculated back to the cold salt tank until the salt outlet temperature reaches 1,050°F. Salt is then continuously transferred from the cold salt tank, through the receiver and into the hot salt tank. The quantity of salt in the cold tank decreases while the quantity in the hot tank increases during solar energy collection.

As a decoupled process, small amount of cold salt is circulated continuously through the steam generation system to produce steam. The steam is continuously applied to the steam seals on the turbine to keep the turbine warm while it rotates slowly on the turning gear when the steam turbine is not in production. During power generation cycle, a hot salt pump will gradually send hot salt to mix with the cold salt flow through the steam generation system to increase the temperature of the steam generation system. The RSEP will use dry cooling technology for the steam turbine cycle using an air-cooled condenser.

9. The RSEP technology consists of the following elements: 1) 17,500 heliostats or mirrors, each encompasses 672 square feet in area occupying approximately 1,370 acres; 2) A 538-foot-high concrete solar receiver tower with a 100-foot-tall solar receiver and 15-foot-long crane; 3) A liquid salt circulation and storage system capable of storing 70 million pounds of liquid salt (sodium nitrate/potassium nitrate mixture); 4) A 150 Mega Watt condensing steam turbine generator system and equipment; 5) A 20 cell ACC for cooling of the steam turbine exhaust; 6) A 10 mile long generation tie-line to connect with the Parker-Blythe No. 2 transmission line; 7) A new interconnection substation; 8) An onsite switchyard; 9) Two onsite wells for industrial water use and a water treatment system; 10) Three evaporation ponds for waste disposal, approximately 5 acres each; 11) A 30-acre storm water detention pond; 12) Two diesel fire-water pumps and two emergency diesel generator sets for backup emergency power supply; and 13) The existing 12-kV electrical distribution line is extended to have a total length of approximately 1.1 miles long to the facility fence-line.
10. The facility water demand is met by pumping raw water from two onsite water wells. Each well will have sufficient capacity to supply water for the plant needs throughout the expected 30-year operational life of the plant. Groundwater will go through pre-treatment system and then be further purified for use as boiler makeup water and for pressure washing of the heliostats (mirrors). Pretreatment of groundwater is necessary because it contains undesirable levels of TDS unsuitable for heliostat/mirror washing, and for boiler feed water. The Discharger's initial RWD provided project average daily use and estimated maximum annual water requirements. The project water use and discharge estimates were later amended

by the Discharger in March 2010 in response to CEC staff data requests on project water conservation measures. The project water balance was revised to allow for reuse of water treatment reject and WSAC blowdown, thereby reducing both the project's water demand and the volume of wastewater discharged to the evaporation ponds. The revised average water use and discharge estimates are as follows:

Water Use	Average Daily Use (gpm)⁴	Annual Use (AFY)⁵
Heliostat Wash	51	31
Steam Cycle Makeup	52	31
Potable Water	5	3
Other uses including wet surface air cooler (WSAC), service water, quench water	62	38
Average Use Total	170	103
Margin for other uses	25	15
Total Plant Consumption	195	118
Maximum Annual Use	--	150
Wastewater Discharge		
Service water	5	--
WSAC blowdown	27	--
Hydrostatic test water	*	--
Average discharge to evap. ponds	32	~20

11. The RWD, as amended by data responses, indicates that the raw water treatment system will include the following components: 1) Reverse Osmosis (RO) system; and 2) Electro-deionization. The steam-power generation cycle heat rejection system will consist of an air-cooled steam condenser and includes a generator, turbine lube oil system, and pumps. The cooling is achieved through a closed-loop cooling circuit that utilizes fin-fan heat exchangers that are cooled by mechanical draft ambient airflow forced across the finned-tubes to cool the water circulating within. A small quantity of make-up water will be required to compensate for minor leakage and to maintain system-water-chemistry to prevent corrosion.

WASTEWATER CHARACTER & PROPOSED DISCHARGE

12. The Discharger proposes to use double-lined evaporation ponds as part of its waste disposal. The evaporation ponds will receive, store and evaporate wastewater from operations at the project site. The proposed discharge to lined evaporation ponds was initially reported to be derived from five sources: 1) Reaction Chamber and

⁴ Gallons per minute

⁵ Acre-feet per year, based on 3286 hours of operation per year .

* A volume of approximately 6 million gallons will be used during hydrostatic testing. Wastewater discharge facilities shall be operational, and monitoring networks must be installed prior to discharge.

Clarifier waste stream; 2) Steam Cycle Blow down; 3) Treated effluent from the oil water separator; 4) Wet Surface Air Cooler (WSAC) Blow down; and 5) Service Water. However, the Discharger revised the project water use in response to CEC staff data requests and now proposes to reuse the RO/reaction chamber waste and steam cycle blow down. Consequently, the proposed discharge would instead be derived just from the WSAC blow down, service water, and treated effluent from the oil/water separator. The estimated flow rate and volume of wastewater discharge is tabulated above in Finding No. 10.

13. The RWD indicates that plant drains will collect containment area wash down and drainage from facility equipment drains. Wastewater from these areas will be collected in a system of floor drains, hub drains, sumps, and piping and then routed to a wastewater collection system. Drains that would contain water mixed with oil and grease will first pass through an oil/water separator unit. Ultimately, wastewater from the wastewater collection system will be piped to three 5-acre lined evaporation ponds for disposal.
14. The RWD states that wastewater discharge into the evaporation ponds is non hazardous; however, it does contain pollutants which could exceed water quality objectives if released, or that could be expected to affect the beneficial uses of ground water. Therefore, the wastewater is classified as a “designated waste.” This classification is consistent with CCR Title 27, Chapter 3, Subchapter 2, Article 2 Section 20210.
15. The RWD indicates that approximately 31 acre-feet per year of heliostat/mirror wash water will be used by the project. Any wash water from mirror washing that does not infiltrate into the soil around the heliostats would be allowed to sheet flow along the site’s current drainage pattern to the south end of the heliostat field. An expansive and shallow detention basin of 30 acre-feet capacity will be constructed to detain any increase in storm flows.
16. The RWD states that during facility construction the average water use over the 30-month construction period will be approximately 780 acre-feet. The water will be required for soil moisture conditioning during earthmoving operations and for dust control.
17. Sanitary waste will be generated from the onsite toilets and showers. The wastewater disposal will be to two (2) separate septic tank leach-field systems. The Riverside County Department of Environmental Health would normally issue a permit for construction of the septic-tank leach-field system and regulate the discharge. However, pursuant to provisions of the Warren-Alquist Act, the CEC’s certification would act as an “in-lieu” permit for the Riverside County sewage permit by incorporating the regulatory requirements and conditions of those permits into the Commission’s certification.

18. Solid waste such as oily rags, broken and rusted metal and machine parts, empty containers, and broken materials generated at the facility will be trucked off site for recycling, or disposed off to a designated waste disposal facility.
19. The RWD indicates that during the 30-year operating life of the facility, about 1-ft of sludge may accumulate at the bottom of the evaporation ponds, which consists of precipitated solids from the evaporated wastewater. Over 30 years, the sludge accumulation is estimated to be about 4,600 tons.

HYDROLOGY, SOILS & BENEFICIAL USES

20. The project site is located in the Rice Hydrological Unit (716.00) of the Hayfield Planning Area. The Hayfield Planning Area covers approximately 1,860 square miles of desert with barren mountains and valleys, with the Chuckwalla Mountains on the south boundary and the McCoy Mountains on the east boundary. Beneficial uses for the Rice Hydrologic Unit include municipal and domestic supply
21. The project site is located within the Rice Valley and has a slope of less than 2%. Runoff occurs primarily during thunderstorms and the surface runoff from the mountains drains towards the center of the valley, except in the eastern part of the valley, where Big Wash drains to the Colorado River.
22. The RWD indicates that the Rice Valley area is in the Sonoran Desert / Mojave Desert physiographic province of California. The Sonoran Desert / Mojave Desert region is dominated by broad alluvial basins that are mostly aggrading surfaces receiving non-marine continental deposits from adjacent uplands.
23. The RWD indicates that subsurface soils at the project site consist of dense silty sands and poorly graded sands interpreted from onsite drilled borings. Specifically, the onsite soils are classified as typical durorthids, loamy-skeletal mixed, hyperthermic and shallow, and typical torripsamments, mixed, hyperthermic. Boring depths ranged from approximately 10 to 85 feet below ground surface (bgs). Expansive soils were not encountered in any site borings.
24. The project site is located in the north central portion of the Rice Valley Groundwater Basin, a desert basin with relatively limited groundwater recharge and little existing groundwater use. The RWD indicates that site specific investigations were conducted and it was found that the alluvium can be divided into two units, the upper alluvium and the lower alluvial aquifer. The saturated upper alluvium occurs from approximately 80 feet bgs to 600 feet bgs and the lower alluvial aquifer occurs from approximately 600 feet bgs to 810 feet bgs. The upper alluvium is comprised of clays and sands with finer grained materials dominating. The lower alluvial aquifer is comprised of sands, gravels and clays with coarser grained materials dominating.
25. The RWD states that depth to ground water ranged between 150 to 153 feet bgs. Groundwater beneath the project site is approximately 285 feet bgs, and flows northeast in the direction of the Vidal Valley Groundwater Basin. Five wells in the basin tested for groundwater quality showed total dissolved solids (TDS) levels

range between 662 mg/L to 3,540 mg/L. The average TDS concentration is about 1,900 mg/L. At one well, fluoride content was 1.8 mg/L and boron content was 2.8 mg/L, which may indicate a local impairment of the groundwater.

26. The RWD reflects that recharge within the basin is mainly from infiltration of runoff through alluvial deposits and by mountain front recharge with negligible amount of areal recharge from precipitation. Natural recharge is estimated to be 500 acre-feet per year and represents mountain front recharge. Additional recharge could be from subsurface inflow from the Ward Valley Groundwater Basin but is not quantified.
27. The project site is located in an arid desert climate, low annual precipitation, strong seasonal winds and mostly clear skies. Average annual evaporation in the project area, based on published data at the Indio Fire Station about eighty five miles southwest of the site is 105 inches.
28. Average annual precipitation ranges from 3 inches to 8 inches west of the Rice Valley (source: SWRCB, 2006; DWR, 2004). The RWD indicates that average annual precipitation in the project area, based on the gauging station at Blythe is 3.55 inches.
29. Surface water runoff from the mountains drains towards the center of the valley, except in the eastern part of the valley, where Big Wash drains to the Colorado River. The RWD indicates that there are no perennial streams in the vicinity of project site, and most of the moisture from rain is lost through evapotranspiration. The Colorado River aqueduct flows in an east-west direction within 1,000 feet north of the project site. The aqueduct is a concrete lined manmade controlled feature, and does not affect the natural hydrology of Rice Valley.
30. The off-site storm water flows originate from an area north of SR-62 (i.e., the Arizona-California Railroad, and the Colorado River Aqueduct). Small dikes have been constructed to control the flow of water across these features. The dikes direct the offsite flows from the north to specific channels/culverts over the aqueduct, under the railroad and then across SR-62 through small dips in the roadway.
31. The project site, including the utility lines, lies entirely within an area designated by FEMA as Zone D, where there are possible but undetermined flood hazards. The RWD indicates that evaporation ponds will be protected from offsite and onsite flows by the perimeter road. Storm water will be managed around the evaporation ponds to prevent inundation or washout due to floods in a 100 year storm event.
32. The RWD indicates that, based on site's earthquake history, the site could be subject to minor to moderate ground accelerations. Based on National Seismic Hazard Maps 2002 (USGS, 2008a) the peak bedrock acceleration at the site is 0.14 g for a 2,475 year recurrence interval or 2% probability of exceedance in 50 years. The San Andreas Fault is the controlling fault impacting the potential ground motion at the Project site.

33. The Water Quality Control Plan Colorado River Basin- Region 7, (hereafter Basin Plan), designates beneficial uses, establishes water quality objectives, and contains implementation plans and policies, for Basin Waters. These requirements implement the Basin Plan.
34. Federal regulations for storm water discharge were promulgated by the United States Environmental Protection Agency (USEPA) on 16 November 1990 (Title 40 CFR Parts 122, 123, and 124). The regulations require specific categories of activities (construction and industrial) and facilities that discharge storm water to waters of the United States to obtain a National Pollutant Discharge Elimination System permit (NPDES), and to implement Best Conventional Pollutant Technology to reduce or eliminate industrial storm water pollution. The Rice Solar Energy Project, however, would be excluded from the requirement to obtain both the construction and the industrial NPDES storm water permits because it would not discharge storm water to waters of the United States.
35. The conditional discharge as described herein is consistent with the antidegradation provisions of State Water Resources Control Board Resolution No. 68-16. Degradation of groundwater immediately beneath the WMUs is unlikely to occur if the proposed project complies with the terms and conditions of these WDRs and MRP. The proposed project appears to be consistent with maximum benefit to the people of the State, as the land use at this location is not expected to change and best practical treatment or control can be achieved through a combination of the described treatment processes, WMU design and construction, and ground water quality monitoring.

WASTE MANAGEMENT UNIT DESIGN & CONSTRUCTION

36. The Discharger proposes to construct three Class II Surface Impoundment Waste Management Units (WMU) to handle designated liquid waste generated at the facility as described in Finding Nos. 12, 13, and 14. The three 5-acre evaporation ponds will have a proposed average design depth of 6 feet across each pond to ensure: one foot of sludge build up; three feet of operational depth; and two feet of freeboard.
37. The RWD indicates that containment design for the evaporation ponds from surface of the evaporation ponds downwards will consist of the following: 1) a primary 60 mil high density polyethylene (HDPE) liner; 2) a leak detection and removal system comprising a geonet and collection sump; 3) a secondary HDPE liner (minimum of 40 mil); and 4) a base layer consisting of either a geosynthetic clay liner (GCL) or 2 feet of onsite material with a hydraulic conductivity of less than 1×10^{-6} cm/sec of which at least 30%, by weight, shall pass through a No. 200 Standard sieve. If this material is unavailable, then a geosynthetic clay liner (GCL) or approved equivalent is the alternative design for the base layer. The GCL option is proposed as an engineered alternative.

38. The RWD states that a ramp will be constructed to provide access for equipment and maintenance to each pond. At the ramp location, there will be a protective layer above the primary HDPE liner.
39. The RWD indicates that side slopes around the evaporation ponds will contain the same liner system as the base of the ponds, except that leak collection pipes will not be located on the pond side slopes. The berms shall be covered with a minimum 6-inch thickness of road base or approved equivalent. The top of the berms will be a minimum of 2 feet above the surrounding existing grade to prevent potential inflow of storm water.
40. The RWD indicates that the leak detection system between the upper and lower liners will consist of a geonet drainage media and a trench containing piping and sand bedding. The sand bedding in the trench, including the perforated piping system, will have to be carefully placed on top of the underlying 40 mil HDPE liner. The geonet will be placed across the top of the sand-filled trench to avoid strain on the material.
41. The RWD indicates that the moisture detection system below the liner system will consist of continuous carrier pipes installed at the sides and low point of each pond (one carrier pipe per pond) at a depth of approximately 5 feet below the secondary liner. The carrier pipes will be terminated at the surface on each side of the pond and will be equipped with a pull cable system for conveyance of a neutron probe for moisture detection.
42. The RWD indicates that excavation and berm construction will use standard cut and fill techniques. The sub grade will be moisture conditioned to 2% above the optimum moisture content, compacted to at least 90% relative compaction as determined by American Society for Testing and Materials (ASTM) D1557, and proof-rolled using a smooth drum roller prior to placement of the GCL or the 2 feet of low permeable onsite material.
43. The RWD further states that the quality assurance program will be implemented consistent with the State Water Resources Control Board's Construction Quality Assurance (CQA) Requirements. CQA testing will be performed on the sub-grade, GCL, HDPE liners, granular/free draining native soil, and hard surface materials.

IMPROVEMENTS OVER EXISTING TITLE 27 PRESCRIPTIVE STANDARDS

44. Under this Order, the Title 27 prescriptive standard, set forth in Title 27 of the California Code of Regulations, Section 20415(e)(8)(E)2, to use what would, in modern phraseology, be called a pass-2-of-3 retesting approach for statistical compliance testing has been replaced by the far more statistically powerful pass-1-of-3 retesting approach suggested in the USEPA's **Unified Guidance** ("UG," 2009). (All subsequent regulatory citations shall be to Title 27.) Likewise, the prescriptive standard to take all retest samples within 30 days of a preliminary release indication (Section 20415(e)(8)(E)3) has been replaced by the UG-supported improvement of

allowing roughly 90 days to separate successive samples (for a given monitoring parameter at a given well), in order to avoid serial correlation that would likely invalidate the retest. These improvements are implemented as allowed under Section 20080(a)(1) and constitute the means for assuring that the monitoring program meets Title 27's performance standard for a Detection Monitoring Program (Section 20420(b)), i.e., that the water quality monitoring systems required to be installed "are appropriate for detecting, at the earliest possible time, a release from the Unit..."

MONITORING AND REPORTING PROGRAM (MRP) TO PHASE IN

45. It is not possible to initiate monitoring for a release until after the groundwater flow direction, and groundwater monitoring points and background monitoring points have been established, and each monitored waste constituent (Monitoring Parameter {MonPar}) has, at each Monitoring Point (MonPt), an approved Concentration Limit (suite of background reference data) and an approved data analysis method to apply to that Concentration Limit in order to obtain the retest-triggering concentration ("Threshold Value"), against which each new datum will be compared, for that MonPar at that MonPt (i.e., for that "MonPt/MonPar pair"). Therefore, as noted at the start of the attached Monitoring and Reporting Program (MRP), most of the MRP does not come into effect until the Discharger has completed this preparatory work.

Therefore, the first six-monthly Reporting Period during which the MRP will become fully in-effect (i.e., the Discharger initiates compliance monitoring and testing for all MonPt/MonPar pairs), will start around 2.5 years after the Monitoring Points and Background Monitoring Points are installed. This delay in initiating compliance analysis monitoring should cause no absence of water quality protection, given that a release from one of the three impoundments would, most likely, take several years to reach the down gradient wells and be detected. Nevertheless, it is not possible to conduct an effective monitoring program absent the completion of the above-described preparatory work.

A. DISCHARGE SPECIFICATIONS

1. The Discharger shall inform the Energy Commission's Compliance Project Manager (CPM) and the Regional Board immediately upon its determination that this Order fails to implement any applicable requirement of Title 27.
2. Wastes must be only discharged into, and confined to, approved WMUs specifically designed for their containment, as described in Finding Nos. 36 and 37.
3. The Discharger must follow the Water Quality Protection Standard (WQPS) for detection monitoring established by the Regional Board. The following are parts of the WQPS, as established by the Regional Board.

- a. The Discharger must test for the monitoring parameters⁶ (MonPars) in the attached Monitoring and Reporting Program (MRP) and revisions thereto. The MRP is an integral part of the proposed WDRs and must be implemented.
 - b. **Concentration Limits [see also Provisions C.6 through C.10]** – for each monitoring point, the concentration limit for each monitoring parameter shall be its background value, as represented by a set of at least eight background data points collected from an appropriate up gradient “interpoint” background monitoring point (or an “intrapoint” concentration limit using data collected from that compliance-testing monitoring point before there is any evidence of a release there).
 - c. The monitoring wells, including those located along the Point of Compliance⁷ (which follows the down gradient boundary of the WMU) will be determined when the Discharger submits its ground water monitoring work plan for approval by the CPM, in consultation with the Regional Board Executive Officer, in accordance with Discharge Specification A.6 of these WDRs. The up gradient and down gradient wells (i.e., background monitoring points and monitoring points, respectively) and their location must be specified in the work plan. These monitoring points, and the location of the surface trace of the Point of Compliance, will be approved based on calculated groundwater gradient at the site. A revised MRP may be required if the groundwater gradient changes. All proposed changes to the monitoring program, including any additional or replacement monitoring points, would need approval in advance of implementation.
4. The Discharger must report test results to the CPM, with copies to the Regional Board, for monitoring parameters listed in the MRP and future revisions thereto. Monitoring parameters and COCs are subject to the most appropriate statistical or non-statistical test under the MRP, and any revised MRP approved by the CPM, in consultation with the Regional Board. Typically, such testing involves applying the approved statistical or nonstatistical test to the appropriate background data set (“Concentration Limit” for a given constituent at a given monitoring point) to determine a “Threshold Value” (a concentration above which a release is indicated, triggering a retest for validation), which is then compared with the then-current concentration of that constituent at that Monitoring Point.
 5. Discharges to a WMU must cease immediately, and the Discharger must empty the WMU by conveying its waste to a functioning WMU, if there is any containment system failure of that unit, including, but not limited to, any detectable flow of the

⁶ At this site, every Constituent of Concern (COC) is also a monitoring parameter (MonPar), so the two terms are equivalent.

⁷ The “Point of Compliance” is a conceptual curvilinear vertical surface that extends down into the uppermost aquifer. Its surface trace follows along the down gradient side(s) of the WMU. At least one of the down gradient monitoring wells must be placed along the Point of Compliance, and the Point of Compliance, once determined, must show up on the site map in each monitoring report.

Unit's contained liquid waste into the leak-detection system (between the upper and lower liners), until such time as the cause of the failure has been remedied to restore complete containment to the WMU. The Discharger must inform the CPM and Regional Board immediately upon discovering the failure and convey to them promptly information concerning all remedial actions taken to remedy the condition.

6. Containment of waste shall be limited to the areas designated for such activity. Any revision or modification of the waste containment area, or change in operation that alters the nature and constituents of the waste produced, must be submitted in writing to the CPM, with copies to the Regional Board Executive Officer, for review. The CPM, in consultation with the Regional Board Executive Officer, must approve the proposed change before the change in operation or modification of the designated area is implemented.
7. At any WMU where the groundwater separation is less than five feet below the base of the waste, the Discharger shall construct a groundwater drainage system capable of maintaining this minimum allowable separation. The design's separation from groundwater must be based upon the separation between the pond's uppermost liner and the highest anticipated groundwater elevation.
8. Wastewater to be discharged from the project, as defined in Finding Nos. 12 and 13, must not overflow the ponds. Liquids must maintain a minimum freeboard of two feet at all times.
9. The Discharger must install in all surface impoundments/WMUs (as in this case) a permanent marker delineating the brim of the WMU. The marker is to be maintained as a reference point for measuring the freeboard.
10. Prior to removal of solids accumulated in the evaporation ponds, an analysis of the material must be conducted to verify that it is not a hazardous waste and the material must be disposed of in a manner consistent with that analysis and applicable laws and regulations. After removing the residual solids, prior to resuming use of that impoundment, the Discharger must inspect all portions of the impoundment's uppermost geomembrane to identify, and repair, any breaches in it (including any damage to underlying liner system components), and must submit a report to the CPM, with a copy to the Regional Board, that is signed by a suitably-licensed professional, detailing the location and nature of any such repair and certifying the pond's readiness for continued use.
11. The lined waste disposal ponds must be designed, constructed, operated, and maintained to prevent inundation or washout due to floods using the 24-hour/100-year design storm in water balance calculations.
12. Prior to the use of any new chemicals for control of microbes, pH, scale, and corrosion of equipments or pipelines, the Discharger must request review and approval by the CPM, in consultation with the Regional Board Executive Officer, in writing.

13. Waste conveyance systems throughout the facility area must be cleaned at least once every 90 days to prevent the buildup of solids, or when activity at the site creates the potential for release of solid materials from the conveyance systems.
14. Pipe maintenance and de-scaling activities that may include hydroblasting or sandblasting must be performed in a designated area to prevent wastes generated from these activities from impacting the environment.
15. Public contact with wastes must be precluded through means such as fences, signs, or other alternatives acceptable to the CPM, in consultation with the Regional Board Executive Officer.
16. The WMUs/surface impoundments must be managed and maintained to ensure their effectiveness, in particular:
 - a. Erosion control measures must be implemented to ensure small coves and irregularities are not created, and
 - b. Solid materials must be removed in a manner that does not damage or compromise the integrity of the liners, or any component of the containment systems.
17. Water used in the processes, dust control, and maintenance (i.e., cleanup) must be limited to the least amount necessary.

B. DISCHARGE PROHIBITIONS

1. The Discharger is prohibited from discharging, treating or composting the following wastes to the WMUs (evaporation ponds) at the facility:
 - a. Municipal solid and liquid waste;
 - b. Sludge (including sewage sludge, water treatment sludge, and industrial sludge);
 - c. Septage;
 - d. Oily and greasy liquid waste;
 - e. Radioactive waste;
 - f. Infectious or bio-hazardous materials, as defined by Health and Safety Code Section 25020.5;
 - g. Hot, burning waste materials or ash; and
 - h. Filter cake, if it is hazardous, and, thus, must be disposed of at a Class I Hazardous Waste Landfill.
2. The Class II WMUs (i.e., lined evaporation ponds) must receive only waste streams as identified in Finding Nos. 12 and 13.

3. Discharge of waste streams as mentioned above (Discharge Specifications A.2) to an area other than the evaporation ponds is strictly forbidden.
4. The Discharger must not cause degradation of any groundwater aquifer or water supply.
5. The discharge of waste to land not owned or controlled by the Discharger is prohibited.
6. Use of industrial waste streams generated at the facility for dust control on access roads, the heliostat field, or other locations is prohibited.
7. The discharge of hazardous is prohibited. The discharge of designated waste to an area other than waste management units authorized to receive such waste is prohibited.
8. The treatment or disposal of wastes at this facility must not cause pollution or nuisance, as defined in Section 13050 of the California Water Code.
9. The Discharger must not cause the concentration of any Constituent of Concern or Monitoring Parameter to exceed its respective background value (as represented by its respective Concentration Limit {suite of at least eight background data points}) at any Monitoring Point in any monitored medium addressed in the attached MRP, which is a part of these WDRs.

C. PROVISIONS

1. The Monitoring and Reporting Program is necessary to determine compliance with the WDRs and to identify facility impacts, if any, to receiving waters.
2. The Discharger must notify the CPM and the Regional Board Executive Officer at least **10 days** prior to construction of the sub grade, the installation of an unsaturated zone monitoring system, the installation of all soil and synthetic liners for containment and ancillary cover systems, and the construction of the LCRS(s) for any WMUs.
3. Visual observations and detailed geologic mapping of foundation conditions underlying each excavation for a WMU must be made during construction by a California registered geologist. A geologic report and map of the excavation for each WMU must be submitted to the CPM, with a copy to the Regional Board Executive officer, before discharging waste to the WMU.
4. The groundwater detection monitoring system must consist of monitoring wells as approved by the CPM, in consultation with the Regional Board Executive Officer. The Discharger must maintain all onsite groundwater monitoring wells in good working order at all times to ensure compliance with the monitoring provisions of these WDRs. Well maintenance may include, but need not be limited to, periodic well re-development to remove sediments.

5. **One Hundred Eighty days (180)** prior to facility operation, the Discharger must submit for approval by the CPM, in consultation with the Regional Board Executive Officer, assurances of financial responsibility for initiating and completing corrective action for all known or reasonably foreseeable releases from the WMUs. The financial assurance mechanism must be made payable to the CEC and must address the cost for a third party (i.e., someone other than the Discharger) to complete remediation of the most likely release scenario. In the event of a release, the Discharger is expected to finance the cleanup. But in the event that the Discharger fails to perform that duty, for whatever reason, the financial assurance mechanism will be used by the CEC to provide it with the funds to address the release.
6. **One Hundred Eighty Days (180)** prior to discharge into the WMUs, the Discharger must submit to the CPM, with a copy to the Regional Board Executive Officer, a technical report describing a work plan for the installation of a groundwater-monitoring network. The network must consist of one or more background monitoring wells and two or more down gradient wells capable of yielding representative samples from the uppermost portion of the uppermost aquifer located at the hydraulically down gradient limit(s) of the WMUs. All monitoring wells must meet DWR Well Standards in addition to performance standards prescribed by Section 20415(b)(4).. All well locations and construction features are subject to the prior approval of the CPM, in consultation with the Regional Board Executive Officer, and must be sufficient to monitor potential impacts of wastes (leaked from any one of the lined evaporation ponds) on the uppermost groundwater aquifer underneath the WMUs.
7. Within **60 days** following work plan approval, the Discharger must implement the program. Within **30 days** following the construction of the approved network, the Discharger must submit copies of drillers' logs and "as built" construction drawings of each groundwater monitoring well, as well as properly surveyed reference point elevations for each well, to the CPM, with a copy to the Regional Board Executive Officer.
8. The Discharger must notify the CPM and the Regional Board Executive Officer at least **10 days** prior to installing groundwater monitoring well(s).
9. The Discharger shall commence monitoring of the background monitoring wells within **30 days** of completion of the approved groundwater monitoring network and must monitor for all specified Constituents of Concern by collecting a sample from each down gradient and background well quarterly for two years and then proposing (to the CPM, with a copy to the Regional Board Executive Officer) the most appropriate Concentration Limit (background location and suite of at least eight data points from that location). The groundwater monitoring program must include consistent sampling and analytical procedures that are designed to ensure that monitoring results provide a reliable indication of water quality at all monitoring points.

10. The Discharger's report, under Provision C.9, must characterize background groundwater quality using data from approved background well(s) using methods as prescribed in Section 20415(e)(10) by proposing a Concentration Limit for each MonPt/MonPar pair (for each MonPar at each monitoring point, including a determination of the best background data source⁸ and a set of at least eight data points from it. The Discharger's report should also propose (for each MonPt/MonPar pair, considered individually) an appropriate statistical or nonstatistical data analysis method [see Section 20415(e)(7)-(9), the USEPA's **Unified Guidance**⁹ (2009), and MRP Parts I.D.1, II.A.4., and III], to be used to determine that MonPt/MonPar pair's respective retest-triggering/confirming concentration (here called the "Threshold Value") which, if exceeded by that pair in a future sample, would provide an initial release indication, subject to validation by retesting. The proposal shall also include a retesting approach in accordance with MRP Part III, with the Threshold Value for any statistical method lowered to compensate for retesting effects, as described either in the **Unified Guidance** or, for a 95% Gamma Upper Prediction Limit method, in the two papers referenced in the footnote to Part II.A.3. of the MRP.
11. The Discharger must implement the MRP, Attachment C and revisions thereto as specified by the CPM, in consultation with the Regional Board Executive Officer, to detect at the earliest opportunity any unauthorized discharge of waste constituents from the facility, or any impairment of beneficial uses associated with brine or waste discharge from similar identified processes (i.e., boiler blow down, WSAC blow down, etc) to the evaporation ponds.
12. The Discharger should use the constituents listed in the MRP and revisions thereto, as Monitoring Parameters (i.e., all COCs are Monitoring Parameters).
13. The Discharger must submit technical and monitoring program reports, as directed by the CPM, in consultation with the Regional Board Executive Officer. Monitoring reports must be certified to be true and correct, and signed under penalty of perjury, by an authorized official of the company.
14. All monitoring must be conducted pursuant to a compliance testing program the CPM, in consultation with the Regional Board Executive Officer, has determined meets the requirements of Title 27 of the California Code of Regulations.
15. The Discharger must maintain records that contain appropriate supporting documentation of the nonhazardous nature of each waste stream accepted for on-site disposal or treatment. The records must contain certified analytical results of waste streams and a description of the waste stream generating processes, and any

⁸ The Concentration Limit can be either a (preferred) "intra-well" background data set collected from the same well that will be tested in the future or an "inter-well" background data set collected from an up gradient well, with the most appropriate being the source that produces the lowest Threshold Value (using an appropriate data analysis method), and, for the interpoint approach only, that has a mean that is comparable to that of the compliance well mean.

⁹ The **Unified Guidance** is available for downloading from <http://www.epa.gov/osw/hazard/correctiveaction/resources/guidance/sitechar/gwstats/>.

other information that may be necessary to demonstrate the nonhazardous nature of the waste being disposed into the lined ponds.

16. The Discharger must retain records of all monitoring information, copies of all reports required by these WDRs, and records of all data for a period of at least five (5) years from the date of the sample, measurement, report or application.
17. Unless otherwise approved by the CPM, in consultation with the Regional Board Executive Officer, all analyses should be conducted at a laboratory certified for such analyses by the California Department of Public Health. All analyses must be conducted in accordance with the latest California Environmental Laboratory Accreditation Program (ELAP) rulings.
18. The laboratory must use the lowest achievable reporting limits for groundwater samples required under the MRP.
19. **Ninety days (90)** prior to terminating discharge operation, the Discharger must submit a work plan, for review and approval by the CPM, in consultation with the Regional Board Executive Officer, to determine the extent (if any) of contamination to natural geologic materials and underlying groundwater by the waste. **One hundred twenty days (120)** following work plan approval, the Discharger must submit a technical contamination assessment report. A California Registered Civil Engineer or Certified Engineering Geologist must prepare the work plan and technical contamination assessment report.
20. Upon ceasing operation at this facility, all waste, liner system components, and natural geologic material contaminated by waste and surplus or unprocessed material, shall be removed from the site and disposed of in accordance with applicable laws and regulations. After removal of all wastes, the Discharger should request in writing an inspection and approval by the CPM and a representative of the Regional Board Executive Officer.
21. **Two years prior** to closure of the facility or any portion thereof, the Discharger must submit, for review and approval by the CPM, in consultation with the Regional Board Executive Officer, a closure plan in accordance with Section 21769.
22. The closure plan must include at least the following:
 - ii. Facility location map;
 - iii. Topographic maps;
 - iv. Existing monitoring and control systems;
 - v. Land uses;
 - vi. Estimated closure date and schedule;
 - vii. General closure description;
 - viii. Other special requirements;
 - ix. Revised closure cost estimates (if appropriate); and
 - x. Any other applicable requirements as specified in CCR Title 27.

23. The Discharger must notify the CPM and the Regional Board Executive Officer at least **180 days** prior to beginning of any partial or final closure activity of the evaporation ponds.
24. The Discharger must maintain the established irrevocable bond for closure in an amount acceptable to the CPM, in consultation with the Regional Board Executive Officer, or provide other means to ensure financial security for closure. The amount of bond may be changed to reflect updated closure cost adjusted for inflation at the discretion of the CPM, in consultation with the Regional Board Executive Officer.
25. In the event of any change in control or ownership of land or waste discharge facility presently owned or controlled by the Discharger, the Discharger must notify the succeeding owner or operator of the existence of these WDRs by letter, a copy of which must be immediately forwarded to the CPM and the Regional Board.

To assume operation under these WDRs, the succeeding owner or operator must apply in writing to the CPM and the Regional Board Executive Officer requesting transfer of these WDRs. The request must contain the requesting entity's full legal name, the state of incorporation if a corporation, address and telephone number of the persons responsible for maintaining contact with the CPM and the Regional Board, and a statement, as follows. The statement shall comply with the signatory paragraph of Standard Provision and shall state that the new owner or operator assumes full responsibility for compliance with these WDRs. Failure to submit the request will be considered a discharge without requirements, a violation of the California Water Code. Transfer must be approved or disapproved in writing by the CPM, in consultation with the Regional Board Executive Officer.

26. Prior to a modification that results in any material change in the quality or quantity of waste discharge, or a material change in the location of waste discharge, the Discharger must report all pertinent information in writing to the CPM and the Regional Board Executive Officer and obtain revised WDRs for inclusion in the CEC certification.
27. All permanent containment structures, and erosion and drainage control systems, must be certified by a California Registered Civil Engineer or Certified Engineering Geologist to meet prescriptive standards and performance goals.
28. The Discharger must ensure that all site-operating personnel are familiar with the content of these requirements, and that a copy of these WDRs remains available at the facility.
29. The Discharger must allow authorized representative(s) of the CPM and/or Regional Board to:
 - a. Enter the premises regulated by these WDRs, or the place where records are kept under the conditions of these WDRs;
 - b. Have access to and copy records kept under the condition of these WDRs;

- c. Inspect at reasonable times facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under these WDRs; and
 - d. Sample or monitor for the purpose of assuring compliance with these WDRs or as authorized by the California Water Code, any substance or parameter at this location.
30. The Discharger must comply with terms and conditions of these WDRs. Any noncompliance constitutes a violation of the WDRs pursuant to the Porter-Cologne Water Quality Act (Water Code Section 13000 et seq.), and is grounds for enforcement action by the CEC or the Regional Board.
31. These WDRs do not convey property rights of any sort, or any exclusive privilege, nor does it authorize injury to private property, or invasion of personal rights, nor infringement of federal, state or local laws or regulations.
32. Pursuant to the California Business and Professions Code Sections 6735, 7835, and 7835.1 all engineering and geologic evaluations and judgments must be performed by or under the direction of California registered professionals.

THIS PAGE INTENTIONALLY LEFT BLANK

SOIL AND WATER RESOURCES – APPENDIX C

MONITORING AND REPORTING PROGRAM – Rice Solar Energy Project, Class II Disposal Facility, Riverside County

Note: the site's declared Monitoring Parameters (MonPars) under Part II.A.4 and the Reporting Period declaration under Part I.D.1, of this Monitoring and Reporting Program (MRP), together with MRP Part III (for reference purposes) and the waste and surface impoundment sampling of Parts II.B. and II.C., become effective on the day that the CEC certification for this site becomes effective. All MRP requirements are in-effect as of the start of the first six-month-long Reporting Period [see Part I.D.1 of this MRP] following approval of the Discharger's Concentration Limit Report [see WDR Provisions C.10].

PART I -- GENERAL REQUIREMENTS

A. GENERAL

A Discharger who owns or operates a Class II Surface Impoundment is required to comply with this site-specific Monitoring and Reporting Program (MRP) in order to meet the provisions of Title 27, Division 2, Chapter 3, Subchapter 3, Article 1 of the California Code of Regulations for the purpose of detecting, characterizing, and responding to releases to the groundwater. Because this will be a new facility, there is no existing release. Therefore, the purpose of this MRP is to establish a Detection Monitoring Program that meets the first of the Title 27 purposes ("detecting").

1. This MRP is established pursuant to Provisions C.1 of the Appendix B WDRs. The principal purpose of this self-monitoring program is:
 - a. To document compliance with Waste Discharge Requirements (WDRs), and prohibitions established by the California Energy Commission, in consultation with the Colorado River Basin Regional Water Quality Control Board (Regional Water Board);
 - b. To facilitate self-policing by the Discharger in the prevention and abatement of pollution arising from waste discharge;
 - c. To conduct water quality analyses designed to detect a release from any of the three regulated surface impoundments at the facility.
2. The Energy Commission's Compliance Project Manager (CPM), in consultation with the Regional Water Board Executive Officer, may alter the monitoring parameters and/or the monitoring frequency during the course of this monitoring program if deemed necessary. *Failure to comply with this MRP constitutes noncompliance with the WDRs and the California Water Code, which can result in imposition of civil monetary liability.*

B. SAMPLING AND ANALYTICAL METHODS

Sample collection, storage, and analysis must be performed according to the most recent version of USEPA approved methods. Specific methods of analysis must be identified. If methods other than USEPA-approved methods are used, the exact methodology must be submitted for review and approval by the CPM, in consultation with the Regional Water Board Executive Officer, prior to use. All analyses shall be conducted by a laboratory certified by the California Department of Public Health to perform the required analyses. The director of the laboratory whose name appears on the certification shall supervise all analytical work in his/her laboratory and shall sign all reports of such work submitted to the CPM and the Regional Water Board. All monitoring instruments and equipment shall be properly calibrated and maintained to ensure accuracy of measurement. For any left-censored concentration data point (i.e., either a non-detect {ND} value, or trace value), the laboratory should report the Method Detection Limit (MDL) and Practical Quantitation Limit (PQL) for that determination and, if feasible, should include an estimated concentration (e.g., with a "P-value" flag, and with the concentration estimate in parentheses) for any trace value determination.

C. RECORDS TO BE MAINTAINED

Written reports shall be maintained by the Discharger or laboratory, and shall be retained for a minimum of five years. This period of retention shall be extended during the course of any unresolved litigation regarding this discharge or when requested by the CPM, in consultation with the Regional Water Board. Such records shall show the following for each sample:

1. Identity of sample and of the Monitoring Point or Background Monitoring Point from which it was taken, along with the identity of the individual who obtained the sample;
2. Date and time of sampling;
3. Date and time that analyses were started and completed, and the initials of the personnel performing each analysis;
4. Complete procedure used, including method of preserving the sample, and the identity and volumes of reagents used;
5. Calculations of results; and
6. Results of analyses, and the MDL and PQL for each analysis.

D. REPORTING

1. Detection Monitoring Reports – For each Monitored Medium, all Monitoring Points and Background Monitoring Points assigned to detection monitoring under Part II.A.7 of this MRP shall be monitored **semiannually** for the **Monitoring Parameters (Part II.A.4)**. Unlike with most WMUs under Title 27 WDRs, there will be no five-yearly monitoring for those COCs that are not Monitoring Parameters, given that, for this site's WMUs, there are so few waste constituents that each COC is a Monitoring

Parameter. The monitoring year's first Reporting Period begins on March 1 and ends on August 31, with the report due by September 15; the second Reporting Period begins on September 1 and ends on February 28, with the report due by March 15.

A "Detection Monitoring Report" shall be submitted to both the CPM and the Regional Water Board in accordance with the schedule contained in the Summary of Self-Monitoring and Reporting Requirements, and shall include the following:

- a. A Letter of Transmittal that summarizes the essential points in each report shall accompany each report submittal. The letter of transmittal shall be signed by a principal executive officer at the level of vice-president or above, or by his/her duly authorized representative, if such representative is responsible for the overall operation of the facility from which the discharge originates. The letter of transmittal must include:
 - i. A discussion of any violations noted since the previous report submittal and a description of the actions taken or planned for correcting those violations. If no violations have occurred since the last submittal, that should be so stated;
 - ii. If the Discharger has previously submitted a detailed time schedule or plan for correcting any violations, a progress report on the time schedule and status of the corrective actions being taken; and
 - iii. A statement by the official, under penalty of perjury, that to the best of the signer's knowledge the report is true, complete, and correct.
- b. A Compliance Evaluation Summary shall be included in each Detection Monitoring Report. The compliance evaluation summary shall contain at least:
 - i. Velocity and direction of groundwater flow for each monitored groundwater body under and around the surface impoundment based upon the water level elevations taken during the collection of water quality data at the start of the Reporting Period and during a separate mid-Period velocity-and-direction determination. For each of these two determinations, include a description and graphical presentation (e.g., arrow on a map);
 - ii. Methods used for water level measurement and pre-sampling purging for each monitoring well addressed by the report including:
 - a. Method, time, and equipment used for water level measurement;
 - b. Type of pump used for purging, placement of the pump in the well, pumping rate, and well recovery rate;
 - c. Methods and results of field testing for pH, temperature, electrical conductivity, and turbidity, including; equipment calibration methods, and method for disposing of purge water

- iii. Methods used for sampling each Monitoring Point and Background Monitoring Point, including:
 - a. A description of the type of pump, or other device used, and its placement for sampling;
 - b. A detailed description of the sampling procedure: number and description of samples, field blanks, travel blanks, and duplicate samples; types of containers and preservatives used; date and time of sampling; name and qualifications of individual collecting samples, and other relevant observations;
 - c. A map or aerial photograph showing the locations of Monitoring Points, and Background Monitoring Points;
 - d. For each Detection Monitoring Report, provide all relevant laboratory information including results of all analyses;
 - e. An evaluation of the effectiveness of the run-off/run-on control facilities;
 - f. A summary of reportable spills/leaks occurring during the reporting period; include estimated volume of liquids/solids discharged outside designated containment area, a description of management practices to address spills/leaks, and actions taken to prevent reoccurrence.
2. Annual Summary Report – The Discharger shall submit to the CPM and Regional Water Board, an “Annual Summary Report” for the period the prior and current Reporting Periods; this Annual Summary Report can be combined with the monitoring report for the Reporting Period just ending (see Part I.D.1 of this MRP). The “Annual Summary Report” is due **March 15** of each year, and shall include the following:
 - a. A graphical presentation of analytical data for each Monitoring Point and Background Monitoring Point (Title 27, Section 20415(e)(14)), in the form of a concentration-versus-time plot showing all data, for that MonPt/MonPar pair, obtained for that pair during at least the prior five calendar years. Each such graph can plot the concentration of a given MonPar over time for a given Monitoring Point and Background Monitoring Point, at a scale appropriate to show trends or variations in water quality. The graphs shall plot each datum, rather than plotting mean values. For any given monitoring parameter, the scale for background plots shall be the same as that used to plot down gradient data. On the basis of any aberrations noted in the plotted data, the CPM, in coordination with the Regional Water Board Executive Officer, may direct the Discharger to carry out a preliminary investigation (Title 27, Section 20080(d)(2)) the results of which will determine whether or not a release is indicated;

- b. A tabular presentation of all monitoring analytical data obtained during the previous two Monitoring and Reporting Periods, submitted on hard copy within the annual report as well as digitally on electronic media in a file format acceptable to the CPM, in consultation with the Regional Water Board Executive Officer (Title 27, Section 20420(h)). The submittal of data in hard copy and on diskette CD-ROM constitutes the "... form necessary for..." statistical analysis, in that this facilitates periodic review of the Discharger's declared monitoring and testing results;
- c. A comprehensive discussion of the compliance record and any corrective actions taken or planned, which may be needed to bring the Discharger into full compliance with WDRs;
- d. **Annual Influent sampling report** containing analytical results of quarterly samples collected from the waste collection system prior to disposal to evaporation ponds, and evaporation pond sampling results as specified in Part II B and C of this MRP, respectively.
- e. A written summary of the groundwater analyses, indicating changes made since the previous annual report;
- f. An evaluation of the effectiveness of the run on/run-off control facilities, pursuant to Title 27, Section 20365;
- g. The following two appendices, updated to reflect conditions at the end of that monitoring year's just-completed (#2-of-2) Reporting Period:
 - i. **Appendix A** — a table having a record (row) for each MonPt/MPar pair (i.e., for each Monitoring Parameter at each Monitoring Point) that shows that pair's: then-current concentration limit type (e.g., enter "interpoint" and background MonPt name, if the data is from a background MonPt, or enter "intrapoint," if the data comes from that same MonPt during at least its initial two years); retesting method (either "pass-1-of-3" or "pass-1-of-2"); background data points; Threshold Value ("TV," calculated by applying the data analysis method {declared under Part I.D.2.g.i} to that pair's concentration limit); and compliance status (enter "Detection Mode" if the pair has shown no retest-verified release indication or "Tracking Mode" if there has been such an indication). This is how this MRP implements Title 27, Section 20390(a); and
 - ii. **Appendix B** — a table showing, for each then-current data analysis compliance-testing method, a description thereof [including, for statistical methods applied to readily-detectable inorganic waste constituents, the value used for each parameter setting (e.g., $\alpha = 0.01$)], and a list of each MonPt/MonPar pair that uses that method. For "Detection Mode" MonPt/MonPar pairs (i.e., pairs that have not shown a verified release indication) that are evaluated under the California Nonstatistical Data Analysis Method (CNSDAM), the description is "CNSDAM, per the MRP." For a

statistical method applied to a MonPt/MonPar pair in Detection Mode, the description is adequate if a person familiar with the method can apply it to that pair's declared concentration limit in the above-required table (Part I.D.2.g.i of this MRP) and come up with the same Threshold Value (TV) as declared for that pair in that table. For any (release-affected) MonPt/MonPar pair in Tracking Mode, the TV is the background mean value (serving as that pair's respective cleanup concentration goal), which shall be plotted as a horizontal line on that pair's respective concentration-versus-time plot (included elsewhere in the Annual report). For any statistical method following the USEPA's 2009 Unified Guidance (UG) the method description can be the method's name, the UG page range(s) to be following in calculating the TV, and the parameter settings. This is how this MRP implements Title 27, Sections 20415(e)(7) and 20420(e); and

- h. If appropriate (every four years) a proposed-and-validated update, under Part II.A.7.b. of this MRP, of the Concentration Limits to include appropriate new background data (from that MonPt/MonPar pair's declared background data source).

3. Contingency Reporting

The Discharger shall report by telephone any spill that may endanger human health or the environment to the Regional Water Board Executive Officer and the California Emergency Management Agency as soon as: (1) the Discharger has knowledge of the discharge, (2) notification is possible, and (3) notification can be provided without substantially impeding cleanup or other emergency measures. During non-business hours, the Discharger shall leave a message on the Regional Water Board office voice recorder. Any other type of spill, regardless of type or size, is to be reported to the CPM and the Regional Water Board by telephone within 48 hours.

After reporting a spill, a written report shall be filed with the CPM and the Regional Water Board Executive Officer within seven days, containing at a minimum the following:

- i. A map showing the location(s) of the discharge/spill;
 - ii. A description of the nature of the discharge (all pertinent observations and analyses including quantity, duration, etc.); and
 - iii. Corrective measures underway or proposed.
- a. Should the initial statistical comparison (Part III.A.1.) or non-statistical comparison (Part III.A.2.) indicate, for any Monitoring Parameter (MonPar), that a release is tentatively identified, the Discharger shall immediately notify the CPM and the Regional Water Board verbally as to the Monitoring Point(s) and MonPar(s) involved, shall provide written notification by certified mail within seven days of such determination (Title 27, Section 20420(j)(1)), and shall conduct a discrete retest in accordance with Part III.A.3. If the retesting confirms the existence of a release, the Discharger shall carry out the requirements of Part I.D.3.d. In any case, the Discharger shall inform the CPM and the Regional

Water Board of the outcome of the retest as soon as the results are available, following up with written results submitted by certified mail within seven days of completing the retest and the inclusion of a discussion of the event in the next scheduled Monitoring Report and a notation on it in the Annual Summary Monitoring Report summary section.

- b. If either the Discharger or the CPM, in consultation with the Regional Water Board, determines that there is significant physical evidence of a release (Title 27, Section 20385(a)(3)), the Discharger shall immediately notify the CPM and the Regional Water Board of this fact by certified mail (or acknowledge the CPM's determination made in consultation with the Regional Water Board) and shall carry out the requirements of Part I.D.3.d. for all potentially-affected monitored media.
- c. If the Discharger concludes that a release has been discovered:
 - i. If this conclusion is not based upon "direct monitoring" and compliance testing of the MonPars, pursuant to Part II.A.5., then the Discharger shall, within thirty days, sample for all MonPars at all Monitoring Points and submit them for laboratory analysis. Within seven days of receiving the laboratory analytical results, the Discharger shall notify the CPM and Regional Water Board, by certified mail, of the concentration of all MonPars at each Monitoring Point. Because this is a scan, rather than an application of the site's statistical-or-nonstatistical data analysis method, merely obtain and report a single concentration datum for each MonPar at each Monitoring Point (Title 27 Section 20420(k)(1));
 - ii. The Discharger shall, within 90 days of discovering the release (Title 27, Section 20420(k)(5)), submit to the CPM and the Regional Water Board an addendum to the site's Report of Waste Discharge proposing an Evaluation Monitoring Program meeting the requirements of Title 27, Section 20425; and
 - iii. The Discharger shall, within 180 days of discovering the release [Title 27, Section 20420(k)(6)], submit to the CPM and the Regional Water Board a preliminary engineering feasibility study meeting the requirements of Title 27, Section 20430.
- d. Any time the Discharger concludes - or the CPM, in consultation with the Regional Water Board Executive Officer directs, the Discharger to conclude - that a release from the surface impoundment has proceeded beyond the facility boundary, the Discharger shall so notify all persons who either own or reside upon the land that directly overlies any part of the plume (Affected Persons).
 - i. Initial notification to Affected Persons should be accomplished within 14 days of making this conclusion and shall include a description of the Discharger's current knowledge of the nature and extent of the release; and

- ii. Subsequent to initial notification, the Discharger shall provide updates to all Affected Persons, including any persons newly affected by a change in the boundary of the release, within 14 days of concluding a material change in the nature or extent of the release has occurred.

4. Leakage Detection System (LDS), and Solids Monitoring

- a. Reporting shall be conducted **semi-annually**.
- b. Provide volume of solids removed from the holding pond each month for that reporting period, and transported to a waste management facility for disposal. Include name and location of waste management facility.
- c. Conduct **quarterly** inspections of Leakage Detection System (LDS), and evaporation ponds.

PART II -- MONITORING REQUIREMENTS FOR GROUNDWATER

A. GROUNDWATER SAMPLING AND ANALYSIS FOR DETECTION MONITORING

1. Groundwater Surface Elevation and Field Parameters – Groundwater sampling and analysis shall be conducted semiannually pursuant to California rulings, and include an accurate determination of the groundwater surface elevation and field parameters (temperature, electrical conductivity, turbidity) at each groundwater sampling location (Title 27, Section 20415(e)(13) & (e)(15)). In addition, the Discharger shall make a mid-Reporting-Period determination of the elevation (at each groundwater sampling location). If a given well is to be sampled (in addition to the groundwater elevation determination), the groundwater elevation shall be obtained prior to purging the well and sample collection. The resulting suite of location-specific groundwater elevation values shall be used to produce the quarterly groundwater flow rate/direction analyses required under Part I.D.1.b.i. Groundwater wells shall have their water surface elevation gauged using an electronic sounder capable of measuring depth to groundwater within 100th of an inch. Following gauging, wells that are to be sampled shall be purged according to EPA groundwater sampling procedures until:
 - a. pH, temperature, and conductivity are stabilized within 10%, and
 - b. turbidity has been reduced to 10 NTUs or the lowest practical levels achievable.

The above identified parameters shall be recorded in the field, and submitted in the monitoring report. Sampling equipment shall be decontaminated between wells. Purge water may be discharged to the brine pond; discharge to the ground surface is prohibited.

2. Groundwater Sample Collection – Groundwater samples shall be collected from all groundwater monitoring points and background monitoring points after wells recharge to within at least 80% of their original static water level. Groundwater samples shall be collected with a peristaltic pump that is decontaminated between sampling events. Samples shall be labeled, logged on chain-of-custody forms, and placed in cold storage pending delivery to a State certified analytical laboratory.
3. Five-Day Sample Procurement Limitation – To satisfy data analysis requirements for a given reporting period, samples collected from all Monitoring Points and Background Monitoring Points shall be taken within a span not exceeding five days, and shall be taken in a manner that insures sample independence to the greatest extent feasible (Title 27, Section 20415(e)(12)(B)). Therefore, in order to accommodate the pass-1-of-3 retesting approach used under the MRP for statistically-tested Monitoring Parameters (MonPars), and the pass-1-of-2 retesting approach used for VOCs under the nonstatistical test method, the first sample of the Reporting Period, for all COCs at all Monitoring Points and Background Monitoring Points, shall be taken at the very start of the Reporting Period. If the first sample

exceeds that MonPt/MonPar pair's respective Threshold Value, then the Discharger shall take and process a mid-Reporting-Period retest sample (for that MonPt/MonPar pair). If a second retest is needed (pass-1-of-3 approach only), the Discharger will take the sample just prior to the end of that Period and, in that case only, will not take a sample for that MonPt/MonPar pair at the start of the subsequent Report.

Under a pass-1-of-3 retesting approach for a statistically-based test, the Threshold Value shall be calculated in accordance with the USEPA's **Unified Guidance** (2009) or other guidance that lowers the TV to compensate for the effect of retesting¹⁰, and the initial release-indication shall prevail only if both retests confirm the original indication. This MRP applies this improved approach in place of Title 27's prescriptive pass-2-of-3 approach and retest-within-30-days approach (applicable to statistical tests), as allowed pursuant to §20080(a)(1) of that Title.

Under a pass-1-of-2 retesting approach for the nonstatistical method included in this MRP, the initial **release**-indication shall prevail only if the single retest confirms the original indication.

4. Groundwater Monitoring Parameters for Detection Monitoring – Groundwater samples collected from monitoring points and background monitoring points shall be analyzed for the following:

<u>Parameter</u>	<u>Unit</u>	<u>Sample Type</u>
Total Dissolved Solids (TDS)	mg/L	Grab
EC (Electrical Conductivity)	µmhos/cm	Grab
pH	pH units	Grab
All Volatile Organic Compounds ever detected above their PQL in wastewater (see MRP Part II.B)	µg/L	Grab
CCR Title 22 Heavy Metals, Dissolved (As, Ba, Cd, Pb, Zn, etc)	mg/L	Grab
Oil & Grease	mg/L	Grab
Total Petroleum Hydrocarbon (TPH-gas & diesel)	µg/L	Grab

For all Monitoring Points and Background Monitoring Points, the initial sampling event for each of the two semi-annual Reporting Periods shall early in March and

¹⁰ For example, for a 95% Gamma Upper Prediction Limit, see the Table 4 discussion at the back of: **One-Sided Approximate Prediction Intervals for at Least p of m Observations from a Gamma Population at Each of r Locations**, by DK Bhaumik and RD Gibbons [TECHNOMETRICS, February 2006, VOL. 48, NO. 1] and **Simultaneous Gamma Prediction Limits for Ground Water Monitoring**, by RD Gibbons and DK Bhaumik [Ground Water Monitoring & Remediation 26, no. 3 / Summer 2006 / pages 105-116].

September, respectively, of each year in accordance with Parts I.D.1 and II.A.3. of this MRP. Monitoring results obtained during a given Reporting Period shall be reported in the semiannual Detection Monitoring Report for that Reporting Period.

5. Data Analysis – Non-statistical and statistical compliance-testing data analysis, whether for an initial sample (for that Reporting Period) or a retest sample, shall be carried out as soon as the data is available, in accordance with Part III of this monitoring program.
6. Monitoring Points and Background Monitoring Points – The Discharger shall sample the Monitoring Points and Background Monitoring Points listed in the approved report submitted under Part C.10 of the WDRs, which report is incorporated by reference in this MRP, in accordance with the sampling schedule given under Parts I.D.1., II.A.3, and II.A.4 of this MRP, by obtaining a single new concentration datum for each MonPt/MonPar pair for each initial test (for that Reporting Period) or retest, and subjecting it to the most appropriate test under Part III. In addition, the Discharger shall sample each background monitoring point at least once each Reporting Period.
7. Initial Background Determination – The initial background data set (Concentration Limit) for each MonPt/MonPar pair is established under the approved report submitted under Part C.10 of the WDRs. However:
 - a. **New MonPars or Wells**
 - i. Whenever a new waste constituent is added to the MonPars in the Water Quality Protection Standard, the Discharger shall collect at least one (1) sample **quarterly** for two (1) years from each Monitoring Point and Background Monitoring Point in each monitored medium. Nevertheless, for any of these eight data points (for that new MonPar at each sampling location), the Discharger can substitute existing data for that constituent, from the sampling location. As part of the next scheduled Monitoring Report following completion of this data collection effort, the Discharger shall propose a Concentration Limit for that new MonPar at each Monitoring Point, as was done initially under Part C.10 of the WDRs. The new Monitoring Parameter and its Concentration Limits become effective during the Reporting Period following the approval of the Rice Solar Energy Project; and
 - ii. Whenever a new Monitoring Point is added, the Discharger shall sample the new monitoring point at least **quarterly** for at least two (2) years, and shall propose an appropriate Concentration Limit for each MonPar there, as done initially under Part C.10 of the WDRs analyzing for all Monitoring Parameters. The new Monitoring Point, and the Concentration Limits for each MonPar there, become effective during the Reporting Period following the approval of the Rice Solar Energy Project.

- b. **Updating Concentration Limits** — The updating of the Concentration Limit for each MonPt/MonPar pair follows a four-year cycle, regardless of whether the Concentration Limit is of the interpoint or intrapoint type. Every four years after this monitoring program becomes effective, the Annual Summary Monitoring Report will include a proposal to update each Concentration Limit by adding the data from its background data source, if appropriate. For each given MonPt/MonPar pair, the proposal shall create a pool of the eight prospective new data points and the Concentration Limit's most recent background data points and shall run a Sen's-Slope/Mann-Kendall test at 90% confidence, looking only for a significant upward slope (thus, it is really a one-tailed test at 95% confidence). In the absence of a significant slope indication, the Discharger shall declare that result and propose that the new data be added to that MonPt/MonPar pair's Concentration Limit. The revised Concentration Limits become effective during the Reporting Period following approval of the Rice Solar Energy Project.

8. Semiannual Reporting of the Quarterly Determination of Groundwater Flow Rate/Direction [Title 27, Section 20415(e)(13) & (e)(15)] – The groundwater flow rate and direction determinations done twice each Reporting Period under Part I.D.1.b of this MRP.

B. WASTE COLLECTION SYSTEM SAMPLING

Influent samples shall be collected from the waste collection system, which receives combined industrial waste streams generated at the facility. The samples should be representative of the volume and nature of the discharge. Influent sampling should include the following, with the results included in each Annual Summary Monitoring Report and with due attention paid to any non-MonPar constituent present in excess of its respective PQL:

<u>Parameter</u>	<u>Unit</u>	<u>Sample Type</u>	<u>Frequency</u>
Total Dissolved Solids (TDS)	mg/L	Grab	Quarterly
EC (Electrical Conductivity)	µmhos/cm	Grab	Quarterly
pH	pH units	Grab	Quarterly
Volatile Organic Compounds	µg/L	Grab	Annually
CCR Title 22 Heavy Metals, Dissolved (As, Ba, Cd, Pb, Zn, etc)	mg/L	Grab	Annually
Oil & Grease	mg/L	Grab	Quarterly
Total Petroleum Hydrocarbon (TPH-gas & diesel)	µg/L	Grab	Quarterly

For Volatile Organic Compounds (VOCs), any VOC detected pursuant to this waste testing that is present in excess of its respective PQL concentration becomes a

Groundwater MonPar. For any such new VOC MonPar, the Discharger shall meet the data gathering and submittal requirements of MRP Part II.A.7.a.i.

Note that sampling and analysis under this Part and Part II.C. begins as soon as there is waste to sample, even though groundwater compliance testing is not yet in effect, and that, until groundwater compliance testing begins, this information will constitute the majority of the information in the semi-annual Monitoring Reports and the Annual Summary Monitoring Report.

C. EVAPORATION PONDS / SURFACE IMPOUNDMENT SAMPLING

<u>Parameter</u>	<u>Unit</u>	<u>Sample Type</u>	<u>Frequency</u>
Freeboard	feet	Measurement	Monthly

The Discharger must inspect the condition of lined evaporation ponds each month and record visual observations (e.g., in data sheets or bound logbook). Notations, which shall be included in each Reporting Period's monitoring report, shall include observations of whether weeds are developing along the bank, whether scum, or debris accumulating on the water surface; whether burrowing animals or insects are present.

D. FACILITY MONITORING

1. Annual Inspection

The Discharger should conduct an annual rainy season inspection. The inspection must assess the facility drainage control systems, WMUs, retention basin, groundwater monitoring wells, and fencing. Any necessary construction, maintenance, or repairs must be completed within 15 days of the inspection. The Discharger must include its finding and any corrective action taken in the Annual report.

2. Seismic Events

The Discharger must implement the Post-Earthquake Inspection and Response Plan following any seismic event which causes significant ground motion at the site.

PART III -- STATISTICAL AND NON-STATISTICAL ANALYSES

A. STATISTICAL DATA ANALYSIS METHODS

The Discharger shall use any one of the following statistical data analysis methods for each MonPt/MonPar pair having a Concentration Limit consisting of (all or mostly) numerical concentration values, including estimated concentrations (“J” values), rather than “ND” determinations. The best method for a given MonPt/MonPar pair may not be the same for another MonPar at that MonPt or for that same MonPar at another MonPt, so the proposal [under WDR Part C.10] must be specific to each MonPt/MonPar pair:

1. A parametric Upper Prediction Limit run in accordance with the USEPA’s **Unified Guidance**¹¹ (“UG”, 2009) manual;
2. A parametric Shewhart Control Chart run in accordance with the USEPA’s UG;
3. A parametric 95% Gamma Upper Prediction Limit run in accordance with the two papers (by Gibbons and Bhaumik) listed in the footnote to MRP Part II.A.3; or
4. If none of the above methods are suitable, another method used in accordance with the USEPA’s UG.

All statistical methods used for validating ongoing compliance (Detection Mode testing) shall use a pass-1-of-3 plan for retesting [see MRP Part II.A.3], with the retest-triggering concentration (Threshold Value) lowered to compensate for the retesting approach, pursuant to the UG or the Gibbons/Bhaumik papers referenced above.

B. NONSTATISTICAL DATA ANALYSIS METHOD (NSDAM)¹²

1. **Non-Statistical Method For Detection Mode MonPars Seldom Found In Background** — For any given Monitoring Point (MonPt) subject to compliance testing each Reporting Period, the discharger shall use this data analysis method, jointly, for all Monitoring Parameters (MonPars) on that MonPt’s “scope list” (see ¶III.B.1.a. for the initial test scope list and ¶III.B.2.b for the modified scope list used during the single retest).
 - a. **Scope List** — Create a current “scope list” for that MonPt showing each detection mode MonPar, at that MonPt, that exceeds its respective MDL in less than 10% of its background data set (Concentration Limit).
 - b. **Two Triggers** — From the scope list made for that MonPt under ¶III.B.1.a. above, for an initial test [or, for a retest, the modified scope list under ¶III.B.2.b, below], identify each scope-list-MonPar in the current sample from that MonPt that exceeds either its respective MDL or its respective PQL. The discharger shall conclude that these exceeding MonPars provide a preliminary indication [or,

¹¹ The **Unified Guidance** is available for downloading from <http://www.epa.gov/osw/hazard/correctiveaction/resources/guidance/sitechar/gwstats/> .

¹² For this site, this nonstatistical test applies mainly to the VOC MonPars (i.e., those VOCs that have been detected above their respective PQL in the facility waste stream).

for a retest, provide a measurably significant release indication], at that MonPt, if either:

- i. two or more of the MonPars on the MonPt's scope list exceed their respective MDL; or
- ii. at least one of the MonPars on the MonPt's scope list equals or exceeds its respective PQL.

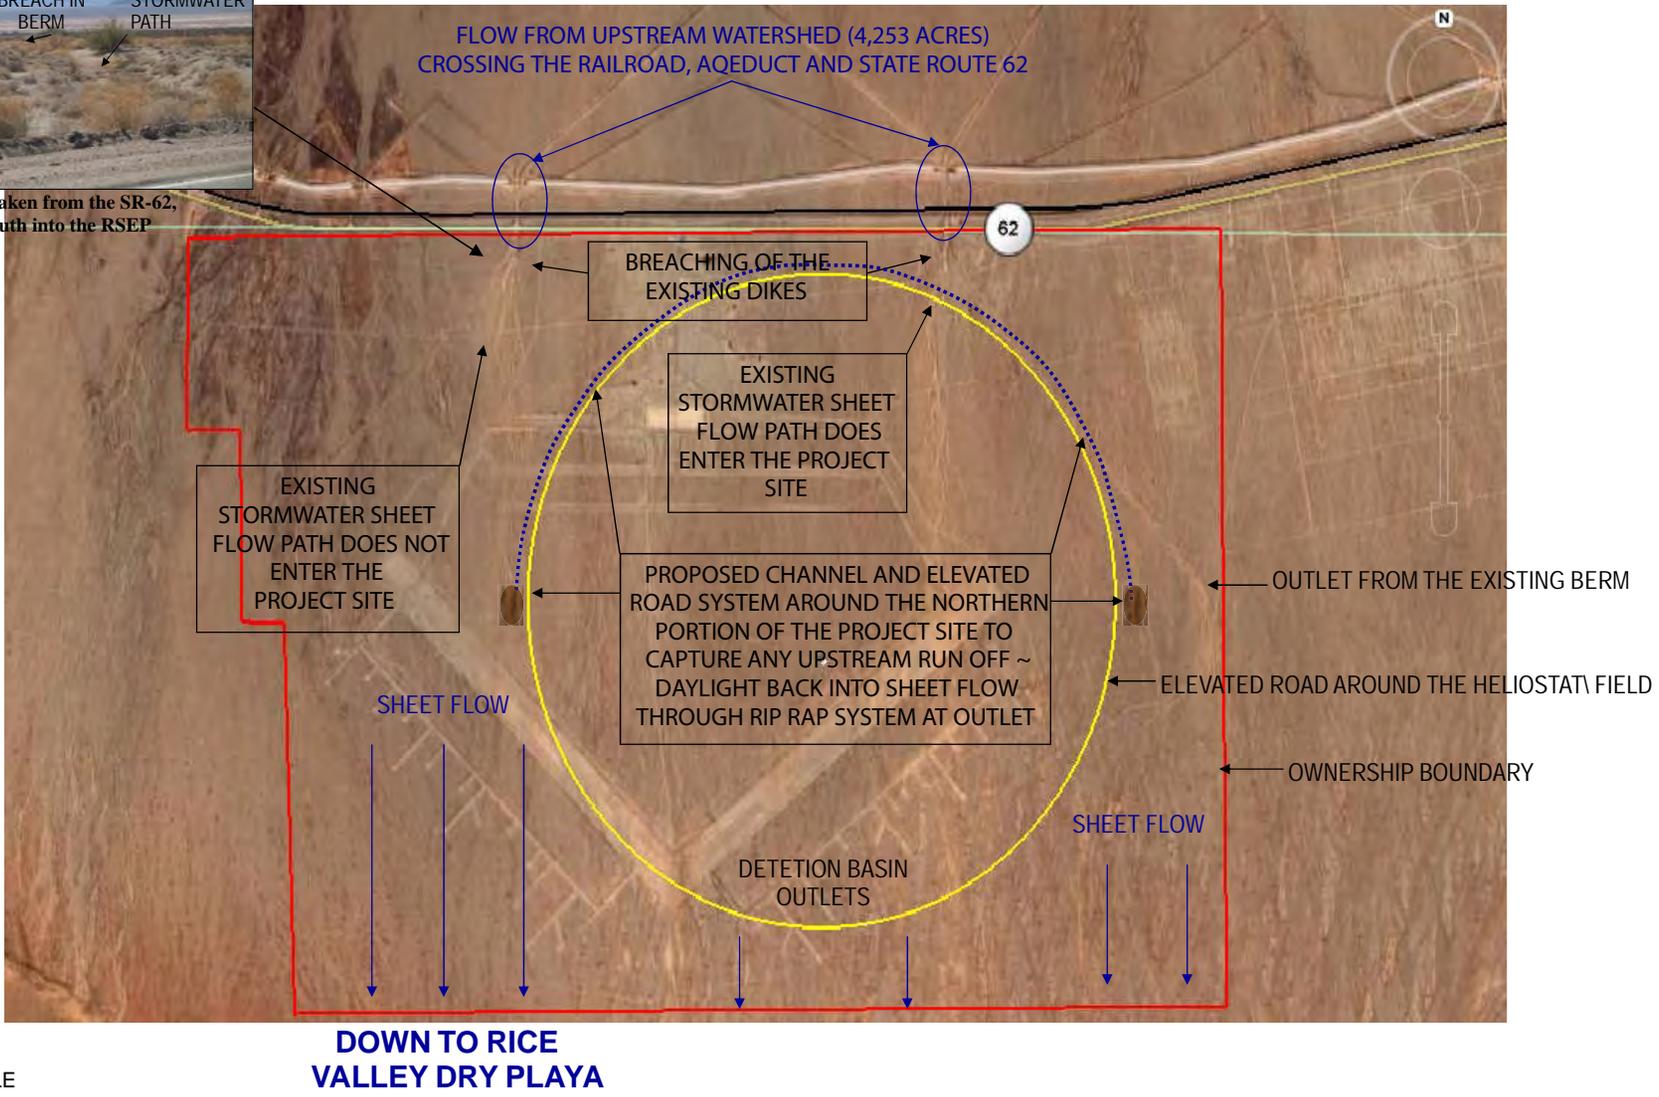

2. Single Discrete Retest (A "Pass-1-of-2" Plan):

- a. In the event that the discharger concludes [pursuant to paragraph III.B.1.ii.b., above] that there is a preliminary indication, then the discharger shall immediately notify the CPM and the Regional Water Board staff by phone or e-mail and obtain a new independent (retest) sample from the indicating MonPar at mid-Reporting-Period.
- b. For any given MonPt retest sample, the discharger shall include, in the retest analysis, only the laboratory analytical results for those constituents indicated in that MonPt's original test [under ¶III.B.1.b.], and these indicated constituents shall comprise the MonPt's "modified scope list," for use in the retest. As soon as the retest data are available, the discharger shall apply the same test [under ¶III.B.1.b, above, but using this modified scope list] to analyze the retest sample's data at that compliance MonPt.
- c. If the retest sample trips either (or both) of the triggers under ¶ III.B.1.b, then the Discharger shall conclude that there is a measurably significant increase at that MonPt for the constituent(s) indicated in the validating retest sample. Furthermore, given a confirming retest, beginning with the next Reporting Period, the discharger shall monitor the indicated-and-verified constituent(s) in Tracking Mode (instead of Detection Mode) at that MonPt, shall report this conclusion immediately to the CPM and Regional Water Board, shall remove the indicating constituent(s) from the scope list created (under ¶III.B.1.a. of this M&RP) for that MonPt, and shall highlight this release-indication conclusion and these changes in the next scheduled monitoring report and in the facility's operating record.

PRECIPITATION

TRAFFIC AND TRANSPORTATION

Testimony of James Jewell, Alan Lindsley, Shaelyn Strattan, Clifford Ho and Scott Debauche

SUMMARY OF CONCLUSIONS

The U.S. Bureau of Land Management (BLM), Western Area Power Administration (Western) and Energy Commission staff (staff), hereafter jointly referred to as agencies, have reviewed the Rice Solar Energy Project (RSEP or proposed project) in accordance with the requirements of the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA). With respect to CEQA, staff concludes that with the adoption of the attached Conditions of Certification **TRANS-1** through **TRANS- 10**, the RSEP would not cause a significant adverse direct or indirect impact or contribute significantly to cumulative transportation or traffic impacts associated with RSEP construction, operation and decommissioning. These Conditions of Certification meet the Energy Commission's responsibility to comply with the California Environmental Quality Act and serve as recommendations for the Energy Commission to consider in its decision to avoid or reduce the severity of traffic and transportation-related impacts to less than significant and for the project to conform with all applicable traffic and transportation-related laws, ordinances, regulations, and standards (LORS). The identification of relevant and reasonable mitigation measures also conforms to National Environmental Policy Act (NEPA) requirements for BLM's and Western's analysis that can be considered in its Record of Decision.

INTRODUCTION

In the **Traffic and Transportation** section, the agencies address the extent to which the proposed RSEP may affect the traffic and transportation system within the vicinity of the project site. This analysis focuses on whether construction and operation of RSEP would cause traffic and transportation impact(s) under CEQA and NEPA and whether the project complies with the applicable LORS.

LAWS, ORDINANCES, REGULATIONS, AND STANDARDS

Traffic and Transportation Table 1 provides a general description of adopted federal, state, and local LORS pertaining to traffic and transportation relevant to the proposed project.

Traffic and Transportation Table 1
Laws, Ordinances, Regulations, and Standards

Applicable Law	Description
Federal	
Code of Federal Regulations, Title 14 Aeronautics and Space, Part 77 Objects Affecting Navigable Airspace	This regulation establishes standards for determining physical obstructions to navigable airspace; sets noticing and hearing requirements; and provides for aeronautical studies to determine the effect of physical obstructions on the safe and efficient use of airspace.

(14 CFR 77/FAR Part 77)	
49 CFR, Subtitle B	Includes procedures and regulations pertaining to interstate and intrastate transport (including hazardous materials program procedures) and provides safety measures for motor carriers and motor vehicles that operate on public highways.
State	
California Vehicle Code (CVC), division 2, chapter 2.5; div. 6, chap. 7; div. 13, chap. 5; div. 14.1, chap. 1 & 2; div. 14.8; div. 15	Includes regulations pertaining to licensing, size, weight, and load of vehicles operated on highways; safe operation of vehicles; and the transportation of hazardous materials.
California Streets and Highway Code, division 1 & 2, chapter 3 & chapter 5.5	Includes regulations for the care and protection of state and county highways and provisions for the issuance of written permits.
California Street and Highway Code §§670-695	Includes permit provisions from California Department of Transportation (Caltrans) including but not limited to permits for roadway encroachment during truck transportation and delivery and permits for any load that exceeds Caltrans weight, length, or width standards for public roadways.
Government Code §§65940 and 65944	Requires identification of military installations within 1,000 feet of the project site, low-level flight paths, special use airspace, and urbanized areas in the project area, and requires consultation among the project applicant, public agency, and the affected military branch to reduce the potential for impacts to military operations.
Local	
Riverside County Ordinance 461	Provides road improvement standards and specifications.
Riverside County General Plan Transportation Element	Specifies that all County maintained roads and conventional state highways shall operate at a Level of Service (LOS) C or better.
Riverside County Code, Ordinance 448 (as amended through 448.A) Airport Operations (2000)	This ordinance establishes airport operating areas and regulates height standards and limits within those areas. (Applies only to North of Desert Center Alternative)
Riverside County Congestion Management Plan (CMP)	Specifies that all CMP roadways shall operate at a LOS E or better.
Riverside County Airport Land Use Compatibility Plan (ALUCP); 2004	The intent of the ALUCP to promote compatibility between airports in Riverside County and the land uses that surround them. It sets compatibility criteria applicable to local agencies, in their preparation or amendment of land use plans and ordinances, and landowners (including special districts, other local government entities, and private parties) in their design of new development.
San Bernardino County Code, Title 5, Division 1, Highway Permit	Addresses permitting requirements for oversize/overweight vehicles.
San Bernardino Association of Governments CMP	Specifies that all CMP roadways shall operate at a LOS E or better.

METHODOLOGY AND THRESHOLDS FOR DETERMINING ENVIRONMENTAL CONSEQUENCES

The analysis of proposed project effects must comply with both CEQA and NEPA requirements given the respective power plant licensing and land jurisdictions of the California Energy Commission and BLM. CEQA requires that the significance of individual effects be determined by the Lead Agency; however, the use of specific significance criteria is not required under NEPA. Because this document is intended to meet the requirements of both NEPA and CEQA, the methodology used for determining environmental impacts of the proposed project includes a consideration of guidance provided by both laws.

Based on a review of recent environmental assessment documents prepared for the BLM and the CEQA Guidelines, Appendix G (amendments of the CEQA Guidelines, effective March 18, 2010), staff has determined the list of thresholds below to be appropriate for analysis of traffic and transportation impacts under both NEPA and CEQA. A project may have a significant effect on traffic and transportation if the project would:

- Cause an increase in traffic which is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in substantial increase in either the number of vehicle trips, the volume to capacity ratio on roads, or congestion at intersection);
- Conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes and transportation, including mass transit and nonmotorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths;
- Conflict with an applicable congestion management program, including, but not limited to, level of service standards (LOS) and travel demand measures or other standards established by the county congestion management agency for designated roads or highways;
- Result in a change in air traffic patterns, including either an increase in traffic counts or a change in location, that results in increased safety risks.
- Interfere with the takeoff, landing, or maneuvering of aircraft within an airport approach zone, airport turning zone, or airport transition zone, or in an area where flight paths are expected to occur below 1,000 feet above ground level (AGL)?
- Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment). CEQA compliance to this guideline is determined by the extent, if any, that the project would substantially increase hazards due to a design feature;
- Result in inadequate emergency access;
- Result in inadequate parking capacity;
- Conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., bus turnouts, bicycle racks).

Have individual environmental effects which, when considered with other impacts from the same project or in conjunction with impacts from other closely related past, present, and reasonably foreseeable future projects, are considerable, compound, or increase other environmental impacts. In general, a power plant and its related facilities may also result in potentially significant impacts if it is located near schools, results in ground-level fogging of roads and highways, or requires the transportation, storage, and/or use of hazardous materials. Please see other sections of this document, as noted, for a detailed discussion of any additional discussion of project impacts, recommended mitigation, or conditions of certification. Criteria for the transport of hazardous materials are analyzed in the **Hazardous Materials** section of this document.

PROPOSED PROJECT

SETTING AND EXISTING CONDITIONS

The RSEP will be located in rural eastern Riverside County, CA. The project site is located adjacent to State Route (SR) 62 between Parker, AZ, and Twentynine Palms, CA. The project will be located in a sparsely settled portion of the Sonoran Desert on abandoned private land that was formerly used as a private military airfield (SR 2009a, p. 5.12-1). The nearest residences are located in Vidal Junction, about 15 miles northeast of the site; and at the Metropolitan Water District's Iron Mountain Pumping Plant, about 17 miles to the west (SR 2009a, p. 5.12-1). The nearest urban communities to the project site are Parker, Arizona, approximately 32 miles east and Blythe, California approximately 40 miles south.

CRITICAL ROADS AND FREEWAYS

The transportation network within the proposed RSEP region is composed of a mix of interstate, county highways, and rural local roadways. State Route (SR) 62 would provide local access and is immediately adjacent to and north of the RSEP site (SR 2009a, p. 5.12-1). SR 177 intersects SR 62 approximately 25 miles southwest of the site. US Route 95 connects with SR 62 approximately 16 miles east of the RSEP site. Additional freeways serving the regional area are Interstate 10 (I-10), approximately 32 miles south of the site, and Interstate 40 (I-40), approximately 55 miles north of the site. US Route 95 connects I-40 and I-10 in the north/south direction. The following describes the main regional and local roadways that would be used for RSEP construction and operational related traffic accessing the proposed project site, as shown in **Traffic and Transportation Figure 1**.

Existing Regional and Local Transportation Facilities

US Route 95

US Route 95 is an undivided two-lane rural highway that connects I-10 and I-40 to SR 62 east of the RSEP site. According to traffic counts published by the California Department of Transportation (Caltrans) in 2008, the average daily traffic volume on US 95 near the junction with SR 62 is 3,000 vehicles per day with truck trips accounting for approximately 12% of all traffic (SR 2009a, p. 5.12-2).

Interstate 10

I-10 is an east-west freeway connecting to SR 177 at the city of Desert Center, 35 miles southwest of the site, and to US 95 at the city of Blythe, California approximately 30 miles southeast of the RSEP site. Access from I-10 to the project site is provided via SR 62 (connected from either SR 177 from the southwest or US 95 from the southeast). Near the proposed project, I-10 has two lanes in each direction. Caltrans 2008 traffic counts indicate the average daily traffic volume on I-10 near the junction with SR 177 is 23,000 vehicles per day with trucks trips comprising approximately 40% of all traffic (SR 2009a, pp. 5.12-1 and 5.12-2).

Interstate 40

I-40 connects to US 95 at Needles, California, approximately 40 miles northeast of the RSEP site. Access from I-40 to the RSEP site is via US 95 and SR 62 to the east. Nearest the RSEP site, I-40 has two lanes in each direction (SR 2009a, p. 5.12-2). According to traffic counts published by Caltrans in 2008, the average daily traffic volume on I-40 near the junction with US 95 is 15,000 vehicles per day with truck trips comprising approximately 50% of all traffic (SR 2009a, p. 5.12-2).

State Route 62

SR 62 is an east-west roadway immediately north of the RSEP site; it is also known as Twentynine Palms Highway or Aqueduct Road west of SR 177. SR 62 is an undivided two-lane highway in California, but widens to four lanes in downtown Parker, Arizona (SR 2009a, p. 5.12-2). Caltrans 2008 traffic counts indicate the average daily traffic volume on SR 62 near the junction with SR 177 is 2,200 vehicles per day with truck trips comprising approximately 7% of all traffic (SR 2009a, p. 5.12-2).

State Route 177

SR 177 is a north-south roadway west of the RSEP site and is also known as Desert Center-Rice Road. It is an undivided two-lane highway. Caltrans 2008 traffic counts indicate the average daily traffic volume on SR 177 near the junction with SR 62 is 1,300 vehicles per day with truck trips comprising approximately 20% of all traffic (SR 2009a, p. 5.12-2).

Current Roadway Conditions

Level of Service

To quantify the existing baseline traffic conditions, the RSEP area roadways likely used by construction traffic were analyzed to determine their operating conditions. Based on the traffic volumes, the turning movement counts, and the existing number of lanes along each roadway, the volume/capacity (V/C) ratios and levels of service (LOS) have been determined for each roadway.

LOS is a qualitative measure describing operational conditions within a traffic stream. It is used to describe and quantify the congestion level on a particular roadway or intersection and generally describes these conditions in terms of such factors as speed or vehicle movement. **Traffic and Transportation Table 2** summarizes roadway LOS for associated V/C ratios.

**Traffic and Transportation Table 2
Level of Service Criteria Definition for Roadways**

Level of Service	Volume/Capacity	Description
A	0.00 – 0.60	Free flow; insignificant delays
B	0.61 – 0.70	Stable operation; minimal delays
C	0.71 – 0.80	Stable operation; acceptable delays
D	0.81 – 0.90	Approaching unstable flow; queues develop rapidly but no excessive delays
E	0.91 – 1.00	Unstable operation; significant delays
F	> 1.00	Forced flow; jammed conditions

Source: SR 2009a, p. 5.12-6

Level of Service — Existing Roadway Conditions

Traffic and Transportation Table 3 summarizes the results of the existing morning and afternoon peak-hour LOS analysis for roadway segments located within the proposed RSEP area that could be impacted by proposed project construction and operational related traffic (SR 2009a, p. 5.12-14).

AVIATION

Civilian

The proposed project would be located, in part, on the site of the Rice Airport (formerly Rice AAF), a closed and abandoned airfield about three miles east of the Rice townsite. The site is approximately 26 miles northeast of the Desert Center Airport; 30 miles from the Blythe Airport; 39 miles east of Twenty-nine Palms Airport (KTMP); 45 miles south of the Needles Airport in San Bernardino County; 35 miles west of Avi Suquilla Airport in Parker, Arizona; and 40 miles southwest of Lake Havasu City Airport in Lake Havasu City, Arizona. There are no public or private airports within two miles of the project site.

The closest airstrip to the project site is the Iron Mountain Pumping Plant Airport (FAA Airport Designation: 72CL), a private, unattended airstrip approximately seven miles northeast, that is owned by the Metropolitan Water District of Southern California. It has a single, 3200 foot-long asphalt runway (RWY 17/35), but no services. The airstrip is for the owner's use only and permission is required prior to landing. There are no published instrument procedures for this airport. (2010b,d)

The project's power block and solar arrays would be located on the site of the Rice Army Air Field and a portion of Camp Rice, a World War II (WWII) desert training base that was part of the infantry and artillery Desert Training Center, California-Arizona Maneuver Area (DTC-CAMA). It was used by General George S. Patton, Jr., from 1942-1944 to prepare American soldiers for combat in the North African desert. This location, a municipal airfield prior to WWII, reverted to civilian/public airport status again about 1949, then to a private airfield around 1952. Apparently abandoned between 1955-1958, the airport continued to be used sporadically by private pilots until the runways became unsafe. It was no longer shown at all on the March 1958 LA Sectional Chart and was depicted as an abandoned airfield on the 1998 World Aeronautical Chart. (ARPT 2009a) To the east, Camp Rice (Rice Divisional Camp) housed the 5th Armored Division during its training at the CAMA, and maintained a large quartermaster

depot at that location. (CSMD 2010) The area surrounding the project site was also used for Joint Exercise Desert Strike in 1964 (SR2009a). Little remains of Camp Rice or the Rice Army Airfield, aside a few foundations, concrete pads, and defunct runways. Although the outline of both the airport and Camp Rice can still be easily discerned from the air, the sense of place is deteriorating at ground level. (See **Cultural Resources** section for additional information.)

National parks, wilderness areas, and national wildlife refuge areas all fall under the definition of “National Park” for aviation purposes and the areas above them are considered special use airspace. All aircraft are to maintain a minimum altitude of 2,000 feet AGL. There are 11 wilderness areas and one national park within 50 miles of the project site that are overlain by designated special use airspace (see **Land Use, Recreation, and Wilderness** section of this document for further information).

Military

There are three military airfields and three operational areas within 50 miles of the proposed project site. The Twenty-nine Palms Strategic Expeditionary Landing Field (SELF; KNXP) is approximately 39 miles west of the project site and serves the Marine Corps Air Ground Combat Center (MCAGCC) Twenty-nine Palms. SELF is the largest expeditionary airfield (EAF) operated by the U.S. Marine Corps and has an 8,000-foot long aluminum-mat runway that can accommodate the largest aircraft in the military inventory. The Marine Wing Support Squadron 374 operates the SELF 300 days, conducts 3,600 hours of flight operations, and supports up to 16,647 aircraft. Except for emergencies, the SELF field is for military use only. (ARPT 2010f; WIKI 2010j)

The Chocolate Mountain Naval Aerial Gunnery Range is about 50 miles southwest of the project site and is a 456,000 acre restricted area used by the Navy and Marines for aerial bombing and live fire aerial gunnery practice (WIKI 2010k). It includes the Kane and Abel North Military Operations Areas and has several areas of restricted airspace extending from the surface to 40,000 feet AGL (FL 400). There is no airfield within the range.

Thirty-five miles southeast of the project site is the U.S. Army’s Yuma Proving Ground (YPG). One of the largest military installations in the world, YPG is located about 30 miles northeast of Yuma, Arizona. The facility covers over 1,307 square miles of the Sonoran Desert and includes portions of southwestern La Paz County and western Yuma County. Unlike CAMA, the YPG (originally part of Camp Laguna and the U.S. Army Corps of Engineers Yuma Test Branch) was gradually expanded after the end of WWII until, by 1973, it had achieved its current status. Both the Laguna Army Airfield complex, including two runways (5,150 and 6,000 feet in length) and the Castle Dome Army Heliport, part of the Western Army National Guard Aviation Training Site, are located within the YPG.

Due to the significant military presence in the southern desert areas, there are a number of military training routes designated for aircraft exercises in the vicinity of the proposed project site and alternatives. Military training routes (MTRs) are aerial corridors across the United States in which military aircraft can operate faster than 250 knots at altitudes below 10,000 feet. Civilian aircraft are not prohibited from these areas, but are required

to operate at slower speeds and are usually diverted from the areas by enroute controllers when operations are in progress. The routes are divided into Instrument Routes (IR), and Visual Routes (VR). There are also Slow Routes (SR) for aircraft operating below 250 knots and between 250 feet and 1,500 feet AGL, and Aerial Refueling Routes (AR), areas where military tankers routinely refuel other military aircraft, generally at altitudes above 10,000 feet AGL. Military aircraft flying within an IR or AR route are under positive Air Traffic Control. Those in VR or SR routes areas generally are not. The vast majority of military training flights on MTRs are on VR routes. There are three low-level military training routes above the proposed project site, designated IR250, IR255, and SR397, which place limitations on the use of airspace above the project site from the surface to varying altitudes above 10,000 AGL.

RAILWAYS

Four Arizona and California Railroad (ARZC) rail lines represent the nearest railways to the proposed RSEP site. These four rail lines contain at-grade public railroad crossings (SR 2009a, p. 5.12-12). One line runs parallel to SR 62 north of both the RSEP site and SR 62, crossing SR 62 near Radio Tower Road about 7.5 miles northeast of the project site, while another crossing of this line is on US 95 near Old Parker Road, about 17.5 miles northeast of the RSEP site (SR 2009a, p. 5.12-12). Both of these crossings are protected with automatic arms (SR 2009a, p. 5.12-12). Northwest of the RSEP site, two additional crossings are located on SR 62, about 2.5 miles from the project site with flashing beacons but no arms (SR 2009a, p. 5.12-12). These two crossings are on an abandoned spur of the ARZC (SR 2009a, p. 5.12-12).

**Traffic and Transportation Table 3
Existing (2008) Roadway Segment Level of Service Summary**

County	Roadway Segment	Number of Lanes	Peak Hour Capacity	AM Peak Hour V/C	AM Peak Hour LOS	PM Peak Hour V/C	PM Peak Hour LOS
Riverside, CA	US 95 NB between Hobson Way and San Bernardino/Riverside County Line	1	1,700	N/A	C or Better	N/A	LOS C or Better

Notes: N/A –data not available; NB – Northbound, SB – Southbound, EB – Eastbound, WB – Westbound, V/C = Traffic Volume/Traffic Capacity of Roadway

BUS TRANSPORTATION

No public transportation is available to or from the RSEP site (SR 2009a, p. 5.12-11). The nearest local bus service is provided by the Palo VerdeValley Transit Agency, with the nearest bus line located approximately 25 miles southeast of the RSEP site in the city of Blythe (SR 2009a, p. 5.12-12)

BICYCLES AND PEDESTRIANS

The Riverside County General Plan discusses the development of bikeways and regional trails within the County. As the proposed RSEP site is not designated as being located within or along any Riverside County General Plan designated bikeway, a regional discussion is provided as RSEP traffic would access the site throughout Countywide roadways. US 95 (within the county) is classified as a Regional Trail, a designation assigned to roadways that could provide linkages between areas that connect state and federal trails (SR 2009a, p. 5.12-11). Additionally, within Riverside County, the Bradshaw Trail is a historic trail that runs along part of I-10 in Blythe and offers bicycle use, located approximately 25 miles southeast of the RSEP site (SR 2009a, p. 5.12-11). No pedestrian facilities were identified by staff as being located within proximity of the proposed RSEP site or along identified travel routes of construction-related traffic.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

PERFORMANCE OF THE CIRCULATION SYSTEM

Roadway Levels of Service – Performance Standards

As discussed earlier, State Route (SR) 62 would provide local access, which is immediately adjacent to and north of the site (SR 2009a, p. 5.12-1). SR 177 intersects SR 62 approximately 25 miles southwest of the site. US Route 95 connects with SR 62 approximately 16 miles east of the RSEP site (SR 2009a, p. 5.12-1). To determine impacts to roadway capacity, applicable LOS standards and thresholds established by potentially impacted local jurisdictions are utilized. As shown in **Traffic and Transportation Table 1**, the Riverside County General Plan specifies that all conventional state highways not part of the Congestion Management Plan (CMP) shall operate at a LOS C or better. With regard to California roadways analyzed as likely utilized by RSEP construction traffic, all roadway segments belong to either Riverside County or San Bernardino CMP routes (AFC, p. 5.12-2). Therefore, these applicable standards are utilized as thresholds for determining impacts to California roadways. As shown in **Traffic and Transportation Table 1**, in both Riverside and San Bernardino Counties, CMP roadways must achieve LOS E or better. The portion of SR 62 in Arizona is in a rural area and, as such, must achieve LOS C or better (SR 2009a, p. 5.12-5).

Roadway Levels of Service – Construction Analysis

The applicant expects that construction of the proposed project would last approximately thirty months, starting in the first quarter of 2011 and ending in the third quarter of 2013 (SR 2009a, p. 2-37). There would be a peak daily workforce of 483 between months 8 and 20 of construction (SR 2009a, p. 2-37). This peak workforce

time would be the critical construction period when the highest total number of daily trips is anticipated. Therefore, estimated daily construction trips during this peak construction period were used to determine potential impacts, as this would represent the worst-case construction traffic scenario. Because of the proposed projects remote location, it is estimated that 30% of the workforce will carpool (SR 2009a, p. 5.12-13). Furthermore, the proposed project will include an on-site worker camp for temporary construction worker lodging (SR 2009a, Figure 2.2-6).

For purposes of this analysis, construction truck trips were converted to passenger car equivalent (PCE) trips consistent with the *Highway Capacity Manual* guidelines. A detailed breakdown of this determination and methodology is provided in the AFC (SR 2009a, pp. 5.12-14 and 15). **Traffic and Transportation Table 4** lists the estimate of total construction vehicle trip for the proposed RSEP, including identifying which of those would be generated during both the A.M. and P.M. peak hour periods. The RSEP will make available a workforce RV/trailer park with a capacity of up to 300 trailers/RVs and will provide basic electric, water, and sanitary sewer services for the park (SR 2009a, p. 5.12-14). However, to analyze the most conservative case for construction worker traffic, the AFC traffic analysis (approved by staff and utilized within this section) did not assume that any workers would use the park (SR 2009a, p. 5.12-14).

Traffic and Transportation Table 4
Estimated Total and Peak Hour Trip Generation – Maximum Construction Period

	Total Daily Trips	A.M. Peak Hour			P.M. Peak Hour		
		In	Out	Total	In	Out	Total
Total Construction Traffic in PCE	765 ¹	330	15	345	15	330	345

Source: SR 2009a, p.5.12-14

¹Total Average Daily Trips includes off-peak hour construction related trips

Based on the construction vehicle trip calculations presented in **Traffic and Transportation Table 4**, an analysis was conducted in the AFC to determine the impacts of these construction vehicle trips on current LOS for project area roadways. **Traffic and Transportation Table 5** identifies the LOS anticipated with and without RSEP construction vehicle traffic for critical roadways in the vicinity of the project. As shown, with the addition of the RSEP peak construction traffic, all study area roadways will continue to operate within the designated LOS thresholds during both the A.M. and P.M. peak hours as compared to without project conditions. Therefore, construction related trips would not exceed any designated threshold and result in less than significant impacts to performance standards of utilized roadways.

Linear Facilities

In addition to direct construction related trips, interconnecting the RSEP project into the Western Area Power Administration system will require the construction of approximately 10-miles of generation tie line (SR 2009a, p. 3-1). The RSEP will also extend an existing 12-kV distribution line for 1.1 miles from a point 175 feet east of the project site boundary, along the northern boundary of the site paralleling SR 62, to the proposed administration building area for construction power purposes (SR 2009a, pp. 3-1 and 2). The stringing of power line adjacent to and across roadways could result in temporary lane closures, thus temporarily impacting traffic LOS. To minimize impacts from required power line infrastructure, Condition of Certification **TRANS-1**, which would

require the applicant to prepare a Construction Traffic Control Plan prior to construction, would also include the identification and minimization of any disruptions to street segments during power line construction activities, to the maximum extent feasible. Therefore, Condition of Certification **TRANS-1** will reduce transmission related construction activity impacts to roadway LOS to a less than significant level.

**Traffic and Transportation Table 5
With and Without Project Roadways Levels of Service - Construction**

Source: SR 2009a, p. 5.12-17

Notes: ¹ Refer to AFC p. 5.12-7 for methodology used to determine LOS with project traffic to existing traffic volumes without V/C ratio calculations (SR 2009a).

ROADWAY LEVELS OF SERVICE - OPERATION ANALYSIS

During operation, the proposed project is expected to require approximately 47 staff members (SR 2009a, p. 5.12-13). A quantitative traffic analysis was not conducted in the AFC for the long-term (30-year) operations phase because it would generate such a low volume of trips that it was found to not have the potential to generate a measurable impact on the project area roadways (SR 2009a, p. 5.12-13). Staff agrees with this conclusion as this volume of traffic represents a minimal increase over existing traffic volumes and peak hour capacity available on local roadways as presented in **Traffic and Transportation Table 3**. Therefore, RSEP operation would have only minor effects and would not alter performance standards of RSEP area roadways, which would result in a less than significant impact with respect to CEQA.

REGIONAL CONGESTION MANAGEMENT PLANS

California State Proposition 111, passed by voters in 1990, established a requirement that urbanized areas prepare and regularly update a Congestion Management Plan (CMP). The purpose of the CMP is to monitor the performance of the countywide transportation system, develop programs to address near-term and long-term congestion, and better integrate transportation and land use planning. Both Riverside County and the San Bernardino Association of Governments (SANBAG), as the designated Congestion Management Agency for the RSEP region, must develop, adopt, and regularly update the CMP.

The Riverside County 2006 CMP Update identifies US 95 as a CMP roadway (Riverside County 2006), while the SANBAG 2007 CMP identifies US 95 and SR 62 as CMP roadways (SANBAG 2010). These CMP's both identify that all roadway segments on the Congestion Management network shall maintain a LOS E or better (refer to **Traffic and Transportation Table 1**). As shown in **Traffic and Transportation Table 5**, RSEP construction traffic would not exceed CMP LOS thresholds on analyzed roadways. Furthermore, as discussed above, RSEP operational traffic would represent a minimal increase over existing traffic volumes and peak hour capacity available on local roadways as presented in **Traffic and Transportation Table 3**. Therefore, no impacts to CMP designated roadways would occur from RSEP construction- or operational-related traffic.

AVIATION

Would the project result in a change in air traffic patterns, including either an increase in traffic counts or a change in location, which results in increased safety risks.

The project would not result in a change to civilian air traffic patterns in the project vicinity. There are no published commercial aviation (Victor) routes below 18,000 feet AGL or other published departure/arrival or regularly traveled route that would bring aircraft into the vicinity of the project stack below 2,500 feet AGL.

The project would, however, result in a change in air traffic patterns for military aircraft operating within the MTRs over the project area. The project site and alternative locations proposed in the general vicinity underlie three low-level military training routes,

designated IR250, IR255, and SR397, which place limitations on the use of airspace above the project site from the surface to varying altitudes above 10,000 AGL. However, the military has agreed to alter operational training procedures and flight patterns to avoid the project's proposed solar tower, in conjunction with marking and notification requirements identified in conditions of certification **TRANS-8** and **TRANS-9**. As a result the changes in air traffic patterns would not result in increased safety risks. (See further discussion of military operational impacts and conditions of certification below.)

Would the project interfere with the takeoff, landing, or maneuvering of aircraft within an airport approach zone, airport turning zone, or airport transition zone, or in an area where flight paths are expected to occur below 1,000 feet above ground level (AGL)?

The proposed project is not within an airport approach, turning, or transition zone, and would not interfere with the takeoff, landing, or maneuvering of any aircraft during approach or departure from any airport. As noted in the Setting discussion above, the closest airstrip is the Iron Mountain Pumping Plant Airport, a private, little used field approximately seven miles northwest of the project site. The closest commercial airport is over 30 miles away, in Blythe. However, under visual flight rules (VFR), aircraft may legally fly below 1,000 feet AGL in the project area. Aircraft, except for helicopters, flying VFR are normally required to remain 500 feet above structures. There are currently no structures in the project vicinity that would pose a hazard to aircraft flying at that altitude.

The project proposes to construct a solar collection stack that would rise 653 feet AGL. The applicant submitted Form 7460-1 advising the Federal Aviation Administration (FAA) of the project proposal to construct a structure exceeding 200 feet AGL. An FAA Determination of No Hazard to Air Navigation has been received (FAA 2009c), which indicated that the solar tower would not be a hazard to air navigation, as defined by 14 CFR 77/FAR Part 77, provided the structure did not exceed 653 feet AGL in height and would be marked and lighted in accordance with FAA Obstruction Marking and Lighting requirements. Condition of certification **TRANS-8** meets this requirement. As this would be a unique structure within the Rice Valley, staff is also recommending condition of certification **TRANS-9**, which would require notations on the appropriate aeronautical charts, identifying the location and height of the stack, to ensure pilots are aware of the structure and able to see and avoid it, as required under VFR.

In addition, as noted in the Operational Intrusive Light discussion below, reflections from the solar heliostats have the potential to cause annoyance, discomfort, or loss of visual performance and visibility, up to and including retinal damage, to pilots or observers within a certain range of the project's solar array. This poses a potentially significant health and safety risk for pilots and observers overflying the project site. Therefore, **TRANS-9** would also require chart notation and airport advisory notices that inform pilots of the potential safety risk and recommend that overflight of the project stack and solar arrays be avoided below 1,500 feet AGL. This would reduce impacts to general aviation aircraft to a less than significant level. If overflight of the project site is avoided, incidental intrusive light may still occur, but would not present a substantial hazard to aircraft operations or a health risk to aircraft occupants.

Construction and operation of the proposed project would also impact existing military training operations in the project vicinity. As noted in the Setting discussion above, there are three low-level military training routes (MTRs), designated IR250, IR255, and SR397, which place limitations on the use of airspace above the project site from the surface to varying altitudes above 10,000 AGL. Based on information provided by the Department of Defense (DOD) Southwest Renewable Energy Work Group (DOD 2010), the proposed solar power tower would encroach into airspace used by the military to conduct low-level and night training exercises and has the potential to significantly impact the safety of military testing and operations conducted along these MTRs. Regular stack lighting, consistent with FAA obstruction lighting requirements, is not sufficient for military pilots to see and avoid the stack obstruction during low-level or lights-out training missions. Therefore, condition of certification **TRANS-8** would require solar tower lighting consistent with both FAA and DOD requirements.

In addition, frequencies used during normal power plant construction and operations have the potential to interfere with military transmissions and equipment operation. Therefore, condition of certification **LAND-9** addresses the issue of frequency interference and would require coordination with the military to ensure that no frequencies used at the project site or in conjunction with plant construction or operation would interfere with frequencies used for communication or other military operations. The military has indicated a willingness to alter training patterns to avoid the project area, to the extent feasible, which, in conjunction with full implementation of all other proposed aviation-related conditions of certification, would reduce any potential impacts to military operations to a less than significant level.

HAZARDS AND PUBLIC SAFETY

Construction impacts to vehicle hazards and public safety would be minimized by proposed Condition of Certification **TRANS-1**, which requires the preparation of a Construction Traffic Control Plan that includes use of flagging and covering open trenches, would minimize hazards due to possible backup as construction workers enter and exit the RSEP site when their shifts begin and end. As construction related traffic would access the sites from a number of regional areas with the potential for traveling along roadways with residential development, Condition of Certification **TRANS-1** requires that all construction-related traffic be diverted to the maximum extent feasible away from residential areas.

Additionally, another potential safety hazard for the public is at-grade railroad crossings which creates a potential for train to vehicle collisions, particularly with RSEP construction-related large trucks hauling heavy loads. As discussed earlier, four at-grade public crossings are close to the project site. To minimize any potential impacts from rail crossings, Condition of Certification **TRANS-1** requires the preparation of a Construction Traffic Control Plan that includes identifying safety measures in the event oversized vehicles cross any railroad tracks.

There is also a potential for unexpected damage to roads by vehicles and equipment within the project area that could result in a roadway hazard to the public. Therefore, staff is proposing Condition of Certification **TRANS-3**, which would require that any road damaged by project construction be repaired to its original condition. This will ensure

that any damage to local roadways will not be a safety hazard to motorists.

The use of oversize vehicles during construction can create a hazard to the public by limiting motorist views on roadways and by the obstruction of space. As described above in **Traffic and Transportation Table 1**, CVC Sections 35550-35559 establish guidelines for oversize vehicle loads. To ensure consistency with these applicable ordinances, staff is proposing Condition of Certification **TRANS-4**, which would require that all oversize vehicles used on public roadways during construction comply with Caltrans, Riverside County, San Bernardino County, and other relevant jurisdiction's limitations on vehicle sizes and weights, as well as oversize vehicle routes and any other applicable limitations or other relevant jurisdictional policies.

As discussed in the **Visual Resources** section in this SA/DEIS, a ground fogging plume analysis was not considered necessary for the following reasons:

- 1) For operations, the main steam-cycle cooling is done by an Air Cooled Condenser.
- 2) There are no boilers; therefore, there are no boiler visible plumes.
- 3) There is a very small Wet Surface Air Condenser for auxiliary cooling loads, but the plumes from this device will be very limited in both frequency and size.

Temporary visible water vapor plumes associated with salt conditioning may occur during construction. Visible plumes could occur at higher temperatures depending on relative humidity, but in general very few plumes would occur when the temperature was above 90 – 95 °F. Therefore, if the conditioning occurs in the winter, the visible plumes would likely be constant during the 140 days of conditioning. If salt conditioning occurred in the peak of summer, plumes would likely form in the late afternoon, night, and morning when the atmospheric temperatures are below 85F. When occurring, the plumes would be small in size and would be limited to the internal portion of the RSEP site due to the limited exhaust source flow rate. As the main power block area where these activities will take place is over 1,000 meters from Hwy 62, visible plumes would not reach adjacent public roadways. Therefore, no impact on surface traffic safety would occur from any ground fogging plumes related to RSEP activities.

The implementation of Conditions of Certification **TRANS-1**, **TRANS-3**, and **TRANS-4** would ensure that the proposed project would avoid or result in only minor hazard and safety impacts to motorists. These would be less than significant with respect to CEQA and would ensure project compliance with applicable LORS.

Another potential traffic and transportation hazard impact would come from the delivery of hazardous materials and removal of wastes. For a discussion of the potential impacts related to the transport of hazardous materials please see the **Hazardous Materials** section in this Staff Assessment/Draft Environmental Impact Statement (SA/DEIS).

Operational Intrusive Light

The proposed RSEP involves the use of mirrors mounted on pylons with motor controls for following the sun (heliostats) to redirect sunlight at a solar power receiver to generate heat for use in electric power generation (SR 2009a). Because of the possible impact of this redirected sunlight on observers such as motorists on the adjacent

highway or in aircraft overhead, these impacts are analyzed below.

Total solar energy is the complete spectrum of sunlight including ultra violet energy (UV), the visible spectrum, and infrared energy (IR). It is this total solar irradiation that has the potential to create a human safety impact by causing erythema damage, such as sunburn and retinal damage. Total solar energy is evaluated in units of power as kilowatts per square meter (kW/m²).

Intrusive light or glare is defined as the sensation produced by a point luminance within the visual field that is sufficiently greater than the luminance to which the eyes are adapted, which causes annoyance, discomfort, or loss of visual performance and visibility. Luminance or brightness perceived by observers is evaluated in units of candelas per square meter (cd/m²) and its impact as illuminance in lux or lumens per square meter (lm/m²).

Energy and Safety

There are currently no regulations specific to light reflected from solar arrays; however, potential safety effects of solar radiation from the proposed project have been analyzed within the context of principles and procedures developed for beam safety in the Solar 1 experimental plant at Daggett, California, as conducted by the Sandia National Laboratories (Sandia Report SAND83-8035 by T.D. Brumleve), which identified the following maximum permissible exposure (MPE) limits for reflected sunlight:

- MPE for momentary exposure (for a period of 0.15 second or less) is a retinal irradiance of 10 kW/m² that could cause temporary flash blindness
- MPE for continuous exposure (for a period greater than 0.15 second) is a retinal irradiance of 1 kW/m² that could cause permanent retinal injury (Sloney and Freasier, 1973)

With regard to heliostat safety, the highest intensity of solar radiation that could be directly reflected from a single heliostat would be that of one sun. The RSEP heliostats are flat, mirrored 672 square foot surfaces 28 feet by 24 feet mounted on twelve-foot pedestals. Because the mirrors are flat rather than a segment of a sphere or of a parabola, they will not concentrate the solar radiation. Eight years of data collection at the site show the direct normal irradiance (DNI) does not to exceed 1,005 W/m² per heliostat. Since the mirrors have a reflectivity of 94% the reflected beam will have a total reflected solar energy of no greater than 945 W/m² per heliostat. This assumes that there will be a clear line of sight from the mirror to an observer (CH2MHill 2010a, DR 153).

It is intended that the flat mirrors be mounted as close to each other as is possible without causing a shading effect. The heliostat spacing will vary through the field with tighter spacing in the center of the field near the power block and central tower. The spacing will gradually become greater as the heliostats are arranged further from the central tower in concentric rows, since the outermost rows will reflect at a flatter angle and require more spacing to avoid blocking effects on each other. The nearest spacing will average 30 feet between heliostats and 27 feet between rows (foundation center to foundation center) at the first two rows nearest the solar tower. The farthest spacing will range from an average of 57 feet between heliostats and 67 feet between rows at the outermost rows on the south side of the solar field, and an average of 60 feet between

heliostats and 80 feet between rows at the outermost rows on the north side (CH2MHill 2010a, DR 101). They will be arranged in a circular field with the solar power receiver tower located slightly beyond center in the southern portion of field. As a result of this arrangement, the square heliostats will tend to mask each other and the backs of them will present a wall-like surface to an observer outside the project fence line and at a similar elevation as the project. The heliostats adjacent to SR 62 will face south away from State route 62 towards the solar power receiver and a smaller number, masked by the south-facing heliostats will face north, east and west. This also makes it unlikely that an observer near SR 62 would be exposed to reflected solar energy during normal operation of the plant.

The heliostats have the ability to rotate 360 degrees around the pedestal and would move in the vertical plane within an approximate range from facing laterally to facing upward. The range of vertical motion can more specifically be defined by referencing two points in that range defined by 0 degrees as facing laterally and 90 degrees as facing upward. If looking at the heliostat from a side view, the full vertical range would vary from a position of six degrees upward from facing laterally and would extend to 10 degrees beyond facing perfectly upward (or at a position corresponding to an arc of 100 degrees from facing laterally). The range of motion is as illustrated in **Project Description Figure 4**. Daily positioning of the heliostats would vary according to operating mode and is described as follows:

1. Night Stow position – During the night, the heliostats would face upward;
2. Morning startup - At dawn, the applicant proposes that the heliostats would be moved from the stowed position to their respective standby position to be readied for sun tracking;
3. Standby position - The standby position is proposed to be relatively close to the tracking position, but instead of reflecting solar energy to the receiver, it would be reflected to one of four target points located at the horizontal center plane elevation of the receiver and approximately 100 feet radially from the receiver surface;
4. Sun tracking - The tracking position that would vary according to the heliostat's location in proximity to the power tower and the sun's position;
5. Evening shutdown – Heliostats would move slowly along predefined paths of motion in groups specified to minimize simultaneous power consumption, and come to rest in the stow position facing upward;
6. Load (power output) reduction – The RSEP thermal energy receiver and storage system can receive all solar energy collected at any time of day, and thus heliostats would not need to be directed away from the receiver to control power output;
7. Reducing solar input to avoid overheating the receiver – In the event the receiver is at risk of overheating, such as related to equipment failure, pre-assigned groups of heliostats would be placed in standby position in order to off-point from the receiver; Should the condition persist for a longer period, the heliostats would be directed to the stow position.

8. Loss of AC station power – The emergency standby generator(s) will automatically start and the entire collector field will begin an emergency defocus sequence where all the heliostats are commanded to point off of the receiver so that all concentrated solar energy is removed within 60 seconds; The applicant has proposed that the heliostats would focus on one of four target points according to the Standby position.
9. Mirror washing - Approximately every two weeks, mirrors would be washed during the night by moving the heliostats into a position between 6 and 45 degrees (CH2MHill 2010a, DRs 150, 151).

The aiming control system of the heliostats uses optimization software to instruct the solar field controller where each heliostat should aim to maximize solar energy collection and output. The software accounts for the light flux intensity and distribution required for the solar energy receiver and various other conditions such as sun radiation, wind, air pressure, and the number of heliostats available for tracking. When computing the optimal aiming policy, the control system factors in the differences between heliostats with respect to their tracking accuracy, the intensity of the beam they reflect, and other relevant aspects. The applicant has indicated that the optimization software would also prevent the mirrors from being aimed toward SR 62 or at any angle that would reflect sunlight near the ground surface. If, however, they were to be observed and if only one mirror was reflected toward an observer at a time, the effect would be comparable to observing the sun reflected from the windows of a building or from automobile windshields, both common occurrences.

The RSEP site underlies two low-level military aircraft training routes in which the proposed RSEP could impact the training conducted on those routes. The affected routes are identified as IR250 and IR255, and both extend down to ground level. The proposed 653-foot high solar receiver tower would encroach into those routes. This issue is discussed further in the Land Use section. While the military has the ability to recognize and avoid obstruction hazards such as the tower, there is need for non-obstruction hazards such as any potential for concentrated solar energy to affect aviation safety to be fully assessed and mitigated. Assuming all mirrors are returned to the horizontal stowed position (facing upwards) before dawn, staff has identified three circumstances under which an observer or wildlife could potentially be exposed to reflected solar radiation from one or more heliostats, including:

1. **Standby Position.** During daylight hours, some or all of the heliostats could be focused according to the stand-by position to one of four target points located at the horizontal center plane elevation of the receiver and approximately 100 feet radially from the receiver surface. This would result in the potential for sunlight to be reflected upward at focal points and concentrated to levels that could incinerate birds or affect the vision of airborne observers.
2. **Technical Malfunction.** Solar radiation could be reflected offsite as a result of a technical malfunction if the mirror position was such that it would reflect sunlight toward an observer;
3. **Maintenance.** During day-time maintenance if the heliostat was moved from the stowed to the wash position and passed momentarily through a position that would reflect sunlight to an observer;

4. **Stowed Position:** When the heliostats are stowed in the face-up position during daylight hours (due to high wind or other factors), the reflection of the sun in the mirrors may be observable at great distances (many miles) from pilots flying overhead. The irradiance will be no greater than that of the sun, and the effect will be analogous to viewing the sun's reflection off of a large, still body of water, although the irradiance will be greater due to the high specular reflectivity of the mirrors.

Staff expects that, for all of the scenarios described above, the exposure to solar radiation reflected from heliostats would be momentary because the observers would most likely be in motion—traveling either by vehicle or aircraft. In the case of reflection from stowed heliostats, the intrusive light could persist as long as the reflected sun image from the heliostats was viewable by an observer flying overhead. The applicant has indicated that, in the event a heliostat is not aimed at the solar receiver tower, there would never be more than one heliostat aimed at a single location or angle in the sky, except for those focused at the standby positions. Based on the applicant's proposed positioning of heliostats, it is likely that an observer on the ground would not be exposed to solar energy exceeding one sun, as would be reflected from a single heliostat mirror. An airborne observer, however, could be exposed to continuous reflected solar radiation at a level exceeding the continuous MPE threshold (causing permanent eye damage) if an aircraft were to fly through or near one of the four stand-by focal points. The applicant proposes that the focal points be located at the horizontal center plane elevation of the receiver at approximately 588 feet above ground and approximately 100 feet radially outward from the receiver surface. The concentration of solar energy to each of the four standby focal points would increase as the sun's energy reflects from each heliostat mirror surface near ground level and approaches its maximum at the focal point. The concentration would tend to create a conical path of light and energy from the ground tapering and increasing in concentration to the focal point. The concentrated solar energy would then dissipate in a similar conical pattern expanding and decreasing in concentration as it radiates above the focal point. The potential for encountering harmful concentrations of solar energy while airborne would occur above and below the focal point elevation at the horizontal center plane elevation of the receiver. In general, the height range could be considered harmful between the heliostats near ground level to a height that is twice the height of the horizontal center plane elevation of the receiver, or roughly a range from 0 to 1,100 feet above ground in the vicinity of the four focal points. While the brightness of light reflected from heliostats would not likely cause permanent eye damage (retinal burn) to pilots or people on the ground, the potential for momentary flash blindness exists at large distances. According to the models presented in Ho et al. (2010), temporary flash blindness can occur at distances up to 6400 m (4 miles) resulting from solar reflection from a flat heliostat with an effective size of 62.4 m^2 (672 ft^2), a reflectivity of 0.94, a slope error of 1 mrad, a direct normal insolation of 1000 W/m^2 , no atmospheric attenuation, and ocular parameters recommended in Ho et al. (2010) (pupil diameter = 2 mm, eye focal length = 17 mm, ocular transmission coefficient = 0.5). Intrusive light caused by the tower receiver or the array of heliostats while in a stowed face-up position may also cause temporary flash blindness.

The airspace above the proposed project site is not restricted. General aviation aircraft may fly as low as 500 feet about the solar arrays, at pilot's discretion. There are also

three low-level military training routes above the project site, designated IR250, IR255 & SR397, that extends from the surface through 10,000 feet AGL. Therefore, there is the potential for both civilian and military aircraft to pass through or near any of the four focal points where the project-reflected solar energy could be up to 4,300 suns.

While the brightness of light reflected from the heliostats would likely cause observers to avoid looking directly into the light for longer than a fraction of a second, similar to the potential exposure to observers on the ground, it is not conclusive that the personal reaction of those overflying the area to the intensely bright light, at locations near the focal point where solar energy could be concentrated, would adequately mitigate the risk of exposure that could cause retinal injury. Each point will receive the solar energy of approximately 4,300 suns. The amount of solar energy will vary with the solar irradiance available at any given moment. Based on the applicant's estimation of 950 W/m² as the reflected solar flux of each heliostat, the maximum solar flux at the stand by points will be 4.06 MW/m². Outside of a range of 0 to 1,100 feet AGL in the vicinity of the standby focal points and within a horizontal plane directly above the RSEP solar field, there would not be a substantial risk to airborne observers. Once the beams pass through this high-energy zone, they would disperse and would no longer pose a substantial threat. Therefore, given the potential safety risk to aircraft pilots and passengers, staff has recommended condition of certification **TRANS-9**, which would inform pilots of the potential hazard and advise that overflight of the project's solar stack or heliostat arrays should be avoided below 1,500 feet AGL. Military training exercises within the MTRs would be altered as necessary to avoid overflight of the site below 1,100 feet AGL during daylight hours and avoidance of the solar tower at all times (DOD 2010).

Because the agencies have limited experience with the impacts associated with the performance of concentrated solar power technologies, including associated intrusive light issues, and in consideration of potential harmful and/or distractive solar energy exposure to ground and airborne observers, staff recommends long-term monitoring to identify the risk of exposure to light reflected from heliostats. Condition of Certification **TRANS-6** would require the applicant to prepare a Heliostat Positioning Plan that would accomplish the following:

1. Identify the heliostat movements and positions (including reasonably possible malfunctions) that could result in potential exposure of observers at various locations including in aircraft, motorists, pedestrians and hikers in nearby wilderness areas to reflected solar radiation from heliostats;
2. Describe within the HPP how programmed heliostat operation would avoid potential for human health and safety hazards at locations of observers, and would limit or avoid potential for harm to birds;
3. Prepare a monitoring plan that would: a) obtain field measurements in response to legitimate complaints; b) verify that the Heliostat Positioning Plan would avoid potential for human health and safety hazards including temporary or permanent blindness at locations of observers; and c) provide requirements and procedures to document, investigate and resolve legitimate complaints regarding intrusive light.
4. Provide that the monitoring plan would be coordinated with the CalTrans, CHP, FAA, U.S. Military and the Riverside County Airport Land Use Commission and be

updated on an annual basis for the first 5 years, and at 2-year intervals thereafter for the life of the project.

In addition to aircraft, birds could also fly through or near the potentially harmful range of a focal point and likely would be injured or incinerated. In consideration of the potential for birds to pass through a focal point and to be incinerated, staff has proposed Condition of Certification **BIO-25** in the **Biological Resources** section to be prepared in coordination with the Heliostat Positioning Plan and to minimize death and injury to birds. This mitigation would require the applicant to prepare an Avian Protection Plan and include modifications to proposed plant operation during standby mode to avoid or minimize directing heliostats to aim at focal points. Instead of directing heliostats to the focal points, staff is recommending that during standby mode the heliostats be placed into the stowed position or another alternative configuration that would avoid concentrating energy from more than one heliostat on any one location.

Solar Power Receiver Tower

With regard to solar receiver tower safety, the highest intensity of incident solar radiation expected to be reflected from the solar power receiver tower at its surface would be as high as 688 kw/m². However, as noted, the intensity of reflected light and solar radiation diminishes as distance from the source increases. The solar receiver tower will consist of a 538-foot concrete tower topped by a solar power receiver 100 feet high for a height of 638 topped by a crane (total height = 653 feet AGL). Applicant states that the energy design point for the solar power receiver is calculated assuming a solar irradiance of 950 W/m² from each heliostat and has calculated that at a distance of 1600 meters, the distance from the nearest location on SR 62 to the solar receiver tower and nearly twice the distance from KOP-1, the luminous flux will be 200 lux (lumens/m²). This light level at the human eye is only roughly twice that of common 60-watt incandescent lamp and well within normal levels of illuminance in domestic architecture. Therefore, solar radiation reflected from the solar receiver of the tower is not expected to pose a health and safety hazard to motorists on SR 62 and is not expected to pose a health and safety hazard to pilots or passengers in aircraft flying over the site. It would remain a bright, intrusive object in the field of view, but without the potential for physical hazard. To ensure the solar receiver tower would have less than significant impacts to motorists or aviation activities, the agencies have identified and staff has recommended Condition of Certification **TRANS-7**, which would require the applicant to prepare a Solar Energy Receiver Luminance Monitoring Plan to provide procedures for conducting periodic monitoring and to document, investigate, and resolve complaints regarding distracting effects from potentially excessive brightness on aviation, vehicular traffic, and other possible observers from the solar energy receiver.

EMERGENCY ACCESS

In the event of an emergency at the RSEP site during construction or operation, emergency vehicles would likely use SR 62 to the plant entrance driveway to access the project site. To maintain temporary access for emergency vehicles and allow for adequate access into the facility, proposed Condition of Certification **TRANS-1** requires the preparation of a Construction Traffic Control Plan, which includes the assurance of access and movement of emergency vehicles during construction. To ensure all RSEP

internal access roadways required for operation (including a proposed new one-lane dirt access road for 4.6 miles between the project site fence line and Rice Valley Road) would be designed consistent with all Riverside County Ordinance 461 requirements, Condition of Certification **TRANS-5** is required to ensure adequate turning radius for emergency vehicles to navigate within the facility boundaries and internal circulation roadways. Proposed Condition of Certification **WORKER SAFETY-6** would add a second access road to the project for emergency services. For additional discussion of access/movement of emergency vehicles within the site for the RSEP, refer to the **Worker Safety and Fire Protection** section in this SA/DEIS.

ALTERNATIVE TRANSPORTATION

As discussed earlier, no public bus transportation is available to or from the RSEP site. Therefore, no local bus stops are in immediate proximity of the RSEP site. Because the Riverside County General Plan designates US 95 (within the county) as a Regional Trail for bicycle use and this roadway would be utilized by RSEP construction vehicles, Condition of Certification **TRANS-1** requires the preparation of a Construction Traffic Control Plan which includes the assurance of access and movement of bicycles along construction truck routes. Once operational, the RSEP involves minimal traffic that would not impact pedestrian or bicycle routes. The incorporation of this condition ensures impacts would not occur or would only be minor to alternative transportation facilities or use during the 30-month construction of the proposed RSEP, and these would not be significant with respect to CEQA.

PROJECT CLOSURE AND DECOMMISSIONING

As described in the **Project Description** section of the SA/DEIS, it is assumed the planned operational life of the RSEP is 30 years, but the facility conceivably could operate for a longer or shorter period depending on economic or other circumstances (SR 2009a, p. 2-51). If the RSEP remains economically viable, it could operate for more than 30 years, which would defer environmental impacts associated with closure and with the development of replacement power generating facilities. However, if the facility were to become economically non-viable before 30 years of operation, permanent closure could occur sooner. In any case, a Facility Closure Plan in accordance with Condition of Certification **COMPLIANCE-11** (See the General Conditions section) would be prepared at RSEP closure and put into effect when permanent closure occurs. In general, the Facility Closure Plan will address: decommissioning measures for the RSEP and all associated facilities; activities necessary for site restoration/revegetation if removal of all equipment and facilities is needed; recycling of facility components, collection and disposal of hazardous wastes, and resale of unused chemicals to other parties; decommissioning alternatives other than full site restoration; costs associated with the planned decommissioning activities and where funding will come from for these activities; and conformance with applicable LORS (SR 2009a, p. 2-51). It should be noted that closure and decommissioning of the RSEP would likely require further environmental impact evaluation.

It is assumed that the number and type of workers required for closure and decommissioning activities would be similar to that described above for construction of the RSEP. Also, it is assumed decommissioning activities would utilize the same regional and local roadways that currently serve the RSEP site. Staff cannot speculate

as to the capacity or LOS of these roadways at the time of decommissioning activities because future conditions are unknown. However, as closure and decommissioning activities would be temporary in duration resulting in a similar or less number of vehicle trips to that presented above for proposed project construction, no significant traffic or transportation impacts to RSEP area roadways or transportation related facilities are expected to result from RSEP closure and decommissioning activities. Therefore, closure and decommissioning of the proposed RSEP would not result in any direct permanent effects to local and regional roadway capacities serving the site, or alternative transportation facilities.

REDUCE ACREAGE ALTERNATIVE

The Reduced Acreage Alternative would be 7.2% smaller than the proposed project. It would be located in the same 2,560-acre square-shaped parcel within the larger 3,324-acre ownership property as the proposed project. Although the overall heliostat field distance from the central tower would be reduced, the number of heliostats would remain the same. The heliostat field (plus the evaporation pond and administration areas) would occupy about 1,270 acres instead of the 1,370 acres required for the proposed project. The receiver location would remain the same, with the edges of the field contracting towards the center. The heliostat footprint of the Reduced Acreage Alternative is shown in **Alternatives Figure 2**. The site layout, 653-foot total height of the solar tower and receiver, and transmission interconnection to Western's Parker-Blythe transmission line would be the same as the proposed project. The generation output would be reduced by approximately 2 MW.

Similar to the proposed project, the Reduced Acreage Alternative would transmit power to the grid via the proposed 10-mile long Generation Tie Line through the planned Western substation to be located adjacent to Western's Parker Blythe 161 kV transmission line.

The Reduced Acreage Alternative is evaluated in this SA/DEIS because it would eliminate about 100 acres of the proposed project footprint, reducing impacts to ephemeral washes, the loss of land considered habitat for the state and federally listed threatened desert tortoise and impacts to the historic Rice airfield. The Reduced Acreage Alternative would allow the applicant to contribute clean, renewable energy to help meet the State's energy goals, while minimizing impacts to the desert environment. A limited acreage alternative was suggested in scoping comments.

SETTING AND EXISTING CONDITIONS

Based on the alternative description above, the setting for the Reduced Acreage Alternative is the same as for the proposed project. As the reduced project footprint would not result in a change to the overall site location as analyzed for the RSEP, this alternative would have the identical traffic and transportation regional and local area resources as those described above serving the proposed RSEP.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

PERFORMANCE OF THE CIRCULATION SYSTEM

The roadway LOS impacts of the Reduced Acreage Alternative would be similar to those of the proposed RSEP, as described above. The same regional and local area roadways would continue to provide access to the Reduced Acreage Alternative site. It is possible due to the smaller footprint of the site that construction activities could be decreased, resulting in a shorter overall construction schedule and a potential decrease to the number of construction related trips from both construction workers and construction activities. However, this potential reduction in construction activities is not anticipated to result in a substantial change to roadway LOS impacts when compared to the proposed RSEP (as presented in **Traffic and Transportation Table 5**). Therefore, less than significant impacts regarding performance standards of utilized roadways by construction related traffic would occur.

Regarding linear facilities, it is assumed that construction of required transmission interconnections would remain the same as the proposed RSEP. Therefore, Condition of Certification **TRANS-1** would be required to reduce any potential disruption to roadways during Generation Tie Line construction. The implementation of this measure would reduce any potential capacity issues to roadways impacts by temporary transmission line infrastructure installation associated with the Reduced Acreage Alternative to a less than significant level.

It is assumed that the Reduced Acreage Alternative would require a similar number of operational employees as the RSEP. As discussed above for the RSEP, operational related traffic from employees would generate minimal traffic volumes on the regional and local area roadways and would have no impact on utilized roadway capacities during an estimated 30-year RSEP operational life. Therefore with respect to CEQA, RSEP operational related traffic would have less than significant impacts to utilized roadways under the Reduced Acreage Alternative.

REGIONAL CONGESTION MANAGEMENT PLANS

As discussed above, the Reduce Acreage Alternative would utilize identical roadways for construction and operational related traffic as the RSEP and result in similar or slightly decreased traffic volumes as those presented for the RSEP. As discussed above for the RSEP, all analyzed California roadways are contained within both the Riverside County and SANBAG CMPs. As shown in **Traffic and Transportation Table 5** for the RSEP, construction traffic would not exceed CMP LOS thresholds on analyzed roadways. Furthermore, as discussed above, RSEP operational traffic would represent a minimal increase over existing traffic volumes and peak hour capacity available on local roadways as presented in **Traffic and Transportation Table 3**. Therefore, no impacts to CMP designated roadways would occur from Reduced Acreage Alternative construction- or operational-related traffic.

AVIATION

Aviation hazards and potential impacts would be identical to those of the proposed RSEP. All conditions of certification for the proposed project would also apply to this alternative. Full implementation of the recommended conditions of certification would reduce potential aviation impacts to a less than significant level. No substantial residual effects would remain as all potential adverse effects would be avoided.

HAZARDS AND PUBLIC SAFETY

Hazards and public safety impacts of the Reduced Acreage Alternative would be identical to those of the proposed RSEP, as described above. While this alternative could result in a potential reduction in construction activities, Condition of Certification **TRANS-1** would still be required to minimize construction vehicle impacts to vehicle hazards and public safety as well as potential hazards from oversize vehicles crossing at-grade railroad crossings. This alternative would result in similar potential for unexpected damage to roads by vehicles and equipment within the project area and require Condition of Certification **TRANS-3**. Additionally, as this alternative would likely use identical regional and local area roadways to access the site, Condition of Certification **TRANS-4** would also be required for this alternative to ensure that all oversize vehicles used on public roadways during construction comply with Caltrans, Riverside County, San Bernardino County, and other relevant jurisdictions limitations on vehicle sizes and weights to ensure consistency with applicable LORS (as described above in **Traffic and Transportation Table 1**). The potential for ground fogging from the Reduced Acreage Alternative is assumed identical to that described above for the proposed RSEP, resulting in no potential adverse impacts to surface transportation.

OPERATIONAL INTRUSIVE LIGHT

With regard to intrusive light, this alternative reduces the size of the heliostat field with no changes to other aspects of the proposed RSEP. The northern edge of the heliostat field will remain in the same relation to SR 62. However, the heliostats may be located closer together so as to retain maximum solar energy at the solar receiver tower. If so, the masking that the flat mirrors provide for each other may improve. Therefore, the Reduced Acreage Alternative would make no significant changes to the impacts of reflected total solar energy or to reflected solar brightness (intrusive light) as described for the proposed RSEP, as described above. As for the proposed project, recommended Condition of Certification **TRANS-6** (Heliostat Positioning Plan) ; **TRANS-7** (Solar Energy Receiver Luminance Monitoring Plan); and **TRANS-8** would reduce any potential adverse impacts from excessive brightness on aviation and vehicular traffic to a less than significant level.

EMERGENCY ACCESS

Emergency access impacts of the Reduced Acreage Alternative would be identical to those of the proposed RSEP, as described above. During construction, access to the site is assumed to be to the same as that proposed for RSEP. With implementation of a Construction Transportation Plan in accordance with Condition of Certification **TRANS-1**, emergency access would be maintained during site and generation tie line construction . Therefore, emergency access associated with the Reduced Acreage Alternative construction would conform to LORS.

To ensure all Reduced Acreage internal access roadways required for operation be designed consistent with all applicable Riverside County Ordinance 461 requirements, Condition of Certification **TRANS-5** is required to ensure adequate turning radius for emergency vehicles to navigate within the facility boundaries and internal circulation roadways. The Reduced Acreage Alternative would also require the implementation of

Condition of Certification Worker Safety and Fire Protection **WORKER SAFETY-6**, which would add a second access road for emergency services. For additional discussion of access/movement of emergency vehicles within the site for the Reduced Acreage Alternative, refer to the **Worker Safety and Fire Protection** section in this SA/DEIS.

ALTERNATIVE TRANSPORTATION

Potential impacts to alternative transportation facilities from the Reduced Acreage Alternative would be identical to those of the proposed RSEP, as described above. The alternative site is located within the proposed RSEP site and construction vehicle access and travel routes to the site would be similar or identical to that of the proposed RSEP. Therefore, no local bus stops are in immediate proximity of the Reduced Acreage Alternative site and would not be impacted. Identical to the proposed RSEP, Condition of Certification **TRANS-1** would be required for this alternative to ensure the access and movement of bicycles along US 95 construction truck routes. With this condition incorporated, the Reduced Acreage Alternative would not substantially affect alternative transportation during construction and would be less than significant with respect to CEQA.

Identical to the proposed RSEP, once operational the Reduce Acreage Alternative would involve minimal daily traffic that would not adversely affect any existing pedestrian or bicycle routes or facilities. Therefore, the Reduced Acreage Alternative would result in no operational impacts to alternative transportation routes or facilities.

CUMULATIVE TRAFFIC AND TRANSPORTATION EFFECTS

The cumulative traffic and transportation impacts of the Reduced Acreage Alternative would be similar or identical to those of the proposed RSEP, as described below, due to the Reduced Acreage Alternative utilizing the same regional and local area roadways for construction- and operational-related vehicle access. It should be noted this alternative could result in a slight decrease in construction schedule and related vehicle trips when compared to the RSEP. As described for the RSEP, while cumulative project development utilizing the same roadways could combine with this alternative to increase the demand on regional and local area roadways, construction traffic is temporary and short-term, and would be reduced to the maximum extent feasible with the incorporation of Condition of Certification **TRANS-1** (as proposed for the RSEP and required for the Reduced Acreage Alternative). This measure requires the Construction Traffic Control Plan to consider and minimize cumulative traffic impacts of possible overlapping construction schedules of other nearby solar energy projects utilizing SR 62/US 95 during construction. Identical to that described below for the RSEP, once operational the Reduced Acreage Alternative would not contribute daily traffic on regional and local roadways at a volume that could contribute substantially to cumulative impacts of existing roadway LOS, including applicable CMP performance standards.

The contribution of this alternative to the cumulative aviation hazards and potential impacts would also be identical to those of the proposed RSEP. All conditions of certification for the proposed project would also apply to this alternative.

As described, the Reduced Acreage Alternative will make no changes to the impacts of

reflected total solar energy or to reflected solar brightness (intrusive light) as described for the original proposal. The northern edge of the heliostat field will remain in the same relation to SR 62. However, the heliostats may be located closer together so as to retain maximum solar energy at the solar receiver tower. If so, the masking that the flat mirrors provide for each other may increase.

Cumulative hazards and public safety impacts attributable to the Reduced Acreage Alternative, including: damage to roadways, hazards from oversize vehicles, emergency access and circulation, and disruption of alternative transportation; would be reduced during construction would not be substantial through the implementation of mitigation similar to Condition of Certification **TRANS-1**, **TRANS-3**, and **TRANS-4** proposed for the RSEP. Thus the Reduced Acreage Alternatives cumulative contribution to these impacts would be less than significant with respect to CEQA.

NORTH OF DESERT CENTER ALTERNATIVE

The North of Desert Center Alternative would be a 150 MW solar thermal facility located on approximately 2,643 acres of land. It is located along Desert Center Rice Road (State Route 177) east of Kaiser Road, north of Oasis Road, and approximately 1.6 miles north of I-10. The North of Desert Center Alternative is primarily private land with smaller sections of BLM land in the eastern portion of the site. It is largely fallow agricultural land. The existing SCE 161-kV transmission line (from the Blythe-2 substation to the Eagle Mountain-1 substation) that traverses the alternative site would be realigned to roughly follow the site boundary. A new 0.125-mile generation tie line (along Osborne Ave.) and substation would interconnect to the realigned SCE line at the northeast boundary of the site. The boundaries and transmission realignment of the North of Desert Center Alternative are illustrated in **Alternatives Figure 3**.

SETTING AND EXISTING CONDITIONS

The North of Desert Center Alternative site is located north of I-10; access to the North of Desert Center Alternative site would be via Rice Road off of I-10. Workers employed to construct the project at this alternative site would most likely commute from Blythe (approximately 50 miles east of the site) or the Coachella and Indio area (approximately 50 miles west of the site) or reside in the construction worker RV Park. Given the western location of this alternative, the primary regional roadway serving this site would be I-10 east of Palm Springs.

Aviation

The North of Desert Center Alternative site is approximately 16 miles east of the Chiriaco Summit Airport (L77); 45 miles west of the Blythe Airport; 45 miles southeast of Twenty-nine Palms Airport (KTMP); and about 50 miles east of several public airports and heliports in the Indio-Palm Springs area. There are no public or private airports within two miles of the project site.

The closest airstrip is the Julian Hinds Pumping Plant Airport (73CL), a private, unattended airstrip approximately twelve miles west of Desert Center. The strip is owned by the MWD. It has a single, 2000 foot-long asphalt runway (RWY 04/22), but no

services. The airstrip is for the owner's use only and permission is required prior to landing. There are no published instrument procedures for this airport. (ARPT 2010i)

The Desert Center Airport (formerly Desert Center Army Air Field), located immediately across SR177 from the North of Desert Center Alternative site, has been closed as a public airport since 1992, although up to 150 aircraft per year continued to land there through at least 2004. The airport recently reopened as a private airfield, in conjunction with the conversion of the remainder of the airport land to the Chuckwalla Valley Raceway. The Raceway's first track opened in April 2010, with plans to construct the remaining tracks and facilities over the next 5-10 years. The original airfield had two runways, capable of accommodating B-24 bombers; tie-down areas, and more than 40 buildings. One asphalt runway (RWY 05/23), 4,200 feet long and 50 feet wide, remains and will be used by the Raceway as a private airstrip. The runway has no lights, services, or published instrument procedures, and permission is required prior to landing. Traffic pattern altitude is 1,000 feet AGL, with a left traffic pattern. Previous use patterns indicate 60% of aircraft landed/departed RWY 05; 40% on RWY 23. There are no existing land use compatibility conflicts and none are anticipated.

National parks, wilderness areas, and national wildlife refuge areas all fall under the definition of "National Park" for aviation purposes and the areas above them are considered special use airspace. All aircraft are to maintain a minimum altitude of 2,000 feet AGL. In the project vicinity, the Joshua Tree National Park and Wilderness Area (6 miles north); Chuckwalla Mountains Wilderness (7 miles south); Orocopia Mountains Wilderness (20 miles southwest); and Palen/McCoy Wilderness (12 miles east) are all designated special use airspace.

As noted in the Aviation discussion of the proposed project, there are a number of MTRs designated for aircraft exercises in the southern desert. There are four low-level MTRs above the North of Desert Center Alternative project site, designated IR217, IR218, VR289 and VR296, which place limitations on the use of airspace above the project site from the surface to varying altitudes above 10,000 AGL.

There is one military airfield and three operational areas within 50 miles of the proposed project site. The Twenty-nine Palms Strategic Expeditionary Landing Field (SELF; KNXP) is approximately 45 miles northwest of the project site and serves the Marine Corps Air Ground Combat Center (MCAGCC) Twenty-nine Palms. Except for emergencies, the SELF field is for military use only. (ARPT 2010f; WIKI 2010j) The Chocolate Mountain Naval Aerial Gunnery Range is about 15 miles south of the project site and includes the Kane and Abel North Military Operations Areas, with areas of restricted airspace extending from the surface to 40,000 feet AGL (FL 400). There is no airfield within the range. The times these areas are active vary within each restricted area, from 0700 to 2300 or continuously, depending on the status of military training exercises in the area. The low-level MTRs above the project site also provide flight corridors between the many desert training areas.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

PERFORMANCE OF THE CIRCULATION SYSTEM

The volume of traffic generated during construction and operation of the North of Desert Center Alternative would be similar or identical to that discussed above for the RSEP; however, utilized roadways by construction traffic are expected to differ significantly when compared to those utilized by the RSEP. Staff assumes Project development at this alternative site would primarily utilize the I-10 freeway segments between the city of Palm Springs, California and the US 95 junction for a large volume of construction related vehicle trips. Therefore, it is expected that a significant change in construction trip distribution would occur to that analyzed above for the RSEP.

To provide a quantitative analysis comparing the potential roadway LOS impacts of the North of Desert Center Alternative to those presented above for the RSEP, traffic data for the proposed adjacent Blythe Solar Power Project (BSPP) is utilized (Solar Millennium 2009a). Staff has determined that absent a detailed traffic report for the North of Desert Center Alternative, the use of the BSPP traffic analysis is reflective of anticipated traffic system impacts of the Project constructed at the North of Desert Center Alternative site due to the similarity of project type (solar power project), project size, and primary construction traffic route (I-10).

As provided in the BSPP SA/DEIS, when construction traffic volumes anticipated to that of the North of Desert Center Alternative are added to existing LOS for I-10 east and west of the alternative site, the addition of this traffic would not impact the performance standards of I-10, with the freeway continuing to operate at LOS A before and during peak hour construction conditions (Solar Millennium2009a). As the I-10 freeway is located within Riverside County and designated a CMP highway, the applicable CMP performance standard threshold would be LOS E, as identified in **Traffic and Transportation Table 1** (Solar Millennium2009a).

It should be noted that the BSPP project proponent has proposed to divide the workforce in shifts and stagger travel times of construction vehicles, thus reducing delays at I-10 exists used to access the project site. It is assumed that for the North of Desert Center Alternative that would result in similar traffic volume impacts as BSPP, this alternative would be required to incorporate similar construction traffic management strategies. These measures would likely be included within a required Construction Traffic Control Plan, similar to that of RSEP Condition of Certification **TRANS-1**. Therefore, based on the assumption that the North of Desert Center Alternative would have similar construction traffic volume increase to I-10 as the BSPP and that the traffic management mitigation measures would substantially lessen impacts, project specific impacts to the LOS performance standards of I-10 would be substantially reduced and would be less than significant with respect to CEQA.

Similarly, it was determined that operation of the BSPP would result in a small amount of daily vehicular traffic, resulting in I-10 to operate well below capacity when BSPP operational traffic is added (Solar Millennium2009a). Based on the level of operational traffic associated with the RSEP and the assumption that an identical level of operational traffic would occur with the North of Desert Center Alternative, it is expected

that operation of this alternative would result in less than significant project specific impacts to the performance standards of the I-10 freeway with respect to CEQA.

REGIONAL CONGESTION MANAGEMENT PLANS

As discussed above, the North of Desert Center Alternative would utilize the I-10 freeway for construction and operational related traffic. I-10 is designated as a Riverside County CMP roadway (Riverside County 2006). As discussed above, it is assumed that North of Desert Center construction- and operational-related traffic would represent a minimal increase over existing traffic volumes and peak hour capacity available on I-10, operating at LOS A (Solar Millennium 2009a and 2009b). Therefore, no impacts to CMP designated roadways are expected to occur from the North of Desert Center Alternative.

AVIATION

As noted above, the Desert Center Airport is about one-quarter mile southeast of the project site. Aircraft departing RWY 23 on a direct heading or entering a left traffic pattern would normally remain southeast of the solar stack and heliostat arrays. However, the proximity of the proposed North of Desert Center Alternative site to the Desert Center Airport increases the potential for intrusive light to affect pilots during takeoff and landing, or when approaching the airport from the north or west. Pattern altitude for the Desert Center Airport is 1,000 feet AGL. The southwest end of RWY 05/23 would be less than one-quarter mile southeast of the project's solar heliostat array. There is a potentially significant health and safety risk should pilots overfly one of the four solar focal points at or below 1,100 feet AG (see Operational Intrusive Light discussion below). Although the airport does not operate at night, the project's solar stack, at 653 feet AGL, would constitute a potentially significant flight obstruction if not lighted appropriately and if pilots were not made aware of its presence. Therefore, conditions of certification **TRANS-8** and **TRANS-9** would also apply to this Alternative to reduce these potential impacts to a less than significant level. Condition of certification **TRANS-8** would require stack lighting consistent with both FAA and DOD requirements and condition of certification **TRANS-9** would inform pilots of the potential hazard and advise that overflight of the project's solar stack or heliostat arrays should be avoided below 1,500 feet AGL. If overflight of the project site is avoided, incidental intrusive light may still occur, but would not present a substantial hazard to aircraft operations or a health risk to aircraft occupants.

As with the proposed project site, military operations in the airspace above and in the vicinity of this alternative site could be significantly impacted. As noted above, there are four low-level military training routes (MTRs), designated IR250, IR255, and SR397, which place limitations on the use of airspace above the site from the surface to varying altitudes above 10,000 AGL. Impacts identical to those discussed in the proposed project Aviation analysis could also occur at this site. Therefore, condition of certification **TRANS-8** would require stack lighting consistent with DOD requirements for military operations. Condition of certification **TRANS-9** would inform military commands of the potential hazard and solar stack (obstruction) height. Military training exercises within the MTRs would be altered as necessary to avoid overflight of the site below 1,100 feet AGL during daylight hours and avoidance of the solar tower at all times (DOD 2010).

In addition, at any site location, frequencies used during normal power plant

construction and operations have the potential to interfere with military transmissions and equipment operation. Therefore, as with the proposed project, condition of certification **LAND-9** would ensure that no frequencies used at the project site or in conjunction with plant construction or operation would interfere with communication or other military operations. The military has indicated a willingness to alter training patterns to avoid the project area, to the extent feasible, which, in conjunction with full implementation of all other proposed aviation-related conditions of certification, would reduce any potential impacts to military operations to a less than significant level.

HAZARDS AND PUBLIC SAFETY

Hazards and public safety impacts of the North of Desert Center Alternative would be similar to those of the proposed RSEP, as described above. It is assumed that this alternative would result in a similar level of construction activities. Condition of Certification **TRANS-1** would still be required to minimize construction vehicle impacts to vehicle hazards and public safety. This alternative would result in similar potential for unexpected damage to roads by vehicles and equipment within the project area and require Condition of Certification **TRANS-3**. Additionally, while this alternative would likely use I-10 as the primary regional and local area roadway to access the site, Condition of Certification **TRANS-4** would also be required for this alternative to ensure that all oversize vehicles used on public roadways during construction comply with Caltrans, Riverside County, San Bernardino County, and other relevant jurisdictions limitations on vehicle sizes and weights to ensure consistency with applicable LORS (as described above in **Traffic and Transportation Table 1**). The potential for ground fogging from the North of Desert Center Alternative is assumed identical to that described above for the proposed RSEP as it is likely ground fogging activities would only occur minimally within the interior of the site at a distance eliminating them from intruding on any public roadway, thus resulting in no potential impacts to surface transportation with respect to CEQA.

Operational Intrusive Light

This alternative relocates the Rice SEP to a location along the Desert Center Rice Road (State Route 177), where the concerns expressed for the proposed RSEP, regarding the exposure of passing motorists along SR 62 or aircraft aloft to the possible misdirection of total solar energy or excessive brightness from a mirror surface, would also apply.

The small Desert Center Airport is located 0.25 miles southeast of the alternative project site. Aircraft landing or departing RWY 23 (southwest) would not be confronted directly by the brightness of direct solar reflections, although they would be skirting the southwestern edge of the solar array. However, pilots landing on Rwy 05 (to the northeast) or circling to land in either direction could pass over the heliostat field during normal solar tracking periods and experience visual adaptation difficulties due to possible exposure to the extreme range of brightness differences between the field of heliostats, the adjacent ground, and cockpit surfaces. In addition, if pilots were to pass over the RSEP during standby mode, when heliostats are directed to the four focal points, the aircraft pilot or passengers could be exposed to hazardous levels of solar radiation. These four standby focal points are approximately 100 feet from the tower and at the center plane elevation of the receiver. The reflected total solar energy at

these points could be up to 4,300 suns or 4.06 MW/m². This is sufficient total solar energy to cause ocular damage. However, because of the proximity of this alternative site to an active airport, the potential for exposure to reflected solar brightness for general aviation air traffic would be greater than at the proposed project site. This would pose a potentially significant health and safety impact under CEQA and could have a substantial effect to aircraft operations and use of navigable airspace under NEPA. Therefore, staff has proposed condition of certification **TRANS-9**, which would advise pilots of the potential hazard and recommend no overflight of the solar stack or heliostat arrays below 1,500 AGL. **TRANS-9** would also inform military commands of the potential hazard and solar stack (obstruction) height. Military training exercises within the MTRs would be altered as necessary to avoid overflight of the site below 1,100 feet AGL during daylight hours and avoidance of the solar tower at all times. This would reduce potential intrusive light-related aviation impacts to a less than significant level.

Similar to the proposed project and in consideration of the potential for birds to pass through a focal point and to be incinerated, staff would recommend Condition of Certification **BIO-25** in the **Biological Resources** section to be prepared in coordination with the Heliostat Positioning Plan and to minimize death and injury to birds. This mitigation would require the applicant to prepare an Avian Protection Plan and include modifications to proposed plant operation during standby mode to avoid or minimize directing heliostats to aim at focal points. Instead of directing heliostats to the focal points, staff is recommending that during standby mode the heliostats be placed into the stowed position or another alternative configuration that would avoid concentrating energy from more than one heliostat on any one location.

EMERGENCY ACCESS

Emergency access plans for the North of Desert Center Alternative would be similar to those of the proposed RSEP, as described above. While this alternative would use I-10 as the primary regional roadway to access the site, Condition of Certification **TRANS-1** would be required to ensure emergency access is maintained during site construction and any generation tie line construction activities. Therefore, operation of the North of Desert Center Alternative would conform to applicable LORS with respect to emergency access.

Furthermore, identical to the proposed RSEP, all internal access roadways required for North of Desert Center Alternative operation and facility access would be required to be designed consistent with all applicable Riverside County Ordinance 461 requirements, with a measure similar or identical to Condition of Certification **TRANS-5** required to ensure adequate turning radius for emergency vehicles to navigate within the facility boundaries and internal circulation roadways. It is assumed that the North of Desert Center Alternative would also require the implementation of Condition of Certification **WORKER SAFETY-6**.

ALTERNATIVE TRANSPORTATION

Alternative transportation impacts of the North of Desert Center Alternative would likely be similar to those of the proposed RSEP, as described above. A brief map survey conducted by staff indicated that this alternative site is not located in immediate proximity of any significant bus, pedestrian, or bicycle routes or facilities. As discussed for the RSEP, the Bradshaw Trail is an historic trail that runs along part of I-10 in Blythe and offers bicycle use (SR 2009a, p. 5.12-11). It is unknown by staff at this time what, if any impacts construction traffic along I-10 could have on this bicycle route. However, as the North of Desert Center Alternative would utilize I-10 as a major transportation route, it is possible that potential impacts to this bicycle route from construction related traffic could occur as compared to that associated with the RSEP. However, measures contained within Condition of Certification **TRANS-1**, including the ensurance of access and movement of bicycles along construction truck routes would be required of this alternative. With this condition incorporated, the North of Desert Center Alternative would not result in a substantial effect to alternative transportation during construction, and the effect would be less than significant with respect to CEQA.

Similar to the proposed RSEP, once operational, the North of Desert Center Alternative would involve minimal daily traffic that is not expected to impact public bus, or bicycle routes. Therefore, the North of Desert Center Alternative would result in no operational impacts to alternative transportation routes or facilities.

CUMULATIVE TRAFFIC AND TRANSPORTATION EFFECTS

The cumulative traffic and transportation impacts of the North of Desert Center Alternative would differ when compared to those of the proposed RSEP, as described below. Because this alternative would likely use I-10 as the primary regional roadway to access the site, the development of the proposed project at this site would have a greater potential to combine with other large solar renewable projects in the area (Palen Solar Power Project (PSPP), Blythe Solar Power Project (BSPP), Genesis Solar Power Project (GSPP), and the Desert Sunlight PV Project) that are identified as using I-10 as a primary travel route for construction related traffic. When using the BSPP cumulative project analysis as an indicator of likely cumulative traffic impacts from the North of Desert Center Alternative to I-10, this alternative would likely combine with the other four proposed projects to increase the demand on regional and local area roadways (Solar Millenium2009a). It is indicated by the BSPP document that although I-10 currently operates at LOS A, the high volume of traffic resulting from the overlapping construction of all projects could result in I-10 operating at an unacceptable LOS. However the BSPP, PSPP, and GSEP staff analysis have included similar conditions of certification as those recommended in Condition of Certification **TRANS-1** to reduce cumulative impacts for those projects. Based on the implementation of those measures, the BSPP concludes that cumulative traffic impacts of I-10 corridor projects would be reduced to a less than significant level (Solar Millenium2009a).

Regarding the potential cumulative impacts of the North of Desert Center Alternative, construction traffic is temporary and short-term (30 months for the North of Desert Center Alternative), and this cumulative impact would be reduced to the maximum extent feasible with the incorporation of a Construction Traffic Control Plan similar to

that identified for the RSEP per Condition of Certification **TRANS-1**. The cumulative component of Condition of Certification **TRANS-1**, the Construction Traffic Control Plan, would need to address and mitigate cumulative construction impacts associated with the North of Desert Center Alternative and the overlapping construction schedules of other nearby solar energy projects utilizing I-10 during construction including the Blythe Solar Power Project, Palen Solar Power Project, and Genesis Solar Energy Project (Solar Millennium2009a, Solar Millennium2009b, GSEP2009a). Therefore, due to the number of renewable energy projects proposed on the I-10 corridor (refer to **Cumulative Impacts Figure 2** and **Cumulative Tables 2 and 3**), it is possible that cumulative construction traffic impacts of the North of Desert Center Alternative could result in significant performance standards impacts on I-10 with respect to CEQA. However, it is unknown at this time if significant cumulative impacts would occur on I-10 absent a quantitative traffic analysis of the RSEP constructed at the North of Desert Center Alternative site (as would be required by Condition of Certification **TRANS-1**). Based on the cumulative analysis performed in the BSPP and used in this document as a likely scenario for North of Desert Center traffic impacts to I-10, staff concludes that with implementation of a Construction Traffic Control Plan as would be required with recommended Condition of Certification **TRANS-1**, it is possible but unknown at this time these cumulative construction traffic impacts would be reduced to less than significant with respect to CEQA (Solar Millennium2009a)

Once operational, the North of Desert Center Alternative would not contribute daily traffic on regional and local roadways at a volume that could contribute substantially to cumulative impacts of existing roadway LOS, including applicable CMP performance standards, similar to that described for the BSPP (Solar Millennium2009a).

Multiple solar projects are proposed along I-10 and SR 177 that would contribute to the need for site avoidance by private aircraft and alterations to military operations over the area. Altitude restrictions would be further expanded in the Chuckwalla Valley and along the I-10 corridor. General aviation would be most affected, as the current long stretches of uncontrolled airspace for VFR flight would be broken up, especially below 2,500 feet AGL. However, military operations could also be adversely affected as more and more training activities would need to be altered to avoid obstructions and intrusive light. While the proposed conditions of certification would allow pilots to avoid the stack obstruction and minimize exposure to intrusive light for this project, when added to the list of similar proposed projects, the cumulative alterations to airspace would be significant, unavoidable, and, possibly, unmitigable. However, as the actual number of similar projects that will be approved and built are speculative, at best, it is difficult to tell what the actual cumulative impact would be. It can only be said that this project would add to the cumulative potential impacts to aviation, as noted above. Due to the cumulative intrusive light impacts and potential for ocular damage from the close adjacency of the Desert Center Airport, intrusive light impacts associated with this alternative would be limited by implementing Conditions of Certification **TRANS-6**, **TRANS-7**, and **TRANS-9** and would be less than significant with respect to CEQA.

Hazards and public safety impacts attributable to the North of Desert Center Alternative, including damage to roadways, hazards from oversize vehicles, emergency access and circulation, and disruption of alternative transportation would be substantially reduced during construction through the implementation of mitigation similar to Condition of

Certification **TRANS-1**, **TRANS-3**, and **TRANS-4** proposed for the RSEP. The North of Desert Center Alternative's cumulative contribution to these impacts would be less than significant with respect to CEQA.

SR 62/Rice Valley Road Generation Tie Line Alternative

The SR 62/Rice Valley Road Generation Tie Line Alternative would interconnect to Western Area Power Administration's (Western) 161-kV/230-kV Parker-Blythe transmission line at the same location as the proposed project transmission line. This alternative generation tie line would exit the power block directly to the east and follow a proposed access road within the heliostat field. The tie-in would then turn north inside the RSEP property boundary and run along the RSEP's circular perimeter road to the north and northwest. At the north end of the heliostat field, the route would traverse the construction laydown area on previously disturbed land over a distance of approximately 500 feet to the southern side of State Route 62. The route would follow State Route 62 approximately 3.8 miles east to the junction of Rice Valley Road. It would then trend south to follow the unpaved Rice Valley Road for 4.1 miles to its juncture with the applicant's proposed new generation tie line alignment and continue southeast for 5.4 miles along the proposed alignment to Western's Parker-Blythe transmission line. The SR 62/Rice Valley Road Generation Tie Line Alternative route is illustrated in **Alternatives Figure 4**.

The SR 62/Rice Valley Road Generation Tie Line Alternative is evaluated in this SA/DEIS because it would reduce Biological Resources impacts and avoid the creation of a new 4.6 mile vehicle access route between the proposed solar facility and the proposed junction of the new transmission line access road with the existing Rice Valley road.

Setting and Existing Conditions

Based on the alternative description above, the setting for the SR 62/Rice Valley Road Transmission Line Alternative is the same as for the proposed project. As the project footprint would not result in a change to the overall site location, only resulting in slight changes to the required transmission line routing, this alternative would have the identical traffic and transportation regional and local area resources as those described above serving the proposed RSEP.

Assessment of Impacts and Discussion of Mitigation

PERFORMANCE OF THE CIRCULATION SYSTEM

The roadway LOS impacts of the SR 62/Rice Valley Road Transmission Line Alternative would be similar or identical to those of the proposed RSEP, as described above. The same regional and local area roadways would continue to provide access to the SR 62/Rice Valley Road Transmission Line Alternative site. It is assumed that the level of construction activities would be identical to that of the proposed RSEP, resulting in an identical number of construction related trips from both construction workers and construction activities. Therefore, this alternative would not result in a substantial change to roadway LOS impacts when compared to the proposed RSEP (as presented in **Traffic and Transportation Table 5**), as the same regional and local area roadways

would continue to provide access to the SR 62/Rice Valley Road Transmission Line Alternative. Therefore, less than significant impacts regarding performance standards of utilized roadways by construction related traffic would occur as part of the SR 62/Rice Valley Road Transmission Line Alternative.

Regarding linear facilities, it is assumed that temporary traffic delays associated with construction of required transmission interconnections would remain similar to those described above for the proposed RSEP. While this alternative introduces a change in the transmission line routes as compared to the RSEP, Condition of Certification **TRANS-1** would be required for this alternative to reduce any potential disruption to roadways during transmission line stringing activities. The implementation of this measure would reduce any potential capacity issues to roadways impacts by temporary transmission line infrastructure installation associated with the SR 62/Rice Valley Road Transmission Line Alternative to a less than significant level with respect to CEQA.

It is assumed that operation of this alternative would require an identical number of operational employees as the RSEP. As discussed above for the RSEP, operational related traffic from employees would generate minimal traffic volumes on the regional and local area roadways and would have no impact on utilized roadway capacities. Therefore, less than significant impacts regarding performance standards of utilized roadways by operational related traffic would occur as part of the SR 62/Rice Valley Road Transmission Line Alternative with respect to CEQA.

REGIONAL CONGESTION MANAGEMENT PLANS

As discussed above, the SR 62/Rice Valley Road Transmission Line Alternative would utilize identical roadways for construction and operational related traffic as the RSEP and result in identical construction and operational traffic volumes as those described for the RSEP. As discussed above for the RSEP, all analyzed California roadways are contained within both the Riverside County and SANBAG CMP's. As shown in **Traffic and Transportation Table 5** for the RSEP, construction traffic would not exceed CMP LOS thresholds on analyzed roadways. Furthermore, as discussed above, RSEP operational traffic would represent a minimal increase over existing traffic volumes and peak hour capacity available on local roadways as presented in **Traffic and Transportation Table 3**. Therefore, no impacts to CMP designated roadways would occur from SR 62/Rice Valley Road Transmission Line Alternative construction- or operational-related traffic.

AVIATION

Aviation hazards and potential impacts would be identical to those of the proposed RSEP. All conditions of certification for the proposed project would also apply to this alternative.

HAZARDS AND PUBLIC SAFETY

Hazards and public safety impacts of the SR 62/Rice Valley Road Transmission Line Alternative would be identical to those of the proposed RSEP, as described above. While this alternative would in a slight change to required transmission line interconnection alignments, Condition of Certification **TRANS-1** would still be required

to minimize construction vehicle impacts to vehicle hazards and public safety as well as potential hazards from oversize vehicles crossing at-grade railroad crossings. This alternative would result in similar potential for unexpected damage to roads by vehicles and equipment within the project area and require Condition of Certification **TRANS-3**. Additionally, as this alternative would likely use identical regional and local area roadways to access the site, Condition of Certification **TRANS-4** would also be required for this alternative to ensure that all oversize vehicles used on public roadways during construction comply with Caltrans, Riverside County, San Bernardino County, and other relevant jurisdictions limitations on vehicle sizes and weights to ensure consistency with applicable LORS (as described above in **Traffic and Transportation Table 1**). The potential for ground fogging from the While this alternative would in a slight change to required transmission line interconnection alignments, Alternative is assumed identical to that described above for the proposed RSEP, resulting in no potential impacts to surface transportation.

Operational Intrusive Light

This alternative would not diminish the brightness or the total solar energy impacts associated with the proposed project.

With regard to intrusive light, this alternative would make no significant changes to the potential impacts of reflected total solar energy or to reflected solar brightness (intrusive light), as described for the proposed RSEP. Recommended Conditions of Certification **TRANS-6** (Heliostat Positioning Plan), **TRANS-7** (Solar Energy Receiver Luminance Monitoring Plan), and **TRANS-9** would reduce any potential distracting or adverse effects on aviation and vehicular traffic from excessive brightness to a less than significant level under CEQA.

EMERGENCY ACCESS

Emergency access impacts of the SR 62/Rice Valley Road Transmission Line Alternative would be similar or identical to those of the proposed RSEP, as described above. During construction, access to the site would likely be identical to that of the proposed RSEP, with Condition of Certification **TRANS-1** required to ensure emergency access is maintained during site construction and transmission line stringing activities. Therefore, less than significant emergency access impacts would occur with SR 62/Rice Valley Road Transmission Line Alternative construction.

As discussed above, this alternative would avoid the creation of a new 4.6-mile vehicle access route between the proposed solar facility and the proposed junction of the new transmission line access road with the existing Rice Valley road, as required with the proposed RSEP. However, any required internal access roadways associated with SR 62/Rice Valley Road Transmission Line Alternative operation would require Condition of Certification **TRANS-5** to ensure roadways are designed consistent with all applicable Riverside County Ordinance 461 requirements, thus providing adequate turning radius for emergency vehicles to navigate within the facility boundaries and internal circulation roadways

It is assumed that the SR 62/Rice Valley Road Transmission Line Alternative would also require the implementation of Condition of Certification **WORKER SAFETY-6**. For

additional discussion of access/movement of emergency vehicles within the site for the SR 62/Rice Valley Road Transmission Line, refer to the **Worker Safety and Fire Protection** section in this SA/DEIS. Therefore, less than significant emergency access impacts would occur with SR 62/Rice Valley Road Transmission Line Alternative operations.

ALTERNATIVE TRANSPORTATION

Alternative transportation impacts of the SR 62/Rice Valley Road Transmission Line Alternative would be similar or identical to those of the proposed RSEP, as described above. While this alternative would result in a slight change to required transmission line interconnection alignments, the alternative site is identical to the proposed RSEP site and construction vehicle access and travel routes to the site would be similar or identical to that of the proposed RSEP. Therefore, no local bus stops are in immediate proximity of the SR 62/Rice Valley Road Transmission Line Alternative site and would not be impacted. Identical to the proposed RSEP, Condition of Certification **TRANS-1** would be required for this alternative to ensure the access and movement of bicycles along construction truck routes. With this condition incorporated, the SR 62/Rice Valley Road Transmission Line Alternative would result in less than significant impacts to alternative transportation during construction with respect to CEQA.

Identical to the proposed RSEP, once operational, the SR 62/Rice Valley Road Transmission Line Alternative would involve minimal daily traffic that is not expected to impact public bus or bicycle routes. Therefore, the SR 62/Rice Valley Road Transmission Line Alternative would result in no operational impacts to alternative transportation routes or facilities with respect to CEQA.

CUMULATIVE TRAFFIC AND TRANSPORTATION EFFECTS

The cumulative traffic and transportation impacts of the SR 62/Rice Valley Road Transmission Line Alternative would be similar or identical to those of the proposed RSEP, as described below. This alternative is assumed to result in a similar or identical construction schedule and related vehicle trips when compared to the RSEP. Furthermore, it is assumed the same regional and local area roadways would provide access for the SR 62/Rice Valley Road Transmission Line Alternative. As described for the RSEP, while cumulative project development utilizing the same roadways could combine with this alternative to increase the demand on regional and local area roadways, construction traffic is temporary and short-term, and would be reduced to the maximum extent feasible with the incorporation of Condition of Certification **TRANS-1** (as proposed for the RSEP and required for the SR 62/Rice Valley Road Transmission Line Alternative). This measure requires the Construction Traffic Control Plan to consider and minimize cumulative traffic impacts of possible overlapping construction schedules of other nearby solar energy projects utilizing SR 62/US 95 during construction. Identical to that described below for the RSEP, once operational the SR 62/Rice Valley Road Transmission Line Alternative would not contribute daily traffic on regional and local roadways at a volume that could contribute substantially to cumulative impacts of existing roadway LOS, including applicable CMP performance standards.

[Hazards and public safety impacts not site specific, including: damage to roadways,

hazards from oversize vehicles, emergency access and circulation, and disruption of alternative transportation; would be reduced during construction through the implementation of mitigation similar to Condition of Certification **TRANS-1**, **TRANS-3**, and **TRANS-4** proposed for the RSEP, thus reducing the SR 62/Rice Valley Road Transmission Line Alternatives cumulative contribution to these impacts to a less than significant level with respect to CEQA.

The contribution of this alternative to the cumulative aviation hazards and potential impacts would also be identical to those of the proposed RSEP.

NO PROJECT/NO ACTION ALTERNATIVE - No Project and No Action on proposed transmission line application and on CDCA land use plan amendment

The No Project Alternative under CEQA or the No Action Alternative under NEPA defines the scenario that would exist if the proposed project were not constructed. The CEQA Guidelines state that “the purpose of describing and analyzing a ‘no project’ alternative is to allow decision makers to compare the impacts of approving the proposed project with the impacts of not approving the proposed project” (Cal. Code Regs., tit. 14 § 15126.6(i)). The No Project analysis in this SA/EIR considers existing conditions and “what would be reasonably expected to occur in the foreseeable future if the project were not approved...” (Cal. Code Regs, tit. 14 § 15126.6(e)(2)). Under NEPA, the No Action Alternative is used as a benchmark of existing conditions by which the public and decision makers can compare the environmental effects of the proposed action and the alternatives.

Under this alternative, the Energy Commission would not approve the proposed RSEP; BLM would not approve the generation tie line right-of-way application and would not amend the CDCA Plan; and Western would not approve the interconnection request. As a result, no solar energy project would be constructed on the project site, BLM would continue to manage the land encompassing the transmission line consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended, and Western would continue to operate the Parker Blythe Transmission Line #1 under current conditions.

Because there would be no amendment to the CDCA Plan and no solar project approved for the site under this alternative, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site. In the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations.

SETTING AND EXISTING CONDITIONS

The No Project analysis in this SA/DEIS considers existing conditions and “what would be reasonably expected to occur in the foreseeable future if the project were not approved...” (Cal. Code Regs, tit. 14 § 15126.6(e)(2)). Under NEPA, the No Action Alternative is used as a benchmark of existing conditions by which the public and decision makers can compare the environmental effects of the proposed action and the alternatives. The traffic and transportation setting for the No Project/No Action

Alternative would be the same as those of the proposed project local and regional study areas, as described above.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Under this alternative, the proposed RSEP would not be approved by the CEC and BLM and BLM would not amend the CDCA Plan. As a result, no solar energy project would be constructed on the project site and BLM would continue to manage the site consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended.

Because there would be no amendment to the CDCA Plan and no solar project approved for the site under this alternative, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site. As a result, the transportation and traffic related impacts (mitigated to less than significant levels) of the RSEP would not occur at the proposed site. However, the land on which the project is proposed would become available to other uses that are consistent with BLM's land use plan, including another solar project requiring a land use plan amendment. In addition, in the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations.

CUMULATIVE IMPACTS

A project may result in significant adverse cumulative impacts when its effects are "cumulatively considerable." Cumulatively considerable means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, or the effects of probable future projects (Title 14, California Code of Regulations, section 15130). Cumulative traffic and transportation impacts could occur when more than one project has an overlapping construction schedule that creates additional traffic flow on shared roadways that cannot be met by the existing capacity, resulting in LOS impacts. Operational cumulative socioeconomic impacts could occur when the development of multiple projects significantly impacts the local area roadway LOS.

The Cumulative Scenario section of this SA/DEIS provides detailed information on the potential cumulative solar and other development projects in the project area. Together, these projects comprise the cumulative scenario, which forms the basis of the cumulative impact analysis for the proposed project. In summary, these projects are:

- Renewable energy projects on State and Private Lands in California Desert District Counties, as shown in **Cumulative Table 1A**, and renewable Energy Projects in the California Desert District, as shown on and in **Cumulative Table 1B**. These projects can be seen on **Cumulative Figure 1**. Although not all of those projects are expected to complete the environmental review processes, or be funded and constructed, the list is indicative of the large number of renewable projects currently proposed in California.
- Existing and foreseeable future projects in the Rice Valley area and Eastern Riverside County, as shown on **Cumulative Impacts Figure 2** and **Cumulative**

Tables 2 and 3. Table 2 presents existing projects in this area and Table 3 presents future foreseeable projects in the Rice Valley area and Eastern Riverside County. Both tables indicate project name and project type, its location and its status.

These projects are defined within a geographic area that has been identified by the CEC and BLM as covering an area large enough to provide a reasonable basis for evaluating cumulative impacts for all resource elements or environmental parameters. Most of these projects have, are, or will be required to undergo their own independent environmental review under CEQA and/or NEPA. Even if the cumulative projects described in the Cumulative Scenario section have not yet completed the required environmental processes, they were considered in the cumulative impacts analyses in this SA/Draft EIS.

Geographic Extent of Cumulative Impact Analysis

The area of cumulative effect for traffic and transportation resources is roadways that may share construction-related traffic associated with the proposed RSEP (as identified in **Traffic and Transportation Table 5**). The analysis of cumulative effects considers a number of variables including geographic (spatial) limits, time (temporal) limits, and the characteristics of the resource being evaluated. The geographic scope of cumulative impact analysis is based on the workforce boundaries of the cumulative development projects. While it is possible that the geographic scope of cumulative effects will extend beyond these three counties with some construction workers and equipment trips potentially coming from adjacent counties beyond a two-hour commute radius of the proposed RSEP site, due to the similar nature of skill set required by the workforce during construction activities as well as the number of proposed cumulative renewable energy projects, it is not anticipated that the geographic scope for cumulative impact analysis extent beyond the scope of the direct and indirect effects of the proposed action.

Effects of Past and Present Projects

A wide variety of past and present development projects contribute to the cumulative conditions for traffic and transportation. As noted above in the “Setting and Existing Conditions” subsection, past development has further urbanized the area and increased traffic conditions and roadway congestion. As shown in the AFC, from 2000 to 2008 the populations of Riverside and San Bernardino Counties increased by 25.6 and 16.2%, respectively while the population within La Paz County increased by 8.5% during the same time frame (SR 2009a, Section 5.11, Socioeconomics). This is an example of the steady growth rate that has occurred throughout the regional area that contributes to daily traffic. As a result, past and present residential, commercial, and industrial development has contributed to the overall traffic and transportation growth within the study area.

Effects of Reasonably Foreseeable Future Projects

Transportation and traffic facilities are also expected to be affected by the following reasonably foreseeable future projects as follows: a number of large electrical generation and distribution infrastructure development projects are proposed within the Rice Valley area and Eastern Riverside County (as shown in **CUMULATIVE IMPACTS Figure 2** and **CUMULATIVE IMPACTS Table 3**); and solar and wind applications

proposed on approximately 1,000,000 acres of BLM land in the California Desert District Planning Area as well as a large number of electrical generation and distribution infrastructure development projects proposed on non-federal land (as shown in **CUMULATIVE IMPACTS Tables 1a and 1b** and on **CUMULATIVE IMPACTS Figure 1**).

Contribution of the RSEP to Cumulative Impacts

Construction. As discussed earlier for the proposed Project, construction of the RSEP will result in a short-term increase in traffic volumes on US 95 and SR 62 related to construction activities and workers. Foreseeable development in the project area at the scope of which may combine with the RSEP cumulatively includes primarily renewable energy electrical generation and transmission infrastructure projects. With the large number of renewable energy projects occurring within the RSEP regional area, it is possible that some overlap of construction phasing could occur between the RSEP and the cumulative development projects as described above and identified in SA/DEIS Section, Cumulative Scenario. Therefore, cumulative projects that may be under construction at the same time as the RSEP could utilize the same regional roadways for construction related vehicle site access during their respective construction periods. However, it should be noted that based on direct construction traffic volumes, the RSEP would be expected to contribute a less than significant increase of daily traffic volumes to the possible short term roadway LOS cumulative impacts.

All cumulative projects identified in **CUMULATIVE IMPACTS Tables 1a, 1b, 2, and 3** would be expected to draw on the regional transportation system serving Riverside/San Bernardino Counties and the State of Arizona. As shown in **CUMULATIVE IMPACTS Figure 1**, the RSEP is located between clustered future development of solar energy projects to the northwest along the SR 62 corridor and to the south along the I-10 corridor. Due to its location to these cumulative development projects and the geography of the regional transportation system, the RSEP has the most potential to contribute cumulatively to those proposed projects located along the SR 62 corridor. As described and analyzed above, RSEP related traffic is considered to only have the potential to impact SR 62 and US 95 (SR 2009a, p. 5.12-14). Therefore, cumulative development located along these corridors is considered to have the greatest cumulative potential. Of these projects, as identified on **CUMULATIVE IMPACTS Figure 2** and provided in **CUMULATIVE IMPACTS Tables 2 and 3**, staff considers the following cumulative projects along both SR 62 and US 95 to have the greatest potential to combine with the RSEP from traffic impact evaluation:

SR 62

- B. Ward Valley, 100-250 MW solar power generating facility utilizing three facilities (with a potential for two additional facilities) encompassing an approximate area of 4,800 (for three facilities) up to 8,000 acres, not inclusive of the required transmission ROW, proposed in the Ward Valley approximately 5 miles northwest of the proposed Rice Solar Energy project;
- C. Clean Air Solar II, 900 MW technology neutral (no specific technology at this time) solar power plant located near Iron Mountains 11 miles west of proposed Rice project;
- D. Clean Air Solar III, 1,700 MW technology neutral (no specific technology at this

time) solar power plant located near Iron Mountains 15 miles west of proposed Rice project;

- E. Killbeck, 1,000 MW solar thermal power plant located 26 miles northwest of proposed Rice project
- F. Cadiz Lake, 1,000 MW solar thermal power plant located 26 miles west of proposed Rice project

US 95

- N. Big Maria Vista Solar Project, 500 MW solar photovoltaic project 14 miles south of proposed Rice project

While **CUMULATIVE IMPACTS Figure 2** shows both the BSPP and McCoy Solar Project located approximately 26 and 20 miles southeast of the proposed RSEP, respectively, staff review of the BSPP AFC indicated that no traffic on US 95 was assumed or evaluated in the traffic analysis (Solar Millennium2009a). Therefore, neither project is assumed to combine with RSEP traffic on US 95. With regards to the adjacent cumulative projects identified above with the potential to combine with RSEP related traffic, at the time of this SA/DEIS publication staff was unable to obtain traffic volume data to consider a quantitative evaluation of cumulative traffic impacts.

To mitigate the potential for cumulative impacts to roadway performance standards, Condition of Certification **TRANS-1** requires that the Construction Traffic Control Plan for the RSEP take into account the cumulative traffic impacts of other nearby solar energy projects utilizing both SR 62 and US 95 during construction. This condition requires coordination with all solar development project applicants likely to share SR 62 and US 95 as key construction vehicle routes in conjunction with the RSEP, ensuring that timing of heavy equipment and building materials deliveries as well as worker trips of overlapping construction schedules do not result in either SR 62/US 95 to operate at an acceptable LOS with the addition of cumulative construction traffic. With the incorporation of this condition, the proposed RSEP would not contribute construction traffic on regional and local roadways at a volume that could contribute substantially to cumulative impacts of existing roadway LOS, including applicable CMP performance standards.

With regards to temporary cumulative safety impacts during construction, incorporation of proposed Conditions of Certification **TRANS-1**, **TRANS-3**, **TRANS-4** and **TRANS-5** as part of the RSEP would ensure that the proposed project not have a considerable contribution to cumulative hazards and public safety, emergency access, or alternative transportation impacts during construction. While cumulative development could result in overlapping construction vehicles on utilized construction traffic routes, it is assumed each cumulative project will include project specific measures similar to that of RSEP Conditions of Certification **TRANS-1**, **TRANS-3**, **TRANS-4** and **TRANS-5** reducing respective traffic hazard impacts and thus insuring each cumulative project to be in compliance with applicable LORS, consistent with those applicable to the RSEP, as described in **Traffic and Transportation Table 1**. Therefore, due to the incorporation of Condition of Certification **TRANS-1**, **TRANS-3**, **TRANS-4** and **TRANS-5**, the RSEP would not contribute to cumulative traffic or transportation related construction vehicle hazard impacts.

Operation. Operation of the RSEP would result in minimal long-term daily traffic volumes on regional and local roadways. Furthermore, staff review of renewable energy electrical generation and transmission infrastructure projects occurring within the RSEP regional area, as identified in SA/DEIS Section Cumulative Scenario, indicated they were also expected to generate negligible daily traffic volumes similar to that of the RSEP. These operational traffic volumes would likely utilize multiple travel routes for worker and maintenance related traffic. Based on the available future capacity and LOS of roadways likely utilized by RSEP operational traffic (as shown in **Traffic and Transportation Table 5** without project scenario), any cumulative increase in traffic volumes by projects identified in SA/DEIS Section Cumulative Scenario, are not expected to significantly impact the performance standards of these roadways. Therefore, the proposed RSEP would not contribute cumulatively to adverse long-term impacts to roadway LOS serving the regional or local area.

With regards to aviation, multiple solar projects are proposed along SR 62, SR 177, I-10, and north into San Bernardino County that would contribute to the need for site avoidance by private aircraft and alterations to military operations over the entire southern desert area. Altitude restrictions would be further expanded in the Rice Valley, Ward Valley, Chuckwalla Valley, and along the I-10 corridor from Desert Center to Blythe and into Arizona. General aviation would be most affected, as the current long stretches of uncontrolled airspace for VFR flight would be broken up, especially below 2,500 feet AGL. Conditions of certification **TRANS-8** and **9** would provide pilots with the information needed to meet FAA requirements to see and avoid the proposed project stack and exhaust plume, and minimize exposure to intrusive light for this project. Construction of additional solar or wind projects in the general vicinity would expand the areas that pilots would need to avoid, but would not substantially increase aviation risks or impose undue hardship on the limited civil aviation traffic in the area at this time. The proposed project would not significantly increase the potential cumulative impacts to civil aviation.

The cumulative alterations to airspace would be significant, unavoidable, and, possibly, unmitigable. However, as the actual number of similar projects that will be approved and built are speculative, at best, it is difficult to tell what the actual cumulative impact would be. It can only be said that this project would add to the cumulative potential impacts to aviation, as noted above.

Aviation and Military Use

As with civilian aviation traffic, the cumulative impacts of the proposed project and all other foreseeable renewable energy projects in the area have the potential to adversely affect the use of the area's airspace as a military training location. There are three low-level military training areas above the Ward and Rice Valleys, extending from the surface to above 10,000 feet AGL. Potential impacts to military maneuvers increase incrementally with each additional facility and can include structural obstructions to the airspace, visibility issues, and frequency interference. Conditions of certification **LAND-7**, **8**, and **9**, in conjunction with the military's willingness to alter its training program, would reduce the proposed project impacts on military operations to a less than significant level. However, this is the first of many projects proposed for this area. While it is reasonable to assume that similar conditions of certification or approval would

be required for similar projects, it would depend on the military's cooperation and ability to repeatedly alter its training patterns to avoid any substantial cumulative impacts. Assuming military cooperation, the proposed project would not contribute significantly to any potential cumulative aviation impacts. Otherwise, the cumulative alterations to military airspace could be significant, unavoidable, and, possibly, unmitigable.

Intrusive Light (glare). Based on review of the past, present and foreseeable projects, the proposed Ward Valley Solar Electric Project is the only project that is potentially foreseeable to be developed within the Visual view shed of the RSEP. The Ward Valley project would be located approximately five miles northwest of RSEP, and would be located north of SR 62. It is expected that the intrusive light impacts associated with the Ward Valley project would be mitigated to less than significant similar to the manner as the agencies have identified for RSEP. The separation by distance of the Ward Valley project from RSEP and even greater distances of existing and foreseeable projects, and the ability to identify mitigation to lessen impacts below levels of significance for both RSEP and Ward Valley, allow staff to conclude that the cumulative effects of intrusive light from RSEP are deemed less than significant if Conditions of Certification **TRANS-6**, **TRANS-7**, and **TRANS-9** are implemented.

Decommissioning. Due to the short-term construction based activities associated with the decommissioning of the RSEP, it is expected to result in similar cumulative impacts related to traffic and transportation as RSEP construction impacts, as described above. It is possible that the decommissioning of nearby proposed solar energy projects, as identified in SA/DEIS Section Cumulative Scenario, could occur concurrently with the decommissioning of this project, due to the similar lifespan of these projects. However, due the unknown roadway capacity or LOS of regional roadways serving the RSEP and cumulative project area at the time of decommissioning, it is not possible at this time for the agencies to speculate the level of, if any, cumulative effects related to traffic and transportation that could occur during decommissioning of the RSEP. However, based on the cumulative impact analysis above for RSEP construction activities, it is likely the impacts of the decommissioning of the RSEP would not be expected to contribute to cumulative impacts related to traffic and transportation because it is assumed that closure and decommissioning activities would include mitigation similar to that proposed for the RSEP as Conditions of Certification **TRANS-1**, **TRANS-3**, **TRANS-4** and **TRANS-5**.

COMPLIANCE WITH LAWS, ORDINANCES, REGULATIONS, AND STANDARDS

Traffic and Transportation Table 6 provides a general description of applicable statutes, regulations, and standards adopted by the federal government, the State of California, and regional/local agencies pertaining to traffic and transportation with which the project is required to comply. Conditions of certification have been proposed to ensure project consistency with a law, ordinance, regulation, or standard where it was not already mandated by federal or state regulations.

Traffic and Transportation Table 6
Project Compliance with Adopted Traffic and Transportation Laws, Ordinances
Regulations, and Standards

Applicable Law	LORS Description and Project Compliance Assessment
<p>Federal</p> <p>Code of Federal Regulations, Title 14 Aeronautics and Space, Part 77 Objects Affecting Navigable Airspace (14 CFR 77/FAR Part 77)</p>	<p>FAR Part 77 establishes standards for evaluating the potential hazards associated with physical objects that extend into navigable airspace. It also sets noticing and hearing requirements and provides for aeronautical studies to determine the effect of physical objects on the safe and efficient use of airspace. Projects that would result in a structure taller than 200 feet AGL or any construction or alteration on a public use or military airport are required to file an FAA Form 7460-1 notification, providing information on the location, height, and other pertinent information. Other conditions may also trigger the need to notify the FAA, including the construction of structures within 10,000 ft. of a public-use or military airport having no runway more than 3200 ft. in length and exceeding a 50:1 slope; within 20,000 ft. of a public-use or military airport having at least one runway more than 3200 ft. in length and exceeding a 100:1 slope; or within 5,000 ft. of any public-use heliport and exceeding a 25:1 slope. It also applies to any highway, railroad, or other traverse way for mobile objects of a height which, if adjusted upward to the height of the highest mobile object that would normally traverse it, would exceed the above-mentioned criteria. However, none of these additional criteria would apply to the proposed project.</p> <p>Once the notification is filed, the FAA Air Traffic Division initiates a review to determine if the proposed structures or objects would affect any public use airport, require a change in aeronautical operations or procedures, exceed obstruction standards, or would have a possible impact on VFR operations. The notification is also circulated to various interested agencies, public-use airports within 13 miles, private-use airports and heliports within five miles, military and state aviation departments, air traffic control facilities and flight service stations that serve the area, and local interested organizations and individuals for comment. To be considered to have an adverse effect on navigation, the obstruction must be a physical structure or object that:</p> <ul style="list-style-type: none"> • Exceeds Part 77 obstruction standards or have a physical or electromagnetic effect on air navigational facilities; • Requires a change to an instrument procedure or minimum flight altitude; • Restricts control tower line-of-site; • Reduces airport capacity and efficiency; or • Affects useable runway length. <p>However, in order to be considered a “hazard” to navigation, the obstruction must also result in a substantial adverse effect. This requires a finding of adverse effect (see list above) that impacts a significant volume of aeronautical operations, which is defined as:</p> <ul style="list-style-type: none"> • One or more aeronautical operations per day (regardless of type of activity); or • An average of one aeronautical operation a week for an affected instrument approach procedure or minimum altitude, if the procedure serves as the primary procedure under specific conditions (i.e., a crosswind runway with an instrument approach procedure). (FAA 2008)

If the proposed obstruction meets both criteria, a hazard determination will be issued. Otherwise, a "Determination of No Hazard to Navigation" will be made. It should be noted that the FAA has no authority to prohibit construction of any project. It can only identify the potential hazard and work with the proponent to mitigate any potential impacts. A Determination of No Hazard to Navigation also does not preclude the potential for aviation hazards not addressed in the rather narrow criteria indicated above.

The proposed project would result in the construction of a single stack structure to a height of approximately 653 feet AGL. An FAA Form 7460-1 was filed by the applicant on May 1, 2009, in compliance with the requirements of FAR Part 77. Although the proposed stack would exceed FAR Part 77 obstruction standards, it was not deemed to result in a substantial adverse effect on navigation, based on the criteria defined above. The FAA Air Traffic Airspace Branch in Fort Worth, Texas, issued a "Determination of No Hazard to Navigation" on December 28, 2009, subject to the following requirements:

- The project owner would be required to file FAA Form 7460-2 Notice of Actual Construction or Alteration (Part 1) at least 10 days prior to the start of construction.
- The project owner would be required to file FAA Form 7460-2 Notice of Actual Construction or Alteration (Part 2) within five days after stack construction reaches its greatest height.
- The project owner would be required to mark and/or light the stack, in accordance with the FAA's requirements for 24-hour medium strobes. (FAA 2007)

The Notice also advised the applicant that construction of any structure with a height exceeding 653 feet AGL (1,461 feet above mean sea level) would result in a substantial adverse effect and would warrant a "Determination of Hazard to Air Navigation." (FAA 2009c)

The project would be consistent with this regulation with full implementation of conditions of certification **TRANS-2** and **TRANS-8**.

CFR, Title 49, Subtitle B	Includes procedures and regulations pertaining to interstate and intrastate transport (includes hazardous materials program procedures) and specifies safety measures for motor carriers and motor vehicles that operate on public highways.
	Enforcement is conducted by state and local law enforcement agencies and through state agency licensing and ministerial permitting (e.g., California Department of Motor Vehicles licensing, Caltrans permits), and/or local agency permitting (e.g., Riverside County Department of Public Works permits). For a discussion of the potential impacts related to the transport of hazardous materials, please refer to the Hazardous Materials Management section in this SA/DEIS.
State	
California Vehicle Code, division 2, chapter 2.5; div. 6, chap. 7; div. 13, chap. 5; div. 14.1, chap. 1 & 2; div. 14.8; div. 15	Includes regulations pertaining to licensing, size, weight, and load of vehicles operated on highways; safe operation of vehicles; and the transportation of hazardous materials.
	Enforcement is provided by state and local law enforcement agencies and through ministerial state agency licensing and permitting and/or local agency permitting. The use of oversize vehicles during construction can create a hazard to the public by limiting motorist views on roadways and by the obstruction of space by the oversize vehicle. Therefore, staff is proposing Condition of Certification TRANS-4 , which would require that all oversize vehicles used on public roadways during construction comply with Caltrans limitations on vehicle sizes and weights.
California Streets and Highway Code, division 1 & 2, chapter 3 & chapter 5.5	Includes regulations for the care and protection of state and county highways and provisions for the issuance of written permits.
	Enforcement is provided by state and local law enforcement and through ministerial state agency licensing and permitting and/or local agency permitting. There is also a potential for unexpected damage to roads by vehicles and equipment within the project area. Therefore, staff is proposing Condition of Certification TRANS-3 , which would require that any road damaged by project construction be repaired to its original condition.
Government Code §§65940 and 65944	Government Code §§65940 and 65944 require consultation among the project applicant, public agencies, and affected military branch(es) to reduce the potential for project impacts to military operations. The proposed project and all alternatives at the primary project site are in a DOD Airspace Consultation Area and underlie three low-level military training routes, designated IR250, IR255 & SR397. The Desert Center alternate site (Alternative 3) underlies four low-level military training routes, designated IR217, IR218, VR289 and VR296. Consistent with GC §§65940 and 65944, Energy Commission staff has consulted with the Military Sustainability Office - NAVAIR Ranges (Department of Defense Southwest Renewable Energy Work Group), which identified the applicable military training routes and direction for those actions necessary to avoid any impact to military operations (DOD 2010). Staff has proposed three Conditions of Certification (TRANS-8 , TRANS-9 , and TRANS-10) in response to that information, which, when implemented, would reduce potential mission impacts to a less than significant level (also see the Land Use section of this document). The project would then be consistent with the requirements of this portion of the California Government Code.
Local	
Riverside County Ordinance 461	Provides County road improvement standards and specifications.
	Condition of Certification TRANS-5 is required to ensure commercial driveways comply with Riverside County Public Works (Riverside County Ordinance 461) requirements.
Riverside County General Plan Circulation	Specifies that all County maintained roads and conventional state highways shall operate at a Level of Service (LOS) C or better
	As shown in Traffic and Transportation Table 5 , Riverside County roadways

Element	include US 95 NB between Hobson Way and San Bernardino/Riverside County Line. During construction, this segment of US 95 would operate at LOS C or better. Therefore, the RSEP would be in compliance with this LORS.
Riverside County Code, Ordinance 448 (as amended through 448.A) Airport Operations (2000)	The Airport Approaches Zoning Ordinance, adopted pursuant to the Airport Approaches Zoning Law (GC §§50485-50485.14) establishes airport operating areas and regulates height standards and limits therein. "Airport Hazard" is defined as "any structure or tree or use of land which obstructs the airspace required for the flight of aircraft in landing or taking off at an airport or is otherwise hazardous to such landing or taking off of aircraft." The operational area of an airport is all land lying within an area of two miles of the landing area. The proposed North of Desert Center Alt. site is within the Turning Zone of the Desert Center Airport. Height restrictions within the Turning Zone do not allow the construction of any structure over 150 feet tall. A variance to this ordinance requirement can be approved by the Riverside County Planning Commission, except for the Energy Commission's exclusive authority, provided enforcement would result in practical difficulty, the relief granted would not be contrary to the public interest, and it would do substantial justice and be in accordance with the spirit of the regulations and §7(c) of this ordinance. However, lights and markers necessary to indicate the presence of an airport hazard to aerial navigators must be installed, operated, and maintained. Condition of certification TRANS-8 would require appropriate lighting of the solar tower, consistent with both DOD and FAA requirements. Condition of certification TRANS-9 would require notices to aeronautical charts for the area to advise pilots of the airport hazard. This would ensure consistency with this ordinance.
Riverside County Ordinance No. 748	<p>This ordinance adopts and sets forth policies, regulations and fees relating to the funding and installation of Traffic Signals that are a part of the mitigation of the cumulative environmental impacts of traffic congestion generated by new developments and land use changes</p> <p>Prior to issuance of a building permit, the project proponent will coordinate with Riverside County based on final site design the required fees related to Riverside County Ordinance No. 748. The payment of these fees, as assessed and paid during part of the required building permit process, will ensure compliance with this LORS.</p>
Riverside County Congestion Management Plan (CMP)	<p>Specifies that all CMP roadways shall operate at a LOS E or better.</p> <p>The Riverside County 2006 CMP Update identifies US 95 as a CMP roadway. As shown in Traffic and Transportation Table 5, RSEP construction would have no impact on study area roadway LOS, with US 95 operating above LOS E with project construction added. It should also be noted that operational traffic would not reduce any CMP roadway to operate at less than LOS E. Therefore, the proposed RSEP would be in compliance with this LORS.</p>
Riverside County Airport Land Use Compatibility Plan (ALUCP); 2004	The Riverside County ALUCP, adopt by the Riverside County Board of Supervisors in October 2004, contains general compatibility criteria applicable to all airports within Riverside County, as well as specific requirements for individual airports. The Desert Center Airport, known during WWII as the Desert Center Army Airfield, is located directly across SR 177 from the proposed Alternative 3 project site. The airport is privately owned by the developers of the Chuckwalla Valley Raceway and only available for use by members and guests. Activity levels should remain consistent with flight operations prior to 2004 (i.e., no more than 2,300 operations annually). There is no tower or published instrument approach/departure routes. The airspace above the Desert Center Airport is uncontrolled and air traffic control has no authority or responsibility for flights below 1,200 feet AGL within this airspace. There is no master plan for the Desert Center Airport. Standard direct departures from the single remaining runway are to the southwest (heading of 230 degrees) or northeast (heading of 050), into prevailing winds. Straight in(out) departures would remain outside the proposed project site boundaries. The airport is not lighted and is only available during daylight hours. The entire project site, including the central tower, would be

	<p>outside all airport compatibility zones and the airport area of influence boundary (see Land Use Figure 11), but would be within the two-mile Airport Turning Zone. TRANS-8 would require the solar tower to be lighted, consistent with the FAA requirements for Obstruction Marking and Lighting (FAA 2007), requirements in response to FAA 7460 Finding of No Significant Hazard (FAA 2009c), Air Force Aviation Safety-Flight Safety Flash 09-01 (USAF 2009), and FAA Safety Alert for Operators (SAFO) 09007 (FAA 2009a). TRANS-9 would require pilots to be advised of the location of the proposed solar tower through issuance of a temporary Notice to Airmen (NOTAM) that would be superseded by a permanent notation of the tower's location on the applicable aviation charts for the Desert Center Airport and surrounding airspace. (RC 2004, p.3-16) Therefore, this project alternative would be consistent with requirements of the Riverside County ALUCP and the existing airport use.</p>
San Bernardino Association of Governments CMP	<p>Specifies that all CMP roadways shall operate at a LOS E or better.</p> <p>The SANBAG 2007 CMP identifies US 95 and SR 62 as CMP roadways. As shown in Traffic and Transportation Table 5, RSEP construction would have no impact on study area roadway LOS, with US 95 and SR 62 operating above LOS E with project construction added. It should also be noted that operational traffic would not reduce any CMP roadway to operate at less than LOS E. Therefore, the proposed RSEP would be in compliance with this LORS.</p>
San Bernardino County Code, Title 5, Division 1, Highway Permit	<p>Addresses permitting requirements for oversize/overweight vehicles.</p> <p>Enforcement is provided by state and local law enforcement agencies and through ministerial state agency licensing and permitting and/or local agency permitting. The use of oversize vehicles during construction can create a hazard to the public by limiting motorist views on roadways and by the obstruction of space by the oversize vehicle. Therefore, staff is proposing Condition of Certification TRANS-4, which would require that all oversize vehicles used on public roadways during construction comply with San Bernardino County limitations on vehicle sizes and weights.</p>

NOTEWORTHY PUBLIC BENEFITS

Neither the applicant nor staff has identified any traffic-related benefits associated with the proposed RSEP.

PROPOSED CONDITIONS OF CERTIFICATION/MITIGATION MEASURES

The following Conditions of Certification meet the Energy Commission's responsibility to comply with the California Environmental Quality Act and serve as recommendations for the Energy Commission to consider in its decision to avoid or reduce the severity of impacts to less than significant. The identification of relevant and reasonable mitigation measures also conforms to National Environmental Policy Act (NEPA) requirements for U.S. Bureau of Reclamation's (BLM's) and Western Area Power Administration's (Western's) analysis that can be considered in their Records of Decision.

Construction Traffic Control Plan

TRANS-1—The project owner shall consult with Riverside County, San Bernardino County, and/or Caltrans and shall prepare and submit to the Compliance Project Manager (CPM) for approval a Construction Traffic Control Plan and implementation program. The Traffic Control Plan shall be prepared in accordance with Caltrans Manual

on Uniform Traffic Control Devices and the WATCH Manual and shall include but is not limited to the following issues (as needed and as feasible):

Project Specific Measures:

- Encourage use of carpools, vanpooling or other ride share programs
- Scheduling heavy equipment and building materials deliveries
- Redirecting construction traffic with a flag person as needed
- Signing, lighting, and traffic control device placement if required
- Scheduling of construction work hours and arrival/departure times outside peak traffic periods as needed
- Ensurance of access for emergency vehicles to and within the project site
- Ensurance of access and movement of bicycles along US-95 construction truck routes
- Identification of haul routes requiring rail crossings of oversize vehicles and safety measures to limit potential impacts
- Temporary closure of travel lanes or disruptions to street segments and intersections during generation tie line construction activities or any other utility tie-ins. In the event any lane closures are required on the State Highway System, the Construction Traffic Control plan shall demonstrate compliance with Caltrans Section 517 of the Encroachment Permits Manual
- Access to residential and/or commercial property located near generation tie line routes or any other utility tie ins
- Identification of safety procedures for exiting and entering the site access gate(s)

Cumulative Measures:

- Take into account the cumulative traffic impacts of the overlapping construction schedules of other nearby renewable energy projects utilizing SR 62, US 95, or any roadway indicated by the Construction Traffic Control Plan as a haul route, ensuring that timing of heavy equipment and building materials deliveries as well as worker trips of overlapping construction schedules do not result in SR 62, US 95, or any freeway/roadway to operate at an unacceptable LOS with the addition of cumulative construction traffic. These roadway LOS performance standards shall be established by the applicable General Plan, Congestion Management Plan, or overseeing agency of the utilized roadway
- If required, provide for a coordinated park-and-ride system of bus service for workers at nearby solar energy project sites

Verification: At least 30 days prior to site mobilization, the project owner or contractor shall provide to the CPM a copy of the Construction Traffic Control Plan and implementation program documents for review and approval.

FAA Notice of Actual Construction or Alteration

TRANS-2— The project owner shall file FAA Form 7460-2 Notice of Actual Construction or Alteration with the FAA Air Traffic Airspace Branch (ASW-520) at least 10 days prior to the start of construction and within five days after the construction reaches its greatest height, or immediately following abandonment of the project. A copy of the filing and any related correspondence shall be forwarded to the CMP.

Verification: Within 10 days of the start of construction and, again, within five days after the construction reaches its greatest height, the project owner shall fill FAA Form 7460-2 with the appropriate FAA Air Traffic Airspace Branch and concurrently submit a copy of said completed form to the CPM. Copies of any additional correspondence related to this requirement shall be submitted to the CPM within 10 days of receipt.

Repair of Damage to Public Roadways

TRANS-3—Following completion of project construction, the project owner shall repair any damage to public roadways affected by construction activity along with the primary roadways identified in the traffic control plan for construction traffic to the road's pre-project construction condition. Prior to the start of construction, the project owner shall photograph, videotape, or digitally record images of the roadways that will be affected by all heavy construction traffic and utility line construction. The project owner shall provide the CPM, Riverside County, San Bernardino County, and/or Caltrans with a copy of the images for the roadway segments under its jurisdiction. Also prior to start of construction, the project owner shall notify the Counties and/or Caltrans about the schedule for project construction, providing copies of such to the CPM. The purpose of this notification is to postpone any planned roadway resurfacing and/or improvement projects until after the project construction has taken place and to coordinate construction-related activities associated with other projects.

Verification: At least 30 days prior to site mobilization, the project owner or contractor shall provide to the CPM a copy of all photograph, videotape, or digitally record images of the roadways. Within 30 days after completion of the project, the project owner shall meet with the CPM and affected jurisdictions to determine and receive approval for the actions necessary and schedule to complete the repair of identified sections of public roadways to original or as near-original condition as possible. Following completion of any regional road improvements, the project owner shall provide to the CPM a copy of all required permits and a letter from affected jurisdictions if work occurred within its jurisdictional public right-of-way stating its satisfaction with the road repairs.

Road Use Limitations and Permits

TRANS-4 The project owner shall comply with Caltrans, Riverside County, San Bernardino County, and other relevant jurisdictions limitations on vehicle sizes, weights, and travel routes. In addition, the project owner shall obtain all necessary transportation and encroachment permits from Caltrans, Riverside County, San Bernardino County, and other relevant jurisdictions for roadway use.

Verification: In the Monthly Compliance Reports, the project owner shall submit copies of any permits received during that reporting period. In addition, the project

owner shall retain copies of these permits and supporting documentation in its compliance file for at least six months after the start of commercial operation.

Road Improvement Standards and Specifications

TRANS-5— The project owner shall comply with Riverside County Public Works requirements (Riverside County Ordinance 461) regarding road improvement standards and specifications, as they apply to the commercial driveway at the primary entrance to the facility. Internal access roads and secondary fire access road shall be constructed and maintained consistent with the requirements stipulated in the **Worker Safety and Fire Protection** section of this document.

Verification: In the Monthly Compliance Reports, the project owner shall submit copies of any permits and approvals received from Riverside County Public Works during that reporting period regarding compliance with Riverside County Ordinance 461 requirements for commercial driveway construction. In addition, the project owner shall retain copies of these permits and supporting documentation in its compliance file for the life of the project.

Heliostat Positioning Plan

TRANS-6—The project owner shall prepare and implement a Heliostat Positioning Plan in coordination with the Avian Protection Plan specified in Condition of Certification **BIO-25** that would avoid potential for human health and safety hazards and minimize bird injury or mortality from solar radiation exposure.

Prior to RSEP commercial operation, the project owner shall submit a Heliostat Positioning Plan (HPP) to the CPM for review and approval. The project owner shall also submit the plan to CalTrans, CHP, FAA, and the Department of Defense (DOD) Southwest Renewable Energy Work Group for review and comment and forward any comments received to the CPM. The Heliostat Positioning Plan shall accomplish the following:

1. Identify the heliostat movements and positions (including reasonably possible malfunctions) that could result in potential exposure of observers at various locations including in aircraft, motorists, pedestrians and hikers in nearby wilderness areas to reflected solar radiation from heliostats;
2. Describe within the HPP how programmed heliostat operation would avoid potential for human health and safety hazards at locations of observers, and would limit or avoid potential for harm to birds;
3. Prepare a monitoring plan that would: a) obtain field measurements in response to legitimate complaints; b) verify that the Heliostat Positioning Plan would avoid potential for human health and safety hazards including temporary or permanent blindness at locations of observers; and c) provide requirements and procedures to document, investigate and resolve legitimate complaints regarding intrusive light.
4. The monitoring plan should be coordinated with the CalTrans, CHP, FAA, Department of Defense (DOD) Southwest Renewable Energy Work Group – and be updated on an annual basis for the first 5 years, and at 2-year intervals thereafter for the life of the project.

Verification: No more than 90 days before commercial operation of the RSEP, the project owner shall submit the Heliostat Positioning Plan to the CPM for review and approval. The project owner shall also submit the plan to CalTrans, CHP, FAA, and the Department of Defense (DOD) Southwest Renewable Energy Work Group for review and comment and forward any comments received to the CPM.

Power Tower Luminance Monitoring Plan

TRANS-7 The project owner shall prepare and implement a Power Tower Luminance Monitoring Plan to provide procedures to conduct periodic monitoring and to document, investigate and resolve complaints regarding distraction effects to aviation, vehicular and pedestrian traffic associated with the RSEP solar receiver tower.

The Power Tower Luminance Monitoring Plan shall include provisions for the following:

1. Coordination of luminance evaluations with the CalTrans, CHP, FAA, and the Department of Defense (DOD) Southwest Renewable Energy Work Group ;
2. Reporting within 30 days after completing luminance measurements required under this plan; the project owner shall submit a summary report to CalTrans, CHP, FAA, and the Department of Defense (DOD) Southwest Renewable Energy Work Group for review and comment, and to the CPM for review and approval.
3. Measurement of luminance at the locations where any distraction effects have been reported and at the locations nearest the solar receiver tower from the four sides of the power plant boundary, and the nearest public road, which may be substituted for one of the sides of the solar receiver tower during the time of day when values would be highest;
4. Measurement of luminance using an illuminance meter, photometer, or similar device and reporting of data in photometric units; the measurements are intended to provide a relative and quantifiable measure of luminance that can be associated with any observed and reported distraction effect from the solar receiver tower that may support anticipation and investigation of any future effects.
5. Provisions for identifying and implementing appropriate mitigation measures if reported distraction is determined to be legitimate and if solar receiver tower is determined to be causing a safety concern; The project owner shall consider and propose any reasonable mitigation measures that are technically and financially feasible. The mitigation measures may include surface treatment or material changes to increase absorption and reduce reflectivity of the solar receiver tower, road signage, screening or other reasonable measures.
6. Post-mitigation verification; Within 30 days following the implementation of mitigation measures designed to reduce reflectivity of the solar receiver tower, the project owner shall repeat the luminance measurements to demonstrate the effectiveness of mitigation measures and prepare a supplemental survey report for review and comment by CalTrans, CHP, FAA, and the Department of Defense (DOD) Southwest Renewable Energy Work Group , and for review and approval by the CPM.

Verification: No later than 60 days prior to RSEP commercial operation, the project owner shall provide a Power Tower Luminance Monitoring Plan applicable to RSEP for review and approval by the CPM. The project owner shall evaluate the effects of the intensity of the luminance of light reflected from the solar receiver tower according to the following:

- A. Within 90 days following commercial operation;
- B. After the initial 5 years of operation;
- C. If a major design change is implemented that results in an increase of the reflective luminance of the RSEP solar receiver tower; and
- D. After receiving a legitimate complaint regarding a distraction associated with the solar receiver tower.

The plan shall specify procedures to document, investigate and resolve complaints regarding intrusive light, and report these to the CPM within 10 days of receiving a complaint.

Solar Receiver Tower Obstruction Marking and Lighting

TRANS-8 The project owner shall install obstruction marking and lighting on the solar receiving tower, consistent with both the FAA and DOD requirements, as expressed in the following documents:

- FAA Advisory Circular 70/7460-1K, Change 2: Obstruction Marking and Lighting, 24-hour medium-strobes;
- Air Force Aviation Safety: Flight Safety Flash 09-01; and
- FAA Safety Alert for Operators (SAFO) 09007.

Temporary lighting shall be installed on the top of the structure once the construction height has exceeded 200 feet AGL, activated within five days of installation, and maintained in operation 24 hours a day, 7 days a week until construction is complete. Permanent lighting consistent with all requirements shall be installed and activated within five days of completion of construction. Lighting shall be operational 24 hours a day, 7 days a week, for the life of the project and until such time as the tower no longer exists at a height exceeding 200 feet AGL. Upgrades to the required lighting configurations, types, location, or duration shall be implemented consistent with any changes to FAA or DOD obstruction marking and lighting requirements.

Verification: At least 60 days prior to the start of construction, the project owner shall submit final design plans for the power plant solar receiving tower that depict the required air traffic obstruction marking and lighting to the CPM for approval.

Within five days of completion of the solar receiving tower to a height exceeding 200 feet AGL, the project owner shall install and activate temporary obstruction marking and lighting at the top of the structure and shall maintain temporary lighting at the top of said structure until construction of the tower is complete. The project owner shall inform the CPM in writing within 10 days of the time the lighting is first installed and activated.

Within five days of completion of the tower construction, the project owner shall install and activate permanent obstruction marking and lighting consistent with both FAA and DOD requirements and shall inform the CPM in writing within 10 days of installation and activation. The lighting shall be inspected and approved by the CPM (or designate inspector) within 30 days of activation.

Notifications of Potential Hazards to Aviation

TRANS-9 The project owner shall initiate the following actions to ensure pilots are aware of the project location, maximum height, and potential hazards to aviation:

- Submit a letter to the FAA requesting a Notice to Airmen (NOTAM), Category D, be issued, advising pilots of the location of the RSEP and height of the solar receiving tower, and recommending that overflight of the project site below 1,500 feet AGL should be avoided. The letter should also request that the NOTAM be maintained in active status until all navigational charts and Airport Facilities Directories (AFDs) have been updated.
- Submit a letter to Mr. Anthony M. Parisi, PE –Department of Defense (DOD) Southwest Renewable Energy Work Group, requesting a military advisory be issued, advising military units and training offices using the low-level military training routes (MTRs) in the vicinity of the project site of the location of the RSEP and height of the solar receiving tower, and recommending that training exercises requiring overflight of the project site (both solar receiving tower and solar arrays) below 1,100 feet AGL during daylight hours should be avoided. The letter should also request that the advisory be maintained in active status until all navigational charts and training patterns have been updated.
- Submit a letter to the FAA requesting a power plant depiction symbol be placed at the RSEP site location on the Los Angeles Sectional Chart, with a notice to “avoid overflight below 1,500 feet AGL”.
- Request the Los Angeles Enroute Traffic Control Center or Riverside Flight Service Station submit aerodrome remarks describing the location of the RSEP plant and advising against direct overflight of the solar receiving tower or solar heliostat arrays below 1,500 feet AGL to the:
 - FAA National Aeronautical Charting Office (Airport/Facility Directory, Southwest United States)
 - Jeppesen Sanderson Inc. (JeppGuide Airport Directory, Western Region)
 - Airguide Publications (Flight Guide, Western States)

Verification:

1. Within 30 days after the start of construction, the project owner shall submit draft language for the FAA and military letters of request to the CPM for review and approval. The project owner shall submit the letters of request to the appropriate agencies within 10 days of receiving CPM approval.

If no response is received within 45 days (at least 60 days prior to the start of operations), the project owner shall follow up with a letter to the respective agencies to confirm implementation of the request. A copy of any resulting correspondence

shall be submitted to the CPM with 10 days of receipt. The project owner shall contact the CPM with 72 hours if notified that any or all of the requested notices cannot be implemented. The project owner shall also advise the CPM at least 15 days prior to the start of operations if any of the notified agencies have failed to respond to these requests.

2. Within 10 days of installing and activating temporary obstruction marking and lighting at the top of the solar receiving tower, but no later than 60 days prior to the start of operations, the project owner shall submit the required letters of request to the FAA and DOD Southwest Renewable Energy Work Group, with copies to the CPM. A copy of any resulting correspondence shall be submitted to the CPM with 10 days of receipt.

Avoidance of Radio Interference

TRANS-10— The project owner shall modify the project's equipment and radio frequency use as necessary to avoid interference with Department of Defense (DOD) military activities, in consultation with the DOD Southwest Renewable Energy Work Group. DOD recommendations, including substitution or modification of equipment or operations, shall be fully implemented prior to or in conjunction with the installation and operation of electronic systems that could result in frequency interference. Prior to the start of operations, the project owner shall provide, to the CPM, written confirmation from DOD that the frequency spectrum usage for the project, as modified, would not interfere with DOD activities.

Verification: At least 90 days prior to the scheduled installation of any equipment capable of producing frequencies that could interfere with DOD operations, the project operator shall consult directly with the DOD Southwest Renewable Energy Work Group and provide details of said equipment to the DOD staff and CPM for evaluation. The project owner shall provide complete information concerning any intended changes to previously approved equipment, project design, or operational procedures; and all correspondence between the project owner, facilities personnel, and DOD representatives to the CPM for review and approval at least 30 days prior to any scheduled equipment installation date or start of operations, whichever occurs first. DOD recommendations, including substitution or modification of equipment or operations, shall be fully implemented prior to or in conjunction with the installation of electronic systems that could result in frequency interference. Copies of any additional correspondence shall be provided to the CPM within 10 days of receipt. The project owner shall provide written verification from DOD to the CPM that the frequency spectrum usage, as modified, would not interfere with DOD activities and that all equipment, installation, and operational procedures comply with DOD requirements at least 10 days prior to the start of operations.

CONCLUSIONS

Based on the list of significance thresholds identified above, staff has analyzed potential construction and operational impacts by the proposed RSEP related to the regional and local traffic and transportation system and conclude the following:

- Construction- and operational-related traffic would not impact transportation facilities and existing traffic LOS within the project area and would not result in a substantial increase in congestion, deterioration of the existing LOS, or operating capacities along the roadways used to access the RSEP site.
- The project would not result in a change to civilian air traffic patterns in the project vicinity. Impacts resulting from changes in air traffic patterns for military aircraft operating within the MTRs over the project area would be mitigated to a less than significant level (under CEQA) with full implementation of conditions of certification **TRANS-8** and **TRANS-9**, in conjunction with the military's willingness to alter training activities in the area.
- Condition of certification **TRANS-8** would require lighting of the solar receiving tower consistent with both FAA and DOD requirements, reducing potential obstruction to military or general aviation airspace, especially at night, to a less than significant level.
- Intrusive light from the solar arrays at specific points over the heliostats has the potential to result in a significant health and safety visual and control risk for aircraft pilots and their passengers. Condition of certification **TRANS-9** would advise pilots of the hazard and the need to avoid overflight of the solar receiving tower and solar arrays below 1,500 feet AGL. Implementation of this condition of certification would reduce the risk to a less than significant level.
- Frequencies used during plant construction and operation have the potential to interfere with military training operations in the project vicinity. Implementation of Condition of certification **TRANS-10** would require military coordination and approval of frequencies in use at the project site and would reduce any potential impact to a less than significant level.
- The project itself would not have a cumulatively considerable impact on either general or military aviation in the project area. However, depending on the number of other similar facilities constructed in the area in the future, there is the potential for a significant cumulative impact to aviation, especially military training, in the vicinity.
- Implementation of Condition of Certification **TRANS-3** would ensure that any road damaged by project construction be repaired to its original condition.
- Implementation of Condition of Certification **TRANS-4** would ensure that all oversize vehicles used on public roadways during construction comply with Caltrans, Riverside County, San Bernardino County, and other relevant jurisdictions limitations on vehicle sizes and weights, as well as oversize vehicle routes and any other applicable limitations or other relevant jurisdictional policies. Implementation of Condition of Certification **TRANS-6** would insure preparation and application of a Heliostat Positioning Plan in coordination with the Avian Protection Plan specified in Condition of Certification **BIO-24** that would avoid potential for human health and safety hazards and bird injury or mortality from solar radiation exposure.

- Implementation of Condition of Certification **TRANS-7** would allow for preparation and application of a Power Tower Luminance Monitoring Plan to provide procedures to conduct periodic monitoring and to document, investigate and resolve complaints regarding distraction effects to aviation, vehicular and pedestrian traffic associated with the RSEP solar receiver tower.
- No local bus stops, pedestrian, or bicycle facilities are in immediate proximity of the proposed RSEP site, and therefore will not be impacted. Furthermore, Condition of Certification **TRANS-1** would be required to ensure the access and movement of bicycles along construction truck routes.

TRANSMISSION LINE SAFETY AND NUISANCE

Testimony of Obed Odoemelam, Ph.D.

SUMMARY OF CONCLUSIONS

Bureau of Land Management (BLM), Western Area Power Administration (Western), and Energy Commission staff (staff) (hereafter jointly referred to as agencies) have analyzed transmission line safety and nuisance-related information pertaining to the proposed Rice Solar Energy Project (RSEP) for the following potential effects:

- aviation safety;
- interference with radio-frequency communication;
- audible noise;
- fire hazards;
- hazardous shocks;
- nuisance shocks; and
- electric and magnetic field (EMF) exposure.

With respect to the California Environmental Quality Act (CEQA), staff concludes that the proposed project, after implementing all staff-recommended conditions of certification, would not cause related field and nonfield impacts that would constitute a significant environmental hazard in the areas around the proposed generation tie line and distribution line routes. RSEP would conform to all related health and safety laws, ordinances, regulations, and standards (LORS).

As a condition of RSEP's proposed generation tie line interconnection to Western's power grid, the generation tie line would be constructed, operated, and maintained according to Western's guidelines for line safety and field management which conform to applicable laws, ordinances, regulations and standards (LORS). Likewise, the extension of the distribution line would be constructed, operated, and maintained according to Southern California Edison's guidelines for line safety and field management which conform to applicable LORS. The routes for both proposed lines would respectively traverse undisturbed, sparsely populated desert land with no residences in the immediate vicinity thereby eliminating the potential for residential electric and magnetic field exposures that have been a health concern of recent past. With staff's four proposed conditions of certification, any safety and nuisance impacts from construction and operation of the proposed lines would be less than significant with respect to CEQA.

INTRODUCTION

The agencies have evaluated transmission line safety and nuisance impacts associated with the proposed RSEP's construction, operating and decommissioning activities. This Staff Assessment/Draft Environmental Impact Statement (SA-DEIS) meets the Energy Commission's responsibility to comply with the California Environmental Quality Act

(CEQA) and BLM's and Western's responsibility to comply with the National Environmental Policy Act (NEPA). The purpose of this Staff Assessment/Draft Environmental Impact Statement (SA/DEIS or staff analysis) is to assess the proposed Rice Solar Energy Project's (RSEP's) generation tie line design and operational plan to determine whether its related field and nonfield impacts would constitute a significant environmental hazard in the areas around the proposed routes. All related health and safety laws, ordinances, regulations, and standards (LORS) are currently aimed at minimizing such hazards. Staff's analysis focuses on the following issues taking into account both the physical presence of the line and the physical interactions of its electric and magnetic fields:

- aviation safety;
- interference with radio-frequency communication;
- audible noise;
- fire hazards;
- hazardous shocks;
- nuisance shocks; and
- electric and magnetic field (EMF) exposure.

The following federal, state, and local laws and policies apply to the control of the field and nonfield impacts of electric power lines. Staff's analysis examines the project's compliance with these requirements.

METHODOLOGY AND THRESHOLDS FOR DETERMINING ENVIRONMENTAL CONSEQUENCES

The potential magnitude of the line impacts of concern in this staff analysis depends on compliance with the listed design-related LORS and industry practices. These LORS and practices have been established to maintain impacts below levels of potential significance. Thus, if the agencies determine that the project would comply with applicable LORS, we would conclude that any transmission line-related safety and nuisance impacts would be less than significant under CEQA and NEPA. The nature of these individual impacts is discussed below together with the potential for compliance with the LORS that apply.

Laws, Ordinances, Regulations, and Standards

**Transmission Line Safety and Nuisance (TLSN) Table 1
Laws, Ordinances, Regulations, and Standards (LORS)**

Applicable LORS	Description
Aviation Safety	
Federal	
Title 14, Part 77 of the Code of Federal Regulations (CFR), "Objects Affecting the Navigable Air Space"	Describes the criteria used to determine the need for a Federal Aviation Administration (FAA) "Notice of Proposed Construction or Alteration" in cases of potential obstruction hazards.
FAA Advisory Circular No. 70/7460-1G, "Proposed Construction and/or Alteration of Objects that May Affect the Navigation Space"	Addresses the need to file the "Notice of Proposed Construction or Alteration" (Form 7640) with the FAA in cases of potential for an obstruction hazard.
FAA Advisory Circular 70/460-1G, "Obstruction Marking and Lighting"	Describes the FAA standards for marking and lighting objects that may pose a navigation hazard as established using the criteria in Title 14, Part 77 of the CFR.
Interference with Radio Frequency Communication	
Federal	
Title 47, CFR, section 15.2524, Federal Communications Commission (FCC)	Prohibits operation of devices that can interfere with radio-frequency communication.
State	
California Public Utilities Commission (CPUC) General Order 52 (GO-52)	Governs the construction and operation of power and communications lines to prevent or mitigate interference.
Audible Noise	
Local	
Riverside County General Plan, Noise Element	References the county's Ordinance Code for noise limits.
Riverside County Noise Ordinance	Establishes performance standards for planned residential or other noise-sensitive land uses.
Hazardous and Nuisance Shocks	
State	
CPUC GO-95, "Rules for Overhead Electric Line Construction"	Governs clearance requirements to prevent hazardous shocks, grounding techniques to minimize nuisance shocks, and maintenance and inspection requirements.
Title 8, California Code of Regulations (CCR) section 2700 et seq. "High Voltage Safety Orders"	Specifies requirements and minimum standards for safely installing, operating, working around, and maintaining electrical installations and equipment.
National Electrical Safety Code	Specifies grounding procedures to limit nuisance shocks. Also specifies minimum conductor ground clearances.
Industry Standards	

Applicable LORS	Description
Institute of Electrical and Electronics Engineers (IEEE) 1119, "IEEE Guide for Fence Safety Clearances in Electric-Supply Stations"	Specifies the guidelines for grounding-related practices within the right-of-way and substations.
Electric and Magnetic Fields	
State	
GO-131-D, CPUC "Rules for Planning and Construction of Electric Generation Line and Substation Facilities in California"	Specifies application and noticing requirements for new line construction including EMF reduction.
CPUC Decision 93-11-013	Specifies CPUC requirements for reducing power frequency electric and magnetic fields.
Industry Standards	
American National Standards Institute (ANSI/IEEE) 644-1944 Standard Procedures for Measurement of Power Frequency Electric and Magnetic Fields from AC Power Lines	Specifies standard procedures for measuring electric and magnetic fields from an operating electric line.
Fire Hazards	
State	
14 CCR sections 1250-1258, "Fire Prevention Standards for Electric Utilities"	Provides specific exemptions from electric pole and tower firebreak and conductor clearance standards and specifies when and where standards apply.

PROPOSED PROJECT

SETTING AND EXISTING CONDITIONS

As discussed by the applicant, Rice Solar Energy, LLC, the proposed 150 megawatt (MW) Rice Solar Energy Project (RESP) would be located on a 3,324-acre privately owned site in the eastern area of unincorporated Riverside County immediately south of State Route (SR) 62. The nearest town with a significant population is Parker Arizona, approximately 32 miles to the east. Blythe is approximately 40 miles to the south. The land surrounding the site (a portion of which would be traversed by the project's generation tie line) is mostly federal desert land currently managed by the Bureau of Land Management (BLM). The proposed facility would consist of a solar field and related electric power generating unit from which the generated power would be transmitted via the tie line to the Western power grid. The interconnection would be via a new substation located 10 miles to the southwest and adjacent to the Western Parker-Blythe #2 161/230-kV transmission line built to a capacity of 230 kV but presently operated at 161 kV. The proposed tie line would be an overhead 10-mile long, single-circuit, 161/230-kV line extending from the project's on-site switchyard to the proposed connection point. As with the Western grid line to be interconnected, this tie line would be operated at 161 kV, although built to a capacity of 230 kV (SR 2009a, pp.1-8, 3-1, 3-2, 5.6-1, and 5.7-4), hence, the 161/230-kV designation.

The applicant also proposes a project-related extension of an existing Southern California Edison (SCE) overhead 12-kV distribution line for 1.1 miles from a point 175 feet east of RSEP's property boundary (on the northern side, parallel to SR 62), to the project's administration building area. The design, construction and operation of the 161/230 kV generation tie line would be according to Western's guidelines, and likewise the 12 kV distribution line would be according to SCE's guidelines, and both would reflect compliance with existing safety and field management-related LORS (SR 2009a, pp. 3-1 and 3-2).

The proposed project and related generation tie line would be located in an uninhabited open desert area where the nearest residential area is approximately 17 miles to the northeast at Vidal Junction (SR 2009a 5.7-4), meaning that there would not be the type of residential field exposure that has been of health concern in recent years.

PROJECT DESCRIPTION

The proposed project-related tie-in line and distribution line extension would respectively consist of the following individual segments:

- A new, single-circuit 161/230-kV overhead transmission line extending 10 miles southeast from the on-site project switchyard to the proposed Rice interconnection substation adjacent to Western's Parker-Blythe #2 transmission line ;
- The project's on-site 161/230-kV switchyard from which the conductors would extend to the Western Connection substation; and
- The 1.1-mile extension of the existing SCE 12-kV distribution line.

The proposed 10-mile project generation tie line would be located within its own unshared right-of-way as it extends from the on-site switchyard from take-off structures of approximately 30 to 40 feet in height to the connection point within the new interconnection substation 10 miles to the southeast. These support structures would be up to 115 feet tall in the areas outside the solar field and would be placed approximately 600 feet apart. The conductors would be aluminum steel-reinforced cables supported on steel monopole towers as typical of similar Western lines. The applicant provided the details of the proposed monopole support structures as related to line safety, maintainability, and field reduction efficiency. As previously noted, the line would be designed to be operated at 161 kV or 230 kV as determined by Western (SR 2009a, pp. 3-1 and, 3-2, and Figure 3.1-4). The 1.1 mile extension of the existing 12-kV distribution line would also be designed and erected according to SCE design guidelines for lines in this voltage class.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

DIRECT IMPACTS AND MITIGATION

Proposed Project

Aviation Safety

Any potential hazard to area aircraft would relate to the potential for collision in the navigable airspace. The requirements listed on **TLSN Table 1** establish the standards for assessing the potential for obstruction hazards within the navigable space and establish the criteria for determining when to notify the FAA about such hazards. As noted by the applicant (SR 2009a, pp. 3-15 and 3-16), these regulations require FAA notification in cases of structures over 200 feet from the ground. Notification is also required if the structure is to be below 200 feet in height but would be located within the restricted airspace in the approaches to public or military airports. For airports with runways longer than 3,200 feet, the restricted space is defined by the FAA as an area extending 20,000 feet from the runway. For airports with runways of 3,200 feet or less, the restricted airspace would be an area that extends 10,000 feet from this runway. For heliports, the restricted space is an area that extends 5,000 feet.

As noted by applicant, the nearest public airports to the proposed project and related lines are the Avi Sequilla Airport near Arizona, and approximately 32 miles to the east. There is also the Blythe Airport approximately 30 miles to the south. The nearest heliport is the LaPaz Regional Hospital heliport in Parker Arizona and 32 miles to the east (SR 2009a, p. 3-16). These noted distances show the proposed project and related facilities as too far from these airports and the heliport to pose a collision hazard to utilizing aircraft according to FAA criteria. Furthermore, the maximum height of 115 feet for the proposed line support structures (SR 2009a p. 3-2 and Figure 3.1-4) would be much less than the 200-foot height that triggers the concern over aviation hazard according to FAA requirements.

The only project-related structure above the 200-foot FAA aviation hazard threshold would be the 653-foot-high solar receiver tower (SR 2009a, p. 2-4). The applicant would install the aircraft warning lights required by FAA regulations (SR 2009a, p 2-6) and had submitted the required Form 7460 to the FAA for its aviation hazard assessment (SR 2009a, Appendix 3B). The FAA concluded that RSEP would not cause a hazard to aviation safety (CH2MHill 2010a, Attachment DR147-1). (Please see the **Traffic and Transportation** section for more information.) Staff does not recommend any related condition for certification since the FAA is responsible for the related aviation hazard assessment and issuance of any construction and operational permit.

Interference with Radio-Frequency Communication

Transmission line-related radio-frequency interference is one of the indirect effects of line operation and is produced by the physical interactions of line electric fields. Such interference is due to the radio noise produced by the action of the electric fields on the surface of the energized conductor. The process involved is known as *corona discharge*, but is referred to as *spark gap electric discharge* when it occurs within gaps

between the conductor and insulators or metal fittings. When generated, such noise manifests itself as perceivable interference with radio or television signal reception or interference with other forms of radio communication. Since the level of interference depends on factors such as line voltage, distance from the line to the receiving device, orientation of the antenna, signal level, line configuration and weather conditions, maximum interference levels are not specified as design criteria for modern transmission lines. The level of any such interference usually depends on the magnitude of the electric fields involved and the distance from the line. The potential for such impacts is therefore minimized by reducing the line electric fields and locating the line away from inhabited areas.

The proposed project lines would be built and maintained in keeping with standard Western and SCE practices that minimize surface irregularities and discontinuities. Moreover, the potential for such corona-related interference is usually of concern for lines of 345 kV and above, and not for 161/230-kV and 12-kV lines such as the proposed lines. The lines' proposed low-corona designs are used for all Western and SCE lines of similar voltage ratings to reduce surface-field strengths and the related potential for corona effects. Since the generation tie line would traverse uninhabited open space, and the distribution line extension would have limited exposure associated with RSEP to primarily motorists for only 1.1 miles along SR 62, staff does not expect any corona-related radio-frequency interference or related complaints and does not recommend any related condition of certification.

Audible Noise

The noise-reducing designs related to electric field intensity are not specifically mandated by federal or state regulations in terms of specific noise limits. As with radio noise, such noise is limited instead through design, construction, or maintenance practices established from industry research and experience as effective without significant impacts on line safety, efficiency, maintainability, and reliability. Audible noise usually results from the action of the electric field at the surface of the line conductor and could be perceived as a characteristic crackling, frying, or hissing sound or hum, especially in wet weather. Since the noise level depends on the strength of the line electric field, the potential for perception can be assessed from estimates of the field strengths expected during operation. Such noise is usually generated during rainfall, but mainly from overhead lines of 345 kV or higher. It is, therefore, not generally expected at significant levels from lines of less than 345 kV as proposed for RSEP. Research by the Electric Power Research Institute (EPRI 1982) has validated this by showing the fair-weather audible noise from modern transmission lines to be generally indistinguishable from background noise at the edge of a right-of-way of 100 feet or more. Since the low-corona designs are also aimed at minimizing field strengths, staff does not expect the proposed line operation to add significantly to current background noise levels in the project area. For an assessment of the noise from the proposed line and related facilities, please refer to staff's analysis in the **Noise and Vibration** section.

Fire Hazards

The fire hazards addressed through the related LORS in **TLSN Table 1** are those that could be caused by sparks from conductors of overhead lines, or that could result from direct contact between the line and nearby trees and other combustible objects.

Standard fire prevention and suppression measures for similar Western lines would be implemented for the proposed project lines (SR 2009a, p. 3-16). The applicant's intention to ensure compliance with the clearance-related aspects of GO-95 would be an important part of this mitigation approach. Staff recommends Condition of Certification **TLSN-3** to ensure compliance with important aspects of the fire prevention measures.

Hazardous Shocks

Hazardous shocks are those that could result from direct or indirect contact between an individual and the energized line, whether overhead or underground. Such shocks are capable of serious physiological harm or death and remain a driving force in the design and operation of transmission and other high-voltage lines.

No design-specific federal regulations have been established to prevent hazardous shocks from overhead power lines. Safety is assured within the industry from compliance with the requirements specifying the minimum national safe operating clearances applicable in areas where the line might be accessible to the public.

The applicant's stated intention to implement the GO-95-related measures against direct contact with the energized line (SR 2009a, p.3-16) would serve to minimize the risk of hazardous shocks. Staff's recommended Condition of Certification **TLSN-1** would be adequate to ensure implementation of the necessary mitigation measures.

Nuisance Shocks

Nuisance shocks are caused by current flow at levels generally incapable of causing significant physiological harm. They result mostly from direct contact with metal objects electrically charged by fields from the energized line. Such electric charges are induced in different ways by the line's electric and magnetic fields.

There are no design-specific federal or state regulations to limit nuisance shocks in the transmission line environment. For modern overhead high-voltage lines, such shocks are effectively minimized through grounding procedures specified in the National Electrical Safety Code (NESC) and the joint guidelines of the American National Standards Institute (ANSI) and the Institute of Electrical and Electronics Engineers (IEEE). For the proposed project lines, the project owner will be responsible in all cases for ensuring compliance with these grounding-related practices within the right-of-way.

The potential for nuisance shocks around the proposed lines would be minimized through standard industry grounding practices (SR 2009a, p. 3-17). Staff recommends Condition of Certification **TLSN-4** to ensure such grounding for RSEP.

Electric and Magnetic Field Exposure

The possibility of deleterious health effects from EMF exposure has increased public concern in recent years about living near high-voltage lines. Both electric and magnetic fields occur together whenever electricity flows, and exposure to them together is generally referred to as *EMF exposure*. The available evidence as evaluated by the CPUC, other regulatory agencies, and staff has not established that such fields pose a significant health hazard to exposed humans. There are no health-based federal

regulations or industry codes specifying environmental limits on the strengths of fields from power lines. Most regulatory agencies believe, as staff does, that health-based limits are inappropriate at this time. They also believe that the present knowledge of the issue does not justify any retrofit of existing lines.

Staff considers it important, as does the CPUC, to note that while such a hazard has not been established from the available evidence, the same evidence does not serve as proof of a definite lack of a hazard. Staff therefore considers it appropriate, in light of present uncertainty, to recommend feasible reduction of such fields without affecting safety, efficiency, reliability, and maintainability.

While there is considerable uncertainty about EMF health effects, the following facts have been established from the available information and have been used to establish existing policies:

- Any exposure-related health risk to the exposed individual will likely be small.
- The most biologically significant types of exposures have not been established.
- Most health concerns are about the magnetic field.
- There are measures that can be employed for field reduction, but they can affect line safety, reliability, efficiency, and maintainability, depending on the type and extent of such measures.

State's Approach to Regulating Field Exposures

In California, the CPUC (which regulates the installation and operation of many high-voltage lines owned and operated by investor-owned utilities) has determined that only no-cost or low-cost measures are presently justified in any effort to reduce power line fields beyond levels existing before the present health concern arose. The CPUC has further determined that such reduction should be made only in connection with new or modified lines. It requires each utility within its jurisdiction to establish EMF-reducing measures and incorporate such measures into the designs for all new or upgraded power lines and related facilities within their respective service areas. The CPUC further established specific limits on the resources to be used in each case for field reduction. Such limitations were intended by the CPUC to apply to the cost of any redesign to reduce field strength or relocation to reduce exposure. Publicly owned utilities, which are not within the jurisdiction of the CPUC, voluntarily comply with these CPUC requirements. This CPUC policy resulted from assessments made to implement CPUC Decision 93-11-013.

The CPUC has recently revisited the EMF management issue to assess the need for policy changes to reflect the available information on possible health impacts. The findings specified in Decision D.06-1-42 of January 2006, did not point to a need for significant changes to existing field management policies. Since there are no residences in the immediate vicinity of the proposed project lines, there would not be the long-term residential EMF exposures mostly responsible for the health concern of recent years. The only project-related EMF exposures of potential significance would be the short-term exposures of plant workers, regulatory inspectors, maintenance personnel, visitors,

or individuals in the vicinity of the line. These types of exposures are short term and well understood as not significantly related to the health concern.

In keeping with this CPUC policy, staff requires a showing that each proposed overhead line would be designed according to the EMF-reducing design guidelines applicable to the utility service area involved. These field-reducing measures can impact line operation if applied without appropriate regard for environmental and other local factors bearing on safety, reliability, efficiency, and maintainability. Therefore, it is up to each applicant to ensure that such measures are applied in ways that prevent significant impacts on line operation and safety. The extent of such applications would be reflected by ground-level field strengths as measured during operation. When estimated or measured for lines of similar voltage and current-carrying capacity, such field strength values can be used by staff and other regulatory agencies to assess the effectiveness of the applied reduction measures. These field strengths can be estimated for any given design using established procedures. Estimates are specified for a height of one meter above the ground, in units of kilovolts per meter (kV/m), for the electric field, and milligauss (mG) for the companion magnetic field. Their magnitude depends on line voltage (in the case of electric fields), the geometry of the support structures, degree of cancellation from nearby conductors, distance between conductors, and, in the case of magnetic fields, amount of current in the line.

Since the CPUC currently requires that most new lines in California be designed according to the EMF-reducing guidelines of the electric utility in the service area involved, their fields are required under this CPUC policy to be similar to fields from similar lines in that service area. Designing the proposed project generation tie line according to existing Western field strength-reducing guidelines, and the distribution line extension according to SCE field strength-reducing guidelines, would constitute compliance with the CPUC requirements for line field management.

Industry's and Applicant's Approach to Reducing Field Exposures

The present focus is on the magnetic field because unlike electric fields, it can penetrate the soil, buildings, and other materials to produce the types of human exposures at the root of the health concern of recent years. The industry seeks to reduce exposure, not by setting specific exposure limits, but through design guidelines that minimize exposure in each given case. As one focuses on the strong magnetic fields from the more visible high-voltage power lines, staff considers it important, for perspective, to note that an individual in a home could be exposed to much stronger fields while using some common household appliances than from high-voltage lines (National Institute of Environmental Health Services and the U.S. Department of Energy, 1998). The difference between these types of field exposures is that the higher-level, appliance-related exposures are short term, while the exposures from power lines are lower level, but long term. Scientists have not established which of these types of exposures would be more biologically meaningful in the individual. Staff notes such exposure differences only to show that high-level magnetic field exposures regularly occur in areas other than around high-voltage power lines.

As with similar Western lines, specific field strength-reducing measures would be incorporated into the proposed line's design to ensure the field strength minimization currently required by the CPUC in light of the concern over EMF exposure and health.

The field reduction measures to be applied include the following:

1. increasing the distance between the conductors and the ground to an optimal level;
2. reducing the spacing between the conductors to an optimal level;
3. minimizing the current in the line; and
4. arranging current flow to maximize the cancellation effects from interacting of conductor fields.

Since the routes of the proposed project lines would have no nearby residences, the long-term residential field exposures at the root of the health concern of recent years would not be a significant concern. The field strengths of most significance in this regard would be as encountered at the edge of the line's right-of-way. These field intensities would depend on the effectiveness of the applied field-reducing measures. The previously noted short-term exposures for plant workers, regulatory inspectors, maintenance personnel, visitors, or individuals in the vicinity of the line are expected of all operating lines. Staff recommends the field measurements in Condition of certification **TSLN-2** for RSEP to assess this specific aspect of human exposure.

The applicant (RS 2009a, p. 3-13 and Figure 3.1-4) presented the design and operational measures necessary to maintain the intensity of fields from the proposed generation tie line within the levels established for similar Western lines as required by current field management LORS. Since these field strengths depend on the applied design, their measured values along the proposed route would reflect the efficiency of these control measures. Staff is in agreement with the applicant about the effectiveness of the proposed field control measures but recommends Condition of Certification **TLSN-2** for the field strength measurements necessary to compare resulting exposures to exposures from similar Western lines. It is this similarity in exposure levels that constitutes validation of the applicant's assumed field reduction efficiency.

Facility Closure and Decommissioning

If the proposed RSEP were to be closed, decommissioned and all related structures are removed as described in the **Project Description** section, the minimal area aviation risk and electric shocks and fire hazards from the physical presence of this tie-in line would be eliminated. Decommissioning and removal would also eliminate the line's field impacts assessed in this analysis in terms of nuisance shocks, radio-frequency impacts, audible noise, and electric and magnetic field exposure. Since the generation tie line and extended distribution line would be designed and operated according to existing Western and SCE guidelines, these impacts would be as expected for Western and SCE lines of the same voltage and current-carrying capacity and therefore, at levels reflecting compliance with existing health and safety LORS.

REDUCED ACREAGE ALTERNATIVE

The Reduced Acreage Alternative would be 7.2% smaller in occupied area than the proposed RSEP and would be located on the same 2,560-acre square-shaped parcel within the larger 3,324-acre private property proposed for the project. Although the overall heliostat field distance from the central tower would be reduced, the number of heliostats would remain the same. The heliostat field (plus the evaporation pond and administrative areas) would occupy about 1270 acres instead of the 1,370 acres proposed for the project. The receiver location would remain the same with the edges of the field contracting towards the center. The heliostat footprint for the Reduced Acreage Alternative is shown in **Alternatives Figure 2**. The site layout, the 653-foot height of the solar tower and receiver, and the transmission interconnection to the Western Area Power Administration's Parker-Blythe line, would remain the same as for the proposed project. The generation capacity would be reduced by approximately 2 MW.

SETTING AND EXISTING CONDITIONS

The setting for the Reduced Acreage Alternative would be the same as described in the **Setting and Existing Conditions** subsection for the proposed project.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Staff's analysis focuses on the required transmission line and addresses the following issues taking into account both the physical presence of the line and the physical interactions of its electric and magnetic fields:

- aviation safety;
- interference with radio-frequency communication;
- audible noise;
- fire hazards;
- hazardous shocks;
- nuisance shocks; and
- electric and magnetic field (EMF) exposure.

The power from the Reduced Acreage Alternative would be transmitted at the same voltage to Western's power grid through the same new line and substation that would connect the proposed RSEP to the Parker-Blythe line. Therefore, the voltage-related (electric) field impacts of specific concern in this analysis would remain the same as for the proposed 150-MW RSEP. Since the generating capacity would lower at 148 MW, the magnitude of the current-related (magnetic) field impacts of concern would be correspondingly slightly lower.

CEQA LEVEL SIGNIFICANCE

Since staff finds the impacts of line operations to be potentially less than significant for the proposed RSEP design, staff would expect operation of the Reduced Acreage Alternative to also result in field and nonfield impacts that would be less than significant.

NORTH OF DESERT CENTER ALTERNATIVE

The North of Desert Center Alternative would be a facility of the same 150-MW as proposed and would be located on approximately 2,643 acres along Desert Center Rice Road (State Route 177) east of Kaiser Road, north of Oasis Road, and approximately 1.6 miles north of I-10. The site for the North Desert Center Alternative is primarily private land with smaller sections of BLM land in the eastern portion of the site. It is largely fallow agricultural land with some orchards. An existing Southern California Edison (SCE) 161-kV transmission line traverses this alternate site and would be realigned to roughly follow the site boundary. A new 0.125-mile transmission line (along Osborne Ave.) and substation would interconnect to the realigned SCE line at the northeastern boundary of the site. The boundaries of the site for this alternative are shown in **Alternatives Figure 3**.

Since North of Desert Center Alternative would have the same generating capacity as the proposed project, the utilized transmission line would be of the same voltage and carrying-capacity as for the proposed project. This alternative is evaluated in this analysis because its use would lead to impact reduction in the areas around the historic Rice Army Airfield with important cultural resources.

SETTING AND EXISTING CONDITIONS

The setting for the North of Desert Center Alternative is generally similar as that described for the proposed RSEP in the **Setting and Existing Conditions** subsection, except that it would be closer to an existing population, in which the nearest existing housing subdivision would be approximately 1 mile away, and there would be an existing racetrack across the road from the North of Desert Center site.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Staff's analysis for this alternative site focuses on the tie line required to serve the generation facility, and addresses the following issues taking into account both the physical presence of the line and the physical interactions of its electric and magnetic fields:

- aviation safety;
- interference with radio-frequency communication;
- audible noise;
- fire hazards;
- hazardous shocks;
- nuisance shocks; and
- electric and magnetic field (EMF) exposure.

The main difference with the North of Desert Center Alternative compared to the proposed RSEP is that the generation tie line would be reduced in length to 0.125 miles compared to 10 miles for the proposed project. The shorter tie line would reduce the exposure of potential risks associated with physical interactions of its electric and

magnetic fields, and the risks would be further minimized considering the line would be routed through fallow agricultural land and open space. Since the line for this alternative would be designed, constructed, operated, and maintained according to Western's guidelines for line safety and field management, its use would lead to impacts of the same types and magnitude as the proposed project, but over a much shorter length.

CEQA LEVEL OF SIGNIFICANCE

Since the Northern Desert Alternative would have the same generating capacity as the proposed RSEP, and all the lines would be designed and constructed, and routed according to the same Western guidelines that comply with existing LORS, their respective safety and nuisance impacts would be encountered at less-than-significant levels.

SR 62/RICE VALLEY ROAD GENERATION TIE LINE ALTERNATIVE

The SR/62 Rice Valley Road Alternative would interconnect to Western's 161-kV/230-kV Parker-Blythe transmission line at the same location as proposed for the project's transmission line. This alternative transmission line would exit the proposed solar facility at the northeast corner and follow State Route 62 for approximately 4.5 miles east to the junction of Rice Valley Road. It would then trend southwards to follow the unpaved Rice Road Valley Road for over 9.5 miles to the connection point at Western's Parker-Blythe #1 transmission line. The route of the SR 62/Rice Valley Road Generation Tie Line Alternative is shown in **Alternatives Figure 4**.

SETTING AND EXISTING CONDITIONS

The setting for the SR 62/Rice Valley Generation Tie Line Alternative is generally the same as that described in the **Setting and Existing Conditions** subsection for the proposed RSEP generation tie line.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Staff's analysis for this alternative tie line line focuses on the following issues taking into account both the physical presence of the line and the physical interactions of its electric and magnetic fields:

- aviation safety;
- interference with radio-frequency communication;
- audible noise;
- fire hazards;
- hazardous shocks;
- nuisance shocks; and
- electric and magnetic field (EMF) exposure.

Since this alternative line would (a) be constructed, operated, and maintained according to Western's guidelines for line safety and field management which conform to applicable laws, ordinances, regulations and standards and (b) would traverse

undisturbed desert land with no nearby residents, its use would eliminate the potential for residential electric and magnetic field exposures as would the lines for proposed project.

CEQA LEVEL OF SIGNIFICANCE

Since the four conditions of certification recommended by staff for the proposed project would also be required of the SR 62 Rice Valley Road Generation Tie Line Alternative (as required for any line interconnected to Western), any safety and nuisance impacts from its operation would be at less-than-significant levels as with the lines for the proposed project.

NO PROJECT/NO ACTION ALTERNATIVE

No Project / No Action on the Application for the Rice Solar Energy Project and no amendment of the CDCA land use plan

Under this alternative, the proposed Rice Solar Energy Project would not be approved by the Energy Commission; BLM would not approve the transmission line application and would not amend the CDCA Plan; and Western would not approve the interconnection request. As a result, no solar energy project would be constructed on the project site, BLM would continue to manage the land encompassing the generation tie line consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended, and Western would continue to operate the Parker Blythe Transmission Line under current conditions.

The results of the No Project/No Action Alternative would be the following:

- The field and nonfield impacts from operating the project's transmission line would not occur. However, the land to be traversed by the line would become available to other uses that are consistent with BLM's land use plan, including another renewable energy project.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Staff's analysis focuses on the tie line required to serve the generation facility, but lacking a project and related generation tie line, there would not be any adverse impacts associated with the physical presence of the line and the physical interactions of its electric and magnetic fields including:

- aviation safety;
- interference with radio-frequency communication;
- audible noise;
- fire hazards;
- hazardous shocks;
- nuisance shocks; and
- electric and magnetic field (EMF) exposure.

CEQA LEVEL OF SIGNIFICANCE

Lacking any impacts for the No Project/No Action alternative, there are no effects to evaluate for significance under CEQA.

CUMULATIVE IMPACTS

A project may result in a significant adverse cumulative impact where its effects are cumulatively considerable. "Cumulatively considerable" means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects (California Code Regulation, Title 14, section 15130). NEPA states that cumulative effects can result from individually minor but collectively significant actions taking place over a period of time" (40 CFR §1508.7).

When field intensities are measured or calculated for a specific location, they reflect the interactive, and therefore, cumulative effects of fields from all contributing conductors. This interaction could be additive or subtractive depending on prevailing conditions. Since the proposed project's generation tie line would be designed, built, and operated according to applicable field-reducing Western guidelines (as currently required by the CPUC for effective field management), any contribution to cumulative area exposures should be at levels expected for Western lines of similar voltage and current-carrying capacity. It is this similarity in intensity that constitutes compliance with current CPUC requirements on EMF management. The actual field strengths and contribution levels for the proposed line design would be assessed from the results of the field strength measurements specified in Condition of Certification **TLSN-2**. Because the generation tie line would only be near other existing transmission lines (where cumulative effects could increase above those of the project alone) at the proposed interconnection with Western's Parker-Blythe Transmission Line, and this location is not near any existing population, the limited exposure for cumulative effects are not cumulatively considerable.

COMPLIANCE WITH LORS

As previously noted, current CPUC policy on safe EMF management requires that any high-voltage line within a given area be designed to incorporate the field strength-reducing guidelines of the main area utility lines to be interconnected. The utility in the case of RSEP is Western. Since the proposed project's 161/230-kV generator tie line and related substation, as well as the 12-kV distribution line extension would be designed according to the respective requirements of the LORS listed in **TLSN Table 1**, and operated and maintained according to current Western and SCE guidelines on line safety and field strength management, staff considers the proposed design and operational plan to be in compliance with the health and safety requirements of concern in this analysis. The actual contribution to the area's field exposure levels would be assessed from results of the field strength measurements required in Condition of Certification **TLSN-2**.

NOTEWORTHY PUBLIC BENEFITS

Since the proposed tie-in line would pose specific, although insignificant risks of the field and nonfield effects of concern in this analysis, its building and operation would not yield any public benefits regarding the effort to minimize any human risks from these impacts.

PROPOSED MITIGATION MEASURES/CONDITIONS OF CERTIFICATION

The following Conditions of Certification meet the Energy Commission's responsibility to comply with the California Environmental Quality Act and serve as recommendations for the Energy Commission to consider in its decision to avoid or reduce the severity of impacts to less than significant and to assure conformance with LORS. The identification of relevant and reasonable mitigation measures also conforms to National Environmental Policy Act (NEPA) requirements for U.S. Bureau of Reclamation's (BLM's) and Western Area Power Administration's (Western's) analysis that can be considered in its Record of Decision.

TLSN-1 The project owner shall construct the extension of the existing 12-kV distribution line according to the requirements of California Public Utility Commission's GO-95, GO-52, GO-131-D, Title 8, and Group 2, High Voltage Electrical Safety Orders, sections 2700 through 2974 of the California Code of Regulations, and SCE's EMF reduction guidelines. The project owner shall construct the proposed 161/230 kV generation tie line according to Western's EMF reduction guidelines.

Verification: At least 30 days before starting the transmission line or related structures and facilities, the project owner shall submit to the Compliance Project Manager (CPM) a letter signed by a California registered electrical engineer affirming that the lines will be constructed according to the requirements stated in the condition.

TLSN-2 The project owner shall use a qualified individual to measure the strengths of the electric and magnetic fields from the line at the points of maximum intensity along the proposed generation tie line and distribution line route. The measurements shall be made before and after energization according to the American National Standard Institute/Institute of Electrical and Electronic Engineers (ANSI/IEEE) standard procedures. These measurements shall be completed no later than 6 months after the start of operations.

Verification: The project owner shall file copies of the pre-and post-energization measurements with the CPM within 60 days after completion of the measurements.

TLSN-3 The project owner shall ensure that the rights-of-way of the proposed generation tie line and distribution line are kept free of combustible material, as required under the provisions of section 4292 of the Public Resources Code and section 1250 of Title 14 of the California Code of Regulations.

Verification: During the first 5 years of plant operation, the project owner shall provide a summary of inspection results and any fire prevention activities carried out

along the right-of-way and provide such summaries in the Annual Compliance Report on transmission line safety and nuisance-related requirements.

TLSN-4 The project owner shall ensure that all permanent metallic objects within the right-of-way of the project-related lines are grounded according to industry standards regardless of ownership.

Verification: At least 30 days before the lines are energized, the project owner shall transmit to the CPM a letter confirming compliance with this condition.

CONCLUSIONS

Since FAA has concluded that RSEP would not pose a hazard to aviation safety, staff concludes that the proposed 161/230-kV transmission tie-in line and 12-kV distribution line extension would not pose an aviation hazard according to current FAA criteria.

The potential for nuisance shocks would be minimized through grounding and other field-reducing measures that would be implemented in keeping with current Western guidelines (reflecting standard industry practices). These field-reducing measures would maintain the generated fields within levels not associated with radio-frequency interference or audible noise.

The potential for hazardous shocks would be minimized through compliance with the height and clearance requirements of CPUC's General Order 95. Compliance with Title 14, California Code of Regulations, section 1250, would minimize fire hazards while the use of low-corona line design, together with appropriate corona-minimizing construction practices, would minimize the potential for corona noise and its related interference with radio-frequency communication in the area around the route.

Since electric or magnetic field health effects have neither been established nor ruled out for the proposed Rice Solar Energy Project and similar transmission lines, the public health significance of any related field exposures cannot be characterized with certainty. The only conclusion to be reached with certainty is that the proposed line's design and operational plan would be adequate to ensure that the generated electric and magnetic fields are managed to an extent the CPUC considers appropriate in light of the available health effects information. The long-term, mostly residential magnetic exposure of health concern in recent years would be insignificant for the proposed line given the absence of residences along the proposed routes. On-site worker or public exposure would be short term and at levels expected for Western lines of similar design and current-carrying capacity. Such exposure is well understood and has not been established as posing a significant human health hazard.

Since the proposed project's lines would be operated to minimize the health, safety, and nuisance impacts of concern to staff and would be routed through areas with no nearby residences, staff considers the proposed design, maintenance, and construction plan as complying with the applicable LORS. With implementation of the four recommended conditions of certification, any related impacts would be at less-than-significant levels.

VISUAL RESOURCES

Testimony of William Kanemoto, Alan Lindsley and James Jewell

SUMMARY OF CONCLUSIONS

Bureau of Land Management (BLM), Western Area Power Administration (Western), and Energy Commission staff (staff) (hereafter jointly referred to as agencies) have analyzed visual resource-related information pertaining to the proposed RSEP. With respect to CEQA, staff concludes that the proposed project, after implementing all staff-recommended conditions of certification, would still have significant and unavoidable adverse direct and cumulative visual impacts from several Key Observation Points including:

- Highway SR-62 to background distances of 5 miles or more, due particularly to solar receiver brightness; and
- portions of the Turtle Mountain Wilderness Area at distances of roughly 5 miles or under due to the combination of mirror-field visibility, mirror-field glare, and solar receiver glare.

Staff has recommended **Traffic and Transportation** Conditions of Certification **TRANS-6**, Heilostat Positioning Plan, and **TRANS-7**, Power Tower Monitoring Plan, to ensure that potential glare from the project is minimized to the maximum extent possible and does not pose a health and safety risk. However, staff concludes that with these measures, glare from the project, particularly from the solar receiver, would remain a bright, intrusive source of sub-hazardous nuisance glare to viewers on Highway SR 62 and in other locations at distances within a range of 5 miles or more.

Impacts of the Reduced Acreage Alternative, with staff-recommended conditions of certification, would also have significant unavoidable visual impacts. However, the degree and extent of those impacts would be somewhat less than those of the Proposed Project.

Impacts of the North of Desert Center Alternative, with staff-recommended conditions of certification, would also have significant unavoidable visual impacts. Comparison to the proposed project is mixed. Impacts would be less than those of the Proposed Project due to the more developed and visually compromised setting when compared to that of the Proposed Project. However, the number of residents adversely affected would be substantial, and viewers in the easternmost slopes of Joshua Tree National Park could be affected.

Impacts of the State Route 62/Rice Valley Road Generation Tie Line Alternative would have the same significant unavoidable visual impacts as the proposed project, and in addition would substantially increase those impacts by introducing a new line into the immediate visual foreground of State Route 62 (SR-62).

The anticipated visual impacts of the Proposed Project, Reduced Acreage, North of Desert Center and SR 62/Rice Valley Road Generation Tie Line Alternatives, in

combination with past and foreseeable future local projects in their local vicinity, and past and foreseeable future region-wide projects in the southern California desert are considered cumulatively considerable and significant.

Along SR 62, there are four proposed solar energy projects including RSEP that would result in a substantial man-made visual intrusion into a majority of the remaining visually intact and scenic portions of SR 62, potentially rendering it ineligible for designation as a State scenic highway. These four projects would affect over 50 miles of the most scenically intact portions of that highway, altering it from a natural, scenically intact desert landscape into one characterized by the strong visual influence of these industrial facilities. In addition, cumulative night light pollution impacts in the project area could become cumulatively considerable. Therefore, within the local viewshed of Rice Valley and of SR 62 in the project vicinity, the anticipated operational visual impacts of the RSEP in combination with past and foreseeable future projects are considered potentially significant and unmitigable, particularly to motorists on SR 62, and to visitors to the area's many wilderness areas and Joshua Tree National Park.

Within the southern California desert, anticipated cumulative operational impacts of past and foreseeable future region-wide projects are considered cumulatively considerable, potentially significant and unmitigable considering the substantial decline in the overall number and extent of scenically intact, undisturbed desert landscapes, and a substantially more urbanized character in the overall southern California desert landscape.

All action alternatives studied, with staff-recommended conditions of certification, would not conform with a number of applicable local Laws, Ordinances, Regulations and Standards (LORS) of San Bernardino and Riverside Counties pertaining to preservation of scenic resources and scenic highway view corridors, as described under the Compliance With LORS section of this analysis.

INTRODUCTION

The following analysis evaluates potential visual impacts of the Rice Solar Energy Project; its consistency with applicable Laws, Ordinances, Regulations and Standards (LORS); and conformance with applicable guidelines of the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA).

To provide a consistent framework for the analysis, a standard visual assessment methodology developed by California Energy Commission staff and applied to numerous siting cases in the past was employed in this study. A description of this methodology is provided in **Appendix VR-1**.

As noted above, the project is evaluated for conformance with applicable LORS. Adopted expressions of local public policy pertaining to visual resources are given great weight in determining levels of viewer concern. In accordance with staff's procedure, conditions of certification are proposed as needed to reduce potentially significant impacts to less than significant levels, and to ensure LORS conformance, if feasible. These Conditions of Certification meet the Energy Commission's responsibility to

comply with the California Environmental Quality Act and serve as recommendations for the Energy Commission to consider in its decision. The identification of relevant and reasonable mitigation measures also conforms to National Environmental Policy Act (NEPA) requirements for BLM's and Western's analysis that can be considered in its Record of Decision.

METHODOLOGY AND THRESHOLDS FOR DETERMINING ENVIRONMENTAL CONSEQUENCES

Federal

The National Environmental Policy Act (NEPA) requires that the federal government use 'all practicable means to ensure all Americans safe, healthful, productive, and *aesthetically* (emphasis added) and culturally pleasing surroundings (42 U.S. Code 4331[b][2]).'

Significance under NEPA is defined in terms of a) context and b) intensity. Context means that the significance of an action must be analyzed in several contexts, such as society, the affected region, affected interests, and locale. Intensity refers to the severity of impact, and includes a variety of factors to be considered (40 CFR 1508.27).

Some of the intensity factors cited in 40 CFR 1508.27 that are potentially relevant to visual impacts include 'unique characteristics of the geographic area such as proximity to historic or cultural resources, park lands . . . , degree of controversy, degree of uncertainty about possible effects, degree to which an action may establish a precedent for future actions, and potential for cumulatively significant impacts.

Portions of the proposed project are located on BLM lands. These lands have not been previously inventoried under BLM's Visual Resource management (VRM) system. CEC and BLM staff have thus agreed to assess the visual effects of the project using the CEC visual assessment method. In staff's professional opinion, however, despite differences in application and process, the fundamental visual assessment principles used in the BLM and CEC methodologies are consistent. Staff thus considers that the conclusions of this analysis are substantially equivalent to those that would be reached by applying BLM-specific methods of visual assessment.

State

The CEQA *Guidelines* define a "significant effect" on the environment to mean a "substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including . . . objects of historic or aesthetic significance." (Cal. Code Regs., tit.14, § 15382.) Appendix G of the *Guidelines*, under Aesthetics, lists the following four questions to be addressed regarding whether the potential impacts of a project are significant:

- A Would the project have a substantial adverse effect on a scenic vista?
- B Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

- C Would the project substantially degrade the existing visual character or quality of the site and its surroundings?
- D Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

In addition, staff evaluates potential impacts in relation to standard criteria described in detail in Appendix VR-1. Staff evaluates both the existing visible physical environmental setting, and the anticipated visual change introduced by the proposed project to the view, from representative, fixed vantage points (called “Key Observation Points” (KOPs). KOPs are selected to be representative of the most characteristic and most critical viewing groups and locations from which the project would be seen. The likelihood of a visual impact exceeding Criterion C. of the CEQA Guidelines, above, is determined in this study by two fundamental factors: the susceptibility of the setting to impact as a result of its existing characteristics (reflected in its current level of visual quality, the potential visibility of the project, and the sensitivity to scenic values of its viewers); and the degree of visual change anticipated as a result of the project. These two factors are summarized respectively as *visual sensitivity* (of the setting and viewers), and *visual change* (due to the project) in the discussions below. Briefly, KOPs with high sensitivity (due to outstanding scenic quality, high levels of viewer concern, etc.), that experience high levels of visual change from a project, are more likely to experience adverse impacts.

Under the Energy Commission criteria, as under all professionally accepted visual assessment methods, visibility of a project per se does not constitute a threshold for significant visual impact, regardless of the sensitivity of viewers, except under unusual circumstances in which applicable legal restrictions apply. For example, within a national park or BLM Wilderness Area, very low levels of visibility of a project may be considered the appropriate significant visual impact threshold.

Local

Staff also reviews local LORS and their policies or guidelines for aesthetics or preservation and protection of sensitive visual resources that may be applicable to the project site and surrounding area. These LORS include local government land use planning documents where applicable.

Please refer to **Appendix VR-1** for a complete description of staff’s visual resources evaluation criteria.

PROPOSED PROJECT

SETTING AND EXISTING CONDITIONS

Regional Landscape

The Project is located within the Colorado Desert, a sub-region of the Sonoran Desert, at the boundary of an ecological transition zone between the Mojave Desert to the

north, and the Colorado Desert to the south. The Colorado Desert is distinguished from the Mojave to the north primarily by elevation and corresponding vegetation types. It is situated primarily below 1,000 feet above mean sea level (amsl) in contrast to the high desert of the Mojave to the north.

The Colorado Desert is typified by creosote and bursage scrub land cover, often mixed with yucca and cholla cactus, sandy soil grasslands and, especially farther to the south, ocotillo cactus, ironwood, and palo verde trees. Like other parts of the Basin and Range physiographic province of which it is a part, the area is characterized by periodic low, barren mountain ranges with jagged peaks and sloping alluvial fans or bajadas at their feet, with arid, sparsely vegetated open valleys in between offering expansive, panoramic views. Dark browns and garnets are the dominant mountain hues, although blues and purples prevail as viewing distance increases. In contrast, lighter brown and tan soils dominate the desert floor, sparsely dotted with the grey-green of low-growing creosote bush and golden bursage scrub vegetation.

Project Site and Vicinity

The 1,410-acre RSEP site is located in Rice Valley, a small desert valley roughly 12 miles long by 18 miles wide with flat to gently sloping terrain and elevations that range from 283 feet amsl in the north, to 205 feet amsl in the south. The northern end of the valley, including the project site, is a portion of the bajada or alluvial fan descending from the southern slopes of the Turtle Mountains; much of the valley south of the project site, including the northern portions of the Rice Valley Wilderness, consists of the Rice Valley Sand Dunes. This system of 30- to 40-foot tall sand dunes is part of a massive sand sheet which extends from Cadiz and Ward Valleys to the west, representing a part of one of the largest dune systems in the California Desert. Typical of the region's basin and range physiography, low, barren mountain ranges enclose the valley: Turtle Mountains, 3 miles to the north; West Riverside and Riverside Mountains, 7 and 10 miles respectively, to the east; Big and Little Maria Mountains, 10 miles to the south; and the Arica and Granite Mountains, 7 and 13 miles respectively, to the west.

The RSEP site is located on private land in an unincorporated area of northeastern Riverside County, immediately south of the Riverside-San Bernardino County line (defined by SR 62) and 20 miles west of the California-Arizona state line. The Riverside County General Plan land use designation for the RSEP site and the non-federal lands that surround it is Open Space-Rural, defined as remote, privately owned open space areas with limited access and a lack of public services (Riverside County, 2003). The site is entirely surrounded by public lands under BLM jurisdiction. A new proposed generation tie-line would extend approximately 10-miles to the southeast of the site, and a new interconnection substation constructed to connect the project with the Western 161/230-kV Parker-Blythe #2 transmission line. The tie-line and substation would be located predominantly within BLM lands. Those lands are classified under the California Desert Conservation Area (CDCA) Plan as Multiple-Use Class M (Moderate Use). No BLM VRM classifications have been assigned to the BLM lands surrounding the project site.

The site occupies the former Rice Army Airfield, a World War II military flight training center that opened in 1942 and closed in 1944. It subsequently operated as a private

airfield until closing around 1956. A few areas of foundation or concrete from two paved 5,000-foot runways and hardstands remain, but there are no standing structures and any remaining features, though visible in aerial photography, are not evident to the public from SR 62. The abandoned town of Rice is located immediately east of the site. Like the abandoned airfield, remaining visible evidence of the town as seen from the highway is very subtle and would not be noticed by most casual observers.

In addition to State Route (SR 62), other existing man-made features within the project viewshed include the Atchison Topeka & Santa Fe (ATSF) Arizona-California Railroad line, and the California Aqueduct, both generally paralleling SR 62 in an east-west direction a short distance north of the highway in the project vicinity. These nearby features obstruct views of the natural terrain surface in views to the north toward the Turtle Mountain; the mountains themselves however remain unobstructed. The earth berm supporting the ATSF rail line in this segment is marked by extensive rock graffiti which, because it is made primarily of rocks from the area, is visible but not highly contrastive and intrusive.

SR 62, which bounds the site to the north, connects Parker, Arizona (32 miles east) to the community of Twenty Nine Palms (75 miles west). Joshua Tree National Park is located south of SR 62 roughly 25 miles to the west of the project site. The nearest community is Vidal Junction, approximately 15 miles northeast. The nearest residence is at the Metropolitan Water District of Southern California's Iron Mountain Pumping Plant, 17 miles west of the project. Two tall communication poles and associated low communication lines are located a short distance east of the project site to the south of the highway. AT&SF railroad crossings and associated warning lights, located roughly two miles to the west and six miles to the east of the project site, respectively, are among the only other man-made intrusions in the larger project viewshed.

Visual Resources Figure 1 depicts photographs of the existing landscape setting.

Scenic Highways

SR 62 north of the RSEP site is part of a 143-mile segment of SR 62 eligible for State Scenic Highway designation. Called the "29 Palms Highway", the eligible scenic highway extends from a 9-mile officially designated State Scenic Highway segment at SR 10 in Riverside County, north into San Bernardino County, and past the project site to the Arizona border at Parker, roughly 30 aerial miles to the east. Highway 62 serves as the principal public access to Joshua Tree National Park roughly 25 aerial miles west of the project site.

Wilderness Areas

There are four BLM wilderness areas (WAs) within 10 miles of the project site: the Rice Valley, Turtle Mountain, Riverside Mountains and Palen/McCoy WAs. No motorized use is allowed within the wilderness areas, and none have established trail networks, parking areas, or areas of known concentrated recreational use. The areas are accessible by off-highway vehicles (OHVs) or high clearance vehicles via unmaintained dirt roads that end 30 feet outside the wilderness boundary. BLM considers that recreational use of the WAs in this area is very low, and that recreational use was not a primary consideration in their establishment as WAs. BLM does attribute high viewer

sensitivity to all areas of the California Desert Conservation Area (CDCA) however, because preservation of scenery is a prime objective of the CDCA.

Turtle Mountain is the nearest wilderness area to the RSEP site and lies roughly 2 miles to the north. The 177,209-acre wilderness reaches a maximum height of 3,865 feet amsl at Horn Peak. The area is considered by the BLM to be a transition zone between the Mojave and Sonoran Deserts, supporting a high diversity of plant and animal species. Three miles south of the RSEP site is the Rice Valley Wilderness, a 41,776-acre area that contains the Rice Valley Sand Dunes. The area is accessible from the north via Rice-Midland Road and unnamed dirt trails. Six miles southwest of the RSEP site is the northernmost portion of the 236,486-acre Palen/McCoy WA, a large area encompassing five separate mountain ranges: the Arica, Granite, Little Maria, Palen, and McCoy. Mountain top elevations range from a high of 3,852 feet amsl in the Palen Mountains, to 3,753 in the Granite Mountains, 2,316 feet amsl in the West Riverside Mountains, and 2,162 in the Arica Mountains, compared to the 200 – 280 foot elevations of the project site.

Project Visual Setting: Viewshed and KOPs

Project Viewshed

A feature of this desert landscape is the potential for large structures to be seen over great distances where even slightly elevated viewpoints exist, due to the large open areas of level topography and absence of intervening landscape features.

As indicated in **Visual Resources Figure 2 - Project Setting, Key Observation Points (KOPs) and Solar Receiver Tower Viewshed**, the project would potentially be visible to background distances of over 20 miles to the east and west on SR 62, and up to 15 miles to the south of the site (SR 2009a). For the roughly 50-mile segment of SR 62 between its intersection with Desert Center Road to the west, and several miles beyond Vidal Junction (at SR 395) to the east, the receiver tower would potentially be visible as a source of nuisance glare to background distances. These potential effects are discussed further in the section on Glare Impacts, below.

As depicted in **Visual Resources Figure 3 - Heliostat Field Viewshed**, visibility of the heliostat field would also potentially extend over a considerable area, extending to background distances to the west, south, and east. As depicted in the figure, however, the extent of potential visibility to viewers on SR 62 would be more limited than for the solar receiving tower. The heliostats would come into view to SR 62 motorists roughly one mile to the west and 3 miles to the east, for an overall distance of roughly 4 miles of the highway.

Viewer Sensitivity and Key Observer Positions: Visual Quality, Viewer Concern, and Viewer Exposure

VISUAL RESOURCES Figure 2 - Project Setting, Key Observation Points (KOPs) & Solar Receiver Tower Viewshed, depicts the location of Key Observation Points (KOPs) used as the basis for this analysis. KOPs are used in the Energy Commission

visual analysis method as the basis for evaluating potential project impacts, and represent the key sensitive viewer groups and viewing locations likely to be affected by the project.

In the CEC assessment approach, each KOP is rated according to the visual quality of its setting, and an assessment of its level of viewer concern and viewer exposure. Those three primary attributes are summarized in a KOP's *overall visual sensitivity* rating, which reflects an assessment of the overall susceptibility to visual impact of the viewer group/receptors it represents. These sensitivity ratings serve as the environmental baseline against which potential project impacts, measured in terms of level of *visual change*, are identified.

KOPs used in this study include those used in the project AFC, which were selected for the AFC in consultation with Energy Commission staff. Two additional KOPs were added by staff for this analysis. For simplicity the numbering of viewpoints in the AFC has been retained in this analysis. (All figures referred to in the text may be found at the end of this section).

In this discussion, the distance-zone term 'foreground' is used generically to refer to viewing distances under ½-mile; 'middle-ground' to distances between ½ and 4 or 5 miles; 'near middle-ground' refers to that portion of middle-ground under roughly one mile; and 'background' to distances over 5 miles.

Because KOP photos represent the existing views of project simulations, the reader is referred below to these 'before project' photos in the discussion that follows. All figures may be found at the end of this section.

KOP 1 - Eastbound SR 62 (Middle-Ground Distance)

KOP 1 represents potential viewers of the project from eastbound SR 62, approximately 1 mile northwest of the RSEP site. The view is toward the southeast where the RSEP site is seen at middle-ground viewing distance. **VISUAL RESOURCES Figure 4a** depicts the existing view from KOP 1. The landscape is characterized by a flat tan, desert plain in the foreground and middle-ground, with dark, jagged garnet to bluish mountain ranges of the West Riverside Mountains and Riverside Mountains in the distant background to the southeast. Land cover consists of sparse, low-growing creosote-bursage scrub characteristic of the area.

Visual Quality: Visual quality of this landscape is moderately high. A relatively high level of intactness and unity of the characteristic landscape results from the absence of human development and disturbance in the Rice Valley Wilderness Area and surrounding mountain ranges in the middle-ground and background distance zones. Panoramic, long-distance views of the vast, undisturbed Rice Valley and surrounding mountain ranges are present to the south through much of this segment of SR 62. These middle-ground and background distance portions of the view are the focus of travelers' attention. Man-made features are present in the foreground of the view in this segment of SR 62, but are not highly intrusive and do not block these scenic views of the valley and mountains to the south of the road. The AT&SF rail line and, to its north, the Colorado Aqueduct, parallel SR 62 for a distance of roughly 6 miles to both the east

and west of the project site at a distance of as little as 150 feet and 500 feet respectively, occupying the roadway foreground to the north. They do not obstruct scenic views of the Turtle Mountains to the north, however, and tend to be overlooked because viewers' attention is so strongly drawn to the scenic views of the valley toward the south. Evidence of past paving and development is visible in the roadway foreground to the south near KOP 1, but does not interfere with scenic views of the valley and mountains in the background.

Viewer Concern: Viewer concern is considered moderately high due to the eligible State Scenic Highway status of SR 62, its designated County scenic highway status, and a presumed high proportion of recreation- and scenery-oriented travelers in this area. According to Caltrans Year 2008 Average Annual Daily Traffic (AADT) volumes, SR 62 averages approximately 2,200 vehicles per day, of which 7 to 21 percent of the vehicles were trucks (SR 2009a, Section 5.13-21). In general, BLM assigns high viewer sensitivity to all viewers in the CDCA due to the emphasis on preservation of scenery in the objectives of the CDCA Plan.

Viewer Exposure: Viewer exposure from eastbound SR 62 up to this point, approximately 1 mile west of the project, is moderate. Up until the vicinity of KOP 1, travelers on eastbound SR 62 would experience partially screened views of the project site due to orientation of the road and intervening topography, which tends to block views of the site ground surface until the westward turn in the road. Between KOP 1 and KOP 2, marked by the turns in SR 62 west and east of the site, respectively, views of the project site would come into full view, as indicated in **VISUAL RESOURCES Figure 3** and discussed further under KOP 4, below,

Overall visual sensitivity of SR 62 motorists in this portion of the viewshed was considered to be moderately high.

KOP 2 - Westbound SR 62 (Middle-Ground Distance)

KOP 2 represents potential viewers of the project from westbound SR 62, approximately 3.5 miles northeast of the RSEP site. The view is to the southwest and the RSEP site is viewed near the boundary of middle-ground/ background viewing distances. **VISUAL RESOURCES Figure 5a** depicts the existing view from KOP 2. The valley floor in the foreground consists of a typically light tan, flat desert floor with low, sparse desert grasses and shrubs typical of the creosote-bursage scrub type of the area. Wood distribution poles parallel the highway. In the background, the Arica Mountains and, behind them, the more distant Granite and Little Maria Mountains can be seen forming the backdrop of westward views. To the right of the photo frame, the low ridges of the Turtle Mountains would appear at middle-ground distances of as little as one mile.

Visual Quality: As described previously, visual quality of this landscape is moderately high due to the relatively high level of intactness and unity that comes from the predominantly unaltered character of the panoramic valley views toward the south. Man-made intrusions into the view include the distribution lines in the photo, and two tall telecommunications towers and associated lines farther to the west. Their effect on scenic long-distance views of the valley and mountains remains minor.

Viewer Concern: Viewer concern is considered moderately high due to the eligible State and designated County Scenic Highway status of SR 62, and a presumed high proportion of recreation- and scenery-oriented travelers in this area.

Viewer Exposure: Viewer exposure in this background distance zone from the project site on SR 62 is moderate. As indicated in **VISUAL RESOURCES Figure 3** (Heliostat Viewshed) and depicted in **VISUAL RESOURCES Figure 5a (KOP 2)**, as travelers progress westward on SR 62, the southwest orientation of the highway and resulting intervening, higher terrain limits views of the valley floor in the direction of the site to a relatively short distance. The ground surface of the project site itself remains obscured until past the westward bend in the highway. West of KOP2 on SR 62, views of the project site would come into full view, as indicated in **VISUAL RESOURCES Figure 3** and discussed further under KOP 4, below,

Overall visual sensitivity of SR 62 motorists in this portion of the viewshed is considered to be moderately high.

KOP 3 - Northbound Rice Road/Rice Valley Wilderness Area

KOP 3 represents potential viewers of the Project from northbound Rice Valley Road, including views of visitors to the Rice Valley Wilderness Area. KOP 3 is approximately 5 miles southwest of the RSEP site where the RSEP generator tie-line would intersect with Rice Valley Road. The view is to the northwest, where the RSEP site is at the edge of the middleground/background viewing distance. **VISUAL RESOURCES Figure 6a** depicts the existing view from KOP 3. Foreground and middleground views are dominated by the flat desert terrain and creosote-bursage scrub of Rice Valley. A dirt OHV road is in the immediate foreground. Distant views of Turtle Mountain on the right, and Iron Mountain on the left, are softened by atmospheric haze.

Visual Quality: Visual quality of this landscape is moderately high due in part to the high level of intactness and unity that comes from vast, unobstructed, panoramic views of a pristine, largely unaltered natural landscape. The ground plane and ground surface appears virtually undisturbed. In this setting this very absence of man-made intrusions over a vast viewshed constitutes one of its principal vivid qualities. The isolated mountain ranges are also a vivid element, emerging like islands within the level plain of Rice Valley, creating a scene of great legibility and visual coherence expressive of the natural processes that formed the landscape.

Viewer Concern: Viewer concern is considered moderately high. The area is used by OHV recreationists accessing the Rice Valley Wilderness Area on closed, designated trails and is representative of the experience of visitors enroute to the wilderness. Presumably, the majority of visitors to the WA would have a high degree of concern for scenic quality.

Viewer Exposure: Viewer exposure is considered moderately low overall. Travelers on northbound Rice Valley Road would experience open, unobstructed views of the project site from KOP 3 and throughout the Rice Valley. View duration would be extended since

travel within the WA would take place on unimproved roads and, within the WA, on foot. However, viewer numbers in and out of the WA are believed by BLM to be extremely low.

Prior to 2002, portions of the Rice Valley and dunes outside of the WA remained open to OHV use. After 2002, however, motorized travel in the area was restricted to designated trails by BLM based on a history of little or no recreational use in the area (DOI, 2002). The large majority of the Rice Valley WA is located in the background distance zone (over 5 miles from the project); this distance would greatly reduce potential project visual effects in the WA.

Accounting for distance and low viewer numbers, overall visual sensitivity of the WA was considered to be moderate.

KOP 4 - Westbound SR 62 (Middleground Distance)

KOP 4 represents potential viewers of the project from SR 62 in the roughly 4.6-mile segment in which the project site and proposed mirror fields would be visible, as depicted in the mapped purple area of **VISUAL RESOURCES Figure 3**. The view is to the southwest and the RSEP site is seen at a viewing distance of approximately 1 mile. **VISUAL RESOURCES Figure 7a** depicts the existing view from KOP 4. In the background, the Arica Mountains and, behind them, the more distant Granite and Little Maria Mountains can be seen forming the backdrop of westward views. Panoramic views of the vast and highly intact expanse of the valley are visible, extending to the Little and Big Maria Mountains to the south.

Visual Quality: As described above, visual quality from this portion of SR 62 is moderately high due to the high level of intactness of the scene, which is largely free of intrusive elements; and the high degree of unity, legibility, and vividness imparted by the panoramic views of the whole of the valley in the background. Some visible evidence of the former Rice Airfield can sometimes be seen in the highway foreground, usually as small bare or sparsely vegetated level areas. These signs are subtle and do not noticeably detract from the scenic long distance views of the valley that are the focus of viewers' attention.

Viewer Concern: Viewer concern is considered moderately high due to the eligible State Scenic Highway status of the highway, and a presumed high proportion of recreation- and scenery-oriented travelers in this area.

Viewer Exposure: Viewer exposure is high within this portion of the project viewshed. Numbers of motorists are relatively high, and views of the site are unobstructed and at close distance.

Overall visual sensitivity is considered to be moderately high.

KOP 5 - Views from Turtle Mountain WA

VISUAL RESOURCES Figure 8 depicts KOP 5. KOP 5 includes two simulated views, created in Google Earth, from elevated ridges within the Turtle Mountain Wilderness Area at distances ranging from 2 to 4.8 aerial miles from the project site, within the

middle-ground distance zone. The views have been adjusted to approximate a 'normal' cameral lens (40-degree horizontal angle of view). The views are all facing south toward the project site, and are representative of the views of climbers within the Turtle Mountain WA. In each view, the bajada or alluvial fan descending from the foot of the mountains is visible in the foreground, with the expanse of the Rice Valley in the distance, and the Little and Big Maria Mountains roughly 15 miles in the background. The KOPs are considered relatively accessible in terms of distance from nearby points on SR 62, although there are no trails within the WA.

Visual Quality: Visual quality of KOPs within the Turtle Mountains is considered to be moderately high. The rocky, jagged ridges and contrasting swales and alluvial washes are highly intact, with vivid form, line, color and texture. Panoramic elevated views of the vast, visually intact Rice Valley Wilderness Area is back-dropped by distant views of the Little and Big Maria Mountains Chuckwalla Mountains to the south.

Viewer Concern: BLM considers all areas of the CDCA to have high viewer sensitivity, and this would be even more so within the wilderness areas and elevated viewpoints, where the panoramic views, sensitivity levels, and scenic values generally would be particularly high.

Viewer Exposure: As depicted in the viewshed mapping of **VISUAL RESOURCES Figure 2**, the project site would be visible within the Turtle Mountains Wilderness Area from a relatively limited area of ridges in the southernmost portions of the Wilderness Area, primarily within middle-ground distance (up to 5 miles) except for small, highly isolated areas representing a minute proportion of the WA. The project, particularly the solar receiver, would be visible at background distances in other directions greater than 5 miles, however, including portions of the Rice Valley and Palen-McCoy Wilderness Areas to the south and west. As suggested in **VISUAL RESOURCES Figure 8b**, depicting a view at a point approaching background distance within the Turtle Mountain Wilderness, intervening ridges would begin to obscure the project site as viewpoints progress farther northward into the Turtle Mountain WA beyond background distance, but in the middle-ground distance zone views from south-facing slopes and high ridges would remain largely unobstructed. The elevated viewing positions would expose the expanse of the mirror field fully to view, although the field would remain oblique. In general, visual magnitude or the proportion of the field of view occupied by the project would decline as the square of the distance; that is, magnitude of the project from 4 miles is $\frac{1}{4}$ that from 2 miles, and so on. Duration of viewer exposure within the WA is considered relatively limited because climbers in the WA would quickly be out of the area of potential visibility. Although user numbers for the WA are not available, viewer numbers are assumed to be extremely low. Accounting for the limited view duration and extent from elevated locations within the WA, and the very low anticipated number of viewers within the project viewshed, exposure is thus considered to be moderately low.

Overall viewer sensitivity is thus considered to be moderate.

Project Visual Description

Power Plant

The following description is taken from the AFC project description and applicant data responses (-cite-). **VISUAL RESOURCES Figure 9** (AFC Figure 2.2-1) depicts the proposed project layout. **VISUAL RESOURCES Figure 10** depicts architectural elevations of the proposed power blocks (AFC Figure 2.2-3A). **VISUAL RESOURCES Figure 11** (DR 156-1, -2) depicts the proposed solar collector mirror units. **VISUAL RESOURCES Figure 12** depicts the proposed generation tie line poles.

The proposed project would include an overall project footprint of approximately 2.14 square miles (1,370 acres), plus an approximately 10-mile-long single-circuit 230-kV generator tie-line. The project would consist of up to 17,500 individual heliostats arranged in a circular formation, with a diameter of 1.63 miles. Each heliostat would be 24 feet long by 28 feet wide, with a 12-foot pedestal height, 14.5-foot overall height in horizontal stowed position, and up to approximately 24-foot overall height in vertical position.

A single concrete solar receiver tower consisting of a 538-foot-tall concrete tower, 100-foot-tall cylindrical solar receiver, and 15-foot crane (overall height of 653 feet) would be located within the mirror field. The tower is proposed to be constructed of untreated and unpolished concrete.

Various other structures include a steam generation building, hot and cold salt storage tanks, pump support and maintenance area, water treatment building, an on-site switchyard, and an air-cooled condenser, as depicted in **VISUAL RESOURCES Figure 10**. The applicant has proposed to paint the buildings in shades of beige, tan, and gray to blend with the surrounding environment.

Three 5-acre evaporation ponds would be built south of the heliostat field, within the project fence line.

Construction Staging Area

A construction laydown area, temporary heliostat assembly building, administration building, workforce parking, and construction parking are proposed in a roughly 65-acre area adjoining SR 62 north of the heliostat field within the project fence line. This area would have a highway frontage of approximately 3,750 feet (AFC Figure 2.2-6). Construction is estimated to last 30 months, and occur between 5 a.m. and 7 p.m. on weekdays and Saturdays, but may take place on a 24-hour, 7-day basis during some periods.

Plant Night Lighting

Outdoor night lighting is proposed in various locations including building exterior entrances and driveways, around outdoor equipment in the power block and switchyard areas, storage tank containment areas, water treatment building, power block perimeter roadway and internal driveways, parking areas, plant entrance road, signage and main gate. Applicant has proposed adoption of standard CEC lighting requirements, such as restricting direct lighting on site, shielding to avoid upward 'backscatter' illumination, etc.

Linear Facilities

A proposed 10-mile generator tie-line would connect the RSEP to the existing Western Area Power Administration (Western) 161/230-kV Parker-Blythe transmission line. The portions of the tie-line right-of-way outside of the heliostat field would be predominantly on BLM land. The tie-line route would extend south through the heliostat field, east to the project site boundary, and southeast across Rice Valley to Rice Valley Road, approximately 1.7 miles north of the Rice Valley Wilderness. From there the tie-line would parallel Rice Valley Road between the northeast border of Rice Valley Wilderness Area and West Riverside Mountains, until intersecting with the existing Parker-Blythe #2 transmission line, where an interconnection substation would be built on BLM land. The tie line would require construction of 4.6 miles of new unpaved access roads, and use of 5.4 miles of existing unpaved roads.

Interconnection Substation

A new interconnection substation of approximately 300 by 400 feet would be constructed at the point of connection with the existing Western Parker-Blythe #2 transmission line.

Telecommunications

Several alternative telecommunication system options have been proposed by the applicant. The telecommunications would serve to provide monitoring of RSEP generation and system protection of Western's transmission system. The options include: 1) optical ground wire (OPGW) – both above ground and underground; 2) microwave (radio-frequency) transmission; 3) power line carrier/broadband-over-Power-Line (BPL and; 4) all-dielectric, self-supporting (ADSS) optical cable.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

DIRECT PROJECT IMPACTS

Project Operation Impacts

Impacts of Structures on Key Observation Points

KOP 1 – Eastbound SR 62 (approximately 1 mile distance - mirror field not visible)

Visual Resources Figures 4A and 4B depict the view of the site from KOP 1, at a distance of approximately 1 mile looking southeast, and is representative of the view of eastbound motorists on SR 62. As depicted in the simulation, from KOP 1 the mirror fields would remain out of sight. As indicated in **Visual Resources Figure 3**, KOP 1 lies just outside the segment of SR 62 in which the mirror field would be visible. From this point eastward for a distance of roughly 1-1/2 miles, the mirror fields would become visible to eastbound motorists at close distance, after which the project would lie behind them. That segment of roadway, in which the mirror field would be visible, is discussed separately under KOP 4, below.

Visual Contrast. As depicted in the simulation, the receiver tower and other project structures would be visible in eastbound views. The 653-foot tall receiver tower would

exhibit strong vertical form and line contrast, seen against the open sky above the ridgeline of mountains in the distant background. Color contrast of the tower and other structures would vary according to lighting conditions but would generally be moderate with appropriate surface color treatment. However, the bright glare of the 100-foot-tall solar receiver would be highly contrastive, strongly drawing the attention of motorists. At this distance, a staff glare specialist concluded that the receiver would be a bright, visually intrusive, distracting object in the field of view, though it would not represent a physical hazard.

A short distance east of KOP 1, the mirror field would come into full view. This condition is discussed under KOP 4, below, and depicted in **Visual Resources Figure 7b**.

Overall visual contrast for eastbound motorists would be high for a distance of at least two to three miles.

Impacts from proposed construction laydown, operations, and parking would occupy a considerable portion of the immediate foreground highway frontage north of the mirror field. This impact is discussed separately below under Construction Impacts.

Visual Dominance. At this distance the solar receiver tower would exert strong scale dominance, as the only comparable vertical element within the immediate field of view, in a setting characterized by flat, horizontal topography. It would exert strong spatial dominance by strongly attracting attention to the bright solar receiver. Shortly east of KOP 1, the mirror field would also come into full view. That condition is discussed under KOP 4, below. Before the bend in the highway at KOP 1, the mirror field itself would remain out of view and visual effects would be limited largely to the tower and receiver.

View Blockage. View blockage would be moderate. The receiver tower would intrude into views of the Rice Valley and mountains behind, and penetrate the ridgeline of those mountains from some viewing angles. The bright receiver would be a highly distracting element in the view at this distance.

From KOP 1 at a distance of one mile, overall visual change for viewers on SR 62 is considered high. The project would demand attention, could not be overlooked, and would be dominant in the landscape. In the context of the setting's moderately high visual sensitivity, this high level of visual change would represent a significant adverse impact.

Mitigation

To minimize form and color contrast of the project features, staff recommends Condition of Certification VIS-1, Surface Color Treatment of Non-Mirror Structures. Applicant has proposed to color-treat structures other than the receiver tower to blend with the visual background. In addition, Condition of Certification VIS-1 recommends similar color treatment of the receiver tower and heliostat backs to minimize color contrast and blend with the background of the valley floor. With this measure, project color contrast could be reduced considerably. However, visual change would remain high, and impacts significant.

KOP 2 – Westbound SR 62 (approximately 3.5 miles distance – mirror field not visible)

Visual Resources Figures 5A and 5B depict the view of the site from KOP 2, at a distance of approximately 3.5 miles looking southeast, and is representative of the view of motorists, in this case westbound, on SR 62 at distances of roughly 3 miles or greater. As depicted in the simulation, from KOP 2 the mirror fields would remain out of sight. As indicated in **Visual Resources Figure 3**, KOP 2 lies just outside the segment of SR 62 in which the mirror field would be visible. From approximately one mile west of this point for a distance of roughly 3-1/2 miles, the mirror fields would become visible to westbound motorists at close distance, after which the project would lie behind them.

Visual Contrast. At this distance and greater, the project would exhibit moderate form and line contrast. Although contrasting with the predominant horizontal line of the landscape, at this distance the overall magnitude of the structure is small and does not penetrate the mountain ridgeline. As depicted in the simulation, color contrast is relatively high. The tower appears bright against the tan and darker colored background of the mountains behind. This color contrast could be reduced, as discussed under Mitigation, below. In this particular view, the tower is seen against the foreground of small distribution line poles that echo its vertical form. What is not known at this time is how bright the solar receiver would appear to motorists at this distance, and how strongly that brightness would act as a distraction or nuisance. Although it is known that the brightness of the receiver is not capable of causing physical harm to viewers's eyes, the subjective brightness as experienced by motorists is not well-understood. For the purposes of this analysis, staff assumed that at distances of roughly 3 miles or more, as depicted in KOP 2, this brightness would represent a moderately high level of contrast. Overall contrast at this distance and greater is thus considered to be moderate to high.

Visual Dominance. At this distance, the solar receiver would exert moderately high visual spatial and scale dominance. Particularly due to the brightness of the receiver, the tower would draw attention to itself.

View Blockage. View blockage would be moderately low at this distance. The receiver tower would intrude into views of the mountains behind, but would not penetrate their ridgeline. From this distance and greater, the mirror field would not be visible. However, the brightness of the receiver within the field of view could distract from any views seen behind it.

Overall, visual change from KOP 2 and other SR 62 viewpoints at distances of roughly 3 miles or more is considered moderately high. In the context of the setting's moderately high visual sensitivity, this would represent a potentially significant impact with respect to CEQA.

If brightness of the receiver is perceived to be stronger than currently anticipated during operation, significant impacts could extend for greater distances than represented by this KOP. Brightness would however decline as the square of the distance from the light source (solar receiver).

KOP 3 – Northbound Rice Road/Rice Valley/Rice Valley Wilderness (approximately 5 miles from site)

Visual Resources Figures 6A and 6B depict the view of the site from KOP 3, at a distance of approximately 5 miles to the southeast, and is representative of the view from northbound Rice Valley Road, as well as of visitors to the Rice Valley Wilderness. The northern boundary of the Rice Valley Wilderness is located approximately 3 miles south of the project site and includes the Rice Valley Dunes, located in the northern portion of the WA. The northern portions of the WA are thus located at comparable distance to the project site.

Visual Contrast. In this view, the proposed tie-line is viewed in the immediate foreground and is highly prominent. Throughout the rest of the area represented in this KOP, including the WA, the tie-line would remain visible but less prominent, representing a generally moderate level of form, line, and texture contrast. As depicted in this view at background distance, overall project contrast remains moderately high. Even at background distance the mirror field occupies a substantial proportion of the field of view. Further, it is seen within a view notable for the pristine, intact character of panoramic views of the natural valley-and-mountain landscape. Against this backdrop, color, texture, and form contrast of the project would all be high. As accurately indicated in the simulation, from such viewpoints south of the site, heliostat reflection would be visible due to the southward sloping gradient of the mirror field. The receiver tower would be conspicuous in its vertical form contrast, which is accentuated by its brightness.

Visual Dominance. To at least the background distance represented in this view, project spatial dominance would remain moderately high. The bright receiver tower and, under most light conditions, the bright mirror field would strongly draw attention to themselves.

View Blockage. The mirror field would block views of the currently intact valley floor to a moderate degree. The receiver tower would intrude into views of background mountain ridges in some locations and not, as in this photo, of others. The proposed tie-line would intrude into views to varying degrees according especially to distance from the viewer. These would be seen primarily under front-lit conditions. This view intrusion of generation tie line towers is considered moderate, and could be reduced somewhat by color treatment. Overall, view blockage to visitors to the WA would be moderate.

Overall, visual change from KOP 3 and other similar viewpoints in the Rice Valley WA to at least 5 miles' distance is considered moderately high, decreasing with distance.

In the context of the setting's moderate visual sensitivity, this moderately high level of visual change is considered adverse but less than significant, decreasing with greater distance. Because the WA lies predominantly in the background distance zone, potential impacts to visitors in the WA are considered less-than-significant.

Mitigation

To minimize form and color contrast of the project features, staff recommends Condition of Certification VIS-1, Surface Color Treatment of Non-Mirror Structures. Applicant has proposed to color-treat structures other than the receiver tower to blend with the visual background. In addition, Condition of Certification VIS-1 recommends similar color treatment of the receiver tower, heliostat backs, and generation tie line tower to minimize color contrast and blend with the background of the valley floor. Although staff experience has indicated that lattice towers produce less contrast at medium and background distance than the proposed transmission line monopoles, lattice towers have not been recommended on this project due to potentially substantial secondary biological impacts that could result from their use. .

KOP 4 - Westbound SR 62 (approximately 1 mile distance – mirror field visible)

Visual Resources Figures 7A and 7B (DR# 157-2) depict the view of the site from KOP 4, at a distance of approximately 1 mile looking southeast, and is representative of the view of motorists on SR 62 in the roughly 4.6-mile segment of the highway in which the mirror field would be visible to either west- or east-bound motorists. This portion of the highway is also indicated in **Visual Resources Figure 3** (Heliostat Viewshed). As depicted in the simulation, from KOP 4 the mirror fields would be prominently visible in near middle-ground distance from the highway, for roughly 3 miles of the highway for westbound motorists, and for roughly 1 mile for eastbound motorists.

Visual Contrast. Form contrast of the receiver tower (653-foot height) and other tall power plant structures, particularly the steam generation building (150-foot height) and air-cooled condensers (112-foot height), would be high at near-middle-ground distance. The receiver tower would penetrate the skyline of background mountain ridges. Overall contrast of these prominent structures could be reduced considerably by color treatment to reduce color contrast. However, the anticipated brightness of the solar receiver would strongly accentuate project contrast.

As shown in the simulation, the heliostats are dark-colored, strongly increasing color contrast against the generally light-valued, tan-hued foreground and background. As discussed further under the separate analysis of glare impacts, below, a staff glare expert concluded that the amount of reflective glare from the mirror field of this particular project is not anticipated to be high or greatly problematic for viewers on the highway. This is because the backs of the southward-oriented heliostats in the northern portions of the mirror field are expected to physically mask the slightly lower-elevation, northward-oriented heliostats behind them to a large degree. In other words, the mirror field would tilt away (southward) from viewers on SR 62, and mirrors facing motorists on the road would tend to be screened by the backs of closer, southward facing heliostats. This effect would tend to minimize anticipated contrast due to reflective glare from the mirrors as seen from the roadway to the north.

Not depicted in the simulation are the 75 – foot (220/160 kV transmission tie-line power poles, which would be visible from distances of as little as 2 miles, and would exhibit a moderate level of contrast due to their conspicuous vertical form and intrusion into views of the background valley and mountains, contributing further to overall project

contrast. Their contrast would be heightened by the fact that they would be seen most often in back-lit condition.

Also not depicted in this view is the condition that would be experienced by viewers nearer to the center of the project site. At its nearest point to the highway at the center of the site, the mirror field would be quite close to the highway. For some portion of this road segment, the 14.5 to 20+ foot-high heliostats in the foreground would completely block southward views to Rice Valley from the roadway.

Given the vast extent of the mirror field seen at close distances, and the high contrast of the tall, brightly lit receiver tower, overall project contrast from this portion of the highway would be high.

Visual Dominance. As depicted in the simulation, from this portion of SR 62 the mirror field, with a diameter of 1.6 miles, would be seen at an oblique angle, but would extend across the entire field of view, occupying much of the foreground and near-middle-ground view. Views would be strongly drawn by the bright solar receiver, and high contrast of the tall receiver tower. The vast expanse of the mirror field would be highly prominent. For a portion of this segment, the heliostats would dominate and block views from the highway. Visual dominance from this and similar KOPs would be high.

View Blockage. View blockage would be moderate. The receiver tower would intrude into views of the Rice Valley and mountains behind, and penetrate the ridgeline of those mountains from most viewing angles. The mirror field would obstruct views of the bajada floor that would otherwise be visible, but as seen in the simulation, long-distance views of the Rice Valley in the background would remain an attractive, scenic element visible behind it, as would the Little and Big Maria, Arica and Iron Mountains (depending upon direction of view). However, for some portion of the highway toward the center of the site, the heliostats would also completely block views of the valley to the south. Motorists' views would be enclosed on both sides of the highway for a short distance, the aqueduct to the north, and the heliostats to the south.

Overall visual change for viewers on SR 62 in this and other KOPs in this 4.6-mile segment of highway would be high. The project would demand attention, could not be overlooked, and would be dominant in the landscape.

In the context of the setting's moderately high visual sensitivity, this high level of visual change would represent a significant adverse impact.

Mitigation -

To reduce potentially significant visual impacts from this and similar KOPs, staff recommends Condition of Certification VIS-1, Surface Treatment of Non-Mirror Project Structures and Buildings, including backs of heliostats, to reduce color contrast with the project setting. However, even with available mitigation measures, impacts are anticipated to remain significant.

KOP 5a, 5b – Turtle Mountain Wilderness Elevated Viewpoints

VISUAL RESOURCES Figures 8A and 8B are virtual views created with Google Earth to simulate views toward the project site from ridges within the Turtle Mountain Wilderness Area north of the project site. These schematic simulated views are created from accurately scaled layouts of the project footprint, and have been cropped to emulate a 'normal' camera lens (approximately 40 degree horizontal angle of view). Distances to the project site for the two viewpoints are 2 and 4.8 miles respectively, i.e., representing a range of distance zones from near-middle-ground to background distance. Elevations of viewpoints generally increase with distance, from the foot of the mountains near the project site to the higher ridges at background distance to the north.

KOP 5A - As suggested in **VISUAL RESOURCES Figure 8A**, from elevated middle-ground viewpoints in the Turtle Mountains, the vertical angle of view is such that visual exposure of the mirror fields would exhibit moderate form contrast, as well as strong color and texture contrast with the setting. The latter, however, would vary greatly according to changing brightness levels of diffuse reflected sunlight, as described further under a separate discussion of project glare, below. At this height and distance (2 miles distance, 1,380-foot elevation), the project would appear as more than a thin contrasting line, as it would in views from the valley; however, the angle of view also remains sufficiently oblique that the proportion of the overall view occupied by the mirrors is moderate. The solar receiver tower would present strong vertical form contrast; overall tower contrast could be moderated by surface treatment to reduce color contrast. However, contrast of the tower would be heightened substantially by the brightness of the receiver which, though not blinding, would strongly draw attention and detract from views in the direction of the project. Overall, contrast from this KOP would be high.

Visual Dominance. The project would exert moderately high visual dominance at this distance. The mirror fields occupy a relatively high portion of the overall field of view. Their potentially high contrast under bright reflective conditions would further attract attention. The bright solar receiver would strongly attract attention, tending to dominate attention.

View Blockage. The project heliostat field would block views of the portion of the valley floor that it occupies. At this distance this would represent a moderate portion of the field of view. The solar receiver tower would intrude into background views of the valley and mountains to a moderately high degree due to the continuous brightness of the receiver.

At this distance (approximately 2 miles), overall visual change from elevated viewpoints would be high. In the context of the setting's moderate visual sensitivity, this would represent a potentially significant impact.

KOP 5B - (background) - **VISUAL RESOURCES Figures 8A and 8B** is representative of background distance zone viewpoints within the Turtle Mountains. It is a virtual view of the project footprint from the KOP is roughly 4.8 miles from the project site at an elevation of approximately 2,428 feet or roughly 2,100 feet or more above the project site, at the top of a ridge.

Visual Contrast. As suggested in the figure, at this distance and elevation, visual magnitude of the mirror field has declined substantially from the view at 2 miles. The vertical angle of view remains relatively oblique, and foreground features, particularly intervening ridges of the Turtle Mountains, are beginning to block a part of the view of the project. Form contrast would be moderately low; color and texture contrast would be moderately high. Contrast would range from moderate to moderately high depending upon the brightness of the mirror field, which would vary according to season and time; and the solar receiver. The latter would appear bright, and contrast with the darker visual background.

Visual Dominance. Visual dominance would be moderate. The overall portion of the view occupied by the project is moderate. Dominance would depend to a degree on how much attention the solar receiver and mirror field attract due to brightness. At this distance, the dominance of these bright objects is anticipated to be moderate.

View Blockage. The project heliostat field would block views of the portion of the valley floor that it occupies. At this distance this would represent a moderately low portion of the field of view. The solar receiver tower would intrude into background views of the valley and mountains to a minor degree due to the continuous brightness of the receiver.

Overall, visual change from elevated viewpoints in the Turtle Mountains would decrease with distance. From viewpoints approaching background such as KOP 5B, visual change would be moderate overall. In the context of the setting's moderate visual sensitivity, this would represent an adverse but less-than-significant impact.

Glare Impacts

As discussed in detail in the **Traffic and Transportation** section, based on applicant's Data Response #148, at 1,000 meters (3,281 feet or .62 miles), the distance from the nearest point on SR 62 to the solar receiver tower, reflected luminous flux would be 200 lumens (CH2MHill 2010a). At this level of brightness, staff determined that the solar tower, while not constituting a hazard, would represent a very bright, intrusive and distracting object in the field of view. Staff also concluded that the receiver could be visible as a bright object in the field of view to a distance of ten miles or more. To minimize potential adverse impacts on the solar receiver tower on motorists or aviation activities, cooperating agencies have identified and staff has recommended Condition of Certification **TRANS-7**, which would require the applicant to prepare a Solar Energy Receiver Luminance Monitoring Plan, as described in the Transportation section of this Staff Assessment. However, with this measure, illumination from the solar receiver, although not hazardous, would remain bright, intrusive and distracting to considerable distances.

The majority of mirrors in the solar field, including those nearest SR 62, would point south toward the receiver tower and would not be expected to direct light toward the highway. A smaller proportion of mirrors would face north toward SR 62. These would be largely shielded by the closely mounted heliostats to their north, whose backs face the highway. As a result none of the mirrors can be expected to direct total solar energy towards motorists during normal operation. The potential aggregate brightness of the

mirror field to observers on the ground is thus believed by staff not to be a hazard. However, under some conditions the mirror field could appear as a bright, distracting source of nuisance glare to observers on the ground, including motorists on SR 62, hikers in the Turtle Mountains to the north, and hikers to the south of the project.

Due to the topography of the site and vicinity, which slopes to the south, some mirror surfaces would be visible in viewpoints to the south, as illustrated in **VISUAL RESOURCES Figure 6B**, depicting a simulated view of the project from KOP 3 south of the project site. Under certain conditions these reflections could appear quite bright, varying by time of day and season. The distances between south-facing mirrors and viewpoints such as KOP 3 would reduce the potential impact. Under no circumstance are the solar reflections likely to represent a hazard to ground-level viewers. However, the level of brightness of reflection from the mirror field could at various times remain a bright, distracting nuisance to observers at this distance.

Thus, for purposes of this visual analysis, glare from both the solar receiver and from heliostats would not represent a hazard to viewers on the ground, but would appear as very bright objects in the field of view. They would attract attention, intrude into scenic views, and contribute to a heightening of the overall contrast and visual change of the project, within the middle-ground distance zone in general, and in those locations where mirror-field and solar tower are both visible together, in particular. This heightening of contrast of the project due to solar tower and heliostat brightness would substantially increase its area of potentially significant adverse visual effects. Project glare, particularly from the solar receiver, is thus considered to be a significant and unmitigable impact.

Project Construction Impacts

Construction Staging Area

Proposed project laydown, parking, and other construction-related facilities would be located along a 3,750 (0.72 mile) length of highway frontage south of SR 62 at the north project site boundary. These facilities would occupy the immediate visual foreground of viewers on SR 62 and would represent a high level of adverse visual change for the estimated 30 months of project construction, plus the time required for full restoration of the ground disturbance caused by these temporary facilities. The existing visual foreground of scrub vegetation would be replaced by the visually dominant presence of equipment, construction materials, parked vehicles and disturbed ground. These disturbances in the immediate highway foreground would represent a high level of visual change and a significant adverse impact for the 30 months of construction, and for some period of time until re-vegetation matures. To address this impact, staff recommends **Condition of Certification VIS-3**, Construction Area Buffer Zone, Screening and Restoration. With this measure, short- and long-term impacts from construction area disturbance could be reduced to a less-than-significant level.

Site Grading

Site grading would potentially represent a substantial visual component of the proposed project during construction. Surface disturbance of the proposed site, as in most desert landscapes of the region, would result in high contrast between the disturbed area and

surroundings, due to high contrast between the disturbed soil color and albedo, and the color and albedo of the existing undisturbed, vegetated surface. Furthermore, effectiveness of revegetation in this arid environment is difficult, often of limited effectiveness, and capable of full recovery only over a long-term time frame. Grading impacts would be similar in extent to the completed project itself, and somewhat less in terms of degree of visual contrast and change, and would be replaced by impacts of the heliostats and power plant themselves, analyzed previously. In effect site grading would represent the onset of project impacts at a slightly earlier date, and would immediately be superceded by the more severe project impacts themselves. Consequently, site grading impacts are considered here as a part of the significant project impacts already identified, above.

Indirect Impacts

Indirect impacts could result from proposed telecommunications interconnections between the RSEP and either or both Western's Parker and Blythe substations. Several alternative telecommunication system options are under consideration. These include: 1) optical ground wire (OPGW) – both above ground and underground; 2) microwave (radio-frequency) transmission; 3) power line carrier/broadband-over-Power-Line (BPL) and; 4) all-dielectric, self-supporting (ADSS) optical cable. These are assessed as follows:

Fiber-optic Cable Alternative

Construction equipment associated with installation of fiber optic cable (either above or below ground) could create short-term temporary (1 to 2 days) impacts to viewers along SR 62 and particularly in segments of the existing transmission line that would be visible to Wilderness area visitors. Visual impacts would be minor in comparison to the overall impacts from the RSEP. Buried cable along SR 62 would have no impact on the highway's potential scenic designation. Visual impacts would be less than significant with respect to CEQA.

Microwave Alternative

A 150-tall microwave tower at either of Western's Headgate Rock, Black Point or Blythe substations would be, by its nature, highly visible since the intent is to have line-of-sight communication with the RSEP directly or via an intermediate tower. The Headgate Rock substation is located south of recreational land associated with the Colorado River, north of a residential development, and in proximity to Highway 62. A microwave tower at this location would create adverse, long-term scenic impacts to visitors and residents. The tower would exhibit strong vertical form and line contrast, seen against the open sky above the ridgeline of mountains in the distant background to the west and to the undeveloped desert land to the east. Color contrast of the tower and other structures would vary according to lighting conditions but would generally be moderate with appropriate surface color treatment.

The Blythe substation location would be located in foreground views of large numbers of motorists on Highway I-10. The visual effects of the alternative would be as described above. However, the existing visual setting is compromised by existing development, including an airport, light industrial uses, and agriculture, moderating the scenic sensitivity of the site.

The Black Point substation location would affect far fewer receptors than at other alternative sites. However, the facility would be visible at foreground distance and thus highly prominent as seen from points within the nearby Big Maria Mountains Wilderness Area, as well as from Highway 95 and the Colorado River, elevating visual sensitivity of the site.

Another microwave site option would be located at Cunningham Mountain, which is an existing telecommunications site that likely would have space on an existing tower for a microwave receiver dish. Because this structure already exists, the addition of an additional receiver dish here would have the least impact of the alternatives described.

A proposed intermediate tower site (if needed) would be visible by motorists traveling along SR 62. The tower would exhibit strong vertical form and line contrast, seen against the open sky above the ridgeline of mountains in the distant background. Color contrast of the tower and other structures would vary according to lighting conditions but would generally be moderate with appropriate surface color treatment. The proposed location appears to be one where several other transmission towers already exist. As such, a new tower would contribute further to the dominance of these strong vertical elements within the immediate field of view, in a setting characterized by flat, horizontal topography. View blockage would be moderate. The receiver tower would intrude into views of the Rice Valley and mountains behind, and penetrate the ridgeline of those mountains from some viewing angles.

Staff concludes that the construction of a microwave tower at the Headgate Rock substation, the Black Point substation, and possibly an intermediate microwave tower in the Rice Valley would result in adverse impacts to existing scenic resource values. However, with the inclusion of the following recommended Conditions of Certification or similar, potential visual impacts would be less than significant:

VIS 1 Surface Color Treatment of Non-Mirror Structures: to lower color contrast of the proposed transmission poles and blend with the visual background;

VIS 3 Construction Area Buffer Zone, Screening and Restoration.: to minimize and remediate construction impacts.

The above measures are recommended by staff for all microwave tower alternatives in order to minimize potential visual impacts.

BPL Alternative

No impacts to visual resources would occur under the BPL alternative.

Closure and Decommissioning Impacts and Mitigation

Permanent closures would require the applicant to submit to the Energy Commission a contingency plan or a decommissioning plan. A decommissioning plan would be implemented to ensure compliance with applicable LORS, removal of equipment and shutdown procedures, site restoration, potential decommissioning alternatives, and the costs and source of funds associated with decommissioning activities.

The removal of the existing facility would leave a very prominent visual impact over the entire site due to form, line, color and texture contrast created between graded or disturbed soil areas and undisturbed areas in the region of the project site. This color contrast is due particularly to the removal of the dark color element contributed by normal scrub vegetation cover. After decommissioning, the site would leave a geometric area of form, line, color and texture contrast visible mainly to elevated locations within the adjacent wilderness area. Revegetation of areas in this desert region are difficult but have been implemented by the BLM with success over time. Thus, visual recovery from land disturbance after closure and decommissioning could take place, although over a long period of time, with implementation of an active and comprehensive revegetation program for the site.

CEQA LEVEL OF SIGNIFICANCE

Appendix G of the CEQA Guidelines lists four significance criteria for evaluating aesthetic impacts, as follows:

A. Would the project have a substantial adverse effect on a scenic vista?

No specific designated scenic vista locations were identified in the project viewshed. However, BLM considers that a primary purpose of the CDCA is to recognize and conserve the natural beauty and scenic recreational qualities of the California Desert. As described above, the project viewshed as a whole is considered to be highly scenic, and various KOPs with high levels of viewer concern for scenic values would be affected by the project, including motorists on Highway SR-62, and visitors to the Turtle Mountain and Rice Valley Wilderness Areas (WAs). In the segment of SR 62 nearest the project, the heliostats would block scenic southward views to the Rice Valley. These effects were determined to be potentially significant in the staff analysis presented above. The effect on existing scenic vistas within the project viewshed, both from SR 62 and within the adjoining WAs, are thus considered significant.

B. Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway?

The project is adjacent to Highway SR-62, a 140-mile long eligible State Scenic Highway. Much, though not all, of that eligible segment is currently highly pristine, free of substantial man-made visual intrusion, particularly in the segment east of the town of Twenty Nine Palms to the Arizona border. Therefore, visual intrusions into the scenic corridor of the highway could potentially affect its eligibility for nomination as an officially designated State Scenic Highway. However, the proportion of the eligible scenic segment potentially affected by this project would not, in itself, jeopardize possible future scenic designation. No rock outcroppings or other notable geographic features are found on the project site. However, the site is an abandoned airfield of some historic interest. Whether the site is historically significant or eligible for state or national listing is discussed in the Cultural Resources section of this report. However, the remnants of the airfield and abandoned town of Rice are no longer visually evident to the public traveling on SR 62, so integrity of the visual setting is unlikely to be an important contributing factor to its status as an historic property. The project would therefore not

substantially damage scenic resources or adversely affect the eligible State Scenic Highway to a significant degree.

C. Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

As described in the main analysis above, the project could degrade the existing visual character and quality of views from Highway SR-62 and the Turtle Mountain and Rice Valley Wilderness Areas. With staff-recommended Conditions of Certification, these impacts could be reduced, but would remain significant.

D. Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Glare is an issue of concern for the Rice Solar Project, primarily due to the potential to accentuate project contrast and aesthetic impact. Physical hazard from project glare is not anticipated. Glare would take three forms: 1) reflected glare from heliostats as seen from certain viewpoints, particularly elevated viewpoints within the Turtle Mountain WA, and ground-level viewpoints within the Rice Valley WA; 2) direct glare from the solar receiver atop the solar receiver tower; 3) night-time light pollution from both facility lighting and possible FAA-required aviation warning lights atop the solar receiver tower. The first two forms of daytime glare would contribute strongly to overall project contrast and have been analyzed in the discussion on project impacts from various KOPs, above. Because of the strong contribution of daytime glare to project visual incompatibility with the setting, and the substantial expansion of the affected area due to the brightness of the solar receiver, daytime glare is considered to represent a significant and unmitigable impact.

Nighttime light pollution impacts would be of particular concern to visitors to the two WAs. The pristine, completely unlit night sky conditions of the existing setting is a part of the attraction of virtually all WAs within the California Desert, and is often cited as a valued attraction of the desert for campers (IDSA, 2010). However, staff concluded that these night light pollution effects of the project, with appropriate mitigation measures as proposed by the applicant and described in staff-recommended Condition of Certification VIS-2, would not be substantial beyond background distances of very roughly 4 or 5 miles. This radius of effect from FAA aviation lighting and illuminated power block, parking and other associated facilities would correspond roughly to the boundary of the adjoining WAs. Therefore, campers within the boundaries of the WAs would be minimally affected. This, together with the fact that the number of such visitors to either WA is believed to be extremely low, leads staff to the conclusion that such effects would be less-than-significant.

Similarly, motorists on SR 62 would experience these adverse light pollution effects within the same general radius of effect. Sensitivity of night time motorists is believed to be moderate for the following reasons: the brightness of auto headlights would be brighter than the project lighting effects being considered; the overall number of night motorists would be relatively low; the experience for such motorists would be of relatively short duration. Consequently, light pollution impacts to nighttime motorists are considered adverse, but less-than-significant. There are no residents in the viewshed to

experience such effects. The potential for cumulative nighttime light pollution impacts is discussed below under the analysis of cumulative impacts.

REDUCED ACREAGE ALTERNATIVE

The Reduced Acreage Alternative would be 7.2 percent smaller than the proposed project. It would be located in the same 2,560-acre square-shaped parcel within the larger 3,324-acre ownership property as the proposed project. Although the overall heliostat field distance from the central tower would be reduced, the number of heliostats would remain the same. The heliostat field (plus the evaporation pond and administration areas) would occupy about 1,270 acres instead of the 1,370 acres required for the proposed project. The receiver location would remain the same, with the edges of the field contracting towards the center. The heliostat footprint of the Reduced Acreage Alternative is shown in **Alternatives Figure 2**. The site layout, 653-foot total height of the solar tower and receiver, and transmission interconnection to Western's Parker-Blythe transmission line would be the same as the proposed project. The generation output would be reduced by approximately 2 MW.

Similar to the proposed project, the Reduced Acreage Alternative would transmit power to the grid through the planned Western substation to be located adjacent to Western's Parker Blythe 161 kV transmission line #2.

1. The Reduced Acreage Alternative is evaluated in this SA/DEIS because it would eliminate about 100 acres of the proposed project footprint, reducing impacts to ephemeral washes, the loss of land considered habitat for the state and federally listed threatened desert tortoise and impacts to the historic Rice airfield. The Reduced Acreage Alternative would allow the applicant to contribute clean, renewable energy to help meet the State's energy goals, while minimizing impacts to the desert environment. A limited acreage alternative was suggested in scoping comments

SETTING AND EXISTING CONDITIONS

The Reduced Acreage Alternative would incorporate the following changes

- It would modify the boundaries of the heliostat field as follows:
- The northern edge of the heliostat field would remain the same as with the proposed project
- The western, southern, and eastern edges would contract slightly towards the center of the smaller heliostat field

As such, the setting for the Reduced Acreage Alternative is the same as for the proposed project with the exception of the changes addressed above.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Project Operation Impacts

Impacts of the Reduced Acreage Alternative would be similar in character but reduced to a small extent and degree compared to the Proposed Project from all KOPs.

From viewpoints on SR 62, differences in the visual effect of this alternative compared to the proposed project would be minor. Outside of a four-mile segment in which the mirror field would be visible to motorists on SR 62, the impacts of the Reduced Acreage Alternative would be identical to those of the proposed project. Within the segment where the mirror field could be seen from SR 62, reduction in impacts to motorists would be minor and inconsequential. Because the northern edge of the mirror field would remain the same, the nearest and most visually prominent portion of the field would remain generally unaltered from the perspective of motorists. The overall extent of the mirror field would be reduced to an almost imperceptible degree. From the perspective of motorists, the field would still appear vast in extent and spatially dominant where visible. Impacts in the roughly 4-mile segment of SR 62 in which the mirror field would be visible to motorists would thus remain significant. Impacts of other features of the project, particularly the solar receiver and tower, would remain the same as under the proposed project.

From viewpoints in the Turtle Mountain and Rice Valley WAs, the reduction in the overall size of the mirror field would reduce the level of visual change attributable to it, but by a small extent. The contrast, dominance, and blockage of views of the desert floor would remain substantially as under the proposed project, that is, moderately high and impacts significant.

Project Construction Impacts

Construction Staging Area

While the dimensions of construction staging have not been described for this alternative, it is assumed that these could be 7.2% smaller than those of the proposed project. These would be essentially the same as under the proposed project, and would be potentially significant for the duration of construction, and potentially longer. To address this impact, staff recommends **Condition of Certification VIS-3**, Construction Area Buffer Zone, Screening and Restoration. With this measure, short- and long-term impacts from construction area disturbance could be reduced to a less-than-significant level.

Site Grading

As described under the propose project, site grading would in effect represent the onset of project impacts at a slightly earlier date, and would immediately be superceded by the more severe project impacts themselves. Consequently, site grading impacts are considered here as a part of the significant project impacts already identified, above.

CEQA LEVEL OF SIGNIFICANCE

Appendix G of the CEQA Guidelines lists four significance criteria for evaluating aesthetic impacts, as follows:

A. Would the project have a substantial adverse effect on a scenic vista?

No specific designated scenic vista locations were identified in the project viewshed. However, BLM considers that a primary purpose of the CDCA is to recognize and

conserve the natural beauty and scenic recreational qualities of the California Desert. As described above, the project viewshed as a whole is considered to be highly scenic, and various KOPs with high levels of viewer concern for scenic values would be affected by the project, including motorists on Highway SR-62, and visitors to the Turtle Mountain and Rice Valley Wilderness Areas. These effects were determined to be potentially significant in the staff analysis of the Reduced Acreage Alternative presented above. The effect on existing scenic vistas within the project viewshed, both from SR 62 and within the adjoining WAs, are thus considered significant.

B. Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway?

The project is adjacent to Highway SR-62, a 140-mile long eligible State Scenic Highway. Much, though not all, of that eligible segment is currently highly pristine, free of substantial man-made visual intrusion, particularly in the segment east of the town of Twenty Nine Palms to the Arizona border. Therefore, visual intrusions into the scenic corridor of the highway could potentially affect its eligibility for nomination as an officially designated State Scenic Highway. However, the proportion of the eligible scenic segment potentially affected by this project would not, in itself, jeopardize possible future scenic designation. No rock outcroppings or other notable geographic features are found on the project site. However, the site is an abandoned airfield of some historic interest. Whether the site is historically significant or eligible for state or national listing is discussed in the Cultural Resources section of this report. However, the remnants of the airfield and abandoned town of Rice are no longer visually evident to the public traveling on SR 62. Consequently, integrity of the site's visual setting *per se* is considered unlikely to be an important contributing factor to its status as an historic property at this time. The Reduced Acreage Alternative is therefore not anticipated to substantially damage scenic resources or adversely affect the eligible State Scenic Highway to a significant degree.

C. Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

As described in the main analysis above, the project could degrade the existing visual character and quality of views from Highway SR-62 and the Turtle Mountain and Rice Valley Wilderness Areas. Under the Reduced Acreage Alternative, these effects would be reduced to a small extent, but as discussed in the analysis above, visual impacts to key receptors would remain moderately high, and significant. With staff-recommended Conditions of Certification, these impacts could be reduced further, but would remain significant.

D. Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Glare impacts under the Reduced Acreage Alternative would be essentially identical to those described under the proposed project. Glare from the solar receiver would contribute strongly to the overall visual change of the project, generally representing its most visually conspicuous aspect during daytime. Overall, daytime glare impacts of the alternative are considered significant and unmitigable. Nighttime light pollution impacts, including possible FAA-required aviation, are considered less-than-significant with staff-

recommended Condition of Certification VIS-2 due to the anticipated distance of key sensitive viewers within the adjoining WAs to the light source.

NORTH OF DESERT CENTER ALTERNATIVE

The North of Desert Center Alternative would be a 150 MW solar thermal facility located on approximately 2,643 acres of land. It is located along Desert Center Rice Road (State Route 177) east of Kaiser Road, north of Oasis Road, and approximately 1.6 miles north of I-10. The North of Desert Center Alternative is primarily private land with smaller sections of BLM land in the eastern portion of the site. It is largely fallow agricultural land. The existing SCE 161-kV transmission line (from the Blythe-2 substation to the Eagle Mountain-1 substation) that traverses the alternative site would be realigned to roughly follow the site boundary. A new 0.125-mile generation tie line (along Osborne Ave.) and substation would interconnect to the realigned SCE line at the northeast boundary of the site. The boundaries and transmission realignment of the North of Desert Center Alternative are illustrated in **Alternatives Figure 2**.

The Desert Center Alternative is evaluated in this SA/DEIS because it would reduce impacts to cultural resources; the RSEP is located on the historic Rice Army Airfield. The North of Desert Center Alternative would allow the applicant to contribute clean, renewable energy to help meet the State's energy goals, while minimizing impacts to the desert environment.

SETTING AND EXISTING CONDITIONS

The North of Desert Center Alternative site is located on primarily private land adjacent to BLM-managed land north of Desert Center. Surrounding BLM lands are currently under study by BLM as part of the Riverside East Solar Energy Study Area (ANL, 2010). The SCE 161 kV transmission line crosses the site from the northwest to southeast corner. Some active agriculture (date palm orchards) occurs along the southeast corner of the project site. The site is roughly 3 miles north of I-10, immediately east of Rice Road (Highway 177), and a short distance east of the Desert Center Airport and the Chuckwalla Valley Raceway, a 400-acre racing facility that is currently under construction and plans to open in 2010. Other features visible in the SR 177 viewshed include Lake Tamarisk, a small rural residential community, and other small residential settlements; extensive areas of cultivated arid agriculture of different kinds; an auto towing and storage yard; ruins of abandoned buildings and extensive evidence of past ground disturbance in the roadway foreground.

Potential sensitive viewer groups within the viewshed of the North of Desert Center Alternative include motorists on I-10 three miles to the south; motorists on SR 177 (Rice Road); residents off of Rice Road in the western Chuckwalla Valley; potential background distance viewers within Joshua Tree National Park, the BLM Chuckwalla Mountains WA and, to a lesser extent due to greater distance (over 10 miles), the BLM Palen-McCoy WA.

The quality of existing views for these different groups varies. From I-10, this western portion of the Chuckwalla Valley retains the typical characteristics of the region in a relatively undisturbed state – distant views of low, jagged-peaked mountain ranges in

the distance over vast, open areas of level valley floor with characteristic sparse creosote scrub vegetation. From I-10 the overall landscape character and visual quality of the affected area of the Chuckwalla Valley is predominantly natural in appearance from this viewpoint, with a few structures at Desert Center and residences of the community of Lake Tamarisk visible. Similarly, views from within the National Park and BLM WAs are predominantly intact with moderately high visual quality.

Within the view corridor seen from SR 177, the character and quality of views is quite different than that from I-10, and also quite different from the proposed project site in its level of scenic intactness and overall visual quality. Though retaining a picturesque and predominantly natural, rural character, views from SR 177 have substantial evidence of human disturbance and a relatively low level of scenic intactness. There are unquestionably segments of the SR 177 north of Desert Center that retain a relatively natural, undisturbed character, but overall this portion of the viewshed is characterized by human settlement and has moderate visual quality.

The quality of views of local residents varies. Some, particularly those west of SR 177, are predominantly intact and include intact, scenic views of the Eagle and Coxscomb Mountains toward the west and north. Others adjoining SR 177 share the views described for that highway above.

In general, overall sensitivity of motorists on both highways is considered to be moderately high. BLM considers that conservation of scenic qualities of the California Desert is a primary purpose of the CDCA Plan and scenic expectations of motorists in the region, a large proportion engaged in recreation-oriented travel, are considered higher than average. Overall sensitivity of viewers within the special designation recreation areas mentioned are considered to be high. Overall sensitivity of local residents is considered to be moderately high.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Project Operation Impacts

With the addition of the project, views of the North of Desert Center Alternative site would change from an natural or pastoral landscape to a substantially more industrial, highly man-altered one. The industrial landscape would include the 1.63-mile diameter field of 15-to-25-foot-tall heliostats, and the 653-foot-tall solar receiver tower and brightly lit solar receiver. There would be no natural features to substantially block the view of the solar facilities on any side. The North of Desert Center Alternative site would be prominently visible from I-10 for both westbound and eastbound traffic. Travelers would be approximately 3 miles south of the project at their nearest point (middle-ground distance), and there is little elevation or natural contouring to block views of the solar field. Given the terrain and view relationships prevailing at this site, views from I-10 would resemble that depicted in **Visual Resources Figure 7B** (simulation from KOP 3), except that the project would be nearer and thus more prominent. Views from residences west of SR 177 would be similar, or could resemble that depicted in **Visual Resources Figure 8B** (simulation from KOP 4) for those residences located within the near-middle-ground distance zone. Overall project visual change from these viewpoints would range from moderately high to high mainly as a function of distance. In the

context of moderately high visual sensitivity of I-10 motorists and local residents, then, these high levels of visual change are considered a significant adverse impact.

The North of Desert Center Alternative site would be potentially visible from the easternmost portions of Joshua Tree National Park, including east-facing portions of the Eagle Mountains at a distance of approximately 5 miles to the west, and from south-facing portions of the Coxscomb Mountains at a distance of approximately 3.5 miles to the north. It would also be visible from the BLM Desert Lily Preserve ACEC, located across SR 177 at a distance of approximately 3 miles; from the Chuckwalla Wilderness at distances of under 5 miles at its nearest point; and the Palen-McCoy Wilderness at distances of over 10 miles. Elevated views at least within middle-ground distance (5 miles or less) would resemble those depicted in **Visual Resources Figure 9** (simulation of views from KOP 5B). As depicted in that KOP, overall visual change from the combination of mirror field, receiver tower, and bright solar receiver would be moderately high. In the context of these viewpoints' moderately high visual sensitivity, this level of visual change is considered a significant adverse impact.

Within the SR 177 highway corridor, the project would be seen in the near foreground and exhibit high overall visual change. In the context of the highway's moderate visual sensitivity, this would represent a potentially significant impact.

Project Construction Impacts

Construction Staging Area

Construction staging has not been described for this alternative. However, if these were located in the foreground of SR 177, their impacts on views of motorists on the highway could be high, extensive and significant. If this alternative is selected, staff thus recommends **Condition of Certification VIS-3**, Construction Area Buffer Zone, Screening and Restoration. With this measure, short- and long-term impacts from construction area disturbance could be reduced to a less-than-significant level.

Site Grading

As described under the propose project, site grading would in effect represent the onset of project impacts at a slightly earlier date, and would immediately be superceded by the more severe project impacts themselves. Consequently, site grading impacts are considered here as a part of the significant project impacts already identified, above.

Comparison to Proposed Project

The North of Desert Center Alternative site would have significant adverse visual impacts to various sensitive viewers identified within its viewshed. However, in contrast to the highly pristine and undisturbed character of the Rice Valley, this portion of the Chuckwalla Valley on the SR 177 corridor, though retaining a picturesque and predominantly rural character, has substantial evidence of human disturbance and a comparatively low level of scenic intactness, particularly as seen from SR 177. Thus, in terms of impacts to the visual quality of its setting, impacts of this alternative from the adjacent highway would be less severe than the proposed project. Similarly, impacts of this alternative to viewers on I-10 would be less than those of the proposed project to viewers on SR-62, although they would remain significant.

However, compared to the proposed project, the North of Desert Center Alternative would affect a considerable number of residents, whose visual exposure to project impacts would be extended and extensive. The project could also affect viewpoints in the easternmost slopes of the Joshua Tree National Park, although use levels in these portions of the park were not known at the time of writing.

CEQA LEVEL OF SIGNIFICANCE

Appendix G of the CEQA Guidelines lists four significance criteria for evaluating aesthetic impacts, as follows:

A. Would the project have a substantial adverse effect on a scenic vista?

No specific designated scenic vista locations were identified in the viewshed of the North of Desert Center Alternative. However, BLM considers that a primary purpose of the CDCA is to recognize and conserve the natural beauty and scenic recreational qualities of the California Desert. As described above, various KOPs with moderately high or high levels of viewer concern for scenic values would be affected by the project, including motorists on Highway I-10, visitors to the easternmost portions of Joshua Tree National Park and Chuckwalla Mountains WA, and local residents. The effect on existing scenic vistas within the project viewshed, both from I-10 and within the adjoining recreational areas, is thus considered significant.

B. Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway?

The North of Desert Center Alternative is not located within the viewshed of any designated or eligible State scenic highways. The site is a brownfield site and does not contain notable scenic resources. The North of Desert Center Alternative is therefore not anticipated to substantially damage scenic resources or adversely affect an eligible State scenic highway.

C. Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

As described in the analysis above, the North of Desert Center Alternative could degrade the existing visual character and quality of views from Highway I-10, portions of Joshua Tree National Park, the Chuckwalla Mountains Wilderness Area, and local residents in the western Chuckwalla Valley. With staff-recommended Conditions of Certification, these impacts could be reduced further, but would remain significant.

D. Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

As described for the proposed project, glare would take three forms: 1) reflected glare from heliostats as seen from certain viewpoints, particularly elevated viewpoints within the Joshua Tree National Park and Chuckwalla Mountains WA, and to a lesser degree,

ground-level viewpoints on Highway I-10; 2) direct glare from the solar receiver atop the solar receiver tower; 3) night-time light pollution from both facility lighting and possible FAA-required aviation warning lights atop the solar receiver tower.

Under the North of Desert Center Alternative the first type of glare would be similar to that described for the proposed project.

The other two types of glare would also be comparable to those described under the proposed project. Glare from the solar receiver would contribute strongly to the overall visual change of the project, often representing its most visually conspicuous aspect in daytime. However, in comparison to the proposed project, whose viewers are primarily transient motorists, sensitive receptors of the receiver glare would include substantial numbers of nearby residents, whose exposure would be intensive, continuous, and long-term. Overall, daytime glare impacts of the alternative are considered significant and unmitigable.

Nighttime light pollution impacts are considered potentially significant even with staff-recommended Condition of Certification VIS-2. Although existing developments in the viewshed contribute to existing light pollution, addition of FAA aviation strobe lighting atop the receiver tower could represent a disruptive, character-changing element into the foreground of a substantial number of local residents. This impact is considered significant, and unmitigable.

SR 62/RICE VALLEY ROAD GENERATION TIE LINE ALTERNATIVE

The SR 62/Rice Valley Road Generation Tie Line Alternative would interconnect to Western Area Power Administration's (Western) 161-kV/230-kV Parker-Blythe #2 transmission line at the same location as the proposed project generation tie line. This alternative generation tie line would exit the power block directly to the east and follow a proposed access road within the heliostat field. The tie-in would then turn north inside the RSEP property boundary and run along the RSEP's circular perimeter road to the north and northwest. At the north end of the heliostat field, the route would traverse the construction laydown area on previously disturbed land over a distance of approximately 500 feet to the southern side of State Route 62. The route would follow State Route 62 approximately 3.8 miles east to the junction of Rice Valley Road. It would then trend south to follow the unpaved Rice Valley Road for 4.1 miles to its juncture with the applicant's proposed new generation tie line alignment and continue southeast for 5.4 miles along the proposed alignment to Western's Parker-Blythe #2 transmission line. The SR 62/Rice Valley Road Generation Tie Line Alternative route is illustrated in **Alternatives Figure 4**.

SETTING AND EXISTING CONDITIONS

The setting of the SR 62/Rice Valley Road Generation Tie Line Alternative would be as described for the proposed project.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Although the impacts of this alternative would be similar to the proposed project, the SR 62/Rice Valley Road Generation Tie Line Alternative would aggravate the adverse

visual effects of the proposed project by placing a highly prominent transmission line and its attendant 75-foot power poles, in a 3.8-mile segment of the immediate Highway SR-62 visual foreground. In the context of the highly sensitive project setting and the highway's State-eligible scenic status, this impact alone would be considered potentially significant.

From a purely visual standpoint this alternative would substantially increase the visual impact of the proposed project. If this alternative is selected, staff recommends adoption of mitigation measures that include an altered alternative tie-line alignment with substantially greater set-back from SR 62. Depending upon the precise alignment selected, such a measure would have the potential to reduce the additional visual impact of the alternative tie-line to less-than-significant levels.

CEQA LEVEL OF SIGNIFICANCE

Appendix G of the CEQA Guidelines lists four significance criteria for evaluating aesthetic impacts, as follows:

A. Would the project have a substantial adverse effect on a scenic vista?

The SR 62/Rice Valley Road Generation Tie Line Alternative would strongly aggravate significant adverse project impacts on scenic views toward the Rice Valley and from SR 62 in general.

B. Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway?

As described previously, no notable scenic resources were identified within the proposed project site. The proposed project would affect a substantial segment of an eligible State scenic highway. However, the highway is not currently designated. Effects of the project alone would not render SR 62 ineligible for official designation as a State scenic highway, but could affect its ultimate eligibility for designation. The SR 62/Rice Valley Road Generation Tie Line Alternative would add incrementally to those adverse effects on the scenic corridor of the highway. The SR 62/Rice Valley Road Generation Tie Line Alternative would not substantially damage scenic resources.

C. Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

As described previously, the proposed project would substantially degrade the existing visual character and quality of the site and its surroundings. The SR 62/Rice Valley Road Generation Tie Line Alternative would substantially increase those already significant adverse effects.

D. Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Light and glare effects under this alternative would be identical to those described under the proposed project, and would be significant and unmitigable.

NO PROJECT/NO ACTION ALTERNATIVE

NO PROJECT AND NO ACTION ON RICE SOLAR ENERGY PROJECT TRANSMISSION LINE APPLICATION AND INTERCONNECTION REQUEST. NO CDCA LAND USE PLAN AMENDMENT.

Under this alternative, the proposed Rice Solar Energy Project would not be approved by the Energy Commission; BLM would not approve the generation tie line application and would not amend the CDCA Plan; and Western would not approve the interconnection request. As a result, no solar energy project would be constructed on the project site, BLM would continue to manage the land encompassing the proposed generation tie line consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended, and Western would continue to operate the Parker Blythe Transmission Line under current conditions.

Because there would be no amendment to the CDCA Plan and no solar project approved for the site under this alternative, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site. As a result, none of the visual impacts from the proposed project would occur and none of the benefits of the proposed project would occur. In the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations.

Visual Resources Table 1 - Comparison of Visual Resources Impacts

Potential Impact	Proposed Project	Reduced Acreage Alternative	North of Desert Center Alternative	SR 62/Rice Valley Road Transmission Line Alternative	No Action Alternative
Appearance during construction	Adverse impacts would be mitigated	Minor, insignificant reduction in overall impact.. Would be mitigated	Adverse impacts would be mitigated	Somewhat greater than proposed project due to transmission towers in highway foreground. Adverse, would not be mitigated.	No potential impact
Appearance from SR 62 (daytime view and night lighting)	Adverse impact, would not be fully mitigated.	Minor, insignificant reduction in overall impact. still adverse and unmitigable	No impact to SR 62. Impacts to I-10, SR 177 less severe than Proposed Project effects on SR 62. Impacts to residents in SR 177 corridor adverse, would not be mitigated.	Somewhat greater than proposed project due to transmission towers in highway foreground. Adverse, would not be mitigated.	No potential impact
Appearance viewing points in adjacent WAs	Adverse impact, would not be fully mitigated.	Minor, insignificant reduction in overall impact., still adverse and unmitigable	Similar to Proposed Project. Impacts to adjacent portions of Joshua Tree NP.	Same as Proposed Project	No potential impact

CUMULATIVE IMPACTS

GEOGRAPHIC SCOPE OF ANALYSIS

Cumulative impacts could occur if implementation of the Rice Solar Energy Project would combine with those of other local or regional projects. The Rice Solar Energy Project is potentially associated with two types of cumulative impact:

1. cumulative impacts within the immediate, local project viewshed, essentially comprising foreseeable future projects in the Chuckwalla Valley;
2. cumulative impacts of foreseeable future solar and other renewable energy projects within the southern California Colorado (Sonoran) Desert, or other broad regional basin of the project's affected landscape type. The widest applicable basin of cumulative effect would include all of the southern California desert, or the Sonoran and Mojave desert landscapes extending into neighboring states. This analysis, focusing on regional effects of renewable projects only, is considered appropriate because the potential cumulative contribution of all other types of permissible development within this region is comparatively minor, and is dwarfed by the potential cumulative effect of renewable projects.

EXISTING CUMULATIVE CONDITIONS

Existing Projects in the Project Area

Existing cumulative projects potentially affecting the local project viewshed include the ATSF Arizona-California Railroad line and the Colorado River Aqueduct. As described in detail in the project impact analysis above, these projects, though paralleling SR 62 at close distance and quite evident, have had limited effects on the most valued portions of the project viewshed and scenic views. With these present, the viewshed remains relatively intact, natural in character, and highly scenic.

Existing Renewable Projects in the California Desert

The RSEP is among the first of a large number of existing renewable project applications in the southern California desert. As such, past and present projects have had a negligible region-wide cumulative impact on regional visual resources.

FUTURE FORESEEABLE PROJECTS

Foreseeable Projects in the Project Area

Foreseeable projects within the project viewshed primarily include the proposed Ward Valley solar thermal power plant, that could potentially lead to development of up to five projects similar in scope and size to RSEP using concentrated solar technology on up to 8,000 – 10,000 acres as proposed roughly 5 miles northwest of the project site in immediate proximity to SR 62. Other foreseeable projects in close proximity to SR 62 in the project vicinity include the Clean Air Solar II 900 MW solar project (no technology specified), a potentially 13,000-acre project located 11 miles northwest of the project site; and the Cadiz Lake solar thermal power plant, a potentially 35,639-acre, 1,000 MW facility 26 miles west of the project site.

Taken together, these four projects including the proposed project would result in substantial man-made visual intrusion into a majority of the remaining visually intact and scenic portions of SR 62, potentially rendering it ineligible for designation as a State scenic highway. These four projects would affect over 50 miles of the most scenically intact portions of that highway, altering it from a natural, scenically intact desert landscape into one characterized by the strong visual influence of these industrial facilities. In addition, cumulative night light pollution impacts in the project area could become cumulatively considerable. Therefore, the anticipated operational visual impacts of the RSEP in combination with past and foreseeable future projects in the local viewshed of Rice Valley and of SR 62 in the project vicinity are considered potentially significant and unmitigable.

Foreseeable Renewable Projects in the California Desert

As shown on **Cumulative Impacts Figures 1 and 2** and **Cumulative Impacts Table 1A and 1B**, solar and wind applications for use of BLM lands cover approximately 1 million acres in addition to proposed projects on State and private land in the California Desert Conservation Area.

The analysis of cumulative impacts is not necessarily restricted to the immediate viewshed of a project, and the need for cumulative analysis over a broad geographic area may often be determined by the affected resource itself. In this case the affected resource is the unique and highly valued landscape type of which the project site forms a small part – the landscape of the southern California and Sonoran Desert. The Sonoran Desert and California Desert Conservation Area (CDCA) within which the Rice Solar Energy Project is located are a unique and highly valued scenic resource of national importance, as reflected by the presence of three national parks and numerous Wilderness Areas within the CDCA boundaries. **Cumulative Impacts Table 1** identifies 63 solar projects and 62 wind project applications with a total overall area of over one million acres within the CDCA, which is indicative of the interest in, and potential impact on, public lands for renewable energy generation at a regional level. This figure does not include renewable projects within the Nevada and Arizona portions of the Sonoran and Mojave Deserts. Of the 62 wind applications in the California Desert District, only five of the applications are for wind development; the remaining proposals are for site testing and monitoring. BLM's experience is that a small percentage of applications for site testing have resulted in wind development proposals. In regards to the solar applications filed with BLM in California, only approximately 10 percent of the proponents have prepared acceptable detailed Plans of Development required by BLM to begin a NEPA analysis.

Although it is not likely that all of the future solar and wind development projects proposed in the region would be constructed, it is reasonable to assume that some of them will. With this very high number of renewable energy applications currently filed with BLM, the potential for profound widespread cumulative impacts to scenic resources within the southern California desert is clear. These cumulative impacts could include a substantial decline in the overall number and extent of scenically intact, undisturbed desert landscapes, and a substantially more urbanized character in the overall southern California desert landscape. In particular, the number of current renewable applications before the BLM and Energy Commission that could potentially be prominently visible

from the desert region's major highways is proportionally high. Likewise, the cumulative length of potentially affected highways also appears proportionately high. Because these highways are the location from which the vast majority of viewers experience the California desert, this potential effect is of concern to staff. Viewed in the cumulative context of the Southern California desert region as a whole, the potential visual impacts of renewable energy projects are thus considered to be cumulatively considerable, potentially significant and unmitigable.

Overall Conclusion – Cumulative Impacts

The anticipated operational visual impacts of the RSEP in combination with past and foreseeable future projects in the local viewshed of Rice Valley and of SR 62 in the project vicinity are considered potentially significant and unmitigable, particularly to motorists on SR 62, and to visitors to the area's many wilderness areas and Joshua Tree National Park. Anticipated cumulative operational impacts of past and foreseeable future region-wide projects in the southern California desert are considered cumulatively considerable, potentially significant and unmitigable considering the substantial decline in the overall number and extent of scenically intact, undisturbed desert landscapes, and a substantially more urbanized character in the overall southern California desert landscape.

Visual Resources Table 1 - Comparison of Visual Resources Impacts

Potential Impact	Proposed Project	Reduced Acreage Alternative	North of Desert Center Alternative	SR 62/Rice Valley Road Transmission Line Alternative	No Action Alternative
Appearance during construction	Adverse impacts would be mitigated	Minor, insignificant reduction in overall impact.. Would be mitigated	Adverse impacts would be mitigated	Somewhat greater than proposed project due to transission towers in highway foreground. Adverse, would not be mitigated.	No potential impact
Appearance from SR 62 (daytime view and night lighting)	Adverse impact, would not be fully mitigated.	Minor, insignificant reduction in overall impact.still adverse and unmitigable	No impact to SR 62. Impacts to I-10, SR 177 less severe than Proposed Project effects on SR 62. Impacts to residents in SR 177 corridor adverse, would not be mitigated.	Somewhat greater than proposed project due to transmission towers in highway foreground. Adverse, would not be mitigated.	No potential impact
Appearance viewing points in adjacent WAs	Adverse impact, would not be fully mitigated.	Minor, insignificant reduction in overall impact.,still adverse and unmitigable	Similar to Proposed Project. Impacts to adjacent portions of Joshua Tree NP.	Same as Proposed Project	No potential impact
Glare	Adverse impact, would not be mitigated.	Adverse impact, would not be mitigated.	Similar impacts as Proposed Project to motorists. Greater impacts to nearby residents. Adverse, would not be mitigated.	Same as Proposed Project.	No potential impact
Appearance during decommissioning	Adverse impact, would be mitigated	Adverse impact,. Would be mitigated	Adverse impact. Would be mitigated		No potential impact

COMPLIANCE WITH LORS

**VISUAL RESOURCES Table 2
Project Compliance with Laws, Ordinances, Regulations, and Standards (LORS)**

LORS Source	LORS Policy and Strategy Descriptions	Consistency Determination	Basis of Determination
Federal			
BLM			
The California Desert Conservation Area(CDCA) Plan	Multiple-Use Class M (Moderate Use) is based upon a controlled balance between higher intensity use and protection of public lands. This class provides for a wide variety of present and future uses such as mining, livestock grazing, recreation, energy, and utility development. Class M management is also designed to conserve desert resources and to mitigate damage to those resources which permitted uses may cause.	YES	The federal land that the RESP would occupy is designated as Multiple Use Class M in the CDCA Plan. The CDCA Plan indicates that solar electric generation plants may be allowed in Class M areas after NEPA requirements are met.
State			
Department of Transportation			
California Scenic Highway Program and System (California Streets and Highways Code, Division 1, Chapter 2, Article 2.5, Section 260 et seq.)	Protect scenic highway corridors from changes that would diminish the aesthetic value of lands adjacent to highways.	NO	The RSEP solar receiver tower would be a substantial visual intrusion in the otherwise natural landscape viewed from State Route 62. The more pristine the natural landscape and the less affected by intrusions, the more likely an eligible highway that is nominated for designation will qualify as scenic. The RESP could jeopardize the potential for State Route 62 to be designated as a State Scenic Highway
Local			
Riverside County			
Riverside County General Plan (2008), Land Use Element Policy LU 6.4	Retain and enhance the integrity of existing residential, employment, agricultural, and open space areas by protecting	NO	The RSEP solar receiver tower would be a visually dominant and highly intrusive

	them from encroachment of land uses that would result in impacts from noise, noxious fumes, glare, shadowing, and traffic.		structure in an otherwise mostly natural landscape. The brightness of the solar receiver atop the tower would attract attention.
Riverside County General Plan, Land Use Element Policy LU 8.1	Provide for permanent preservation of open space lands that contain important natural resources, hazards, water features, watercourses, and scenic and recreational values.	YES	The Riverside County General Plan does not specifically identify the RSEP site as containing important scenic values.
Riverside County General Plan, Land Use Element Policy LU 13.1	Preserve and protect outstanding scenic vistas and visual features for the enjoyment of the traveling public.	NO	The landscape setting of the RSEP scenic vistas of desert and distant mountains. The RSEP would be a visually dominant and highly intrusive feature of industrial character in the otherwise predominantly natural landscape.
Riverside County General Plan, Land Use Element Policy LU 13.3	Ensure that the design and appearance of new landscaping, structures, equipment, signs, or grading within Designated and Eligible State and County scenic highway corridors are compatible with the surrounding scenic setting or environment.	NO	The RSEP solar receiver tower would be a substantial visual intrusion in the otherwise natural landscape viewed from State Route 62 and is not compatible with the scenic values of the surrounding setting. The RSEP could jeopardize the potential for State Route 62 to be designated as a State Scenic Highway
Riverside County General Plan, Land Use Element Policy LU 13.4	Maintain at least a 50-foot setback from the edge of the right-of-way for new development adjacent to Designated and Eligible State and County Scenic Highways.	YES	The project would be set back a minimum of 50 feet from SR 62.
Riverside County General Plan, Land Use Element Policy LU 13.5	Require new or relocated electric or communication distribution lines, which would be visible from Designated and Eligible State and County Scenic Highways, to be placed underground.	NO	According to the AFC, power for construction of the project will come from extending an existing overhead 12-kV distribution line west along the south shoulder of State Route 62 about 1 mile into the RSEP site.

			<p>The proposed generation tie-line would be visible from State Route 62.</p> <p>Under the SR 62/Rice Valley Road Generation Tie Line Alternative, the tie-line would be sited adjacent to the immediate foreground of State Route 62.</p>
Riverside County General Plan, Land Use Element Policy LU 13.7	Require that the size, height, and type of on-premise signs visible from Designated and Eligible State and County Scenic Highways be the minimum necessary for identification. The design, materials, color, and location of the signs shall blend with the environment, utilizing natural materials where possible.	YES	Signage for the RSEP would be the minimum necessary for identification and would be designed to blend with the environment.
Riverside County General Plan, Land Use Element Policy LU 13.8	Avoid the blocking of public views by solid walls.	YES	The RSEP does not include solid walls that would block public views.
Riverside County General Plan, Land Use Element Policy LU 24.8	Require that industrial development be designed to consider their surroundings and visually enhance, not degrade, the character of the surrounding area.	NO	The landscape setting of the RESP has a mostly natural character. The RESP would be a visually dominant and highly intrusive feature that would degrade the scenic qualities of its surroundings.
Riverside County General Plan, Circulation Element Policy LU 19.1	Preserve scenic routes that have exceptional or unique visual features in accordance with Caltrans Scenic Highways Plan.	NO	The RSEP would represent a substantial visual intrusion into the otherwise natural landscape viewed from State Route 62. The high level of scenic intactness of this portion of the eligible scenic highway makes its view corridor exceptional. The RSEP could jeopardize the potential for State Route 62 to be designated as a State Scenic Highway
Riverside County	Identify and conserve the skylines,	NO	The RSEP would be a

General Plan, Multipurpose Open Space Element Policy LU 21.1	view corridors, and outstanding scenic vistas within Riverside County.		visually dominant and highly intrusive feature in a highly intact, scenic natural landscape. The project would dominate a large proportion of views of the Rice Valley as seen from SR 62.
Riverside County General Plan, Multipurpose Open Space Element Policy LU 22.1	Design developments within designated scenic highway corridors to balance the objectives of maintaining scenic resources with accommodating compatible land uses.	N/A	SR 62 is not a designated scenic highway. However, the RSEP has the potential to jeopardize designation of this eligible state scenic highway.
Riverside County General Plan, Multipurpose Open Space Element Policy LU 22.4	Impose conditions on development within scenic highway corridors requiring dedication of scenic easements consistent with the Scenic Highways Plan, when it is necessary to preserve unique or special visual features.	N/A	SR 62 is not a designated scenic highway. However, if SR 62 were to be nominated by the County for State scenic highway status, due to the physical nature of the RSEP site and surrounding area it would not be possible to establish a scenic easement that would effectively avoid the visual impact of the project on the highway corridor.
Riverside County General Plan, Multipurpose Open Space Element Policy LU 22.5	Utilize contour grading and slope rounding to gradually transition graded road slopes into a natural configuration consistent with the topography of the areas within scenic highway corridors.	YES	The RSEP site is primarily flat. Substantial grading would not be required in order to construct or operate the project.
Riverside County Ordinance 348 Land Use Ordinance Section 15.2 a	One-family residences shall not exceed 40 feet in height. No other building or structure shall exceed 50 feet in height, unless a greater height is approved pursuant to Section 18.34 of this ordinance. In no event, however, shall a building exceed 75 feet in height or any other structure exceed 105 feet in height, unless a variance is approved pursuant to Section 18.27 of this ordinance.	NO	The RSEP solar receiver tower would be 653 feet in height, six times higher than the maximum allowed without a variance.

San Bernardino County			
San Bernardino County General Plan (2007), Open Space Element Goal OS 5.	The County will maintain and enhance the visual character of scenic routes in the County.	NO	SR 62 in the project viewshed is a designated County scenic route under Policy OS 5.3, as well as an eligible state scenic highway. The project would not maintain or enhance the visual character of the route's visual corridor.
Policy OS 5.2	Development along scenic corridors will be required to demonstrate through visual analysis that proposed improvements are compatible with the scenic qualities present.	NO	The present visual analysis concludes that the proposed project is not compatible with the scenic qualities present in the corridor.
Policy OS 5.3	<p>The County desires to retain the scenic character of visually important roadways throughout the County. A "scenic route" is a roadway that has scenic vistas and other scenic and aesthetic qualities that over time have been found to add beauty to the County. Therefore, the County designates the following routes as scenic highways and applies all applicable policies to development on these routes (see Figures 2-4A through 2-4C of the Circulation and Infrastructure Background Report):</p> <p>DESERT REGION:</p> <p>p. State Route 62 (Twentynine Palms Highway) . . . from the Riverside County line northeast to state line.</p>	NO	<p>The proposed project would introduce the bright glare of the solar receiver into the view of the Rice Valley as seen from SR 62.</p> <p>The preponderance of SR 62 within the project viewshed would lie in the San Bernardino County portion of the highway.</p>

NOTEWORTHY PUBLIC BENEFITS

No noteworthy public benefits in the area of visual resources were identified.

MITIGATION MEASURES/PROPOSED CONDITIONS OF CERTIFICATION/APPROVAL

The following Conditions of Certification meet the Energy Commission's responsibility to comply with the California Environmental Quality Act and serve as recommendations for the Energy Commission to consider in its decision to avoid or reduce significant adverse impacts to less than significant level and to conform with LORS. The identification of relevant and reasonable mitigation measures also conforms to National Environmental Policy Act (NEPA) requirements for U.S. Bureau of Land Management (BLM's) and Western Area Power Administration's (Western's) analysis that can be considered in their Records of Decision.

SURFACE TREATMENT OF NON-MIRROR PROJECT STRUCTURES AND BUILDINGS

VIS-1 The project owner shall treat all non-mirror surfaces of the outermost row or rows (as needed) of heliostats in the northern 180-degree circumference of the mirror field; and all other project structures and buildings visible to the public such that: a) their colors minimize visual intrusion and contrast by blending with their existing visual background: in the case of lower buildings and structures, bajadas and mountain slopes as seen from the highway; in the case of foreground generation tie line towers, the valley floor; in the case of the solar tower, the sky; b) colors and finishes of all components, including mirror support structures, tie line poles and conductors, do not create glare or specular reflection; and c) their colors and finishes are consistent with local policies and ordinances. The generation tie line conductors and arms shall be non-specular and non-reflective, and the insulators shall be non-reflective and non-refractive. This measure shall include coloring of security fencing with vinyl or other non-reflective coating to blend visually to the greatest feasible extent with the background soil.

The project owner shall submit for CPM review and approval, a specific Surface Treatment Plan that will satisfy these requirements. The treatment plan shall include:

- A. A description of the overall rationale for the proposed surface treatment, including the selection of the proposed color(s) and finishes;
- B. A list of each major project structure, building, tank, pipe, mirror support, and wall; the generation tie line towers and/or poles; and fencing, specifying the color(s) and finish proposed for each. Colors must be identified by vendor, name, and number; or according to a universal designation system;
- C. One set of color brochures or color chips showing each proposed color and finish;
- D. A specific schedule for completion of the treatment; and

E. A procedure to ensure proper treatment maintenance for the life of the project.

The project owner shall not specify to the vendors the treatment of any buildings or structures treated during manufacture, or perform the final treatment on any buildings or structures treated in the field, until the project owner receives notification of approval of the treatment plan by the CPM. Subsequent modifications to the treatment plan are prohibited without CPM approval.

Verification: At least 90 days prior to specifying to the vendor the colors and finishes of the first structures or buildings that are surface treated during manufacture, the project owner shall submit the proposed treatment plan to the CPM for review and approval and simultaneously to Riverside County for review and comment. If the CPM determines that the plan requires revision, the project owner shall provide to the CPM a plan with the specified revision(s) for review and approval by the CPM before any treatment is applied. Any modifications to the treatment plan must be submitted to the CPM for review and approval.

Prior to the start of commercial operation, the project owner shall notify the CPM that surface treatment of all listed structures and buildings has been completed and they are ready for inspection and shall submit to each one set of electronic color photographs from the same key observation points identified in (d) above. The project owner shall provide a status report regarding surface treatment maintenance in the Annual Compliance Report. The report shall specify a) the condition of the surfaces of all structures and buildings at the end of the reporting year; b) maintenance activities that occurred during the reporting year; and c) the schedule of maintenance activities for the next year.

TEMPORARY AND PERMANENT EXTERIOR LIGHTING

VIS-2 To the extent feasible and consistent with safety and security considerations, the project owner shall design and install all temporary and permanent exterior lighting so that:

- A lighting does not cause excessive reflected glare
- B lighting does not illuminate the nighttime sky either directly or indirectly
- C mounting heights of all lighting fixtures will not allow light to fall on the mirror surfaces of the solar thermal power generation reflector systems in any night time position
- D illumination of the project and its immediate vicinity is minimized as to times of use and extent
- E lighting on the solar receiver tower shall be the minimum needed to satisfy safety and security concerns.

Permanent night lighting shall comply with all applicable standards, best practices and regulations including specifically, the following Illuminating

Engineering Society documents for Lighting Zone 1 per CEC-400-2008-017-CMF-Rev I:

- RP-33-99 Lighting for Exterior Environments
- DG-13-99 Outdoor Lighting
- TM-10-00 Addressing Obtrusive Light (Urban Sky Glow and Light Trespass) in Conjunction with Roadway Lighting
- TM-15-07 Luminaire Classification System for Outdoor Luminaires

Verification: At least 90 days prior to ordering any exterior lighting, the project owner shall contact the CPM to show compliance with all of the above requirements. This shall include, but not be limited to, final lighting plans, fixture and control schedules, fixture and control cut sheets and specifications, a photometric plan showing vertical and horizontal footcandles at all property lines to a height of 20 feet, and the proposed time clock schedule or occupancy sensor programming.

Prior to construction and prior to commercial operation, the project owner shall notify the CPM that the installation of the temporary and permanent lighting has been completed and is ready for inspection. If after inspection the CPM notifies the project owner that modifications to the lighting are needed, within 90 days after receiving the notification the project owner shall implement the modifications and notify the CPM when the modifications are completed and ready for inspection.

Within 48 hours of receiving a lighting complaint, the project owner shall provide the CPM with a complaint resolution form as specified in the Compliance General Conditions, including a proposal to resolve the complaint, and a schedule for implementation of the proposed resolution. The project owner shall notify the CPM within 48 hours after completing the resolution of the complaint. A copy of the complaint resolution form report shall be submitted to the CPM within 30 days and included in the Annual Report.

CONSTRUCTION AREA BUFFER ZONE, SCREENING AND RESTORATION.

VIS-3 To address potential impacts to motorists on SR 62 during and after the period of project construction, all construction laydown, administration, parking and other construction-related facilities shall be setback from SR-62 a minimum of 250 feet, or greater where feasible. The soil surface and vegetation of the set-back area south of the highway shall remain undisturbed to the maximum extent feasible, except to accommodate the minimum practical number of access drive-ways, or to enhance existing native vegetation. All construction-related areas shall be screened from the highway by 8'-tall opaque screening of tan or brown color to blend with the surrounding soil surface to the extent feasible.

All construction-related lighting shall be shielded, downwardly directed, with all direct lighting limited to within the project site.

Following completion of construction, the project owner shall provide a re-vegetation plan describing how the staging site will be restored, and the buffer zone area enhanced, following construction. The plan shall call for beginning of restoration of the site within the shortest feasible time following completion of construction. Under the plan, all disturbed areas shall be graded to conform to surrounding natural contours, and re-vegetated with locally native species.

Verification: At least 90 days prior to start of construction, the project owner shall present to BLM's Authorized Officer and the CPM a revised staging area site plan including a set-back from SR-62 of at least 250 feet. If the CPM determines that the plan requires revision, the project owner shall provide to the CPM a revised plan for review and approval by the CPM. The project owner shall not begin construction until receiving CPM approval of the revised plan.

At least 60 days prior to start of operation, the project owner shall present to the CPM a restoration and revegetation plan for the staging and buffer areas. If the CPM determines that the plan requires revision, the project owner shall provide to the CPM a revised plan for review and approval by the CPM. The project owner shall not begin operation until receiving CPM approval of the revised plan.

CONCLUSIONS

BLM, Western and staff have analyzed visual resource-related information pertaining to the proposed RSEP. With respect to CEQA, staff concludes that the proposed project, with all staff-recommended conditions of certification, would still have significant and unavoidable adverse direct and cumulative visual impacts. With respect to CEQA, staff concludes that the proposed project, after implementing all staff-recommended conditions of certification, would still have significant and unavoidable adverse direct and cumulative visual impacts from several Key Observation Points including:

- Highway SR-62 to background distances of 5 miles or more, due particularly to solar receiver brightness, as well as high visual contrast and incompatibility of character of mirror arrays seen at foreground and middle-ground distances; and
- Portions of the Turtle Mountain Wilderness Area at distances of roughly 5 miles or under due to the combination of mirror-field visibility, mirror-field glare, and solar receiver glare.

Staff has recommended **Traffic and Transportation** Conditions of Certification **TRANS-6**, Heliostat Positioning Plan, and **TRANS-7**, Power Tower Monitoring Plan, to ensure that potential glare from the project is minimized to the maximum extent possible and does not pose a health and safety risk. However, staff concludes that with these measures glare from the project, particularly from the solar receiver, would remain a bright, intrusive source of sub-hazardous nuisance glare to viewers on Highway SR 62 and in other locations to background distances within a range of 5 miles or more.

Impacts of the Reduced Acreage Alternative, with staff-recommended conditions of certification, would also have significant unavoidable visual impacts. However, the

degree and extent of those impacts would be somewhat less than those of the Proposed Project.

Impacts of the North of Desert Center Alternative, with staff-recommended conditions of certification, would also have significant unavoidable visual impacts. Though affecting a less pristine viewshed than the proposed project, this alternative would also strongly affect a substantial number of nearby residents.

Impacts of the SR 62/Rice Valley Road Generation Tie Line Alternative would have the same significant unavoidable visual impacts as the proposed project, and in addition would substantially increase those impacts by introducing a new line into 4.5 miles of the immediate visual foreground of SR 62.

The anticipated visual impacts of the Proposed Project, Reduced Acreage, North of Desert Center and SR 62/Rice Valley Road Generation Tie Line Alternatives, in combination with past and foreseeable future local projects in their local vicinity, and past and foreseeable future region-wide projects in the southern California desert are considered cumulatively considerable and potentially significant.

Along SR 62, there are four proposed solar energy projects including RSEP that would result in a substantial man-made visual intrusion into a majority of the remaining visually intact and scenic portions of SR 62, potentially rendering it ineligible for designation as a State scenic highway. These four projects would affect over 50 miles of the most scenically intact portions of that highway, altering it from a natural, scenically intact desert landscape into one characterized by the strong visual influence of these industrial facilities. In addition, cumulative night light pollution impacts in the project area could become cumulatively considerable. Therefore, within the local viewshed of Rice Valley and of SR 62 in the project vicinity, the anticipated operational visual impacts of the RSEP in combination with past and foreseeable future projects are considered potentially significant and unmitigable, particularly to motorists on SR 62, and to visitors to the area's many wilderness areas and Joshua Tree National Park.

Within the southern California desert, anticipated cumulative operational impacts of past and foreseeable future region-wide projects are considered cumulatively considerable, potentially significant and unmitigable considering the substantial decline in the overall number and extent of scenically intact, undisturbed desert landscapes, and a substantially more urbanized character in the overall southern California desert landscape.

All action alternatives studied, with staff-recommended conditions of certification, would not conform with a number of applicable local Laws, Ordinances, Regulations and Standards (LORS) of San Bernardino and Riverside Counties pertaining to preservation of scenic resources and scenic highway view corridors, as described under the Compliance with LORS section of this analysis.

APPENDIX VR-1

STAFF'S VISUAL RESOURCES EVALUATION METHODOLOGY

Staff evaluates the visual characteristics of the existing physical setting, the proposed project, the circumstances affecting the viewer, and the degree of visual change that a proposed project may introduce using the elements generally accepted criteria for determining substantial environment impact significance identified below.

ELEMENTS OF THE METHODOLOGY

Key Observation Points

Staff evaluates the existing visible physical environmental setting from a fixed vantage point, called a *key observation point* (KOP) that provides a view of the visual change introduced by the proposed project to the view from that KOP. The view as seen from the KOP is referred to as the *viewshed*. Staff uses a KOP¹ to represent a location(s) from which to conduct detailed analyses of the proposed project and to obtain existing condition photographs and prepare photo simulations. KOPs are selected to be representative of the most critical viewshed locations from which the project would be seen. Because it is not feasible to analyze all the views in which a proposed project would be seen, it is necessary to select a KOP that would most clearly display the visual effects of the proposed project. A KOP may also represent primary viewer groups that would potentially be affected by the project. In addition to KOP photo(s), staff reviews landscape character photos that help provide a visual overview of a project site, its vicinity, and the selected KOP area, as appropriate. Prior to application submittal, staff participates in the selection of appropriate KOP(s) for the analysis.

LORS Consistency

Energy Commission staff considers federal, state, and local laws, ordinances, regulations, and standards (LORS) relevant to aesthetics or protection and preservation of visual sensitive resources. Conflicts with such LORS can constitute significant visual impacts. For example, visual staff examines land use planning documents, such as a local government's General Plan, Specific Plan, and zoning ordinances applicable to the project site and surrounding area to gain insight as to the type of land uses intended for the area, and the guidelines given for aesthetics, or protection and preservation of visual sensitive resources.

California Environmental Quality Act Guidelines

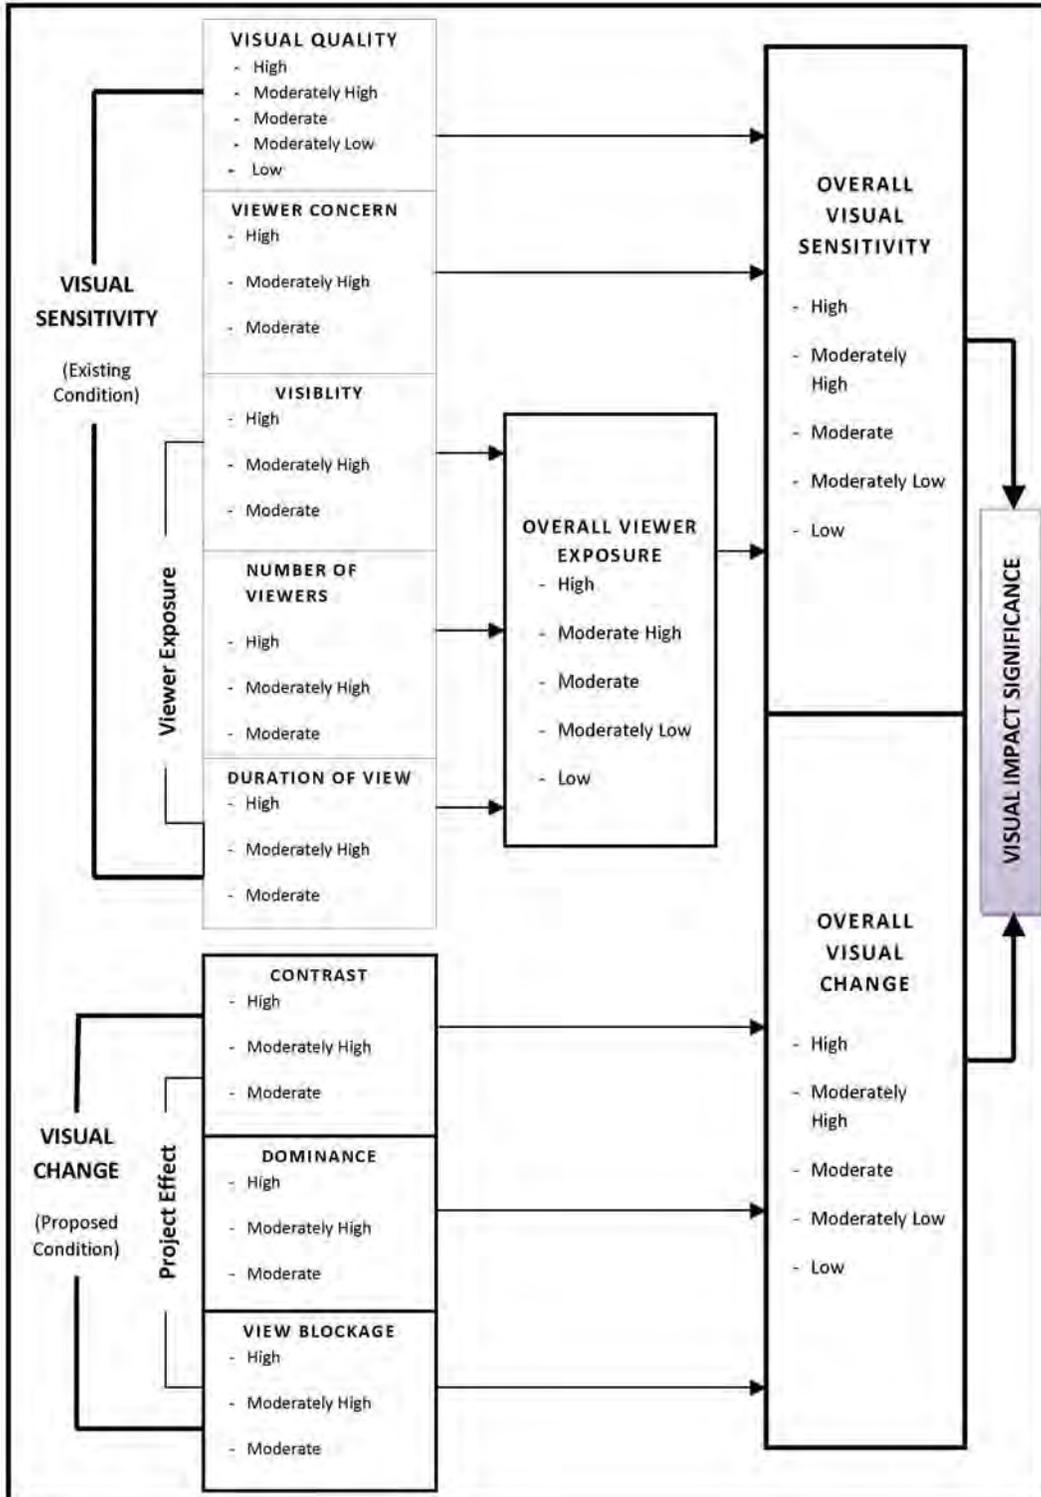

The CEQA Guidelines define a "significant effect on the environment" to mean a "substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including . . . objects of historic or aesthetic significance" (California Code of Regulations, Title 14, section 15382).

¹The use of KOPs or similar view locations is common in visual resource analysis. The U.S. Bureau of Land Management (USDI BLM 1986a, 1986b, 1984) and the U.S. Forest Service (USDA Forest Service 1995) use such an approach.

Appendix G Environmental Checklist Form of the CEQA Guidelines, under “Aesthetics,” lists the following four questions to be addressed regarding whether the potential impacts of a project are significant:

- A. Would the project have a substantial adverse effect on a scenic vista?
- B. Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?
- C. Would the project substantially degrade the existing visual character or quality of the site and its surroundings?
- D. Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Staff answers each of the four checklist questions for the proposed project, including any related facility such as a transmission line or gas pipeline, for both construction and operation phases.

WASTE MANAGEMENT

Testimony of Ellen Townsend-Hough

SUMMARY OF CONCLUSIONS

The U.S. Bureau of Land Management (BLM), Western Area Power Administration (Western) and Energy Commission staff (staff), hereafter jointly referred to as agencies, have reviewed the Rice Solar Energy Project (RSEP or proposed project) in accordance with the requirements of the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA). With respect to CEQA, staff concludes that with the adoption of the recommended Conditions of Certification **WASTE-1** through **WASTE-8**, management of the waste generated during construction, operation and closure/decommissioning of the proposed Rice Solar Energy Project (RSEP) would not generate a significant impact.

There is sufficient landfill capacity for wastes generated during RSEP construction and operation, RSEP would properly handle, treat and dispose of any existing site contamination, and the project would be consistent with the applicable waste management laws, ordinances, regulations, and standards (LORS) if the measures recommended in staff's conditions of certification are implemented,. These Conditions of Certification meet the Energy Commission's responsibility to comply with the California Environmental Quality Act and serve as staff's recommendations for the Energy Commission to consider in its decision to avoid or reduce the severity of waste management-related impacts to less than significant and for the project to conform to all applicable LORS. The identification of relevant and reasonable mitigation measures also conforms to National Environmental Policy Act (NEPA) requirements for BLM's and Western's analysis that can be considered in their Records of Decision.

In evaluating the RSEP, Reduced Acreage Alternative, North of Desert Center Alternative, SR62/Rice Valley Road Generation Tie Line Alternative, and No Project/No Action Alternative, the agencies consider compliance with California Environmental Quality Act guidelines (Appendix G: Environmental Checklist Section XVI-Utilities and Service Systems) and applicable waste management laws, ordinances, regulations, and standards. With implementation of the recommended conditions of certification, staff concludes that no significant direct, indirect or cumulative waste management impacts would result from construction, operation and closure/decommissioning from either the proposed project or the alternatives with respect to CEQA.

INTRODUCTION

This section presents an analysis of issues associated with wastes generated from the proposed construction and operation of the RSEP. The technical scope of this analysis encompasses solid and liquid wastes existing on site and wastes that would likely be generated during facility construction and operation. Management and discharge of wastewater is addressed in the **SOIL AND WATER RESOURCES** section of this document. Additional information related to waste management may also be covered in

the **WORKER SAFETY & FIRE PROTECTION** and **HAZARDOUS MATERIALS MANAGEMENT** sections of this document.

The agencies have established the following objectives in conducting this waste management analysis. These objectives would ensure that:

- the management of project wastes would be in compliance with all applicable LORS; Compliance with LORS ensures that existing site contamination and wastes generated during the construction and operation of the proposed project would be managed in an environmentally safe manner.
- the disposal of project wastes would not result in significant adverse impacts to existing waste disposal facilities; and
- upon project completion, the site is managed in such a way that project wastes and waste constituents would not pose a significant risk to humans or the environment.

METHODOLOGY AND THRESHOLDS FOR DETERMINING ENVIRONMENTAL CONSEQUENCES

In accordance with California Environmental Quality Act (CEQA) guidelines (Appendix G: Environmental Checklist Section XVI – Utilities and Service Systems), staff evaluated the potential significance of project wastes in terms of landfill capacity and LORS compliance. The following federal, state, and local environmental laws, ordinances, regulations, and standards (LORS) have been established to ensure the safe and proper management of both solid and hazardous wastes in order to protect human health and the environment, and absent any unusual circumstances, compliance would be sufficient to ensure that no significant impacts would occur as a result of project waste management.

**Waste Management Table 1
Laws, Ordinances, Regulations, and Standards (LORS)**

Applicable Law	Description
<p>Federal</p> <p>Title 42, United States Code (U.S.C.), §6901, et seq.</p> <p>Solid Waste Disposal Act of 1965 (as amended and revised by the Resource Conservation and Recovery Act of 1976, et al.)</p>	<p>The Solid Waste Disposal Act, as amended and revised by the Resource Conservation and Recovery Act (RCRA) et al., establishes requirements for the management of solid wastes (including hazardous wastes), landfills, underground storage tanks, and certain medical wastes. The statute also addresses program administration, implementation and delegation to states, enforcement provisions, and responsibilities, as well as research, training, and grant funding provisions.</p> <p>RCRA Subtitle C establishes provisions for the generation, storage, treatment, and disposal of hazardous waste, including requirements addressing:</p> <ul style="list-style-type: none"> • Generator record keeping practices that identify quantities of hazardous wastes generated and their disposition; • Waste labeling practices and use of appropriate containers; • Use of a manifest when transporting wastes; • Submission of periodic reports to the United States Environmental Protection Agency (U.S. EPA) or other authorized agency; and

Applicable Law	Description
	<ul style="list-style-type: none"> • Corrective action to remediate releases of hazardous waste and contamination associated with RCRA-regulated facilities. <p>RCRA Subtitle D establishes provisions for the design and operation of solid waste landfills.</p> <p>RCRA is administered at the federal level by U.S. EPA and its 10 regional offices. The Pacific Southwest regional office (Region 9) implements U.S. EPA programs in California, Nevada, Arizona, and Hawaii.</p>
<p>Title 42, U.S.C., §9601, et seq.</p> <p>Comprehensive Environmental Response, Compensation and Liability Act</p>	<p>The Comprehensive Environmental Response, Compensation and Liability Act (CERCLA), also known as <i>Superfund</i>, establishes authority and funding mechanisms for cleanup of uncontrolled or abandoned hazardous waste sites, as well as cleanup of accidents, spills, or emergency releases of pollutants and contaminants into the environment. Among other things, the statute addresses:</p> <ul style="list-style-type: none"> • Reporting requirements for releases of hazardous substances; • Requirements for remedial action at closed or abandoned hazardous waste sites, and brownfields; • Liability of persons responsible for releases of hazardous substances or waste; and • Requirements for property owners/potential buyers to conduct “all appropriate inquiries” into previous ownership and uses of the property to 1) determine if hazardous substances have been or may have been released at the site, and 2) establish that the owner/buyer did not cause or contribute to the release. A Phase I Environmental Site Assessment is commonly used to satisfy CERCLA “all appropriate inquiries” requirements.
<p>Title 40, Code of Federal Regulations (CFR), Subchapter I – Solid Wastes</p>	<p>These regulations were established by U.S. EPA to implement the provisions of the Solid Waste Disposal Act and RCRA (described above). Among other things, the regulations establish the criteria for classification of solid waste disposal facilities (landfills), hazardous waste characteristic criteria and regulatory thresholds, hazardous waste generator requirements, and requirements for management of used oil and universal wastes.</p> <ul style="list-style-type: none"> • Part 257 addresses the criteria for classification of solid waste disposal facilities and practices. • Part 258 addresses the criteria for municipal solid waste landfills. • Parts 260 through 279 address management of hazardous wastes, used oil, and universal wastes (i.e., batteries, mercury-containing equipment, and lamps). <p>U.S. EPA implements the regulations at the federal level. However, California is an RCRA-authorized state, so most of the solid and hazardous waste regulations are implemented by state agencies and authorized local agencies in lieu of U.S. EPA.</p>
<p>Title 49, CFR, Parts 172 and 173.</p> <p>Hazardous Materials Regulations</p>	<p>These regulations address the United States Department of Transportation (DOT) established standards for transport of hazardous materials and hazardous wastes. The standards include requirements for labeling, packaging, and shipping of hazardous materials and hazardous wastes, as well as training requirements for personnel completing shipping papers and manifests. Section 172.205 specifically addresses use and preparation of hazardous waste manifests in accordance with</p>

Applicable Law	Description
	Title 40, CFR, section 262.20.
Federal CWA, 33 USC § 1251 <i>et seq.</i>	The Clean Water Act controls discharge of wastewater to the surface waters of the U.S.
Title 40 CFR Section 112	<p>This establishes procedures, methods, equipment, and other requirements to prevent the discharge of oil from non-transportation-related onshore and offshore facilities into or upon the navigable waters of the United States or adjoining shorelines, or into or upon the waters of the contiguous zone, or in connection with activities under the Outer Continental Shelf Lands Act or the Deepwater Port Act of 1974.</p> <p>Subpart B - The Spill Prevention, Control and Countermeasures (SPCC) Plan includes procedures, methods, and equipment at the facility to prevent discharges of petroleum from reaching navigable waters.</p>
State	
<p>California Health and Safety Code (HSC), Chapter 6.5, §25100, <i>et seq.</i></p> <p>Hazardous Waste Control Act of 1972, as amended</p>	<p>This California law creates the framework under which hazardous wastes must be managed in California. The law provides for the development of a state hazardous waste program that administers and implements the provisions of the federal RCRA program. It also provides for the designation of California-only hazardous wastes and development of standards (regulations) that are equal to or, in some cases, more stringent than federal requirements.</p> <p>The California Environmental Protection Agency (Cal/EPA), Department of Toxic Substances Control (DTSC) administers and implements the provisions of the law at the state level. Certified Unified Program Agencies (CUPAs) implement some elements of the law at the local level.</p>
<p>Title 22, California Code of Regulations (CCR), Division 4.5.</p> <p>Environmental Health Standards for the Management of Hazardous Waste</p>	<p>These regulations establish requirements for the management and disposal of hazardous waste in accordance with the provisions of the California Hazardous Waste Control Act and federal RCRA. As with the federal requirements, waste generators must determine if their wastes are hazardous according to specified characteristics or lists of wastes. Hazardous waste generators must obtain identification numbers; prepare manifests before transporting the waste off site; and use only permitted treatment, storage, and disposal facilities. Generator standards also include requirements for record keeping, reporting, packaging, and labeling. Additionally, while not a federal requirement, California requires that hazardous waste be transported by registered hazardous waste transporters.</p> <p>The standards addressed by Title 22, CCR include:</p> <ul style="list-style-type: none"> • Identification and Listing of Hazardous Waste (Chapter 11, §66261.1, <i>et seq.</i>). • Standards Applicable to Generator of Hazardous Waste (Chapter 12, §66262.10, <i>et seq.</i>). • Standards Applicable to Transporters of Hazardous Waste (Chapter 13, §66263.10, <i>et seq.</i>). • Standards for Universal Waste Management (Chapter 23, §66273.1, <i>et seq.</i>). • Standards for the Management of Used Oil (Chapter 29, §66279.1, <i>et seq.</i>). • Requirements for Units and Facilities Deemed to Have a Permit

Applicable Law	Description
	<p>by Rule (Chapter 45, §67450.1, et seq.).</p> <p>The Title 22 regulations are established and enforced at the state level by DTSC. Some generator and waste treatment standards are also enforced at the local level by CUPAs.</p>
<p>HSC, Chapter 6.11 §§25404 – 25404.9</p> <p>Unified Hazardous Waste and Hazardous Materials Management Regulatory Program (Unified Program)</p>	<p>The Unified Program consolidates, coordinates, and makes consistent the administrative requirements, permits, inspections, and enforcement activities of the six environmental and emergency response programs listed below.</p> <ul style="list-style-type: none"> • Aboveground Petroleum Storage Act requirements for Spill Prevention, Control, and Countermeasure (SPCC) Plans. • Hazardous Materials Release and Response Plans and Inventories (Business Plans). • California Accidental Release Prevention (CalARP) Program. • Hazardous Materials Management Plan / Hazardous Materials Inventory Statements. • Hazardous Waste Generator / Tiered Permitting Program. • Underground Storage Tank Program. <p>The state agencies responsible for these programs set the standards for their programs while local governments implement the standards. The local agencies implementing the Unified Program are known as CUPAs. The DTSC's Calexico Field Office is the CUPA for the RSEP.</p> <p>Note: The Waste Management analysis only considers application of the Hazardous Waste Generator/Tiered Permitting element of the Unified Program.</p>
<p>Title 27, CCR, Division 1, Subdivision 4, Chapter 1, §15100, et seq.</p> <p>Unified Hazardous Waste and Hazardous Materials Management Regulatory Program</p>	<p>While these regulations primarily address certification and implementation of the program by the local CUPAs, the regulations do contain specific reporting requirements for businesses.</p> <ul style="list-style-type: none"> • Article 9 – Unified Program Standardized Forms and Formats (§§ 15400–15410). • Article 10 – Business Reporting to CUPAs (§§15600–15620).
<p>Public Resources Code, Division 30, §40000, et seq.</p> <p>California Integrated Waste Management Act of 1989</p>	<p>The California Integrated Waste Management Act (CIWMA) establishes mandates and standards for management of solid waste in California. The law addresses solid waste landfill diversion requirements; establishes the preferred waste management hierarchy (source reduction first, then recycling and reuse, and treatment and disposal last); sets standards for design and construction of municipal landfills; and addresses programs for county waste management plans and local implementation of solid waste requirements.</p>

Applicable Law	Description
<p>Title 14, CCR, Division 7, §17200, et seq.</p> <p>California Integrated Waste Management Board</p>	<p>These regulations implement the provisions of the California Integrated Waste Management Act and set forth minimum standards for solid waste handling and disposal. The regulations include standards for solid waste management, as well as enforcement and program administration provisions.</p> <ul style="list-style-type: none"> • Chapter 3 – Minimum Standards for Solid Waste Handling and Disposal. • Chapter 3.5 – Standards for Handling and Disposal of Asbestos Containing Waste. • Chapter 7 – Special Waste Standards. • Chapter 8 – Used Oil Recycling Program. • Chapter 8.2 – Electronic Waste Recovery and Recycling.
<p>HSC, Division 20, Chapter 6.5, Article 11.9, §25244.12, et seq.</p> <p>Hazardous Waste Source Reduction and Management Review Act of 1989</p>	<p>This law was enacted to expand the state's hazardous waste source reduction activities. Among other things, it establishes hazardous waste source reduction review, planning, and reporting requirements for businesses that routinely generate more than 12,000 kilograms (approximately 26,400 pounds) of hazardous waste in a designated reporting year. The review and planning elements are required to be done on a 4-year cycle, with a summary progress report due to DTSC every fourth year.</p>
<p>Title 22, CCR, §67100.1 et seq.</p> <p>Hazardous Waste Source Reduction and Management Review</p>	<p>These regulations further clarify and implement the provisions of the Hazardous Waste Source Reduction and Management Review Act of 1989 (noted above). The regulations establish the specific review elements and reporting requirements to be completed by generators subject to the act.</p>
<p>Title 23, CCR Division 3, Chapters 16 and 18</p>	<p>These regulations relate to hazardous material storage and petroleum UST cleanup, as well as hazardous waste generator permitting, handling, and storage. The DTSC Riverside County CUPA is responsible for local enforcement.</p>
Local	
<p>County of Riverside General Plan, Safety Element: Policy S 6.1</p>	<p>Describes the County's policies and siting criteria identified in the County of Riverside Hazardous Waste Management Plan including coordination of hazardous waste facility responsibilities on a regional basis through the Southern California Hazardous Waste Management Authority</p>
<p>Riverside County Code Title 8 Chapters 8.60, 8.84, and 8.132, Health and Safety</p>	<p>Establishes requirements for the use, generation, storage, and disposal of hazardous and non-hazardous materials and wastes within the County.</p>

PROPOSED PROJECT

SETTING AND EXISTING CONDITIONS

Proposed Project

The proposed RSEP site is situated on 1,410 acres of privately owned land located in eastern Riverside County, California (SR 2009a, page ES-1). The project is bordered to the north by Highway 62 at marker 109 followed by Arizona and California (ARZC) railroad tracks, the Colorado River Aqueduct, along with several dikes and siphons. East and south of the site is vacant land. There is vacant land, ARZC railroad tracks, and a paved road located to the west of the project site (SR 2009a, Phase I ESA). The project site is made up of four parcels; the assessor's parcel numbers are 801-070-003, 801-070-004, 801-070-005, 801-070-0006 (SR 2009a, page 1-7).

The Project is located in Rice Valley, in the Sonoran Desert. The area is comprised of relatively stable sheets of sand held in place by perennial vegetation. The Rice Valley is part of a massive sand sheet that extends from Cadiz Valley through Ward Valley, representing a part of one of the largest dune systems in the California Desert. The Project site is relatively flat and generally slopes from north to south with an elevation of approximately 820 feet above mean sea level. The project site is located in an area historically used for military training during World War II. The project site would be located on the former Rice Army Airfield which served as a camp and training center for the Air Corps, infantry and artillery divisions of the Army, and was part of the Desert Training Center/California-Arizona Maneuver Area. After the war, the airfield was privately operated until it was abandoned during the 1950's.

The 150 Megawatt (MW) project would use concentrating solar power technology, with a central receiver tower and an integrated thermal storage system. The RSEP's technology generates power from sunlight by focusing energy from a field of sun-tracking mirrors called heliostats on to a central receiver. A heat-transfer fluid heated in the receiver is used to generate steam, which, in turn, is used in a conventional steam turbine-generator to produce electricity. Liquid salt is the heat-transfer fluid. The salt has superior heat-transfer and energy-storage capabilities. The energy-storage capability, or thermal storage, allows the system to continue to generate electricity during cloudy weather or at night. Within the project area will be an administration building, a heliostat field with power block and evaporation ponds. The features and facilities associated with the proposed project include but are not limited to:

- A circular arrangement of 17,500 tracking heliostats, each 24 feet tall by 28 feet wide, concentrating the sun's energy onto a tower-mounted receiver on a 1,410-acre project site;
- A 540-foot tall concrete central tower, which includes a maintenance crane and a 100-foot receiver situated on top the tower;
- A liquid salt storage system which includes hot and cold salt storage tanks;
- A 150- MW (net) steam turbine generator system;
- Two on-site water wells for heliostat washing, steam cycle makeup and other process uses;

- Three five-acre lined evaporation ponds;
- Two emergency diesel generators and associated equipment for emergency backup power; and
- Transmission line and associated equipment.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

This waste management analysis addresses:

- a) existing project site conditions and the potential for contamination associated with prior activities on or near the project site; and
- b) the impacts from the generation and management of wastes during project construction and operation.

Existing Project Site Conditions and Potential for Contamination

For any site in California proposed for the construction of a power plant, the applicant must provide documentation of the nature of any potential or existing releases of hazardous substances or contamination at the site. If potential or existing releases or contamination at the site are identified, the significance of the releases or contamination would be determined by site-specific factors, including, but not limited to: the amount and concentration of contaminants or contamination; the proposed use of the area where the contaminants/contamination is found; and any potential pathways for workers, the public, or sensitive species or environmental areas to be exposed to the contaminants. Any unmitigated contamination or releases of hazardous substances that pose a risk to human health or environmental receptors would be considered significant by Energy Commission staff.

As a first step in documenting existing site conditions, the Energy Commission's power plant site certification regulations require that a Phase I Environmental Site Assessment (ESA) be prepared¹ and submitted as part of an Application for Certification (AFC). The Phase I ESA is conducted to identify any conditions indicative of releases and threatened releases of hazardous substances at the site and to identify any areas known to be contaminated (or a source of contamination) on or near the site.

In general, the Phase I ESA uses a qualified environmental professional to conduct inquiries into past uses and ownership of the property, research hazardous substance releases and hazardous waste disposal at the site and within a certain distance of the site, and visually inspect the property, making observations about the potential for contamination and possible areas of concern. After conducting all necessary file reviews, interviews, and site observations, the environmental professional then provides findings about the environmental conditions at the site. In addition, since the Phase I ESA does not include sampling or testing, the environmental professional may give an opinion about the potential need for any additional investigation. Additional investigation may be needed, for example, if there were significant gaps in the information available

¹ Title 20, California Code of Regulations, section 1704(c) and Appendix B, section (g)(12)(A). Note that the Phase I ESA must be prepared according to American Society for Testing and Materials protocol or an equivalent method agreed upon by the applicant and the agencies.

about the site, an ongoing release is suspected, or to confirm an existing environmental condition.

If additional investigation is needed to identify the extent of possible contamination, a Phase II ESA may be required. The Phase II ESA usually includes sampling and testing of potentially contaminated media to verify the level of contamination and the potential for remediation at the site.

In conducting its assessment of a proposed project, the agencies will review the project's Phase I ESA and work with the appropriate oversight agencies, as necessary, to determine if additional site characterization work is needed and if any mitigation is necessary at the site to ensure protection of human health and the environment from any identified hazardous substance releases or contamination.

A Phase I ESA, dated September 24, 2009, was prepared by Terracon in accordance with the American Society for Testing and Materials Standard Practice E 1527-05 for ESAs (SR 2009a, Appendix 5.14B). The ESA did not identify any Recognized Environmental Conditions (REC) in connection with historic or current site operations. A REC is the presence or likely presence of any hazardous substances or petroleum products on a property under the conditions that indicated an existing release, past release, or a material threat of a release of any hazardous substance or petroleum products into structures on the property or in the ground, groundwater, or surface water of the property. However, the Phase I ESA did identify a number of potential areas of concern related to possible soil contamination. In follow-up to the Phase I ESA, Terracon completed a Limited Site Investigation, dated July 29, 2009, which includes the chemical analysis of forty-four soil samples. The results indicated that there were no contaminants that would pose a health, and/or safety risk to RSEP personnel working at the project site (SR 2009a, Appendix 5.14B).

DIRECT/INDIRECT IMPACTS AND MITIGATION

Existing Site Conditions

The project site is located immediately south of State Route 62, near mile marker 109, Riverside County, California 92239. The 1,410 acre project site is located within an approximately 3,300 acre tract of privately owned land. The site was historically used as a military airfield and training camp (Rice Army Airfield) in the 1940's, and as a public, civilian airport facility (Rice Airfield) until the 1950s. The site is vacant although remnant features from the former airfield remain. The remaining site features include two runways and associated apron hardstands and taxiways, building foundations, paved roads and pathways and associated litter (SR 2009a, Appendix 5.14B).

A Phase I ESA, dated September 24, 2009, was prepared by the Terracon for the applicant. The Phase I ESA was completed in accordance with the American Society for Testing and Materials Standard Practice E 1527-05 for ESAs (SR 2009a, Appendix 5.14B). The ESA did not identify any Recognized Environmental Conditions (RECs) in connection with historic site operations or current activity. A REC is the presence or likely presence of any hazardous substances or petroleum products on a property under the conditions that indicated an existing release, past release, or a material threat of a

release of any hazardous substance or petroleum products into structures on the property or in the ground, groundwater, or surface water of the property.

Terracon performed a Limited Site Investigation which identified areas of potential environmental concern. Terracon's site reconnaissance identified concrete pads, remnants of structural foundations, exposed subsurface piping, apparent drainage, sumps, rock-filled pits, discolored soil (apparent burn areas), various areas of debris and a large soil mound. Samples were collected and analyzed at several locations along the runways, in the burned debris piles, also in the rock pits, aprons and tie-down areas. The chemical analysis results did not indicate that the soils beneath these areas were impacted with high concentrations of hazardous substances associated with the historic activities at the site.

No RECs were identified within the one-mile radius search of offsite areas. However, the project area was within General Patton's World War II (WWII) Desert Training Center, California-Arizona Maneuver Area region (DTC/CAMA) (1942 to 1944) which surrounds the project area and was considered a suitable location for training troops that would be deployed in the North Africa Campaign. The DTC/CAMA was part of a large area in southern California, southern Nevada, and western Arizona. After two years in operation and the training of one million troops, the desert training camps were closed in 1944. There is a soil mound located east of the eastern runway (See Waste Management Figure 1), that may have been used as a firing butt for aircraft to test guns prior to planes taking off. Also, 4.7 miles of the proposed RSEP generator tie line route and proposed interconnection substation site lie within the DTC/CAMA Rice Valley Sand Dunes Formerly Used Defense Site (FUDS) -Training Area. The Training Area was used for a variety of training purposes some of which utilized munitions and explosives and/or munitions constituents (See Waste Management Figure 1) (SR 2009a, page 5.14-3 and Appendix 5.14B).

Staff recommends Conditions of Certification **WASTE-1** and **WASTE-2** to address any soil contamination contingency that may be encountered during project construction. **WASTE-1** would require that an experienced and qualified Professional Engineer or Professional Geologist be available for consultation in the event contaminated soil is encountered. If contaminated soil is identified, **WASTE-2** would require that the Professional Engineer or Professional Geologist inspect the site, determine what is required to characterize the nature and extent of contamination, and provide a report to the Compliance Project Manager (CPM), BLM Authorized Officer (AO), and DTSC with findings and recommended actions including remediation if necessary.

Proposed Project

Proposed Project - Construction Impacts and Mitigation

Site preparation and construction of the proposed solar project and its associated facilities would last approximately 30 months and generate both non-hazardous and hazardous wastes in solid and liquid forms (SR2009a, ES-5). Before construction can begin, the project owner would be required to develop and implement a Construction Waste Management Plan per proposed Condition of Certification **WASTE-3** to ensure that the waste will be properly handled and temporarily stored when on-site and when transported off-site either recycled when possible or properly disposed. In addition, to

ensure site workers are properly trained to recognize, avoid, and report unexploded ordnance (UXO), proposed Condition of Certification **WASTE-4** would require the project owner to develop a UXO identification training and reporting procedures program. The UXO training program should include the identification of trained UXO ordnance experts that are available to complete removal of UXO and supplemental geophysical surveys to search for additional or buried ordnance.

Non-Hazardous Wastes

Construction activities, as outlined in **Waste Management Table 2**, would generate an estimated 350 cubic yards of non-hazardous solid wastes, consisting of scrap wood, steel, glass, plastic, scrap metal, and paper. Of these items, recyclable materials would be separated and removed to the extent reasonably possible, and transported to recycling facilities. Non-recyclable solid materials (insulation, other plastics, food waste, roofing materials, vinyl flooring and base, carpeting, paint containers, packing materials, etc.) would be disposed of at a Class III landfill (SR 2009a, Table 5.14-1).

**Waste Management Table 2
Waste Generated during Construction**

Waste	Origin	Composition	Estimated Quantity	Classification	Disposal
Scrap wood, steel, glass, plastic, paper, calcium silicate insulation, mineral wool insulation	Construction of the facility	Normal refuse	120 tons	Nonhazardous	Recycle and/or dispose of in a Class II or III landfill.
Scrap metals	Construction of facility	Parts, containers	22.5	Nonhazardous	Recycle and/or dispose of in a Class III landfill.
Empty hazardous material containers	Construction of facility	Drums, containers, totes	60 containers	Hazardous and nonhazardous solids	Containers < 5 gallons will be disposed of as normal refuse, Containers >5 gallons will be

					returned to vendors for recycling or reconditioning.
Spent welding materials	Construction of facility	Solid	0.6 ton	Hazardous	Disposal at a Class I landfill.
Scrap bags (salt delivery)	Means of delivery of salt	Woven nylon	35,000 bags, or 10 tons	Nonhazardous	Recycle and/or dispose of in a Class III landfill
Waste oil filters	Construction equipment and vehicles	Solids	125 lb per month	Nonhazardous	Recycle at a permitted treatment, storage, and disposal facility.
Used and waste lube oil	Steam turbine lube oil flushes and equipment vehicles	Hydrocarbons	7,500 gallons (life of project construction)	Hazardous	Recycle at a permitted TSDF.
Oily rags, oil sorbent excluding lube oil flushes	Cleanup of small spills	Hydrocarbons	1,900 lb during construction	Hazardous	Recycle or dispose of at a permitted TSDF.
Waste oil	Equipment, vehicles	Hydrocarbons	2,000 gallons	Non-RCRA hazardous liquid	Dispose of at a permitted TSDF.
Solvents, paint, adhesives	Construction of facility	Varies	110 lb per month	Hazardous	Recycle at a permitted TSDF.
Spent lead-acid	Equipment and trucks	Heavy metals	6 batteries per year	Hazardous	Store no more than 10 batteries

batteries					(up to 1-year) – recycle offsite.
Spent alkaline batteries	Equipment	Metals	30 batteries per month	Universal Waste solids	Recycle or dispose of offsite at a Universal Waste Destination Facility.
Steam turbine cleaning waste	Pre-boiler piping	Corrosive cleaning chemicals	125 gallons before plant startup	Hazardous or nonhazardous liquid	Dispose of at a permitted TSDF.
Sanitary waste	Portable toilet holding tanks	Sewage sludge	Approx. 125 gallons per day	Nonhazardous Liquid	Remove by contracted sanitary service.
Fluorescent, mercury vapor lamps	Lighting	Metals and polychlorinated biphenyls (PCB)	60 lb per year	Universal Waste solids	Recycle or dispose offsite at a universal waste destination facility.
Passivating and chemical cleaning fluid waste	Pipe cleaning and flushing	Varies	125,000 to 250,000 gallons (life of project construction)	Hazardous or non hazardous liquid	Sample and characterize -if clean, dispose of in sanitary sewer; otherwise, manage appropriately offsite.
Hydrotest water	Testing equipment and piping integrity	Water	6,000,000 gallons (life of project construction)	Hazardous or non hazardous liquid	Sample and characterize -if clean, discharge to the surrounding

			n)		area; otherwise, manage appropriately offsite.
Stormwater	Rainfall	Water	5,200,000 gallons per year	Non hazardous liquid	Discharge to surrounding land.
NOx emission control scrubbing solution purge	Four-stage chemical scrubber	Solution varying concentration of salts	740 gallons per hour (17,760 gallons per day)	Non hazardous liquid	Treated for pH and accumulated in an onsite holding tanks for shipment offsite.

Source: RSEP AFC Table 5.14-1

Non-hazardous liquid wastes would be generated during construction, and would include equipment washdown water, emission control scrubbing solution purge, storm water runoff and sanitary waste. Storm water runoff would be managed in accordance with appropriate LORS (SR 2009a, Table 5.14-2). Sanitary wastes would be pumped to tanker trucks by licensed contractors for transport to a sanitary wastewater treatment plant. Please see the **SOIL AND WATER RESOURCES** section of this document for more information on the management of project wastewater.

Hazardous Wastes

During construction, anticipated hazardous wastes include waste paint, spent construction solvents, waste cleaners, waste oil, oily rags, waste batteries, and spent welding materials. Estimated amounts are 60 empty containers, 7,500 gallons of oils, solvents, and adhesives (every 90 days), and 36 batteries (per year). Empty hazardous material containers would be returned to the vendor or disposed of at a hazardous waste facility; solvents, used oils, paint, oily rags, and adhesives would be recycled or disposed of at a hazardous waste facility; and spent batteries would be transported to a recycling facility (SR 2009a, Table 5.14-1).

The generation of hazardous waste requires a unique hazardous waste generator identification number to identify and document the source of hazardous waste, and assure responsibility of the waste generator for proper handling, storage, transportation and disposal. The hazardous waste generator number is determined based on site location; therefore, both the construction contractor and the project owner/operator could be considered the generator of hazardous wastes at the site. The project owner would be required to obtain a unique hazardous waste generator identification number for the site prior to starting construction, pursuant to proposed Condition of Certification

WASTE-5. This would ensure compliance with California Code of Regulation Title 22, Division 4.5.

Hazardous waste would be collected in hazardous waste accumulation containers and stored in a laydown area, warehouse/shop area, or storage tank on equipment skids for less than 90 days. The accumulated wastes would then be properly manifested, transported, and disposed of at a permitted hazardous waste management facility by licensed hazardous waste collection and disposal companies. Should any construction waste management-related enforcement action be taken or initiated by a regulatory agency, the project owner would be required by proposed Condition of Certification **WASTE-6** to notify the CPM whenever the owner becomes aware of this action.

The agencies have reviewed the proposed waste management methods described in AFC section 5.14.1.2, and in the responses to data requests. Based on that review, staff concludes that with respect to CEQA, project construction wastes would be managed in accordance with all applicable LORS.

In the event that construction excavation, grading, or trenching activities for the proposed project encounter potentially contaminated soils, specific waste handling, disposal, or other precautions may be necessary pursuant to hazardous waste management LORS. Staff believes that proposed Conditions of Certification **WASTE-1** and **-2** would be adequate to address any soil contamination contingency that may be encountered during construction of the project and would assure compliance with applicable LORS.

Proposed Project - Construction and Demolition (C&D) Waste Diversion and Mitigation

The Integrated Waste Management Act of 1989 [Assembly Bill (AB) 939, Sher, Chapter 1095, Statutes of 1989] set landfill waste diversion goals of 50% (by 2000) for local jurisdictions. To meet this goal, many jurisdictions require applicants for construction and demolition projects to submit a reuse/recycling plan for at least 50% of C&D materials prior to the issuance of a building or demolition permit. While the proposed project is not responsible to a local jurisdiction (Riverside County does not have a construction and demolition waste diversion ordinance), staff encourages the applicant to meet the 50% waste diversion goal as specified in Condition of Certification **WASTE-3** for development and implementation of a Construction Waste Management Plan.

Proposed Project - Operation Impacts and Mitigation

The proposed RSEP would generate both non-hazardous and hazardous wastes in solid and liquid forms under normal operating conditions. **Waste Management Table 3** gives a summary of the anticipated operation waste streams, estimated waste volumes and generation frequency, and proposed management methods.

**Waste Management Table 3
Wastes Generated during Operations**

Waste	Origin	Composition	Estimated Quantity	Classification	Disposal
Lubricating oil	Small leaks and spills from the steam turbine lubricating oil system and routine maintenance of the steam turbine	Hydrocarbons	200 gallons	Hazardous	Recycled by certified oil recycler
Lubricating oil filters	Steam turbine lubricating oil system	Paper, metal and hydrocarbons	950 lb per year	Hazardous	Recycled by certified oil recycler
Solvents, paint, adhesives	Operation of facility	Varies	110 lb per month	Hazardous	Recycled by certified oil recycler
Clarifier solids slurry	Water treatment process	Moist filter cake sludge	25 lb per day	Expected to be nonhazardous, but will be tested	Appropriate landfill
Oily rags	Maintenance, wipe down of equipment, etc.	Hydrocarbons, cloth	600 lb per year (500 rags per year)	Hazardous	Recycled by certified oil recycler
Oil sorbents	Cleanup of small spills	Hydrocarbons	375 lbs per year	Hazardous	Recycled or disposed of by certified oil recycler
Sewage solids and liquids	Sanitary waste from buildings	Sewage sludge and grey water	Approx. 400 gallons per day	Nonhazardous	Solids trucked off site, as needed to treatment facility by cleaning of septic tank, grey water to leach field.

Source: RSEP AFC Table 5.14-2 page 5.14-7

Before operations can begin, the project owner would be required to develop and implement an Operations Waste Management Plan as required by proposed Condition of Certification **WASTE-7**. This would ensure that an accurate record is maintained of the project's waste storage, generation, and disposal; and that compliance with waste management regulations is maintained during operation.

Non-Hazardous Solid Wastes

Non-hazardous solid wastes generated during project operations would consist of glass, paper, wood, plastic, cardboard, deactivated equipment and parts, defective or broken electrical materials, empty non-hazardous containers, and other miscellaneous solid wastes. The project would generate approximately 10 cubic yards per year of non-hazardous waste, (the estimate does not include sewage) (SR 2009a, Section 5.14.1.2.2). Such wastes would be recycled to the greatest extent possible, and the remainder would be removed on a regular basis for disposal in a Class III landfill. Non-hazardous oily rags (one 55-gallon drum per month) would be laundered at an authorized recycle facility. Sanitary wastewater would be treated with an onsite septic system, and sludge would be contained onsite and transported to an off-site disposal facility as needed.

Non-Hazardous Liquid Wastes

Non-hazardous liquid wastes (storm water runoff) would be generated during facility operation and are discussed in the **SOIL AND WATER RESOURCES** section of this document.

Hazardous Wastes

The project owner/operator would be considered the generator of hazardous wastes at the site during facility operations. Therefore, the project owner's unique hazardous waste generator identification number, obtained prior to construction in accordance with proposed Condition of Certification **WASTE-5**, would be retained and used for managing and disposing of hazardous waste generated during facility operation.

Hazardous wastes that may be generated during routine project operation include oily absorbent and spent oil filters, and used hydraulic fluid (SR 2009a, p. 5.14-8). In addition, spills and unauthorized releases of hazardous materials or hazardous wastes may generate contaminated soils or cleanup materials that may also require management and disposal as hazardous waste. Proper hazardous material handling and good housekeeping practices would help keep spill wastes to a minimum. However, to ensure proper cleanup and management of any contaminated soils or waste materials generated from hazardous materials spills, staff proposes Condition of Certification **WASTE-8**, requiring the project owner/operator to document, clean up, and properly manage and dispose of wastes from any hazardous materials spills or releases in accordance with all applicable federal, state, and local requirements. More information on project hazardous materials spill reporting, containment, and control; and countermeasures plan provisions for the project, are provided in the **HAZARDOUS MATERIALS MANAGEMENT** section of this document.

The amount of hazardous wastes generated during operation of the RSEP would be minor, with source reduction and recycling of wastes implemented whenever possible.

The hazardous wastes would be temporarily stored on site, transported off site by licensed hazardous waste haulers, and recycled or disposed of at authorized disposal facilities in accordance with established standards applicable to generators of hazardous waste (Title 22, CCR, §66262.10 et seq.). Should any operations waste management-related enforcement action be taken or initiated by a regulatory agency, the project owner would be required by proposed Condition of Certification **WASTE-6** to notify the CPM when advised of any such action.

Proposed Project - Closure and Decommissioning Impacts and Mitigation

The closure or decommissioning of the RSEP would produce both hazardous and non-hazardous solid and liquid waste. The project's General Compliance Conditions of Certification, including the Compliance Monitoring and Closure Plan (Compliance Plan), are required by Public Resources Code section 25532. The plan provides a means for assuring that the facility is constructed, operated and closed in compliance with public health and safety, environmental and other applicable regulations, guidelines, and conditions adopted or established by the California Energy Commission. Required elements of a facility's closure would be outlined in a Facility Closure Plan as specified in Conditions of Certification **Compliance-12, -13** and **-14**. To ensure adequate review of a planned project closure, the project owner shall submit a proposed Facility Closure Plan to the Energy Commission for review and approval at least 12 months (or other period of time agreed to by the CPM) prior to commencement of closure activities. The Facility Closure Plan will document non-hazardous and hazardous waste management practices, including: the inventory, management, and disposal of hazardous materials and wastes, and permanent disposal of permitted hazardous materials and waste storage units.

The handling and management of waste generated by the RSEP would follow the hierarchical approach of source reduction, recycling, treatment, and disposal, as specified in California Public Resources Code Sections 40051 and 40196. The first priority of the project owner will be to use materials that reduce the waste that is generated. The next level of waste management will involve reusing or recycling wastes. For wastes that cannot be recycled, treatment will be used, if possible, to make the waste nonhazardous. Finally, waste that cannot be reused, recycled or treated would be transported off-site to a permitted treatment, storage, or disposal facility. As discussed below, staff expects that there will be adequate landfill capacity available to dispose of both non-hazardous and hazardous waste from the closure or decommissioning of the proposed project. Conditions of Certification **WASTE-4** through **-6** and **-8** would continue to apply to the RSEP during closure or decommissioning of the project. In addition, the applicant would be required to address waste disposal associated with project demolition as part of its Facility Closure Plan in conformance with all applicable LORS.

Proposed Project - Impact on Existing Waste Disposal Facilities

Non-Hazardous Solid Wastes

Construction and operation of the proposed project would respectively generate approximately 350 cubic yards and 10 cubic yards per year of nonhazardous solid waste (wood, paper/cardboard, glass, plastic, insulation, and concrete), respectively.

The waste would be stored onsite for less than 30 days, and then recycled or disposed of in a Class III landfill.

Desert Center and Blythe Sanitary Landfill are two solid waste disposal facilities located in Riverside County that could potentially take the non-hazardous construction and operation wastes generated by the RSEP (SR 2009a, Table 5.14-3). The remaining combined capacity of the Desert Center and Blythe Sanitary Landfills are currently over 2.3 million cubic yards. The total amount of non-hazardous solid waste generated from project construction is estimated to be 349 cubic yards, and the total amount from lifetime operations is estimated to be 274 cubic yards (for 30 years). The total non-recyclable solid waste would consume much less than 1% of the available landfill capacity. Staff expects that there will be adequate landfill capacity available to dispose of both non-hazardous and hazardous waste from the closure or decommissioning of the proposed project. Conditions of Certification **WASTE-5** through **-8** would continue to apply to RSEP during closure or decommissioning of the project. The agencies believe that disposal of the solid wastes generated by the RSEP can occur without substantially impacting the capacity or remaining life of any of these facilities.

Hazardous Wastes

Hazardous wastes generated during construction and operation would be recycled to the extent possible and practical. Those wastes that cannot be recycled would be transported off site to a permitted treatment, storage, or disposal facility. As calculated from waste streams presented in **Waste Management Tables 2** and **3** (SR 2009a, Tables 5.14-1 and 5.14-2), staff calculated that approximately 47 cubic yards of recyclable and non-recyclable hazardous waste would be generated over the 30 month construction period. Approximately 127 cubic yards of hazardous non-recyclable waste would be generated over the 30-year operating lifetime.

Two hazardous waste (Class I) disposal facilities are currently accepting waste and could be used to manage RSEP hazardous wastes: the Clean Harbors Buttonwillow Landfill in Kern County and the Chemical Waste Management Kettleman Hills Landfill in Kings County. The Kettleman Hills facility also accepts Class II and Class III wastes. In total, there is a combined excess of 10 million cubic yards of remaining hazardous waste disposal capacity at these landfills, with at least 30 years remaining in their operating lifetimes (SR 2009a, Section 5.14.2.3.2). In addition, the Kettleman Hills facility is in the process of permitting an additional 4.6 to 4.9 million cubic yards of disposal capacity (Waste Management 2009), and the Buttonwillow facility has 30 years to reach its capacity at its current disposal rate (SR 2009a, Section 5.14.2.3.2). Thus hazardous wastes from the RSEP requiring off-site disposal would not substantially impact the remaining capacity of either Class I waste facility.

CEQA LEVEL OF SIGNIFICANCE

Absent any unusual circumstances, staff considers project compliance with LORS and staff's proposed conditions of certification to be sufficient to ensure that no significant impacts (per guidelines in CEQA Appendix G: Environmental Checklist Section XVI – Utilities and Service systems) would occur as a result of project waste management activities.

REDUCED ACREAGE ALTERNATIVE

The Reduced Acreage Alternative would be 7.2% smaller in area than the proposed project. It would be located in the same 2,560-acre square-shaped parcel within the larger 3,324-acre ownership property on which the proposed project would be located. Although the overall heliostat field distance from the central tower would be reduced, the number of heliostats would remain the same. The heliostat field, plus the evaporation pond and administration areas, would occupy about 1,270 acres instead of the 1,370 acres required for the proposed project. The receiver location would remain the same, with the edges of the field contracting towards the center. The heliostat footprint of the Reduced Acreage Alternative is shown in **Alternatives Figure 2**. The site layout, 653-foot total height of the solar tower and receiver, and transmission interconnection to Western's Parker-Blythe #2 transmission line, would be the same as the proposed project. The generation output would be reduced by approximately 2 MW.

The Reduced Acreage Alternative is evaluated in this SA/DEIS because it would eliminate about 100 acres of the proposed project footprint, reducing impacts to ephemeral washes, the loss of land considered habitat for the state and federally listed threatened desert tortoise, and impacts to the historic Rice airfield. The Reduced Acreage Alternative would allow the applicant to contribute clean, renewable energy to help meet the State's energy goals, while minimizing impacts to the desert environment. A limited acreage alternative was suggested in scoping comments.

Under the Reduced Acreage Alternative, the agencies would approve a facility with a 7.2% heliostat field area reduction.

SETTING AND EXISTING CONDITIONS

The setting for the Reduced Acreage Alternative is the same as for the proposed project except that the heliostat field would occupy 1,270 acres within the 1,370-acre footprint of the proposed project.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

The Reduce Acreage Alternative would generate similar types of hazardous and non-hazardous wastes from construction, operation and closure/decommissioning of the project. However, the quantities of waste could be proportionately reduced by approximately 7% related to the heliostat field. Wastes associated with the power block and facilities other than the solar field would not substantially change compared to the proposed project. The amount of non-hazardous and hazardous solid wastes generated under a Reduced Acreage Alternative that would require landfill/treatment over the life of the project would not substantially change compared to the proposed project. Similar to the proposed project, wastes requiring off-site disposal would not significantly impact the remaining capacity of off-site disposal facilities. Disposal methods would remain the same as for the proposed project and the same Conditions of Certification (**WASTE-1** through **-8** and **COMPLIANCE-12** through **-14** related to facility closure) would apply.

CEQA LEVEL OF SIGNIFICANCE

Similar to the proposed project, staff considers that with respect to CEQA, project compliance with LORS and staff's proposed conditions of certification to be sufficient to ensure that no significant adverse impacts would occur as a result of waste management activities associated with the Reduced Acreage Alternative.

NORTH OF DESERT CENTER ALTERNATIVE

The North of Desert Center Alternative would be a 150 MW solar thermal facility located on approximately 2,643 acres of land. It would be located along Desert Center Rice Road (State Route 177) east of Kaiser Road, north of Oasis Road, and approximately 1.6 miles north of I-10. The North of Desert Center Alternative is primarily private land, with smaller sections of BLM land in the eastern portion of the site. It is largely fallow agricultural land. The existing SCE 161-kV transmission line (from the Blythe-2 substation to the Eagle Mountain-1 substation) that traverses the alternative site would be realigned to roughly follow the site boundary. A new 0.125-mile generation tie line (along Osborne Ave.) and substation would interconnect to the realigned SCE line at the northeast boundary of the site. The boundaries and transmission realignment of the North of Desert Center Alternative are illustrated in **Alternatives Figure 3**.

The Desert Center Alternative is evaluated in this SA/DEIS because it would reduce impacts to cultural resources; the RSEP is located on the historic Rice Army Airfield. The North of Desert Center Alternative would allow the applicant to contribute clean, renewable energy to help meet the State's energy goals, while minimizing impacts to the desert environment.

SETTING AND EXISTING CONDITIONS

Environmental Setting. Two leaking underground fuel tank sites were identified south of the North of Desert Center Alternative, at the intersection of I-10 and Rice Road (SR 177) (Envirostor 2010). Additionally, as with the proposed RSEP site, the North of Desert Center Alternative region was used as part of General Patton's Desert Training Camps during World War II. Because the North of Desert Center Alternative site is located on previously farmed land, unexploded ordinances are unlikely on the majority of the alternative site. However, because the site was previously used for agriculture, it is possible that the site has been contaminated by agriculture residues.

As discussed in this **WASTE MANAGEMENT** section of this SA/DEIS, preparation and construction of the proposed solar project and its associated facilities would last approximately 2.5 years (30 months) and generate non-hazardous, universal, and hazardous wastes in solid and liquid forms. Construction activities would generate an estimated 349 cubic yards of non-hazardous solid wastes, consisting of scrap wood, concrete, steel, glass, plastic, paper, insulating materials, aluminum, and food waste. For all construction waste, recyclable materials would be separated and removed to recycling facilities; non-recyclable materials would be disposed of at a Class III landfill. Non-hazardous liquid wastes would be generated during construction, and would include storm water runoff, sanitary waste, dust suppression drainage, and equipment wash water.

During construction, anticipated hazardous waste includes empty hazardous material containers; solvents, used oil, paint, and oily rags; heat exchanger cleaning waste (chelant-type solution); and flushing and cleaning wash water (SR 2009a, Table 5.14-1). The hazardous wastes would be transferred to a Class I landfill that accepts hazardous wastes.

The proposed project would generate non-hazardous, universal, and hazardous wastes in solid and liquid forms under normal operating conditions. **Waste Management Table 3** gives a summary of the anticipated operation waste streams, estimated waste volumes and generation frequency, and proposed management methods.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Environmental Impacts. Both nonhazardous and hazardous wastes would be created by the construction of the project at the North of Desert Center Alternative site in similar quantities as at the proposed site and would be disposed of at the same facilities as for the proposed project. The applicant would be required to obtain a unique hazardous waste generator identification number for the site prior to starting construction and would be required to comply with staff-proposed conditions of certification similar to those identified for the proposed site. The project at either the RSEP site or the North of Desert Center Alternative site would produce minimal maintenance and plant wastes.

All nonhazardous wastes would be recycled to the extent possible, and nonrecyclable wastes would be regularly transported off site to a local solid waste disposal facility. Generation plant wastes include oily rags, broken and rusted metal and machine parts, defective or broken electrical materials, empty containers, and other miscellaneous solid wastes, including the typical refuse generated by workers. All construction and operation activities would need to be conducted in compliance with regulations pertaining to the appropriate management of wastes.

Comparison to Proposed Project. The environmental impacts of waste disposal at the Desert Center Alternative site would be similar to those at the proposed RSEP site.

CEQA LEVEL OF SIGNIFICANCE

Similar to the proposed project, staff considers that with respect to CEQA, project compliance with LORS and staff's proposed conditions of certification to be sufficient to ensure that no significant adverse impacts would occur as a result of waste management activities associated with the North of Desert Center alternative.

SR 62/RICE VALLEY ROAD GENERATION TIE LINE ALTERNATIVE

The SR 62/Rice Valley Road Generation Tie Line Alternative would interconnect to Western's 161-kV/230-kV Parker-Blythe Transmission Line #2 at the same location as the proposed project southeast of the RSEP. This alternative generation tie line would exit the power block directly to the east and follow a proposed access road within the heliostat field. The tie-in would then turn north inside the RSEP property boundary and run along the RSEP's circular perimeter road to the north and northwest. At the north end of the heliostat field, the route would traverse the construction laydown area on previously disturbed land over a distance of approximately 500 feet to the southern side

of State Route 62. The route would follow State Route 62 approximately 3.8 miles east to the junction of Rice Valley Road. It would then trend south to follow the unpaved Rice Valley Road for 4.1 miles to its juncture with the applicant's proposed new generation tie line alignment and continue southeast for 5.4 miles along the proposed alignment to Western's Parker-Blythe #2 transmission line. The SR 62/Rice Valley Road Generation Tie Line Alternative route is illustrated in **Alternatives Figure 4**.

1. The SR 62/Rice Valley Road Generation Tie Line Alternative is evaluated in this SA/DEIS because it would avoid the permanent loss of 13.4 acres of foraging and cover habitat for plant and animal species, including the state and federally listed threatened desert tortoise, and would avoid the creation of a new 4.6 mile vehicle access route between RSEP and the proposed junction of the new generation tie line access road with the existing Rice Valley road.

SETTING AND EXISTING CONDITIONS

Environmental Impacts. Both nonhazardous and hazardous wastes would be created by the construction of SR 62/Rice Valley Road Transmission Line Alternative in similar quantities as at the proposed site and would be disposed of at the same facilities as for the proposed project. The applicant would be required to obtain a unique hazardous waste generator identification number for the site prior to starting construction and would be required to comply with staff's proposed conditions of certification similar to those identified for the proposed site.

All nonhazardous wastes would be recycled to the extent possible, and nonrecyclable wastes would be regularly transported off site to a local solid waste disposal facility. Generation plant wastes include oily rags, broken and rusted metal and machine parts, defective or broken electrical materials, empty containers, and other miscellaneous solid wastes, including the typical refuse generated by workers. All construction and operation activities would need to be conducted in compliance with regulations pertaining to the appropriate management of wastes.

Comparison to Proposed Project. The environmental impacts of waste disposal for the SR 62/Rice Valley Road Generation Tie Line Alternative would be similar to those at the proposed RSEP site.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

As discussed in this **WASTE MANAGEMENT** section of this SA/DEIS, preparation and construction of the proposed solar project and its associated facilities would last approximately 2.5 years (30 months) and generate non-hazardous, universal, and hazardous wastes in solid and liquid forms. Construction activities would generate an estimated 349 cubic yards of non-hazardous solid wastes, consisting of scrap wood, concrete, steel, glass, plastic, paper, insulating materials, aluminum, and food waste. For all construction waste, recyclable materials would be separated and removed to recycling facilities; non-recyclable materials would be disposed of at a Class III landfill. Non-hazardous liquid wastes would be generated during construction, and would include storm water runoff, sanitary waste, dust suppression drainage, and equipment wash water.

During construction, anticipated hazardous waste would include empty hazardous material containers; solvents, used oil, paint, and oily rags; heat exchanger cleaning waste (chelant-type solution); and flushing and cleaning wash water (SR 2009a, Table 5.14-1). The hazardous wastes would be transferred to a Class I landfill that accepts hazardous wastes.

The proposed project would generate non-hazardous, universal, and hazardous wastes in solid and liquid forms under normal operating conditions. **Waste Management Table 3** gives a summary of the anticipated operation waste streams, estimated waste volumes and generation frequency, and proposed management methods.

CEQA LEVEL OF SIGNIFICANCE

Similar to the proposed project, staff considers that with respect to CEQA, project compliance with LORS and staff's proposed conditions of certification to be sufficient to ensure that no significant adverse impacts would occur as a result of waste management associated with the SR 62/Rice Valley Road Generation Tie Line alternative.

NO PROJECT/NO ACTION ALTERNATIVE

No Project and No Action on Rice Solar Energy Project transmission line application and interconnection request. No California Desert Conservation Area (CDCA) land use plan amendment.

Under this alternative, the proposed Rice Solar Energy Project would not be approved by the Energy Commission; BLM would not approve the transmission line application and would not amend the CDCA Plan; and Western would not approve the interconnection request. As a result, no solar energy project would be constructed on the project site, BLM would continue to manage the land encompassing the generation tie line consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended, and Western would continue to operate the Parker Blythe Transmission Line under current conditions.

Because there would be no amendment to the CDCA Plan and no solar project approved for the site under this alternative, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site. As a result, no new wastes would be generated. This No Project/No Action Alternative would not result in impacts to waste management at this location. However, the land on which the project is proposed would become available to other uses that are consistent with BLM's land use plan, including another solar project requiring a land use plan amendment. In addition, in the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations.

CUMULATIVE IMPACTS

A project may result in a significant adverse cumulative impact where its effects are cumulatively considerable. "Cumulatively considerable" means that the incremental

effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects (California Code Regulation, Title 14, section 15130). NEPA states that cumulative effects can result from individually minor but collectively significant actions taking place over a period of time” (40 CFR §1508.7).

There is the potential for substantial future development in eastern Riverside County and throughout the southern California desert region. Analysis of cumulative impacts is based on data provided in the following maps and tables (see **CUMULATIVE SCENARIO**):

- Cumulative Impacts Figure 1, Renewable Energy Applications in California Desert District;
- Cumulative Impacts Figure 2, Existing and Future/Foreseeable Projects;
- Cumulative Impacts Table 1A, Renewable Energy Projects in the California Desert District
- Cumulative Impacts Table 1B, Renewable Energy Projects on State and Private Lands
- Cumulative Impacts Table 2, Existing Projects in Rice Valley area and Eastern Riverside Eastern Riverside County; and
- Cumulative Impacts Table 3, Future Foreseeable Projects in Rice Valley area and Eastern Riverside Eastern Riverside County.

The analysis in this section first defines the geographic area over which cumulative impacts related to waste management could occur. The cumulative impact analysis itself describes the potential for cumulative impacts to occur as a result of implementation of the proposed project along with the listed local and regional projects.

GEOGRAPHIC EXTENT

The geographic extent for the analysis of the cumulative impacts associated with the RSEP project is Riverside County, the location of the closest large Class III landfills. This geographic scope is appropriate because waste disposal facilities in Riverside County are the ones most likely to be used for disposal of waste generated by the RSEP Project considering regulatory acceptability and transport costs.

Existing Cumulative Conditions

Cumulative impacts could occur within Riverside County if the RSEP is implemented in combination with other local or regional projects. Cumulative impacts could also occur as a result of development of some of the many proposed solar and wind development projects that have been or are expected to be under consideration by the BLM and the Energy Commission in the near future. Many of these projects are located within the California Desert Conservation Area, as well as on BLM land in Nevada and Arizona.

Future Foreseeable Projects

The RSEP Project would generate non-hazardous solid waste that would add to the total waste generated in Riverside County. Non-hazardous solid waste generated by all

of the past, present, and reasonably foreseeable projects presented in Cumulative Impacts Table 2 and Cumulative Impacts Table 3 would also be disposed of within Riverside County. Most of the reasonably foreseeable projects identified in Cumulative Impacts Table 3 would generate smaller volumes of non-hazardous waste than the RSEP Project because wind and photovoltaic projects would not generate wastes associated with construction and operation of a power block.

Foreseeable Projects in the Project Area

Staff used a value of 100 cubic yards/MW as a rough guide for determining total volume of non-hazardous solid wastes that could result from implementation of all the projects listed in the two tables, the majority of which are renewable energy facilities, and particularly solar facilities. The value is based on the 150-MW RSEP project total lifetime value of 23,000 cubic yards of non-hazardous solid waste, factoring in the lesser amounts of waste likely to be generated by solar photovoltaic projects. Similar to the proposed projects, these quantities do not include closure or decommissioning wastes; disposal at landfills with adequate capacity would be a condition in facility closure plans. The approximately 450,000 cubic yards generated from projects listed in **Cumulative Impacts Table 3** compares to be less than 1% of the almost 200,000,000 cubic yards of Class III landfill capacity available to these generators as identified in AFC Table 5.16-4 (Solar Millennium 2009a, page 5.16-10, 11). Based on this information, the agencies conclude that the non-hazardous waste generated by the RSEP Project would not contribute substantially to diminishing Class III landfill capacity in Riverside County

As stated above, the non-recyclable component of the 60 cubic yards of total lifetime hazardous waste from the RSEP project would not impact the capacity or remaining life of the Class I waste facilities. Using a similar conversion factor as that noted above, the agencies estimated that approximately 16,000 cubic yards of lifetime hazardous waste would be generated by the projects listed in Cumulative Impacts Table 3. This compares to be less than 1% of the almost 10,000,000 cubic yards of Class I landfill capacity available to these generators, as identified in AFC (RSEP 2009a, page 5.14-11). Based on this information, staff concludes that hazardous waste generated by the RSEP Project would not contribute substantially to diminishing available Class I landfill capacity.

Foreseeable Renewable Projects in the California Desert

Implementation of the multiple solar and wind projects proposed to be developed in the California Desert, and other planned non-energy projects, would result in an increase in generation of hazardous and non-hazardous solid and liquid wastes and would add to the total quantity of wastes generated throughout the desert. However, project wastes would be recycled wherever practical and sufficient capacity is available throughout the area, especially with the addition of the Mesquite Regional Landfill with a capacity of 600 million tons that is scheduled to be fully operational in 2011/2012 (Mesquite Regional Landfill 2010). Therefore, impacts of the RSEP project, when combined with impacts of the future solar, wind and other development projects that are currently proposed within the California desert would not contribute substantially to diminishing regional landfill capacity.

Cumulative Impact Conclusion

Impacts of the RSEP project would combine with impacts of past, present, and reasonably foreseeable projects to result in a contribution to local and regional cumulative impacts related to waste management.

The amount of non-hazardous and hazardous wastes generated during construction, operation and closure/decommissioning of the RSEP project would add to the total quantity of hazardous and non-hazardous waste generated in Riverside County. However, sufficient capacity is available at treatment and disposal facilities to handle the volumes of wastes that would be generated by the project as well as past, present and reasonably foreseeable projects. Therefore, staff concludes that with respect to CEQA, the waste generated by the RSEP project would not result in significant adverse cumulative waste management impacts, either locally or regionally.

COMPLIANCE WITH LORS

With respect to CEQA, staff concludes that with adoption of staff's proposed Conditions of Certification, the proposed RSEP would comply with all applicable LORS regulating the management of hazardous and non-hazardous wastes during both facility construction and operation. The applicant is required to recycle and/or dispose hazardous and non-hazardous wastes at facilities licensed or otherwise approved to accept the wastes.

Because hazardous wastes would be produced during both project construction and operation, the RSEP would be required to obtain a hazardous waste generator identification number from U.S. EPA. The RSEP would also be required to properly store, package, and label all hazardous wastes; use only approved transporters; prepare hazardous waste manifests; keep detailed records; and appropriately train employees in accordance with state and federal hazardous waste management requirements.

NOTEWORTHY PUBLIC BENEFITS

Staff has not identified any noteworthy public benefits associated with Waste Management.

PROPOSED MITIGATION MEASURES/CONDITIONS OF CERTIFICATION

The following Mitigation Measures/Conditions of Certification meet the Energy Commission's responsibility to comply with the California Environmental Quality Act and serve as staff's recommendations for the Energy Commission to consider in its decision to avoid or reduce the severity of waste management-related impacts to less than significant and for the project to conform to all applicable LORS. The identification of relevant and reasonable mitigation measures also conforms to National Environmental Policy Act (NEPA) requirements for BLM's and Western's analysis that can be considered in their Records of Decision.

WASTE-1 The project owner shall provide the resume of an experienced and qualified professional engineer or professional geologist, who shall be available during site characterization (if needed), demolition, excavation, and grading activities, to the CPM for review and approval. The resume shall show experience in remedial investigation and feasibility studies.

The professional engineer or professional geologist shall be given authority by the project owner to oversee any earth moving activities that have the potential to disturb contaminated soil and impact public health, safety and the environment.

Verification: At least 30 days prior to the start of site mobilization, the project owner shall submit the resume to the CPM for review and approval.

WASTE-2 If potentially contaminated soil is identified during site characterization, demolition, excavation or grading at either the proposed site or linear facilities, as evidenced by discoloration, odor, detection by handheld instruments, or other signs, the professional engineer or professional geologist shall inspect the site, determine the need for sampling to confirm the nature and extent of contamination, and provide a written report to the project owner, representatives of Department of Toxic Substances Control or Regional Water Quality Control Board, the CPM stating the recommended course of action.

Depending on the nature and extent of contamination, the professional engineer or professional geologist shall have the authority to temporarily suspend construction activity at that location for the protection of workers or the public. If, in the opinion of the professional engineer or professional geologist, significant remediation may be required, the project owner shall contact the CPM, and representatives of the Department of Toxic Substances Control or Regional Water Quality Control Board, for guidance and possible oversight.

Verification: The project owner shall submit any reports filed by the professional engineer or professional geologist to the CPM within 5 days of their receipt. The project owner shall notify the CPM within 24 hours of any orders issued to halt construction.

WASTE-3 The project owner shall prepare a Construction Waste Management Plan for all wastes generated during construction of the facility and shall submit the plan to the CPM for review and approval prior to the start of construction. The plan shall contain, at a minimum, the following:

- A description of all construction waste streams, including projections of frequency, amounts generated, and hazard classifications; and
- Management methods to be used for each waste stream, including temporary on-site storage, housekeeping and best management practices to be employed, treatment methods and companies providing treatment services, waste testing methods to assure correct classification, methods of transportation, disposal requirements and sites, and recycling and waste minimization/source reduction plans. The applicant shall strive to achieve at least a 50% reduction of waste

construction and demolition materials by reuse and recycling to meet landfill waste diversion goals consistent with the Integrated Waste Management Act of 1989.

Verification: The project owner shall submit the Construction Waste Management Plan to the CPM for approval no less than 30 days prior to the initiation of construction activities at the site.

WASTE-4 The project owner shall prepare Unexploded Ordnance (UXO) Identification, Training and Reporting Plan to properly train all site workers in the recognition, avoidance and reporting of military waste debris and ordnance. The project owner shall submit the plan to the CPM and AO for review and approval prior to the start of construction. The plan shall contain, at a minimum, the following:

- A description of the training program outline and materials, and the qualifications of the trainers; and
- Identification of available trained experts that will respond to notification of discovery of any ordnance (unexploded or not); and
- A work plan to recover and remove discovered ordnance, and complete additional field screening, possibly including geophysical surveys to investigate adjacent areas for surface, near surface or buried ordnance in all proposed land disturbance areas.
- The project owner shall provide documentation of the plan and provide survey results to the CPM.

Verification: The project owner shall submit the UXO Identification, Training and Reporting Plan to the CPM for approval no less than 60 days prior to the initiation of construction activities at the site. The results of geophysical surveys shall be submitted to the CPM within 30 days of completion of the surveys.

WASTE-5 The project owner shall obtain a hazardous waste generator identification number from the United States Environmental Protection Agency (USEPA) prior to generating any hazardous waste during project construction and operations.

Verification: The project owner shall keep a copy of the identification number on file at the project site and provide documentation of the hazardous waste generation and notification and receipt of the number to the CPM in the next scheduled Monthly Compliance Report after receipt of the number. Submittal of the notification and issued number documentation to the CPM is only needed once unless there is a change in ownership, operation, waste generation, or waste characteristics that requires a new notification to USEPA. Documentation of any new or revised hazardous waste generation notifications or changes in identification number shall be provided to the CPM and AO in the next scheduled compliance report.

WASTE-6 Upon notification of any impending waste management-related enforcement action by any local, state, or federal authority, the project owner shall notify the CPM of any such action taken or proposed against the project itself, or against any waste hauler or disposal facility or

treatment operator with which the owner contracts, and describe how the violation will be corrected.

Verification: The project owner shall notify the CPM in writing within 10 days of becoming aware of an impending enforcement action. The CPM shall notify the project owner of any changes that will be required in the way project-related wastes are managed.

WASTE-7 The project owner shall prepare an Operation Waste Management Plan for all wastes generated during operation of the proposed project and shall submit the plan to the CPM for review and approval. The plan shall contain, at a minimum, the following:

- A detailed description of all operation and maintenance waste streams, including projections of amounts to be generated, frequency of generation, and waste hazard classifications;
- Management methods to be used for each waste stream, including temporary on-site storage, housekeeping and best management practices to be employed, treatment methods and companies providing treatment services, waste testing methods to assure correct classification, methods of transportation, disposal requirements and sites, and recycling and waste minimization/source reduction plans;
- Information and summary records of conversations with the local Certified Unified Program Agency and the Department of Toxic Substances Control regarding any waste management requirements necessary for project activities. Copies of all required waste management permits, notices, and/or authorizations shall be included in the plan and updated as necessary;
- A detailed description of how facility wastes will be managed, and any contingency plans to be employed, in the event of an unplanned closure or planned temporary facility closure; and
- A detailed description of how facility wastes will be managed and disposed of upon closure of the facility.

Verification: The project owner shall submit the Operation Waste Management Plan to the CPM for approval no less than 30 days prior to the start of project operation. The project owner shall submit any required revisions to the CPM within 20 days of notification from the CPM that revisions are necessary.

The project owner shall also document in each Annual Compliance Report the actual volume of wastes generated and the waste management methods used during the year; provide a comparison of the actual waste generation and management methods used to those proposed in the original Operation Waste Management Plan; and update the Operation Waste Management Plan as necessary to address current waste generation and management practices.

WASTE-8 The project owner shall ensure that all accidental spills or unauthorized releases of hazardous substances, hazardous materials, and hazardous waste are documented and remediated, and that wastes generated from

accidental spills and unauthorized releases are properly managed and disposed of in accordance with all applicable federal, state, and local requirements.

The project owner shall document management of all accidental spills and unauthorized releases of hazardous substances, hazardous materials, and hazardous wastes that occur on the project property or related linear facilities. The documentation shall include, at a minimum, the following information: location of release; date and time of release; reason for release; volume released; how release was managed and material cleaned up; amount of contaminated soil and/or cleanup wastes generated; if the release was reported; to whom the release was reported; release corrective action and cleanup requirements placed by regulating agencies; level of cleanup achieved and actions taken to prevent a similar release or spill; and disposition of any hazardous wastes and/or contaminated soils and materials that may have been generated by the release.

Verification: A copy of the accidental spill or unauthorized release documentation shall be provided to the CPM within 30 days of the date the release was discovered.

CONCLUSIONS

Consistent with the three main objectives of staff's waste management analysis (as noted in the Introduction section of this analysis), staff provides the following conclusions:

After review of the applicant's proposed waste management procedures, staff concludes that project wastes would be managed in compliance with all applicable waste management LORS. Staff notes that construction, demolition, and operation wastes would be characterized and managed as either hazardous or non-hazardous waste. All non-hazardous wastes would be recycled to the extent feasible, and nonrecyclable wastes would be collected by a licensed hauler and disposed of at a permitted solid waste disposal facility. Hazardous wastes would be stored onsite in accordance with accumulation time, and then properly manifested, transported to, and disposed of at a permitted hazardous waste management facility by licensed hazardous waste collection and disposal companies.

However, to help ensure and facilitate ongoing project compliance with LORS, staff proposes Conditions of Certification **WASTE-1** through **-8**. These conditions would require the project owner to do all of the following:

- Ensure the project site is investigated and any contamination identified is remediated as necessary, with appropriate professional and regulatory agency oversight (**WASTE-1** and **-2**).
- Prepare Construction Waste Management and Operation Waste Management Plans detailing the types and volumes of wastes to be generated and how wastes will be managed, recycled, and/or disposed of after generation (**WASTE-3** and **-7**).

- Ensure the project site is investigated and remediated for any unexploded ordnance that may pose a risk to construction personnel or the environment (**WASTE-4**).
- Obtain a hazardous waste generator identification number (**WASTE-5**).
- Report any waste management-related LORS enforcement actions and how violations will be corrected (**WASTE-6**).
- Ensure that all spills or releases of hazardous substances are reported and cleaned-up in accordance with all applicable federal, state, and local requirements (**WASTE-8**).

The existing available capacity for the Class III landfills that may be used to manage nonhazardous project wastes exceeds 3.73 million cubic yards, with another 600 million cubic yards of capacity expected in the future with full operation of the Mesquite Regional Landfill. The total amount of non-hazardous wastes generated from construction, demolition and operation of the RSEP would consume much less than 1% of the projected landfill capacity. Therefore, disposal of project generated non-hazardous wastes would have a less than significant impact on Class III landfill capacity.

In addition, the two Class I disposal facilities that could be used for hazardous wastes generated by the construction and operation of RSEP have a combined remaining capacity in excess of 16 million cubic yards, with another 4.6 to 4.9 million cubic yards of proposed capacity. The total amount of hazardous wastes generated by the RSEP would be less than significant in relation to the remaining permitted capacity. Therefore, impacts from disposal of RSEP generated hazardous wastes would also have a less than significant impact on the remaining capacity at Class I landfills.

Staff concludes that management of the waste generated during construction and operation of the RSEP would not result in any significant adverse impacts, and would comply with applicable LORS, if the waste management practices and mitigation measures proposed in the RSEP AFC and staff's proposed conditions of certification are implemented.

WORKER SAFETY AND FIRE PROTECTION

Testimony of Geoff Lesh, PE, Alvin Greenberg, PhD. and Rick Tyler

SUMMARY OF CONCLUSIONS

The U.S. Bureau of Land Management (BLM), Western Area Power Administration (Western) and Energy Commission staff (staff), hereafter jointly referred to as agencies, have reviewed the Rice Solar Energy Project (RSEP or proposed project) in accordance with the requirements of the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA). With respect to CEQA, staff concludes that if the applicant for the proposed RSEP project provides a Project Construction Safety and Health Program and a Project Operations and Maintenance Safety and Health Program, as required by Conditions of Certification **WORKER SAFETY-1** and **-2** and fulfils the requirements of Conditions of Certification **WORKER SAFETY-3** through **-11** the project would incorporate sufficient measures to ensure adequate levels of industrial safety and comply with applicable laws, ordinances, regulations, and standards.

The proposed conditions of certification provide assurance that the Construction Safety and Health Program and the Operations and Maintenance Safety and Health Program proposed by the applicant would be reviewed by the appropriate agencies before implementation. The conditions also require verification that the proposed plans adequately assure worker safety and fire protection and comply with applicable laws, ordinances, regulations, and standards.

The agencies have considered the position of the Riverside County Fire Department (RCFD) and all relevant information as well as past experience at other solar power plants in California, and staff has determined with respect to CEQA that the project would cause a significant direct and cumulative impact on local fire protection services and the public which is served by RCFD. Therefore, staff is proposing mitigation to reduce these impacts to less than significant by requiring payment to the RCFD for capital and operations and maintenance support as apportioned among other solar energy developers in addition to the requirement to provide onsite emergency medical services and transport during construction and operations (see proposed Conditions of Certification **WORKER SAFETY-7**, **-8**, **-10** and **-11**).

These Conditions of Certification meet the Energy Commission's responsibility to comply with the California Environmental Quality Act and serve as staff's recommendations for the Energy Commission to consider in its decision to avoid or reduce the severity of worker safety- and fire protection-related impacts to less than significant and for the project to conform to all applicable LORS. The identification of relevant and reasonable mitigation measures also conforms to National Environmental Policy Act (NEPA) requirements for BLM's and Western's analysis that can be considered in their Records of Decision.

INTRODUCTION

The proposed action evaluated within this Staff Assessment-Draft Environmental Impact Statement (SA-DEIS) is the construction and operation of the Rice Solar Electric Project (RSEP, referred to herein as the Project), a proposed solar-thermal electricity generation facility located on private lands in northern Riverside County, California.

Worker safety and fire protection are regulated through laws, ordinances, regulations, and standards (LORS), at the federal, state, and local levels. Industrial workers at the facility operate equipment and handle hazardous materials daily and may face hazards that can result in accidents and serious injury. Protection measures are employed to eliminate or reduce these hazards or to minimize the risk through special training, protective equipment, and procedural controls.

The purpose of this SA-DEIS is to assess the worker safety and fire protection measures proposed by the RSEP and to determine whether the applicant has proposed adequate measures to:

- comply with applicable safety LORS;
- protect the workers during construction and operation of the facility;
- protect against fire; and
- provide adequate emergency response procedures.

LAWS, ORDINANCES, REGULATIONS, AND STANDARDS

Worker Safety and Fire Protection Table 1
Laws, Ordinances, Regulations, and Standards (LORS)

Applicable Law	Description
Federal	
Title 29 U.S. Code (USC) section 651 et seq (Occupational Safety and Health Act of 1970)	This act mandates safety requirements in the workplace with the purpose of “[assuring] so far as possible every working man and woman in the nation safe and healthful working conditions and to preserve our human resources” (29 USC § 651).
Title 29 Code of Federal Regulation (CFR) sections 1910.1 to 1910.1500 (Occupational Safety and Health Administration Safety and Health Regulations)	These sections define the procedures for promulgating regulations and conducting inspections to implement and enforce safety and health procedures to protect workers, particularly in the industrial sector.
29 CFR sections 1952.170 to 1952.175	These sections provide federal approval of California’s plan for enforcement of its own Safety and Health requirements, in lieu of most of the federal requirements found in 29 CFR sections 1910.1 to 1910.1500.
State	
Title 8 California Code of Regulations (Cal Code Regs.) all applicable sections (Cal/OSHA regulations)	These sections require that all employers follow these regulations as they pertain to the work involved. This includes regulations pertaining to safety matters during construction, commissioning, and operations of power plants, as well as safety around electrical components, fire safety, and hazardous materials use, storage, and handling.
24 Cal Code Regs. section 3, et seq.	This section incorporates the current addition of the International Building Code.
Health and Safety Code section 25500, et seq.	This section presents Risk Management Plan requirements for threshold quantity of listed acutely hazardous materials at a facility.
Health and Safety Code sections 25500 to 25541	These sections require a Hazardous Material Business Plan detailing emergency response plans for hazardous materials emergency at a facility.
Local (or locally enforced)	
Riverside County Ordinance 457	Adopts specific building, mechanical, plumbing, and electrical codes from sources such as the California Building Standards Commission with county-specific modifications.
Riverside County Ordinance 787	Adopts the 2007 edition of the California Fire Code and portions of the 2007 edition of the California Building Code with county-specific modifications.
Riverside County Ordinance 615	Establishes requirements for the use, generation, storage and disposal of hazardous materials within the County.
Riverside County Dept. of Environmental Health, Hazardous Materials Releases	Adopts State requirements and guidelines to govern hazardous materials release response plans and inventories.
Chapter 22 of the 2007 California Fire Code	This section of the CFC addresses requirement for Motor Fuel-Dispensing Facilities and Repair Garages. It has been adopted by Riverside County and will apply to the fuel depot at the site.
NFPA 30a	This is the NFPA code for Motor Fuel Dispensing Facilities and Repair Garages (2008Edition) and is the industry standard for fuel depots.

METHODOLOGY AND THRESHOLDS FOR DETERMINING ENVIRONMENTAL CONSEQUENCES

Two issues are assessed in Worker Safety and Fire Protection:

1. The potential for impacts on the safety of workers during demolition, construction, and operations activities, and
2. Fire prevention/protection, emergency medical services (EMS) and response, and hazardous materials (hazmat) spill response during demolition, construction, and operations.

Worker safety issues are thoroughly addressed by the California Department of Occupational Safety and Health (Cal/OSHA) regulations. If all LORS are followed, workers will be adequately protected. Thus, the standard for the agencies' review and determination of significant impacts on workers is whether or not the applicant has demonstrated adequate knowledge about and dedication to implementing all pertinent and relevant Cal/OSHA standards.

Regarding fire prevention matters, the agencies review and evaluate the on-site fire-fighting systems proposed by the applicant and the time needed for off-site local fire departments to respond to a fire, medical, or hazardous material emergency at the proposed power plant site. If on-site systems do not follow established codes and industry standards, the agencies identify and recommend additional measures. The agencies review and evaluate the local fire department capabilities and response time in each area and interviews the local fire officials to determine whether they feel adequately trained, manned, and equipped to respond to the actual and potential needs of a power plant. The agencies then determine if the presence of the power plant would cause a significant impact on a local fire department. If it does, the agencies will identify and recommend that the applicant mitigate this impact by providing increased resources to the fire department.

The agencies have also established a procedure for use when a local fire department has identified either a significant incremental project impact to the local agency or a significant incremental cumulative impact to a local agency. The agencies first conduct an initial review of the fire department's position and either agree or disagree with the fire department's determination that a significant impact would exist if the proposed power plant were built and operated. A process then starts whereby the project applicant can either accept the determination made by the agencies or refute the determination by providing a Fire Needs Assessment and a Risk Assessment. The Fire Needs Assessment would address fire response and equipment/staffing/location needs while the Risk Assessment would be used to establish that while an impact to the fire department might indeed exist, the risk (chance) of that impact occurring and causing injury or death may or may not be less than significant.

PROPOSED PROJECT

SETTING AND EXISTING CONDITIONS

The RSEP is within a larger, privately owned holding that is 3,324 acres in size. Within the project parcel will be the administration buildings area, heliostat field with power block, and evaporation pond areas, (collectively, the project site or facility site) totaling 1,410 acres, that will be surrounded by a security fence. Areas outside the facility site but within the project parcel will not be fenced or developed or disturbed as part of the RSEP. The site is primarily on previously disturbed private land (RSEP 2009a, AFC pg. ES-4). Existing use adjacent to the proposed project site consists of undeveloped open space uses to the east, south, and west. Along the northern boundary of the site, State Route 62, the California Aqueduct, and the Arizona-California Railroad run parallel to the site (RSEP 2009a, AFC Section 5.7.2.1).

The two closest Riverside County Fire Department (RCFD) stations that would respond to an incident at the proposed project, located on the former Rice Army Airfield in Rice, CA are Station # 49, located at 43880 Lake Tamarisk, Desert Center, CA. and Station # 43 located at 140 West Barnard Street, Blythe, CA. Riverside County Fire Station # 49 is located approximately 70 miles from the project site and the second Riverside County Fire Station (# 43) is located approximately 75 miles from the proposed site. From the above listed fire stations, the response time for engine # 49 is approximately 1 hour and forty-five minutes after dispatch. The second unit, engine # 43 will respond to the project area in approximately two hours. Riverside County Fire Department Fire Stations are staffed full-time, 24 hours/7 days a week, with a minimum 3 person crew, including paramedics, operating a "Type-1" structural fire fighting apparatus. Each member of the engine company is a certified Emergency Medical Technician and certified to the level of Hazardous Materials First Responder Operational (Riverside 2010e)

The applicant has stated that in accordance with emergency response procedures specified in the Hazardous Materials Business Plan (HMBP), designated personnel will be trained as members of a plant hazardous material response team, and team members will receive the first responder and hazardous material technical training to be developed in the HMBP, including training in appropriate methods to mitigate and control accidental spills. In the event of a chemical emergency, plant personnel will defer to the Riverside County Department of Environmental Health, Hazardous Materials Management Division (RCDEH HMMD). (RSEP 2009a, Section 5.5.4.2.1). In the event of a hazardous materials incident, The Riverside County Fire Department Hazardous Materials Response Team will respond to the project area. The Hazardous Materials Response Team # 81 is located at 37955 Washington Street in Palm Desert, CA, approximately 100 miles from the project site. The estimated response time is approximately 2 hours. (Riverside 2010b).

Staff concludes that with respect to CEQA and given the remote location, the hazardous material response time is acceptable, and that the Riverside County Hazmat Team is adequately trained and equipped to respond to an emergency at RSEP. The remote location lengthens the response time but, at the same time, reduces the risk of off-site consequences to the public. More detailed discussion and analysis of hazardous

materials use and storage at the proposed RSEP project can be found in the Hazardous Materials Management section of this SA-DEIS.

ASSESSMENT OF DIRECT AND INDIRECT IMPACTS AND DISCUSSION OF MITIGATION

Worker Safety

Industrial environments are potentially dangerous during construction and operation of facilities. Workers at the proposed RSEP would be exposed to loud noises, moving equipment, trenches, and confined space entry and egress problems. The workers may experience falls, trips, burns, lacerations, and numerous other injuries. They have the potential to be exposed to falling equipment or structures, chemical spills, hazardous waste, fires, explosions, and electrical sparks and electrocution. It is important for the RSEP to have well-defined policies and procedures, training, and hazard recognition and control at its facility to minimize such hazards and protect workers. If the facility complies with all LORS, workers will be adequately protected from health and safety hazards.

Safety and Health Programs would be prepared by the applicant to minimize worker hazards during construction and operation. The agencies use the phrase “Safety and Health Program” to refer to the measures that would be taken to ensure compliance with the applicable LORS during the construction and operational phases of the project.

Construction Safety and Health Program

Workers at the RSEP would be exposed to hazards typical of construction and operation of a solar thermal electric power generating facility.

Construction Safety Orders are published at Title 8 California Code of Regulations sections 1502, et seq. These requirements are promulgated by Cal/OSHA and would be applicable to the construction phase of the project. The Construction Safety and Health Program would include the following:

- Construction Injury and Illness Prevention Program (8 Cal Code Regs. § 1509)
- Construction Fire Prevention Plan (8 Cal Code Regs. § 1920)
- Personal Protective Equipment Program (8 Cal Code Regs. §§ 1514 — 1522)
- Emergency Action Program and Plan

Additional programs under General Industry Safety Orders (8 Cal Code Regs. §§ 3200 to 6184), Electrical Safety Orders (8 Cal Code Regs. §§2299 to 2974) and Unfired Pressure Vessel Safety Orders (8 Cal Code Regs. §§ 450 to 544) would include:

- Electrical Safety Program
- Motor Vehicle and Heavy Equipment Safety Program
- Forklift Operation Program
- Excavation/Trenching Program
- Fall Protection Program

- Scaffolding/Ladder Safety Program
- Articulating Boom Platforms Program
- Crane and Material Handling Program
- Housekeeping and Material Handling and Storage Program
- Respiratory Protection Program
- Employee Exposure Monitoring Program
- Hand and Portable Power Tool Safety Program
- Hearing Conservation Program
- Back Injury Prevention Program
- Ergonomics Program
- Heat and Cold Stress Monitoring and Control Program
- Hazard Communication Program
- Lock Out/Tag Out Safety Program
- Pressure Vessel and Pipeline Safety Program
- Solar Components Safe Handling Program

The Application for Certification (AFC) includes adequate outlines of the above programs (RSEP 2009a, Section 5.16.2.2.1 and Table 5.16-3). Prior to the start of construction of RSEP, detailed programs and plans would be provided to the California Energy Commission Compliance Project Manager (CPM) and to the RCFD pursuant to the Condition of Certification **WORKER SAFETY-1**.

Operations and Maintenance Safety and Health Program

Prior to the start of operations at RSEP, the Operations and Maintenance Safety and Health Program would be prepared. This operational safety program would include the following programs and plans:

- Injury and Illness Prevention Program (8 Cal Code Regs. § 3203)
- Fire Protection and Prevention Program (8 Cal Code Regs. § 3221)
- Personal Protective Equipment Program (8 Cal Code Regs. §§ 3401 to 3411)
- Emergency Action Plan (8 Cal Code Regs. § 3220)

In addition, the requirements under General Industry Safety Orders (8 Cal Code Regs. §§ 3200 to 6184), Electrical Safety Orders (8 Cal Code Regs. §§2299 to 2974) and Unfired Pressure Vessel Safety Orders (8 Cal Code Regs. §§ 450 to 544) would be applicable to the project. Written safety programs for RSEP, which the applicant would develop, would ensure compliance with the above-mentioned requirements.

The AFC includes adequate outlines of the Injury and Illness Prevention Program, Emergency Action Plan, Fire Prevention Program, and Personal Protective Equipment

Program (RSEP 2009a, Section 5.16.2 and Table 5.16-4). Prior to operation of RSEP, all detailed programs and plans would be provided to the CPM and RCFD pursuant to Condition of Certification **WORKER SAFETY-2**.

Safety and Health Program Elements

As mentioned above, the applicant provided the proposed outlines for both a Construction Safety and Health Program and an Operations Safety and Health Program. The measures in these plans are derived from applicable sections of state and federal law. Both safety and health programs would be comprised of six more specific programs and would require major items detailed in the following paragraphs.

Injury and Illness Prevention Program

The IIPP would include the following components as presented in the AFC (RSEP 2009a, Section 5.16.2.3):

- identity of person(s) with authority and responsibility for implementing the program;
- safety and health policy of the plan;
- definition of work rules and safe work practices for construction activities;
- system for ensuring that employees comply with safe and healthy work practices;
- system for facilitating employer-employee communications;
- procedures for identifying and evaluating workplace hazards and developing necessary program(s);
- methods for correcting unhealthy/unsafe conditions in a timely manner;
- safety procedures; and
- training and instruction.

Fire Prevention Plan

California Code of Regulations requires an Operations Fire Prevention Plan (8 Cal Code Regs. § 3221). The AFC outlines a proposed Fire Prevention Plan which is acceptable to staff with respect to CEQA (RSEP 2009a, Section 5.16.2.3). The plan would accomplish the following:

- determine general program requirements (scope, purpose, and applicability);
- determine potential fire hazards;
- develop good housekeeping practices and proper handling and materials storage;
- determine potential ignition sources and control measures for these sources;
- determine persons responsible for equipment and system maintenance;
- locate portable and fixed fire-fighting equipment in suitable areas;
- establish and determine training and instruction requirements; and
- define recordkeeping requirements.

Staff proposes that the applicant submit a final Fire Prevention Plan to the RCFD for review and comment and to the CPM for review and approval to satisfy proposed Conditions of Certification **WORKER SAFETY-1** and **-2**.

Personal Protective Equipment Program

California regulations require Personal Protective Equipment (PPE) and first aid supplies whenever hazards are present that, due to process, environment, chemicals or mechanical irritants, can cause injury or impair bodily function as a result of absorption, inhalation, or physical contact (8 Cal Code Regs. §§ 3380 to 3400). The RSEP operational environment would require PPE.

All safety equipment must meet National Institute of Safety and Health (NIOSH) or American National Standards Institute (ANSI) standards and would carry markings, numbers, or certificates of approval. Respirators must meet NIOSH and Cal/OSHA standards. Each employee must be provided with the following information pertaining to the protective clothing and equipment:

- proper use, maintenance, and storage;
- when to use the protective clothing and equipment;
- benefits and limitations; and
- when and how to replace the protective clothing and equipment.

The PPE Program ensures that employers comply with the applicable requirements for PPE and provides employees with the information and training necessary to protect them from potential workplace hazards.

Emergency Action Plan

California regulations require an Emergency Action Plan (8 Cal Code Regs. § 3220). The AFC contains a satisfactory outline for an emergency action plan (RSEP 2009a, Section 5.16.2.3).

The emergency action plan would accomplish the following:

- establish scope, purpose, and applicability;
- identify roles and responsibilities;
- determine emergency incident response training;
- develop emergency response protocols;
- specify evacuation protocols;
- define post emergency response protocols; and
- determine notification and incident reporting.

Written Safety Program

In addition to the specific plans listed above, additional LORS called *safe work practices* apply to the project. Both the Construction and the Operations Safety Programs would address safe work practices under a variety of programs. The components of these

programs include, but are not limited to, the programs found under the heading “Construction Safety and Health Program” in this Worker Safety and Fire Protection section.

Safety Training Programs

Employees would be trained in the safe work practices described in the above-referenced safety programs.

Additional Safety Issues

The applicant has indicated that workers will be adequately trained and protected, but has not included precautions against exposure to herbicides. Therefore, to ensure that workers are indeed protected, the agencies have identified and staff has proposed additional requirements to proposed Conditions of Certification **WORKER SAFETY-1** and **-2**. These requirements consist of the following provision:

- The development and implementation of Best Management Practices (BMP) for the storage and application of herbicides used to control weeds beneath and around the solar heliostats.

A BMP requiring proper herbicide storage and application will mitigate potential risks to workers from exposure to herbicides and reduce the chance that herbicides will contaminate either surface water or groundwater. The agencies have identified and staff recommends that a BMP follow either the guidelines established by the U.S. EPA (EPA 1993), or more recent guidelines established by the State of California or U.S. EPA.

Additional Mitigation Measures

Protecting construction workers from injury and disease is among the greatest challenges in occupational safety and health. The following facts are reported by the National Institute for Occupational Safety and Health (NIOSH):

- More than 7 million persons work in the construction industry, representing 6 percent of the labor force. Approximately 1.5 million of these workers are self-employed.
- Of approximately 600,000 construction companies, 90 percent employ fewer than 20 workers. Few have formal safety and health programs.
- From 1980 to 1993, an average of 1,079 construction workers were killed on the job each year—more fatal injuries than in any other industry.
- Falls caused 3,859 construction worker fatalities (25.6 percent) between 1980 and 1993.
- Construction injuries account for 15 percent of workers' compensation costs.
- Assuring safety and health in construction is complex, involving short-term work sites, changing hazards, and multiple operations and crews working in close proximity.
- In 1990, Congress directed NIOSH to undertake research and training to reduce diseases and injuries among construction workers in the United States. Under this mandate, NIOSH funds both intramural and extramural research projects.

The hazards associated with the construction industry are thus well documented. These hazards increase in complexity in the multi-employer worksites typical of large, complex, industrial-type projects such as the construction of solar power plants. In order to reduce and/or eliminate these hazards, it has become standard industry practice to hire a Construction Safety Supervisor to ensure a safe and healthful environment for all personnel. That this standard practice has reduced and/or eliminated hazards has been evident in the audits the agencies recently conducted of power plants under construction. The federal Occupational Safety and Health Administration (OSHA) has also entered into strategic alliances with several professional and trade organizations to promote and recognize safety professionals trained as Construction Safety Supervisors, Construction Health and Safety Officers, and other professional designations. The goal of these partnerships is to encourage construction subcontractors in four areas:

- to improve their safety and health performance;
- to assist them in striving for the elimination of the four hazards (falls, electrical, caught in/between and struck-by hazards), which account for the majority of fatalities and injuries in this industry and have been the focus of targeted OSHA inspections;
- to prevent serious accidents in the construction industry through implementation of enhanced safety and health programs and increased employee training; and
- to recognize those subcontractors with exemplary safety and health programs.

To date, there are no OSHA or Cal/OSHA requirements that an employer hire or provide for a Construction Safety Officer. OSHA and Cal/OSHA regulations do, however, require that safety be provided by an employer and the term *Competent Person* is used in many OSHA and Cal/OSHA standards, documents, and directives. A Competent Person is usually defined by OSHA as an individual who, by way of training and/or experience, is knowledgeable of standards, is capable of identifying workplace hazards relating to the specific operations, is designated by the employer, and has authority to take appropriate action. Therefore, in order to meet the intent of the OSHA standard to provide for a safe workplace during power plant construction, the agencies have identified and staff proposes Condition of Certification **WORKER SAFETY-3**, which would require the applicant/project owner to designate and provide for a power plant site Construction Safety Supervisor.

As discussed above, the hazards associated with the construction industry are well documented. These hazards increase in complexity in the multi-employer worksites typical of large, complex, industrial-type projects such as the construction of solar power plants.

Accidents, fires, and a worker death have occurred at Energy Commission-certified power plants in the recent past due to the failure to recognize and control safety hazards and the inability to adequately supervise compliance with occupational safety and health regulations. Safety problems have been documented by Energy Commission staff in safety audits conducted in 2005 at several power plants under construction. The findings of the staff audits include, but are not limited to, such safety oversights as:

- lack of posted confined space warning placards/signs;

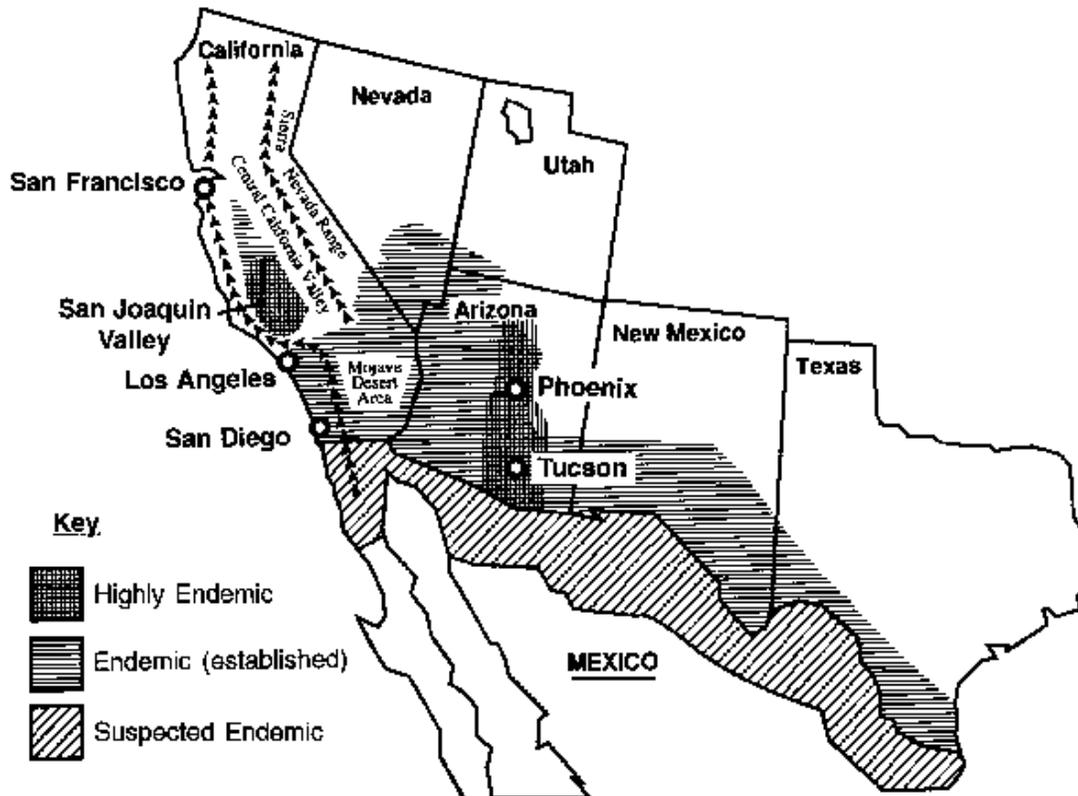

- confusing and/or inadequate electrical and machinery lockout/tagout permitting and procedures;
- confusing and/or inappropriate procedures for handing over lockout/tagout and confined space permits from the construction team to commissioning team and then to operations;
- dangerous placement of hydraulic elevated platforms under each other;
- inappropriate placement of fire extinguishers near hotwork;
- dangerous placement of numerous power cords in standing water on the site, thus increasing the risk of electrocution;
- construction of an unsafe aqueous ammonia unloading pad;
- inappropriate and unsecure placement of above-ground natural gas pipelines inside the facility but too close to the perimeter fence; and
- lack of adequate employee- or contractor-written training programs addressing proper procedures to follow in the event of finding suspicious packages or objects either on or off site.

In order to reduce and/or eliminate these hazards, it is necessary for the Energy Commission to have a professional Safety Monitor on site to track compliance with Cal/OSHA regulations and periodically audit safety compliance during construction, commissioning, and the hand-over to operational status. These requirements are outlined in Condition of Certification **WORKER SAFETY-4**. A Safety Monitor, hired by the project owner, yet reporting to the Chief Building Official (CBO) and CPM, will serve as an “extra set of eyes” to ensure that safety procedures and practices are fully implemented at all power plants certified by the Energy Commission. During the audits conducted by staff, most site safety professionals welcomed the audit team and actively engaged it in questions about the team’s findings and recommendations. These safety professionals recognized that safety requires continuous vigilance and that the presence of an independent audit team provided a fresh perspective of the site.

Valley Fever (Coccidioidomycosis)

Coccidioidomycosis or "Valley Fever" (VF) is primarily encountered in southwestern states, particularly in Arizona and California. It is caused by inhaling the spores of the fungus *Coccidioides immitis*, which are released from the soil during soil disturbance (e.g., during construction activities) or wind erosion. The disease usually affects the lungs and can have potentially severe consequences, especially in at-risk individuals such as the elderly, pregnant women, and people with compromised immune systems. Trenching, excavation, and construction workers are often the most exposed population. Treatment usually includes rest and antifungal medications. No effective vaccine currently exists for Valley Fever. VF is endemic to the San Joaquin Valley in California, which presumably gave this disease its common name. In California, the highest VF rates are recorded in Kern, Kings, and Tulare Counties, followed by Fresno and San Luis Obispo Counties. LA County, San Diego County, San Bernardino County, and Riverside County also have reported VF cases although much fewer.

Worker Safety and Fire Protection Figure 1
The geographic distribution of coccidioidomycosis*

*Source: CDC 2006, Figure 2

A 2004 CDC report found that the number of reported cases of coccidioidomycosis in the US increased by 32 percent during 2003-2004, with the majority of these cases occurring in California and Arizona. The report attributed these increases to changes in land use, demographics, and climate in endemic areas, although certain cases might be attributable to increased physician awareness and testing (CDC 2006). According to the CDC Morbidity and Mortality Weekly Report of February 2009, incidences of valley fever have increased steadily in Arizona and California in the past decade. Cases of coccidioidomycosis averaged about 2.5 per 100,000 population annually from 1995 to 2000 and increased to 8.0 per 100,000 population between 2000 and 2006 (incident rates tripled). In 2007 there was a slight drop in cases, but the rate was still the highest it has been since 1995. The report identified Kern County as having the highest incidence rates (150.0 cases per 100,000 population), and non-Hispanic blacks having the highest hospitalization rates (7.5 per 100,000 population). In addition, between the years 2000 and 2006, the number of valley fever related hospitalizations climbed from 1.8 to 4.3 per 100,000 population (611 cases in 2000 to 1,587 cases in 2006) and then decreased to 1,368 cases in 2007 (3.6 per 100,000 population). Overall in California, during 2000-2007, a total of 752 (8.7 percent) of the 8,657 persons hospitalized for coccidioidomycosis died (CDC 2009).

A 2007 study published in the Emerging Infectious Diseases journal of the Center for Disease Control and Prevention (CDC), found the frequency of hospitalization for coccidioidomycosis in the entire state of California to be 3.7 per 100,000 residents per year for the period between 1997 and 2002 (see Table 2 below). There were 417 deaths from VF in California in those years, resulting in a mortality rate of 2.1 per 1 million California residents annually.

Worker Safety and Fire Protection Table 2
Hospitalizations for coccidioidomycosis, California, 1997–2002*

Category	Total hospitalizations	Total person- yrs (× 10 ⁶)	Frequency of hospitalization**	Frequency of hospitalization for coccidioidal meningitis**
Total	7,457	203.0	3.67	0.657
Year				
1997	1,269	32.5	3.90	0.706
1998	1,144	32.9	3.50	0.706
1999	1,167	33.4	3.5	0.61
2000	1,100	34.0	3.23	0.62
2001	1,291	34.7	3.7	0.58
2002	1,486	35.3	4.2	0.71
Highest incidence counties				
Kern	1,700	3.97	42.8	
Tulare	479	2.21	21.7	
Kings	133	0.77	17.4	
SLO	170	1.48	11.5	

*Source: Flaherman 2007 **Per 100,000 residents per year

Riverside County has approximately 50 cases of VF per year (population is roughly 2 million) while nearby San Diego County has about 120 cases per year (population roughly 3 million). In comparison, an average of over 1,000 cases have been reported annually in Kern County during the last five years. Cases of VF in Riverside County have remained steady in the past several years, fluctuating only slightly between 48 and 55 cases per year. Nine deaths related to VF have been reported in Riverside County between 2005 and 2008 (Williams 2009). A rate of 50 cases per year per 2,000,000 persons corresponds to a risk of about 25 in one million and a rate of 2.5 cases per 100,000 persons, which is lower than the average rate for the entire state of California (~3.6 cases per 100,000 residents). Data received from the Riverside County Department of Public Health indicates that the crude VF rate in Riverside County between 1999 and 2006 has been even lower, about 15 per 100,000 residents. The region near which the RSEP project would be located (generally between Blythe and Dessert Center) has recorded five or fewer cases between 1999 and 2006 (RCDPH 2007).

Worker Safety and Fire Protection Table 3 Valley Fever rates in Riverside County

County of Riverside

Reported Cases: Coccidioidomycosis (Valley Fever)

Years 1999 – 2006

By Zip Code of Residence*

ZIP	PO_NAME	8 Year Total	8 Year Estimated Crude Aggregate Rate (per 10,000)
92236	Coachella	5	1.7
92225	Blythe	5	2.8
92883	Corona	5	2.6

Riverside County Department of Public Health

Epidemiology and Program Evaluation

Kevin Meconis, Epidemiologist

11/19/2007

A 1996 paper that tried to explain the sudden increase in Coccidioidomycosis cases that began in the early 90s found that the San Joaquin Valley in California has the largest population of *C. immitis*, which is found to be distributed unevenly in the soil and seems to be concentrated around animal burrows and ancient Indian burial sites. It is usually found 4 to 12 inches below the surface of the soil. The paper also reported that incidences of coccidioidomycosis vary with the seasons; with highest rates in late summer and early fall when the soil is dry and the crops are harvested. Dust storms are frequently followed by outbreaks of coccidioidomycosis (Kirkland 1996). A modeling attempt to establish the relationship between fluctuations in VF incident rates and weather conditions in Kern County found that there is only a weak connection between weather and VF cases (weather patterns correlate with up to 4 percent of outbreaks). The study concluded that the factors that cause fluctuations in VF cases are not weather-related but rather biological and anthropogenic (i.e. human activities, primarily construction on previously undisturbed soil) (Talamantes 2007).

During correspondence with Dr. Michael MacLean of the Kings County Health Department, he noted that according to his experience and of those who study VF, it is very hard to find the fungus in soil that was previously farmed and irrigated, which greatly reduces the risk of infection resulting from disturbance of farmed lands. This does not apply to previously undisturbed lands where excavation, grading, and construction may correlate with increases in VF cases. Dr. MacLean feels that with the current state of knowledge, we can only speculate on the causes and trends influencing VF cases and he does not feel that construction activities are necessarily the cause of VF outbreaks (KCEHS 2009).

Valley Fever is spread through the air. If soil containing the fungus is disturbed by construction, natural disasters, or wind, the fungal spores get into the air where people can breathe in the spores. The disease is not spread from person to person. Occupational or recreational exposure to dust is an important consideration. Agricultural workers, construction workers, or others (such as archeologists) who dig in the soil in the disease-endemic area of the Central Valley are at the highest risk for the disease (CDC 2006; CDHS 2010). The risk for disseminated coccidioidomycosis is much higher among some ethnic groups, particularly African-Americans and Filipinos. In these ethnic groups, the risk for disseminated coccidioidomycosis is tenfold that of the general population (CDC 2006).

Worker Safety and Fire Protection Table 4 Disease Forms of Valley Fever

CATEGORIES	NOTES
Asymptomatic	<ul style="list-style-type: none"> • Occurs in about 50 percent of patients
Acute Symptomatic	<ul style="list-style-type: none"> • Pulmonary syndrome that combines cough, chest pain, shortness of breath, fever, and fatigue. • Diffuse pneumonia affects immunosuppressed individuals • Skin manifestations include fine papular rash, erythema nodosum, and erythema multiforme • Occasional migratory arthralgias and fever
Chronic Pulmonary	<ul style="list-style-type: none"> • Affects between 5 percent to 10 percent of infected individuals • Usually presents as pulmonary nodules or peripheral thin-walled cavities
Extrapulmonary/Disseminated Varieties	
Chronic skin disease	<ul style="list-style-type: none"> • Keratotic and verrucose ulcers or subcutaneous fluctuant abscesses
Joints / Bones	<ul style="list-style-type: none"> • Severe synovitis and effusion that may affect knees, wrists, feet, ankles, and/or pelvis • Lytic lesions commonly affecting the axial skeleton
Meningeal Disease	<ul style="list-style-type: none"> • The most feared complication • Presenting with classic meningeal symptoms and signs • Hydrocephalus is a frequent complication
Others	<ul style="list-style-type: none"> • May affect virtually any organ, including thyroid, GI tract, adrenal glands, genitourinary tract, pericardium, peritoneum

Given the available scientific and medical literature on Valley Fever, it is difficult for the agencies to assess the potential for VF to impact workers during construction and operation of the proposed RSEP with a reasonable degree of certainty. To minimize potential exposure of workers and also the public to coccidioidomycosis during soil excavation and grading, extensive wetting of the soil prior to and during construction activities should be employed and dust masks should be worn at certain times during these activities. The dust (PM10) control measures found in the Air Quality section of this SA-DEIS should be strictly adhered to in order to adequately reduce the risk of contracting VF to less than significant. Towards that, the agencies have identified and staff proposes Condition of Certification **WORKER SAFETY-9** which would require that the dust control measures found in proposed Conditions **AQ-SC3** and **AQ-SC4** be supplemented with additional requirements including implementing methods equivalent to the requirements of Rule 402 of the Kern County Air Pollution Control District (as amended Nov. 3, 2004).

In addition, because the site of the proposed RSEP was used in the past for military training exercises, to ensure site workers are properly trained to recognize, avoid, and report any unexploded ordnance (UXO), the agencies have identified and staff also recommends adoption of the proposed Condition of Certification **WASTE-4** in the Waste Management Section of this SA-DEIS which would require the project owner to develop a UXO identification training and reporting procedures program. The UXO training program should include the identification of trained UXO ordnance experts that are available to complete removal of UXO and supplemental geophysical surveys to search for additional or buried ordnance.

Fire Hazards

During construction and operation of the proposed RSEP project, there is the potential for both small fires and major structural fires. Electrical sparks, combustion of fuel oil, hydraulic fluid, mineral oil, insulating fluid at the power plant switchyard or flammable liquids, explosions, and over-heated equipment, may cause small fires. Major structural fires in areas without automatic fire detection and suppression systems are unlikely to develop at power plants. Compliance with all LORS and the proposed COCs would be adequate to assure protection from all fire hazards.

The agencies reviewed the information provided in the AFC and reviewed correspondence from a representative of the RCFD to determine if available fire protection services and equipment would adequately protect workers and to determine the project's impact on fire protection services in the area. The project will rely on both on-site fire protection systems and local fire protection services. The on-site fire protection system provides the first line of defense for small fires. In the event of a major fire, fire support services, including trained firefighters and equipment for a sustained response, would be provided by the RCFD (Riverside 2010b, Riverside 2010e, RSEP 2009a, Section 2.3.1.1.2).

Construction

During construction, the permanent fire protection systems proposed for the RSEP would be installed as soon as practical; until then portable fire extinguishers would be placed throughout the site at appropriate intervals and periodically maintained. Safety

procedures and training would be implemented according to the guidelines of the Construction Fire Protection and Prevention Plan.

The applicant has also indicated that it intends to construct and operate an above-ground fuel depot for motor vehicles on the site. The fuel depot will contain a maximum of 10,000 gallons of diesel fuel (RSEP 2009a, Section 5.5.4.1).

The fire protection measures that are required by code for the fuel depot and dispensing facility include:

- Chapter 22 of the 2007 California Fire Code: Motor Fuel-Dispensing Facilities and Repair Garages (formally adopted by Riverside County)
- NFPA 30a: Code for Motor Fuel Dispensing Facilities and Repair Garages (2008 Edition)

Applicable sections of the 2007 California Fire Code (CFC) and NFPA 30a are very similar; however NFPA 30a contains more details for fuel tank design specifications and other requirements. The requirements listed in these codes include the materials to be used to construct fuel tanks, location of dispensing devices, spacing from other structures, fencing, physical protective barriers, shut-off valves, emergency relief venting, secondary containment, vapor and liquid detection systems with alarms, and other general design requirements.

NFPA 30a requires the following:

7.3.5 Fixed Fire Protection.

7.3.5.1 For an unattended, self-serve, motor fuel dispensing facility, additional fire protection shall be provided where required by the *authority having jurisdiction. (italics added)*

7.3.5.2 Where required, an automatic fire suppression system shall be installed in accordance with the appropriate NFPA standard, manufacturers' instructions, and the listing requirements of the systems.

9.2.5 Basic Fire Control.

9.2.5.1 Sources of Ignition. Smoking materials, including matches and lighters, shall not be used within 6m (20 ft) of areas used for fueling, servicing fuel systems.

9.2.5.2 Fire Extinguishers. Each motor fuel dispensing facility or repair garage shall be provided with fire extinguishers installed, inspected, and maintained as required by NFPA 10, *Standard for Portable Fire Extinguishers*. Extinguishers for outside motor fuel dispensing areas shall be provided according to the extra (high) hazard requirements for Class B hazards, except that the maximum travel distance to an 80 B:C extinguisher shall be permitted to be 30.48m (100 feet).

9.2.5.3 Fire Suppression Systems. Where required, automatic fire suppression systems shall be installed in accordance with appropriate NFPA standard, manufacturer's instructions, and the listing requirements of the systems.

The authority having jurisdiction is the Energy Commission and the RCFD, which will review and comment on the fire detection and suppression plans for the fuel depot before it is built and operated.

The only fire protection measure explicitly listed in the California Fire Code is a requirement for fire extinguishers to be located within 75 feet of the fuel dispensing equipment. Neither the CFC nor the Riverside County code requires sprinkler systems for fuel dispensing facilities. Section 2203.2 of the CFC requires an approved, clearly identified and readily accessible emergency disconnect switch at an approved location to stop the transfer of fuel to the fuel dispensers in the event of a fuel spill or other emergency. Section 2205.3 requires spill control to prevent liquids spilled during dispensing operations from flowing into buildings and section 2206.5 requires that above-ground tanks be provided with secondary containment in the form of drainage control or placement of berms or dikes. The applicant has proposed to install secondary containment.

The agencies have assessed the proposed fuel depot and have determined that the applicant intends to meet all codes and standards in their operations of the fuel depot. Proposed Condition of Certification **WORKER SAFETY-1** would require that the RCFD review and the CPM review and approve the fire protection systems for the fuel depot.

Regarding the need for emergency response during construction and the impacts on the RCFD, please see the discussion below.

Operation

The information in the AFC indicates that the project intends to meet the fire protection and suppression requirements of the 2007 California Fire Code, all applicable recommended NFPA standards (including Standard 850 addressing fire protection at electric generating plants), and all Cal/OSHA requirements, with the exception of providing a secondary access point for emergency response vehicles. The California Fire Code (24 CCR Part 9, chapter 5, section 503.1.2) requires that access to the site be reviewed and approved by the fire department. All power plants licensed by the Energy Commission have more than one access point to the power plant site. This is sound fire safety procedure and allows for fire department vehicles and personnel to access the site should the main gate be blocked. The RCFD stated that a second point of access and a second access road for emergency responders is required for this site (Riverside 2010e).

The revised site layout for RSEP shows both a primary and secondary access roads from State Route SR-62 (CH2MHill 2010y). The AFC does not discuss a secondary access gate through the perimeter fence. The agencies find that a second gate is necessary to ensure fire department access for emergency response. If the main access gate is blocked for whatever reason, the RSEP project would essentially be

isolated. This access gate can be restricted to emergency use only and, if possible, the gate should be equipped with a system for remote keyless entry. Therefore, in order to comply with the requirements of LORS and with the RCFD, the agencies have identified and staff proposes a Condition of Certification **WORKER SAFETY-6** that would require the project owner to identify and provide a second access gate at the site, accessible via the secondary access road, for emergency vehicles. This second access gate would be equipped with a remote system, keypad, or other method acceptable to the RCFD, for fire department personnel to open the gate.

Fire suppression elements in the proposed plant would include both fixed and portable fire extinguishing systems. The fire water would be supplied from two on-site wells and stored in one 840,000 gallon water storage tank with a dedicated fire protection supply of 360,000 gallons. Two sets of fire pumps, each consisting of one electric and one diesel-fueled backup firewater pump would ensure water supply to two fire protection water loops and an electric jockey pump would maintain pressure in the system (RSEP 2009a, Sections 2.2.5 and 2.2.10).

Fire hydrants would be installed throughout the site per California Fire Code requirements and a sprinkler deluge system would be installed in areas of risk including each unit's transformer. A sprinkler system would be installed at the steam turbine generator and in administrative buildings. In addition to the fixed fire protection system, appropriate class of service portable extinguishers and fire hydrants/hose stations would be located throughout the facility at code-approved intervals.

The fire protection system must have fire detection sensors and monitoring equipment that would trigger alarms and automatically actuate the suppression systems. Staff has determined that these systems will ensure adequate fire protection.

The applicant would be required by Conditions of Certification **WORKER SAFETY-1** and **-2** to provide the final construction and operations Fire Protection and Prevention Programs to staff and to the RCFD prior to construction and operation of the project to confirm the adequacy of the proposed fire protection measures.

RCFD Impacts

In two letters from the RCFD (Riverside 2010b and 2010e), Captain Neuman of the RCFD has stated that the RSEP would have an impact on RCFD's ability to respond to fire, hazmat, and EMS emergencies at the RSEP. He also stated that the proposed RSEP, in addition to the three solar projects proposed for the Interstate-10 corridor (Blythe, Genesis, and Palen), would have a cumulative adverse impact on the RCFD's ability to provide an acceptable level of service. The RCFD based its analysis on their categories of industrial facilities, the type and level of service needed for projects in each category, the appropriate response times needed for each category, and the level of response required for the RSEP.

The RCFD determined that, due to the remote location of the RSEP and the other three solar power plants, the response time from the RCFD's existing facilities would be inadequate. Although the initial response time for a fire would be approximately one-hour and 45 minutes from Station # 49 and approximately two hours from Station # 43,

both those stations would only be able to send out one engine each with three firefighters each (Riverside 2010e). This is because each station must leave at least one engine in reserve at all times and the minimum number of fire fighters on-duty at all times is three at each station. If an emergency response due to a confirmed fire is required, RCFD Standard Operating Procedures call for at least six engines to be dispatched, with three fire fighters on each engine and one battalion chief for a total of 19 fire fighters on the scene. The other engines would have to be dispatched from more remote fire stations. There is also the standard procedure of “back-fill” at the stations that are responding to an emergency to maintain response capability from those stations. Rather than leave the territory unprotected, the RCFD will try to move equipment and personnel to the vacated stations. The long travel times to the RSEP project (approximately 4 hours round trip), prolong the durations during which back filling of responding stations would be required, potentially impacting response capability at other fire stations.

The agencies have considered the position of the RCFD and all relevant information as well as past experience at existing solar power plants that are similar to, but smaller than, the proposed project. Staff reviewed the records of emergency responses of the San Bernardino County Fire Department (SBCFD) to the only three thermal solar power plants in the state. These are the Solar Electric Generating Station (SEGS) 1 & 2 in Daggett (operating since 1984), SEGS 3-7 at Kramer Junction (1989), and SEGS 8 & 9 at Harper Dry Lake (1989). Staff also reviewed what records were immediately available at the three solar plants. All sources stated that their records were incomplete and not comprehensive. Staff wishes to caution that since the number of thermal solar power plants is so few and their operating history so short, any conclusion as to accident incident rates is meaningless from a statistical perspective. Simply put, the data set is not robust enough to draw any conclusions about their safety records. Nevertheless, this information is provided for illustrative purposes.

Three types of fire department responses to the solar power plants were surveyed:

1. Plan reviews
2. Hazmat and fire inspections
3. Emergency Response including medical, fire, rescue, and hazardous materials incidents

Regarding visits to the sites for plan review during the years the plant was operating, the SBCFD made four visits to the Kramer Junction facility and one visit to the Harper Lake facility.

Regarding site visits for inspections, reviews, enforcement activities, and follow ups, the SBCFD made 10 inspections to Daggett since 2008, totaling 24 hours of time, 48 visits to Kramer Junction since 2003, totaling 128 hours of time, and 29 visits to Harper Lake since 2004, totaling 105 hours of time.

Regarding emergency response including fire, rescue, medical and hazardous materials incidents, approximately 30 incidents occurred since 1998 that required the SBCFD

(and other fire stations through mutual aid agreements) to respond to the three solar power plant sites. These include fires, fire alarm activations, injuries, medical emergencies, hazardous materials spills, complaints/calls from the public, and false alarms. However, the available records did not include documentation of a major fire at the SEGS 8 facility in January of 1990 that required a large part of the regional resources from four different fire districts including the San Bernardino County, Edwards Air Force Base, California Department of Forestry and Fire Protection (CDF), and the Kern County Fire Departments. This fire is the largest incident that has occurred at a solar thermal plant in California and demonstrates the magnitude of fire department resources that can be required to respond to a fire at a large thermal solar facility.

According to the Daggett solar plant records, only three incidents in the life of the plant required emergency services:

1. Feb 25, 1999: A heat transfer fluid (HTF) fire occurred in the HTF tanks. This was a major fire and the fire department allowed the fire to burn itself out over two days. There were no injuries, but extensive damage occurred.
2. Feb 28, 2000: An employee had a suspected heart attack (which was actually caused by drinking a whole bottle of hot sauce), and an ambulance responded from the fire department.
3. May 15-17, 2010: An HTF spill of about 60 gallons occurred in the solar field. The facility personnel cleaned it up on May 15 and reported it to San Bernardino County on the next business day, May 17. When receiving the report the dispatcher misunderstood the report and sent out a 911 call indicating a spill is in progress. The whole fire department showed up on scene.

According to information received from the Kramer Junction plant, the following incidents required fire department response:

1. August 2002 for an unknown hazmat incident.
2. In 2007 when 30,000 gallons of HTF spilled.
3. In Feb. 2009 when a flex hose failure and a vapor cloud ignited. According to Kramer Junction plant officials, the fire department was not needed as plant staff had the situation under control. A concerned citizen had made a 911 call.

According to information received from the Harper Lake plant, only the January 1990 fire required fire department response.

To summarize, relying on sparse data received from the SBCFD for only the past 10 years and not including the 1990 SEGS 8 fire, the department responded to about 30 incidents and emergencies at the nine solar units (at three locations) , including two fires and two hazardous materials spills. During the same period the SBCFD conducted approximately 90 inspections and visits for enforcement actions/plan reviews, totaling about 260 hours of personnel time. The incident rate, therefore, for all three power plants would be 30 in 12 years or 2.5 emergency calls per year or 0.83 emergencies per solar plant per year.

The RCFD is the Authority Having Jurisdiction to the proposed RSEP solar power plant and will provide the initial response. The RCFD currently does not have a mutual aid agreement with any other fire department in the county. Although RCFD does have a mutual aid agreement with the San Bernardino County Fire Department, mutual aid is utilized when an incident is likely to exceed, or has exceeded, the ability of a responsible entity to control the event. The basic assumptions are that the local governmental entity has taken all actions within its capabilities necessary to mitigate a potential or on-going disaster, and has reasonably exhausted local resources before requesting outside assistance through the California Fire Service and Rescue Emergency Mutual Aid System (Riverside 2010b).

As described above, the standard fire department responses for fires and for hazmat spills include response of six engines and at least three fire fighters on each engine. To fight a fire inside a structure, the RCFD must adhere to standard operating procedures and Cal/OSHA regulations that require “two men in”, “two men out”. Thus, a response of three fire fighters from one station would not allow fire fighters to attack a fire from within a structure or conduct a rescue. Confined space and collapsed trench rescues would also be problematic with only three fire fighters. Therefore, no matter what size the fire or how many workers are initially in need of rescue, the RCFD would dispatch engines from at least three fire stations so that at a minimum, nine firefighters are sent to the scene. Even if mutual aid was available, the RCFD would still have to respond to an emergency at the RSEP site because it is the Authority Having Jurisdiction. The agencies also note that budgetary shortfalls that will impact fire services are common today and Riverside County is no exception.

Additionally, it is very important to note that the RSEP power plant (along with the other solar power plants) will be located in an extremely harsh desert environment. The ability of a fire fighter to perform duties while wearing a turn-out coat, heavy boots, and a respirator (self contained breathing apparatus) is limited under the best of circumstances. If conducting a rescue or fighting a fire that necessitates use of a respirator, the high-temperatures of the desert, which often exceed 115 degrees Fahrenheit (°F), severely limit a fire fighter’s ability to perform the duties to 15 minutes at a time. This severe time restriction necessitates the mobilization of more fire fighters to respond to the emergency.

The agencies have considered the position of the RCFD and all relevant information as well as past experience at existing solar power plants that are similar to the proposed project. The proposed facility would be located in an area that is currently served by the RCFD. The fire, hazmat, and EMS needs at the proposed plant are real and would pose significant added demands on local fire protection and emergency medical services. Staff concurs with the assessment of the RCFD and has determined that the RSEP would cause a significant direct and cumulative impact on the local fire department with respect to CEQA.

Furthermore, emergency response would be needed during construction when construction worker crew sizes are large, sometimes approaching several hundred workers. The fact that a fuel depot will be on-site also speaks to the need for emergency response capability.

Proposed Mitigation

Certain tax exemptions for solar power plants reduce the tax revenues going to counties and local agencies that would normally be used to provide the resulting expansion in fire and emergency medical services needed to cover them. Thus, the potential exists with such solar power plants to cause impacts on public safety as a result of drawdown of local agency resources that provide needed services, such as fire and EMS response to protect the public during emergencies.

Regarding potential mitigation, Captain Neuman felt that, in general, the impacts could be mitigated at least in part to a level of insignificance if the developers of all four currently- proposed solar projects participate in the “Development Impact Fee Programs” adopted by the Riverside County Board of Supervisors. In personal communications via telephone (February 10, 2010), staff discussed these impacts and the potential for mitigation with Captain Neuman and Mr. Ross of the Riverside County Planning Department.

The applicant has provided an assessment of emergency medical services (not fire and rescue) in which it proposes mitigations of the impacts resulting from construction and operation of RSEP on the RCFD (Pacific 2010). These mitigations propose that the applicant will provide the following:

1. during any construction activities, an onsite EMT-P (paramedic) along with the appropriate equipment and supplies;
2. during any construction activities, a Basic Life Support Ambulance onsite for use during a medical emergency event;
3. during ongoing power plant operations, a minimum of one staff member onsite per shift that has Advanced First Aid Level training along with the appropriate equipment and supplies; and,
4. during construction and operation of the RSEP, a contract with an air medical service to respond to a service request from on onsite EMT-P.

Staff evaluated the potential and likely demands on the RCFD with the above proposed mitigations provided by the applicant. Staff believes that there would be an intrinsically lower fire risk at RSEP resulting from its use of non-flammable molten salt, rather than a flammable organic heat transfer fluid (HTF) as is proposed for the other three solar-thermal power plants proposed for Riverside County (Blythe, Genesis, and Palen). Additionally, the design of the RSEP solar field, being made up of solar heliostats (mirrors) and having no piping arrays carrying HTF will greatly reduce the potential for fire, EMS, and Hazmat service calls to RCFD. Without HTF storage tanks and solar field piping arrays, staff believes that the potential for a large conflagration does not exist at RSEP. Hence, the potential for an event requiring a large enough response from RCFD to cause a significant drawdown of RCFD resources or to significantly impact service levels to the rest of the county would be extremely unlikely.

Staff therefore believes that the potential for calls by RSEP would be fewer for fire, EMS, and Hazmat than for the other three solar-thermal power plant proposed for

Riverside County. Hence, staff proposes mitigation for RSEP at a reduced level compared to the other solar thermal power plants.

Staff has reviewed the cost figures of the proposed fire station presented by the RCFD and finds the costs to be reasonable and consistent with the costs per square foot for building a fire station, for a new fire engine, and for fire fighter salaries and benefits. In regards to the allocation of costs between the four thermal solar power plants proposed at this time in Riverside County, staff found that allocating 1/4 of the total costs of locating and staffing a new fire station was reasonable and fair. Staff based its recommendation, in part, on the Emergency Response Matrix that staff developed to help determine impacts.

After the applicant proposed training and maintaining paramedics on-site during construction and operations, staff adjusted its matrix which then showed Rice project rated a score of 2.0 as compared to the proposed Palen project (4.45), the proposed Blythe project (2.5) and the proposed Genesis project (3.0). The Rice project score is 17 percent of the sum of all the scores. Staff contends that the extreme remoteness of the Rice project and the difficulty of fire and rescue emergency response crews arriving at the project site in a timely manner from existing fire stations adds to the need for new resources and thus adds to the Rice project's allocation. Staff also bases its determination, in part, on its professional experience and judgment.

Therefore, staff is proposing Conditions of Certification **WORKER SAFETY- 7** and **-8** that requires the RSEP applicant to accomplish one of the following:

1. Reach an agreement, either individually or in conjunction with a power generation industry association or group that negotiates on behalf of its members located within the jurisdiction of the RCFD to negotiate payment for their project-related shares of capital and operating costs to build and operate new fire protection/response infrastructure and provide appropriate equipment as mitigation of project-related impacts on fire protection services; OR
2. Fund a portion of the county fire department capital improvements in the amount of \$570,000 and to make an annual payment of \$250,000 to fund operating and maintenance costs to mitigate both its individual impact on the fire department and its share of a cumulative impact on the fire department; OR
3. The Project Owner shall fund a Fire Needs Assessment and Risk Assessment conducted by an independent contractor who shall be selected and approved by the CEC Compliance Project Manager (CPM) and fulfill all mitigation identified in the independent fire needs assessment and a risk assessment. The Fire Needs Assessment would address emergency response and equipment/staffing/location needs while the Risk Assessment would be used to establish the risk (chances) of significant impacts occurring.

Staff is proposing that the other three solar projects proposed for Riverside County also make payments, although at higher amounts due to their higher fire risks. The \$570,000 for capital improvements is less than one-quarter of the amount estimated by the RCFD needed to fund a new fire station along Interstate-10 near the Ford Dry Lake Road interchange and one new fire engine. The yearly payment of \$250,000 is staff's

determination of RSEP's pro-rated share, based on expected service request needs, of the estimated amount needed to fund operations and maintenance (O&M) for the station and the salaries of three fire fighters.

The agencies understand that an allocation of staff-determined amounts to each project may not be the only approach. To address this, the agencies have also identified and staff is proposing that the project owner be given the option to form and join a power generation industry association or group. This association or group would provide an opportunity for membership to power plants located within the jurisdiction of the RCFD to negotiate payment for their project-related shares of capital and operating costs to build and operate new fire protection/response infrastructure and provide appropriate equipment as mitigation of project-related impacts on fire protection services. The association would be able to raise funds, negotiate payment for emergency response services with the RCFD, audit County and Fire department fire protection/emergency response expenditures to ensure that funds go towards emergency response needs, and develop and implement an appropriate fee structure for its members. The fee structure could include the partial re-payment of funds initially provided by its members upon the joining of new members, and includes consideration of individual project characteristics (e.g., size, technology chemical usage, or project location relative to infrastructure).

Also, as a tool to assist any efforts directed at creating a power industry association, staff developed an Emergency Response Matrix (see Appendix A) that the agencies, the fire departments, and project owners may use to assess the level of emergency response needed. This analytical tool has a weighting scheme for the various categories of fire department response but does utilize professional judgment in the assignment of the "score" to the categories. Staff has tested this methodology on existing and planned solar power plants and finds it to be useful but cautions against using it as the sole basis for determining need or for allocating financial responsibility for direct individual or cumulative impacts.

Emergency Medical Services Response

Staff conducted a statewide survey to determine the frequency of Emergency Medical Services (EMS) response to natural gas-fired power plants in California. The purpose of the analysis was to determine what impact, if any, power plants might have on local emergency services. Staff concluded that incidents at gas-fired power plants that require EMS response are infrequent and represent an insignificant impact on the local fire departments, except for instances where response times are high or a rural fire department has mostly volunteer fire-fighting staff. While RSEP might be expected to have an average number of calls, response times from the three nearest RCFD responding stations are greater than one hour. For year 2009, more than 50 percent of emergency service request calls to those three stations, were for emergency medical services (Pacific 2010, Table 5-2).

To reduce the number of potential calls and resulting impacts to RCFD for Emergency Medical Services (EMS) during both construction and operation of RSEP, staff proposes Conditions of Certification **WORKER SAFETY-10** and **-11** which adopt, with modification, the proposed mitigation measures described in Applicant's submitted Fire

Needs Assessment (Pacific 2010). Staff believes that implementation of these conditions will shorten the crucial time-to-treatment and reduce the time-to-hospital for injured workers, while at the same time reducing potential demands on and impacts to RCFD resources, benefitting both workers and the community. Staff notes that worker commuting and goods and equipment transport by truck to RSEP over state routes SR-62, SR-177, and US-95 during construction and operations would contribute to increased calls for fire and EMS response, and contribute to the cumulative impact to RCFD.

Due to its remote location, potential calls for technical rescue resulting from worker accidents at RSEP during construction and operations remain a factor for impact to RCFD. An impact reduction (with associated reduction in proposed mitigation) could be realized if the project owner were to establish its own certified technical rescue capability, available on all shifts, capable of handling potential rescue scenarios at RSEP. The potential need for technical rescue is a factor used in the Emergency Response Decision Matrix (see Appendix A). Applicant has not proposed and staff's proposed mitigation does not require that there would be such an onsite rescue team.

Additionally, staff has determined that the potential for both work-related and non-work-related heart attacks exists at power plants. In fact, staff's research on the frequency of EMS response to gas-fired power plants shows that many of the responses for cardiac emergencies involved non-work-related incidences, including those involving visitors. The need for prompt response within a few minutes is well documented in the medical literature. The agencies believe that the quickest medical intervention can only be achieved with the use of an on-site automatic external defibrillator (AED); the response from an off-site provider would take longer regardless of the provider location. This fact is also well documented and serves as the basis for many private and public locations (e.g., airports, factories, government buildings) maintaining on-site cardiac defibrillation devices. Therefore, staff concludes that, with the advent of modern cost-effective cardiac defibrillation devices, it is proper in a power plant environment to maintain such a device on site in order to treat cardiac arrhythmias resulting from industrial accidents or other non-work related causes.

The agencies have identified and staff proposes Condition of Certification **WORKER SAFETY-5**, which would require that a portable AED be located on site, that all power plant employees on site during operations be trained in its use, and that a representative number of workers on site during construction and commissioning also be trained in its use.

Closure and Decommissioning Impacts and Mitigation

A closure of the proposed RSEP (either temporary or permanent) would follow a Facility Closure Plan prepared by the applicant and designed to minimize public health and environmental impacts. Decommissioning procedures would be consistent with all applicable LORS (RSEP 2009a, Section 2.4). The agencies expect that impacts from the closure and decommissioning process would represent a fraction of the impacts associated with the construction or operation of the proposed RSEP. Therefore based on the agencies' analysis for the construction and operation phases of this project, staff

concludes that hazardous materials-related impacts from closure and decommissioning of the RSEP would be insignificant with respect to CEQA.

CEQA LEVEL OF SIGNIFICANCE

With respect to CEQA, staff concludes that based on its analysis of Worker Safety and Fire Protection impacts from the proposed RSEP that impacts would be below a level of significance if the proposed mitigation required in the proposed Conditions of Certification is implemented.

Reduced Acreage Alternative

The Reduced Acreage Alternative would be 7.2% smaller in area than the proposed project. It would be located in the same 2,560-acre square-shaped parcel within the larger 3,324-acre ownership property as the proposed project. Although the overall heliostat field distance from the central tower would be reduced, the number of heliostats would remain the same. The heliostat field (plus the evaporation pond and administration areas) would occupy about 1,270 acres instead of the 1,410 acres required for the proposed project. The receiver location would remain the same, with the edges of the field contracting towards the center. The heliostat footprint of the Reduced Acreage Alternative is shown in **Alternatives Figure 2**. The site layout, 653-foot total height of the solar tower and receiver, and transmission interconnection to Western's Parker-Blythe No. 2 transmission line would be the same as the proposed project. The project's nominal 150 megawatts (MW) generation output would be reduced by approximately 2 MW.

Similar to the proposed project, the Reduced Acreage Alternative would transmit power to the grid through the planned Western substation to be located adjacent to Western's Parker Blythe No. 2 161 kilovolt (kV) transmission line.

The Reduced Acreage Alternative is evaluated in this SA-DEIS because it would eliminate about 100 acres of the proposed project footprint, reducing impacts to ephemeral washes, the loss of land considered habitat for the state and federally listed threatened desert tortoise and impacts to the historic Rice airfield. The Reduced Acreage Alternative would allow the applicant to contribute clean, renewable energy to help meet the State's energy goals, while minimizing impacts to the desert environment. A limited acreage alternative was suggested in scoping comments.

Under the Reduced Acreage Alternative, the agencies would approve a facility with a 148 MW capacity, and not the 150 MW project that is proposed.

SETTING AND EXISTING CONDITIONS

The setting for the Reduced Acreage Alternative is the same as for the proposed project except that the heliostat field would occupy 1,270 acres within the 1,410-acre footprint of the proposed project.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Construction of the Reduced Acreage Alternative is likely to require fewer employees which would potentially reduce impacts in the area of Worker Safety and Fire

Protection. However, the reduced impacts in the area of Worker Safety and Fire Protection would be minor, and staff has determined that with respect to CEQA the project as proposed would have less than significant impacts in the area of Worker Safety and Fire Protection if staff's proposed Conditions of Certification are adopted. Therefore the Reduced Acreage Alternative is not preferable over the project as proposed.

CEQA LEVEL OF SIGNIFICANCE

The CEQA level of significance for Worker Safety and Fire Protection would not change with the Reduced Acreage Alternative, as both the project as proposed and the Reduced Acreage Alternative would have impacts below the level of significance. The same conditions of certification would be required for the Reduced Acreage Alternative and the project as proposed.

NORTH OF DESERT CENTER ALTERNATIVE

The North of Desert Center Alternative would be a 150 MW solar thermal facility located on approximately 2,643 acres of land. It is located along Desert Center Rice Road (State Route 177) east of Kaiser Road, north of Oasis Road, and approximately 1.6 miles north of I-10. The North of Desert Center Alternative is primarily private land with smaller sections of BLM land in the eastern portion of the site. It is largely fallow agricultural land. The existing SCE 161-kV transmission line (from the Blythe-2 substation to the Eagle Mountain-1 substation) that traverses the alternative site would be realigned to roughly follow the site boundary. A new 0.125-mile generation tie line (along Osborne Ave.) and substation would interconnect to the realigned SCE line at the northeast boundary of the site. The boundaries and transmission realignment of the North of Desert Center Alternative are illustrated in **Alternatives Figure 2**.

The Desert Center Alternative is evaluated in this SA-DEIS because it would reduce impacts to cultural resources; the RSEP is located on the historic Rice Army Airfield. The North of Desert Center Alternative would allow the applicant to contribute clean, renewable energy to help meet the State's energy goals, while minimizing impacts to the desert environment.

SETTING AND EXISTING CONDITIONS

The topography of the North of Desert Center Alternative site is essentially flat, as are the immediately surrounding areas. Sensitive receptors are present within the North of Desert Center Alternative and a residential community is located south of the southwest corner of the North of Desert Center Alternative site.

Access to the North of Desert Center Alternative would likely be via Interstate 10 to the Rice Road (SR 177) exit. At Rice Road, transport would turn northeast for approximately two miles through primarily rural residential land.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Construction of the North of Desert Center alternative may have reduced impacts in the area of fire protection due to the closer proximity to an existing fire station that would exist with this alternative. However, the reduced impacts in the area of Worker Safety

and Fire Protection would be minor, and staff has determined with respect to CEQA that the project as proposed would have less than significant impacts in the area of Worker Safety and Fire Protection if staff's proposed Conditions of Certification are adopted. Therefore the Reduced Acreage Alternative is not preferable over the project as proposed.

CEQA LEVEL OF SIGNIFICANCE

The CEQA level of significance for Worker Safety and Fire Protection would not change with the North of Desert Center Alternative, as both the project as proposed and the North of Desert Center Alternative would have impacts below the level of significance. The same conditions of certification would be required for the North of Desert Center Alternative and the project as proposed.

SR 62/RICE VALLEY ROAD GENERATION TIE LINE ALTERNATIVE

The SR 62/Rice Valley Road Generation Tie Line Alternative would interconnect to Western Area Power Administration's (Western) 161-kV/230-kV Parker-Blythe No. 2 transmission line at the same location as the proposed project generation tie line. This alternative generation tie line would exit the power block directly to the east and follow a proposed access road within the heliostat field. The tie-in would then turn north inside the RSEP property boundary and run along the RSEP's circular perimeter road to the north and northwest. At the north end of the heliostat field, the route would traverse the construction laydown area on previously disturbed land over a distance of approximately 500 feet to the southern side of State Route 62. The route would follow State Route 62 approximately 3.8 miles east to the junction of Rice Valley Road. It would then trend south to follow the unpaved Rice Valley Road for 4.1 miles to its juncture with the applicant's proposed new generation tie line alignment and continue southeast for 5.4 miles along the proposed alignment to Western's Parker-Blythe No. 2 transmission line. The SR 62/Rice Valley Road Generation Tie Line Alternative route is illustrated in **Alternatives Figure 4**.

The SR 62/Rice Valley Road Generation Tie Line Alternative is evaluated in this SA-DEIS because it would:

1. Avoid the permanent loss of 13.4 acres of foraging and cover habitat for plant and animal species, including the state and federally listed threatened desert tortoise.
2. Avoid the creation of a new 4.6 mile vehicle access route between the proposed solar facility and the proposed junction of the new generation tie line access road with the existing Rice Valley road.

SETTING AND EXISTING CONDITIONS

The setting for the SR 62/Rice Valley Road Generation Tie Line Alternative is the same as for the proposed project except for the rerouting of the transmission lines within the heliostat field.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Because the amounts and location and size of project would remain the same as for the proposed RSEP project, the impacts and mitigations would also remain the same.

Staff concludes that based on its analysis of impacts associated with Worker Safety and Fire Protection for the SR 62/Rice Valley Road Generation Tie Line Alternative, that impacts would be minor for the duration of the project. With respect to CEQA, impacts would be less than significant if staff's proposed Conditions of Certification are adopted similar to those identified for the proposed project.

NO PROJECT/NO ACTION ALTERNATIVE

No Project and No Action on Rice Solar Energy Project transmission line application and interconnection request. No California Desert Conservation Area (CDCA) land use plan amendment.

Under this alternative, the proposed Rice Solar Energy Project would not be approved by the Energy Commission; the federal Bureau of Land Management (BLM) would not approve the generation tie line right-of-way application and would not amend the CDCA Plan; and Western would not approve the interconnection request. As a result, no solar energy project would be constructed on the project site, BLM would continue to manage the land encompassing the transmission line consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended, and Western would continue to operate the Parker-Blythe No. 2 Transmission Line under current conditions.

Because there would be no amendment to the CDCA Plan and no solar project approved for the site under this alternative, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site. As a result, no RCFD services would be required and no impacts related to the use of RCFD services would occur. In the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations.

CUMULATIVE IMPACTS

The agencies considered the potential for impacts due to construction and operation of the proposed RSEP with other existing or foreseeable nearby facilities as listed in the **Cumulative Scenario** section. Fire protection and emergency services demands caused by routine and emergency incidents at the proposed RSEP would continue for the expected 30-year life of the project but would not cause a substantial adverse effect on local emergency services if staff's Conditions of Certification are adopted. Cumulative impacts would be less than significant with respect to CEQA.

COMPLIANCE WITH LORS

Staff concludes that construction and operation of the RSEP project with staff's proposed mitigation/Conditions of Certification would be in compliance with all

applicable laws, ordinances, regulations, and standards (LORS) regarding long-term and short-term project impacts in the area of worker safety and fire protection.

NOTEWORTHY PUBLIC BENEFITS

The prorated funding by the applicant for the construction and staffing of a new fire station in the county is a noteworthy public benefit in the area of Worker Safety/Fire Protection.

PROPOSED CONDITIONS OF CERTIFICATION/MITIGATION MEASURES

The following Conditions of Certification meet the Energy Commission's responsibility to comply with the California Environmental Quality Act and serve as staff's recommendations for the Energy Commission to consider in its decision to avoid or reduce the severity of worker safety- and fire protection-related impacts to less than significant and for the project to conform to all applicable LORS. The identification of relevant and reasonable mitigation measures also conforms to National Environmental Policy Act (NEPA) requirements for BLM's and Western's analysis that can be considered in their Records of Decision.

WORKER SAFETY-1 The project owner shall submit to the Compliance Project Manager (CPM) a copy of the Project Construction Safety and Health Program containing the following:

- a Construction Personal Protective Equipment Program;
- a Construction Exposure Monitoring Program;
- a Construction Injury and Illness Prevention Program;
- a Construction Heat Stress Protection Plan that implements and expands on existing Cal OSHA regulations as found in 8 CCR 3395;
- a Construction Emergency Action Plan; and
- a Construction Fire Prevention Plan that includes the above-ground fuel depot.
- The Personal Protective Equipment Program, the Exposure Monitoring Program, the Injury and Illness Prevention Program, and the Heat Stress Protection Plan shall be submitted to the CPM for review and approval concerning compliance of the program with all applicable safety orders. The Construction Emergency Action Plan and the Fire Prevention Plan shall be submitted to the Riverside County Fire Department for review and comment prior to submittal to the CPM for approval.

Verification: At least 30 days prior to the start of construction, the project owner shall submit to the CPM for review and approval a copy of the Project Construction Safety and Health Program.

WORKER SAFETY-2 The project owner shall submit to the CPM a copy of the Project Operations and Maintenance Safety and Health Program containing the following:

- an Operation Injury and Illness Prevention Plan;
- an Operation Heat Stress Protection Plan that implements and expands on existing Cal OSHA regulations (8 CCR 3395);
- a Best Management Practices (BMP) for the storage and application of herbicides;
- an Emergency Action Plan;
- Hazardous Materials Management Program;
- Fire Prevention Plan that includes the fuel depot should the project owner elect to maintain and operate the fuel depot during operations (8 Cal Code Regs. § 3221); and
- Personal Protective Equipment Program (8 Cal Code Regs, §§ 3401—3411).

The Operation Injury and Illness Prevention Plan, Heat Stress Protection Plan, BMP for Herbicides, and Personal Protective Equipment, and Personal Protective Equipment Program shall be submitted to the CPM for review and comment concerning compliance of the programs with all applicable safety orders. The Fire Prevention Plan and the Emergency Action Plan shall also be submitted to the Riverside County Fire Department for review and comment.

Verification: At least 30 days prior to commercial operation, the project owner shall submit to the CPM for approval a copy of the Project Operations and Maintenance Safety and Health Program.

WORKER SAFETY-3 The project owner shall provide a site Construction Safety Supervisor (CSS) who, by way of training and/or experience, is knowledgeable of power plant construction activities and relevant laws, ordinances, regulations, and standards; is capable of identifying workplace hazards relating to the construction activities; and has authority to take appropriate action to assure compliance and mitigate hazards. The CSS shall:

- have overall authority for coordination and implementation of all occupational safety and health practices, policies, and programs;
- assure that the safety program for the project complies with Cal/OSHA and federal regulations related to power plant projects;
- assure that all construction and commissioning workers and supervisors receive adequate safety training;
- complete accident and safety-related incident investigations and emergency response reports for injuries and inform the CPM of safety-related incidents; and
- assure that all the plans identified in Conditions of Certification Worker Safety-1 and -2 are implemented.

The CSS shall submit in the Monthly Compliance Report a monthly safety inspection report to include:

- record of all employees trained for that month (all records shall be kept on site for the duration of the project);
- summary report of safety management actions and safety-related incidents that occurred during the month;
- report of any continuing or unresolved situations and incidents that may pose danger to life or health; and
- report of accidents and injuries that occurred during the month.

Verification: At least 60 days prior to the start of site mobilization, the project owner shall submit to the CPM the name and contact information for the Construction Safety Supervisor (CSS). The contact information of any replacement CSS shall be submitted to the CPM within one business day.

WORKER SAFETY-4 The project owner shall make payments to the Chief Building Official (CBO) for the services of a Safety Monitor based upon a reasonable fee schedule to be negotiated between the project owner and the CBO. Those services shall be in addition to other work performed by the CBO. The Safety Monitor shall be selected by and report directly to the CBO and will be responsible for verifying that the Construction Safety Supervisor, as required in Condition of Certification Worker Safety-3, implements all appropriate Cal/OSHA and Energy Commission safety requirements. The Safety Monitor shall conduct on-site (including linear facilities) safety inspections at intervals necessary to fulfill those responsibilities.

Verification: At least 60 days prior to the start of construction, the project owner shall provide proof of its agreement to fund the Safety Monitor services to the CPM for review and approval.

WORKER SAFETY-5 The project owner shall ensure that a portable automatic external defibrillator (AED) is located on site during construction and operations and shall implement a program to ensure that workers are properly trained in its use and that the equipment is properly maintained and functioning at all times. During construction and commissioning, the following persons shall be trained in its use and shall be on site whenever the workers that they supervise are on site: the Construction Project Manager or delegate, the Construction Safety Supervisor or delegate, and all shift foremen. During operations, all power plant employees shall be trained in its use. The training program shall be submitted to the CPM for review and approval.

Verification: At least 60 days prior to the start of site mobilization, the project owner shall submit to the CPM proof that a portable automatic external defibrillator (AED) exists on site and a copy of the training and maintenance program for review and approval.

WORKER SAFETY-6 The project owner shall:
provide a second access gate for emergency personnel to enter the site. This secondary access gate shall be at least one-quarter mile from the main gate,

and provide a second access road that comes to the site. This road shall be at a minimum an all-weather gravel road, at least 20 feet wide, and with culverts to direct flow under the road at any wash the road may cross.

- a. maintain the main access road and the second road and provide a plan for implementation.

Plans for the secondary access gate, the method of gate operation, gravel road, and to maintain the roads shall be submitted to the Riverside County Fire Department for review and comment and to the CPM for review and approval.

Verification: At least sixty (60) days prior to the start of site mobilization, the project owner shall submit to the Riverside County Fire Department and the CPM preliminary plans showing the location of a second access gate to the site, a description of how the gate will be opened by the fire department, and a description and map showing the location, dimensions, and composition of the main road, and the gravel road to the second gate. At least thirty (30) days prior to the start of site mobilization, the project owner shall submit final plans plus the road maintenance plan to the CPM for review and approval. The final plan submittal shall also include a letter containing comments from the Riverside County Fire Department or a statement that no comments were received.

WORKER SAFETY-7 The project owner shall either:

- (1) Reach an agreement, either individually or in conjunction with a power generation industry association or group that negotiates on behalf of its members, with the Riverside County Fire Department (RCFD) regarding funding of its project-related share of capital and operating costs to build and operate new fire protection/emergency response infrastructure and provide appropriate equipment as mitigation of project-related impacts on fire protection/emergency response services within the jurisdiction.

or

- (2) Shall fund its share of the RCFD capital costs in the amount of \$570,000 and provide an annual payment of \$250,000 to the RCFD for the support of new fire department staff, operations, and maintenance commencing with the start of construction and continuing annually thereafter on the anniversary of the payment until the final date of power plant decommissioning.

or

- (3) The Project Owner shall fund a Fire Needs Assessment and Risk Assessment conducted by an independent contractor who shall be selected and approved by the Energy Commission Compliance Project Manager (CPM) and fulfill all mitigation identified in the independent fire needs assessment and a risk assessment. The Fire Needs Assessment would address emergency response and equipment/staffing/location needs while the Risk Assessment would be used to establish the risk (chances) of significant impacts occurring.

Should the applicant pursue option (3), above, the Fire Needs Assessment and Risk Assessment shall evaluate the following:

- (a) Potential for impacts on the RCFD and the project allocated costs of new and/or enhanced fire protection/emergency response services (which shall include services for inspections, permitting, fire response, hazardous materials spill/leak response, rescue, and emergency medical services) necessary to mitigation of such impacts;
- (b) The risk of impact on the local population that could result from potential unmitigated impacts on local fire protection and emergency services (i.e. “drawdown” of emergency response resources);
- (c) The extent that the project’s exemption from local taxes will impact local fire protection and emergency response services; and
- (d) Recommendation of an amount of funding that should be provided to mitigate any identified significant impacts on local fire protection and emergency response services.

Compliance Protocols for the Fire Needs Assessment and Risk Assessment shall be as follows:

- (a) The Fire Needs Assessment and Risk Assessment shall be conducted by an independent consultant(s) selected and approved by the CPM;
- (b) The Fire Needs Assessment and Risk Assessment shall be fully funded by the project owner. The independent consultant(s) preparing the Fire Needs Assessment and Risk Assessment shall work directly for the Energy Commission;
- (c) The project owner shall provide the protocols for conducting the independent fire needs assessment for review and comment by the RCFD and review and approval by the CPM prior to the independent consultant’s commencement of the fire needs assessment;
- (d) The CPM shall be copied in any correspondence including emails or letters and included in any conversations between the project owner and consultant; and
- (e) The CPM shall verify that the Fire Needs Assessment and Risk Assessment are prepared consistent with the approved fire needs assessment protocols and a risk assessment protocols.

Verification: At least thirty (30) days prior to the start of site mobilization, the project owner shall provide to the CPM:

- (1) A copy of the individual agreement with the RCFD or, if the owner joins a power generation industry association, a copy of the group’s bylaws and a copy of the group’s agreement with the RCFD; and evidence in each January Monthly Compliance Report that the project owner is in full compliance with the terms of such bylaws and/or agreement.

or

(2) Documentation that the amount of \$570,000 has been paid to the RCFD, documentation that the first annual payment of \$250,000 has been made, and shall also provide evidence in each January Monthly Compliance Report during construction and the Annual Compliance Report during operation that subsequent annual payments have been made.

or

(3) A protocol, scope and schedule of work for the independent Fire Needs Assessment and Risk Assessment and the qualifications of proposed contractor(s) for review and approval by the CPM; a copy of the completed Fire Needs Assessment and Risk Assessment showing the precise amount the project owner shall pay for mitigation; and documentation that the amount has been paid.

Annually thereafter, the owner shall provide the CPM with verification of funding to the Riverside County Fire Department for required fire protection services mitigation pursuant to the agreement with the Fire Department or the CPM approved independent fire needs assessment.

WORKER SAFETY-8 In the event that the project owner does not reach an agreement with Riverside County Fire Department pursuant to **WORKER SAFETY-7**, the project owner shall provide a \$820,000 payment to Riverside County Fire Department prior to the start of construction and reach an agreement under **WORKER SAFETY-7** within a year of site mobilization. This funding shall off-set any initial funding required by **WORKER SAFETY-7** above, until the funds are exhausted or an agreement is reached under **WORKER SAFETY-7**. This offset will be based on a full accounting by the Riverside County Fire Department regarding the use of these funds.

Verification: At least 30 days prior to site mobilization, if project owner has not reached an agreement with the Riverside Fire Department pursuant to **WORKER SAFETY-7**, the project owner shall provide documentation of the payment described above to the Energy Commission CPM. The Energy Commission CPM shall adjust the payments initially required by **WORKER SAFETY-7** based upon the accounting provided by the Riverside County Fire Department.

WORKER SAFETY-9 The project owner shall develop and implement an enhanced Dust Control Plan that includes the requirements described in **AQ-SC3** and additionally requires:

- a) site worker use of dust masks (NIOSH N-95 or better) whenever visible dust is present;
- b) implementation of methods equivalent to Rule 402 of the Kern County Air Pollution Control District (as amended Nov. 3, 2004); and
- c) implementation of enhanced dust control methods (increased frequency of watering, use of dust suppression chemicals, etc. consistent with AQ-SC4) immediately whenever visible dust comes from or onto the site or when

PM10 measurements obtained when implementing ii (above) exceed 50 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$).

Verification: At least 60 days prior to the commencement of site mobilization, the enhanced Dust Control Plan shall be provided to the CPM for review and approval.

WORKER SAFETY-10 During any construction activities, the project owner shall provide onsite:

- a) an EMT-P (Paramedic) who is certified by Riverside Emergency Services (REMS) along with the appropriate equipment and supplies;
- b) a Advanced Life Support Ambulance with a California certified driver for use during medical emergency events; and
- c) a contract with an air medical service to respond to a request from an onsite EMT-P.

Verification: At least 30 days prior to the commencement of site mobilization, the project owner shall be provide to the CPM for review and approval:

- a) the name and contact information for the EMT-P. The contact information of any replacement EMT-P shall be submitted to the CPM within one business day, and provide evidence in each Monthly Compliance Report during commercial operation; and
- b) a letter to the CPM confirming that the Basic Life Support Ambulance is available and will be onsite during any construction activities and provide evidence in each January Monthly Compliance Report during construction; and
- c) proof of its contract for air medical service to the CPM for review and approval and provide evidence in each January Monthly Compliance Report during construction.

WORKER SAFETY-11 Beginning with commercial operation, the project owner shall provide onsite:

- a) an EMT-P who is certified by Riverside Emergency Services (REMS) along with the appropriate equipment and supplies; and
- b) a contract with an air medical service to respond to a request from an onsite EMT-P.

Verification: At least 30 days prior to the commencement of commercial operation, the project owner shall be provide to the CPM for review and approval:

- a) the name and contact information for the EMT-P(s) to be working on each shift. The contact information of any replacement EMT-P shall be submitted to the CPM within one business day, and provide evidence in each Monthly Compliance Report during commercial operation; and
- b) annually thereafter in the Annual Compliance Report, proof of its contract for air medical service to the CPM for review and approval.

CONCLUSIONS

Staff concludes that if the proposed RSEP project owner provides a Project Construction Safety and Health Program and a Project Operations and Maintenance Safety and Health Program as required by Conditions of Certification **WORKER SAFETY-1** and **-2** and fulfills the requirements of Conditions of Certification **WORKER SAFETY-3** through **-11**, the project would incorporate sufficient measures to ensure adequate levels of industrial safety and fire protection and comply with applicable LORS. Staff also concludes that the operation of this power plant would have a significant individual and cumulative impact on the RCFD and has proposed Conditions of Certification **WORKER SAFETY-7**, **-8**, **-10** and **-11** as mitigation that would reduce this impact to a level of insignificance. Alternatives considered in this SA-DEIS would not avoid worker safety and fire protection adverse impacts except for the No Project/No Action Alternative, which would not accomplish the project objectives. With implementation of the proposed Conditions of Certification, worker safety and fire protection impacts would be mitigated to less than significant for all alternatives including the proposed project.

VERY HIGH Priority: urgent need for additional resources and mitigation.	>3.5		

GEOLOGY, PALEONTOLOGY, AND MINERALS

Testimony of Dal Hunter, Ph.D., C.E.G.

SUMMARY OF CONCLUSIONS

The proposed Rice Solar Energy Project site is located in a region known as the eastern Mojave aseismic area in the east-central Mojave Desert Geomorphic Province in northern Riverside County, south-central California. Because of its geologic setting, the site could be subject to relatively moderate levels of earthquake-related ground shaking. The effects of potential ground shaking would need to be mitigated, to the extent practical, through structural designs required by the California Building Code (CBC 2007) and the project geotechnical report. The CBC (2007) requires that structures be designed to resist seismic stresses from ground acceleration and, to a lesser extent, liquefaction. A preliminary geotechnical investigation has been performed and presents standard engineering design recommendations for mitigation of seismic shaking and site soil conditions.

There are no known viable geologic or mineralogical resources at the proposed RSEP site. Regionally, paleontological resources have been documented within older Quaternary alluvium which is believed to underlie the younger Quaternary alluvium exposed on site surface. Potential impacts to paleontologic resources would be mitigated through worker training and monitoring by qualified paleontologists, as required by Conditions of Certification, **PAL-1** through **PAL-7**.

The project site and portions of the proposed linear facilities are located on private land. Approximately 9 miles of the 10-mile long generation tie line would be located on public land under the jurisdiction of the United States Bureau of Land Management. The U.S. Bureau of Land Management (BLM), Western Area Power Administration (Western) and Energy Commission staff (staff), hereafter jointly referred to as agencies, have reviewed the Rice Solar Energy Project (RSEP or proposed project) in accordance with the requirements of the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA). With respect to CEQA, staff concludes that the potential is low for significant adverse impacts to the proposed project from geological hazards during its design life and to potential geological, mineralogical, and paleontological resources from the construction, operation, and closure of the proposed project. It is staff's opinion that the proposed Rice Solar Energy Project facility could be designed and constructed in accordance with all applicable laws, ordinances, regulations, and standards (LORS) and in a manner that both protects environmental quality and assures public safety. Conditions of certification referred to herein meet the Energy Commission's responsibility to comply with the California Environmental Quality Act and serve as recommendations for the Energy Commission to consider in its decision to avoid or reduce the severity of impacts to less than significant and for the project to conform with all applicable LORS. The identification of relevant and reasonable mitigation measures also conforms to National Environmental Policy Act (NEPA) requirements for BLM's and Western's analysis that can be considered in their Records of Decision. Implementation and enforcement of the proposed conditions of certification should result in less than significant impacts to geology and paleontology.

INTRODUCTION

In this section, the agencies discuss the potential impacts of geologic hazards on the proposed RSEP site as well as the project's potential impacts on geologic, mineralogic, and paleontologic resources. Staff's objective is to ensure that there will be no consequential adverse impacts to significant geological and paleontological resources during the project construction, operation, and closure and that operation of the plant will not expose occupants to high-probability geologic hazards. A brief geological and paleontological overview is provided. The section concludes with Western's and BLM's identified, and staff's proposed, monitoring and mitigation measures for geologic hazards and geologic, mineralogic, and paleontologic resources, with proposed conditions of certification.

METHODOLOGY AND THRESHOLDS FOR DETERMINING ENVIRONMENTAL CONSEQUENCES

The CEQA Guidelines, Appendix G, provide a checklist of questions that lead agencies typically address.

- Section (V) (c) includes guidelines that determine if a project will either directly or indirectly destroy a unique paleontological resource or site or a unique geological feature.
- Sections (VI) (a), (b), (c), (d), and (e) focus on whether or not the project would expose persons or structures to geological hazards.
- Sections (X) (a) and (b) concern the project's effects on mineral resources.

The California Building Standards Code (CBSC) and CBC (2007) provide geotechnical and geological investigation and design guidelines, which engineers must follow when designing a facility. As a result, the criteria used to assess the significance of a geological hazard include evaluating each hazard's potential impact on the design and construction of the proposed facility. Geological hazards include faulting and seismicity, volcanic eruptions, liquefaction, dynamic compaction, hydrocompaction, subsidence, expansive soils, landslides, tsunamis, and seiches. Of these, dynamic compaction, hydrocompaction, subsidence, and expansive soils are geotechnical engineering issues but are not normally associated with concerns for public safety.

The agencies have reviewed geological and mineral resource maps for the surrounding area, as well as site-specific information provided by the applicant, to determine if any geological and mineralogical resources exist in the area and to determine if operations could adversely affect such geological and mineralogical resources.

To evaluate whether the proposed project and alternatives would generate a potentially significant impact as defined by CEQA on mineral resources, the staff evaluated them against checklist questions posed in the 2006 CEQA Guidelines, Appendix G, Environmental Checklist established for Mineral Resources. These questions are:

- A. Would the project result in the loss of availability of a known mineral resource that would be of value to the region and residents of the state?

- B. Would the project result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?

Under NEPA, the impact of the proposed project and alternatives on mineral resources would be considered significant if they would directly or indirectly interfere with active mining claims or operations, or would result in reducing or eliminating the availability of important mineral resources. The agencies' evaluation of the significance of the impact of the proposed project on mineral resources includes an assessment of the context and intensity of the impacts, as defined in the NEPA implementing regulations 40 CFR Part 1508.27.

Staff reviewed existing paleontological information and requested records searches from the Natural History Museum of Los Angeles County (LACM) and the University of California Museum of Paleontology at Berkeley (UCMP) for the site area. Site-specific information generated by the applicant for the proposed RSEP project was also reviewed. All research was conducted in accordance with accepted assessment protocol (SVP 1995) to determine whether any known paleontological resources exist in the general area. If present or likely to be present, conditions of certification which outline required procedures to mitigate impacts to potential resources are proposed as part of the project's approval.

The Antiquities Act of 1906 (16 United States Code [USC]) requires that objects of antiquity be taken into consideration for federal projects and the California Environmental Quality Act, Appendix G, also requires the consideration of paleontological resources. The Paleontological Resources Preservation Act of 2009 requires the Secretaries of the United States Department of the Interior and Agriculture to manage and protect paleontological resources on Federal land using scientific principles and expertise. The potential for discovery of significant paleontological resources or the impact of surface disturbing activities to such resources is assessed using the Potential Fossil Yield Classification (PFYC) system contained within BLM Instruction Memorandum No. 2009-011. This system includes three conditions (Condition 1 [areas known to contain vertebrate fossils]; Condition 2 [areas with exposures of geological units or settings that have high potential to contain vertebrate fossils]; and Condition 3 [areas that are very unlikely to produce vertebrate fossils]). The PFYC classes range from Class 5 (very high) to Class 1 (very low).

The proposed conditions of certification allow Western, BLM's Authorized Officer, and the Energy Commission's compliance project manager (CPM) to the extent they are applicable for each agency, and the applicant to adopt a compliance monitoring scheme ensuring compliance with laws, ordinances, regulations, and standards (LORS) applicable to geological hazards and the protection of geological, mineralogical, and paleontological resources.

Based on the information below, it is the agencies' opinion that the potential for substantial adverse impacts to the project from geological hazards, and to potential geological, mineralogical, and paleontological resources from the proposed project, is low, and that they would be less than significant with respect to CEQA.

LAWS, ORDINANCES, REGULATIONS, AND STANDARDS

The LORS are listed in the application for certification (AFC) (SR 2009a). The following briefly describes the current LORS for both geologic hazards and resources and mineralogic and paleontologic resources.

**Geology, Paleontology and Minerals Table 1
Laws, Ordinances, Regulations, and Standards (LORS)**

<u>Applicable Law</u>	<u>Description</u>
Federal	
Antiquities Act of 1906 (16 United States Code [USC], 431-433)	The proposed RSEP facility site would be partially on private land and partially on land currently administered by the BLM. Although there is no specific mention of natural or paleontological resources in the Act itself, or in the Act's uniform rules and regulations (Title 43 Part 3, Code of Federal Regulations [43 CFR Part 3], 'objects of antiquity' has been interpreted to include fossils by the Federal Highways Act of 1956, the National Park Service (NPS), the BLM, the Forest Service (USFS), and other Federal agencies.
National Environmental Policy Act (NEPA) of 1970 (42 USC 4321, et. seq.)	Established the Council on Environmental Quality (CEQ), which is charged with preserving 'important historic, cultural, and natural aspects of our national heritage'.
Federal Land Policy and Management Act (FLPMA) of 1976 (43 USC 1701-1784)	Authorizes the BLM to manage public lands to protect the quality scientific, scenic, historical, archeological, and other values, and to develop 'regulations and plans for the protection of public land areas of critical environmental concern', which include 'important historic, cultural or scenic values'. Also charged with the protection of 'life and safety from natural hazards'.
Paleontological Resources Preservation Act (PRPA) (Public Law [PL] 111-011)	Authorizes Departments of Interior and Agriculture Secretaries to manage the protection of paleontological resources on Federal lands.
National Historic Preservation Act of 1966 (NHPA) (16 USC 470)	Establishes policies for the 'preservation of the prehistoric and historic resources of the United States', under the direction of the Secretary of the Interior and the BLM.
General Mining Law of 1872	Declares all valuable mineral deposits in lands belonging to the United States to be free and open to exploration and purchase.
Mineral Leasing Act of 1920	Authorizes the leasing of coal, oil & gas, phosphate, sodium and oil shale from public lands in return for payment of a royalty rate on production.
Materials Act of July 31, 1947	Authorizes the sale of certain materials from the public lands including sand, stone, gravel, and common clay.

<u>Applicable Law</u>	<u>Description</u>
National Environmental Policy Act (NEPA) of 1970 (42 USC 4321, et. seq.)	Established the Council on Environmental Quality (CEQ), which is charged with preserving 'important historic, cultural, and natural aspects of our national heritage'.
<u>State</u>	
California Building Code (CBC), 2007	The CBC (2007) includes a series of standards that are used in project investigation, design, and construction (including grading and erosion control).
Alquist-Priolo Earthquake Fault Zoning Act, Public Resources Code (PRC), Section 2621–2630	Mitigates against surface fault rupture of known active faults beneath occupied structures. Requires disclosure to potential buyers of existing real estate and a 50-foot setback for new occupied buildings. Portions of the site and proposed ancillary facilities are located within designated Alquist-Priolo Fault Zones. The proposed site layout places occupied structures outside of the 50-foot setback zone.
The Seismic Hazards Mapping Act, PRC Section 2690–2699	Areas subject to the effects of strong ground shaking, such as liquefaction, landslides, tsunamis, and seiches.
PRC, Chapter 1.7, Sections 5097.5 and 30244	Regulates removal of paleontological resources from state lands, defines unauthorized removal of fossil resources as a misdemeanor, and requires mitigation of disturbed sites.
Warren-Alquist Act, PRC, Sections 25527 and 25550.5(i)	The Warren-Alquist Act requires the Energy Commission to “give the greatest consideration to the need for protecting areas of critical environmental concern, including, but not limited to, unique and irreplaceable scientific, scenic, and educational wildlife habitats; unique historical, archaeological, and cultural sites...” With respect to paleontologic resources, the Energy Commission relies on guidelines from the Society for Vertebrate Paleontology, indicated below.
California Environmental Quality Act (CEQA), PRC sections 15000 et seq., Appendix G	Mandates that public and private entities identify the potential impacts on the environment during proposed activities. Appendix G outlines the requirements for compliance with CEQA and provides a definition of significant impacts on a fossil site.
Society for Vertebrate Paleontology (SVP), 1995	The “Measures for Assessment and Mitigation of Adverse Impacts to Non-Renewable Paleontological Resources: Standard Procedures” is a set of procedures and standards for assessing and mitigating impacts to vertebrate paleontological resources. The measures were adopted in October 1995 by the SVP, a national organization of professional scientists.
<u>Local</u>	

Applicable Law	Description
Riverside County General Plan 2000, Safety Element	Adopts the Uniform Building Code (UBC) (1997), which provides design criteria for buildings and excavations. The UBC is superseded by the CBC (2007). Requires mitigation measures for geologic hazards, including seismic shaking, surface rupture (adopts APEFZ Act), liquefaction, unstable soils and slopes, and flooding.
Riverside County General Plan 2000, Multipurpose Open Space Element	Provides for 'preservation of cultural, historical, archaeological, paleontologic, geologic and educational resources'. Also provides a map showing paleontologic sensitivity in the county.

PROPOSED PROJECT

SETTING AND EXISTING CONDITIONS

The proposed RSEP would be constructed on 1,410 acres approximately 32 miles west of Parker, Arizona in Riverside County, California. The site is immediately south of the boundary between Riverside and San Bernardino Counties. State Route 62, Atchison, Topeka, and Santa Fe railroad tracks, and the Colorado River Aqueduct are also located immediately north of the property. With the exception of part of the proposed project transmission line corridor, the property is located entirely on privately owned land, a portion of which was first developed as Rice Army Airfield during World War II.

The proposed RSEP would be a primary power generating facility capable of producing 150 megawatts (MW) of electricity via a sun-tracking heliostat and central receiver tower array. Power would be generated by up to 17,500 sun-tracking mirrors which would be supported on individual metal pipe or drilled pier foundations. Each heliostat assembly consists of a 24-foot by 28-foot mirror that automatically focuses sunlight onto a central receiver tower. The central receiver tower contains a liquid salt circulation and storage system capable of storing approximately 4.4 million gallons of liquid sodium nitrate and potassium nitrate salt mixture. When the heliostat array is focusing sunlight on the receiver tower the liquid (salt) mixture is circulated through 14 focal points on the tower until it reaches its optimum operating temperature of 1,050 degrees Fahrenheit. The superheated salt mixture is then pumped into a hot salt storage tank. Hot salt is drawn from the tank and circulated through a heat exchanger to generate steam which is used to drive the steam turbine electrical generating system.

Supporting facilities for the proposed RSEP plant would include an air-cooled condenser for exhaust steam, operations and administration building, a maintenance building, and a new 230-kilovolt (kV) switchyard. Water for the project would be provided by two on-site water supply wells and a raw water storage tank with a capacity of approximately 840,000 gallons. The raw water would be demineralized by reverse-osmosis and electrodeionization prior to its use for steam generation and for washing the heliostat mirrors. Brines and waste water from the demineralization process would be disposed in three evaporation ponds.

Off-site ancillary facilities associated with the proposed RSEP plant would include a 10-mile-long 161/230-kV electrical transmission line connecting the new substation to the existing Western Area Power Administration Parker-Blythe No. 2 transmission line east of the site (SR 2009a).

The proposed site is located in the east-central portion of the Mojave Desert physiographic province in Southern California. The Mojave Desert is a broad interior region of isolated mountain ranges which separate vast expanses of desert plains and interior drainage basins. The Mojave Desert occupies approximately 25,000 square miles in southeastern California and portions of Nevada, Utah, and Arizona. In California, its overall topography is dominated by southeast to northwest-trending faulting with a secondary east to west-trending alignment which is correlateable to Transverse Range faulting.

More locally, the proposed RSEP site is located near the western edge of a structural belt correlatable to the southern extension of the Walker Lane Fault Zone. This northwest-trending, approximately 60-mile-wide structural zone is referred to as the Mojave-Sonoran Belt and is marked by abrupt termination of north and northeast trending mountain ranges and basins to the east of the zone and transition to northwest-trending strike-slip faulting to the west of the zone. The area was extensively faulted in the Early to Middle Miocene by thrusting along the Whipple Mountain detachment fault which resulted in up to 25 miles of northeast extensional transport of the upper detachment plate. The area is notable for its relative lack of seismicity and faulting since the end of the Miocene (approximately three million years [m.y.]) (Carr 1991).

Rice Valley lies at the southern end of the Turtle Mountains near the western edge of terrain dominated by Whipple Mountains detachment faulting. Included within the Turtle Mountains complex are the Stepladder Mountains, which are a northern extension of the Turtle Mountains, the Mopah Range which lies on the southeast flank of the Turtle Mountains, and the Arica Mountains which are a small but geologically similar bedrock outcrop southwest of the Turtle Mountains and southwest of the proposed RSEP project. The Mopah Range is composed of Tertiary volcanic rocks whereas the Stepladder, Turtle, and Arica Mountains expose Precambrian through Tertiary metamorphic, crystalline volcanic and sedimentary sequences which are offset against each other along high angle north to northwest-trending east-dipping normal faults related to movement across the underlying detachment fault (Howard, et al. 1982). The stratigraphic and structural record of the Turtle Mountains presents a long complex geologic history beginning with Early Proterozoic sedimentation and volcanism followed by plutonism and high-grade regional metamorphism. The Middle Proterozoic saw more plutonism and dike emplacement followed by a long period of geologic stability during the Paleozoic and much of the Early to Mid-Mesozoic. Another period of pluton and dike intrusion during the Cretaceous was followed by geologic stability until the Early to Middle Miocene when local and regional volcanism, shallow plutonic intrusion, and extensive detachment and normal faulting occurred (Howard, et al. 1988). The area has undergone relatively little tectonic activity since the Middle Miocene.

Surface cover at the site consists of Quaternary and Tertiary alluvium and fan conglomerate deposits composed of sediments washed down from the Turtle Mountains to the north.

Fluvial deposits of the Colorado River and estuarine deposits of the Bouse Formation may be present beneath the site. Overall the site slopes south toward the local topographic low at the center of Rice Valley.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

This section considers two types of impacts. The first is geological hazards, which could impact the proper functioning of the proposed facility and create life/safety concerns. The second is the potential impacts the proposed facility could have on existing geological, mineralogical, and paleontological resources in the area.

Direct/Indirect Impacts and Mitigation

The CBSC and CBC (2007) provide geotechnical and geological investigation and design guidelines, which engineers must follow when designing a facility. As a result, the criteria used to assess the significance of a geologic hazard include evaluating each hazard's potential impact on the design and construction of the proposed facility. Geologic hazards include faulting and seismicity, liquefaction, dynamic compaction, hydrocompaction, subsidence, expansive soils, landslides, tsunamis, and seiches.

The CEQA Guidelines, Appendix G, provide a checklist of questions that lead agencies typically address.

- Section (V) (c) includes guidelines that determine if a project will either directly or indirectly destroy a unique paleontological resource or site or a unique geological feature.
- Sections (VI) (a), (b), (c), (d), and (e) focus on whether or not the project would expose persons or structures to geologic hazards.
- Sections (X) (a) and (b) concern the project's effects on mineral resources.

Staff has reviewed geologic and mineral resource maps for the surrounding area, as well as site-specific information provided by the applicant, to determine if geologic and mineralogic resources exist in the area and to determine if operations could adversely affect geologic and mineralogic resources.

Staff reviewed existing paleontologic information provided by Riverside County and a records search provided by the LACM. Site-specific information generated by the applicant for the project was also reviewed. All research was conducted in accordance with accepted assessment protocol (SVP 1995) to determine whether any known paleontologic resources exist in the general area. If present or likely to be present, conditions of certification which outline required procedures to mitigate impacts to potential resources, are proposed as part of the project's approval.

Although the proposed site is located in a region known as the Eastern Mojave Aseismic Area, ground shaking represents the main geologic hazard at this site. This potential hazard can be effectively mitigated through facility design by incorporating recommendations contained in the project geotechnical report. Proposed Conditions of Certification **GEN-1**, **GEN-5**, and **CIVIL-1** in the **Facility Design** section should also mitigate these impacts to a less than significant level.

The proposed RSEP site is not located within an established Mineral Resource Zone (MRZ) and no economically viable mineral deposits are known to be present at the site.

Near-surface geology beneath the site consists primarily of Quaternary alluvium and conglomerate overlying Quaternary older alluvium with minor outcrops of Tertiary volcanic rocks (CDMG 1964). Staff reviewed correspondence from the LACM (McLeod, 2009), the Riverside County Land Information System website, and the project paleontological resources technical report (CH2MHill 2009) for information regarding known fossil localities and stratigraphic unit sensitivity within the project area. The LACM has no recorded fossil localities within or near the project area and ancillary facilities. Fossil collection sites which include pocket mouse, horse, and camel, are found in Quaternary older alluvium which forms a portion of the subsurface stratigraphy beneath Rice Valley. However, the fossil collection sites for this formation are located some 30 miles to the southwest in the area of Ford Dry Lake and the Eagle and Coxcomb Mountains (McLeod 2009).

Staff considers the probability for significant paleontological resources to be encountered during proposed site construction activities to be low in Holocene age deposits on most of the proposed RSEP site surface. However, mass grading, deep foundation excavation and utility trenching may penetrate underlying Pleistocene age soils at undetermined depths. Overall, the potential for exposure of paleontological resources would be considered as high, until determined otherwise by a qualified professional paleontologist. Low and high paleontological sensitivity roughly corresponds to PFYC Condition 3, Class 1 or 2 and Condition 2, Class 4a and 4b, respectively (USDI 2007). This assessment is based on SVP (1995) criteria and the paleontological report appended to the AFC (SR 2009a). Proposed Conditions of Certification **PAL-1** to **PAL-7** are designed to mitigate paleontological resource impacts, as discussed above, to less than significant levels. These conditions essentially require a worker education program in conjunction with the monitoring of earthwork activities by a qualified professional paleontologist (a paleontological resource specialist [PRS]).

The proposed conditions of certification allow the BLM Authorized Office, the Energy Commission's CPM, and the applicant to adopt a compliance monitoring scheme ensuring compliance with LORS applicable to geological hazards and the protection of geological, mineralogical, and paleontological resources.

Based on the information below, it is staff's opinion that the potential for significant adverse, direct or indirect impacts to the project, from geological hazards, and to potential geological, mineralogical, and paleontological resources, from the proposed project, is low.

Geological Hazards

The AFC provides documentation of potential geologic hazards at the proposed RSEP site, including limited site-specific subsurface information (SR 2009a). Review of the AFC, coupled with staff's independent research, indicates that the potential for geologic hazards to impact the proposed plant site during its practical design life is low if recommendations for mitigation of seismic shaking are followed. Geologic hazards related to seismic shaking are addressed in the project AFC and the preliminary

geotechnical report per CBC (2007) requirements (SR 2009a).

Staff's independent research included the review of available geologic maps, reports, and related data of the RSEP site. Geological information was available from the California Geological Survey (CGS), California Division of Mines and Geology (CDMG, now know as CGS), the U.S. Geological Survey (USGS), the American Geophysical Union, the Geologic Society of America, the South Coast Geological Society, and other organizations.

Faulting and Seismicity

Energy Commission staff reviewed numerous CDMG and USGS publications as well as informational websites in order to gather data on the location, recency, and type of faulting in the proposed project area. Type A and B faults within 100 miles of the proposed RSEP site are listed in **Geology, Paleontology and Minerals Table 2**. Type A faults have slip-rates of ≥ 5 mm per year and are capable of producing an earthquake of magnitude 7.0 or greater. Type B faults have slip-rates of 2 to 5 mm per year and are capable of producing an earthquake of magnitude 6.5 to 7.0. The fault type, potential magnitude, and distance from the site are summarized in **Geology, Paleontology and Minerals Table 2**. Because of the large size of the site the distances to faults are measured from the approximate proposed receiver tower location within the site. Other Type C and otherwise undifferentiated faults which are more than 20 miles from the proposed site are not discussed here because they are unlikely to undergo movement or generate seismicity which could affect the project.

**Geology, Paleontology and Minerals Table 2
Active Faults Relative to the Proposed Rice Solar Energy Site**

<u>Fault Name</u>	<u>Distance From Site (miles)</u>	<u>Maximum Earthquake Magnitude (Mw)</u>	<u>Estimated Peak Site Acceleration (g)</u>	<u>Movement and Strike</u>	<u>Slip Rate mm/yr</u>	<u>Fault Type</u>
Pinto Mountain	64.7	7.2	0.070	Left-Lateral Strike Slip (Northwest)	2.5	B
Pisgah-Bullion Mtn. - Mesquite Lake	68.4	7.3	0.071	Right-Lateral Strike Slip (Northwest)	0.6	B
San Andreas – Whole M-1a	71.2	8.0	0.099	Right-Lateral Strike Slip (Northwest)	34.0	A
San Andreas – San Bernardino – Coachella M-2b	71.2	7.7	0.085	Right-Lateral Strike Slip (Northwest)	25.0	A
San Andreas – Coachella M-1c-5	71.2	7.2	0.065	Right-Lateral Strike Slip (Northwest)	25.0	A
Brawley Seismic Zone	71.2	6.4	0.043	Right-Lateral Strike Slip (Northwest)	25.0	B
Elmore Ranch	75.1	6.6	0.046	Left-Lateral Strike Slip (Northwest)	1.0	B

Fault Name	Distance From Site (miles)	Maximum Earthquake Magnitude (Mw)	Estimated Peak Site Acceleration (g)	Movement and Strike	Slip Rate mm/yr	Fault Type
Emerson South – Copper Mtn.	78.4	7.0	0.054	Right-Lateral Strike Slip (Northwest)	0.6	B
Calico - Hidalgo	85.4	7.3	0.060	Right-Lateral Strike Slip (Northwest)	0.6	B
Eureka Peak	87.7	6.4	0.036	Right-Lateral Strike Slip (Northwest)	0.6	B
Imperial	90.4	7.0	0.049	Right-Lateral Strike Slip (Northwest)	20.0	A
Burnt Mountain	90.6	6.5	0.037	Right-Lateral Strike Slip (Northwest)	0.6	B
Landers	92.5	7.3	0.056	Right-Lateral Strike Slip (Northwest)	0.6	B
San Jacinto - Anza	93.1	7.2	0.053	Right-Lateral Strike Slip (Northwest)	12.0	A
Superstition Hills	93.3	6.6	0.038	Right-Lateral Strike Slip (Northwest)	4.0	A
Johnson Valley (Northern)	95.7	6.7	0.040	Right-Lateral Strike Slip (Northwest)	0.6	B
San Andreas – San Bernardino M-1	95.7	7.5	0.061	Right-Lateral Strike Slip (Northwest)	12.0	A
Superstition Mountain	95.8	6.6	0.038	Right-Lateral Strike Slip (Northwest)	5.0	A
San Jacinto - Borrego	98.3	6.6	0.037	Right-Lateral Strike Slip (Northwest)	4.0	A
San Jacinto – Coyote Creek	99.0	6.6	0.037	Right-Lateral Strike Slip (Northwest)	4.0	A
Northern Frontal Fault Zone (Eastern)	99.4	6.7	0.047	Reverse (West)	0.5	B

In addition to the Type A and B faults, the County of Riverside indicates an unnamed fault which has potential to cause ground shaking at the proposed RSEP site is located beneath Rice Valley immediately south and southwest of the site. The unnamed fault is shown as two or more closely spaced northwest-trending parallel right lateral strike slip faults which are concealed by alluvium along most of their length. Immediately south of the proposed site the fault(s) offsets the low angle northeast dipping structure of the Whipple Mountain detachment fault. Age of the most recent movement on the unnamed fault has not been investigated however recent (Holocene) alluvium does not appear to exhibit any offset. cursory study of the unnamed fault suggests the most recent movement is likely greater than one million years (Carr 1991).

The Whipple Mountain detachment fault is a regional low angle fault system of probable tectonic origin (Carr 1991). The detachment was active in the proposed project area during the Early to Mid-Miocene (approximately 18 to 13 m.y. before present) and was probably responsible for some amount of offset throughout the entire Mojave-Sonoran structural belt. The Whipple Mountain detachment fault was active for approximately 5 m.y., resulting in up to approximately 25 miles of northeast extensional transport of the upper detachment plate. The lack of offset in younger Tertiary formations, notably the 13 m.y. old Osborne Wash fan conglomerate, suggests regional extension ended in the Mid-Miocene concurrently with the onset of northwestward movement along the San Andreas Fault west of the proposed site (Carr 1991). The low frequency of Pliocene and near absence of Pleistocene faulting in the Mojave-Sonoran structural belt make the region unique given its proximity to areas of intense recent faulting and frequent seismicity; most notably the Eastern California Shear Zone (ECSZ) and the Salton

Trough; and indicates a low probability of intense ground shaking in the proposed project area.

Twenty-one Type A and B faults and fault segments were identified within 100 miles of the potential site (**Geology, Paleontology and Minerals Table 2**). Of these, the Pinto Mountain fault is closest at about 65 miles west of the site. However, due to its high frequency of seismic activity, shaking at the site, if it occurs, is likely to be the result of movement of the San Andreas fault system approximately 71 miles west of the proposed site.

Although the proposed RSEP site lies within an area of greatly subdued seismic activity. The ECSZ, which dominates faulting and seismicity in the eastern Mojave Desert province, is present approximately 20 miles to the southwest of the site. Evidence of Holocene movement has been found on nearly every major fault in the ECSZ (Trieman et al. 2002). Therefore, the effects of strong ground shaking would need to be mitigated through structural designs required by the California Building Code (CBC 2007) and the project geotechnical report. The CBC (2007) requires that structures be designed to resist seismic stresses from ground acceleration and, to a lesser extent, liquefaction. A preliminary geotechnical investigation has been performed and presents standard engineering design recommendations for mitigation of seismic shaking and site soil conditions (Terracon 2009). Based on the apparent soil profile beneath the proposed RSEP site, the site soil class is assumed to be seismic Class D. The estimated peak horizontal ground acceleration for the power plant is 0.14 times the acceleration of gravity (0.14g) for bedrock acceleration based on 2% probability of exceedence in 50 years under 2007 CBC criteria. For a Class D site, the soils profile amplifies the potential peak acceleration of the ground surface to 1.94g (USGS 2008a).

Liquefaction

Liquefaction is a condition in which a saturated cohesionless soil may lose shear strength because of sudden increase in pore water pressure caused by an earthquake. However, the potential for liquefaction of strata deeper than approximately 40 feet below surface is considered negligible due to the increased confining pressure and because geologic strata at this depth are generally too compact to liquefy. The reported deep ground water table (greater than 300 feet) would indicate no potential for liquefaction. Soil characteristics reported in the project-specific geotechnical report (Terracon 2009) indicate strata beneath the site are also generally too dense to liquefy. Liquefaction potential on the RSEP site was addressed in the project geotechnical report per CBC (2007) and proposed Condition of Certification **GEN-1** requirements.

Lateral Spreading

Lateral spreading of the ground surface can occur within liquefiable beds during seismic events. Lateral spreading generally requires an abrupt change in slope—that is, a nearby steep hillside or deeply eroded stream bank, etc.—but can also occur on gentle slopes such as are present at the project site. Other factors such as distance from the epicenter, magnitude of the seismic event, and thickness and depth of liquefiable layers also affect the amount of lateral spreading. Because the RSEP site is not subject to significant liquefaction, there is no potential for lateral spreading at the site surface during seismic events.

Dynamic Compaction

Dynamic compaction of soils results when relatively unconsolidated granular materials experience vibration associated with seismic events. The vibration causes a decrease in soil volume, as the soil grains tend to rearrange into a more dense state (an increase in soil density). The decrease in volume can result in settlement of overlying structural improvements. Site specific geotechnical investigation indicates the alluvial deposits in the site subsurface are generally too dense to allow significant dynamic compaction (Terracon 2009).

Hydrocompaction

Hydrocompaction (also known as hydro-collapse) is generally limited to young soils that were deposited rapidly in a saturated state, most commonly by a flashflood. The soils dry quickly, leaving an unconsolidated, low density deposit with a high percentage of voids. Foundations built on these types of compressible materials can settle excessively, particularly when landscaping irrigation dissolves the weak cementation that is preventing the immediate collapse of the soil structure. Site specific geotechnical investigation indicates the subsurface alluvial deposits which underlie the site are generally too dense to experience significant hydrocompaction (Terracon 2009).

Subsidence

Local subsidence or settlement may occur when areas containing compressible soils are subjected to foundation or fill loads. Site-specific geotechnical investigation indicates the alluvial deposits which underlie the site are generally at a medium-dense to very dense consistency and therefore are considered unlikely to subside excessively under normal foundation loading.

Regional ground subsidence is typically caused by petroleum or ground water withdrawal that increases the effective unit weight of the soil profile, which in turn increases the effective stress on the deeper soils. This results in consolidation or settlement of the underlying soils. No petroleum or natural gas withdrawals are taking place in the site vicinity and ground water pumping for day-to-day site operations would be low and unlikely to cause localized subsidence. The Riverside County Land Information System indicates the site could be subject to subsidence due to regional ground water withdrawal (Riverside County 2009). However, subsidence caused by regional ground water withdrawal would probably only occur on a regional scale. Negative impacts to the project due to localized subsidence from tectonism or from petroleum, natural gas, or future ground water production are considered very unlikely.

Expansive Soils

Soil expansion occurs when clay-rich soils with an affinity for water exist in place at a moisture content below their plastic limit. The addition of moisture from irrigation, precipitation, capillary tension, water line breaks, etc. causes the clay soils to absorb water molecules into their structure, which in turn causes an increase in the overall volume of the soil. This increase in volume can produce excessive movement (heave) of overlying structural improvements. The preliminary geotechnical report indicates the proposed site is underlain by poorly to well cemented sand and gravel beds with lesser amounts of silt (Terracon 2009).

The alluvial soils which form most of the site subsurface are not considered to be expansive.

Landslides

The proposed site slopes gently to the south at a gradient of approximately 2%. Due to the low site gradient and the absence of topographically high ground in the site vicinity the potential for landslide impacts to the site is considered to be negligible.

Flooding

According to the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (Map #06065C0575G, 2008), the site of the proposed facility is not within the 100-year floodplain. In addition, because the proposed site is topographically elevated above terrain to the south and west, it is Staff's opinion that the potential for flooding at the site is limited to infrequent high volume (flashflood) events which may occur due to heavy rainfall in the adjacent Turtle Mountains. Flash flooding, if it occurs, will primarily affect the established, entrenched drainages which cross the site from approximately north to south, and it is considered unlikely that significant overbank flow would occur. Therefore the potential for catastrophic flooding at the proposed RSEP site is considered to be low.

Tsunamis and Seiches

The proposed RSEP project and associated linear facilities are not located near any significant surface water bodies and therefore the potential for impacts due to tsunamis and seiches is considered to be negligible.

Volcanic Hazards

The proposed RSEP site is located approximately 65 miles southeast of vents associated with the Amboy Crater volcanic field, which is approximately 33 miles southeast of the Lavic Lake volcanic field. Collectively the two volcanic fields are referred to as the Amboy Crater – Lavic Lake volcanic hazard area (VHA) because of their geologic similarities in rock type, volcanic deposits, and age of eruption. Amboy Crater is an approximately 27-square-mile area within the Mojave Desert comprised of Holocene age dacitic to basaltic flows and pyroclastic rocks. The combined Amboy Crater – Lavic Lake VHA has been designated by the USGS as an area subject to lava flows and tephra deposits associated with basalt or basaltic andesite vents (Miller 1989). The Amboy Crater – Lavic Lake VHA is also considered to be subject to future formation of cinder cones, volcanic ash falls, and phreatic explosions. The recurrence interval for eruptions has not been determined, but is likely to be in the range of 1,000 years or more.

The proposed RSEP site is also located approximately 75 miles northeast of dome complexes associated with the Salton Buttes VHA. Salton Buttes is a relatively small area at the southern end of the Salton Sea within the Colorado Desert comprised of Late Pleistocene age rhyolitic flows and pyroclastic rocks. Five rhyolitic domes formed from four volcanic vents approximately 16,000 years ago. The Salton Buttes VHA has been designated by the USGS as an area subject to explosive and extrusive rhyolitic eruptions (Miller 1989). The recurrence interval for eruptions has not been determined.

Because the proposed RSEP site is not located within a designated volcanic hazard area, staff considers the likelihood of significant impacts to the project resulting from volcanic activity would be low. Eruptive activity would likely be limited to ashfall which would have a minor, short-lived affect on the project.

Due to the distance of the site from known Holocene volcanic areas and the likely long recurrence intervals between eruptions the potential for volcanic eruptions to cause long term or catastrophic damage to the RSEP project is considered low.

Geological, Mineralogical, and Paleontological Resources

Geological and Mineralogical Resources

Energy Commission staff has reviewed applicable geologic maps, reports, and on-line resources for this area (Blake 2006; CDMG 1990; CDMG 1994; CDMG 1998; CDMG 1999; CDMG 2003; CGS 2002a and b; CGS 2007; Jennings and Saucedo 2002; SCEC 2006; USGS 2003; USGS 2008a and b). The proposed RSEP site is not located within an established Mineral Resource Zone (MRZ) and no economically viable mineral deposits are known to be present (Kohler 2006). Several operating and closed mines and mineral prospects are present within five miles of the proposed project boundaries. These have produced a number of industrial minerals, primarily manganese, borates, clay, and talc. No active mines are known to have existed within the proposed project boundaries (USGS 2008b).

Mineral resource potential of the Turtle Mountains Wilderness Study Area have been assessed by remote sensing, field reconnaissance, and laboratory techniques. This study indicates mineralization within the Turtle Mountains occurred prior to and during Miocene time. Six areas in the south-central and northwestern portions of the study area are thought to have high resource potential, two areas are thought to have moderate resource potential, and one area in the southwest corner of the study area, closest to the proposed RSEP site, is regarded as having low potential for low grade but possibly large tonnage gold, silver, copper, lead, zinc, molybdenum, and tungsten production (Howard et al. 1988). There is a possibility that these lode deposits, if they exist, could extend southward within bedrock beneath the proposed site. However, until the existence and structural orientation of an ore body is proven, the probability of the presence of economically recoverable mineral reserves beneath the property is considered to be very low.

Paleontological Resources

Energy Commission staff reviewed the paleontological resources assessment in Section 5.8 and Appendix 5.8A of the AFC (SR 2009a). Staff has also reviewed paleontological literature and records searches conducted by the Natural History Museum of Los Angeles County (McLeod 2009). These studies indicate the Quaternary alluvium, fanglomerate, and volcanic rocks within and near the proposed project site contain few fossils. Fossil collection sites within older Quaternary alluvium similar to that which underlies the site are located some 30 miles to the southwest in the area of Ford Dry Lake and the Eagle and Coxcomb Mountains (McLeod 2009).

Therefore older Quaternary alluvium which underlies the site at unknown depth may contain significant fossil vertebrates.

Based on recorded fossil finds and the age of the sediments which may be encountered during construction, the paleontological resource sensitivity of undisturbed Quaternary alluvium and lacustrine sediments varies from low at shallow depths to high at deeper depths. The depth to Pleistocene age sediments beneath Holocene deposits at the proposed site is unknown. Staff concludes that all sedimentary units below a depth of 1.5 feet of the ground surface, where Holocene age sediments are mapped, should initially be treated as highly sensitive. After monitoring of grading and trenching activities during proposed construction of the site, a qualified professional paleontologist may determine the appropriate depth above which the coarse grained soils are Holocene in age, have a low sensitivity, and low potential for adverse impacts on paleontological resources (PFYC Condition 3, Class 1 or 2).

Drilled shaft foundations may be one method to support the sun tracking heliostats. It must be recognized that fossils in auger cuttings from installation of drilled shaft foundations would be severely disturbed and also out of geological context. Given the small area of disturbance, even for numerous drilled shafts, the likelihood of encountering a significant fossil deposit during drilling of small diameter auger holes would seem low.

This assessment is based on SVP criteria, the paleontological report appended to the AFC (RSE 2009), and the independent paleontological assessment of McLeod (2009). Proposed Conditions of Certification **PAL-1** to **PAL-7** are designed to mitigate paleontological resource impacts, as discussed above, to less than significant levels. These conditions essentially require a worker education program in conjunction with the monitoring of earthwork activities by a qualified professional paleontologist (a PRS).

The proposed conditions of certification allow the BLM Authorized Office, Energy Commission's CPM, and the applicant to adopt a compliance monitoring scheme ensuring compliance with LORS applicable to geologic hazards and the protection of geologic, mineralogic, and paleontologic resources.

Construction Impacts and Mitigation

The design-level geotechnical investigation, required for the project by the CBC (2007) and proposed Condition of Certification **GEN-1** should provide standard engineering design recommendations for mitigation of earthquake ground shaking and excessive settlement (see **Proposed Conditions of Certification, Facility Design**).

As noted above, no viable geological or mineralogical resources are known to exist in the vicinity of the proposed RSEP site. Construction of the proposed project will include grading, foundation excavation, and utility trenching. Based on the soils profile, SVP assessment criteria, and recorded fossil localities within 30 miles of the proposed site, staff considers the probability of encountering paleontological resources to be negligible in the upper 1.5 feet of most of the site. Sediments below 1.5 feet should be treated as highly sensitive (PFYC Condition 2, Class 4a, 4b).

Proposed Conditions of Certification **PAL-1** to **PAL-7** are designed to mitigate any

paleontological resource impacts, as discussed above, to a less than significant level. Essentially, Conditions of Certification **PAL-1 to PAL-7** require a worker education program in conjunction with monitoring of earthwork activities by qualified professional paleontologists (PRS). Earthwork is halted any time potential fossils are recognized by either the paleontologist or the worker. When properly implemented, the conditions of certification yield a net gain to the science of paleontology since fossils that would not otherwise have been discovered can be collected, identified, studied, and properly curated. A paleontological resource specialist is retained, for the project by the applicant, to produce a monitoring and mitigation plan, conduct the worker training, and provide the monitoring. During the monitoring, the PRS can and often does petition the Energy Commission for a change in the monitoring protocol. Most commonly, this is a request for lesser monitoring after sufficient monitoring has been performed to ascertain that there is little chance of finding significant fossils. In other cases, the PRS can propose increased monitoring due to unexpected fossil discoveries or in response to repeated out-of-compliance incidents by the earthwork contractor.

Based upon the literature and archives search, field surveys, and compliance documentation for the RSEP project, the applicant has proposed monitoring and mitigation measures to be followed during the construction of the project. Energy Commission staff believes that the facility can be designed and constructed to minimize the effect of geologic hazards and impacts to potential paleontological resources at the site during project design life.

Operation Impacts and Mitigation

Operation of the proposed new solar energy generating facility should not have any adverse impact on geologic, mineralogic, or paleontologic resources.

Project Closure and Decommissioning

The future decommissioning and closure of the project should not negatively affect geological, mineralogical, or paleontological resources since the ground disturbed during plant decommissioning and closure would have been already disturbed, and mitigated as required, during construction and operation of the project.

CEQA LEVEL OF SIGNIFICANCE

CEQA guidelines strive to assure projects on public lands will not:

- Block access to a geological or mineralogical resource, a source of industrial minerals, or construction aggregates.
- Damage, destroy or block access to a natural geological feature with aesthetic and/or scientific value.
- Damage, destroy, or block access to a significant paleontological resource (primarily but not always, vertebrate fossils).
- Increase or initiate regional ground subsidence through extraction of ground water, petroleum, or natural gas.
- Build structures that would be dangerous to workers or the general public as the result of natural geological hazards of the site.

Independent research conducted by CEC staff geologists verifies that there are no known geological or mineralogical resources or unusual geological features near or within the boundary of the proposed RSEP site. The CEQA level of significance from these areas of concern is “no impact.” Since major ground water withdrawal is not anticipated and regional subsidence is not a known geological hazard in this area, CEC staff concludes that ground water withdrawal for this project would result in an impact of “less than significant.”

All structures on this site must be constructed to the standards of the current California Building Code (CBC 2007), as specified in proposed Condition of Certification **GEN-1** under **Facility Design**. The building code standards are based on both theoretical design and observation of component failures over many years. The intent of the building code is to minimize the risk to human life from natural hazards, including those inherent in the geological environment (earthquake-related, landslides, tsunamis/seiches, volcanic eruptions) and those from other sources, primarily high wind loading. Implementation of these design standards, per **GEN-1**, should result in geological hazards being “less than significant with mitigation” (mitigation being proper design for the site-specific hazards).

Energy Commission staff concludes that the RSEP site is situated in a geological environment with some potential to encounter significant paleontological resources, particularly in deeper excavations required for the large structures. Potential impacts to paleontological resources, within the proposed project, can be mitigated to a (CEQA) less than significant level by adopting and enforcing the proposed Conditions of Certification **PAL-1** through **PAL-7**.

REDUCED ACREAGE ALTERNATIVE

The Reduced Acreage Alternative would be 7.2% smaller than the proposed project. It would be located in the same 2,560-acre square-shaped parcel within the larger 3,324-acre ownership property as the proposed project. Although the overall heliostat field distance from the central tower would be reduced, the number of heliostats would remain the same. The heliostat field (plus the evaporation pond and administration areas) would occupy about 1,270 acres instead of the 1,370 acres required for the proposed project. The receiver location would remain the same, with the edges of the field contracting towards the center. The heliostat footprint of the Reduced Acreage Alternative is shown in **Alternatives Figure 2**. The site layout, 653-foot total height of the solar tower and receiver, and transmission interconnection to Western’s Parker-Blythe transmission line would be the same as the proposed project. The project’s nominal 150 megawatts (MW) generation output would be reduced by approximately 2 MW.

SETTING AND EXISTING CONDITIONS

This alternative is located entirely within the boundaries of the proposed project and thus the setting would essentially be the same.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

The 148 MW facility under this Alternative would create no additional impacts and would lower the potential to encounter fossils by virtue of a reduced construction footprint.

NORTH OF DESERT CENTER ALTERNATIVE

The North of Desert Center Alternative would be a 150 MW solar thermal facility located on approximately 2,643 acres of land. It is located along Desert Center Rice Road (State Route 177) east of Kaiser Road, north of Oasis Road, and approximately 1.6 miles north of I-10. The North of Desert Center Alternative is primarily private land with smaller sections of BLM land in the eastern portion of the site. It is largely fallow agricultural land. An existing SCE 161-kV transmission line traverses the alternative site and would need to be re-routed with the project boundaries. A new 0.125-mile generation tie line (along Osborne Ave.) and substation would interconnect to the realigned SCE line at the northeast boundary of the site. The boundaries and transmission realignment of the North of Desert Center Alternative are illustrated in **Alternatives Figure 3**.

SETTING AND EXISTING CONDITIONS

The North of Desert Center Alternative is located near the southwestern edge of the Chuckwalla Valley near the Chuckwalla Mountains to the south. Geologic units underlain by the alternative site are recent dune sand (Qs), recent alluvium (Qal), and nonmarine sedimentary deposits (Qc and Qco). The alternative transmission line route is primarily underlain by young alluvium with interfingering pockets of older fan deposits (Qc and Qco).

The North of Desert Center Alternative is located in an area of low seismic activity. No active faults cross the alignment or are located in the vicinity. The estimated peak horizontal acceleration for this alternative route is less than 0.2 g; therefore, this area should not experience unusually strong ground shaking. The lack of strong ground shaking and deep ground water elevations preclude liquefaction-related phenomena. This alternative is located on flat to gently sloping alluvial fans and alluvial plains that are not susceptible to landslides (CPUC 2006).

One mineral resource site is located approximately one mile south of the alternative site, a talc-soapstone surface mining operation that is no longer in operation. No other mineral resources are identified in the area (CPUC 2006).

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Minimal seismic ground shaking is expected at this alternative site because it is not located within a seismically active area and is not on a known fault line. The severity and frequency of ground shaking associated with earthquake activity at the North of Desert Center Alternative site is expected to be similar to that of the proposed site. As such, similar design criteria would be required for the North of Desert Center Alternative site in accordance with a design-level geotechnical report and California Building Code (2007) standards. Adequate design parameters for the facility would need to be determined through a site-specific evaluation by a Certified Engineering Geologist or Geotechnical Engineer. Impacts due to seismic hazards and soil conditions, such as

subsidence, would be addressed by compliance with the requirements and design standards of the CBC. The potential for liquefaction in this area is very low due to anticipated depth to ground water. Additionally, as the site has been previously used for agriculture and irrigated in most areas, loose deposits of soils are unlikely as the project site has already been subject to long-term wetting. Therefore, the potential for both hydrocompaction, dynamic compaction, and excessive foundation-induced subsidence is low and manageable.

The paleontological sensitivity and potential to encounter significant paleontological resources at this alternative site and the RSEP site is similar. As stated in the **Geology, Paleontology, and Minerals** section, construction of the proposed project will include grading, foundation excavation, utility trenching, and possibly drilled shafts. There exists the possibility of paleontological resources below the tilled zone at the alternative site and along the transmission line alignment. In general, fossil resource potential is limited to the older alluvial fan deposits and non-marine sedimentary deposits. These units are expected to underlie both the proposed alternate plant site and the possible transmission line alignment at unknown depth. As with the proposed project site, the proposed conditions of certification are designed to mitigate any paleontological resource impacts to a less-than-significant level.

The North of Desert Center Alternative site is subject to a similar risk of geologic hazards as the proposed project site. Although not expected, strong ground shaking could be effectively mitigated through facility design. The potential to encounter geologic resources and significant paleontological resources at the alternative site is similar to the RSEP site. The conditions of certification provided in the **Geology, Paleontology and Minerals** section would be applicable to the North of Desert Center Alternative site.

SR 62/RICE VALLEY ROAD GENERATION TIE LINE ALTERNATIVE

The SR 62/Rice Valley Road Generation Tie Line Alternative would interconnect to Western Area Power Administration's (Western) 161-kV/230-kV Parker-Blythe No. 2 transmission line at the same location as the proposed project generation tie line. This alternative generation tie line would exit the proposed solar facility at the northeast corner and follow State Route 62 approximately 4.5 miles east to the junction of Rice Valley Road. It would then trend south to follow the unpaved Rice Valley Road for 4.0 miles to its juncture with the applicant's proposed new generation tie line alignment and continue southeast for 5.4 miles along the proposed alignment to Western's Parker-Blythe No. 2 transmission line. The SR 62/Rice Valley Road Generation Tie Line Alternative route is illustrated in **Alternatives Figure 4**.

SETTING AND EXISTING CONDITIONS

The SR62/Rice Valley Road Generation Tie Line Alternative traverses younger alluvial fan deposits in the Chuckwalla Valley similar to those at the proposed RSEP site. These deposits are presumed to be underlain, at unknown depth, by older alluvial fan deposits. The alignment is located in an area of relatively low seismic activity with no active faults and minimal potential for landslides, liquefaction, and dynamic compaction (Riverside County 2008). Some potential for hydrocompaction may be present in the youngest alluvial fans (flashflood deposits) but transmission line tower foundations normally

penetrate deep enough so as not to be affected and the towers can tolerate considerable settlement anyway. The alignment does not cross any known mineral resources (Riverside County 2009).

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Depending on the number and weight of the conductors, transmission towers can be supported by direct embedment into a drilled excavation, multiple drilled shafts, or a single drilled shaft. Sometimes guy lines with buried plate anchors are required for lateral support. In all cases, transmission towers are fairly tolerant of normal geologic hazards. The electrical utility companies use specialized (proprietary) design methods (Electrical Power Research Institute [EPRI]) for transmission towers since they are not buildings and therefore not strictly governed by building codes. Ground disturbance at each tower site is relatively minimal and occurs typically on 500- to 1,000-foot-centers.

Minimal seismic ground shaking is expected at this alternative alignment because it is not located within a seismically active area and does not cross a known fault line. The severity and frequency of ground shaking associated with earthquake activity along the alignment is expected to be similar to that of the proposed site. As such, similar design criteria would be required for the site in accordance with a design-level geotechnical report, the CBC (2007) where applicable, and EPRI. Adequate design parameters for the facility would need to be determined through a site-specific evaluation by a Certified Engineering Geologist or Geotechnical Engineer. Impacts due to seismic hazards and soil conditions, such as subsidence, would be addressed by compliance with the requirements and design standards of EPRI. The potential for liquefaction in this area is very low due to anticipated depth to ground water.

The paleontological sensitivity and potential to encounter significant paleontological resources at this alternative transmission line alignment and the proposed RSEP site are similar. Construction of the alternate generation tie line would include subsurface drilling and possibly trenching so that there exists the potential of paleontological resources below the younger alluvial deposits. In general, fossil resource potential is limited to the older alluvial fan deposits and non-marine sedimentary deposits. These units are expected to underlie both the proposed plant site and the alternate generation tie line alignment at unknown depth.

The SR 62/Rice Valley Road Generation Tie Line Alternative is subject to a similar risk of geologic hazards as the proposed project site. Although not expected, strong ground shaking could be effectively mitigated through facility design. The potential to encounter geologic resources and significant paleontological resources at the alternative site is similar to the RSEP site. The conditions of certification provided in the **Geology, Paleontology and Minerals** section would be applicable the SR 62/Rice Valley Road Generation Tie Line Alternative. As for the proposed project site, the proposed conditions of certification are designed to mitigate any paleontological resource impacts to a less-than-significant level.

NO PROJECT/NO ACTION ALTERNATIVE

No Project and No Action on Rice Solar Energy Project transmission line application and interconnection request. No CDCA land use plan amendment.

Under this alternative, the proposed Rice Solar Energy Project would not be approved by the Energy Commission; BLM would not approve the transmission line application and would not amend the CDCA Plan; and Western would not approve the interconnection request. As a result, no solar energy project would be constructed on the project site, BLM would continue to manage the land encompassing the transmission line consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended, and Western would continue to operate the Parker Blythe Transmission Line under current conditions.

Because there would be no amendment to the CDCA Plan and no solar project approved for the site under this alternative, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site. As a result, none of the impacts from the proposed project would occur and none of the benefits of the proposed project would occur. The primary benefit from project construction would be a limited potential to discover, properly collect, preserve, and study fossils exposed by excavations. The primary impact would be a very limited potential to encounter and damage or destroy fossil materials with improper or inadequate monitoring at project excavations. In the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations.

COMPARISON OF ALTERNATIVES AND PROPOSED PROJECT

**Geology, Paleontology and Minerals Table 3
Comparison of Proposed Project and Alternatives**

Impact	Proposed Project (150 MW)	Reduced Acreage Alternative (148 MW)	North of Desert Center Alternative (150 MW)	No Project/No Action
No. of Acres	1,410	1,270	2,643	0
Geological Hazards	Ground Shaking – Less than significant with mitigation	Ground Shaking – Less than significant with mitigation	Ground Shaking – Less than significant with mitigation	Not Applicable (N/A)
Geological Resources	None identified – No impact	None identified – No impact	None identified – No impact	N/A
Mineralogical Resources	None identified – No impact	None identified – No impact	None identified – No impact	N/A
Paleontological Resources	Possible high sensitivity at depth – No impact with mitigation	Possible high sensitivity with depth – No impact with mitigation	Possible high sensitivity with depth – No impact with mitigation	N/A

CUMULATIVE IMPACTS

The **Cumulative Scenario** section, provides detailed information on the potential cumulative solar and other development projects in the project area. Together, these projects comprise the cumulative scenario which forms the basis of the cumulative impact analysis for the proposed project. In summary, these projects are:

- Renewable energy projects on BLM, State, and private lands, as shown on **Cumulative Figures 1 and 2** and in **Cumulative Tables 1A and 1B**. Although not all of those projects are expected to complete the environmental review processes, or be funded and constructed, the list is indicative of the large number of renewable projects currently proposed in California.
- Foreseeable future projects in the immediate project area, as shown on **Cumulative Impacts Figure 3, Existing and Future/Foreseeable Projects in the Ridgecrest Area, and Cumulative Tables 2 and 3**. **Table 2** presents existing projects in this area and **Table 3** presents future foreseeable projects in the project. Both tables indicate project name and project type, its location and its status.

These projects are defined within a geographic area that has been identified by the CEC and BLM as covering an area large enough to provide a reasonable basis for evaluating cumulative impacts for all resource elements or environmental parameters. Most of these projects have, are, or will be required to undergo their own independent environmental review under CEQA and/or NEPA. Even if the cumulative projects described in the **Cumulative Scenario** section have not yet completed the required environmental processes, they were considered in the cumulative impacts analyses in this SA/Draft EIS.

GEOGRAPHIC SCOPE OF ANALYSIS

The geographic area considered for cumulative impacts on geology and paleontology is the east-central region of the Mojave Desert. The potential impacts are limited to those involving paleontological resources since no geological or mineralogical resources have been identified within the boundaries of the proposed project or its possible alternatives. There are no geological hazards with potential cumulative effects, other than regional subsidence from oil, gas, or ground water withdrawal. On-site wells will provide water for the project but pumping quantities should not be sufficient to induce local or regional subsidence.

EFFECTS OF PAST AND PRESENT PROJECTS

Any previously completed project involving subsurface excavation without paleontological monitoring might already have had a detrimental effect on paleontological resources in the area defined above under **Geographic Scope of Analysis**. Given the general scarcity of fossils, even within known fossil bearing strata, the possibility of prior damage is real but modest, unknown, and unavoidable, after the fact.

EFFECTS OF REASONABLY FORESEEABLE FUTURE PROJECTS

Foreseeable Projects in the Project Area

Many future foreseeable projects identified in **Cumulative Tables 2 and 3 (Cumulative Scenario Section)** are located within the east-central area of the Mojave Desert. Such projects could include ground disturbance to sufficient depth to encounter potential fossil-bearing strata. All projects on BLM land would be subject to paleontological monitoring and mitigation during construction. When properly implemented and enforced, these safeguards would provide adequate protection of paleontological resources, reducing potential impacts to a (CEQA) less than significant level.

Foreseeable Renewable Projects in the California Desert

As shown in the **Cumulative Scenario Section, Cumulative Scenario Table 1A**, the Palm Springs, California field office of the BLM is aware of 15 solar energy and 7 wind energy potential projects totaling 191,017 acres of land under their jurisdiction. All energy projects on BLM land would be subject to paleontological monitoring and mitigation during construction. When properly implemented and enforced, these safeguards would provide adequate protection of paleontological resources, reducing potential impacts to a (CEQA) less than significant level.

In addition to potential renewable energy projects on BLM land, a large number of renewable energy projects are proposed for the Basin and Range, Mojave and Colorado Desert regions of Southern California on State and private lands. These projects are summarized in **Table 1B** and **Table 3** of the **Cumulative Scenario** section. Of the numerous possible renewable energy projects within the geographic scope of this analysis, the following, by virtue of size and location, have the greatest potential to have an affect cumulative with RSEP on paleontological resources:

- Ward Valley-Leopold Solar Thermal Power Plant (8,000 acres)
- Clean Air Solar II Wind Farm (13,004 acres)
- Clean Air Solar III Wind Farm (21,688)
- Cadiz Lake Solar Geothermal Power Plant (35,639 acres)
- McCoy Solar Through Project (20,600 acres)
- Big Maria Solar Voltair Project (22,717 acres)

These projects would be subject to CEC and/or NEPA/CEQA environmental review which would include requirements for construction monitoring and mitigation of potential paleontological resources. When properly implemented and enforced, these safeguards should provide adequate protection of paleontological resources, reducing potential impacts to a (CEQA) less than significant level.

Contribution of the Rice Solar Energy Project to Cumulative Impacts

Construction

Construction of the project would require localized excavation over a very large area. Because the project area lies predominantly within geological units with high paleontological sensitivity near surface and increasing potential sensitivity with depth, the deeper excavations could, potentially, damage paleontological resources. Any damage could be cumulative to damage from other projects within the same geological formations. Implementation and enforcement of a properly designed Paleontological Resource Monitoring and Mitigation Plan (PRMMP) at this RSEP site should result in a net gain to the science of paleontology by allowing fossils that would not otherwise have been found, to be recovered, identified, studied, and preserved. Cumulative impacts from RSEP, in consideration with other nearby similar projects, should therefore be either neutral (no fossils encountered) or positive (fossils encountered, preserved, and identified).

Operation

The operation of the RSEP would not present additional risk to geological resources (none identified) or paleontological resources. Once ground disturbing activity is complete plant operation has no real potential to further affect paleontological resources. Therefore, routine plant operation would not increase potential cumulative affects on paleontological resources. The longer the plant operates, however, the more likely it is to be damaged by geological hazards, primarily earthquake-related ground shaking. Construction and operation of the plant does not increase the potential of geological hazards at the site, just their potential to damage civil improvements.

Decommissioning

The decommissioning of the Rice Solar Project is expected to result in no adverse impacts related to geology or paleontology. Any potential impact to geological resources (none identified) or paleontological resources would have occurred and been mitigated during the ground disturbing phase of project construction.

OVERALL CONCLUSION

Paleontological resources have been documented in the general area of the project. As the value of paleontological resources is associated with their discovery within a specific geological host unit, the potential impacts to paleontological resources due to construction activities will be mitigated as required by proposed Conditions of Certification **PAL-1** through **PAL-7**. Implementation of these conditions should result in a net gain to the science of paleontology by allowing fossils that would not otherwise have been found to be recovered, identified, studied, and preserved. Cumulative impacts, in consideration with other nearby similar projects, should be either neutral (no fossils encountered) or positive (fossils encountered, preserved, and identified).

Based on the above discussion, staff believes that the potential for significant adverse cumulative impacts to the proposed project from geological hazards during the project's design life is negligible and that the potential for impacts to geological, mineralogical, and paleontological resources is low.

The proposed conditions of certification allow the BLM Authorized Office and the Energy Commission CPM and the applicant to adopt a compliance monitoring scheme ensuring compliance with applicable LORS for geological hazards and geological, mineralogical, and paleontological resources.

COMPLIANCE WITH LORS

Federal, state, or local/county LORS applicable to this project or alternatives other than the No Action alternative, were detailed in **Geology, Paleontology and Minerals Table 1**. Staff anticipates that the project will comply with applicable LORS.

NOTEWORTHY PUBLIC BENEFITS

The science of paleontology is advanced by the discovery, study and curation of new fossils. These fossils can be significant if they represent a new species demonstrate known species in a new location and/or if they include structures of similar specimens that had not previously been found preserved in similar specimens. Most fossil discoveries are the result of excavations, either purposeful in known or suspected fossil localities or as the result of excavations made during earthwork for civil improvements or mineral extraction. Proper monitoring of excavations at the proposed RSEP facility, in accordance with an approved Paleontological Monitoring and Mitigation Plan, could result in fossil discoveries which would enhance our understanding of the prehistoric climate, geology, and geographic setting of the region for the benefit of current and future generations.

PROPOSED CONDITIONS OF CERTIFICATION

General conditions of certification with respect to engineering geology are proposed under Conditions of Certification **GEN-1, GEN-5, and CIVIL-1** in the **FACILITY DESIGN** section. Proposed paleontological conditions of certification follow. It is staff's opinion that the likelihood of encountering paleontologic resources is moderate at the plant site.

PAL-1 The project owner shall provide the CPM with the resume and qualifications of its PRS for review and approval. If the approved PRS is replaced prior to completion of project mitigation and submittal of the Paleontological Resources Report, the project owner shall obtain CPM approval of the replacement PRS. The project owner shall keep resumes on file for qualified paleontological resource monitors (PRMs). If a PRM is replaced, the resume of the replacement PRM shall also be provided to the CPM.

The PRS resume shall include the names and phone numbers of references. The resume shall also demonstrate to the satisfaction of the CPM the appropriate education and experience to accomplish the required

paleontological resource tasks.

As determined by the CPM, the PRS shall meet the minimum qualifications for a vertebrate paleontologist as described in the SVP guidelines of 1995. The experience of the PRS shall include the following:

1. Institutional affiliations, appropriate credentials, and college degree;
2. Ability to recognize and collect fossils in the field;
3. Local geological and biostratigraphic expertise;
4. Proficiency in identifying vertebrate and invertebrate fossils; and
5. At least three years of paleontological resource mitigation and field experience in California and at least one year of experience leading paleontological resource mitigation and field activities.

The project owner shall ensure that the PRS obtains qualified paleontological resource monitors to monitor as he or she deems necessary on the project. Paleontologic resource monitors shall have the equivalent of the following qualifications:

- BS or BA degree in geology or paleontology and one year of experience monitoring in California; or
- AS or AA in geology, paleontology, or biology and four years' experience monitoring in California; or
- Enrollment in upper division classes pursuing a degree in the fields of geology or paleontology and two years of monitoring experience in California.

Verification: (1) At least 60 days prior to the start of ground disturbance, the project owner shall submit a resume and statement of availability of its designated PRS for on-site work.

(2) At least 20 days prior to ground disturbance, the PRS or project owner shall provide a letter with resumes naming anticipated monitors for the project, stating that the identified monitors meet the minimum qualifications for paleontological resource monitoring required by the condition. If additional monitors are obtained during the project, the PRS shall provide additional letters and resumes to the CPM. The letter shall be provided to the CPM no later than one week prior to the monitor's beginning on-site duties.

(3) Prior to the termination or release of a PRS, the project owner shall submit the resume of the proposed new PRS to the CPM for review and approval.

PAL-2 The project owner shall provide to the PRS and the CPM, for approval, maps and drawings showing the footprint of the power plant, construction lay-down areas, and all related facilities. Maps shall identify all areas of the project where ground disturbance is anticipated. If the PRS requests enlargements or strip maps for linear facility routes, the project owner shall provide copies to the PRS and CPM. The site grading plan and plan and profile drawings for

the utility lines would be acceptable for this purpose. The plan drawings should show the location, depth, and extent of all ground disturbances and be at a scale between 1 inch = 40 feet and 1 inch = 100 feet. If the footprint of the project or its linear facilities changes, the project owner shall provide maps and drawings reflecting those changes to the PRS and CPM.

If construction of the project proceeds in phases, maps and drawings may be submitted prior to the start of each phase. A letter identifying the proposed schedule of each project phase shall be provided to the PRS and CPM. Before work commences on affected phases, the project owner shall notify the PRS and CPM of any construction phase scheduling changes.

At a minimum, the project owner shall ensure that the PRS or PRM consults weekly with the project superintendent or construction field manager to confirm area(s) to be worked the following week and until ground disturbance is completed.

Verification: (1) At least 30 days prior to the start of ground disturbance, the project owner shall provide the maps and drawings to the PRS and CPM.

(2) If there are changes to the footprint of the project, revised maps and drawings shall be provided to the PRS and CPM at least 15 days prior to the start of ground disturbance.

(3) If there are changes to the scheduling of the construction phases, the project owner shall submit a letter to the CPM within 5 days of identifying the changes.

PAL-3 The project owner shall ensure that the PRS prepares, and the project owner submits to the CPM for review and approval, a PRMMP to identify general and specific measures to minimize potential impacts to significant paleontological resources. Approval of the PRMMP by the CPM shall occur prior to any ground disturbance. The PRMMP shall function as the formal guide for monitoring, collecting, and sampling activities and may be modified with CPM approval. This document shall be used as the basis of discussion when on-site decisions or changes are proposed. Copies of the PRMMP shall reside with the PRS, each monitor, the project owner's on-site manager, and the CPM.

The PRMMP shall be developed in accordance with the guidelines of the SVP (1995) and shall include, but not be limited, to the following:

1. Assurance that the performance and sequence of project-related tasks, such as any literature searches, pre-construction surveys, worker environmental training, fieldwork, flagging or staking, construction monitoring, mapping and data recovery, fossil preparation and collection, identification and inventory, preparation of final reports, and transmittal of materials for curation will be performed according to PRMMP procedures;
2. Identification of the person(s) expected to assist with each of the tasks identified within the PRMMP and the conditions of certification;

3. A thorough discussion of the anticipated geologic units expected to be encountered, the location and depth of the units relative to the project when known, and the known sensitivity of those units based on the occurrence of fossils either in that unit or in correlative units;
4. An explanation of why, how, and how much sampling is expected to take place and in what units. Include descriptions of different sampling procedures that shall be used for fine-grained and coarse-grained units;
5. A discussion of the locations of where the monitoring of project construction activities is deemed necessary, and a proposed plan for monitoring and sampling;
6. A discussion of procedures to be followed in the event of a significant fossil discovery, halting construction, resuming construction, and how notifications will be performed;
7. A discussion of equipment and supplies necessary for collection of fossil materials and any specialized equipment needed to prepare, remove, load, transport, and analyze large-sized fossils or extensive fossil deposits;
8. Procedures for inventory, preparation, and delivery for curation into a retrievable storage collection in a public repository or museum, which meet the Society of Vertebrate Paleontology's standards and requirements for the curation of paleontological resources;
9. Identification of the institution that has agreed to receive data and fossil materials collected, requirements or specifications for materials delivered for curation and how they will be met, and the name and phone number of the contact person at the institution; and
10. A copy of the paleontological conditions of certification.

Verification: At least 30 days prior to ground disturbance, the project owner shall provide a copy of the PRMMP to the CPM. The PRMMP shall include an affidavit of authorship by the PRS and acceptance of the PRMMP by the project owner evidenced by a signature.

PAL-4 Prior to ground disturbance and for the duration of construction activities involving ground disturbance, the project owner and the PRS shall prepare and conduct weekly CPM-approved training for the following workers: project managers, construction supervisors, foremen, and general workers involved with or who operate ground-disturbing equipment or tools. Workers shall not excavate in sensitive units prior to receiving CPM-approved worker training. Worker training shall consist of an initial in-person PRS training during the project kick off for those mentioned above. Following initial training, a CPM-approved video or in-person training may be used for new employees. The training program may be combined with other training programs prepared for cultural and biological resources, hazardous materials, or other areas of interest or concern. No ground disturbance shall occur prior to CPM approval of the Worker Environmental Awareness Program (WEAP), unless specifically approved by the CPM.

The WEAP shall address the possibility of encountering paleontological resources in the field, the sensitivity and importance of these resources, and legal obligations to preserve and protect those resources.

The training shall include:

1. A discussion of applicable laws and penalties under the law;
2. Good quality photographs or physical examples of vertebrate fossils for project sites containing units of high paleontologic sensitivity;
3. Information that the PRS or PRM has the authority to halt or redirect construction in the event of a discovery or unanticipated impact to a paleontological resource;
4. Instruction that employees are to halt or redirect work in the vicinity of a find and to contact their supervisor and the PRS or PRM;
5. An informational brochure that identifies reporting procedures in the event of a discovery;
6. A WEAP certification of completion form signed by each worker indicating that he/she has received the training; and
7. A sticker that shall be placed on hard hats indicating that environmental training has been completed.

Verification: (1) At least 30 days prior to ground disturbance, the project owner shall submit the proposed WEAP, including the brochure, with the set of reporting procedures for workers to follow.

(2) At least 30 days prior to ground disturbance, the project owner shall submit the script and final video to the CPM for approval if the project owner is planning to use a video for interim training.

(3) If the owner requests an alternate paleontological trainer, the resume and qualifications of the trainer shall be submitted to the CPM for review and approval prior to installation of an alternate trainer. Alternate trainers shall not conduct training prior to CPM authorization.

(4) In the monthly compliance report (MCR), the project owner shall provide copies of the WEAP certification of completion forms with the names of those trained and the trainer or type of training (in-person or video) offered that month. The MCR shall also include a running total of all persons who have completed the training to date.

PAL-5 The project owner shall ensure that the PRS and PRM(s) monitor consistent with the PRMMP all construction-related grading, excavation, trenching, and augering in areas where potential fossil-bearing materials have been identified, both at the site and along any constructed linear facilities associated with the project. In the event that the PRS determines full-time monitoring is not necessary in locations that were identified as potentially

fossil bearing in the PRMMP, the project owner shall notify and seek the concurrence of the CPM.

The project owner shall ensure that the PRS and PRM(s) have the authority to halt or redirect construction if paleontological resources are encountered. The project owner shall ensure that there is no interference with monitoring activities unless directed by the PRS. Monitoring activities shall be conducted as follows:

1. Any change of monitoring from the accepted schedule in the PRMMP shall be proposed in a letter or email from the PRS and the project owner to the CPM prior to the change in monitoring and will be included in the monthly compliance report. The letter or email shall include the justification for the change in monitoring and be submitted to the CPM for review and approval.
2. The project owner shall ensure that the PRM(s) keep a daily monitoring log of paleontological resource activities. The PRS may informally discuss paleontological resource monitoring and mitigation activities with the CPM at any time.
3. The project owner shall ensure that the PRS notifies the CPM within 24 hours of the occurrence of any incidents of non-compliance with any paleontological resources conditions of certification. The PRS shall recommend corrective action to resolve the issues or achieve compliance with the conditions of certification.
4. For any significant paleontological resources encountered, either the project owner or the PRS shall notify the CPM within 24 hours, or Monday morning in the case of a weekend event, where construction has been halted because of a paleontological find.

The project owner shall ensure that the PRS prepares a summary of monitoring and other paleontological activities placed in the monthly compliance reports. The summary will include the name(s) of PRS or PRM(s) active during the month; general descriptions of training and monitored construction activities; and general locations of excavations, grading, and other activities. A section of the report shall include the geologic units or subunits encountered, descriptions of samplings within each unit, and a list of identified fossils. A final section of the report will address any issues or concerns about the project relating to paleontologic monitoring, including any incidents of non-compliance or any changes to the monitoring plan that have been approved by the CPM. If no monitoring took place during the month, the report shall include an explanation in the summary as to why monitoring was not conducted.

Verification: The project owner shall ensure that the PRS submits the summary of monitoring and paleontological activities in the MCR. When feasible, the CPM shall be notified 10 days in advance of any proposed changes in monitoring different from the plan identified in the PRMMP. If there is any unforeseen change in monitoring, the notice shall be given as soon as possible prior to implementation of the change.

PAL-6 The project owner, through the designated PRS, shall ensure that all components of the PRMMP are adequately performed including collection of fossil materials, preparation of fossil materials for analysis, analysis of fossils, identification and inventory of fossils, the preparation of fossils for curation, and the delivery for curation of all significant paleontological resource materials encountered and collected during project construction.

Verification: The project owner shall maintain in his/her compliance file copies of signed contracts or agreements with the designated PRS and other qualified research specialists. The project owner shall maintain these files for a period of three years after project completion and approval of the CPM-approved paleontological resource report (see Condition of Certification **PAL-7**). The project owner shall be responsible for paying any curation fees charged by the museum for fossils collected and curated as a result of paleontological mitigation. A copy of the letter of transmittal submitting the fossils to the curating institution shall be provided to the CPM.

PAL-7 The project owner shall ensure preparation of a Paleontological Resources Report (PRR) by the designated PRS. The PRR shall be prepared following completion of the ground-disturbing activities. The PRR shall include an analysis of the collected fossil materials and related information and submit it to the CPM for review and approval.

The report shall include, but is not limited to, a description and inventory of recovered fossil materials; a map showing the location of paleontological resources encountered; determinations of sensitivity and significance; and a statement by the PRS that project impacts to paleontological resources have been mitigated below the level of significance.

Verification: Within 90 days after completion of ground-disturbing activities, including landscaping, the project owner shall submit the PRR under confidential cover to the CPM.

Certification of Completion Worker Environmental Awareness Program Rice Solar Energy Project (08-AFC-10)

This is to certify these individuals have completed a mandatory California Energy Commission-approved Worker Environmental Awareness Program (WEAP). The WEAP includes pertinent information on cultural, paleontological, and biological resources for all personnel (that is, construction supervisors, crews, and plant operators) working on site or at related facilities. By signing below, the participant indicates that he/she understands and shall abide by the guidelines set forth in the program materials. Include this completed form in the Monthly Compliance Report.

ENGINEERING ASSESSMENT

FACILITY DESIGN

Testimony of Erin Bright

SUMMARY OF CONCLUSIONS

The California Energy Commission staff (staff) concludes that the design, construction, and eventual closure of the project and its linear facilities would likely comply with applicable engineering laws, ordinances, regulations and standards. The proposed conditions of certification, below, would ensure compliance with these laws, ordinances, regulations and standards.

INTRODUCTION

Facility design encompasses the civil, structural, mechanical, and electrical engineering design of the Rice Solar Energy Project (RSEP). The purpose of this analysis is to:

- Verify that the laws, ordinances, regulations and standards (LORS) that apply to the engineering design and construction of the project have been identified;
- Verify that both the project and its ancillary facilities are sufficiently described, including proposed design criteria and analysis methods, in order to provide reasonable assurance that the project will be designed and constructed in accordance with all applicable engineering LORS, in a manner that also ensures the public health and safety;
- Determine whether special design features should be considered during final design to address conditions unique to the site which could influence public health and safety; and
- Describe the design review and construction inspection process and establish the conditions of certification used to monitor and ensure compliance with the engineering LORS, in addition to any special design requirements.

Subjects discussed in this analysis include:

- Identification of the engineering LORS that apply to facility design;
- Evaluation of the applicant's proposed design criteria, including identification of criteria essential to public health and safety;
- Proposed modifications and additions to the application for certification (AFC) necessary for compliance with applicable engineering LORS; and
- Conditions of certification proposed by staff to ensure that the project will be designed and constructed to ensure public health and safety and comply with all applicable engineering LORS.

LAWS, ORDINANCES, REGULATIONS AND STANDARDS (LORS)

Lists of LORS applicable to each engineering discipline (civil, structural, mechanical, and electrical) are described in the AFC (SR2009a, Appendices 2C). Key LORS are listed in **Facility Design Table 1**, below:

FACILITY DESIGN Table 1
Key Engineering Laws, Ordinances, Regulations and Standards (LORS)

Applicable LORS	Description
Federal	Title 29 Code of Federal Regulations (CFR), Part 1910, Occupational Safety and Health standards
State	2007 (or the latest edition in effect) California Building Standards Code (CBSC) (also known as Title 24, California Code of Regulations)
Local	Riverside County regulations and ordinances
General	American National Standards Institute (ANSI) American Society of Mechanical Engineers (ASME) American Welding Society (AWS) American Society for Testing and Materials (ASTM)

PROPOSED PROJECT

SETTING AND EXISTING CONDITIONS

The Rice Solar Energy Project (RSEP) would be built on an approximately 1,410-acre site located in Riverside County. The project site lies in an area of low seismic activity. For more information about the site's seismic setting, please see the **Geology and Paleontology** section of this document. Also, for more information on the site and its related project description, please see the **Project Description** section of this document. Additional engineering design details are contained in the AFC, Appendix 2C (SR2009a).

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

The purpose of this analysis is to ensure that the project would be built to applicable engineering codes and ensure public health and life safety. This analysis further verifies that applicable engineering LORS have been identified and that the project and its ancillary facilities have been described in adequate detail. It also evaluates the applicant's proposed design criteria, describes the design review and construction inspection process, and establishes conditions of certification that would monitor and ensure compliance with engineering LORS and any other special design requirements. These conditions allow both the California Energy Commission (Energy Commission) compliance project manager (CPM) and the applicant to adopt a compliance monitoring scheme that will verify compliance with these LORS.

SITE PREPARATION AND DEVELOPMENT

Staff has evaluated the proposed design criteria for grading, flood protection, erosion control, site drainage, and site access, in addition to the criteria for designing and constructing linear support facilities such as natural gas and electric transmission interconnections. The applicant proposes the use of accepted industry standards (see SR2009a Appendix 2C, for a representative list of applicable industry standards), design practices, and construction methods in preparing and developing the site. Staff concludes that this project, including its linear facilities, would most likely comply with all applicable site preparation LORS, and proposes conditions of certification (see below and the **Geology and Paleontology** section of this document) to ensure that compliance.

MAJOR STRUCTURES, SYSTEMS, AND EQUIPMENT

Major structures, systems, and equipment are structures and their associated components or equipment that are necessary for power production, costly or time consuming to repair or replace, are used for the storage, containment, or handling of hazardous or toxic materials, or could become potential health and safety hazards if not constructed according to applicable engineering LORS. See condition of certification (**GEN-2**), below.

The RSEP shall be designed and constructed to the 2007 California Building Standards Code (CBSC), also known as Title 24, California Code of Regulations, which encompasses the California Building Code (CBC), California Building Standards Administrative Code, California Electrical Code, California Mechanical Code, California Plumbing Code, California Energy Code, California Fire Code, California Code for Building Conservation, California Reference Standards Code, and other applicable codes and standards in effect when the design and construction of the project actually begin. If the initial designs are submitted to the chief building official (CBO) for review and approval after the update to the 2007 CBSC takes effect, the 2007 CBSC provisions shall be replaced with the updated provisions.

In order to ensure that structures are analyzed according to their appropriate lateral force procedure, staff has included condition of certification **STRUC-1**, below, which, in part, requires the project CBO's review and approval of the owner's proposed lateral force procedures before construction begins.

Major structures as defined above, also include enclosures, tanks, pipes, gas lines, waterlines, septic systems, grading, and are required to comply with the engineering codes adopted by the State of California. Exempt work is listed under Section 105.2 in Appendix Chapter 1 of the CBC.

PROJECT QUALITY PROCEDURES

The project's AFC (SR2009a, AFC § 2.3.2.5) describes a quality program intended to inspire confidence that its systems and components will be designed, fabricated, stored, transported, installed, and tested in accordance with all appropriate power plant technical codes and standards. Compliance with design requirements will be verified through specific inspections and audits. Implementation of this quality assurance/quality

control (QA/QC) program will ensure that the RSEP is actually designed, procured, fabricated, and installed as described in this analysis.

COMPLIANCE MONITORING

Under Section 104.2 of the CBC, the CBO is authorized and directed to enforce all provisions of the CBC. The Energy Commission itself serves as the building official, and has the responsibility to enforce the code, for all of the energy facilities it certifies. In addition, the Energy Commission has the power to interpret the CBC and adopt and enforce both rules and supplemental regulations that clarify application of the CBC's provisions.

The Energy Commission's design review and construction inspection process conforms to CBC requirements and ensures that all facility design conditions of certification are met. As provided by Section 104.2.2 of the CBC, the Energy Commission appoints experts to perform design review and construction inspections and act as delegate CBOs on behalf of the Energy Commission. These delegates typically include the local building official and/or independent consultants hired to provide technical expertise that is not provided by the local official alone. The applicant, through permit fees provided by the CBC, pays the cost of these reviews and inspections. While building permits in addition to Energy Commission certification are not required for this project, the applicant pays in lieu of CBC permit fees to cover the costs of these reviews and inspections.

Engineering and compliance staff will invite Riverside County or a third-party engineering consultant to act as CBO for this project. When an entity has been assigned CBO duties, Energy Commission staff will complete a memorandum of understanding (MOU) with that entity to outline both its roles and responsibilities and those of its subcontractors and delegates.

Staff has developed proposed conditions of certification to ensure public health and safety and compliance with engineering design LORS. Some of these conditions address the roles, responsibilities, and qualifications of the engineers who will design and build the proposed project (conditions of certification **GEN-1** through **GEN-8**). These engineers must be registered in California and sign and stamp every submittal of design plans, calculations, and specifications submitted to the CBO. These conditions require that every element of the project's construction (subject to CBO review and approval) be approved by the CBO before it is performed. Items exempt from this requirement are listed in Section 105.2 of Appendix Chapter 1 of the CBC. They also require that qualified special inspectors perform or oversee special inspections required by all applicable LORS.

The Energy Commission and delegate CBO have the authority to allow some flexibility in scheduling construction activities on a case by case basis. The Energy Commission and the CBO also have the authority to interpret and accept alternate methods of construction and alternate materials.

CEQA LEVEL OF SIGNIFICANCE

As described in the **INTRODUCTION** above, the Facility Design section addresses LORS consistency and provides the agencies a vehicle for verifying compliance with these LORS during construction and operation of power generating facilities. This section is not intended to address environmental impacts under either CEQA or NEPA.

REDUCED ACREAGE ALTERNATIVE

The Reduced Acreage Alternative would be 7.2 percent smaller than the proposed project. It would be located in the same 2,560-acre square-shaped parcel within the larger 3,324-acre ownership property as the proposed project. Although the overall heliostat field distance from the central tower would be reduced, the number of heliostats would remain the same. The heliostat field (plus the evaporation pond and administration areas) would occupy about 1,270 acres instead of the 1,370 acres required for the proposed project. The receiver location would remain the same, with the edges of the field contracting towards the center. The heliostat footprint of the Reduced Acreage Alternative is shown in **Alternatives Figure 2**. The site layout, 653-foot total height of the solar tower and receiver, and transmission interconnection to Western's Parker-Blythe transmission line would be the same as the proposed project. The project's nominal 150 megawatts (MW) generation output would be reduced by approximately 2 MW.

Similar to the proposed project, the Reduced Acreage Alternative would transmit power to the grid through the planned Western substation to be located adjacent to Western's Parker Blythe #2 161 kilovolt (kV) transmission line. Under the Reduced Acreage Alternative, the agencies would approve a facility with a 7.2 percent heliostat field reduction and with a 148 MW capacity compared to the 150 MW project that is proposed.

Assessment of Impacts and Discussion of Mitigation

The Facility Design section is not intended to address environmental impacts under either CEQA or NEPA.

NORTH DESERT CENTER ALTERNATIVE

The North of Desert Center Alternative would be a 150 MW solar thermal facility located on approximately 2,643 acres of land. It is located along Desert Center Rice Road (State Route 177) east of Kaiser Road, north of Oasis Road, and approximately 1.6 miles north of I-10. The North of Desert Center Alternative is primarily private land with smaller sections of BLM land in the eastern portion of the site. It is largely fallow agricultural land. The existing SCE 161-kV transmission line (from the Blythe-2 substation to the Eagle Mountain-1 substation) that traverses the alternative site would be realigned to roughly follow the site boundary. A new 0.125-mile generation tie line (along Osborne Ave.) and substation would interconnect to the realigned SCE line at the northeast boundary of the site. The boundaries and transmission realignment of the North of Desert Center Alternative are illustrated in **Alternatives Figure 3**.

Assessment of Impacts and Discussion of Mitigation

The Facility Design section is not intended to address environmental impacts under either CEQA or NEPA.

SR 62/RICE VALLEY ROAD GENERATION TIE LINE ALTERNATIVE

The SR 62/Rice Valley Road Generation Tie Line Alternative would interconnect to Western Area Power Administration's (Western) 161-kV/230-kV Parker-Blythe #2 transmission line at the same location as the proposed project generation tie line. This alternative generation tie line would exit the proposed solar facility at the northeast corner and follow State Route 62 approximately 4.5 miles east to the junction of Rice Valley Road. It would then trend south to follow the unpaved Rice Valley Road for 4.0 miles to its juncture with the applicant's proposed new generation tie line alignment and continue southeast for 5.4 miles along the proposed alignment to Western's Parker-Blythe #2 transmission line. The SR 62/Rice Valley Road Generation Tie Line Alternative route is illustrated in **Alternatives Figure 4**.

Assessment of Impacts and Discussion of Mitigation

The Facility Design section is not intended to address environmental impacts under either CEQA or NEPA.

No Project / No Action Alternative

No Project and No Action on Rice Solar Energy Project transmission line application and interconnection request. No CDCA land use plan amendment.

Under this alternative, the proposed RSEP would not be approved by the Energy Commission; BLM would not approve the transmission line application and would not amend the CDCA Plan; and Western would not approve the interconnection request. As a result, no solar energy project would be constructed on the project site, BLM would continue to manage the land encompassing the transmission line consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended, and Western would continue to operate the Parker Blythe Transmission Line under current conditions.

Because there would be no amendment to the CDCA Plan and no solar project approved for the site under this alternative, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site. In the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations.

The Facility Design section is not intended to address environmental impacts under either CEQA or NEPA.

CUMULATIVE IMPACT ANALYSIS

The Facility Design section is not intended to address environmental impacts under either CEQA or NEPA.

COMPLIANCE WITH LORS

A detailed discussion of the proposed project's compliance with LORS applicable to facility design is provided above in the subsection Assessment of Impacts and Discussion of Mitigation.

NOTEWORTHY PUBLIC BENEFITS

Staff has not identified any noteworthy public benefits associated with this Facility Design section.

PROPOSED CONDITIONS OF CERTIFICATION/MITIGATION MEASURES

GEN-1 The project owner shall design, construct, and inspect the project in accordance with the 2007 (or the latest edition in effect when initial project engineering designs are submitted for review) California Building Standards Code (CBSC), also known as Title 24, California Code of Regulations, which encompasses the California Building Code (CBC), California Building Standards Administrative Code, California Electrical Code, California Mechanical Code, California Plumbing Code, California Energy Code, California Fire Code, California Code for Building Conservation, California Reference Standards Code, and all other applicable engineering LORS in effect at the time initial design plans are submitted to the CBO for review and approval (the CBSC in effect is the edition that has been adopted by the California Building Standards Commission and published at least 180 days previously). The project owner shall ensure that all the provisions of the above applicable codes are enforced during the construction, addition, alteration, moving, demolition, repair, or maintenance of the completed facility. All transmission facilities (lines, switchyards, switching stations and substations) are covered in the conditions of certification in the **Transmission System Engineering** section of this document.

In the event that the initial engineering designs are submitted to the CBO when the successor to the 2007 CBSC is in effect, the 2007 CBSC provisions shall be replaced with the applicable successor provisions. Where, in any specific case, different sections of the code specify different materials, methods of construction or other requirements, the most restrictive shall govern. Where there is a conflict between a general requirement and a specific requirement, the specific requirement shall govern.

The project owner shall ensure that all contracts with contractors, subcontractors, and suppliers clearly specify that all work performed and materials supplied comply with the codes listed above.

Then project owner shall submit plans, calculations and other related documents that have been specifically developed for the RSEP project

Verification: Five (5) days prior to requesting the issuance of the certificate of occupancy, the project owner shall submit to the CPM and the CBO a statement of verification, signed by the responsible design engineer, attesting that all designs, construction, installation, and inspection requirements of the applicable LORS and the Energy Commission's decision have been met in the area of facility design. The project owner shall provide the CPM a copy of the certificate of occupancy within 30 days of receipt from the CBO.

Once the certificate of occupancy has been issued, the project owner shall inform the CPM at least 30 days prior to any construction, addition, alteration, moving, demolition, repair, or maintenance to be performed on any portion(s) of the completed facility that requires CBO approval for compliance with the above codes. The CPM will then determine if the CBO needs to approve the work.

GEN-2 Before submitting the initial engineering designs for CBO review, the project owner shall furnish the CPM and the CBO with a schedule of facility design submittals, and master drawings and master specifications list. The master drawings and master specifications list shall contain a list of proposed submittal packages of designs, calculations, and specifications for major structures, systems, and equipment. Major structures, systems, and equipment are structures and their associated components or equipment that are necessary for power production, costly or time consuming to repair or replace, are used for the storage, containment, or handling of hazardous or toxic materials, or could become potential health and safety hazards if not constructed according to applicable engineering LORS. The schedule shall contain the planned date of each submittal to the CBO. To facilitate audits by Energy Commission staff, the project owner shall provide specific packages to the CPM upon request. In addition to the design submittals referenced above, plans and calculations for all construction work shall be submitted to the CBO for approval.

Verification: At least 60 days (or a project owner- and CBO-approved alternative time frame) prior to the start of rough grading, the project owner shall submit to the CBO and to the CPM the schedule, and the master drawings and master specifications list of documents to be submitted to the CBO for review and approval. These documents shall be the pertinent design documents for the major structures, systems, and equipment defined above in Condition of Certification **GEN-2**. Major structures and equipment shall be added to or deleted from the list only with CPM approval. The project owner shall provide schedule updates in the monthly compliance report.

GEN-3 The project owner shall make payments to the CBO for design review, plan checks, and construction inspections, based upon a reasonable fee schedule to be negotiated between the project owner and the CBO. These fees may be

based on hourly rates or the valuation of the facilities reviewed, or may be otherwise agreed upon by the project owner and the CBO. A copy of the contract between the owner and the CBO shall be submitted to the CPM for review and approval by staff.

Verification: The project owner shall make the required payments to the CBO in accordance with the agreement between the project owner and the CBO. The project owner shall send a copy of the CBO's receipt of payment to the CPM in the next monthly compliance report indicating that applicable fees have been paid. The CBO shall inform the CPM if the project owner has not met its obligations as specified in the agreement between the project owner and the CBO for payments related to CBO services.

GEN-4 Prior to the start of rough grading, the project owner shall assign a California-registered architect, or a structural or civil engineer, as the resident engineer (RE) in charge of the project. All transmission facilities (lines, switchyards, switching stations, and substations) are addressed in the conditions of certification in the **Transmission System Engineering** section of this document.

The RE shall be aware of construction activities at the project site at all times. However, he/she is not required to be physically present at the job site as long as the construction work is being performed as delegated below. The RE may delegate responsibility for portions of the project to other registered engineers. Registered mechanical and electrical engineers may be delegated responsibility for mechanical, plumbing, and electrical portions of the project, respectively. A registered civil engineer may be delegated responsibility for civil engineering aspects of the project such as grading, storm water pollution prevention practices (SWPPP), storm water management practices (SWMP), drainage, erosion, sedimentation control programs (DESCP) and similar aspects of civil engineering. A project may be divided into parts, provided that each part is clearly defined as a distinct unit. Separate assignments of general responsibility may be made for each designated part.

The RE or his/her delegate shall:

1. Monitor progress of construction work requiring CBO design review and inspection to ensure compliance with LORS;
2. Ensure that construction of all facilities subject to CBO design review and inspection conforms in every material respect to applicable LORS, these conditions of certification, approved plans, and specifications;
3. Prepare documents to initiate changes in approved drawings and specifications when either directed by the project owner or as required by the conditions of the project;
4. Be responsible for providing project inspectors and testing agencies with complete and up-to-date sets of stamped drawings, plans, specifications, and any other required documents;

5. Be responsible for the timely submittal of construction progress reports to the CBO from the project inspectors, the contractor, and other engineers who have been delegated responsibility for portions of the project; and
6. Be responsible for notifying the CBO of corrective action or the disposition of items noted on laboratory reports or other tests when they do not conform to CBO-approved plans and specifications.

The resident engineer (or his delegate) must be located at the project site, or be available at the project site within a reasonable period of time, during any hours in which construction takes place.

The RE shall have the authority to halt construction and to require changes or remedial work if the work does not meet requirements.

If the RE or the delegated engineers are reassigned or replaced, the project owner shall submit the name, qualifications and registration number of the newly assigned engineer to the CBO for review and approval. The project owner shall notify the CPM of the CBO's approval of the new engineer.

Verification: At least 30 days (or project owner- and CBO-approved alternative time frame) prior to the start of rough grading, the project owner shall submit to the CBO for review and approval, the resume and registration number of the RE and any other delegated engineers assigned to the project. The project owner shall notify the CPM of the CBO's approvals of the RE and other delegated engineer(s) within five days of the approval.

If the RE or the delegated engineer(s) is subsequently reassigned or replaced, the project owner has five days to submit the resume and registration number of the newly assigned engineer to the CBO for review and approval. The project owner shall notify the CPM of the CBO's approval of the new engineer within five days of the approval.

GEN-5 Prior to the start of rough grading, the project owner shall assign at least one of each of the following California registered engineers to the project: a civil engineer; a soils, geotechnical, or civil engineer experienced and knowledgeable in the practice of soils engineering; and an engineering geologist. Prior to the start of construction, the project owner shall assign at least one of each of the following California registered engineers to the project: a design engineer who is either a structural engineer or a civil engineer fully competent and proficient in the design of power plant structures and equipment supports; a mechanical engineer; and an electrical engineer. (California Business and Professions Code section 6704 et seq., and sections 6730, 6731 and 6736 require state registration to practice as a civil engineer or structural engineer in California). All transmission facilities (lines, switchyards, switching stations, and substations) are handled in the conditions of certification in the **Transmission System Engineering** section of this document.

The tasks performed by the civil, mechanical, electrical, or design engineers may be divided between two or more engineers, as long as each engineer is

responsible for a particular segment of the project (for example, proposed earthwork, civil structures, power plant structures, equipment support). No segment of the project shall have more than one responsible engineer. The transmission line may be the responsibility of a separate California registered electrical engineer.

The project owner shall submit, to the CBO for review and approval, the names, qualifications, and registration numbers of all responsible engineers assigned to the project.

If any one of the designated responsible engineers is subsequently reassigned or replaced, the project owner shall submit the name, qualifications and registration number of the newly assigned responsible engineer to the CBO for review and approval. The project owner shall notify the CPM of the CBO's approval of the new engineer.

A. The civil engineer shall:

1. Review the foundation investigations, geotechnical, or soils reports prepared by the soils engineer, the geotechnical engineer, or by a civil engineer experienced and knowledgeable in the practice of soils engineering;
2. Design (or be responsible for the design of), stamp, and sign all plans, calculations, and specifications for proposed site work, civil works, and related facilities requiring design review and inspection by the CBO. At a minimum, these include: grading, site preparation, excavation, compaction, construction of secondary containment, foundations, erosion and sedimentation control structures, drainage facilities, underground utilities, culverts, site access roads and sanitary sewer systems; and
3. Provide consultation to the RE during the construction phase of the project and recommend changes in the design of the civil works facilities and changes to the construction procedures.
4. Review, implement and monitor storm water pollution prevention practices (SWPPP).
5. Review, implement and monitor storm water management practices (SWMP).
6. Review, implement and monitor drainage, erosion, sedimentation control programs (DESCP).
7. Review, implement and monitor all other civil engineering (earthwork) aspects of the project.

- B. The soils engineer, geotechnical engineer, or civil engineer experienced and knowledgeable in the practice of soils engineering, shall:
1. Review all the engineering geology reports;
 2. Prepare the foundation investigations, geotechnical, or soils reports containing field exploration reports, laboratory tests, and engineering analysis detailing the nature and extent of the soils that could be susceptible to liquefaction, rapid settlement or collapse when saturated under load;
 3. Be present, as required, during site grading and earthwork to provide consultation and monitor compliance with requirements set forth in the CBC (depending on the site conditions, this may be the responsibility of either the soils engineer, the engineering geologist, or both); and
 4. Recommend field changes to the civil engineer and RE.

This engineer shall be authorized to halt earthwork and to require changes if site conditions are unsafe or do not conform to the predicted conditions used as the basis for design of earthwork or foundations.

C. The engineering geologist shall:

1. Review all the engineering geology reports and prepare a final soils grading report; and
2. Be present, as required, during site grading and earthwork to provide consultation and monitor compliance with the requirements set forth in the CBC (depending on the site conditions, this may be the responsibility of either the soils engineer, the engineering geologist, or both).

D. The design engineer shall:

1. Be directly responsible for the design of the proposed structures and equipment supports;
2. Provide consultation to the RE during design and construction of the project;
3. Monitor construction progress to ensure compliance with engineering LORS;
4. Evaluate and recommend necessary changes in design; and
5. Prepare and sign all major building plans, specifications, and calculations.

E. The mechanical engineer shall be responsible for, and sign and stamp a statement with, each mechanical submittal to the CBO, stating that the proposed final design plans, specifications, and calculations conform to all

of the mechanical engineering design requirements set forth in the Energy Commission's decision.

F. The electrical engineer shall:

1. Be responsible for the electrical design of the project; and
2. Sign and stamp electrical design drawings, plans, specifications, and calculations.

Verification: At least 30 days (or project owner- and CBO-approved alternative time frame) prior to the start of rough grading, the project owner shall submit to the CBO for review and approval, resumes and registration numbers of the responsible civil engineer, soils (geotechnical) engineer and engineering geologist assigned to the project.

At least 30 days (or project owner- and CBO-approved alternative time frame) prior to the start of construction, the project owner shall submit to the CBO for review and approval, resumes and registration numbers of the responsible design engineer, mechanical engineer, and electrical engineer assigned to the project.

The project owner shall notify the CPM of the CBO's approvals of the responsible engineers within five days of the approval.

If the designated responsible engineer is subsequently reassigned or replaced, the project owner has five days in which to submit the resume and registration number of the newly assigned engineer to the CBO for review and approval. The project owner shall notify the CPM of the CBO's approval of the new engineer within five days of the approval.

GEN-6 Prior to the start of an activity requiring special inspection, including prefabricated assemblies, the project owner shall assign to the project, qualified and certified special inspector(s) who shall be responsible for the special inspections required by the applicable edition of the CBC. All transmission facilities (lines, switchyards, switching stations, and substations) are handled in conditions of certification in the **Transmission System Engineering** section of this document.

A certified welding inspector, certified by the American Welding Society (AWS), and/or American Society of Mechanical Engineers (ASME) as applicable, shall inspect welding performed on-site requiring special inspection (including structural, piping, tanks and pressure vessels).

The special inspector shall:

1. Be a qualified person who shall demonstrate competence, to the satisfaction of the CBO, for inspection of the particular type of construction requiring special or continuous inspection;
2. Inspect the work assigned for conformance with the approved design drawings and specifications;

3. Furnish inspection reports to the CBO and RE. All discrepancies shall be brought to the immediate attention of the RE for correction, then, if uncorrected, to the CBO and the CPM for corrective action; and
4. Submit a final signed report to the RE, CBO, and CPM, stating whether the work requiring special inspection was, to the best of the inspector's knowledge, in conformance with the approved plans, specifications, and other provisions of the applicable edition of the CBC.

Verification: At least 15 days (or project owner- and CBO-approved alternative time frame) prior to the start of an activity requiring special inspection, the project owner shall submit to the CBO for review and approval, with a copy to the CPM, the name(s) and qualifications of the certified weld inspector(s), or other certified special inspector(s) assigned to the project to perform one or more of the duties set forth above. The project owner shall also submit to the CPM a copy of the CBO's approval of the qualifications of all special inspectors in the next monthly compliance report.

If the special inspector is subsequently reassigned or replaced, the project owner has five days in which to submit the name and qualifications of the newly assigned special inspector to the CBO for approval. The project owner shall notify the CPM of the CBO's approval of the newly assigned inspector within five days of the approval.

GEN-7 If any discrepancy in design and/or construction is discovered in any engineering work that has undergone CBO design review and approval, the project owner shall document the discrepancy and recommend required corrective actions. The discrepancy documentation shall be submitted to the CBO for review and approval. The discrepancy documentation shall reference this condition of certification and, if appropriate, applicable sections of the CBC and/or other LORS.

Verification: The project owner shall transmit a copy of the CBO's approval of any corrective action taken to resolve a discrepancy to the CPM in the next monthly compliance report. If any corrective action is disapproved, the project owner shall advise the CPM, within five days, of the reason for disapproval and the revised corrective action to obtain CBO's approval.

GEN-8 The project owner shall obtain the CBO's final approval of all completed work that has undergone CBO design review and approval. The project owner shall request the CBO to inspect the completed structure and review the submitted documents. The project owner shall notify the CPM after obtaining the CBO's final approval. The project owner shall retain one set of approved engineering plans, specifications, and calculations (including all approved changes) at the project site or at another accessible location during the operating life of the project. Electronic copies of the approved plans, specifications, calculations, and marked-up as-builts shall be provided to the CBO for retention by the CPM.

Verification: Within 15 days of the completion of any work, the project owner shall submit to the CBO, with a copy to the CPM, in the next monthly compliance report, (a) a written notice that the completed work is ready for final inspection, and (b) a signed statement that the work conforms to the final approved plans. After storing the final

approved engineering plans, specifications, and calculations described above, the project owner shall submit to the CPM a letter stating both that the above documents have been stored and the storage location of those documents.

Within 90 days of the completion of construction, the project owner shall provide to the CBO three sets of electronic copies of the above documents at the project owner's expense. These are to be provided in the form of "read only" (Adobe) files, with restricted (password-protected) printing privileges, on archive quality compact discs.

CIVIL-1 The project owner shall submit to the CBO for review and approval the following:

1. Design of the proposed drainage structures and the grading plan;
2. An erosion and sedimentation control plan;
3. An storm water pollution prevention plan (SWPPP);
4. Related calculations and specifications, signed and stamped by the responsible civil engineer; and
5. Soils, geotechnical, or foundation investigations reports required by the CBC.

Verification: At least 30 days (or project owner- and CBO-approved alternative time frame) prior to the start of site grading the project owner shall submit the documents described above to the CBO for design review and approval. In the next monthly compliance report following the CBO's approval, the project owner shall submit a written statement certifying that the documents have been approved by the CBO.

CIVIL-2 The resident engineer shall, if appropriate, stop all earthwork and construction in the affected areas when the responsible soils engineer, geotechnical engineer, or the civil engineer experienced and knowledgeable in the practice of soils engineering identifies unforeseen adverse soil or geologic conditions. The project owner shall submit modified plans, specifications, and calculations to the CBO based on these new conditions. The project owner shall obtain approval from the CBO before resuming earthwork and construction in the affected area.

Verification: The project owner shall notify the CPM within 24 hours, when earthwork and construction is stopped as a result of unforeseen adverse geologic/soil conditions. Within 24 hours of the CBO's approval to resume earthwork and construction in the affected areas, the project owner shall provide to the CPM a copy of the CBO's approval.

CIVIL-3 The project owner shall perform inspections in accordance with the CBC. All plant site-grading operations, for which a grading permit is required, shall be subject to inspection by the CBO.

If, in the course of inspection, it is discovered that the work is not being performed in accordance with the approved plans, the discrepancies shall be

reported immediately to the resident engineer, the CBO, and the CPM. The project owner shall prepare a written report, with copies to the CBO and the CPM, detailing all discrepancies, non-compliance items, and the proposed corrective action.

Verification: Within five days of the discovery of any discrepancies, the resident engineer shall transmit to the CBO and the CPM a non-conformance report (NCR), and the proposed corrective action for review and approval. Within five days of resolution of the NCR, the project owner shall submit the details of the corrective action to the CBO and the CPM. A list of NCRs, for the reporting month, shall also be included in the following monthly compliance report.

CIVIL-4 After completion of finished grading and erosion and sedimentation control and drainage work, the project owner shall obtain the CBO's approval of the final grading plans (including final changes) for the erosion and sedimentation control work. The civil engineer shall state that the work within his/her area of responsibility was done in accordance with the final approved plans.

Verification: Within 30 days (or project owner- and CBO-approved alternative time frame) of the completion of the erosion and sediment control mitigation and drainage work, the project owner shall submit to the CBO, for review and approval, the final grading plans (including final changes) and the responsible civil engineer's signed statement that the installation of the facilities and all erosion control measures were completed in accordance with the final approved combined grading plans, and that the facilities are adequate for their intended purposes, along with a copy of the transmittal letter to the CPM. The project owner shall submit a copy of the CBO's approval to the CPM in the next monthly compliance report.

STRUC-1 Prior to the start of any increment of construction, the project owner shall submit plans, calculations and other supporting documentation to the CBO for design review and acceptance for all project structures and equipment identified in the CBO-approved master drawing and master specifications list. The design plans and calculations shall include the lateral force procedures and details as well as vertical calculations.

Construction of any structure or component shall not begin until the CBO has approved the lateral force procedures to be employed in designing that structure or component.

The project owner shall:

1. Obtain approval from the CBO of lateral force procedures proposed for project structures;
2. Obtain approval from the CBO for the final design plans, specifications, calculations, soils reports, and applicable quality control procedures. If there are conflicting requirements, the more stringent shall govern (for example, highest loads, or lowest allowable stresses shall govern). All plans, calculations, and specifications for foundations that support structures shall be filed concurrently with the structure plans, calculations, and specifications;

3. Submit to the CBO the required number of copies of the structural plans, specifications, calculations, and other required documents of the designated major structures prior to the start of on-site fabrication and installation of each structure, equipment support, or foundation;
4. Ensure that the final plans, calculations, and specifications clearly reflect the inclusion of approved criteria, assumptions, and methods used to develop the design. The final designs, plans, calculations, and specifications shall be signed and stamped by the responsible design engineer; and
5. Submit to the CBO the responsible design engineer's signed statement that the final design plans conform to applicable LORS.

Verification: At least 60 days (or project owner- and CBO-approved alternative time frame) prior to the start of any increment of construction of any structure or component listed in the CBO-approved master drawing and master specifications list, the project owner shall submit to the CBO the above final design plans, specifications and calculations, with a copy of the transmittal letter to the CPM.

The project owner shall submit to the CPM, in the next monthly compliance report, a copy of a statement from the CBO that the proposed structural plans, specifications, and calculations have been approved and comply with the requirements set forth in applicable engineering LORS.

STRUC-2 The project owner shall submit to the CBO the required number of sets of the following documents related to work that has undergone CBO design review and approval:

1. Concrete cylinder strength test reports (including date of testing, date sample taken, design concrete strength, tested cylinder strength, age of test, type and size of sample, location and quantity of concrete placement from which sample was taken, and mix design designation and parameters);
2. Concrete pour sign-off sheets;
3. Bolt torque inspection reports (including location of test, date, bolt size, and recorded torques);
4. Field weld inspection reports (including type of weld, location of weld, inspection of non-destructive testing (NDT) procedure and results, welder qualifications, certifications, qualified procedure description or number (ref: AWS); and
5. Reports covering other structural activities requiring special inspections shall be in accordance with the CBC.

Verification: If a discrepancy is discovered in any of the above data, the project owner shall, within five days, prepare and submit an NCR describing the nature of the discrepancies and the proposed corrective action to the CBO, with a copy of the

transmittal letter to the CPM. The NCR shall reference the condition(s) of certification and the applicable CBC chapter and section. Within five days of resolution of the NCR, the project owner shall submit a copy of the corrective action to the CBO and the CPM.

The project owner shall transmit a copy of the CBO's approval or disapproval of the corrective action to the CPM within 15 days. If disapproved, the project owner shall advise the CPM, within five days, the reason for disapproval, and the revised corrective action to obtain CBO's approval.

STRUC-3 The project owner shall submit to the CBO design changes to the final plans required by the CBC, including the revised drawings, specifications, calculations, and a complete description of, and supporting rationale for, the proposed changes, and shall give to the CBO prior notice of the intended filing.

Verification: On a schedule suitable to the CBO, the project owner shall notify the CBO of the intended filing of design changes, and shall submit the required number of sets of revised drawings and the required number of copies of the other above-mentioned documents to the CBO, with a copy of the transmittal letter to the CPM. The project owner shall notify the CPM, via the monthly compliance report, when the CBO has approved the revised plans.

STRUC-4 Tanks and vessels containing quantities of toxic or hazardous materials exceeding amounts specified in the CBC shall, at a minimum, be designed to comply with the requirements of that chapter.

Verification: At least 30 days (or project owner- and CBO-approved alternate time frame) prior to the start of installation of the tanks or vessels containing the above specified quantities of toxic or hazardous materials, the project owner shall submit to the CBO for design review and approval final design plans, specifications, and calculations, including a copy of the signed and stamped engineer's certification.

The project owner shall send copies of the CBO approvals of plan checks to the CPM in the following monthly compliance report. The project owner shall also transmit a copy of the CBO's inspection approvals to the CPM in the monthly compliance report following completion of any inspection.

MECH-1 The project owner shall submit, for CBO design review and approval, the proposed final design, specifications and calculations for each plant major piping and plumbing system listed in the CBO-approved master drawing and master specifications list. The submittal shall also include the applicable QA/QC procedures. Upon completion of construction of any such major piping or plumbing system, the project owner shall request the CBO's inspection approval of that construction.

The responsible mechanical engineer shall stamp and sign all plans, drawings, and calculations for the major piping and plumbing systems, subject to CBO design review and approval, and submit a signed statement to the CBO when the proposed piping and plumbing systems have been designed, fabricated, and installed in accordance with all of the applicable

laws, ordinances, regulations and industry standards, which may include, but are not limited to:

- American National Standards Institute (ANSI) B31.1 (Power Piping Code);
- ANSI B31.2 (Fuel Gas Piping Code);
- ANSI B31.3 (Chemical Plant and Petroleum Refinery Piping Code);
- ANSI B31.8 (Gas Transmission and Distribution Piping Code);
- Title 24, California Code of Regulations, Part 5 (California Plumbing Code);
- Title 24, California Code of Regulations, Part 6 (California Energy Code, for building energy conservation systems and temperature control and ventilation systems);
- Title 24, California Code of Regulations, Part 2 (California Building Code); and
- Riverside County codes.

The CBO may deputize inspectors to carry out the functions of the code enforcement agency.

Verification: At least 30 days (or project owner- and CBO-approved alternative time frame) prior to the start of any increment of major piping or plumbing construction listed in the CBO-approved master drawing and master specifications list, the project owner shall submit to the CBO for design review and approval the final plans, specifications, and calculations, including a copy of the signed and stamped statement from the responsible mechanical engineer certifying compliance with applicable LORS, and shall send the CPM a copy of the transmittal letter in the next monthly compliance report.

The project owner shall transmit to the CPM, in the monthly compliance report following completion of any inspection, a copy of the transmittal letter conveying the CBO's inspection approvals.

MECH-2 For all pressure vessels installed in the plant, the project owner shall submit to the CBO and California Occupational Safety and Health Administration (Cal-OSHA), prior to operation, the code certification papers and other documents required by applicable LORS. Upon completion of the installation of any pressure vessel, the project owner shall request the appropriate CBO and/or Cal-OSHA inspection of that installation.

The project owner shall:

1. Ensure that all boilers and fired and unfired pressure vessels are designed, fabricated, and installed in accordance with the appropriate section of the American Society of Mechanical Engineers (ASME) Boiler and Pressure Vessel Code, or other applicable code. Vendor certification, with identification of applicable code, shall be submitted for prefabricated vessels and tanks; and

2. Have the responsible design engineer submit a statement to the CBO that the proposed final design plans, specifications, and calculations conform to all of the requirements set forth in the appropriate ASME Boiler and Pressure Vessel Code or other applicable codes.

Verification: At least 30 days (or project owner- and CBO-approved alternative time frame) prior to the start of on-site fabrication or installation of any pressure vessel, the project owner shall submit to the CBO for design review and approval, the above listed documents, including a copy of the signed and stamped engineer's certification, with a copy of the transmittal letter to the CPM.

The project owner shall transmit to the CPM, in the monthly compliance report following completion of any inspection, a copy of the transmittal letter conveying the CBO's and/or Cal-OSHA inspection approvals.

MECH-3 The project owner shall submit to the CBO for design review and approval the design plans, specifications, calculations, and quality control procedures for any heating, ventilating, air conditioning (HVAC) or refrigeration system. Packaged HVAC systems, where used, shall be identified with the appropriate manufacturer's data sheets.

The project owner shall design and install all HVAC and refrigeration systems within buildings and related structures in accordance with the CBC and other applicable codes. Upon completion of any increment of construction, the project owner shall request the CBO's inspection and approval of that construction. The final plans, specifications and calculations shall include approved criteria, assumptions, and methods used to develop the design. In addition, the responsible mechanical engineer shall sign and stamp all plans, drawings and calculations and submit a signed statement to the CBO that the proposed final design plans, specifications and calculations conform with the applicable LORS.

Verification: At least 30 days (or project owner- and CBO-approved alternative time frame) prior to the start of construction of any HVAC or refrigeration system, the project owner shall submit to the CBO the required HVAC and refrigeration calculations, plans, and specifications, including a copy of the signed and stamped statement from the responsible mechanical engineer certifying compliance with the CBC and other applicable codes, with a copy of the transmittal letter to the CPM.

ELEC-1 Prior to the start of any increment of electrical construction for all electrical equipment and systems 480 Volts or higher (see a representative list, below), with the exception of underground duct work and any physical layout drawings and drawings not related to code compliance and life safety, the project owner shall submit, for CBO design review and approval, the proposed final design, specifications, and calculations. Upon approval, the above listed plans, together with design changes and design change notices, shall remain on the site or at another accessible location for the operating life of the project. The project owner shall request that the CBO inspect the installation to ensure compliance with the requirements of applicable LORS. All transmission facilities (lines, switchyards, switching stations, and

substations) are handled in conditions of certification in the **Transmission System Engineering** section of this document.

A. Final plant design plans shall include:

1. one-line diagrams for the 13.8 kV, 4.16 kV and 480 V systems; and
2. system grounding drawings.

B. Final plant calculations must establish:

1. short-circuit ratings of plant equipment;
2. ampacity of feeder cables;
3. voltage drop in feeder cables;
4. system grounding requirements;
5. coordination study calculations for fuses, circuit breakers and protective relay settings for the 13.8 kV, 4.16 kV and 480 V systems;
6. system grounding requirements; and
7. lighting energy calculations.

C. The following activities shall be reported to the CPM in the monthly compliance report:

1. Receipt or delay of major electrical equipment;
2. Testing or energization of major electrical equipment; and
3. A signed statement by the registered electrical engineer certifying that the proposed final design plans and specifications conform to requirements set forth in the Energy Commission decision.

Verification: At least 30 days (or project owner- and CBO-approved alternative time frame) prior to the start of each increment of electrical construction, the project owner shall submit to the CBO for design review and approval the above listed documents. The project owner shall include in this submittal a copy of the signed and stamped statement from the responsible electrical engineer attesting compliance with the applicable LORS, and shall send the CPM a copy of the transmittal letter in the next monthly compliance report.

CONCLUSIONS AND RECOMMENDATIONS

1. The laws, ordinances, regulations and standards (LORS) identified in the AFC and supporting documents directly apply to the project.

2. Staff has evaluated the proposed engineering LORS, design criteria, and design methods in the record, and concludes that the design, construction, and eventual closure of the project will likely comply with applicable engineering LORS.
3. The proposed conditions of certification will ensure that RSEP is designed and constructed in accordance with applicable engineering LORS. This will be accomplished through design review, plan checking, and field inspections that will be performed by the CBO or other Energy Commission delegate. Staff will audit the CBO to ensure satisfactory performance.
4. Though future conditions that could affect decommissioning are largely unknown at this time, it can reasonably be concluded that if, the project owner submits a decommissioning plan as required in the **General Conditions** portion of this document prior to decommissioning, decommissioning procedures will comply with all applicable engineering LORS.

Energy Commission staff recommends that:

1. The proposed conditions of certification be adopted to ensure that the project is designed and constructed in a manner that protects the public health and safety and complies with all applicable engineering LORS;
2. The project be designed and built to the 2007 CBSC (or successor standards, if in effect when initial project engineering designs are submitted for review) and other applicable codes adopted by the State of California; and
3. The CBO reviews the final designs, checks plans, and performs field inspections during construction. Energy Commission staff shall audit and monitor the CBO to ensure satisfactory performance.

Power Plant Efficiency

Testimony of Shahab Khoshmashrab

SUMMARY OF CONCLUSIONS

The Rice Solar Energy Project (RSEP), if constructed and operated as proposed, would use solar energy to generate most of its capacity. Insignificant amounts of fossil fuel, in the form of propane, would be used only for initial salt melting. The project's expected overall annual energy production rate is approximately 450,000 MW hours (MWh), all of which would be produced using a renewable resource, the sunlight.

The project would decrease reliance on fossil fuel, and would increase reliance on renewable energy resources. It would not create significant adverse effects on fossil fuel energy supplies or resources, would not require additional sources of energy supply, and would not consume fossil fuel energy in a wasteful or inefficient manner. No efficiency standards apply to this project. Energy Commission staff therefore concludes that this project would present no significant adverse impacts on fossil fuel energy resources.

The Rice Solar Power Project, if constructed and operated as proposed, would occupy approximately nine acres per MW of power output.

INTRODUCTION

The RSEP, if constructed and operated as proposed, would generate 150 megawatts (MW) (nominal net output) of electricity. Rice Solar would be a solar thermal power plant in Riverside County, California. The project would use the concentrating solar thermal technology, consisting of a large circular field of heliostats (mirrors) that reflect the sun's energy onto a central receiver tower to produce electrical power using a steam turbine generator fed from solar steam generators. The land that would be occupied by this project for power generation and power plant operation would be approximately a 1,410-acre site. Liquid salt would be used as the heat transfer fluid; it would be circulated through the receiver to collect the sun's heat.

LAWS, ORDINANCES, REGULATIONS AND STANDARDS (LORS)

Presently, there are no laws, ordinances, regulations or standards (LORS) that apply to power plant efficiency.

METHODOLOGY AND THRESHOLDS FOR DETERMINING ENVIRONMENTAL CONSEQUENCES

CEQA METHODOLOGY AND THRESHOLD

CEQA guidelines state that the environmental analysis "...shall describe feasible measures which could minimize significant adverse impacts, including where relevant, inefficient and unnecessary consumption of energy" (Title 14 CCR §15126.4[a][1]).

Appendix F of the guidelines further suggests consideration of such factors as the project's energy requirements and energy use efficiency; its effects on local and regional energy supplies and energy resources; its requirements for additional energy supply capacity; its compliance with existing energy standards; and any alternatives that could reduce the wasteful, inefficient, and unnecessary consumption of energy (Title 14, CCR §15000 et seq., Appendix F).

The inefficient and unnecessary consumption of energy, in the form of non-renewable fuels such as natural gas and oil, constitutes an adverse environmental impact. An adverse impact can be considered significant if it results in:

- adverse effects on local and regional energy supplies and energy resources;
- a requirement for additional energy supply capacity;
- noncompliance with existing energy standards; or
- the wasteful, inefficient, and unnecessary consumption of fuel or energy.

METHOD FOR DETERMINING EFFICIENCY

Fossil fuel use efficiency

One of the responsibilities of the California Energy Commission (Energy Commission) is to make findings on whether the energy use by a power plant, including the proposed Rice Solar project, would result in significant adverse impacts on the environment, as defined in the California Environmental Quality Act (CEQA). If the Energy Commission finds that Rice Solar's energy consumption creates a significant adverse impact, it must further determine if feasible mitigation measures could eliminate or minimize that impact. In this analysis, staff addresses the inefficient and unnecessary consumption of energy.

In order to develop the Energy Commission's findings, this analysis will:

- examine whether the facility would likely present any adverse impacts upon energy resources;
- examine whether these adverse impacts are significant; and if so,
- examine whether feasible mitigation measures or alternatives could eliminate those adverse impacts or reduce them to a level of insignificance.

Solar land use efficiency

Solar thermal power plants typically consume much less fossil fuel (usually in the form of natural gas) than other types of thermal power plants. Therefore, common measures of power plant efficiency such as those described above are less meaningful. Solar power plants do occupy vast tracts of land, so, the focus for these types of facilities shifts from fuel efficiency to land use efficiency. To analyze the land use efficiency of a solar facility staff utilizes the following approach.

Solar thermal power plants convert the sun's energy into electricity in three basic steps:

- Mirrors and/or collectors capture the sun's rays.

- This solar energy is converted into heat.
- This heat is converted into electricity, typically in a heat engine such as a steam turbine generator or a Stirling Engine-powered generator.

The effectiveness of each of these steps depends on the specific technology employed; the product of these three steps determines the power plant's overall solar efficiency. The greater the project's solar efficiency, the less land the plant must occupy to produce a given power output.

The most significant environmental impacts caused by solar power plants result from occupying large expanses of land. The extent of these impacts is likely in direct proportion to the number of acres affected. For this reason, staff will evaluate the land use efficiency of proposed solar power plant projects. This efficiency will be expressed in terms of power produced, or MW per acre, and in terms of energy produced, or MW-hours per acre-year. Specifically:

- Power-based solar land use efficiency is calculated by dividing the maximum net power output in MW by the total number of acres impacted by the power plant, including roads and electrical switchyards and substations.
- Energy-based solar land use efficiency is calculated by dividing the annual net electrical energy production in MW-hours per year by the total number of acres impacted by the power plant. Since different solar technologies consume differing quantities of natural gas for morning warm-up, cloudy weather output leveling and heat transfer fluid freeze protection (and some consume no gas at all), this effect is accounted for. Specifically, gas consumption is backed out by reducing the plant's net energy output by the amount of energy that could have been produced by consuming the project's annual gas consumption in a modern combined cycle power plant. (See **Efficiency Appendix A**, immediately following.) This reduced energy output is then divided by acres impacted.

PROPOSED PROJECT

SETTING AND EXISTING CONDITIONS

The applicant proposes to build and operate Rice Solar, a solar thermal power plant producing a total of 150 MW (nominal net output) and employing the concentrating solar thermal technology. The project would consist of one power plant unit comprised of arrays of mirrors, a central receiver tower, solar steam generator heat exchangers, a steam turbine generator, and an air cooled condenser (SR 2009a, AFC §§ 1.0, 2.1).

The project's power cycle would be based on a steam cycle (also known as the Rankine cycle) (SR 2009a, AFC § 2.2.2). The solar steam generator heat exchangers would receive heated heat transfer fluid from the solar thermal equipment, comprised of arrays of mirrors that reflect energy from the sun to a central solar receiver tower. The heated heat transfer fluid would be used to generate steam in the solar steam generator heat exchangers. This steam would then expand through the steam turbine generators to produce electrical power.

Liquid salt would be used as the heat transfer fluid. Liquid salt has inherent thermal energy storage properties, has greater heat retention capacity and can operate at far higher operating temperatures than alternatives such as synthetic oil.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Project Energy Requirements and Energy Use Efficiency

Rice Solar would consume no fossil fuel for power generation and would use insignificant amounts of propane for initial salt melting.

The applicant estimates an average overall steam cycle efficiency of 38.7 percent for Rice Solar (SR 2009b, § 1.0). There are currently no legal or industry standards for measuring the efficiency of solar thermal power plants (CEC 2008d). Therefore, staff compares the steam cycle efficiency of Rice Solar to the average efficiency of the typical modern steam turbines currently available in the market. The efficiency figures for these turbines range from 35 percent to 40 percent. The project's thermal efficiency of 38.7 percent is comparable to this industry figure.

Therefore, staff considers the impact of the project's fuel consumption on energy supplies and energy efficiency to be less than significant.

Adverse Effects on Energy Supplies and Resources

The applicant has described its sources of propane for the project (SR 2009a, AFC § 2.2.4 and § 4.0). Propane is normally created as a by-product of petroleum refining and from natural gas production. Petroleum products and natural gas (with California's access to natural gas resources from the Rocky Mountains, Canada and the southwest) represent considerable energy resources in California. Propane supplies in California amount to approximately 630 million gallons per year from refineries alone. This is only about 60 percent of California's total propane supply. Only small amounts of propane would be consumed by the project. Therefore, it appears highly unlikely that the project would create a substantial increase in fossil fuel demand.

Additional Energy Supply Requirements

There appears to be no real likelihood that RSEP would require the development of additional energy supply capacity (see above in **Adverse Effects on Energy Supplies and Resources**).

Compliance with Energy Standards

No standards apply to the efficiency of Rice Solar or other non-cogeneration projects.

Alternatives to Reduce Wasteful, Inefficient, and Unnecessary Energy Consumption

Staff typically evaluates the project alternatives to determine if alternatives exist that could reduce the project's fuel use. The evaluation of alternatives to the project (that could reduce wasteful, inefficient, or unnecessary energy consumption) requires the examination of the project's energy consumption.

Efficiency of Alternatives to the Project

Please see the project alternatives discussed below.

Alternative Generating Technologies

Alternative generating technologies for RSEP are considered in the AFC (SR 2009a, AFC § 6.7) and in the Alternatives section of this SA/DEIS. For purposes of this analysis, natural gas, oil, coal, nuclear, geothermal, biomass, hydroelectric, wind, solar photovoltaic and other solar thermal technologies were all considered. Because this project would consume no fossil fuel for power production, staff believes that the Rice Solar project would not constitute a significant adverse impact on fossil fuel energy resources compared to feasible alternatives.

The solar insolation falling on the earth's surface can be regarded as an energy resource. Since this energy is inexhaustible, its consumption does not present the concerns inherent in fossil fuel consumption. What is of concern, however, is the extent of land area required to capture this solar energy and convert it to electricity. Setting aside hundreds or thousands of acres of land for solar power generation removes it from alternative uses.

To assess the Rice Solar's land use efficiency staff proposes to compare the land use efficiency of the solar projects currently before the Commission to the Rice Solar. This comparison will help determine a range of viable efficiencies and where the Rice Solar falls.

There are currently several solar power plant projects that have progressed significantly through the Energy Commission siting process. These projects' power and energy output, and the extent of the land occupied by them, are summarized in **Efficiency Table 1**, below. The solar land use efficiency for a typical natural gas-fired combined cycle power plant is shown only for comparison.

Rice Solar would produce power at the rate of 150 MW net, and would generate energy at the rate of 450,000 MW-hours net per year, while occupying 1,400 acres (SR 2009a, AFC §§ 2.0, 2.1, 2.2.1).

Staff calculates power-based land use efficiency thus:

Power-based efficiency: $150 \text{ MW} \div 1,400 \text{ acres} = 0.11 \text{ MW/acre}$ or **9.0 acres/MW**

Staff calculates energy-based land use efficiency thus:

Energy-based efficiency: $450,000 \text{ MWh/year} \div 1,400 \text{ acres} = 321 \text{ MWh/acre-year}$

As seen in **Efficiency Table 1**, RSEP, employing the power tower technology, is slightly less efficient in use of land than the Beacon Solar, Ridgecrest Solar, Blythe Solar, and Palen Solar projects, which use the linear parabolic trough technology. Rice Solar is as efficient in use of land as the Ivanpah SEGS project, which employs the same technology, and the Calico Solar and the SES Solar Two projects, which use the Stirling Engine technology.

Alternatives to Reduce Solar Land Use Impacts

Building and operating a natural gas-fired combined cycle power plant would yield much greater land use efficiency than any solar power plant; see **Efficiency Table 1**.

However, this would not achieve the basic project objective, to generate electricity from the renewable energy of the sun and would not further the state's renewable energy development and green-house gas reduction goals.

Building a solar power plant employing a different technology, such as the linear parabolic trough technology, would slightly increase the solar land use efficiency of Rice Solar.

Efficiency Table 1 — Solar Land Use Efficiency

Project	Generating Capacity (MW net)	Annual Energy Production (MWh net)	Annual Fuel Consumption (MMBtu LHV)	Footprint (Acres)	Land Use Efficiency (Power-Based) (MW/acre)	Land Use Efficiency (Energy – Based) (MWh/acre-year)	
						Total	Solar Only ¹
Rice Solar (09-AFC-10)	150	450,000	0	1,400	0.11	321	321
Calico Solar (08-AFC-13)	850	1,840,000	0	8,230	0.10	224	224
Beacon Solar (08-AFC-2)	250	600,000	36,000	1,240	0.20	484	480
Ivanpah SEGS (07-AFC-5)	400	960,000	432,432	3,744	0.11	256	238
Abengoa Solar (09-AFC-5)	250	630,000	94,280	1,420	0.18	444	434
Blythe Solar (09-AFC-6)	1000	2,100,000	207,839	5,950	0.17	353	348
Palen Solar (09-AFC-7)	500	1,000,000	103,919	2,970	0.17	337	332
Genesis Solar (09-AFC-8)	250	600,000	60,000	1,800	0.14	333	329
Ridgecrest Solar (09-AFC-9)	250	500,000	51,960	1,440	0.17	347	342
San Joaquin Solar Hybrid (08-AFC-12)	106	774,000	5,899,500	640	0.17	1209	415
Avenal Energy (08-AFC-1) ²	600	3,023,388	24,792,786	25	24.0	120,936	N/A

¹ Net energy output is reduced by natural gas-fired combined cycle proxy energy output; see **Efficiency Appendix A**.

² Example natural gas-fired combined cycle plant.

Alternative Heat Rejection System

The applicant proposes to employ a dry cooling system (air-cooled condensers) as the means for rejecting power cycle heat from the steam turbine (SR 2009a, AFC §§ 1.0, 2.2.2.6). An alternative heat rejection system would utilize evaporative cooling towers.

The local climate in the project area is characterized by high temperatures and low relative humidity (low wet-bulb temperature). In low temperatures and high relative humidity (low dry-bulb temperature), the air-cooled condenser performs relatively efficiently compared to the evaporative tower. However, at the project area (low wet-bulb temperature and high dry-bulb temperature) the air-cooled condenser performance is relatively poor compared to that of an evaporative cooling tower. Furthermore, the performance of the heat rejection system affects the performance of the steam turbine, impacting turbine efficiency. However, to conserve water in the project site's desert environment, the applicant proposes to employ dry cooling for steam condensation, and minimal water would be used for cooling the turbine-generator lubricating oil system. Even though evaporative cooling could offer greater efficiency, staff believes the applicant's selection of dry cooling is a reasonable tradeoff as it would prevent potentially significant environmental impacts that could result from consumption of the large quantities of water required by wet cooling (see **Soil and Water Resources** section of this document).

REDUCED ACREAGE ALTERNATIVE

The Reduced Acreage Alternative would be 7.2 percent smaller than the proposed project. It would be located in the same 2,560-acre square-shaped parcel within the larger 3,324-acre ownership property as the proposed project. Although the overall heliostat field distance from the central tower would be reduced, the number of heliostats would remain the same. The heliostat field (plus the evaporation pond and administration areas) would occupy about 1,270 acres instead of the 1,370 acres required for the proposed project. The receiver location would remain the same, with the edges of the field contracting towards the center. The heliostat footprint of the Reduced Acreage Alternative is shown in **Alternatives Figure 2**. The site layout, 653-foot total height of the solar tower and receiver, and transmission interconnection to Western's Parker-Blythe transmission line would be the same as the proposed project. The project's nominal 150 megawatts (MW) generation output would be reduced by approximately 2 MW.

Similar to the proposed project, the Reduced Acreage Alternative would transmit power to the grid through the planned Western substation to be located adjacent to Western's Parker Blythe #2 161 kilovolt (kV) transmission line. Under the Reduced Acreage Alternative, the agencies would approve a facility with a 7.2 percent heliostat field reduction and with a 148 MW capacity compared to the 150 MW project that is proposed.

Setting and Existing Conditions

The setting for the Reduced Acreage Alternative is the same as for the proposed project with the exception of the changes addressed above.

Assessment of Impacts and Discussion of Mitigation

The reduction in power output would not affect the consumption of fossil fuel; as with the original project, the fossil fuel impact would be insignificant as no fossil fuel is needed to produce power. The land-use efficiency would not substantially change because the size of the land to be occupied by the facility (power block and solar field) and the power output would be reduced proportionally.

NORTH OF DESERT CENTER ALTERNATIVE

The North of Desert Center Alternative would be a 150 MW solar thermal facility located on approximately 2,643 acres of land. It is located along Desert Center Rice Road (State Route 177) east of Kaiser Road, north of Oasis Road, and approximately 1.6 miles north of I-10. The North of Desert Center Alternative is primarily private land with smaller sections of BLM land in the eastern portion of the site. It is largely fallow agricultural land. The existing SCE 161-kV transmission line (from the Blythe-2 substation to the Eagle Mountain-1 substation) that traverses the alternative site would be realigned to roughly follow the site boundary. A new 0.125-mile generation tie line (along Osborne Ave.) and substation would interconnect to the realigned SCE line at the northeast boundary of the site. The boundaries and transmission realignment of the North of Desert Center Alternative are illustrated in **Alternatives Figure 3**.

Setting and Existing Conditions

The setting and existing conditions at the North of Desert Center Alternative site as related to Power Plant Efficiency would be similar to the proposed project.

Assessment of Impacts and Discussion of Mitigation

The power output would be the same as the proposed project and would likely result in the same amounts of fossil fuel to be consumed for the initial salt melting; as with the original project, the fossil fuel impact would be insignificant. The land-use efficiency would not change because likely both, the size of the land to be occupied by the facility (power block and solar field) and the power output would be the same.

SR 62/RICE VALLEY ROAD GENERATION TIE LINE ALTERNATIVE

The SR 62/Rice Valley Road Generation Tie Line Alternative would interconnect to Western Area Power Administration's (Western) 161-kV/230-kV Parker-Blythe #2 transmission line at the same location as the proposed project generation tie line. This alternative generation tie line would exit the proposed solar facility at the northeast corner and follow State Route 62 approximately 4.5 miles east to the junction of Rice Valley Road. It would then trend south to follow the unpaved Rice Valley Road for 4.0

miles to its juncture with the applicant's proposed new generation tie line alignment and continue southeast for 5.4 miles along the proposed alignment to Western's Parker-Blythe #2 transmission line. The SR 62/Rice Valley Road Generation Tie Line Alternative route is illustrated in **Alternatives Figure 4**.

Setting and Existing Conditions

This transmission line alternative's setting and existing conditions are irrelevant to Power Plant Efficiency.

Assessment of Impacts and Discussion of Mitigation

This alternative would not impact Power Plant Efficiency.

NO PROJECT/NO ACTION ALTERNATIVE

No Project and No Action on Rice Solar Energy Project transmission line application and interconnection request. No CDCA land use plan amendment.

Under this alternative, the proposed RSEP would not be approved by the Energy Commission; BLM would not approve the transmission line application and would not amend the CDCA Plan; and Western would not approve the interconnection request. As a result, no solar energy project would be constructed on the project site, BLM would continue to manage the land encompassing the transmission line consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended, and Western would continue to operate the Parker Blythe Transmission Line under current conditions.

Because there would be no amendment to the CDCA Plan and no solar project approved for the site under this alternative, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site. As a result, none of the impacts related to Power Plant Efficiency from the proposed project would occur and none of the benefits of the proposed project related to Power Plant Efficiency would occur. In the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations.

CUMULATIVE IMPACT ANALYSIS

While there are other solar and wind power projects proposed in the vicinity of RSEP, there are no nearby power plant projects or other projects consuming large amounts of fossil fuel that hold the potential for cumulative energy consumption impacts when aggregated with the project. The amount of fuel to be consumed by RSEP would be insignificant compared to the considerable resources of fossil fuel, including propane, in California.

Staff believes that the construction and operation of the project would not create indirect impacts (in the form of additional fuel consumption) that would not have otherwise occurred without this project. Because Rice Solar would consume no fossil fuel for power generation, it should compete favorably in the California power market and replace fossil fuel burning power plants. The project would therefore cause a positive impact on the cumulative amount of fossil fuel consumed for power generation.

COMPLIANCE WITH LORS

No federal, state, or local/county laws, ordinances, regulations, and standards (LORS) apply to the efficiency of this project.

NOTEWORTHY PUBLIC BENEFITS

Rice Solar would employ an advanced solar thermal technology. Solar energy is renewable and unlimited. The project would have a less than significant adverse impact on nonrenewable energy resources. Consequently, the project would help in reducing California's dependence on fossil fuel-fired power plants.

PROPOSED CONDITIONS OF CERTIFICATION/MITIGATION MEASURES

No conditions of certification are proposed.

CONCLUSIONS

Fossil fuel energy use

Rice Solar, if constructed and operated as proposed, would use solar energy to generate all of its capacity, consuming no fossil fuel for power production. The project would decrease reliance on fossil fuel, and would increase reliance on renewable energy resources. It would not create significant adverse effects on energy supplies or resources, would not require additional sources of energy supply, and would not consume energy in a wasteful or inefficient manner. No energy standards apply to this project. Staff therefore concludes that this project would present no significant adverse impacts on energy resources.

No cumulative impacts on energy resources are likely. Facility closure would not likely present significant impacts on electric system efficiency.

Land use

Rice Solar, if constructed and operated as proposed, would occupy approximately nine acres per MW of power output, a figure higher than that of some other solar power technologies. Employing a less land-intensive solar technology, such as the concentrated parabolic trough technology would slightly reduce this figure.

Efficiency Appendix A

Solar Power Plant Efficiency Calculation

Gas-Fired Proxy

In calculating the efficiency of a solar power plant, it is desired to subtract the effect of natural gas burned for morning startup, cloudy weather augmentation and Therminol freeze protection. As a proxy, we will use an average efficiency based on several recent baseload combined cycle power plant projects that have gone through the Energy Commission siting process. Baseload combined cycles were chosen because their intended dispatch most nearly mirrors the intended dispatch of solar plants, that is, operate at full load in a position high on the dispatch authority's loading order.

Below are the list of four of such projects:

Colusa Generating Station (06-AFC-9)

Nominal 660 MW 2-on-1 Combined Cycle with GE Frame 7FA CGTs
Air cooled condenser, evaporative inlet air cooling
Efficiency with duct burners on: 666.3 MW @ 52.5% LHV
Efficiency with duct burners off: 519.4 MW @ 55.3% LHV
Efficiency (average of these two): **53.9% LHV**

San Gabriel Generating Station (07-AFC-2)

Nominal 696 MW 2-on-1 Combined Cycle with Siemens 5000F CGTs
Air cooled condenser, evaporative inlet air cooling
Efficiency with duct burners on: 695.8 MW @ 52.1% LHV
Efficiency with duct burners off: 556.9 MW @ 55.1% LHV
Efficiency (average of these two): **53.6% LHV**

KRCD Community Power Plant (07-AFC-7)

Nominal 565 MW 2-on-1 Combined Cycle with GE or Siemens F-class CGTs
Evaporative cooling, evaporative or fogging inlet air cooling
Efficiency with GE CGTs: 497 MW @ 54.6% LHV
Efficiency with Siemens CGTs: 565 MW @ 56.1% LHV
Efficiency (average of these two): **55.4% LHV**

Avenal Energy (08-AFC-1)

Nominal 600 MW 2-on-1 Combined Cycle with GE Frame 7FA CGTs
Air cooled condenser, inlet air chillers
Efficiency with duct burners on: 600.0 MW @ 50.5% LHV
Efficiency with duct burners off: 506.5 MW @ 53.4% LHV
Efficiency (average of these two): **52.0% LHV**

Average of these four power plants: **53.7% LHV**

POWER PLANT RELIABILITY

Testimony of Shahab Khoshmashrab

SUMMARY OF CONCLUSIONS

The expected equivalent availability factor for the proposed Rice Solar Energy Project (RSEP) is 92-98 percent, which staff believes is achievable (the availability factor of a power plant is the percentage of time it is available to generate power; both planned and unplanned outages subtract from this availability). Based on a review of the proposal, staff concludes that the RSEP would be built and would operate (throughout its intended 30-year life) in a manner consistent with industry norms for reliable operation. No conditions of certification are proposed.

INTRODUCTION

In this analysis, California Energy Commission (Energy Commission) staff addresses the reliability issues of the RSEP to determine if the power plant is likely to be built in accordance with typical industry norms for reliable power generation. Staff uses this norm as a benchmark because it ensures that the resulting project would not be likely to degrade the overall reliability of the electric system it serves (see the “Setting” subsection, below).

The scope of this power plant reliability analysis covers:

- equipment availability;
- plant maintainability;
- fuel and water availability; and
- power plant reliability in relation to natural hazards.

Staff examined the project design criteria to determine if the project is likely to be built in accordance with typical industry norms for reliable power generation. The expected overall availability factor for Rice Solar ranges between 92-98 percent (SR 2009a, AFC § 2.3.2.1). While this prediction is made by the applicant, staff commonly uses typical industry norms as the benchmark, rather than the applicant’s projection, to evaluate the project’s reliability (see below).

LAWS, ORDINANCES, REGULATIONS AND STANDARDS (LORS)

Presently, there are no laws, ordinances, regulations or standards (LORS) that establish either power plant reliability criteria or procedures for attaining reliable operation. However, the Energy Commission must make findings as to the manner in which the project is to be designed, sited and operated to ensure safe and reliable operation (Cal. Code Regulations, Title 20, § 1752[c]). Staff takes the approach that a project is acceptable if it does not degrade the reliability of the utility system to which it is connected. This is likely the case if the project exhibits reliability at least equal to that of other power plants on that system (see **PROPOSED PROJECT** below).

METHODOLOGY AND THRESHOLDS FOR DETERMINING ENVIRONMENTAL CONSEQUENCES

CEQA METHODOLOGY AND THRESHOLD

This does not apply to power plant reliability.

METHOD FOR DETERMINING RELIABILITY

The Energy Commission must make findings as to how a project is designed, sited, and operated in order to ensure its safe and reliable operation (California Code of Regulations, Title 20, §1752[c]). Staff takes the approach that a project is acceptable if it does not degrade the reliability of the utility system to which it is connected. This is likely the case if a project is at least as reliable as other power plants on that system.

The availability factor of a power plant is the percentage of time it is available to generate power; both planned and unplanned outages subtract from this availability. Measures of power plant reliability are based upon both the plant's actual ability to generate power when it is considered to be available and upon starting failures and unplanned (or forced) outages. For practical purposes, reliability can be considered a combination of these two industry measures, making a reliable power plant one that is available when called upon to operate. Power plant systems must be able to operate for extended periods without shutting down for maintenance or repairs. Achieving this reliability requires adequate levels of equipment availability, plant maintainability with scheduled maintenance outages, fuel and water availability, and resistance to natural hazards. Staff examines these factors for the project and compares them to industry norms. If the factors compare favorably for this project, staff may then conclude that Rice Solar would be as reliable as other power plants on the electric system and would not degrade system reliability.

PROPOSED PROJECT

SETTING AND EXISTING CONDITIONS

In the restructured competitive electric power industry, the responsibility for maintaining system reliability falls largely to the state's control area operators, such as the California Independent System Operator (California ISO), that purchase, dispatch, and sell electric power throughout the state. Determining how the California ISO and other control area operators would ensure system reliability has been an ongoing effort. Protocols that allow sufficient reliability to be maintained under the competitive market system have been developed and put in place. "Must-run" power purchase agreements and "participating generator" agreements are two mechanisms that have been employed to ensure an adequate supply of reliable power.

The California ISO's mechanisms to ensure adequate power plant reliability apparently were devised under the assumption that the individual power plants that compete to sell power into the system will each exhibit a level of reliability similar to that of power plants of past decades. However, there has been valid cause to believe that, under free market competition, financial pressures on power plant owners to minimize capital

outlays and maintenance expenditures may act to reduce the reliability of many power plants, both existing and newly constructed (McGraw-Hill 1994). It is possible that, if significant numbers of power plants were to exhibit individual reliability sufficiently lower than this historical level, the assumptions used by California ISO to ensure system reliability would prove invalid, with potentially disappointing results. Accordingly, staff has recommended that power plant owners continue to build and operate their projects to the level of reliability to which all in the industry are accustomed.

As part of its plan to provide needed reliability, the applicant proposes to operate the 150-megawatt (MW) (net power output) Rice Solar, a solar thermal power plant facility employing an advanced solar power technology. This project, using renewable solar energy, would provide dependable power to the grid, generally during the hours of peak power consumption by the interconnecting utility(s). This project would help serve the need for renewable energy in California, as all its generated electricity would be produced by a reliable source of energy that is available during the hot summer afternoons, when power is needed most.

The expected availability factor for the project is 92-98 percent.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

EQUIPMENT AVAILABILITY

Equipment availability would be ensured by adoption of appropriate quality assurance/quality control (QA/QC) programs during the design, procurement, construction, and operation of the plant and by providing for adequate maintenance and repair of the equipment and systems discussed below.

Quality Control Program

The applicant describes a QA/QC program (SR 2009a, AFC § 2.3.2.5) that is typical of the power industry. Equipment would be purchased from qualified suppliers based on technical and commercial evaluations. Suppliers' personnel, production capability, past performance, QA programs, and quality history would be evaluated. The project owner would perform receipt inspections, test components, and administer independent testing contracts. Staff expects that implementation of this program would result in typical reliability of design and construction. To ensure this implementation, staff has proposed appropriate conditions of certification in the section of this document entitled **Facility Design**.

PLANT MAINTAINABILITY

Equipment Redundancy

The thermal storage technology that the RSEP would employ would allow the project to generate electrical power independent of solar energy capture. While solar energy capture would be able to occur only when the sun is shining, electrical power generation would follow peak demand, typically occurring in late afternoon and evening hours. The peaking nature of generation for the RSEP offers adequate opportunity for maintenance work during the downtime for the generating equipment, and maintenance or repairs to

the solar capture equipment could be done when those elements of the plant are shut down at night. The nature of solar thermal generating technology also provides inherent redundancy; the parallel arrangement of the heliostats would allow for the plant to operate with reduced output if one (or possible several) row(s) of reflectors were to require service or repair. This redundancy would allow service or repair to be done during sunny days when the plant is in operation, if required.

Major plant systems are designed with adequate redundancy to ensure their continued operation if equipment fails (SR 2009a, AFC § 2.3.2.2). Examples of the project's redundant equipment include:

- Two 100 percent boiler feed-water pumps,
- Three 50 percent condensate pumps, and
- Multi-fan Air-cooled Condenser.

Staff believes that this project's proposed equipment redundancy would be sufficient for its reliable operation.

Maintenance Program

Equipment manufacturers provide maintenance recommendations for their products, and the applicant is expected to base the project's maintenance program on those recommendations. Such a program would encompass both preventive and predictive maintenance techniques. Maintenance outages would probably be planned for periods of low electricity demand. Staff expects that the project would be adequately maintained to ensure an acceptable level of reliability.

FUEL AND WATER AVAILABILITY

The long-term availability of fuel and of water for cooling or process use is necessary to ensure the reliability of any power plant. The need for reliable sources of fuel and water is obvious; lacking long-term availability of either source, the service life of the plant could be curtailed, threatening both the power supply and the economic viability of the plant.

Fuel Availability

Rice Solar would consume no fossil fuel for power generation. Only small amounts of propane would be used for the initial salt melting.

The applicant has described its sources of propane for the project (SR 2009a, AFC § 2.2.4). Propane is normally created as a by-product of petroleum refining and from natural gas production. Petroleum products and natural gas (with California's access to natural gas resources from the Rocky Mountains, Canada and the southwest) represent considerable energy resources in California. Propane supplies in California amount to approximately 630 million gallons per year from refineries alone. This is only about 60% of California's total propane supply. Compared to this figure, the amounts of propane needed for Rice Solar is insignificant. Staff believes that there would be adequate propane supply and pipeline capacity to meet the project's needs.

Water Supply Reliability

Rice Solar has proposed to use well water from two onsite wells for domestic and industrial water needs, including steam cycle makeup, mirror washing, service water and fire protection water. The project would be dry cooled, so no water would be required for power plant cooling steam condensation, but minimal water would be used for cooling the turbine-generator lubricating oil system. Staff believes that this source of water supply is a reliable source of water for the project.

POWER PLANT RELIABILITY IN RELATION TO NATURAL HAZARDS

Natural forces can threaten the reliable operation of a power plant. Tsunamis (tidal waves) and seiches (waves in inland bodies of water) are not likely to present hazards for this project, but seismic shaking (earthquakes), flooding and high winds could present credible threats to the project's reliable operation (SR 2009a, AFC §§ 5.4, 5.15.1.3).

Seismic Shaking

The project will be designed and constructed to the latest applicable LORS (SR 2009a, AFC Appendix 2C). Compliance with current seismic design LORS represents an upgrading of performance during seismic shaking compared to older facilities since these LORS have been continually upgraded. Because it would be built to the latest seismic design LORS, this project would likely perform at least as well as, and perhaps better than, existing plants in the electric power system. Staff has proposed conditions of certification to ensure this; see the section of this document entitled **Facility Design**. In light of the general historical performance of California power plants and the electrical system in seismic events, staff has no special concerns with the power plant's functional reliability during earthquakes. Also see the **Geology and Paleontology** section of this document.

Flooding

The site lies within an area designated by the Federal Emergency Management Agency as Zone D. Zone D designation is used for areas where there are possible but undetermined flood hazards (SR 2009a, AFC § 5.15.1.3). Project features would be designed and built to provide adequate levels of flood resistance (SR 2009a, AFC Appendix 5.15C). Staff believes there are no special concerns with power plant functional reliability due to flooding, and the site is not within a 100-year floodplain. For further discussion, see **Soil and Water Resources** and **Geology and Paleontology**.

High Winds

High winds are common in the region of the site, which could potentially cause damage to the solar mirrors. Project features would be built to withstand wind loading. Design would be in accordance with applicable LORS, including the latest California Building Code (see the **Facility Design** section of this document). Staff believes there are no special concerns with power plant functional reliability due to wind.

COMPARISON WITH EXISTING FACILITIES

The North American Electric Reliability Corporation (NERC) maintains industry statistics for availability factors (as well as other related reliability data). The NERC regularly polls North American utility companies on their project reliability through its Generating Availability Data System and periodically summarizes and publishes those statistics on the Internet at <<http://www.nerc.com>>. Energy Commission staff typically compares the applicant's claims for reliability to the statistical reliability of similar power plants. Because solar technology is relatively new and the technologies employed so varied, no NERC statistics are available for solar power plants. Staff's typical comparison with other existing facilities thus cannot be accomplished. But, based on experience with power plants and due to the proven solar thermal technology proposed for this project, staff believes that the stated range of availability factor for the project is reasonable and likely achievable.

REDUCED ACREAGE ALTERNATIVE

The Reduced Acreage Alternative would be 7.2 percent smaller than the proposed project. It would be located in the same 2,560-acre square-shaped parcel within the larger 3,324-acre ownership property as the proposed project. Although the overall heliostat field distance from the central tower would be reduced, the number of heliostats would remain the same. The heliostat field (plus the evaporation pond and administration areas) would occupy about 1,270 acres instead of the 1,370 acres required for the proposed project. The receiver location would remain the same, with the edges of the field contracting towards the center. The heliostat footprint of the Reduced Acreage Alternative is shown in **Alternatives Figure 2**. The site layout, 653-foot total height of the solar tower and receiver, and transmission interconnection to Western's Parker-Blythe transmission line would be the same as the proposed project. The project's nominal 150 megawatts (MW) generation output would be reduced by approximately 2 MW.

Similar to the proposed project, the Reduced Acreage Alternative would transmit power to the grid through the planned Western substation to be located adjacent to Western's Parker Blythe #2 161 kilovolt (kV) transmission line. Under the Reduced Acreage Alternative, the agencies would approve a facility with a 7.2 percent heliostat field reduction and with a 148 MW capacity compared to the 150 MW project that is proposed.

Setting and Existing Conditions

The setting for the Reduced Acreage Alternative is the same as for the proposed project.

Assessment of Impacts and Discussion of Mitigation

Staff's methods of analysis and conclusions as related to Power Plant Reliability would remain unchanged. This alternative would be built and would operate in a manner consistent with industry norms for reliable operation.

NORTH OF DESERT CENTER ALTERNATIVE

The North of Desert Center Alternative would be a 150 MW solar thermal facility located on approximately 2,643 acres of land. It is located along Desert Center Rice Road (State Route 177) east of Kaiser Road, north of Oasis Road, and approximately 1.6 miles north of I-10. The North of Desert Center Alternative is primarily private land with smaller sections of BLM land in the eastern portion of the site. It is largely fallow agricultural land. The existing SCE 161-kV transmission line (from the Blythe-2 substation to the Eagle Mountain-1 substation) that traverses the alternative site would be realigned to roughly follow the site boundary. A new 0.125-mile generation tie line (along Osborne Ave.) and substation would interconnect to the realigned SCE line at the northeast boundary of the site. The boundaries and transmission realignment of the North of Desert Center Alternative are illustrated in **Alternatives Figure 3..**

Setting and Existing Conditions

The plant configuration at the North of Desert Center Alternative site would be similar to the proposed project, which means it would result in similar levels of equipment availability. Plant maintainability, fuel and water availability, and reliability of the plant in relation to natural hazards would each be similar at this alternative site to the proposed project.

Assessment of Impacts and Discussion of Mitigation

Staff's methods of analysis and conclusions as related to Power Plant Reliability would remain unchanged. This alternative would be built and would operate in a manner consistent with industry norms for reliable operation.

SR 62/RICE VALLEY ROAD GENERATION TIE LINE ALTERNATIVE

The SR 62/Rice Valley Road Generation Tie Line Alternative would interconnect to Western Area Power Administration's (Western) 161-kV/230-kV Parker-Blythe #2 transmission line at the same location as the proposed project generation tie line. This alternative tie line would exit the proposed solar facility at the northeast corner and follow State Route 62 approximately 4.5 miles east to the junction of Rice Valley Road. It would then trend south to follow the unpaved Rice Valley Road for 4.0 miles to its juncture with the applicant's proposed new generation tie line alignment and continue southeast for 5.4 miles along the proposed alignment to Western's Parker-Blythe #2 transmission line. The SR 62/Rice Valley Road Generation Tie Line Alternative route is illustrated in **Alternatives Figure 4.**

Setting and Existing Conditions

This generation tie line alternative's setting and existing conditions are irrelevant to Power Plant Reliability.

Assessment of Impacts and Discussion of Mitigation

This alternative would not impact Power Plant Reliability.

NO PROJECT/NO ACTION ALTERNATIVE

No Project and No Action on Rice Solar Energy Project transmission line application and interconnection request. No CDCA land use plan amendment.

Under this alternative, the proposed Rice Solar would not be approved by the Energy Commission; BLM would not approve the transmission line application and would not amend the CDCA Plan; and Western would not approve the interconnection request. As a result, no solar energy project would be constructed on the project site, BLM would continue to manage the land encompassing the transmission line consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended, and Western would continue to operate the Parker Blythe Transmission Line under current conditions.

Because there would be no amendment to the CDCA Plan and no solar project approved for the site under this alternative, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site. As a result, none of the benefits of the proposed project related to Power Plant Reliability would occur. In the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations.

NOTEWORTHY PUBLIC BENEFITS

This project, if successful, would help serve the need for renewable energy in California, as all of the electricity generated would be produced by a reliable source of energy that is available during the hot summer afternoons and evenings, when power is needed most.

PROPOSED CONDITIONS OF CERTIFICATION/MITIGATION MEASURES

No Conditions of Certification are proposed.

CONCLUSIONS

The expected equivalent availability factor for this project is 92-98 percent, which staff believes is achievable (the availability factor of a power plant is the percentage of time it is available to generate power; both planned and unplanned outages subtract from this availability). Based on a review of the proposal, staff concludes that the Rice Solar Energy Project would be built and would operate (throughout its intended 30-year life) in a manner consistent with industry norms for reliable operation. No conditions of certification are proposed.

TRANSMISSION SYSTEM ENGINEERING

Testimony of Ajoy Guha, P. E. and Mark Hesters

SUMMARY OF CONCLUSIONS

The U.S. Bureau of Land Management (BLM), Western Area Power Administration (Western) and Energy Commission staff (staff), hereafter jointly referred to as agencies, have reviewed the Rice Solar Energy Project (RSEP or proposed project) in accordance with the requirements of the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA). The proposed interconnection facilities for the Rice Solar Energy Project (RSEP), including the 161/230 kV project switchyard, the generator 230 kV overhead tie line and its termination at the proposed new Western Rice 230 kV substation would comply with industry standards and good utility practices, and are acceptable to staff according to engineering Laws, Ordinances, Regulations and Standards (LORS).

The Western System Impact Study (SIS) and supplementary studies demonstrate that the addition of the 150 MW RSEP would not cause any adverse impacts on the Western transmission system including the Parker-Davis (P-D) transmission system in the Desert Southwest (DSW) region under 2013 heavy summer and 2013 heavy winter system conditions during normal operation (N-0), and emergency Category B and Category C contingencies. But the studies identify that the project could have impacts on the adjacent Southern California Edison (SCE) and Imperial Irrigation District (IID) transmission systems. The addition of the RSEP would cause a new normal (N-0) and a new Category C contingency overload on the SCE Julian Hinds-Mirage 230 kV line, and a new Category B contingency overload on the IID Drop 4-Pilot Knob 92 kV line. The project would also exacerbate pre-project overloads on the SCE Julian Hinds-Mirage 230 kV line and on six transmission elements in the IID system under certain contingency conditions. Sensitivity studies which included the RSEP and another Western queue project, the proposed 110 MW Quartzsite plant (QP), identified similar impacts in the SCE and IID systems.

Western's Open Access Transmission Tariff requires that their interconnection process for Large Generators like the RSEP be coordinated with transmission owners whose system could be affected by the interconnection of the proposed generator. Western has contacted SCE and IID and solicited comments on the RSEP SIS. SCE and IID have indicated that more review of the SIS is required. Staff believes that Western, SCE and IID in coordination with California Independent System Operator (California ISO) and the Metropolitan Water District (MWD) will be able to come up with a viable plan to mitigate overloads on the SCE and IID systems. The proposed Condition of Certification **TSE-5** in section f) iv requires a plan for the mitigation of overloads in the SCE and IID systems.

The RSEP would meet the requirements and standards of all applicable LORS upon compliance with the recommended Conditions of Certification.

INTRODUCTION

The Transmission System Engineering (TSE) analysis examines whether or not the facilities associated with the proposed interconnection conform to all applicable LORS required for safe and reliable electric power transmission. Staff's analysis evaluates the power plant switchyard, generator tie line, termination and downstream facilities identified by the applicant. Additionally, under the California Environmental Quality Act (CEQA), the Energy Commission must conduct an environmental review of the "whole of the action," which may include facilities not licensed by the Energy Commission (California Code of Regulations, title 14, §15378). Therefore, the Energy Commission must identify the system impacts and necessary new or modified transmission facilities downstream of the proposed interconnection that are required for interconnection and represent the "whole of the action." Staff also coordinates with the lead federal agency, Western, and the cooperating federal agency, Bureau of Land Management (BLM) to meet the National Environmental Policy Act (NEPA) environmental requirements.

Energy Commission staff relies on the interconnecting authority for the analysis of impacts on the transmission grid as well as the identification and approval of required new or modified facilities downstream from the proposed interconnection that would be required as mitigation measures. The proposed Rice Solar Energy Project (RSEP) would interconnect to the Western transmission network in the Desert Southwest (DSW) region and requires Western's analysis and approval.

WESTERN'S ROLE

Western is responsible for ensuring electric system reliability in the Western system for interconnection of the proposed generating plant. Western will ensure adequacy and reliability of the proposed generator interconnection to their system according to Western, and applicable national and regional planning and reliability standards. The Western Open Access Transmission Tariff includes the Large Generator Interconnection Process which applies to the interconnection of the RSEP. Western's "General Requirements for Interconnection" provides guidelines and minimum requirements for the interconnection of new generators, and the addition or modification of Western's transmission facilities. Western provides the analysis in their System Impact study (SIS) and Facilities study (FS) based on the expected commercial operation date (COD) of the proposed facility. The studies also identify the facilities and changes in the Western transmission system required for the reliable addition and/or modification of transmission facilities. On satisfactory completion of the FS, Western will proceed for execution of the Facility Construction Agreement (FCA) with the applicant for construction of the facilities and changes required in the Western system required to accommodate the interconnection of the proposed generator. As a Federal agency, Western conducts an environmental review of any action affecting Western's transmission facilities. Western may proceed with execution of the Large Generator Interconnection Agreement (LGIA) with the interconnection customer at the same time as the FCA or, after satisfactory completion of construction and testing of all facilities in conformance with Western's criteria and before energizing the interconnected facilities. Western may provide written and verbal testimony on their findings at the Energy Commission hearings.

LAWS, ORDINANCES, REGULATIONS AND STANDARDS (LORS)

- Western “General Requirements for Interconnection,” September, 1999, provides guidelines, steps and requirements for the interconnection process, and addition or modification to the Western transmission facilities. It provides an overview of the reliability, safety & security, environmental, land acquisition, technical, construction and contractual requirements (Western 1999).
- Western Open Access Transmission Service Tariff (OATT) provides rules and guidelines, procedures and study requirements for system reliability, facilities addition/upgrades & environmental review, and applicable terms and conditions for providing transmission services in the Western grid to a transmission customer. The Tariff also covers cost responsibility, operating arrangements and rates & charges for the transmission services. The Tariff specifies the required LGIP and LGIA to be followed for any large generator interconnection request to the Western grid (Western 2009).
- California Public Utilities Commission (CPUC) General Order 95 (GO-95), “Rules for Overhead Electric Line Construction,” formulates uniform requirements for construction of overhead lines. Compliance with this order ensures adequate service and safety to persons engaged in the construction, maintenance and operation or use of overhead electric lines and to the public in general.
- California Public Utilities Commission (CPUC) General Order 128 (GO-128), “Rules for Construction of Underground Electric Supply and Communications Systems,” formulates uniform requirements and minimum standards to be used for underground supply systems to ensure adequate service and safety to persons engaged in the construction, maintenance and operation or use of underground electric lines and to the public in general.
- The National Electric Safety Code, 2007 provides electrical, mechanical, civil and structural requirements for overhead electric line construction and operation.
- The North American Electric Reliability Corporation (NERC) Reliability Standards define the plans, policies & procedures, methodologies & system models, coordination & responsibilities, and performance criteria for reliable planning, control and operation of the North American Bulk Electric System (BES) over broad spectrum of system conditions and following a wide range of probable disturbances. The Standards cover all aspects of an interconnected BES such as: Transmission system planning & operation, consistent data (steady-state and dynamic) for modeling and simulation, facility ratings methodology and connections, balancing real power, resources & load demand, procedures for voltage control & reactive power, system protection, control, communications & security, nuclear plant interface coordination, emergency operation planning and system restoration plans. The transmission planning standards stipulate periodic system simulations and associated assessments over a planning horizon by the planning authority and transmission planner to ensure that reliable systems are planned with sufficient lead time to meet the system performance requirements and

continue to be modified or upgraded as necessary for operating the network reliably to supply projected customer demands and firm transmission services under normal and forced or maintenance outage system conditions.

For an interconnected bulk electric system, the Table I in the NERC Transmission Planning Standards specifies the system performance requirements during normal system conditions with all facilities in service (pre-contingency) and normal operating procedures in effect under Category A, and during probable and rationale contingencies of a single BES element under Category B and two or more (multiple) BES elements under Category C. The performance limits or impacts for the above Categories A-C are specified for a reliable system as to remain stable, and within applicable normal and emergency facility thermal ratings and system voltage limits as determined and applied by the transmission owner according to the NERC Facility Ratings Standards. Specified system performance limits may vary from no loss of load demand or curtailed generation/firm transfers for insignificant adverse impacts (for Categories A & B) to planned/controlled loss of load demand or curtailed generation/firm transfers (for Category C) without any cascading outages. However, during major extreme disturbances such as loss of multiple 500 kV lines on a common right-of-way with cascading outages or multiple generators with loss of a major load center as stated under Category D in the Table I, some of the interconnected systems may become unstable resulting in widespread black out in islanded areas. The standards require the planning authority to evaluate the risks and consequences for such catastrophic events, and be prepared according to the NERC Emergency Operation Planning Standard and/or to restore the system to normal according to the NERC standard for System Restoration Plans (NERC 2005-10).

- The Western Electric Coordinating Council (WECC) Regional System Performance Criteria is similar to the system performance limits as defined in NERC transmission planning standards. The WECC performance criteria incorporate the Table I of the NERC transmission planning standards and in addition include the WECC Disturbance-Performance Table W-1 which provides standards for transient voltage and frequency limits, and post-transient system voltage variation. Certain aspects of the WECC performance criteria are either more stringent or specific than the NERC standards such as inclusion of contingency event frequencies and additional Category C & D contingencies. Adequate reactive power resources planning criteria for transfer path ratings and post-transient voltage stability are also included. For any past disturbance that actually resulted in cascading outages in the interconnected system, the WECC performance criteria require remedial action so that future occurrences of such event would not result in cascading (WECC 2008).
- California ISO Planning Standards also provide standards and guidelines to ensure the adequacy, security and reliability in the planning of the California ISO grid transmission facilities. The Standards incorporate the current NERC Reliability Planning Standards and WECC Regional System Performance Criteria. However, the California ISO Standards are more stringent or specific than the NERC standards and WECC performance criteria. The Standards include additional Category B disturbance elements and criteria for existing nuclear plant unit's control. The Standards also address new transmission vs. involuntary load interruptions and San Francisco greater bay area generation outage criteria for conducting grid

planning for the bay area. The California ISO Standards apply to the electric systems of all participating transmission owners interconnecting to the California ISO controlled grid. They also apply when there are any impacts to the California ISO grid due to facilities interconnecting to adjacent controlled grids not operated by the California ISO (California ISO 2002a).

PROJECT DESCRIPTION

The RSEP, a concentrated solar power plant, would be located on private property in eastern Riverside County. The proposed RSEP would consist of a steam turbine generator (STG) rated 200 MVA, 18 kV with a nominal net 150 MW output. The STG would be connected through an 8,000-ampere segregated bus duct and an 8,000-ampere 18 kV breaker to the low voltage terminal of a dedicated 118/157/202 MVA, 18/161/230 kV generator step-up (GSU) transformer with a specified impedance of 10% @118 MVA (SR 2009a, AFC, section 2; SR 2009b, Data Adequacy supplement).

SWITCHYARD AND INTERCONNECTION FACILITIES

The 161 kV high voltage terminal of the GSU transformer would be connected to the 161/230 kV switchyard dead-end structure through short overhead 1,272 Kcmil steel-reinforced aluminum conductors (ACSR) conductors and a 2,000-ampere, 230 kV breaker with two associated 2,000-ampere disconnect switches.

The new RSEP 161/230 kV switchyard would be interconnected to the existing Western Parker-Blythe 161/230 kV No. 2 line (currently operating at 161 kV, designed and built to operate at 230 kV) by building an approximately 10-mile long 230 kV single circuit overhead transmission line with 1,272 Kcmil ACSR on 75 to 115-foot high tubular steel poles. The generator tie line will take the direct and shortest southeast route from the RSEP south fence line, first 5.4 miles along a newly built private dirt road to the Rice Valley Road. From this point the line would run another 4.6 miles along public land adjacent to the U. S. Bureau of Land Management (BLM) maintained Rice Valley Road to the interconnection point. The applicant will build, own and operate the RSEP 161/230 kV switchyard and the generator tie line.

The new line would be terminated at a proposed new Western Rice 230 kV substation bus to be located adjacent to Western's Parker-Blythe 230/161 kV No. 2 line through a 2,000-ampere disconnect switch. The new substation would have a 2,000-ampere ring bus configuration with four 2,000-ampere, 230 kV breakers and associated 2,000-ampere disconnect switches. The existing Parker-Blythe 230/161 kV No. 2 line would be looped into the new substation bus through two 2,000-ampere disconnect switches. Western would build, own and operate the proposed new Rice 230 kV substation and the interconnecting facilities within its fence line.

The RSEP switchyard, the proposed new generator tie line and the terminating new substation would be operated at 161-kV until the Western Parker-Blythe 161/230 kV No. 2 line is operated at 230 kV. All construction will be done according to Western's construction standards.

The configuration of the proposed new RSEP 161-kV/230-kV switchyard, the generator 230 kV overhead tie line and its termination at the proposed Western Rice 230 kV substation would comply with industry standards and good utility practices, and is acceptable to staff. Proposed Conditions of Certification TSE 1 to TSE 8 insure that the proposed facilities are designed, built and operated in accordance with good utility practices and applicable LORS.

TRANSMISSION SYSTEM IMPACT ANALYSIS

In accordance with the Western LGIP and “General Requirements for Interconnection”, the SIS and FS are conducted to determine the preferred and alternate interconnection methods to the grid, the downstream transmission system impacts and the mitigation measures needed to ensure system conformance with performance levels required by the Western reliability criteria, NERC Reliability standards, WECC system performance criteria and also California ISO Planning standards. Staff relies on the studies and any review conducted by the responsible agencies to determine the project impacts on the transmission grid and to identify any necessary new downstream facilities or modifications required to bring the transmission network into compliance with applicable reliability standards (NERC 2005-10, WECC 2008, California ISO 2002a).

The SIS and FS analyze the grid with and without the proposed project under conditions specified in the planning standards and reliability criteria. The standards and criteria define the assumptions used in the study and establish the thresholds by which grid reliability is determined. The studies must analyze the impact of the project for the proposed first year of operation and thus are based on a forecast of loads, generation and transmission. Load forecasts are developed by the interconnected utility, and incorporated by Western into their study. Generation forecasts are established by an interconnection queue. The studies are focused on thermal overloads, voltage deviations, system stability (excessive oscillations in generators and transmission system, voltage collapse, loss of loads or cascading outages), and short circuit duties.

If the studies show that the interconnection of the project causes the grid to be out of compliance with reliability standards, the study will then identify mitigation alternatives or ways in which the grid could be brought into compliance with reliability standards. If the interconnecting utility determines that the only feasible mitigation includes transmission modifications or additions which require CEQA review as part of the “whole of the action,” the Energy Commission must analyze those modifications or additions according to CEQA requirements. Staff also coordinates with federal agencies such as BLM and Western to meet the NEPA requirements.

SCOPE OF SYSTEM IMPACT STUDY (SIS)

The May 14, 2010 SIS was prepared by the Western to evaluate the system impacts of the proposed RSEP on the Western transmission system in the DSW region and was supplemented by additional studies and information dated July 16, 2010 and August 9, 2010 conducted by the Utility System Efficiencies, Inc. (a consulting firm) with the Western base cases. The Western SIS was prepared with and without the RSEP 150

MW generation using the following base cases under critical loading conditions for the transmission system in the Western DSW region:

- An updated WECC 2013 heavy summer base case with addition of four higher queue projects with a total of 1319 MW generation
- An updated WECC 2013 heavy winter base case with addition of total 1319 MW generation of four higher queue projects and with maximum allowable East of the River (EOR) seasonal path flow.

In the base cases generation added from the interconnection queue was balanced by reducing fossil fuel generation in Los Angeles area. The existing 520 MW Blythe generating plant (modeled with only 319 MW generation output in the heavy summer case and 509 MW in the heavy winter case) interconnection was shown switched over from the Western system to the California ISO grid at the Julian Hinds 230 kV substation. In each of the studies, it is expected that generation and critical seasonal power flows were maintained within their limits. The base cases included funded & planned transmission upgrades in the Western system and planned California ISO approved upgrades that would be operational by 2013. The study included analyses for power flow, short circuit and transient stability.

In addition power flow sensitivity studies were performed analyzing the addition of 110 MW project, the Quartzsite Plant (QP, Western queue #2008-G12, COD uncertain), to the above base cases with and without the RSEP generation. The Quartzsite Plant was shown interconnected to the existing Bouse-Kofa 161 kV line in the Western P-D system (CH2MHILL 2010s, Western SIS report dated May 14, 2010).

Power Flow Study Results and Mitigation

The SIS demonstrates that the addition of the 150 MW RSEP generation output would not cause any thermal overloads or voltage violations on the Western P-D system in the DSW region under 2013 heavy summer and 2013 heavy winter system conditions during Category A (N-0) normal operation, and emergency Category B (N-1) and Category C (N-2 or more) contingencies. However, the SIS identified a new normal overload on the SCE system, a new N-1 contingency overload on the Imperial Irrigation District (IID) system and one new N-2 contingency overload on the SCE system that were caused by the addition of the RSEP. In addition a pre-project overload on the SCE system and several pre-project overloads on the IID systems were exacerbated under certain contingency conditions. The power flow study results are shown in Appendices A and B of the Western SIS report and supplementary SIS reports dated August 9, 2010 (CH2MHILL 2010s, Western SIS report dated May 14, 2010).

Below is a summary of power flow results for overloads on the IID and SCE systems under the *worst contingencies* for the RSEP addition:

- During 2013 heavy summer conditions for the Category B outage of the N. Gila-Imperial Valley (IV) 500 kV line, the project causes a new overload on the IID Drop4-Pilot Knob 92 kV line (loading increases from 97 to 101% of the emergency line rating) and increases pre-project overloads on the following IID lines:
 - Knob-Pilot Knob 161 kV line (loading increases from 122 to 130%).

- Pilot Knob 161/92 kV transformer (loading increases from 137 to 142%).
- El Centro swtn.-Pilot Knob 161 kV line 92 (loading increases from 120 to 123%).
- During 2013 heavy winter conditions with all facilities in service (N-0) the project causes a new overload on the SCE Julian Hinds-Mirage 230 kV line (loading increases from 100 to 104% of normal line rating).
- During 2013 heavy winter system conditions, the project exacerbates pre-project overloads on the following IID lines for the N. Gila–IV 500 kV line contingency:
 - Knob-Pilot Knob 161 kV line (loading increases from 120 to 127%).
 - Pilot Knob 161/92 kV transformer (loading increases from 123 to 126%).
 - Imperial Valley-El Centro 230 kV line (loading increases from 128 to 134%).
 - El Centro swtn.-Pilot Knob 161 kV line 92 (loading increases from 132 to 135%).
 - Julian Hinds-Mirage 230 kV line (loading increases from 108 to 113%).
- During 2013 heavy winter system conditions, the project exacerbates pre-project overloads on the following SCE and IID lines for the Category B contingency the outage of the Palo Verde-Colorado River 500 kV line:
 - Julian Hinds-Mirage 230 kV line (loading increases from 127 to 133%).
 - Coachella Valley 161/92 kV transformer (loading increases from 104 to 109%).
 - Dixieland-RTap 92 kV line (loading increases from 111 to 113%).
- During 2013 heavy winter system conditions the project causes a new overload on the Julian Hinds-Mirage 230 kV line (loading increases from 98 to 106%) for the Category C (N-2 or more) outage of the Parker 161 kV bus and also increases the pre-project overload on the same line (loading increases from 102 to 108%) for the Category C outage of the Parker 230 kV South bus.

Sensitivity Power Flow study Results:

The SIS demonstrates that the addition of the 150 MW RSEP generation output along with the queue project, 110 MW QP, would not cause any thermal overloads or voltage violations on the Western Parker system in the DSW region under 2013 heavy summer and 2013 heavy winter system conditions during Category A normal operation, and emergency Category B and Category C contingencies. However, for the addition of the RSEP and QP, the SIS identified a new Category B contingency overload on the SCE system and a new Category B contingency overload on the IID system. In addition a pre-project overload on the SCE system and several pre-project overloads on the IID system are exacerbated under normal and certain contingency conditions. The power flow study results are shown in the Appendices A and B of the Western SIS report and supplementary SIS reports dated August 9, 2010 (CH2MHILL 2010s, Western SIS report dated May 14, 2010).

Below is a summary of the power flow results with the sensitivity cases (after adding the

Quartzsite plant to the base cases with and without the RSEP) for overloads on the IID and SCE systems under the *worst contingencies* for the RSEP addition:

- During 2013 heavy summer conditions for Category B outage of the N. Gila-IV 500 kV line, the project causes a new overload on the IID Drop4-Pilot Knob 92 kV line (loading increases from 100 to 104% of the line emergency rating) and increases pre-project overloads on the following IID lines:
 - Knob-Pilot Knob 161 kV line (loading increases from 127 to 135%).
 - Pilot Knob 161/92 kV transformer (loading increases from 141 to 146%).
 - El Centro swtn.-Pilot Knob 161 kV line 92 (loading increases from 123 to 127%).
- During 2013 heavy summer system conditions, the project causes a new overload on the SCE Julian Hinds-Mirage 230 kV line (loading increases from 96 to 101% of emergency line rating) for Category B contingency of the Palo Verde-Colorado River 500 kV line.
- During 2013 heavy winter conditions with all facilities in service (N-0) the project increases the pre-project overload on the SCE Julian Hinds-Mirage 230 kV line (loading increases from 102 to 107% of normal line rating).
- During 2013 heavy winter system conditions, the project causes a new overload and exacerbates pre-project overloads on the following IID and SCE lines for the N. Gila-IV 500 kV line outage:
 - Drop4-Pilot Knob 92 kV line (loading increases from 98 to 101%).
 - Knob-Pilot Knob 161 kV line (loading increases from 125 to 132%).
 - Pilot Knob 161/92 kV transformer (loading increases from 125 to 129%).
 - Imperial Valley-El Centro 230 kV line (loading increases from 132 to 138%).
 - El Centro-Pilot Knob 161 kV line 92 (loading increases from 135 to 138%).
 - Julian Hinds-Mirage 230 kV line (loading increases from 111 to 116%)
- During 2013 heavy winter system conditions, the project exacerbates pre-project overloads on the following SCE and IID lines for the Category B contingency of the Palo Verde-Colorado River 500 kV line outage:
 - Julian Hinds-Mirage 230 kV line (loading increases from 130 to 135%)
 - Coachella Valley 161/92 kV transformer (loading increases from 107 to 112%).
 - Dixieland-RTap1 92 kV line (loading increases from 113 to 115%).
- During 2013 heavy winter system conditions the project increases pre-project overload on the Julian Hinds-Mirage 230 kV line (loading increases from 105 to 111%) for Category C outage of the Parker 230 kV South bus.

The additional studies provided by Utility System Efficiencies, Inc. dated July 16, 2010 and August 9, 2010 and contributing to these conclusions are pending review and approval by Western. If necessary, these conclusions will be updated following Western's review. Condition of Certification **TSE-5**, part f) i) would require that the project owner provide evidence that it has received Western's approval of the additional studies performed by Utility System Efficiencies, Inc. dated July 16, 2010 and August 9, 2010, or has updated them and received Western's approval of any subsequent studies that may be necessary.

Responses from SCE & IID and Mitigation Plan: Since the power flows studies show a similar pattern of potential overloads in the SCE and IID systems with the addition of the RSEP as well as with addition of both the RSEP and QP generation, it is expected that the mitigation plans would be identical. Western has already contacted SCE and IID with the SIS report and base cases. SCE has so far responded to Western by suggesting modifications to the modeling of Static Var Compensator (SVC) at the Devers substation for load flow and transient & post-transient analyses, requested three additional contingency power flow studies and requested the short circuit study results for SCE buses. SCE also requested to coordinate the SIS reports with California ISO and Metropolitan Water District (MWD) and suggested the following possible ways to mitigate the overload on the Julian Hinds-Mirage 230 kV line after coordination with California ISO:

- Generation curtailment in the Western system.
- Not to schedule power into SCE system from Western system.
- Reconductoring the Julian Hinds-Mirage 230 kV line.

In response to Western contact, IID also indicated that they would review the base cases data for accuracy as well as to determine if the current operating procedures adequately protect their system with the proposed addition of the Rice Solar project.

In accordance with the above exchanges between Western and SCE & IID, and positive responses so far from both SCE and IID indicating their further review, studies and coordination, staff believes a viable mitigation plan which would eliminate the identified overloads in the SCE and IID systems will be developed. The proposed Condition of Certification TSE 5 f) iv), insures that an adequate mitigation plan for the identified potential overloads in the SCE and IID systems will be developed (SCE email dated 8-3-10 to Western, Western email dated 8-8-10 to Solar Reserve).

Short Circuit Study Results

Three line-to-ground faults were simulated with and without the RSEP to determine if any equipment or circuit breakers in Western substations in the project vicinity would be overstressed due to increase in fault currents caused by the addition of the project. The short circuit duty analysis with heavy summer and heavy winter cases included all higher queue projects and the related transmission upgrades.

The RSEP addition would increase the fault duties in the range of 1.3 kA to 1.5 kA at the Parker and Blythe 161 kV substations, but will remain within the fault interrupting capacities of the circuit breakers at both the substations. Hence the RSEP does not

trigger the need for any circuit breaker replacements in the Western P-D system. The short circuit results are shown in Table 14 of Section 5.3 of the SIS report (CH2MHILL 2010s, Western SIS report, page 23). SCE has requested that Western provide the short circuit study results for impacts on the SCE system.

Transient Stability Study Results

Transient stability analysis is performed to determine whether the transmission system would remain stable with the addition of the RSEP. The analysis was performed for the 2013 heavy summer and 2013 heavy winter base cases with simulated faults under selected critical Category B and Category C contingencies in the Western P-D system. The study identifies no transient stability concerns in the transmission system for the addition of the RSEP. The transient stability plots are provided in Appendix F of the SIS report (CH2MHILL 2010s, Western SIS report).

DOWNSTREAM FACILITIES

Besides the proposed interconnection facilities which include the new RSEP 230 kV switchyard, generator overhead tie line and Western Rice 230 kV substation, accommodating the interconnection of the RSEP generation output to the Western P-D system would not involve installation of any new downstream transmission facilities or modification of the existing facilities within Western's transmission system.

CUMULATIVE IMPACTS

The TSE analysis focuses on whether or not a proposed project will meet required codes and standards. At all times the transmission grid must remain in compliance with reliability standards, whether one project or many projects interconnect. For the RSEP interconnection to the Western DSW system, the Western SIS did not identify any potential cumulative impacts on the Western transmission network. Further staff does not expect any cumulative impacts in the Western DSW 161/230 kV network because the existing 520 MW Blythe generating plant interconnection was switched over in the recent past from the Western to the California ISO grid and the other pending interconnection projects in Western DSW region will be located in states of Arizona and Nevada.

ALTERNATIVES

The applicant considered the following alternatives:

REDUCED ACREAGE ALTERNATIVE

The Reduced Acreage Alternative would be 7.2% smaller than the proposed project. It would be located in the same 2,560-acre square-shaped parcel within the larger 3,324-acre ownership property as the proposed project. Although the overall heliostat field distance from the central tower would be reduced, the number of heliostats would remain the same. The heliostat field (plus the evaporation pond and administration areas) would occupy about 1,270 acres instead of the 1,370 acres required for the proposed project. The site layout, 653-foot total height of the solar tower and receiver, and transmission interconnection to Western's Parker-Blythe transmission line would be

the same as the proposed project. The generation output would be reduced by approximately 2 MW.

IMPACTS AND MITIGATION: Compared to 150 MW generation output, such 2 MW minimal reduction in the RSEP generation would not change the transmission capacity of the interconnection facilities (including the switchyard and the generator tie line conductor size), and the potential downstream transmission impacts and mitigation measures required for reliable interconnection of the RSEP.

NORTH OF DESERT CENTER ALTERNATIVE

The North of Desert Center Alternative would be a 150 MW solar thermal facility located on approximately 2,643 acres of land. It is located along Desert Center Rice Road (State Route 177) east of Kaiser Road, north of Oasis Road, and approximately 1.6 miles north of I-10. The North of Desert Center Alternative is primarily private land with smaller sections of BLM land in the eastern portion of the site. It is largely fallow agricultural land. The existing Southern California Edison (SCE) Blythe-2-Eagle Mountain-1 161 kV line is passing through this alternative project site.

IMPACTS AND MITIGATION:A short RSEP generator tie line would terminate to the SCE 161 kV line by building a new SCE substation. The existing 161 kV line would be rerouted around the project site and looped into a new substation. In view of least available capacity in the existing local 161 kV transmission network, it is likely that interconnection of RSEP would involve network upgrades in the transmission system.

SR62/RICE VALLEY ROAD TRANSMISSION LINE ALTERNATIVE

The SR 62/Rice Valley Road Transmission Line Alternative would interconnect to Western Area Power Administration's (Western) 161-kV/230-kV Parker-Blythe No. 2 transmission line at the same location as the proposed project transmission line. This alternative transmission line would exit the power block directly to the east and follow a proposed access road within the heliostat field. The line would exit the RSEP northeast fence line and follow State Route 62 about 3.8 miles east to the junction of Rice valley Road. The line would then turn south and follow the unpaved Rice valley Road south for about 4.1 miles. It would further run southeast for 4.6 miles along public land adjacent to BLM maintained Rice Valley Road according to the proposed preferred alignment to the Western Parker-Blythe line. The alternate line would be about 12.5-mile long.

IMPACTS AND MITIGATION: This alternate route for the generator tie line would be longer than the preferred route. It would involve more construction costs and potentially greater environmental impacts than the preferred route.

NO PROJECT/NO ACTION ALTERNATIVE

Under this alternative, there would be no filing of AFC to the Energy Commission, no interconnection request to any electric utility and no CDCA land use plan amendment.

Under this alternative, the proposed Rice Solar Energy Project would not be approved by the Energy Commission; BLM would not approve the transmission line application and would not amend the CDCA Plan; and Western would not approve the

interconnection request. As a result, no solar energy project would be constructed on the project site, BLM would continue to manage the land encompassing the transmission line consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended, and Western would continue to operate the Parker Blythe Transmission Line under current conditions.

Because there would be no amendment to the CDCA Plan and no solar project approved for the site under this alternative, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site. As a result, none of the impacts from the proposed project would occur and none of the benefits of the proposed project would occur. In the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations.

CONFORMANCE WITH LORS AND CEQA REVIEW

The configuration of the proposed new RSEP 161/230 kV switchyard, the generator overhead tie line and its termination at the proposed new Rice 230 kV substation would be adequate in accordance with industry standards and good utility practices, and is acceptable to staff.

The Western SIS and supplementary studies demonstrate that there would be no adverse impacts on the Western DSW system for the addition of the RSEP. But the studies identify that the project would have some potential overload impacts on the adjacent SCE and IID systems. The addition of the RSEP would cause a new normal (N-0) and a new Category C contingency overload on the SCE Julian Hinds-Mirage 230 kV line, and a new Category B contingency overload on the IID Drop 4-Pilot Knob 92 kV line. In addition the project would also exacerbate pre-project overloads on the SCE Julian Hinds-Mirage 230 kV line and on six transmission elements in the IID system under certain contingency conditions. Sensitivity study results with addition of both the RESEP and QP generation also indicate similar pattern of potential overload impacts in the SCE and IID systems.

Western's recent contacts with SCE and IID for comments on the SIS results have received positive responses from SCE and IID and staff expects that further review, study and coordination will result in acceptable procedures for the mitigation of impacts on adjacent transmission systems. The proposed Condition of Certification TSE 5 f) iv) would, therefore, insure adequate mitigation plan for the identified overloads in the SCE and IID systems.

The MSP would meet the requirements and standards of all applicable LORS upon satisfactory compliance of the Conditions of Certifications.

RESPONSE TO AGENCY AND PUBLIC COMMENTS

No agency or public comments related to the TSE discipline have been received.

CONCLUSIONS AND RECOMMENDATIONS

1. The configuration of the proposed new RSEP 161/230 kV switchyard, the generator 230 kV overhead tie line and its termination at the proposed new Western Rice 230 kV substation would comply with industry standards and good utility practices, and is acceptable to staff according to engineering LORS.
2. The May 14, 2010 SIS performed by Western and supplementary studies demonstrate that the addition of the 150 MW RSEP would not cause any adverse impacts on the Western P-D system in their DSW region under 2013 heavy summer and 2013 heavy winter system conditions during normal operation (N-0) and emergency Category B and Category C contingencies.
3. The SIS identifies that the project would have some potential overload impacts on the adjacent SCE and IID systems. The addition of the RSEP would cause a new normal (N-0) and a new Category C contingency overload on the SCE Julian Hinds-Mirage 230 kV line, and a new Category B contingency overload on the IID Drop 4-Pilot Knob 92 kV line. In addition the project would also exacerbate pre-project overloads on the SCE Julian Hinds-Mirage 230 kV line and on six transmission elements in the IID system under certain contingency conditions. Sensitivity studies with inclusion of both the RSEP and 110 MW Quartzsite plant also indicate no adverse impacts on the Western P-D system, but identifies similar pattern of potential overload impacts on the SCE and IID systems as with the addition of the RSEP.
4. Western's recent contacts with SCE and IID for comments on the SIS results have received positive responses from SCE and IID and identified potential mitigation options as well as the need for further review, studies and coordination. Staff believes that in the foreseeable future Western, SCE and IID in coordination with California ISO and MWD will develop a viable mitigation plan which would eliminate the identified overloads on the SCE and IID systems. The proposed Condition of Certification TSE 5 f) iv) would, therefore, insure adequate mitigation plan for the identified potential overloads in the SCE and IID systems.
5. The RSEP would meet the requirements and standards of all applicable LORS upon compliance with the recommended Conditions of Certification.
6. The RSEP as a solar generation facility would provide clean renewable energy towards meeting state mandates and goals.

CONDITIONS OF CERTIFICATIONS FOR TSE

The following Conditions of Certification meet the Energy Commission's responsibility to comply with the California Environmental Quality Act and serve as recommendations for the Energy Commission to consider in its decision to avoid or reduce the severity of transmission system engineering-related impacts to less than significant and for the project to conform with all applicable transmission system engineering -related laws, ordinances, regulations, and standards (LORS). The identification of relevant and reasonable mitigation measures also conforms to National Environmental Policy Act

(NEPA) requirements for BLM's and Western's analysis that can be considered in their Records of Decision.

TSE-1 The project owner shall furnish to the CPM and to the CBO a schedule of transmission facility design submittals, a Master Drawing List, a Master Specifications List, and a Major Equipment and Structure List. The schedule shall contain a description and list of proposed submittal packages for design, calculations, and specifications for major structures and equipment. To facilitate audits by Energy Commission staff, the project owner shall provide designated packages to the CPM when requested.

Verification: At least 60 days (or a lesser number of days mutually agreed to by the project owner and the CBO) prior to the start of construction, the project owner shall submit the schedule, a Master Drawing List, and a Master Specifications List to the CBO and to the CPM. The schedule shall contain a description and list of proposed submittal packages for design, calculations, and specifications for major structures and equipment (see a list of major equipment in **Table 1: Major Equipment List** below). Additions and deletions shall be made to the table only with CPM and CBO approval. The project owner shall provide schedule updates in the Monthly Compliance Report.

TSE-2 Prior to the start of construction the project owner shall assign an electrical engineer and at least one of each of the following to the project:

- A. a civil engineer;
- B. a geotechnical engineer or a civil engineer experienced and knowledgeable in the practice of soils engineering;
- C. a design engineer, who is either a structural engineer or a civil engineer fully competent and proficient in the design of power plant structures and equipment supports; or
- D. a mechanical engineer.

(Business and Professions Code Sections 6704 et seq., require state registration to practice as a civil engineer or structural engineer in California.)

The tasks performed by the civil, mechanical, electrical or design engineers may be divided between two or more engineers, as long as each engineer is responsible for a particular segment of the project (e.g., proposed earthwork, civil structures, power plant structures, equipment support). No segment of the project shall have more than one responsible engineer. The transmission line may be the responsibility of a separate California registered electrical engineer. The civil, geotechnical or civil and design engineer assigned in conformance with Facility Design condition **GEN-5**, may be responsible for design and review of the TSE facilities.

The project owner shall submit to the CBO for review and approval, the names, qualifications and registration numbers of all engineers assigned to the project. If any one of the designated engineers is subsequently reassigned or replaced, the project owner shall submit the name, qualifications and registration number of the newly assigned engineer to the CBO for review and approval. The project owner shall notify the CPM of the CBO's approval of the new engineer. This engineer shall be authorized to halt earthwork and to require changes if site conditions are unsafe or do not conform with predicted conditions used as a basis for design of earthwork or foundations.

The electrical engineer shall:

1. Be responsible for the electrical design of the power plant switchyard, outlet and termination facilities; and
2. Sign and stamp electrical design drawings, plans, specifications, and calculations.

Verification: At least 30 days (or a lesser number of days mutually agreed to by the project owner and the CBO) prior to the start of rough grading, the project owner shall submit to the CBO for review and approval, the names, qualifications and registration numbers of all the responsible engineers assigned to the project. The project owner shall notify the CPM of the CBO's approvals of the engineers within five days of the approval.

If the designated responsible engineer is subsequently reassigned or replaced, the project owner has five days in which to submit the name, qualifications, and registration number of the newly assigned engineer to the CBO for review and approval. The project owner shall notify the CPM of the CBO's approval of the new engineer within five days of the approval.

TSE-3 If any discrepancy in design and/or construction is discovered in any engineering work that has undergone CBO design review and approval, the project owner shall document the discrepancy and recommend corrective action (1998 CBC, Chapter 1, Section 108.4, Approval Required; Chapter 17, Section 1701.3, Duties and Responsibilities of the Special Inspector; Appendix Chapter 33, Section 3317.7, Notification of Noncompliance). The discrepancy documentation shall become a controlled document and shall be

submitted to the CBO for review and approval and shall reference this condition of certification.

Verification: The project owner shall submit a copy of the CBO's approval or disapproval of any corrective action taken to resolve a discrepancy to the CPM within 15 days of receipt. If disapproved, the project owner shall advise the CPM, within five days, the reason for disapproval, and the revised corrective action required to obtain the CBO's approval.

TSE-4 For the power plant switchyard, outlet line and termination, the project owner shall not begin any increment of construction until plans for that increment have been approved by the CBO. These plans, together with design changes and design change notices, shall remain on the site for one year after completion of construction. The project owner shall request that the CBO inspect the installation to ensure compliance with the requirements of applicable LORS. The following activities shall be reported in the Monthly Compliance Report:

- a) receipt or delay of major electrical equipment;
- b) testing or energization of major electrical equipment; and
- c) the number of electrical drawings approved, submitted for approval, and still to be submitted.

Verification: At least 30 days (or a lesser number of days mutually agreed to by the project owner and the CBO) prior to the start of each increment of construction, the project owner shall submit to the CBO for review and approval the final design plans, specifications and calculations for equipment and systems of the power plant switchyard, outlet line and termination, including a copy of the signed and stamped statement from the responsible electrical engineer attesting to compliance with the applicable LORS, and send the CPM a copy of the transmittal letter in the next Monthly Compliance Report.

TSE-5 The project owner shall ensure that the design, construction and operation of the proposed transmission facilities will conform to all applicable LORS, including the requirements listed below. The project owner shall submit the required number of copies of the design drawings and calculations to the CBO as determined by the CBO.

- a) The power plant switchyard and outlet line shall meet or exceed the electrical, mechanical, civil and structural requirements of CPUC General Order 95 or National Electric Safety Code (NESC), Title 8 of the California Code and Regulations (Title 8), Articles 35, 36 and 37 of the "High Voltage Electric Safety Orders", California ISO standards, National Electric Code (NEC) and related industry standards.
- b) Breakers and busses in the power plant switchyard and other switchyards, where applicable, shall be sized to accommodate full output from the project and to comply with a short-circuit analysis.
- c) Outlet line crossings and line parallels with transmission and distribution

facilities shall be coordinated with the transmission line owner and comply with the owner's standards.

- d) The project conductors shall be sized to accommodate the full output from the project.
- e) Termination facilities shall comply with applicable Western interconnection standards.
- f) The project owner shall provide to the CPM:
 - i) Evidence that the project owner has received Western's approval of the additional power flow studies performed by Utility System Efficiencies, Inc. dated July 16, 2010 and August 9, 2010, including any subsequent studies that may be necessary to satisfy Western;
 - ii) The Special Protection System (SPS) sequencing and timing if applicable,
 - iii) The Facilities study report performed by Western.
 - iv) A mitigation plan for potential overloads in the SCE and IID systems identified in the Western SIS as approved by Western through the process that involves all stakeholders (Western, California ISO, SCE, IID and MWD) and agreed to by the project owner.
 - v) An Operational study report or procedures from Western based on the expected or current RSEP Commercial Operation Date (COD).
 - vi) A copy of the executed LGIA signed by Western and the project owner.

Verification: At least 60 days prior to the start of construction of transmission facilities (or a lesser number of days mutually agreed to by the project owner and CBO), the project owner shall submit to the CBO for approval:

- a) Design drawings, specifications and calculations conforming with CPUC General Order 95 or NESC, Title 8, Articles 35, 36 and 37 of the "High Voltage Electric Safety Orders", NEC, applicable interconnection standards and related industry standards, for the poles/towers, foundations, anchor bolts, conductors, grounding systems and major switchyard equipment.
- b) For each element of the transmission facilities identified above, the submittal package to the CBO shall contain the design criteria, a discussion of the calculation method(s), a sample calculation based on "worst case conditions"¹ and a statement signed and sealed by the registered engineer in responsible charge, or other acceptable alternative verification, that the transmission element(s) will conform with CPUC General Order 95 or NESC, Title 8, California Code of Regulations, Articles 35, 36 and 37 of the, "High Voltage Electric Safety Orders", NEC, applicable interconnection standards, and related industry standards.

¹ Worst case conditions for the foundations would include for instance, a dead-end or angle pole.

- c) Electrical one-line diagrams signed and sealed by the registered professional electrical engineer in responsible charge, a route map, and an engineering description of equipment and the configurations covered by requirements **TSE-5** a) through f) above.
- d) The Special Protection System (SPS) sequencing and timing if applicable shall be provided concurrently to the CPM.
- e) A mitigation plan for potential overloads in the SCE and IID systems identified in the Western SIS as approved by Western through the process that involves all stakeholders (Western, California ISO, SCE, IID and MWD) and as agreed by the project owner.
- f) The Facilities study report performed by Western.
- g) An Operational study report or procedures from Western based on the expected or current RSEP COD.
- h) A copy of the executed LGIA signed by Western and the project owner.

TSE-6 The project owner shall inform the CPM and CBO of any impending changes that may not conform to requirements **TSE-5** a) through f), and have not received CPM and CBO approval, and request approval to implement such changes. A detailed description of the proposed change and complete engineering, environmental, and economic rationale for the change shall accompany the request. Construction involving changed equipment or substation configurations shall not begin without prior written approval of the changes by the CBO and the CPM.

Verification: At least 60 days prior to the construction of transmission facilities, the project owner shall inform the CBO and the CPM of any impending changes that may not conform to requirements of **TSE-5** and request approval to implement such changes.

TSE-7 The project owner shall provide the following Notice to Western prior to synchronizing the facility with the Western DSW Transmission system:

1. At least one week prior to synchronizing the facility with the grid for testing, provide Western a letter stating the proposed date of synchronization; and
2. At least one business day prior to synchronizing the facility with the grid for testing, provide telephone notification to the Western Outage Coordination Department.

Verification: The project owner shall provide copies of the Western letter to the CPM when it is sent to Western one week prior to initial synchronization with the grid. The project owner shall contact the Western Outage Coordination Department, Monday through Friday, between the hours of 0700 and 1530 at least one business day prior to synchronizing the facility with the grid for testing. A report of conversation with Western shall be provided electronically to the CPM one day before synchronizing the facility

with the Western DSW transmission system for the first time.

TSE-8 The project owner shall be responsible for the inspection of the transmission facilities during and after project construction, and any subsequent CPM and CBO approved changes thereto, to ensure conformance with CPUC GO-95 or NESC, Title 8, CCR, Articles 35, 36 and 37 of the, “High Voltage Electric Safety Orders”, applicable interconnection standards, NEC and related industry standards. In case of non-conformance, the project owner shall inform the CPM and CBO in writing, within 10 days of discovering such non-conformance and describe the corrective actions to be taken.

Verification: Within 60 days after first synchronization of the project, the project owner shall transmit to the CPM and CBO:

- a) “As built” engineering description(s) and one-line drawings of the electrical portion of the facilities signed and sealed by the registered electrical engineer in responsible charge. A statement attesting to conformance with CPUC GO-95 or NESC, Title 8, California Code of Regulations, Articles 35, 36 and 37 of the, “High Voltage Electric Safety Orders”, and applicable interconnection standards, NEC, related industry standards, and these conditions shall be provided concurrently.
- b) An “as built” engineering description of the mechanical, structural, and civil portion of the transmission facilities signed and sealed by the registered engineer in responsible charge or acceptable alternative verification. “As built” drawings of the electrical, mechanical, structural, and civil portion of the transmission facilities shall be maintained at the power plant and made available, if requested, for CPM audit as set forth in the “Compliance Monitoring Plan”.

A summary of inspections of the completed transmission facilities, and identification of any nonconforming work and corrective actions taken, signed and sealed by the registered engineer in charge.

DEFINITION OF TERMS

ACSR

Aluminum cable steel reinforced.

AAC

All Aluminum conductor.

Ampacity

Current-carrying capacity, expressed in amperes, of a conductor at specified ambient conditions, at which damage to the conductor is nonexistent or deemed acceptable based on economic, safety, and reliability considerations.

Ampere

The unit of current flowing in a conductor.

Kiloampere

(kA) 1,000 Amperes

Bundled

Two wires, 18 inches apart.

Bus

Conductors that serve as a common connection for two or more circuits.

Conductor

The part of the transmission line (the wire) that carries the current.

Congestion Management

Congestion management is a scheduling protocol, which provides that dispatched generation and transmission loading (imports) would not violate criteria.

Emergency Overload

See Single Contingency. This is also called an L-1.

Kcmil or KCM

Thousand circular mil. A unit of the conductor's cross sectional area, when divided by 1,273, the area in square inches is obtained.

Kilovolt (kV)

A unit of potential difference, or voltage, between two conductors of a circuit, or between a conductor and the ground. 1,000 Volts.

Kiloampere (kA)

A unit of current flow in a conductor. 1,000 amperes.

Loop

An electrical cul de sac. A transmission configuration that interrupts an existing circuit diverts it to another connection and returns it back to the interrupted circuit, thus forming

a loop or cul de sac.

Megavar

One megavolt ampere reactive.

Megavars

Megavolt Ampere-Reactive. One million Volt-Ampere-Reactive. Reactive power is generally associated with the reactive nature of motor loads that must be fed by generation units in the system.

Megavolt ampere (MVA)

A unit of apparent power, equals the product of the line voltage in kilovolts, current in amperes, the square root of 3, and divided by 1000.

Megawatt (MW)

A unit of power equivalent to 1,341 horsepower.

Normal Operation/ Normal Overload

When all customers receive the power they are entitled to without interruption and at steady voltage, and no element of the transmission system is loaded beyond its continuous rating.

N-1 Condition

See Single Contingency.

Outlet

Transmission facilities (circuit, transformer, circuit breaker, etc.) linking generation facilities to the main grid.

Power Flow Analysis

A power flow analysis is a forward looking computer simulation of essentially all generation and transmission system facilities that identifies overloaded circuits, transformers and other equipment and system voltage levels.

Reactive Power

Reactive power is generally associated with the reactive nature of inductive loads like motor loads that must be fed by generation units in the system. An adequate supply of reactive power is required to maintain voltage levels in the system.

Remedial Action Scheme (RAS)

A remedial action scheme is an automatic control provision, which, for instance, would trip a selected generating unit upon a circuit overload.

SSAC

Steel Supported Aluminum Conductor.

SF6

Sulfur hexafluoride is an insulating medium.

Single Contingency

Also known as emergency or N-1 condition, occurs when one major transmission element (circuit, transformer, circuit breaker, etc.) or one generator is out of service.

Solid dielectric cable

Copper or aluminum conductors that are insulated by solid polyethylene type insulation and covered by a metallic shield and outer polyethylene jacket.

Switchyard

A power plant switchyard (switchyard) is an integral part of a power plant and is used as an outlet for one or more electric generators.

Thermal rating

See ampacity.

TSE

Transmission System Engineering.

TRV

Transient Recovery Voltage

Tap

A transmission configuration creating an interconnection through a sort single circuit to a small or medium sized load or a generator. The new single circuit line is inserted into an existing circuit by utilizing breakers at existing terminals of the circuit, rather than installing breakers at the interconnection in a new switchyard.

Undercrossing

A transmission configuration where a transmission line crosses below the conductors of another transmission line, generally at 90 degrees.

Underbuild

A transmission or distribution configuration where a transmission or distribution circuit is attached to a transmission tower or pole below (under) the principle transmission line conductors.

APPENDIX TO TRANSMISSION SYSTEM ENGINEERING RSEP TELECOMMUNICATIONS INTERCONNECTION ACTIONS IMPACT ANALYSIS

Testimony of Suzanne Phinney, D.Env.

INTRODUCTION AND PURPOSE

The Energy Commission has the exclusive authority to certify the construction and operation of thermal electric power plants 50 megawatts (MW) or larger and associated facilities. The Energy Commission also has the licensing authority up to the first point of interconnection for transmission facilities. Additionally, under the California Environmental Quality Act (CEQA), the Energy Commission must conduct an environmental review of the “whole of the action,” which may include facilities not licensed by the Energy Commission. Similarly, the Western Area Power Administration (Western) and the Bureau of Land Management (BLM) are conducting an environmental analysis of the RSEP, pursuant to the National Environmental Policy Act (NEPA). NEPA also requires an analysis of “reasonably foreseeable” effects.

Energy Commission staff has prepared this Transmission System Engineering (TSE) Appendix to the Staff Assessment (SA) for the Rice Solar Energy Project (RSEP) to discuss reasonably foreseeable telecommunications interconnection action alternatives. A dual-path telecommunications interconnection between the RSEP and a Western substation would be required for breaker control, protective relaying, metering, and other data and control needs (CH2MHill 2010k). To provide redundancy, two separate paths of communication may be necessary.

The telecommunication pathway from the new RSEP power plant to the new Rice interconnection substation would likely consist of a fiber optic cable that would be incorporated with the 10-mile long overhead generation tie line to the new Rice substation. From the new substation interconnecting the RSEP to Western’s system, telecommunications would be established in one of the following manners via: 1) replacing one of two existing overhead ground wires on the Parker-Blythe #2 transmission line with a fiber optic core overhead ground wire or adding an all-dielectric, self-supporting (ADSS) optical cable extending to either or both of Western’s existing Parker and Blythe substations; 2) microwave (radio-frequency) transmission from either RSEP or the new substation to terminate at either Western’s Blythe, Headgate Rock, or Black Point substations or to an existing telecommunications site at Cunningham Mountain; or 3) power line carrier/broadband-over-Power-Line.

The RSEP applicant has provided an overview of the general construction required for these alternatives. It is a planning level description and site-specific engineering and design documents would be prepared at a later date, following final selection of the preferred telecommunication system. The analysis in TSE Appendix A provides as detailed an analysis as possible with the information available for the project at this time.

The purpose of staff’s analysis is to inform the Energy Commission, interested parties and the general public of the potential environmental and public health effects caused

by the approval of the RSEP. The analysis draws conclusions as to the likelihood that installation of a telecommunications system could be accomplished with no significant environmental impacts, and identifies mitigation measures that could be enacted to ensure that the telecommunications system would not cause significant impacts. The analysis discusses environmental issues that generally reflect the CEQA checklist (Appendix G), but does not include sections specific to power plant operations (Facility Design, Power Plant Efficiency, Power Plant Reliability, and Transmission Line Safety and Nuisance). The construction-related analysis and proposed mitigation measures in those sections of the SA for the RSEP project provide a general understanding of the potential impacts in those areas that could possibly, but not likely, be caused by telecommunication interconnection actions.

CONSTRUCTION METHODS FOR TELECOM ALTERNATIVES

FIBER-OPTIC CABLE ALTERNATIVE

Fiber optic line would likely be utilized on the generation tie line to allow communication between the RSEP and the new Rice interconnection substation. and further, could be used to allow communication between the RSEP and Western's system, through the OPGW on the Parker-Blythe No. 2 transmission line. Under this option, new OPGW or ADSS optical cable would be installed onto the existing Parker-Blythe #2 161-kV transmission line wood H-frame structures in both the north and south directions from the initial point of interconnection for a total of 62 miles (see **TSE Appendix A – Figures 1 and 2**). The Parker-Blythe #2 line extends north from the Blythe substation, then bears northeast between the Rice Valley Wilderness and the Big Maria Mountains Wilderness, then continues northeast along the western boundary of the Riverside Mountains Wilderness, and then follows the Colorado River on uninhabited desert land at a distance of 3 to 5 miles from the river before finally reaching Parker Dam. Additional BLM wilderness areas in the area include the Palen-McCoy Wilderness and the Whipple Mountains Wilderness.

The nearest major towns to the line are Parker, Arizona and Blythe, California. Roads intersecting the line include Midland Road, SR 62 and US 95. SR 62 is eligible for designation as a scenic highway in Riverside and San Bernardino Counties, but it has not been designated as such.

Potential viewers of the project area include travelers along SR 62, which runs east-west along the project's northern boundary. A second group of potential viewers includes recreational viewers traveling to and from off-highway use and wilderness areas on unpaved roads traveling mostly north-south.

One of the two, existing overhead ground wires (OGW) on the line would be replaced with OPGW. As the old OGW is removed, it would be used to pull the new OPGW into place. A manlift truck (multi-axle, rough terrain vehicle with an articulating boom and man-bucket) would first be used to install special hardware allowing installation of the new (OPGW) through each structure. Pulling/tensioning sites (with trucks with spools of cable, tensioners (winches) and other equipment) would be placed about every three miles (to pull out the old OGW, and pull the new OPGW into place. The truck-mounted tensioner would be located at one end and a reel truck and trailer at the other end.

Pulling/splicing/tensioning sites would temporarily disturb an area about 200 feet by 400 feet oriented in line with and centered on the existing right of way. A total of 21 tensioning sites on undisturbed land would be utilized. Vehicles would use the existing maintenance road for all access along the transmission line. Maintenance or reconstruction of the existing access road or use of heavy equipment to tow vehicles in inaccessible areas may be required. Off-road vehicles may be needed to access certain areas (e.g., rugged mountainous portions of the dirt road, drift sands at the valley floor) or helicopters may be required for aerial installation. The vehicles may also need to drive off the dirt roads to set up and pull the OPGW or ADSS optical cable into place; sites used for original construction of the transmission line would be used to the extent possible.

A total of 524 structures would be accessed, including 489 on undeveloped desert land and 35 on abandoned agricultural land. There would be temporary disturbance of an area 50 feet in radius around each of the 489 structures on undeveloped land; a 100-foot radius would be required for splice structures.

At the new substation site, a connection would be made to the fiber optic overhead ground wire at the first line structure within the switchyard (the "Takeoff" Structure) splicing the OPGW to a fiber optic duct cable connecting to the substation via the cable trench. Equipment used would include rubber tired manlifts, rubber-tired spooling trucks, and pickup trucks.

The ADSS optical cable would be installed above ground by one of two methods: 1) ADSS suspended from the existing transmission line structures beneath the existing high-voltage conductors and; 2) ADSS wrapped directly onto one of the existing overhead ground wires. At the time of preparing this SA-DEIS, Western was still evaluating options for the telecommunications between RSEP and Western's substations.

Underground cable buried along a route from the new RSEP substation that parallels/is adjacent to the Parker-Blythe #2 line to the Parker Dam substation or that proceeds from the RSEP site directly to the Parker Dam Substation using SR 62 right-of-way is not considered feasible by Western. Western's Headgate Rock substation is located on the Parker, Arizona side of the Colorado River and a river crossing with buried fiber-optic cable would be impracticable.

MICROWAVE ALTERNATIVE

Under this option, station monitoring and control information would be transmitted to one of Western's existing communications sites via microwave telemetry from a transmitter at the RSEP site or the new substation interconnection site. Either a direct, line-of-sight path to an existing Western microwave site along the Colorado River, an indirect path using an intermediate existing site such as Cunningham Mountain (operated by other entities), or new repeater sites could be utilized. Microwave towers at existing Western substations located near Blythe, CA (Blythe Substation) or Parker, AZ (Headgate Rock Substation) or at Black Point Substation could also be used as is, or heightened, to gain access to Western's system (see **TSE Appendix A – Figure 2**) . An intermediate tower may also be necessary depending on the path chosen and the

height that the transmitting and receiving dishes can be mounted at the terminal ends of the microwave path between RSEP and Western. Under this alternative, fiber optical cable could be buried underground (using simple trenching methods) along the SR 62 ROW to a microwave tower facility.

At the RSEP site, radio-frequency conversion equipment would be co-located within the electrical equipment room located at the 500-foot elevation inside the solar tower. A 6-foot dish could be mounted on the solar receiver tower (subject to detailed engineering) without increasing the overall height of the 653-foot structure, gaining elevation and line-of-sight potential to existing Western sites.

BROADBAND-OVER-POWER LINE (BPL) ALTERNATIVE

Under this option, data would be sent along the high-voltage conductor and would require no additional physical facilities or installation other than signal conditioning equipment at the sending and receiving terminals. A similar but older technology has been used by Western in the past.

ENVIRONMENTAL IMPACTS OF TELECOM ALTERNATIVES

AIR QUALITY

Setting and Existing Conditions

The line traverses both Riverside and San Bernardino Counties and would be within the jurisdiction of the Mojave Desert Air Basin (MDAB). MDAB is an assemblage of mountain ranges interspersed with long broad valleys, with a dry, hot desert climate. Air quality regulations in the MDAB are provided by the Mojave Desert Air Quality Management District (MDAQMD).

Termination of the OPGW or ADSS paths would be at the Parker Dam 161-kV Switchyard and the Blythe Substation, both located in southeastern California. Under the microwave alternatives, existing communications sites would be used in both La Paz and Mohave counties in Arizona or San Bernardino, Riverside and Imperial counties in California. Air quality at locations in La Paz and Mohave counties would be regulated by the Arizona Department of Environmental Quality and air quality conditions would be similar to that on California side of the Colorado River boundary between the two states. Air quality at locations in San Bernardino, Riverside, and Imperial counties would be regulated by the California Air Resources Board. The affected environment is the same as that for the RSEP, described in Section C.1 of the Staff Assessment (SA). No sensitive receptors are expected in areas where telecommunication system alternatives would be constructed.

Assessment of Impacts and Discussion of Mitigation

Fiber-optic Cable Alternative

The installation of approximately 62 miles of new overhead fiber-optic cable on existing transmission line structures would be located largely within utility rights-of-way along existing dirt roads, although some off-road construction vehicle travel is anticipated. Above-ground cable installation would generate minor amounts of vehicle exhaust emissions. The diesel PM emissions generated from proposed construction equipment

and mobile sources are not anticipated to subject sensitive receptors to adverse levels of diesel PM or other emissions.

Installation of fiber-optic cable would be short-term in duration. Control measures identified in Section C.1 of the SA would reduce equipment and fugitive dust emissions to less than significant levels.

Microwave Alternative

Construction of a new or heightened tower at an existing Western substation and possibly an intermediate repeater site would create short-term emissions from installation equipment and vehicle travel. If communications data is sent to the intermediate repeater site via buried fiber-optic cable, trenching activities within the SR-62 ROW would generate minor levels of fugitive dust. Control measures identified in Section C.1 of the SA would reduce equipment and fugitive dust emissions to less than significant levels.

BPL Alternative

No emissions are expected with the BPL Alternative and no mitigation measures to reduce air quality impacts would be needed.

BIOLOGICAL RESOURCES

Setting and Existing Conditions

The study area for biological resources evaluation includes the area occupied by the existing transmission line ROW and environs, SR 62 ROW, and land where microwave towers may be installed. Habitat types may include Sonoran creosote bush scrub, desert dry wash woodland, floodplain woodland and scrub, agriculture and other disturbed or developed land. These habitat types support a diverse assemblage of native plants and wildlife species, including those recognized as special-status by the U.S. Fish and Wildlife Service, Bureau of Land Management, Arizona Game and Fish Department, and California Department of Fish and Game. In addition, biological resources or sensitive habitats under the jurisdiction of the aforementioned agencies and/or the U.S. Army Corps of Engineers (e.g., wetlands and waters of the U.S. or state) may occur within the telecommunication system project area. The special-status species and biological resources considered in the RSEP SA/DEIS and Western's Environmental Assessment for the Blythe – Headgate Rock 161-kV Transmission Line (Western 2005) may also occur within the telecommunication system project area; surveys conducted for future permitting efforts for the selected telecommunication system alternative may identify additional biological resources.

Assessment of Impacts and Discussion of Mitigation

Fiber-optic Cable Alternative

Although construction activities would occur in an existing utility ROW, temporary and permanent ground disturbance would occur and the use of construction equipment could result in various direct and indirect impacts to plants, wildlife, and habitat. Rare plant and wildlife surveys would be required to identify the distribution of potentially affected special-status species.

Direct impacts to native vegetation communities and special-status plants could occur

during trenching and grading, or if plants are crushed or otherwise damaged by construction equipment and vehicle or foot traffic. Ground-disturbing activities have the potential to indirectly affect adjacent vegetation communities by facilitating the transport and dispersal of invasive weed propagules, thereby potentially introducing new weeds and exacerbating invasions already present in the project vicinity.

Potential impacts to special-status wildlife include direct mortality from encounters with construction equipment, burrow/nest destruction during equipment staging, entombing adults, eggs, or young, and disruption or harassment. In addition, short and long-term habitat loss, modification, and fragmentation, as well as the potential spread of noxious weeds could decrease local and regional wildlife habitat values.

Direct impacts to potentially jurisdictional waters or other sensitive aquatic habitat could occur from trenching and the concomitant erosion and sedimentation from soil disturbance.

Consultation with resource agencies would be required to identify appropriate impact avoidance, minimization, and mitigation measures and ensure compliance with applicable LORS. Standard best management practices should be implemented to avoid impacts. In addition, it is likely that mitigation measures similar to those proposed in the RSEP SA/DEIS would be required. Although without additional information, it is not possible to determine if impacts could be mitigated below the level of significance. Measures may include, but are not limited to:

- Prepare and implement special-status species impact avoidance/ minimization plans
- Prepare and implement special-status species translocation/relocation plans
- Acquire and/or enhance compensatory habitat
- Restore temporarily disturbed areas
- Designate a lead biologist to be on-site during construction activities to supervise, conduct and coordinate mitigation, monitoring and other biological resource compliance efforts.
- Develop and implement a Worker Environmental Awareness Program to inform and educate workers prior to site mobilization about sensitive biological resources associated with the project.

Microwave Alternative

Construction of a new or heightened tower at an existing Western substation and possibly a new repeater site would result in temporary and permanent ground disturbance. If communications data are sent to the intermediate repeater site via buried fiber-optic cable, temporary disturbance would occur from trenching activities within the SR-62 ROW. Impacts to biological resources and recommended mitigation measures would be similar to those discussed above for the Fiber-optic Cable Alternative.

BPL Alternative

Impacts to biological resources are not anticipated under the BPL Alternative.

CULTURAL RESOURCES

The cultural resources analysis of the telecommunication system alternatives is based on the applicant-provided cultural resource information for the RSEP (CH2MHill 2010e), previous cultural resource surveys of the Parker-Blythe #2 transmission line, and the Cultural Resources Assessment for the RSEP Project.

Setting and Existing Conditions

The study area for cultural resources evaluation includes the area occupied by the existing transmission line ROW and environs, SR 62 ROW, and land where microwave repeaters may be installed.

Regional Setting

The project area includes the Vidal Valley, Rice Valley and Palo Verde Mesa. The Vidal Valley is bounded by the West Riverside and Riverside Mountains on the south, the Turtle Mountains on the west, the Turtle and Whipple Mountains on the north, and the Colorado River on the east. The Rice Valley is bounded by the Big and Little Maria Mountains on the south and the Riverside Mountains on the east. The Palo Verde Mesa is bounded on the north by portions of both the Little and Big Maria Mountains, on the west by the McCoy and Mule Mountains, and on the south by the Palo Verde Mountains.

Humans have inhabited this region for the last 10,000 years, with the population ebbing and flowing primarily in response to several climatic shifts. Within the region, prehistoric sites are clustered around springs, wells, and other obvious important features/resources. Sites include villages with cemeteries, occupation sites with and without pottery, large and small concentrations of ceramic sherds and flaked stone tools, rock art sites, rock shelters with perishable items, rock rings/stone circles, geoglyphs, and cleared areas, a vast network of trails, markers and shrines, and quarry sites.

This region does not appear to be associated clearly with any historic Native American group (Singer 1984, pp. 36-38). However, seven groups - Chemehuevi, Serrano, Cahuilla, Mojave, Quechan, Maricopa, and Halchidhoma - claim territory nearby or describe this region in their oral history. The trails, rock art, geoglyphs and other prehistoric features are still of religious importance to many of these Native American groups.

The major historical themes for the project area are the establishment transportation routes, mineral exploitation, and military uses. Mineral deposits identified in the region include gold, silver, fluorite, manganese, copper, gypsum, and uranium. Most mining in the region took place in the 1880s and 1890s. Evidence of mining activity in the region primarily takes the form of access roads, pit mines, tailing piles, and refuse. Military uses of the region are primarily associated with Gen. Patton's World War II Desert Training Center/California-Arizona Maneuver Area (DTC/C-AMA), which was in operation from 1942 till 1944. The area was chosen by Gen. Patton to prepare troops for the harsh conditions and environment of combat for the North Africa Campaign. At 12,000,000 acres, the DTC/C-AMA was the largest-ever military training center. The remains of the DTC/C-AMA areas consist of rock features, faint roads, structural

features, concertina wire, tank tracks, footprints of runway and landing strips, foxholes and bivouacs, concrete defensive positions, refuse, and trails (Bischoff 2000).

Existing Resources

Recent surveys associated with other nearby solar energy projects currently being evaluated by the Energy Commission suggest that multiple prehistoric and historic sites and isolates occur in the region. In particular staff expects that contributing elements to two recently defined cultural landscapes may be encountered (NPS 1996). The Cultural Resources section of the SA provides a discussion of resources associated with the telecommunications interconnection actions.

Staff has proposed the Prehistoric Trails Network Cultural Landscape (PTNCL), which is a noncontiguous cultural landscape (historic district) that consists of important destinations in the Colorado Desert near Blythe, California, the network of trails that tie them together, and the features and sites associated with the trails. Native American groups in the Mojave and Colorado Deserts accord mythological importance to springs, petroglyph sites, and trail systems. As such, staff considers the resources that make up the PTNCL to be significant under NRHP Criterion A (CRHR Criteria 1), for their ties to important events in American history. These sites are also considered register-eligible under Criterion D/4 for their ability to yield information important in history and prehistory. As both ethnographic and archaeological resources, PTNCL sites are subject to both direct and indirect project impacts. Indirect impacts include the visual degradation of the historical integrity of a resource through the construction of solar projects and their associated downstream improvements.

Staff has also proposed the creation of the Desert Training Center California-Arizona Maneuver Area (DTC/C-AMA) Cultural Landscape (DTCCL), a contiguous cultural landscape (historic district) that incorporates historical archaeological sites associated with General Patton's Desert Training Center (Bischoff 2000). Most property types associated with the DTC/C-AMA exist today as archaeological resources. These sites would be considered primarily eligible under NRHP Criterion D (CRHR Criterion 4) for their ability to yield information important in history. As many contributing elements to both of these landscapes are often considered not to be significant in their own right, staff expects that previously identified cultural resources would need to be re-evaluated.

Assessment of Impacts

Direct Impacts

Fiber-optic Cable Alternative

Direct impacts to cultural resources would potentially occur from ground disturbance during construction. Staff expects ground disturbance associated with the installation of fiber-optic cable on existing transmission towers to be minor and temporary.

Microwave Alternative

Construction of a new tower at the Headgate Rock substation and possibly an intermediate tower in the Rice Valley, and possible trenching for underground cable

installation along SR 62, would result in ground disturbance consisting of site grading, compaction for construction, and excavation for tower footings. This disturbance could significantly impact any cultural resources present. While many of these resources may have been damaged by previous construction, any additional work may result in their complete destruction. However, installation of transmitting and receiving towers would occur within areas already disturbed, such as within the RSEP power block and an existing substation or telecommunications facility. If an intermediate microwave tower was needed, its location could be selected to avoid cultural resources following survey of the general location.

BPL Alternative

No direct impacts to cultural resources would occur under the BPL Alternative.

Indirect Impacts

Indirect impacts to cultural resources can have both physical and cultural or spiritual components. Western and BLM are in charge of consulting with local Native American groups regarding impacts and potential mitigation resulting from construction of the telecommunication system alternative. Previous research suggests that the project area is one of high ethnographic sensitivity. Unidentified Traditional Cultural Properties may be present.

Mitigation

Implementation of the cultural resources conditions of certification proposed in the RSEP SA would reduce direct impacts to cultural resources to less than significant.

- **CUL-1** and **CUL-2** would fund programs to define, document, and nominate to the NRHP two cultural landscapes.
- **CUL-3** and **CUL-4** are administrative conditions regarding the programs.
- **CUL-5** provides for the preparation and implementation of the Cultural Resources Monitoring and Mitigation Plan (CRMMP).
- **CUL-7** and **CUL-8** are treatment conditions for direct impacts to historic-period and prehistoric resources.
- **CUL-9** would provide training of project personnel.
- **CUL-10** and **CUL-11** would provide construction monitoring and cultural resources discovery protocols.
- **CUL-12** provides for the preparation of a final report to analyze, interpret, and document the ultimate results of the project cultural resources management program.

GEOLOGY AND PALEONTOLOGY

Setting and Existing Conditions

The telecommunication system alternatives would be located in the Mojave Desert physiographic province in Southern California. The Mojave Desert is bounded on the north and northwest by the Tehachapi Mountains, on the west by the Garlock fault, on the east by the Colorado River, and on the south and southwest by the San Andreas

Fault. The Mojave Desert is a broad interior region of isolated mountain ranges which separate vast expanses of desert plains and interior drainage basins.

The topography in the Mojave Desert of California is predominately southeast to northwest, and is associated with similarly-oriented faulting. A secondary east to west orientation correlates with structural trends in the Transverse Ranges physiographic province.

The region encompassing the proposed project is characterized by broad alluvial basins of Cenozoic sedimentary and volcanic materials overlying older plutonic and metamorphic rocks. The plutonic and metamorphic rocks are exposed as eroded hills throughout the region. The alluvial basins are up to several thousand feet thick.

Assessment of Impacts and Discussion of Mitigation

Fiber-optic Cable Alternative

Almost all construction activity associated with fiber-optic cable installation would be within existing ROWs. Construction of the telecommunications facilities would not be expected to disturb significant paleontological resources located within the project area. Indirect impacts to paleontological resources from erosion of features due to channeling of runoff from grading activities for new access roads would also not be expected.

Implementation of the recommended mitigation measures discussed under **Soils and Water Resources** would reduce the amount of erosion that would result from construction (e.g., preparation and implementation of a SWPPP). With implementation of measures and best management practices that would ensure proper re-vegetation, erosion control, drainage, seismic design, among other requirements, impacts from installation of fiber-optic cable would result in a less than significant impact to geology.

Microwave Alternative

Because of the limited area impacted by the construction of a new or heightened tower at one of Western's existing substations and possibly an intermediate repeater site in the Colorado River Valley or Rice Valley, significant impacts to paleontological resources from construction-related ground disturbances are not expected. If communications data is sent to the intermediate tower via buried fiber-optic cable, trenching activities would be within the already disturbed SR-62 ROW, thus reducing impacts.

BPL Alternative

No impacts to geology and paleontology would occur under the BPL alternative.

LAND USE

Setting and Existing Conditions

The telecommunication system alternatives area includes lands managed by the BLM, the Bureau of Indian Affairs/Colorado River Indian Tribes (BIA/CRIT) and private lands. The Parker-Blythe #2 line is within a Department of Energy transmission line corridor. Agricultural land is crossed by the transmission line ROW near its southern terminus near Blythe. The telecommunication system alternatives would conform to the BLM

Yuma Field Office Resource Management Plan (as amended Feb. 1987) and the BLM California Desert Conservation Area Plan (1980).

Assessment of Impacts and Discussion of Mitigation

Fiber-optic Cable Alternative

No impacts to existing or planned residential, commercial, or industrial uses would be expected to occur. Because stringing of cable would occur within an existing transmission line corridor, there would be no long-term impacts to areas of existing residential development near Parker and Blythe, and on CRIT lands. Direct impacts to land use as a result of construction activity along roadway ROW would be temporary and minimal. A small number of transmission structures are on abandoned agricultural lands and no impacts to agricultural activity would occur. The temporary nature of construction would limit impacts to recreation. Creation of new access road, if required and the use of existing roads are not expected to change the use of the access roads or increase accessibility of areas for other users. The use and management of existing roads would remain unchanged. Affected BLM lands would remain available for dispersed recreation activities. No indirect or permanent impacts to land use, preservation, and recreation are expected as a result of fiber-optic cable installation. Access to adjacent recreation areas from users is not expected to change because the condition of the roads is expected to remain relatively unchanged.

Microwave Alternative

Land use impacts are not expected from construction of a new or heightened tower at an existing Western substation and possibly an intermediate repeater site in the Colorado River Valley or Rice Valley. Buried cable along SR 62 would also not impact residential development.

BPL Alternative

No impacts to land use would occur under the BPL Alternative.

NOISE AND VIBRATION

Setting and Existing Conditions

The telecommunication system project area is located within the eastern portions of Riverside and San Bernardino Counties in California and in the western boundary of La Paz, Arizona. The area includes primarily remote areas as well as the towns of Parker, Arizona and Blythe, California. Noise regulations in the downstream upgrades area are provided by the respective counties.

Assessment of Impacts and Discussion of Mitigation

Fiber-optic Cable Alternative

Fiber-optic cable installation would use typical construction equipment, estimated to generate maximum noise levels of short duration not to exceed 90 dBA at 50 feet, or average levels of approximately 80 dBA Leq at 50 feet. At 100 feet, these levels would attenuate below typical levels of significance (75 dBA Leq). Since the potential cable routes would be primarily located in existing utility rights-of-way along existing roadways and transmission lines, off-road construction vehicle travel is anticipated to be minor.

Off-road vehicles may be needed to access certain areas (e.g., rugged mountainous portions of the dirt road, drift sands at the valley floor) or helicopters may be required for aerial installation. These situations would occur in remote areas with no receptors.

Microwave Alternative

Construction of a new tower at the Headgate Rock substation and possibly an intermediate tower in the Rice Valley would create short-term noise levels from installation equipment and vehicle travel. Mitigation measures would not be needed beyond those required by LORS or incorporated within Western's best practices.

BPL Alternative

No emissions are expected with the BPL Alternative and no mitigation measures to reduce noise levels would be needed.

SOCIOECONOMICS

Setting and Existing Conditions

The Town of Parker, Arizona is the northern point of the project area and the City of Blythe is the southern point. Parker's population in 2008 was 3,385 (Arizona Department of Commerce 2010). The town's economy is based primarily on tourism, retail trade and services. The Colorado River provides many water-based recreational activities and makes Parker a destination point for tourists and winter visitors. Parker also serves as the trade and retail center for the CRIT and other small towns in the area. The unemployment rate was 6.8% in 2008.

The City of Blythe is the southern point of the project area. Its population in 2008 was 21,695 (Riverside County 2009). Agriculture is the largest sector of employment in the economy. The second largest is in the service industry - motels, restaurants and campgrounds. Its location near the Colorado River provides recreational opportunities. The two state prisons west of the city (Ironwood and Chuckawalla State Prisons) collectively have approximately 1,914 employees. The unemployment rate was 16.5% in 2009.

The remaining portions of the project area are undeveloped with no residents.

Assessment of Impacts and Discussion of Mitigation

Fiber-optic Cable Alternative

In comparison to construction of the RSEP, a minimal workforce would be required for construction of any of the telecommunication system alternatives. The telecommunication system construction would not cause a significant adverse impact on population, employment, housing, public finance, local economies, or public services. In addition, because there would be no adverse project-related socioeconomic impacts, minority and low-income populations would not be disproportionately impacted. The anticipated downstream upgrades would slightly benefit the study area in terms of an increase in local expenditures and payrolls during construction. These activities would have a short-term positive effect on the local and regional economy. No impact minimization measures are recommended.

Microwave Alternative

Similar to the fiber-optic cable alternative discussion above, no adverse socioeconomic impacts are expected.

BPL Alternative

No socioeconomic impacts would occur under the BPL Alternative.

SOIL AND WATER RESOURCES

Setting and Existing Conditions

The setting for the telecommunications system options is generally the Vidal Valley, Rice Valley and Palo Verde Mesa. Vidal Valley, in southeastern San Bernardino County, encompasses roughly the northern third of the Parker-Blythe No. 2 161kV line. The Vidal Valley Groundwater Basin is bounded by the non-waterbearing rocks of the West Riverside and Riverside Mountains on the south, the Turtle Mountains on the west, the Turtle and Whipple Mountains on the north, and a diffuse drainage divide on the east. Surface water drains southeastward via the Vidal Wash to the Colorado River.

The Rice Valley generally encompasses the middle third of the 161 kV line. The Valley extends across the Riverside and San Bernardino County line and is bound by the Big and Little Maria Mountains in the south and the Riverside Mountains in the east. The Rice Valley is hydraulically connected to both the Ward Valley to the northwest and the Vidal Valley to the northeast. Surface water runoff from the mountains drains towards the center of the valley, except in the eastern part of the valley, where Big Wash drains to the Colorado River.

The Palo Verde Mesa generally encompasses the southern third of the transmission line. The mesa is bounded on the north by portions of both the Little and Big Maria Mountains, on the west by the McCoy and Mule Mountains, and on the south by the Palo Verde Mountains. Soils tend to be well to excessively drained, coarse grained, sands, gravels and loam with relatively low erosion hazards. The McCoy Wash, its major hydrologic feature, is dry, except during intense but infrequent, short-duration summer storms.

Assessment of Impacts and Discussion of Mitigation

Fiber-optic Cable Alternative

The fiber-optic line routes would cross several soils types with differing susceptibility to wind and water erosion and compaction. Soil disturbed during cable stringing is more susceptible to erosion and compacted soil can accelerate storm water erosion. New access roads, particularly in the mountainous portion of the line, could also increase erosion. In addition, the proposed fiber-optic line routes would cross numerous ephemeral streams. Vehicles and equipment crossing these ephemeral streams would disturb and compact the soil and potentially cause the loss of stabilizing vegetation.

The **Soil and Water Resources** section of the SA discusses mitigation measures that are designed to avoid and reduce the amount of soil loss due to wind and water erosion.

While soil erosion would be limited as a result of the temporary nature of cable stringing activities, the following general measures would reflect best practices:

- Erosion control measures should be developed and implemented to ensure minimum soil loss and to maintain water quality.
- Measures should be taken to insure that contaminants would not be discharged from the construction site.
- Soils and vegetation disturbance and removal should be limited to the minimum area necessary for access and construction.
- Removed topsoil should be segregated and stockpiled for reuse if practicable.
- All areas disturbed by the construction activity, except for access roads, should be restored to preconstruction conditions.

Microwave Alternative

Construction of a new tower at the Headgate Rock substation, or an intermediate tower in the Rice Valley and possibly trenching along SR 62 would create temporary, minor impacts from soil disturbance and erosion. Mitigation measures as described above and included in the **Soils and Water Resources** section of the SA would further reduce impacts.

BPL Alternative

No impacts to soils and water resources would occur under the BPL alternative.

TRAFFIC & TRANSPORTATION

Setting and Existing Conditions

The telecommunication system alternatives would involve construction along transmission line ROWs (dirt roads) and along SR 62. SR 62 is an undivided two-lane highway in California, but widens to four lanes in downtown Parker, Arizona. SR 177 intersects SR 62 approximately 25 miles southwest of the RSEP site. The portion of SR 62 west of SR 177 is also known as Aqueduct Road. US Route 95 (US 95) connects I-40 and I-10 in the north/south direction and intersects with SR 62 approximately 16 miles east of the RSEP site. The RSEP AFC indicates that, according to traffic counts published in 2008, the average 2009 daily traffic volume on SR 62 near the junction with SR 177 is 2,200 vehicles per day. Trucks comprise approximately 7 to 21% of all traffic (RSEP 2009a).

Assessment of Impacts and Discussion of Mitigation

Fiber-optic Cable Alternative

Most cable installation would occur within transmission line ROWs and would not affect local roadways. Some short-term impacts to traffic and transportation could occur in proximity to either the Blythe or Parker Dam substations. Western would be required to coordinate this activity with Riverside and San Bernardino Counties. Construction vehicles would comply with all local, state, and federal LORS.

No significant impacts would be expected with implementation of these measures.

Microwave Alternative

Construction of a microwave tower located at the Headgate Rock substation and potentially an intermediate tower located near Radio Tower Road, southwest of Vidal, would not affect local roadways. A minimal workforce would be needed. If fiber-optic cable is buried within the SR 62 ROW from the RSEP site to the intermediate tower location, then some temporary disturbance adjacent to the roadway could occur. Western would be required to coordinate this activity with Riverside and San Bernardino Counties. Construction vehicles would comply with all local, state, and federal LORS. No significant impacts would be expected with implementation of these measures.

BPL Alternative

No impacts to traffic and transportation would occur under the BPL alternative.

WASTE MANAGEMENT/HAZARDOUS MATERIALS

Setting and Existing Conditions

The fiber-optic lines and related facilities would be routed mostly through undeveloped publicly-owned desert land with relatively few activities that could generate hazardous wastes or contaminated areas. Fiber-optic cable could also be installed within the SR 62 ROW; hazardous waste or contaminated areas would not be expected. The microwave facilities would be constructed on private land (at the Headgate Rock substation) and BLM land (near Radio Tower Road).

Assessment of Impacts and Discussion of Mitigation

Fiber-optic Cable Alternative

Waste management activities associated with the telecommunications system alternatives would include the storage, transport, recycling, or disposal of all project waste streams. Waste streams would most likely be limited to solid waste, including excavated soil that could not be backfilled and vegetation from development of new access roads as well as empty cable reels and cut-off pieces of fiber-optic cable. All waste streams are regulated and discharges or disposal of any waste material either requires specific permitting, or disposal at a permitted facility based on the type of waste. Waste streams can be either hazardous or non hazardous, depending on the constituents in the waste stream and the characteristics (e.g., ignitability, reactivity, toxicity, and corrosivity) of the waste. The status of the waste stream determines both the storage options for the material, and the disposal method for the material. Limited quantities of waste materials would be generated by installation of fiber-optic cable.

Solid waste disposal sites are permitted as either Class III facilities, which accept municipal solid waste, or Class I facilities which accept hazardous waste. Within San Bernardino and Riverside Counties, there are existing Class III commercial solid waste disposal facilities which could accommodate the wastes generated by the installation of fiber-optic cable. Best management construction practices and applicable conditions of certification identified in the SA would ensure that impacts from hazardous materials and waste streams are less than significant.

Microwave Alternative

Construction of a larger microwave tower located at one of Western's existing substations near the project and potentially an intermediate repeater site in the

Colorado River Valley or Rice Valley would generate a limited amount of waste. Since excavation of tower footings would require displacement of soil, a Phase 1 Environmental Site Assessment should be conducted prior to earth-moving activities. Additional analysis and avoidance/mitigation measures may be needed based on initial results. No hazardous materials would be expected to be encountered if trenching within SR 62 ROW occurs. Best management construction practices and applicable conditions of certification identified in the SA would ensure that impacts from hazardous materials and waste streams are less than significant.

BPL Alternative

No impacts to traffic and transportation would occur under the BPL alternative.

VISUAL RESOURCES

Setting and Existing Conditions

The telecommunication system alternatives are primarily located within the Colorado Desert, a sub-region of the Sonoran Desert. This region is typified by creosote and bursage scrub land cover, often mixed with yucca and cholla cactus, sandy soil grasslands and, especially farther to the south, ocotillo cactus, ironwood, and palo verde trees. Like other parts of the Basin and Range physiographic province of which it is a part, the area is characterized by periodic low, barren mountain ranges with jagged peaks and sloping alluvial fans or bajadas at their feet, with arid, sparsely vegetated open valleys in between offering expansive, panoramic views. Dark browns and garnets are the dominant mountain hues, although blues and purples prevail as viewing distance increases. In contrast, lighter brown and tan soils dominate the desert floor, sparsely dotted with the grey-green of low-growing creosote bush and golden bursage scrub vegetation. Based on data provided by the applicant for the RSEP site, staff assumes that no BLM VRM classifications have been assigned to the BLM lands comprising the project area.

Visually sensitive areas near the RSEP site footprint and linear corridor include SR 62 which has been designated a Riverside County Scenic Highway and a 143-mile segment of SR 62 (particularly east of Twenty Nine Palms) is eligible for State Scenic Highway designation. There are four BLM wilderness areas (WAs) within 10 miles of the project site: the Rice Valley, Turtle Mountain, Riverside Mountains and Palen/McCoy WAs. These WAs and the BLM land in the region are part of the California Desert Conservation Area (CDCA). The preservation of scenery is a prime objective of the CDC Act, and as such, the BLM attributes high viewer sensitivity to this region. In addition to State Route (SR 62), other existing man-made features within the project viewshed include the Arizona and California Railroad, and the California Aqueduct.

Assessment of Impacts and Discussion of Mitigation

Fiber-optic Cable Alternative

Construction equipment associated with installation of fiber optic cable could create short-term temporary (1 to 2 days) impacts to viewers along SR 62 and particularly in segments of the existing transmission line that would be visible to Wilderness area visitors. Visual impacts would be minor in comparison to the overall impacts from the RSEP and would be less than significant.

Microwave Alternative

Taller microwave towers at one of Western's substations located near the project would be, by its nature, highly visible since the intent is to have line-of-sight communication with the RSEP directly or via an intermediate repeater site. The substation is located south of recreational land associated with the Colorado River and north of a residential development. A microwave tower at this location would create adverse, long-term scenic impacts to visitors and residents. The tower would exhibit strong vertical form and line contrast, seen against the open sky above the ridgeline of mountains in the distant background to the west and to the undeveloped desert land to the east. Color contrast of the tower and other structures would vary according to lighting conditions but would generally be moderate with appropriate surface color treatment.

Depending on the location selected the proposed repeater site could be visible by motorists traveling along SR 62. The tower would exhibit strong vertical form and line contrast, seen against the open sky above the ridgeline of mountains in the distant background. Color contrast of the tower and other structures would vary according to lighting conditions but would generally be moderate with appropriate surface color treatment. The proposed location appears to be one where several other transmission towers already exist. As such, a new tower would increase the dominance of these strong vertical elements within the immediate field of view, in a setting characterized by flat, horizontal topography. View blockage would be moderate. The receiver tower would intrude into views of the Colorado River Valley and Rice Valley and mountains behind, and penetrate the ridgeline of those mountains from some viewing angles.

Buried cable along SR 62 would have no impact on the highway's potential scenic designation.

Staff concludes that the construction of a microwave tower at the Headgate Rock substation and possibly an intermediate microwave tower in the Rice Valley would result in adverse impacts to existing scenic resource values. However, with the inclusion of the following recommended Conditions of Certification or similar, potential visual impacts would be less than significant:

- VIS 1** Surface Color Treatment of Non-Mirror Structures: to lower color contrast of the proposed transmission poles and blend with the visual background;
- VIS 2** Visual Mitigation and Revegetation: to minimize the visual prominence of the proposed construction to travelers on SR 62;
- VIS 3** Temporary and Permanent Exterior Lighting: low glare, not visible from a distance.

BPL Alternative

No impacts to visual resources would occur under the BPL alternative.

PUBLIC AND WORKER SAFETY

Setting and Existing Conditions

Current public and worker safety concerns are minimal within the Project area. The

Parker-Blythe #2 transmission line is within a designated utility corridor. Public access to the area is limited due to local road conditions, although the public may use some roads in the area for recreation. Underground trenching could occur within the SR 62 ROW; see the **Traffic and Transportation** section for information on vehicle use.

Assessment of Impacts and Discussion of Mitigation

Fiber-optic Cable Alternative

During installation of fiber-optic cable, standard health and safety practices would be conducted in accordance with the Occupational Health and Safety Administration's and Cal/OSHA regulations, policies and procedures and Western's Power System Safety Manual, which would reduce worker safety risks to less than significant levels. Project implementation would not affect any local or regional emergency response plan or evacuation plan. Therefore, no significant impacts to public or worker safety would be anticipated. Compliance with LORS would also protect the public.

Microwave Alternative

Construction of a microwave tower located at the Headgate Rock substation and potentially an intermediate tower in the Rice Valley would be subject to the same LORS as described above. A traffic control plan would likely be required for installation of cable within the SR 62 ROW. Project implementation would be short-term and would not affect emergency response or evacuation plans. No significant impacts to public or worker safety would occur.

BPL Alternative

No impacts to traffic and transportation would occur under the BPL alternative.

OTHER CEQA AND NEPA CONSIDERATIONS

Testimony of John Kessler

This section includes discussions of other topics as required by CEQA and/or NEPA, including identification of significant unavoidable adverse impacts, discussion of significant irreversible and irretrievable commitment of resources, and growth-inducing effects.

Significant Unavoidable Adverse Impacts

The environmental impacts of the proposed project are described in the environmental analysis sections of this SA/DEIS. The analysis has identified impacts that are significant, and cannot be reduced to less than significant levels through the application of mitigation measures. Those impacts which have been determined to be significant and unavoidable are summarized below.

Land Use

The proposed Rice Solar Energy Project would be located on land within the California Desert Conservation Area (CDCA), as amended by the Northern and Eastern Colorado Desert Coordinated Management (NECO) Plan. The project footprint would include approximately 1,410 acres of privately owned property and 190 acres of "Multiple-Use Class M" (MUC-M) public (federal) lands, managed by the U.S. Bureau of Land Management (BLM), on a 2,560-acre project site. Siting of electrical generation plants on Class M lands requires compliance with federal, state, and local laws and the NEPA environmental review process.

The proposed project would also require BLM approval of an Amendment to the CDCA Plan and issuance of a Right-of-Way (ROW) grant for use of approximately 99 acres: a 10-mile long corridor, 150 feet wide, and a three acre plot for the interconnection substation. The applicant has submitted an initial ROW application with the approximate acreage and alignment, which would be modified to include only the final project footprint prior to issuance.

The proposed project would not:

- Result in the loss or conversion of Farmland or forest land to non-agricultural uses.
- Conflict with or result in a change to any agricultural zoning or existing Williamson Act contracts.
- Conflict with existing zoning for, or cause rezoning of, forest land, timberland, or timberland zoned Timberland Production.
- Directly or indirectly divide an established community.
- Induce substantial population growth in the project area.
- Impact airport operations.

The proposed project would have a less than significant impact on:

- Wilderness and recreation areas.

- Permanent loss of lands within a portion of the proposed project footprint for agriculture, natural resources, and recreation.
- Recreational use of and access to a portion of the proposed project site and surrounding BLM-managed federal lands.
- The historic significance and National Register eligibility of Camp Rice.
- Future land use and development.

The proposed project would have a less than significant impact, with full implementation of the applicable conditions of certification, on:

- Agricultural use (grazing) and access in an established federal rangeland area within the CDCA.
- Consistency with most applicable land use plans, policies, and regulations of an agency with jurisdiction, or that would normally have jurisdiction, over the project.

The proposed project would have the following significant/substantial, unavoidable impacts before considering whether impacts would be mitigated to less than significant with proposed conditions of certification:

- Result in a loss of scenic character when considering both direct and cumulative impacts;
- Result in the loss of a National Register eligible historic resource (Rice Army Airfield).
- Contribute substantially to cumulative land use and visual/scenic character, recreational, biological, and cultural impacts.

The proposed project would have the following significant/substantial, unavoidable impacts :

- Result in a loss of scenic character, both project-specific and cumulative.
- Result in the loss of a historic resource with potential National Register eligibility (Rice Army Airfield) (NEPA).
- Contribute substantially to cumulative loss of visual/scenic character.

The proposed project would not be consistent with the following laws, ordinances, regulations, and standards, even with implementation of proposed conditions of certification:

- Riverside County General Plan Land Use Element policies: LU 6.1, LU 13.1, LU 13.3, LU 20.1, LU 20.2, LU 20.4, LU 30.1. Inconsistency with these General Plan polices are primarily the result of the significant impacts to visual/scenic impacts identified above.
- Riverside County General Plan Multipurpose Open Space Element policy OS 21.1

Visual Resources

The agencies have identified, and staff concludes with respect to CEQA, that the proposed project, after implementing all staff-recommended conditions of certification, would still have significant and unavoidable adverse direct and cumulative visual impacts from several Key Observation Points including:

- Highway SR-62 to background distances of five miles or more, due particularly to solar receiver brightness; and
- portions of the Turtle Mountain Wilderness Area at distances of roughly 5 miles or under due to the combination of mirror-field visibility, mirror-field glare, and solar receiver glare.

Staff has recommended **Traffic and Transportation** Conditions of Certification **TRANS-6**, Heliostat Positioning Plan, and **TRANS-7**, Power Tower Monitoring Plan, to ensure that potential glare from the project is minimized to the maximum extent possible and does not pose a health and safety risk. However, staff concludes that with these measures, glare from the project, particularly from the solar receiver, would remain a bright, intrusive source of sub-hazardous nuisance glare to viewers on Highway SR 62 and in other locations at distances within a range of five miles or more.

Impacts of the Reduced Acreage Alternative, with staff-recommended conditions of certification, would also have significant unavoidable visual impacts. However, the degree and extent of those impacts would be somewhat less than those of the Proposed Project.

Impacts of the North of Desert Center Alternative, with staff-recommended conditions of certification, would also have significant unavoidable visual impacts. Comparison to the proposed project is mixed. Impacts would be less than those of the Proposed Project due to the more developed and visually compromised setting when compared to that of the Proposed Project. However, the number of residents adversely affected would be substantial, and viewers in the easternmost slopes of Joshua Tree National Park could be affected.

Impacts of the State Route 62/Rice Valley Road Generation Tie Line Alternative would have the same significant unavoidable visual impacts as the proposed project, and in addition would substantially increase those impacts by introducing a new line into the immediate visual foreground of State Route 62 (SR-62).

The anticipated visual impacts of the Proposed Project, Reduced Acreage, North of Desert Center and SR 62/Rice Valley Road Generation Tie Line Alternatives, in combination with past and foreseeable future local projects in their local vicinity, and past and foreseeable future region-wide projects in the southern California desert are considered cumulatively considerable and significant.

Along SR 62, there are four proposed solar energy projects including RSEP that would result in a substantial man-made visual intrusion into a majority of the remaining visually intact and scenic portions of SR 62, potentially rendering it ineligible for designation as a State scenic highway. These four projects would affect over 50 miles of the most

scenically intact portions of that highway, altering it from a natural, scenically intact desert landscape into one characterized by the strong visual influence of these industrial facilities. In addition, cumulative night light pollution impacts in the project area could become cumulatively considerable. Therefore, within the local viewshed of Rice Valley and of SR 62 in the project vicinity, the anticipated operational visual impacts of the RSEP in combination with past and foreseeable future projects are considered potentially significant and unmitigable, particularly to motorists on SR 62, and to visitors to the area's many wilderness areas and Joshua Tree National Park.

Within the southern California desert, anticipated cumulative operational impacts of past and foreseeable future region-wide projects are considered cumulatively considerable, potentially significant and unmitigable considering the substantial decline in the overall number and extent of scenically intact, undisturbed desert landscapes, and a substantially more urbanized character in the overall southern California desert landscape.

All action alternatives studied, with staff-recommended conditions of certification, would not conform with a number of applicable local Laws, Ordinances, Regulations and Standards (LORS) of San Bernardino and Riverside Counties pertaining to preservation of scenic resources and scenic highway view corridors, as described under the Compliance With LORS section of this analysis.

Irreversible and Irretrievable Commitment of Resources

Section 15126.2(c) of CEQA requires that CEQA documentation address significant irreversible changes and irretrievable commitments of resources that would be caused by a proposed project. Similarly, 40 CFR 1502.16 of the NEPA regulations requires a discussion of any irreversible or irretrievable commitments of resources which would be involved in the proposed project.

Implementation of the proposed project would result in the consumption of energy as it relates to the fuel needed for construction-related activities. Large amounts of gasoline, diesel, and jet fuel would be required for project construction. Additionally, construction would require the manufacture of new materials, some of which would not be recyclable at the end of the lifetime of the proposed project. The raw materials and energy required for the production of these materials would also result in an irretrievable commitment of natural resources. Operation of the proposed project would not cause a substantial increase in the consumption or use of non-renewable resources.

Implementation of the proposed project would require the loss of approximately 1,770 acres of vegetation and habitat. The loss of this habitat would be long-term, enduring throughout the proposed 30-year lifespan of the facility. Following decommissioning, restoration would be conducted which would involve removal of structures, restoration of topography, and revegetation, all of which would work towards restoration of the original habitat. However, it is likely that restoration of native vegetation would be slow, and the success uncertain. Therefore, the loss of desert tortoise habitat is assumed to be permanent since restoration of vegetation for which they depend for foraging and other factors affecting the quality of the restored habitat are uncertain.

The majority of access required for construction and operation of the proposed project would utilize existing public access roads and rights-of way from SR 62 onto the project site, before entering private property where RSEP would be located. The proposed project would not significantly affect opportunities for public access on public roads.

Construction and operation of the proposed project would require the use of a limited amount of hazardous materials such as fuel, lubricants, and cleaning solvents. All hazardous materials would be stored, handled, and used in accordance with Best Management Practices and applicable, federal, state, and local regulations, including a construction-phase Stormwater Pollution Prevention Plan (SWPPP) and an operational-phase SWPPP. Assuming appropriate implementation of these plans and practices as are recommended in the conditions of certification, potential degradation of the environment due to accidental spills associated with the proposed project's use of hazardous materials would be less than significant.

Visual impacts would be significant and long-term considering the context and intensity of the project effects in general. The context of the project is one adjacent to an eligible scenic highway (SR 62) and having four BLM wilderness areas within 10 miles of the project site: the Rice Valley, Turtle Mountain, Riverside Mountains and Palen/McCoy Wilderness Areas, and Joshua Tree National Park within the regional vicinity of the project. Intensity of potential effects involves the unique scenic characteristics of the local landscape as indicated by the wilderness designations of portions of the project viewshed; concerns expressed by public commenters to date; and a degree of uncertainty as to the level of discomfort or disability glare from the solar tower receiver; and concern over cumulative visual effects of renewable projects in the Chuckwalla Valley and the southern California Mojave Desert as a whole. The loss of visual quality would be long-term, enduring throughout the proposed 30-year lifespan of the facility. After the end of the project's useful life, it would be decommissioned in accordance with a Facility Closure Plan. The facility would be removed to a depth below grade, original contours restored, and the site revegetated. However, the removal of the existing facility would leave a very prominent visual impact over the entire site due to the strong color contrast created between graded, disturbed soil areas and undisturbed soil areas in the vicinity of the project site. In addition, revegetation of areas in this desert region are difficult and generally of limited success. Thus, visual recovery from land disturbance of closure and decommissioning would likely occur only over a very long period of time.

Growth-Inducing Effects

Section 15126.2(d) of the CEQA Guidelines requires that CEQA documents address the ways in which a proposed project encourages economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment. Section 1508.8(b) of the NEPA regulations also requires that an EIS discuss growth-inducing impacts of a project. The discussion must address how a proposed project may remove obstacles to growth, or encourage or facilitate other activities that could significantly impact the environment, either individually or cumulatively. Typically, the growth-inducing potential of a proposed project would be considered significant if it fosters growth or a concentration of population above what is assumed in local and regional land use plans, or in projections made by regional planning authorities. Significant growth impacts could also occur if a project adds

infrastructure or service capacity which could accommodate growth levels which exceed those permitted by local or regional plans and policies.

The proposed project would employ up to 954 construction personnel and 47 operations personnel. Research shows that construction workers would commute as much as two hours each direction from their communities rather than relocate, and operations workers would commute as much as one hour (EPRI 1982). Staff reviewed the socioeconomics data for counties within the one-hour and two-hour commute ranges, which is within the study area and includes Riverside and San Bernardino Counties. **SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 4** indicates that an adequate number of construction workers are available within the study area. In addition, a total of 47 operational workers would account for a negligible amount of the total San Bernardino County and Clark County total labor force. As all workers would reside within the study area, no impacts to existing population levels would occur. Because the number of operational workers required represents such a small portion of the local available labor force, no significant impacts to the study area population or employment base would result from proposed project operation.

As discussed in the Introduction to this SA/DEIS, the primary need for the proposed project is driven by Federal and State requirements regarding the generation of renewable energy. According to the Energy Commission, peak electricity demand within California is projected to increase at a rate of 1.35% per year from 2008 through 2018 (CEC 2007), and therefore, additional generating capacity from new sources will be required. The proposed project is not intended to supply power related to growth for any particular development, either directly or indirectly, and would not result in direct growth-inducing impacts.

GENERAL CONDITIONS INCLUDING COMPLIANCE MONITORING AND CLOSURE PLAN

Testimony: Chris Davis

INTRODUCTION

The project's General Compliance Conditions of Certification, including Compliance Monitoring and Closure Plan (Compliance Plan) have been established as required by Public Resources Code section 25532. The plan provides a means for assuring that the facility is constructed, operated, and closed in compliance with public health and safety, environmental, and other applicable regulations, guidelines, and conditions adopted or established by the California Energy Commission and specified in the written decision on the Application for Certification or otherwise required by law. The Compliance Plan will be integrated with a U.S. Bureau of Land Management (BLM) Compliance Monitoring Plan (hereafter referred to as the Compliance Plan) to assure compliance with the terms and conditions of any approved Right-of-Way (ROW) grant including the approved Plan of Development (POD).

The Compliance Plan is composed of elements that:

- set forth the duties and responsibilities of the Compliance Project Manager (CPM), the project owner, delegate agencies, and others;
- set forth the requirements for handling confidential records and maintaining the compliance record;
- state procedures for settling disputes and making post-certification changes;
- state the requirements for periodic compliance reports and other administrative procedures that are necessary to verify the compliance status for all Energy Commission approved conditions of certification;
- establish requirements for facility closure plans; and
- specify conditions of certification for each technical area containing the measures required to mitigate any and all potential adverse project impacts associated with construction, operation and closure below a level of significance. Each specific condition of certification also includes a verification provision that describes the method of assuring that the condition has been satisfied.

In addition to meeting the Energy Commission's Conditions of Certification, the project owner will be required to comply with all terms and conditions required by the BLM and the Western Area Power Administration (Western) for the project's transmission line interconnection to the existing Western transmission system. The conditions and terms will be described in the Records of Decision from BLM and Western and in BLM's Right-of-Way grant documents.

DEFINITIONS

The following terms and definitions are used to establish when Conditions of Certification are implemented.

PRE-CONSTRUCTION SITE MOBILIZATION

Site mobilization is limited preconstruction activities at the site to allow for the installation of fencing, construction trailers, construction trailer utilities, and construction trailer parking at the site. Limited ground disturbance, grading, and trenching associated with the above mentioned pre-construction activities is considered part of site mobilization. Walking, driving or parking a passenger vehicle, pickup truck and/or light vehicles is allowable during site mobilization.

CONSTRUCTION

Onsite work to install permanent equipment or structures for any facility.

Ground Disturbance

Construction-related ground disturbance refers to activities that result in the removal of top soil or vegetation at the site beyond site mobilization needs, and for access roads and linear facilities.

Grading, Boring, and Trenching

Construction-related grading, boring, and trenching refers to activities that result in subsurface soil work at the site and for access roads and linear facilities, e.g., alteration of the topographical features such as leveling, removal of hills or high spots, moving of soil from one area to another, and removal of soil.

Notwithstanding the definitions of ground disturbance, grading, boring, and trenching above, construction does **not** include the following:

1. the installation of environmental monitoring equipment;
2. a soil or geological investigation;
3. a topographical survey;
4. any other study or investigation to determine the environmental acceptability or feasibility of the use of the site for any particular facility; and
5. any work to provide access to the site for any of the purposes specified in 1, 2, 3, or 4 above.

START OF COMMERCIAL OPERATION

For compliance monitoring purposes, “commercial operation” begins after the completion of start-up and commissioning, when the power plant has reached reliable steady-state production of electricity at the rated capacity. At the start of commercial operation, plant control is usually transferred from the construction manager to the plant operations manager.

COMPLIANCE PROJECT MANAGER RESPONSIBILITIES

The Compliance Project Manager (CPM) shall oversee the compliance monitoring and is responsible for:

1. Ensuring that the design, construction, operation, and closure of the project facilities are in compliance with the terms and conditions of the Energy Commission Decision;
2. Resolving complaints;
3. Processing post-certification changes to the conditions of certification, project description (petition to amend), and ownership or operational control (petition for change of ownership) (See instructions for filing petitions);
4. Documenting and tracking compliance filings; and
5. Ensuring that compliance files are maintained and accessible.

The CPM is the contact person for the Energy Commission and will consult with appropriate responsible agencies, Energy Commission, and staff when handling disputes, complaints, and amendments.

All project compliance submittals are submitted to the CPM for processing. Where a submittal required by a condition of certification requires CPM approval, the approval will involve all appropriate Energy Commission staff and management. All submittals must include searchable electronic versions (pdf or MS Word files). The CPM may accept and approve, on a case by case basis, compliance submittals that provide sufficient detail to allow construction activities to commence without the submittal containing detailed information on construction activities that will be commenced later in time.

PRE-CONSTRUCTION AND PRE-OPERATION COMPLIANCE MEETING

The CPM usually schedules pre-construction and pre-operation compliance meetings prior to the projected start-dates of construction, plant operation, or both. The purpose of these meetings is to assemble both the Energy Commission's and project owner's technical staff to review the status of all pre-construction or pre-operation requirements contained in the Energy Commission's conditions of certification. This is to confirm that all applicable conditions of certification have been met, or if they have not been met, to ensure that the proper action is taken. In addition, these meetings ensure, to the extent possible, that Energy Commission conditions will not delay the construction and operation of the plant due to oversight and to preclude any last minute, unforeseen issues from arising. Pre-construction meetings held during the certification process must be publicly noticed unless they are confined to administrative issues and processes.

ENERGY COMMISSION RECORD

The Energy Commission shall maintain the following documents and information as a public record, in either the Compliance file or Dockets file, for the life of the project (or other period as required):

1. All documents demonstrating compliance with any legal requirements relating to the construction and operation of the facility;
2. All monthly and annual compliance reports filed by the project owner;
3. All complaints of noncompliance filed with the Energy Commission; and
4. All petitions for project or condition of certification changes and the resulting staff or Energy Commission action.

PROJECT OWNER RESPONSIBILITIES

The project owner is responsible for ensuring that the compliance conditions of certification and all other conditions of certification that appear in the Commission Decision are satisfied. The compliance conditions regarding post-certification changes specify measures that the project owner must take when requesting changes in the project design, conditions of certification, or ownership. Failure to comply with any of the conditions of certification or the compliance conditions may result in reopening of the case and revocation of Energy Commission certification; an administrative fine; or other action as appropriate. A summary of the Compliance Conditions of Certification is included as **Compliance Table 1** at the conclusion of this section.

COMPLIANCE CONDITIONS OF CERTIFICATION

Unrestricted Access (COMPLIANCE-1)

The CPM, responsible Energy Commission staff, and delegated agencies or consultants shall be guaranteed and granted unrestricted access to the power plant site, related facilities, project-related staff, and the records maintained on-site for the purpose of conducting audits, surveys, inspections, or general site visits. Although the CPM will normally schedule site visits on dates and times agreeable to the project owner, the CPM reserves the right to make unannounced visits at any time.

Compliance Record (COMPLIANCE-2)

The project owner shall maintain project files on-site or at an alternative site approved by the CPM for the life of the project, unless a lesser period of time is specified by the conditions of certification. The files shall contain copies of all “as-built” drawings, documents submitted as verification for conditions, and other project-related documents.

Energy Commission staff and delegate agencies shall, upon request to the project owner, be given unrestricted access to the files maintained pursuant to this condition.

Compliance Verification Submittals (COMPLIANCE-3)

Each condition of certification is followed by a means of verification. The verification describes the Energy Commission’s procedure(s) to ensure post-certification compliance with adopted conditions. The verification procedures, unlike the conditions, may be modified as necessary by the CPM.

Verification of compliance with the conditions of certification can be accomplished by the following:

1. Monthly and/or annual compliance reports, filed by the project owner or authorized agent, reporting on work done and providing pertinent documentation, as required by the specific conditions of certification;
2. Appropriate letters from delegate agencies verifying compliance;
3. Energy Commission staff audits of project records; and/or
4. Energy Commission staff inspections of work, or other evidence that the requirements are satisfied.

Verification lead times associated with start of construction may require the project owner to file submittals during the certification process, particularly if construction is planned to commence shortly after certification.

A cover letter from the project owner or authorized agent is required for all compliance submittals and correspondence pertaining to compliance matters. **The cover letter subject line shall identify the project by AFC number, the appropriate condition(s) of certification by condition number(s), and a brief description of the subject of the submittal.** The project owner shall also identify those submittals **not** required by a condition of certification with a statement such as: "This submittal is for information only and is not required by a specific condition of certification." When submitting supplementary or corrected information, the project owner shall reference the date of the previous submittal and CEC submittal number.

The project owner is responsible for the delivery and content of all verification submittals to the CPM, whether such condition was satisfied by work performed by the project owner or an agent of the project owner.

All hardcopy submittals shall be addressed as follows:

**Chris Davis, Compliance Project Manager
(09-AFC-10C)
California Energy Commission
1516 Ninth Street (MS-2000)
Sacramento, CA 95814**

Those submittals shall be accompanied by a searchable electronic copy, on a CD or by e-mail, as agreed upon by the CPM.

If the project owner desires Energy Commission staff action by a specific date, that request shall be made in the submittal cover letter and shall include a detailed explanation of the effects on the project if that date is not met.

Pre-Construction Matrix and Tasks Prior to Start of Construction (COMPLIANCE-4)

Prior to commencing construction, a compliance matrix addressing only those conditions that must be fulfilled before the start of construction shall be submitted by the project owner to the CPM. This matrix will be included with the project owner's first compliance submittal or prior to the first pre-construction meeting, whichever comes first. It will be submitted in the same format as the compliance matrix described below.

Construction shall not commence until the pre-construction matrix is submitted, all pre-construction conditions have been complied with, and the CPM has issued a letter to the project owner authorizing construction. Various lead times for submittal of compliance verification documents to the CPM for conditions of certification are established to allow sufficient staff time to review and comment and, if necessary, allow the project owner to revise the submittal in a timely manner. This will ensure that project construction may proceed according to schedule.

Failure to submit compliance documents within the specified lead-time may result in delays in authorization to commence various stages of project development.

If the project owner anticipates commencing project construction as soon as the project is certified, it may be necessary for the project owner to file compliance submittals prior to project certification. Compliance submittals should be completed in advance where the necessary lead time for a required compliance event extends beyond the date anticipated for start of construction. The project owner must understand that the submittal of compliance documents prior to project certification is at the owner's own risk. Any approval by Energy Commission staff is subject to change, based upon the Commission Decision.

Compliance Reporting

There are two different compliance reports that the project owner must submit to assist the CPM in tracking activities and monitoring compliance with the terms and conditions of the Energy Commission Decision. During construction, the project owner or authorized agent will submit Monthly Compliance Reports. During operation, an Annual Compliance Report must be submitted. These reports, and the requirement for an accompanying compliance matrix, are described below. The majority of the conditions of certification require that compliance submittals be submitted to the CPM in the monthly or annual compliance reports.

Posting A Surety Bond (COMPLIANCE-5)

Prior to site disturbance and each increment of construction, the project owner shall post a surety bond adequate to cover the cost of decommissioning and restoration, including the removal of the project features that have been constructed for that portion of the site and restoring the native topography and vegetation. An "increment of construction" shall mean a significant feature of construction, such as site grading, a building, a fluid storage tank, a water treatment facility, a hydrogen production facility, a switchyard, or a group of solar collectors connected to an electrical transformer (including that transformer). This Surety bond will apply to only site disturbance features located on public lands managed by BLM.

The project owner shall provide the surety bond to the BLM AO for approval and to the CPM for review with written evidence indicating that the surety bond is adequate to cover the cost of decommissioning and removing the project features constructed, allowing for site restoration. The written evidence shall include a valid estimate showing that the amount of the bond is adequate to accomplish such work. The timing for the submittal of the surety bond and approval of this document shall be coordinated with the BLM AO and CPM. Over the life of the project, the surety bond will be updated as necessary to account for any changes to the project description and/or decommissioning costs.

Compliance Matrix (COMPLIANCE-6)

A compliance matrix shall be submitted by the project owner to the CPM along with each monthly and annual compliance report. The compliance matrix is intended to provide the CPM with the current status of all conditions of certification in a spreadsheet format. The compliance matrix must identify:

1. the technical area;
2. the condition number;
3. a brief description of the verification action or submittal required by the condition;
4. the date the submittal is required (e.g., 60 days prior to construction, after final inspection, etc.);
5. the expected or actual submittal date;
6. the date a submittal or action was approved by the Chief Building Official (CBO), CPM, or delegate agency, if applicable;
7. the compliance status of each condition, e.g., “not started,” “in progress” or “completed” (include the date); and
8. if the condition was amended, the date of the amendment.

Satisfied conditions shall be placed at the end of the matrix.

Monthly Compliance Report (COMPLIANCE-7)

The first Monthly Compliance Report is due one month following the Energy Commission business meeting date upon which the project was approved, unless otherwise agreed to by the CPM. The first Monthly Compliance Report shall include the AFC number and an initial list of dates for each of the events identified on the **Key Events List. The Key Events List form is found at the end of these General Conditions.**

During pre-construction and construction of the project, the project owner or authorized agent shall submit an original and an electronic searchable version of the Monthly Compliance Report within 10 working days after the end of each reporting month.

Monthly Compliance Reports shall be clearly identified for the month being reported. The reports shall contain, at a minimum:

1. A summary of the current project construction status, a revised/updated schedule if there are significant delays, and an explanation of any significant changes to the schedule;
2. Documents required by specific conditions to be submitted along with the Monthly Compliance Report. Each of these items must be identified in the transmittal letter, as well as the conditions they satisfy and submitted as attachments to the Monthly Compliance Report;
3. An initial, and thereafter updated, compliance matrix showing the status of all conditions of certification;
4. A list of conditions that have been satisfied during the reporting period, and a description or reference to the actions that satisfied the condition;
5. A list of any submittal deadlines that were missed, accompanied by an explanation and an estimate of when the information will be provided;
6. A cumulative listing of any approved changes to conditions of certification;
7. A listing of any filings submitted to, or permits issued by, other governmental agencies during the month;
8. A projection of project compliance activities scheduled during the next two months. The project owner shall notify the CPM as soon as any changes are made to the project construction schedule that would affect compliance with conditions of certification;
9. A listing of the month's additions to the on-site compliance file; and
10. A listing of complaints, notices of violation, official warnings, and citations received during the month, a description of the resolution of the resolved actions, and the status of any unresolved actions.

All sections, exhibits, or addendums shall be separated by tabbed dividers or as acceptable by the CPM.

Annual Compliance Report (COMPLIANCE-8)

After construction is complete, the project owner shall submit Annual Compliance Reports instead of Monthly Compliance Reports. The reports are for each year of commercial operation and are due to the CPM each year at a date agreed to by the CPM. Annual Compliance Reports shall be submitted over the life of the project, unless otherwise specified by the CPM. Each Annual Compliance Report shall include the AFC number, identify the reporting period, and shall contain the following:

1. An updated compliance matrix showing the status of all conditions of certification (fully satisfied conditions do not need to be included in the matrix after they have been reported as completed);

2. A summary of the current project operating status and an explanation of any significant changes to facility operations during the year;
3. Documents required by specific conditions to be submitted along with the Annual Compliance Report. Each of these items must be identified in the transmittal letter, with the condition it satisfies, and submitted as attachments to the Annual Compliance Report;
4. A cumulative listing of all post-certification changes approved by the Energy Commission or cleared by the CPM;
5. An explanation for any submittal deadlines that were missed, accompanied by an estimate of when the information will be provided;
6. A listing of filings submitted to, or permits issued by, other governmental agencies during the year;
7. A projection of project compliance activities scheduled during the next year;
8. A listing of the year's additions to the on-site compliance file;
9. An evaluation of the on-site contingency plan for unplanned facility closure, including any suggestions necessary for bringing the plan up to date (see Compliance Conditions for Facility Closure); and
10. A listing of complaints, notices of violation, official warnings, and citations received during the year, a description of the resolution of any resolved matters, and the status of any unresolved matters.

Confidential Information (COMPLIANCE-9)

Any information that the project owner deems confidential shall be submitted to the Energy Commission's Executive Director with an application for confidentiality pursuant to Title 20, California Code of Regulations, section 2505(a). Any information that is determined to be confidential shall be kept confidential as provided for in Title 20, California Code of Regulations, section 2501, et. seq.

Annual Energy Facility Compliance Fee (COMPLIANCE-10)

Pursuant to the provisions of Section 25806(b) of the Public Resources Code, the project owner is required to pay an annual compliance fee, which is adjusted annually. Current Compliance fee information is available on the Energy Commission's website http://www.energy.ca.gov/siting/filing_fees.html. Contact the CPM for the current fee information. The initial payment is due on the date of the Business Meeting at which the Energy Commission adopts the final decision. All subsequent payments are due by July 1 of each year in which the facility retains its certification. The payment instrument shall be made payable to the California Energy Commission and mailed to: Accounting Office MS-02, California Energy Commission, 1516 9th St., Sacramento, CA 95814.

Reporting of Complaints, Notices, and Citations (COMPLIANCE-11)

Prior to the start of construction, the project owner must send a letter to property owners living within one mile of the project notifying them of a telephone number to contact project representatives with questions, complaints, or concerns. If the telephone is not staffed 24 hours per day, it shall include automatic answering with a date and time stamp recording. All recorded complaints shall be responded to within 24 hours. The telephone number shall be posted at the project site and made easily visible to passersby during construction and operation. The telephone number shall be provided to the CPM who will post it on the Energy Commission's web page at: http://www.energy.ca.gov/sitingcases/power_plants_contacts.html

Any changes to the telephone number shall be submitted immediately to the CPM, who will update the web page.

In addition to the monthly and annual compliance reporting requirements described above, the project owner shall report and provide copies to the CPM of all complaint forms, including noise and lighting complaints, notices of violation, notices of fines, official warnings, and citations within 10 days of receipt. Complaints shall be logged and numbered. Noise complaints shall be recorded on the form provided in the **NOISE** conditions of certification. All other complaints shall be recorded on the complaint form (Attachment A).

FACILITY CLOSURE

At some point in the future, the project will cease operation and close down. At that time, it will be necessary to ensure that the closure occurs in such a way that public health and safety and the environment are protected from adverse impacts. Although the project setting for this project does not appear, at this time, to present any special or unusual closure problems, it is impossible to foresee what the situation will be in 30 years or more when the project ceases operation. Therefore, provisions must be made that provide the flexibility to deal with the specific situation and project setting that exist at the time of closure. Laws, Ordinances, Regulations, and Standards (LORS) pertaining to facility closure are identified in the sections dealing with each technical area. Facility closure will be consistent with LORS in effect at the time of closure.

There are at least three circumstances in which a facility closure can take place: planned closure, unplanned temporary closure, and unplanned permanent closure.

CLOSURE DEFINITIONS

Planned Closure

A planned closure occurs when the facility is closed in an anticipated, orderly manner, at the end of its useful economic or mechanical life, or due to gradual obsolescence.

Unplanned Temporary Closure

An unplanned temporary closure occurs when the facility is closed suddenly and/or unexpectedly, on a short-term basis, due to unforeseen circumstances such as a natural disaster or an emergency.

Unplanned Permanent Closure

An unplanned permanent closure occurs if the project owner closes the facility suddenly and/or unexpectedly, on a permanent basis. This includes unplanned closure where the owner implements the on-site contingency plan. It can also include unplanned closure where the project owner fails to implement the contingency plan, and the project is essentially abandoned.

COMPLIANCE CONDITIONS FOR FACILITY CLOSURE

Planned Closure (COMPLIANCE-12)

In order to ensure that a planned facility closure does not create adverse impacts, a closure process that provides for careful consideration of available options and applicable laws, ordinances, regulations, standards, and local/regional plans in existence at the time of closure will be undertaken. To ensure adequate review of a planned project closure, the project owner shall submit a proposed Facility Closure Plan to the Energy Commission for review and approval at least 12 months (or other period of time agreed to by the CPM) prior to the commencement of closure activities. The project owner shall file 120 copies (or other number of copies agreed upon by the CPM) of a proposed Facility Closure Plan with the Energy Commission.

The plan shall:

1. identify and discuss any impacts and mitigation to address significant adverse impacts associated with proposed closure activities and to address facilities, equipment, or other project related remnants that will remain at the site;
2. identify a schedule of activities for closure of the power plant site, transmission line corridor, and all other appurtenant facilities constructed as part of the project;
3. identify any facilities or equipment intended to remain on site after closure, the reason, and any future use; and
4. address conformance of the plan with all applicable laws, ordinances, regulations, standards, and local/regional plans in existence at the time of facility closure, and applicable conditions of certification.

Prior to submittal of the proposed facility closure plan, a meeting shall be held between the project owner and the Energy Commission CPM for the purpose of discussing the specific contents of the plan.

In the event that there are significant issues associated with the proposed facility closure plan's approval, or if the desires of local officials or interested parties are inconsistent with the plan, the CPM shall hold one or more workshops and/or the Energy Commission may hold public hearings as part of its approval procedure.

As necessary, prior to or during the closure plan process, the project owner shall take appropriate steps to eliminate any immediate threats to public health and safety and the environment, but shall not commence any other closure activities until the Energy Commission approves the Facility Closure Plan.

Unplanned Temporary Closure/On-Site Contingency Plan (COMPLIANCE-13)

In order to ensure that public health and safety and the environment are protected in the event of an unplanned temporary facility closure, it is essential to have an on-site contingency plan in place. The on-site contingency plan will help to ensure that all necessary steps to mitigate public health and safety impacts and environmental impacts are taken in a timely manner.

The project owner shall submit an on-site contingency plan for CPM review and approval. The plan shall be submitted no less than 60 days (or other time agreed to by the CPM) prior to commencement of commercial operation. The approved plan must be in place prior to commercial operation of the facility and shall be kept at the site at all times.

The project owner, in consultation with the CPM, will update the on-site contingency plan as necessary. The CPM may require revisions to the on-site contingency plan over the life of the project. In the annual compliance reports submitted to the Energy Commission, the project owner will review the on-site contingency plan, and recommend changes to bring the plan up to date. Any changes to the plan must be approved by the CPM.

The on-site contingency plan shall provide for taking immediate steps to secure the facility from trespassing or encroachment. In addition, for closures of more than 90 days, unless other arrangements are agreed to by the CPM, the plan shall provide for removal of hazardous materials and hazardous wastes, draining of all chemicals from storage tanks and other equipment, and the safe shutdown of all equipment. (Also see specific conditions of certification for the technical areas of Hazardous Materials Management and Waste Management.)

In addition, consistent with requirements under unplanned permanent closure addressed below, the nature and extent of insurance coverage, and major equipment warranties must also be included in the on-site contingency plan. In addition, the status of the insurance coverage and major equipment warranties must be updated in the annual compliance reports.

In the event of an unplanned temporary closure, the project owner shall notify the CPM, as well as other responsible agencies, by telephone, fax, or e-mail, within 24 hours and shall take all necessary steps to implement the on-site contingency plan. The project owner shall keep the CPM informed of the circumstances and expected duration of the closure.

If the CPM determines that an unplanned temporary closure is likely to be permanent, or for a duration of more than 12 months, a closure plan consistent with the requirements for a planned closure shall be developed and submitted to the CPM within 90 days of the CPM's determination (or other period of time agreed to by the CPM).

Unplanned Permanent Closure/On-Site Contingency Plan (COMPLIANCE-14)

The on-site contingency plan required for unplanned temporary closure shall also cover unplanned permanent facility closure. All of the requirements specified for unplanned temporary closure shall also apply to unplanned permanent closure.

In addition, the on-site contingency plan shall address how the project owner will ensure that all required closure steps will be successfully undertaken in the event of abandonment.

In the event of an unplanned permanent closure, the project owner shall notify the CPM, as well as other responsible agencies, by telephone, fax, or e-mail within 24 hours and shall take all necessary steps to implement the on-site contingency plan. The project owner shall keep the CPM informed of the status of all closure activities.

A closure plan, consistent with the requirements for a planned closure, shall be developed and submitted to the CPM within 90 days of the permanent closure or another period of time agreed to by the CPM.

Post Certification Changes to the Energy Commission Decision: Amendments, Ownership Changes, Staff Approved Project Modifications and Verification Changes (COMPLIANCE-15)

The project owner must petition the Energy Commission pursuant to Title 20, California Code of Regulations, section 1769, in order to modify the project (including linear facilities) design, operation or performance requirements, and to transfer ownership or operational control of the facility. **It is the responsibility of the project owner to contact the CPM to determine if a proposed project change should be considered a project modification pursuant to section 1769.** Implementation of a project modification without first securing Energy Commission, or Energy Commission staff, approval may result in enforcement action that could result in civil penalties in accordance with section 25534 of the Public Resources Code.

A petition is required for **amendments** and for **staff approved project modifications** as specified below. Both shall be filed as a "Petition to Amend." Staff will determine if the change is significant or insignificant. For verification changes, a letter from the project owner is sufficient. In all cases, the petition or letter requesting a change should be submitted to the CPM, who will file it with the Energy Commission's Dockets Unit in accordance with Title 20, California Code of Regulations, section 1209.

The criteria that determine which type of approval and the process that applies are explained below. They reflect the provisions of Section 1769 at the time this condition was drafted. If the Commission's rules regarding amendments are amended, the rules in effect at the time an amendment is requested shall apply.

Amendment

The project owner shall petition the Energy Commission, pursuant to Title 20, California Code of Regulations, Section 1769(a), when proposing modifications to the project (including linear facilities) design, operation, or performance requirements. If a proposed

modification results in deletion or change of a condition of certification, or makes changes that would cause the project not to comply with any applicable laws, ordinances, regulations or standards the petition will be processed as a formal amendment to the final decision, which requires public notice and review of the Energy Commission staff analysis and approval by the full Commission. The petition shall be in the form of a legal brief and fulfill the requirements of Section 1769(a). Upon request, the CPM will provide a sample petition to use as a template.

Change of Ownership

Change of ownership or operational control also requires that the project owner file a petition pursuant to section 1769 (b). This process requires public notice and approval by the full Commission. The petition shall be in the form of a legal brief and fulfill the requirements of Section 1769(b). Upon request, the CPM will provide a sample petition to use as a template.

Staff Approved Project Modification

Modifications that do not result in deletions or changes to conditions of certification, that are compliant with laws, ordinances, regulations, and standards and will not have significant environmental impacts may be authorized by the CPM as a staff approved project modification pursuant to section 1769 (a) (2). Once staff files an intention to approve the proposed project modifications, any person may file an objection to staff's determination within 14 days of service on the grounds that the modification does not meet the criteria of section 1769 (a) (2). If a person objects to staff's determination, the petition must be processed as a formal amendment to the decision and must be approved by the full commission at a noticed business meeting or hearing.

Verification Change

A verification may be modified by the CPM without requesting an amendment to the decision if the change does not conflict with the conditions of certification and provides an effective alternate means of verification.

CBO DELEGATION AND AGENCY COOPERATION

In performing construction and operation monitoring of the project, Energy Commission staff acts as, and has the authority of, the Chief Building Official (CBO). Energy Commission staff may delegate CBO responsibility to either an independent third party contractor or the local building official. Energy Commission staff retains CBO authority when selecting a delegate CBO, including enforcing and interpreting state and local codes, and use of discretion, as necessary, in implementing the various codes and standards.

Energy Commission staff may also seek the cooperation of state, regional, and local agencies that have an interest in environmental protection when conducting project monitoring.

ENFORCEMENT

The Energy Commission's legal authority to enforce the terms and conditions of its Decision is specified in Public Resources Code sections 25534 and 25900. The Energy Commission may amend or revoke the certification for any facility, and may impose a civil penalty for any significant failure to comply with the terms or conditions of the Energy Commission Decision. The specific action and amount of any fines the Energy Commission may impose would take into account the specific circumstances of the incident(s). This would include such factors as the previous compliance history, whether the cause of the incident involves willful disregard of LORS, oversight, unforeseeable events, and other factors the Energy Commission may consider.

NONCOMPLIANCE COMPLAINT PROCEDURES

Any person or agency may file a complaint alleging noncompliance with the conditions of certification. Such a complaint will be subject to review by the Energy Commission pursuant to Title 20, California Code of Regulations, section 1237, but in many instances the noncompliance can be resolved by using the informal dispute resolution process. Both the informal and formal complaint procedure, as described in current State law and regulations, are described below. They shall be followed unless superseded by future law or regulations.

Informal Dispute Resolution Process

The following procedure is designed to informally resolve disputes concerning the interpretation of compliance with the requirements of this compliance plan. The project owner, the Energy Commission, or any other party, including members of the public, may initiate an informal dispute resolution process. Disputes may pertain to actions or decisions made by any party, including the Energy Commission's delegate agents.

This process may precede the more formal complaint and investigation procedure specified in Title 20, California Code of Regulations, section 1237, but is not intended to be a substitute for, or prerequisite to it. This informal procedure may not be used to change the terms and conditions of certification as approved by the Energy Commission, although the agreed upon resolution may result in a project owner, or in some cases the Energy Commission staff, proposing an amendment.

The process encourages all parties involved in a dispute to discuss the matter and to reach an agreement resolving the dispute. If a dispute cannot be resolved, then the matter must be brought before the full Energy Commission for consideration via the complaint and investigation procedure.

Request for Informal Investigation

Any individual, group, or agency may request the Energy Commission to conduct an informal investigation of alleged noncompliance with the Energy Commission's terms and conditions of certification. All requests for informal investigations shall be made to the designated CPM.

Upon receipt of a request for an informal investigation, the CPM shall promptly notify the project owner of the allegation by telephone and letter. All known and relevant

information of the alleged noncompliance shall be provided to the project owner and to the Energy Commission staff. The CPM will evaluate the request and the information to determine if further investigation is necessary. If the CPM finds that further investigation is necessary, the project owner will be asked to promptly investigate the matter. Within seven working days of the CPM's request, provide a written report to the CPM of the results of the investigation, including corrective measures proposed or undertaken. Depending on the urgency of the noncompliance matter, the CPM may conduct a site visit and/or request the project owner to also provide an initial verbal report, within 48 hours.

Request for Informal Meeting

In the event that either the party requesting an investigation or the Energy Commission staff is not satisfied with the project owner's report, investigation of the event, or corrective measures proposed or undertaken, either party may submit a written request to the CPM for a meeting with the project owner. Such request shall be made within 14 days of the project owner's filing of its written report. Upon receipt of such a request, the CPM shall:

1. immediately schedule a meeting with the requesting party and the project owner, to be held at a mutually convenient time and place;
2. secure the attendance of appropriate Energy Commission staff and staff of any other agencies with expertise in the subject area of concern, as necessary;
3. conduct such meeting in an informal and objective manner so as to encourage the voluntary settlement of the dispute in a fair and equitable manner;
4. After the conclusion of such a meeting, promptly prepare and distribute copies to all in attendance and to the project file, a summary memorandum that fairly and accurately identifies the positions of all parties and any understandings reached. If an agreement has not been reached, the CPM shall inform the complainant of the formal complaint process and requirements provided under Title 20, California Code of Regulations, section 1230, et. seq.

Formal Dispute Resolution Procedure-Complaints and Investigations

Any person may file a complaint with the Energy Commission's Dockets Unit alleging noncompliance with a Commission decision adopted pursuant to Public Resources Code section 25500. Requirements for complaint filings and a description of how complaints are processed are in Title 20, California Code of Regulations, section 1237.

Start Gas Pipeline Construction and Interconnection	
Complete Gas Pipeline Construction	
WATER SUPPLY LINE ACTIVITIES	
Start Water Supply Line Construction	
Complete Water Supply Line Construction	

CONDITION NUMBER	SUBJECT	DESCRIPTION
COMPLIANCE-1	Unrestricted Access	The project owner shall grant Energy Commission staff and delegate agencies or consultants unrestricted access to the power plant site.
COMPLIANCE-2	Compliance Record	The project owner shall maintain project files on-site. Energy Commission staff and delegate agencies shall be given unrestricted access to the files.
COMPLIANCE-3	Compliance Verification Submittals	The project owner is responsible for the delivery and content of all verification submittals to the CPM, whether such condition was satisfied by work performed or the project owner or his agent.
COMPLIANCE-4	Pre-construction Matrix and Tasks Prior to Start of Construction	Construction shall not commence until the all of the following activities/submittals have been completed: <ul style="list-style-type: none"> • property owners living within one mile of the project have been notified of a telephone number to contact for questions, complaints or concerns, • a pre-construction matrix has been submitted identifying only those conditions that must be fulfilled before the start of construction, • all pre-construction conditions have been complied with, • the CPM has issued a letter to the project owner authorizing construction.
COMPLIANCE-5	Surety Bond	Prior to site disturbance and each increment of construction, the project owner shall post a surety bond adequate to cover the cost of decommissioning and restoration and provide the surety bond to the BLM AO for approval.
COMPLIANCE-6	Compliance Matrix	The project owner shall submit a compliance matrix (in a spreadsheet format) with each monthly and annual compliance report which includes the status of all compliance conditions of certification.
COMPLIANCE-7	Monthly Compliance Report including a Key Events List	During construction, the project owner shall submit Monthly Compliance Reports (MCRs) which include specific information. The first MCR is due the month following the Energy Commission business meeting date on which the project was approved and shall include an initial list of dates for each of the events identified on the Key Events List.

COMPLIANCE TABLE 1
SUMMARY of COMPLIANCE CONDITIONS OF CERTIFICATION

CONDITION NUMBER	SUBJECT	DESCRIPTION
COMPLIANCE-8	Annual Compliance Reports	After construction ends and throughout the life of the project, the project owner shall submit Annual Compliance Reports instead of Monthly Compliance Reports.
COMPLIANCE-9	Confidential Information	Any information the project owner deems confidential shall be submitted to the Energy Commission's Executive Director with a request for confidentiality.
COMPLIANCE-10	Annual fees	Payment of Annual Energy Facility Compliance Fee
COMPLIANCE-11	Reporting of Complaints, Notices and Citations	Within 10 days of receipt, the project owner shall report to the CPM, all notices, complaints, and citations.
COMPLIANCE-12	Planned Facility Closure	The project owner shall submit a closure plan to the CPM at least 12 months prior to commencement of a planned closure.
COMPLIANCE-13	Unplanned Temporary Facility Closure	To ensure that public health and safety and the environment are protected in the event of an unplanned temporary closure, the project owner shall submit an on-site contingency plan no less than 60 days prior to commencement of commercial operation.
COMPLIANCE-14	Unplanned Permanent Facility Closure	To ensure that public health and safety and the environment are protected in the event of an unplanned permanent closure, the project owner shall submit an on-site contingency plan no less than 60 days prior to commencement of commercial operation.
COMPLIANCE-15	Post-certification changes to the Decision	The project owner must petition the Energy Commission to delete or change a condition of certification, modify the project design or operational requirements and/or transfer ownership of operational control of the facility.

**DECLARATION OF
John S. Kessler**

I, John S. Kessler, declare as follows:

1. I am presently a consultant as a Project Manager to the California Energy Commission for the Siting Office of the Siting, Transmission and Environmental Protection Division.
2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.
3. I helped prepare the staff testimony on **Executive Summary, Introduction, Project Description, and Other CEQA and NEPA Considerations** for the Rice Solar Energy Project based on my independent analysis of the Application for Certification and supplements thereto, data from reliable documents and sources, and my professional experience and knowledge.
4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issue addressed therein.
5. I am personally familiar with the facts and conclusions related in the testimony, and if called as a witness, could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated: October 6, 2010

Signed: 

At: Sacramento, California

PROFESSIONAL EXPERIENCE:

Mr. Kessler is a licensed Civil Engineer in California with over 28 years experience in water supply and power generation, which includes planning and managing projects with responsibilities in operations, maintenance, environmental assessment, licensing, regulatory compliance, permitting and project management.

May 2000 - Present: Principal - Kessler and Associates

Established Kessler and Associates to provide engineering, regulatory and operating services related to energy and associated water supply projects;

California Energy Commission (CEC) – Application for Certification (AFC) Licensing Process
Project Management and Soil & Water Resource Assessments of Proposed Gas-Fired Generating Facilities (Serving as Project Manager or Technical Lead to assess all potential soil and water resource impacts and/or evaluate water supply/cooling alternatives for the following projects:)

- Humboldt Bay Repowering Project, 06-AFC-7, Serving as the Project Manager of the AFC licensing process before the CEC for the Humboldt Bay Repowering Project (HBRP); The HBRP is a proposed 163-MW facility to replace aging generating units of Humboldt Bay Power Plant.
- Victorville 2 Hybrid Power Project, 07-AFC-1, Serving as the Project Manager of the AFC licensing process before the CEC for the Victorville 2 Hybrid Power Project (Victorville 2); which is a proposed 563 MW facility integrating combined cycle and solar-thermal technology.
- Walnut Creek Energy Park, 05-AFC-2; Co-authored Staff Assessment;
- Vernon Power Plant, 06-AFC-1; Co-authored Staff Assessment;
- Los Esteros Critical Energy Facility, 01-AFC-12; Authored Staff Assessment and coordinated the resolution of storm water discharge issues into Coyote Creek with responsible agencies including City of San Jose, Santa Clara Valley Water District, San Francisco RWQCB, and the U.S. Army Corps of Engineers;
- San Francisco Electric Reliability Project, 04-AFC-01; Authored initial Staff Assessment;
- Blythe Energy Project Transmission Line Modifications, 99-AFC-8, Co-authored Staff Assessment/Environmental Assessment;
- Blythe II Energy Project, 02-AFC-01; Prepared a Water Supply & Cooling Alternatives Analysis;
- San Joaquin Valley Energy Center, 01-AFC-22; Co-authored Staff Assessment;
- Palomar Power Plant, 01-AFC-24; Supported soil and storm water testimony;
- Tesla Power Plant, 01-AFC-21; Prepared Water Supply Alternatives Analysis, and coordinated closely with local agencies to demonstrate the feasibility of using recycled water; The final Commission decision adopted our recommendation to require use of recycled water;

- Inland Empire Energy Center, 01-AFC-17; Co-authored Staff Assessment;
- Russell City Energy Center, 01-AFC-7; Co-authored Staff Assessment;
- East Altamont Energy Center, 01-AFC-6; Prepared a Water Supply Alternatives Analysis, and coordinated with agency representatives to demonstrate the feasibility of using recycled water; The final Commission decision adopted our recommendation to require use of recycled water;
- Valero Cogeneration Project, 01-AFC-05, Co-authored Staff Assessment;
- Avenal Power Plant, 01-AFC-20; Co-authored Staff Assessment before project was suspended;
- Baldwin Hills – Supported Evidentiary Hearings before being withdrawn by the applicant;

CEC – Assessment of Alternative Generation Technologies

Served as the author of the Hydropower Chapter discussing the status of development, potential for new development, costs, and deployment constraints including environmental effects, in comparison to development of gas-fired generation technologies;

CEC - Water Discharge Assessment of Coastal Power Plants – Executive Order 22-01

Served as Project Manager of Water Resources to assess the generation curtailments resulting from regulatory-required cooling water discharge limitations at various coastal thermal power plants;

CEC - Environmental Performance Report of California’s Electric Generation Facilities

Co-authored the 2001, 2003 and 2005 Water and Biological Resources Sections, providing research and analysis of trends in power plant water resource utilization affected by technological changes, improved environmental safeguards, regulatory influences in market development, and diminishing supplies of fresh water;

CEC – California/Mexico Border Energy Issues – 2005 EPR White Paper

Authored the Water Chapter evaluating water quality and supply issues associated with existing and planned energy infrastructure along the U.S-Mexico border, finding that power plant water demands threaten to compromise our most fundamental needs, securing enough water to sustain life and food production;

CPUC – EIR for PG&E’s Application for Authorization to Divest its Hydroelectric Generating Facilities and Related Assets

- Served as Hazards Section Leader and Team Member of the Public Services and Utilities Section in preparing the EIR for considering PG&E's divestiture of its entire hydroelectric system; The environmental assessment included evaluating the safety and potential risks of PG&E’s dams throughout its hydroelectric system in Northern California.

DWR – Oroville Relicensing

Prepared a description of operations for the Oroville Complex, in support of the FERC Relicensing process to understand project constraints and opportunities for modified operations to enhance natural resource protection, water supply and power generation.

Utica Power Authority – Dam Safety and Project Management Services

Serving as UPA’s dam safety engineer and project manager of environmental compliance and special construction projects; The projects include managing natural resources, and planning maintenance and construction improvements to water conveyance and storage facilities.

El Dorado Irrigation District – Engineering, Regulatory Permitting and Compliance Services

Assessed condition of the 23-mile El Dorado Canal water conveyance system, proposing a range of maintenance and capital improvements including cost estimates; Am currently preparing Standard

Operating Procedures and facilitating employee training for project O&M, and preparing license compliance plans for protection of natural resources;

September 1995 – April 2000: Hydroelectric Director - El Dorado Irrigation District

Overall responsibilities included managing operation, maintenance, construction and regulatory activities and the acquisition of the El Dorado Hydroelectric Project from PG&E to EID; Construction activities included managing improvements to the penstock and powerhouse, replacing and relining sections of the penstock, and replacing turbine nozzle bodies, jet deflectors, governors, hydraulic oil systems and associated plant controls. Planning and feasibility studies included evaluating alternatives for replacing canal sections and a diversion dam which incurred flood damage and resulted in approximately \$30 million in capital replacement.

Aug. 1993 – Sept. 1995: Project Engineer - Northern California Power Agency

Managed planning of various enhancements and aquatic resource studies associated with the North Fork Stanislaus River Hydroelectric Project and relicensing studies associated with the Angels and Utica Projects; Coordinated initial development phases of new biomass energy from the Gridley Rice Straw Project for prototype development testing in the production of ethanol;

July 1984 – August 1993: Hydro Supervisor – Pacific Gas & Electric Company

Managed the operations, maintenance, capital improvements and regulatory compliance activities for the El Dorado and Chili Bar Hydroelectric Projects; Responsibilities included planning, estimating and managing numerous water conveyance and dam maintenance/capital projects;

Aug. 1979 – July 1984 - Hydraulic Engineer and Hydrographer/Hydrologist - PG&E

Managed various capital projects within PG&E's and its water district/agency partner's hydroelectric systems, including the low level outlet repair of New Bullards Bar Dam, that required several weeks of underwater construction. Also forecasted snowpack runoff and planned water storage and conveyance schedules for optimizing hydro generation production as integrated with PG&E's other generation and power import sources;

EDUCATION AND PROFESSIONAL CERTIFICATES:

- State Of California Professional Civil Engineer, License No. C034897;
- B.S. Civil Engineering, University Of California, Davis, June 1979;
- A.A. Diablo Valley College, Pleasant Hill, June 1976;

HONORS AND AWARDS:

- 2001 Outstanding Performance Award from the State of California - Energy Commission;
- 1999 Outstanding Achievement Award for Transfer of the El Dorado Hydroelectric Project from PG&E to the El Dorado Irrigation District;

PROFESSIONAL ASSOCIATIONS:

- American Society of Civil Engineers

Jsk:JK's Resume – 2007 - CEC

DECLARATION OF
Suzanne L. Phinney, D.Env.

I, Suzanne L. Phinney, declare as follows:

1. I am presently employed by Aspen Environmental Group, consultant to the California Energy Commission's Facilities Siting Office of the Systems Assessments and Facilities Siting Division as a Senior Associate.
2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.
3. I helped prepare staff testimony on **TSE Appendix A** for the **Rice Solar Energy Project Staff Assessment** based on my independent analysis of the Application for Certification and supplements thereto, data from reliable documents and sources, and my professional experience and knowledge.
4. It is my professional opinion that the prepared testimony and errata is valid and accurate with respect to the issue addressed therein.
5. I am personally familiar with the facts and conclusions related in the testimony and errata and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated: 8/9/2010

Signed: 

At: Sacramento, California

SUZANNE L. PHINNEY
Senior Associate, Energy and Infrastructure

ACADEMIC BACKGROUND

Doctorate, Environmental Science & Engineering (D.Env.), University of California, Los Angeles, 1981
M.S., Marine Biology, Dalhousie University, Halifax, Nova Scotia, Canada, 1975
B.A., Biological Sciences, University of California, Berkeley, 1973

PROFESSIONAL EXPERIENCE

Dr. Phinney has 30 years of experience in the environmental and energy field, providing technical and policy support in energy analysis, environmental assessment, environmental remediation, air and water quality assessments, risk assessment, regulatory compliance, permitting, and project/program management. Her particular emphasis is energy and infrastructure with projects addressing climate change, alternative energy generation technologies, liquefied natural gas, petroleum infrastructure, advanced transportation vehicles and fuels, land use and energy, and power plant siting. Prior to employment at Aspen, Dr. Phinney worked for 16 years with Aerojet, where she oversaw all environmental and safety issues.

Aspen Environmental Group

2001 to present

Dr. Phinney manages energy and infrastructure projects for Aspen and provides environmental support on major projects. She has provided energy and environmental expertise to the following clients:

California Energy Commission (CEC). Dr. Phinney has supported CEC staff since 2001. She has prepared analyses for several power plants throughout the State, and has authored or contributed to over a dozen special studies. She is currently Deputy Program Manager for planning studies conducted by the Aspen team. Her major efforts for the CEC include the following.

- **Power Plant Siting, CEC, Project Management/Technical Support (2001 – Present).** Dr. Phinney prepared the alternatives analysis for the following power plants under review by the Energy Commission:
 - **Palomar Energy Project** – 500 MW combined-cycle natural gas facility in Escondido, San Diego County
 - **Russell City Energy Center** – 600 MW combined-cycle natural gas facility in Hayward, Alameda County
 - **Eastshore Energy Center** - 115.5 MW simple-cycle natural gas facility in Hayward, Alameda County
 - **Carrizo Energy Solar Farm** – 177 MW solar thermal (Compact Linear Fresnel Reflector) plant in the Carrizo Plain, San Luis Obispo County
 - **CPV Sentinel Energy Project** – 850 MW natural gas plant in the Coachella Valley, Riverside County
 - **Marsh Landing Generating Station**- 930 MW natural gas plant within the existing Contra Costa Power Plant in Antioch, Contra Costa County
 - **Orange Grove Project** – 96 MW natural-gas peaking facility near Pala, San Diego County
 - **Willow Pass Generating Station** – 550 MW natural gas plant within the existing Pittsburg Power Plant in Pittsburg, Contra Costa County

- **Almond 2 Peaking Power Plant Project** – 174 MW natural-gas peaking facility near Ceres, Stanislaus County
- **Abengoa Mojave Solar Project** – 250 MW solar thermal (parabolic trough) plant near Harper Dry Lake, San Bernardino County
- **Ridgecrest Solar Power Project** – 250 MW solar thermal (parabolic trough) plant on 3,920 acres of BLM land near Ridgecrest, Kern County

Dr. Phinney prepared the waste management assessments of power plant licensing applications:

- **Eastshore Energy Center** – 115.5 MW natural gas simple-cycle plant in Hayward, Alameda County
- **Carrizo Energy Solar Farm** – 177 MW solar thermal (Compact Linear Fresnel Reflector) plant in the Carrizo Plain, San Luis Obispo County
- **Palmdale Hybrid Power Project** – 570 MW natural gas-solar thermal (parabolic trough) hybrid plant in Palmdale, Los Angeles County
- **SES Solar Two Siting Case** – 750 MW solar thermal (Stirling dish) plant on 6,500 acres of mostly BLM land in Imperial County
- **Hanford Energy Park Peaker Plant** – 120 MW simple-cycle, natural gas facility in Hanford, Kings County
- **Ridgecrest Solar Power Project** – 250 MW solar thermal (parabolic trough) plant on 3,920 acres of BLM land near Ridgecrest, Kern County
- **Blythe Solar Power Project** – 1,000 MW solar thermal (parabolic trough) plant on 9,400 acres of BLM land near Blythe, Riverside County
- **Palen Solar Power Project** – 500 MW solar thermal (parabolic trough) plant on 5,200 acres of BLM land in the Chuckwalla Valley, Riverside County

Dr. Phinney also coordinated the study of cooling water alternatives for the Tesla and Tracy natural gas, combined-cycle power plants.

- **Environmental Performance Report, CEC, Project Manager/Technical Support (2001, 2003, 2005).** Dr. Phinney was Project Manager for Aspen's technical contributions, graphics and production efforts for the 2001 Environmental Performance Report (EPR) which detailed the current and historical air, water and biological impacts from in-state generation facilities. She provided support to the water resources discussion in the 2003 EPR and managed the analysis of out-of-state generation facilities for the 2005 EPR.
- **Advanced Electric Generation Technologies, CEC, Project Manager (2001 - 2002).** Dr. Phinney served as Project Manager for a report defining the technical development, developmental capacity, commercial status, costs and deployment constraints of selected alternative electric generation technologies. Technologies included geothermal, fuel cell, solar thermal, solar photovoltaic, wind and hydro. The focus was on development and application of the technology in California. Two page fact sheets on each technology and a matrix comparing all technologies was developed. Finally, an updated discussion of renewable technologies was developed for insertion into the alternatives section of Staff Assessments for power plant applications.
- **Liquefied Natural Gas Support, CEC, Technical Author (2002 – 2007).** Dr. Phinney has been instrumental in the preparation of numerous safety and policy reports on liquefied natural gas (LNG). She authored the Commission document: *International and National Efforts to Address the Safety and Security of Importing Liquefied Natural Gas: A Compendium*. This report reviewed national and international LNG regulations, standards and guidelines, reviewed risk assessment techniques, and identified, compiled and reviewed LNG safety/risk studies. Dr. Phinney helped organize LNG Access Workshops held in June 2005 and prepared a 40 page summary of presentations made at the workshops. She developed over 30 fact sheets on LNG subject areas for distribution to the public. Dr. Phinney compiled state and local comments on a proposed LNG terminal at the Port of Long Beach;

these were presented in the *Safety Advisory Report on the Proposed Sound Energy Solutions Natural Gas Terminal at the Port of Long Beach, California*, which was delivered to the Federal Energy Regulatory Commission within the mandated 30-day period imposed by the 2005 federal Energy Bill. She provided technical review for the report *The Outlook for Global Trade in Liquefied Natural Gas Projections to the year 2020*.

- **Natural Gas Market Assessment Support, CEC, Technical Author/Editorial Support (2005 – 2007).** Dr. Phinney contributed to natural gas supply and demand analyses for the Commission document, *Natural Gas Assessment Update*. She provided technical and editorial support to the 2005 and 2007 Integrated Energy Policy Report (IEPR) documents, *Preliminary (and subsequently the Revised report) Reference Case in Support of the 2005 Natural Gas Market Assessment* and *2007 Natural Gas Market Assessment*. She edited the Commission document *Natural Gas Quality: Power Turbine Performance During Heat Content Surges*.
- **Petroleum Infrastructure Environmental Performance Report, CEC, Project Manager (2005).** Dr. Phinney served as Project Manager for the 2005 IEPR document *Petroleum Infrastructure Environmental Performance Report*. In addition to managing preparation of the report and workshop presentations, she prepared responses to comments and provided policy recommendations.
- **Hydropower and Global Climate Change, CEC, Technical Author (2005).** Dr. Phinney coauthored the document *Potential Changes in Hydropower Production from Global Climate Change in California and the Western United States*. This report investigated the effects of climate change on hydropower production in the West and compared impacts and policy actions in California, the Pacific Northwest, and the Southwest.
- **Advanced Energy Pathways, CEC, Project Manager (2006 – 2008).** Dr. Phinney provided project management support for a 3-year study evaluating the effects of advanced transportation technologies and fuels (out to 2050) on California's natural gas and electricity systems. This report involved the development of baseline and alternative energy demand and supply scenarios, in-depth technical analysis of advanced transportation technologies and fuels, and the development of an energy-rich model.
- **Land Use and Energy, CEC, Project Manager/Technical Author (2006 – 2008).** Dr. Phinney authored a CEC report on the linkages between land use and energy, which ultimately became one of the two chapters presented in the 2006 IEPR Update. The report highlighted how energy can be better integrated in land use planning, and how efforts such as smart growth can help the state meet its energy and greenhouse gas emission reduction goals. She organized a full-day workshop involving over a dozen speakers representing state agencies, local governments, research entities, environmental groups, utilities, and non-profits. Dr. Phinney was one of the authors of the 2007 land use and energy follow-up report which further defined the role of land use in meeting California's energy and climate change goals. She helped synthesize the report into a chapter for the 2007 IEPR. Dr. Phinney helped edit the Land Use Subgroup of the Climate Action Team report prepared for submission to the California Air Resources Board AB 32 Scoping Plan.
- **AB 1632 Nuclear Power Plant Assessment, CEC, Technical Author (2007 – 2008).** Dr. Phinney was a key member of a team evaluating nuclear power issues in the state in response to AB 1632 legislation. She managed and prepared report sections regarding the impacts to local communities and the environmental issues and costs associated with alternatives, including renewables, to the state's two nuclear facilities. These sections were incorporated in the report *An Assessment of California's Nuclear Power Plants*.
- **Environmental Screening Tool for Out-of-State Renewable Energy Facilities, CEC, Project Manager (2009).** Dr. Phinney prepared an environmental screening tool/analysis allowing CEC to determine quickly whether out-of-state renewable facilities requesting RPS certification met California laws, ordinances, regulations and standards.

- **Energy Aware Facility Planning and Siting Guide, CEC, Project Manager (2009-2010).** Dr. Phinney is updating a 1997 version of the Energy Aware Guide to help local governments plan for and permit electricity generation facilities and transmission lines that will be needed in the upcoming years. The Guide informs planners, decision makers and the public about what, how, and why electricity infrastructure may be developed.

California Public Utilities Commission. Dr. Phinney has managed several environmental assessments for the CPUC and has been heavily involved in editorial support of many other CPUC documents prepared by Aspen.

- **Looking Glass Network Initial Study/Mitigated Negative Declaration, CPUC, Project Manager (2002 – 2003).** Dr. Phinney served as Project Manager for the preparation of Initial Study/Mitigated Negative Declarations (IS/MND) for this telecommunication project that involved construction in the San Francisco Bay Area and the Los Angeles Basin to allow fiber optic connections in numerous locations.
- **Williams Communications Sentry Marysville Project IS/MND, CPUC, Project Manager (2002 – 2003).** Dr. Phinney served as Project Manager for the installation of fiber optic connection to a Beale Air Force Base in Yuba County.
- **Kirby Hills II Natural Gas Storage Facility IS/MND, CPUC, Project Manager (2007).** Dr. Phinney managed an IS/MND for expansions at a natural gas storage facility in Solano County.
- **Multiple EIR Documents, CPUC, Technical Editor (2004 - 2008).** Dr. Phinney provided editorial and QA/QC review for the Diablo Canyon Steam Generator Replacement EIR, the Miguel Mission 230 kV Transmission Line EIR and the Sunrise Powerlink EIR/EIS.

California Institute of Technology/University of California. Dr. Phinney provided project management support to the following project.

- **Combined Array for Research in Millimeter-wave Astronomy EIS/EIR, U.S. Forest Service and the University of California (2001 – 2002).** Dr. Phinney was the Project Manager for this EIS/EIR for a radio telescope antenna array to be placed at a high altitude site in the Inyo National Forest. The evaluation of alternatives was especially contentious, and Aspen's field analyses of several potential sites were pivotal in the ultimate selection of one of these alternative sites.

Western Area Power Administration. Dr. Phinney provided editorial and QA/QC support to the following projects.

- **North Area ROW Maintenance Project Environmental Assessment, Western, Technical Editor/QA/QC (2006-2008).** Dr. Phinney provided technical editing and QA/QC support for all documents relating to the development of 800 miles of transmission lines in Northern California.
- **Sacramento Area Voltage Support Supplemental EIS/EA, Technical Editor/QA/QC (2006 – 2008).** Dr. Phinney provided technical editing and QA/QC support for all environmental documentation and permitting for new construction and reconstruction of transmission lines in the greater Sacramento area.

Vermont Yankee Nuclear Power Plant Report, Vermont Department of Public Service, Project Manager (December 2008 to January 2009). Dr. Phinney was the Project Manager and provided technical support for the environmental analysis of the continued operation of the Vermont Yankee Nuclear Power Station in Vernon, Vermont. The report assessed the environmental impacts to land, water and air resources (including climate change), soil and seismicity, on-site and off-site storage and disposal of high-level and low-level nuclear waste.

GenCorp

1999 to 2000

- As Vice President, Environmental and Regulatory Affairs, Dr. Phinney held primary responsibility for coordinating the company's aerospace and automotive environmental activities with various federal, State, and local regulatory agencies. Her specific responsibilities included: working with external groups and entities to develop responsible environmental legislation, regulations, and standards and the implementation of sound public policy; developing stakeholder base and strategy to ensure that company objectives were achieved; facilitating company and regulatory agency discussions to achieve more comprehensive and quicker remediation of sites; and spearheading a stakeholder group to develop and fund scientific studies on selected chemicals of concern.

Aerojet General Corporation

1984 to 1999

As Vice President, Environmental Health and Safety, Dr. Phinney ensured that programs were in place to meet all regulatory requirements and company initiatives. Her responsibilities included: providing strategic direction and management of all superfund-related investigation and remediation activities; developing environmental management plans; communicating environmental requirements, concerns, and successes to both internal and external audiences, including the board of directors, investment banking, and the analyst community; and participating as a member of the leadership council in defining company-wide business objectives and targets.

- Dr. Phinney created the first corporate EHS department, defining and staffing key functional areas. She managed a \$20,000,000 annual budget and oversaw a staff of up to 30 professionals. Select accomplishments include: the development of remediation technologies that resulted in the cleanup of over 50 billion gallons of contaminated groundwater; development of the world's first groundwater treatment facility for perchlorate; significant reductions in emissions and hazardous waste generation; representation on numerous legislative and regulatory task forces and leadership positions on external business and community EHS committees and councils; and extensive public outreach efforts.

PREVIOUS EXPERIENCE, 1976 TO 1984

Jacobs Engineering Group. Dr. Phinney conducted toxicological, ecological, and air and water quality assessments.

Department of Environmental Science and Engineering at the University of California, Los Angeles. Dr. Phinney analyzed legal, economic, public health, and administrative barriers to waste water reuse. She also conducted an analysis of ecological and institutional factors in coastal siting of power plants.

Southwest Los Angeles Junior College. Dr. Phinney taught lecture and laboratory courses in general science.

TRAINING

- Certificate, Executive Program, University of California, Davis, 1989
- Expert Witness Training, California Energy Commission, 2001

HONORS AND AWARDS

- Who's Who of American Women, 18th Edition
- YWCA Outstanding Woman of the Year (Sciences) Award, 1992
- Woman of Achievement Award, Downtown Capitol Business and Professional Women, 1993
- Individual Award for Outstanding Contribution in Air Quality, 1995
- Sacramento Safety Center Incorporated, Eagle Award for Safety, 1998
- Regional Award for Outstanding Contribution in Air Quality, 2003

ACTIVITIES AND ASSOCIATIONS

- Editorial Board, The Environmental Professional, 1987-1989
- City of Sacramento Toxic Substances Commission, 1986-1988
- Sacramento Environmental Commission, 1988-1991
- Board of Directors, League of Women Voters of Sacramento, 1989-1999; President 1996-1997; Co-President 1997-1998; 2003-2005; Energy Study Committee 2005; Moderator/Facilitator of Debates and Forums (e.g., climate change, the SACOG's MTP, and flood control)
- Toxics Consultant, League of Women Voters of Sacramento, 1988-1989
- Member, Advisory Committee on AB 3777 (Risk Management Prevention Programs)
- Board of Directors, American Lung Association of Sacramento-Emigrant Trails, 1992-2000; President 1998-1999;
- Board of Directors, Sacramento Metropolitan Chamber of Commerce, 1992-1997; Vice President, Public Policy, 1996-1997
- Board of Directors, Air and Waste Management Association, 1991-1994
- Steering Committee Chair, Cleaner Air Partnership, 1993-1996, 2000-2001; Executive Committee 1993 to present
- Co-chair, TCE Issues Group, 1994-2000
- Sacramento Water Forum, 1995-2000
- Rate Advisory Committee, Sacramento Municipal Utility District, 1999-2001

**DECLARATION OF
Brenner Munger**

I, **Brenner Munger**, declare as follows:

1. I am presently employed by the California Energy Commission in the **Engineering Office** of the Siting, Transmission and Environmental Protection Division as an **Air Resources Engineer**.
2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.
3. I helped prepare the staff testimony on **Air Quality** for the **Rice Solar Energy Project** based on my independent analysis of the Application for Certification and supplements thereto, data from reliable documents and sources, and my professional experience and knowledge.
4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issue addressed therein.
5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated: 8/9/10

Signed: Brenner Munger

RESUME

RAYMOND BRENNER MUNGER

EDUCATION

Bachelor of Science in Mechanical Engineering
University of California, Santa Barbara, Graduated with honors, June 1970

Master of Science in Engineering
University of California, Irvine, December 1972

Doctor of Philosophy in Engineering
University of California, Irvine, December 1981

EXPERIENCE

Dates: January 2010 to Present
Title: Air Resources Engineer, Siting, Transmission and Environmental Protection
Division, California Energy Commission, 1516 9th Street, Sacramento, CA 95814

Duties: Conducts staff assessments of air quality impact analyses prepared by project applicants in support of certification process for thermal power plant projects over 50 MW in California. Reviews compliance reports for power plants.

Dates: September 2004 to December 2009
Title: Manager, Power Supply Engineering Department (PSED)
Hawaiian Electric Company, Inc., 820 Ward Avenue, Honolulu, HI 96814

Duties: Responsible for ~50 engineers and support personnel to provide design engineering, project engineering, project management and field engineering support for the capital improvement program (~\$32 million annual capital budget) for the existing power generation assets of Hawaiian Electric Company.

Responsible for the project management support for the generation unit additions for Hawaiian Electric Company (HECO), Maui Electric Company (MECO) and Hawaii Electric Light Company (HELCO). Since 2004, provided project management and engineering support for the completion of five major generation unit addition projects for HECO, MECO and HELCO totaling over \$480 million.

Procure engineering and permitting consultants for generation unit additions through competitive bidding processes and managed consultant contracts for design engineering, permitting, project management, major equipment procurement, construction management and commissioning support for the HECO capital improvement program and the major generation unit addition projects.

Prepare and review applications, testimony and responses to information requests for submittal to Hawaii Public Utilities Commission and Consumer Advocate for capital projects and rate case proceedings.

Regularly serve as lead for cross-functional working groups on a variety of studies and assignments including strike response planning, management review of the Power Supply operations, maintenance and overhaul management programs and seismic vulnerability assessment.

Dates: July 1995 to September 2004

Title: Manager, Power Supply Planning & Engineering Department, Hawaiian Electric Company, Inc., 820 Ward Avenue, Honolulu, HI 96814

Duties: Responsible for ~55 engineers, planners and technical support personnel providing long range resource planning (Integrated Resource Planning, Generation Planning and later in this position Transmission Planning) in addition to the traditional engineering functions required for the capital improvement programs for power generation facilities. The geographical scope of the planning and engineering support covered HECO, MECO and HELCO. The engineering support included the design engineering, project engineering and project management support for the capital improvement program for the existing power generation assets of Hawaiian Electric Company.

Responsible for the project management support for the generation unit additions for HECO, MECO and HELCO.

Major capital projects completed include a 13-mile fuel oil pipeline from HECO's Barber's Point Tank Farm to the HECO Waiiau Power Plant. Scope of responsibilities for the project team included planning, permitting, community relations, engineering, materials procurement, construction and negotiation of services and O&M contracts with a third party.

For the Integrated Resource Planning effort, served as Chair for the Supply-side Resource Advisory Group, which consisted of representatives from government, environmental groups, academia, and industry. The deliverable for this effort was a report on the supply side resources to be considered for inclusion in the long-term resource plans for HECO, MECO and HELCO.

Routinely made presentations on technical matters to both technical and lay audiences.

Regularly served as lead for cross-functional working groups on a variety of studies and assignments including competitive bidding for new generation, fuel oil infrastructure study, interface with LNG project developers, implementation of enterprise software system for Power Supply and strike response planning,

Dates: June 1988 to June 1995

Title: Manager, Engineering Department, Hawaiian Electric Company, Inc., 820 Ward Avenue, Honolulu, HI 96814

Duties: Managed department of ~80 engineers and support personnel to provide design engineering, project engineering and project management support for the capital improvement program for the power generation, transmission, substation and communications assets of Hawaiian Electric Company.

Responsible for the project management support for the generation unit additions for Hawaiian Electric Company, Maui Electric Company and Hawaii Electric Light Company.

Procured consultants through competitive bidding processes and managed consultant contracts for design engineering, project management, major equipment procurement, construction management and commissioning support for these major generation, transmission and substation addition projects.

Program responsibilities included the corporate renewable energy program and the corporate program for membership in the Electric Power Research Institute (Manager of EPRI Technology Transfer - METT). Reviewed proposed state legislation, drafted

testimony and presented testimony to state legislative committees on engineering and renewable energy matters.

Dates: August 1984 to June 1988

Title: Manager, Environmental Department, Hawaiian Electric Company, Inc., 820 Ward Avenue, Honolulu, HI 96814

Duties: Responsible for overall environmental management programs for Hawaiian Electric Company (HECO), Maui Electric Company (MECO) and Hawaii Electric Light Company (HELCO).

Managed ~16 engineers, environmental scientists and support personnel to provide air quality permitting, water quality permitting, compliance audits and assessments, ambient air quality monitoring, emissions source testing, water quality monitoring, noise monitoring, and laboratory support for HECO, MECO and HELCO. Topical areas of responsibility included air, water, hazardous wastes, noise and PCBs.

Augmented in-house personnel with contractors and consultants on an on-going basis to manage workload and meet critical deadlines.

Interfaced regularly with state and federal regulatory agencies on permitting, compliance monitoring and reporting, regulation development and enforcement matters.

Reviewed proposed state legislation, drafted testimony and provided testimony to state legislative committees on environmental matters.

Served as utility representative on inter-disciplinary advisory committee to state regulatory agency on air regulation development.

Dates: August 1981 to July 1984

Title: Senior Engineer and Program Manager, Environmental Research & Technology (ERT), Inc., Newbury Park, California 91320

Duties: Responsible for management and technical direction of project teams for a variety of studies which included:

Microscale modeling of motor vehicle CO impacts in Sacramento, CA and Richmond, CA areas in support of request for reduction in CO nonattainment areas.

Air quality impact assessments for cogeneration projects, resource recovery facilities, and marine tanker emissions using UNAMAP and regional photochemical air quality models.

Development of software systems for addressing the atmospheric release of hazardous materials.

Analytical evaluations of the technical basis for (1) proposed modifications of gasoline lead content regulations, and (b) current nonattainment designations in California.

Responsible for management of computer operations at ERT Newbury Park, CA office, coordination with ERT Concord, MA Computer Services Division, and identification and evaluation of alternatives for improving system efficiency and upgrading/ replacing system hardware.

Principal liaison and business development contact for local and state regulatory and planning agencies involved with air resources.

Dates: September 1979 to July 1981

Title: Air Pollution Research Specialist, Air Quality Modeling Section, Research Division, California Air Resources Board

Duties: Responsible for the regional and microscale air quality modeling components of the nonattainment planning program for Sacramento Valley and San Joaquin Valley Air Basins. This required coordination with federal, local, and other state agencies as well as other CARB divisions. As part of this effort, directed and coordinated the work of several Air Quality Modeling Section (AQMS) staff.

Conducted air quality modeling studies in support of regulation and model rule development by other CARB divisions and in evaluation of regulations proposed by other agencies.

Assessed air quality impacts of specific projects using currently available Gaussian and numerical air quality models. Provide support and direction to local agency staff in air quality studies of specific projects.

Prepared an air quality modeling guidelines document which identified models and modeling procedures acceptable to the CARB. This document was in support of the New Source Review and Prevention of Significant Deterioration programs in the state.

Developed and applied computer software packages for preprocessing data for input to regional air quality modeling. Specific packages were for wind data and terrain data.

Performed statistical analysis involving multiple regression analysis and factor analysis of meteorological and air quality data. Specific products included an algorithm for estimating upper air temperatures for Bakersfield area using Fresno temperature sounding data.

Dates: August 1974 to August 1979

Title: Associate Air Resources Engineer, Air Quality Maintenance Planning Branch, Planning Division, California Air Resources Board

Duties: Provided general technical support to the long range planning activities of the ARB and local agencies, i.e., the Air Quality Maintenance Planning effort. A major product of this support was the Air Quality/Land Use Planning Handbook for California, Part II - Air Quality Fundamentals for Planners. Another major activity was the Land Use/Oxidant Precursors Emissions Study which investigated the relationships between land use patterns and the emissions of oxidant precursors.

Major accomplishments during this period include:

Authored portions and edited all of Emissions and Air Quality Assessment, Air Resources Board Report No. ARB/EP-76001, the first Executive Office-approved report on emissions assessment published by CARB staff.

Coordinated the efforts of over ten staff members in the writing and production of Part II of the Air Quality/Land Use Planning Handbook. Authored portions and edited all of Part II of the handbook.

Supervised and participated in the preparation of the feasibility study for a data digitizing/data reduction system to develop the digitized land use data base for the Land Use/Oxidant Precursors Emissions Study. The feasibility study was submitted to the State Data Processing Management Office, Department of Finance. With conditional approval from DOF, I had lead responsibility for completing contract negotiations with the vendor for the system hardware and software.

Participated in the development of air quality analysis techniques for use in Prevention

of Significant Deterioration and Air Conservation Programs and the development of guidelines for use by state and local technical staff to determine the necessary level of analysis by area and source type.

Dates: November 1973 to July 1974

Title: Assistant Engineering Specialist - Air Pollution, Land Use Planning Program, Evaluation and Planning, California Air Resources Board

Duties: Provided air quality technical support to five-member interdisciplinary team working to interface ongoing air quality, land use and transportation planning processes. Areas of responsibility included: 1) emissions assessments and projections for both mobile and stationary sources, and 2) air quality estimates and projections utilizing non-computer-based techniques. Participated in the preparation of reports documenting methodologies for use by local and regional planners in their air quality planning efforts. LUPP produced ten reports, of which I authored four.

Dates: January 1973 to October 1973

Title: Assistant Engineering Specialist-Air Pollution, Implementation Planning Unit, Division of Implementation and Enforcement, California Air Resources Board

Duties: The Implementation Planning Unit had the staff responsibility, under Board direction, for developing, evaluating, and implementing air quality strategies. Implementation of these strategies was effected by adoption in the State Implementation Plan. I participated in the control strategy evaluation via emissions assessments and air quality projections for Revision 3 of the SIP. Specific duties included monitoring rules and regulations of air pollution control districts and the Environmental Protection Agency, compiling emissions assessments for motor vehicles and aircraft for base years and future years, evaluating the impact of alternate control strategies on mobile source emissions, and providing staff support for the first indirect source proposal presented to the Air Resources Board.

LICENSES AND ORGANIZATIONS

Registered Mechanical Engineer in California - ME16427
Registered Professional Engineer in Colorado - No. 16333
Registered Professional Engineer in Hawaii – No. 6127
Associate Member, American Society of Mechanical Engineers

DECLARATION OF
Testimony of William Walters, P.E.

I, **William Walters**, declare as follows:

1. I am presently employed by Aspen Environmental Group, a contractor to the California Energy Commission's Siting, Transmission and Environmental Protection Division, as a senior associate in engineering and physical sciences.
2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.
3. I helped prepare the staff testimony on **Air Quality** and **Greenhouse Gases** for the **Rice Solar Energy Project Staff Assessment/Draft Environmental Impact Statement** based on my independent analysis of the Application for Certification and supplements hereto, data from reliable documents and sources, and my professional experience and knowledge.
4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issue addressed therein.
5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated: August 6, 2010

Signed:  _____

At: Aqoura Hills, California

WILLIAM WALTERS, P.E.
Air Quality Specialist

ACADEMIC BACKGROUND

B.S., CHEMICAL ENGINEERING, 1985, CORNELL UNIVERSITY

PROFESSIONAL EXPERIENCE

Mr. Walters has over 20 years of technical and project management experience in environmental compliance work, including environmental impact reports, emissions inventories, source permitting, energy and pollution control research RCRA/CERCLA site assessment and closure, site inspection, and source monitoring.

Aspen Environmental Group

2000 to present

Responsible as lead technical and/or project manager of environmental projects, including the following specific relevant recent (2000 and forward) responsibilities and projects:

- **Engineering and Environmental Technical Assistance to Conduct Application for Certification Review for the California Energy Commission:**
 - Preparation and project management of the air quality section of the Staff Assessment and/or Initial Study and the visual plume assessment for the following licensing projects: Hanford Energy Park; United Golden Gate, Phase I; Huntington Beach Modernization Project*; Woodland Generating Station 2; Ocotillo Energy Project, Phase I; Magnolia Power Project*; Colusa Power Project; Rio Linda/Elverta Power Plant Project; Roseville Energy Center; Henrietta Peaker Project; Tracy Peaking Power Plant Project*; Avenal Energy Project; San Joaquin Valley Energy Center*; Salton Sea Unit 6 Project*; Modesto Irrigation District Electric Generation Station*; Walnut Energy Center*; Riverside Energy Resource Center*; Pastoria Energy Facility Expansion; Bullard Energy Center; Panoche Energy Center; Starwood Power Plant; Riverside Energy Resource Center Units 3 and 4 Project; Colusa Generating Station*; Chula Vista Energy Upgrade Project*; Orange Grove Power Plant Project*; Carlsbad Energy Center Power Project*; Hydrogen Energy California (in process); Canyon Power Plant Project*; Imperial Valley Solar Project*; Beacon Solar Energy Project; Calico Solar Power (in process); Abengoa Mojave Solar Project; Genesis Solar Energy Project; Blythe Solar Power Project; Palen Solar Power Project (in process); Ridgecrest Solar Power Project; Rice Solar Energy Project (in process); Ivanpah Solar Electric Generating Station project.
 - Preparation and project management of the visible plume assessment for the following licensing projects: Metcalf Energy Center Power Project*; Contra Costa Power Plant Project*; Mountainview Power Project; Potrero Power Plant Project; El Segundo Modernization Project; Morro Bay Power Plant Project; Valero Cogeneration Project; East Altamont Energy Center*; SMUD Cosumnes Power Plant Project*; Pico Power Project; Blythe Energy Project Phase II; City of Vernon Malburg Generating Station; San Francisco Electric Reliability Project; Los Esteros Critical Energy Facility Phase II; Roseville Energy Park; City of Vernon Power Plant; South Bay Replacement Project; Walnut Creek Energy Park; Sun Valley Energy Project; Highgrove Power Plant; Colusa Generating Station; Russell City Energy Center; Avenal Energy Project; Community Power Project; San Gabriel Generating Station; Sentinel Energy Project; Victorville 2 Hybrid Power Project; City of Palmdale Hybrid Energy Project (in process); Chevron Richmond Power plant Replacement Project; Tracy Combined Cycle Power Plant; Lodi Energy Center; and San Joaquin Solar 1&2 Power Plant.
 - Assistance in the aircraft safety review of thermal plume turbulence for the Riverside Energy Resources Center; Russell City Energy Center Amendment*; Eastshore Energy Power Plant*; Carlsbad Energy Center (in progress), City of Palmdale Hybrid Energy Project; Riverside Energy Resource Center Units 3 and 4 Project; Victorville 2 Hybrid Power Project; Blythe Energy Project Phase II*, Tracy Power Plant; Avenal Energy Project; and Blythe Solar Energy Project siting cases. Assistance in the aircraft safety review of

* - Includes providing expert witness testimony.

thermal and visual plumes of the operating Blythe Energy Power Plant. Preparation of a white paper on methods for the determination of vertical plume velocity determination for aircraft safety analyses.

■ **Other California Energy Commission and relevant project experience:**

- Preparation and instruction of a visual water vapor plume modeling methodology class for the CEC.
- Preparation and project management of the public health section of the Initial Study for the Woodland Generating Station 2 Energy Commission licensing project.
- Preparation of project amendment or project compliance assessments, for air quality or visual plume impacts, for several licensed power plants, including: Metcalf Energy Center; Pastoria Power Plant; Elk Hills Power Plant; Henrietta Peaker Project; Tracy Peaker Project; Magnolia Power Project; Delta Energy Center; SMUD Cosumnes Power Plant; Walnut Energy Center; San Joaquin Valley Energy Center; City of Vernon Malburg Generating Station; Otay Mesa Power Plant; Los Esteros Critical Energy Facility; Pico Power Project; Riverside Energy Resource Center; Blythe Energy Project Phase II; Inland Empire Energy Center; Salton Sea Unit 6 Project; Black Rock 1, 2, and 3 Geothermal Power Project, and Starwood Power-Midway Peaking Power Plant.
- Preparation of the air quality section of the staff paper “A Preliminary Environmental Profile of California’s Imported Electricity” for the Energy Commission and presentation of the findings before the Commission.
- Preparation of the draft staff paper “Natural Gas Quality: Power Turbine Performance During Heat Content Surge”, and presentation of the preliminary findings at the California Air Resources Board Compressed Natural Gas Workshop and a SoCalGas Technical Advisory Committee meeting.
- Preparation of the staff paper “Emission Offsets Availability Issues” and preparation and presentation of the Emission Offsets Constraints Workshop Summary paper for the Energy Commission.
- Preparation of information request and data analysis to update the Energy Commission’s Cost of Generation Model capital and operating cost factors for combined and simple cycle gas turbine projects. Additionally, performed a review of the presentation for the revised model as part of the CEC’s 2007 Integrated Energy Policy Report workshops, and attended the workshop and answering Commissioner questions on the data collection and data analysis. Prepared an update to the Energy Commission’s capital and operating cost factors for combined and simple cycle gas turbine projects within the Cost of Generation model as part of the 2009 Integrated Energy Policy Report process.
- Preparation of the Air Quality Section, air quality emission calculations, or other technical studies, in support of the environmental documentation for renewable energy projects including; the Liberty Energy XXIII Renewable Energy Project; the Topaz Solar Farm, the Pacific Wind Energy Project, and the Pine Tree Wind Development Project.
- Preparation of comments on the Air Quality, Alternatives, Marine Traffic, Public Safety, and Noise section of the Cabrillo Port Liquefied Natural Gas Deepwater Port Draft EIS/EIR for the City of Oxnard.

CERTIFICATION

- Chemical Engineer, California License 5973

AWARDS

- California Energy Commission Outstanding Performance Award 2001

DECLARATION OF

I, Jacquelyn Leyva declare as follows:

1. I am presently employed by the California Energy Commission in the Facilities Siting Office of the Systems Assessments and Facilities Siting Division as an Air Resources Engineer.
2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.
3. I helped prepare the staff testimony on **Air Quality** for the **Rice Solar Energy Project** based on my independent analysis of the Application for Certification and supplements thereto, data from reliable documents and sources, and my professional experience and knowledge.
4. It is my professional opinion that the prepared testimony and errata is valid and accurate with respect to the issue addressed therein.
5. I am personally familiar with the facts and conclusions related in the testimony and errata and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated: 9/28/10 Signed: Original Signature in Dockets

At: Sacramento, California

Jacquelyn Leyva

Objective

Expanding my knowledge of engineering to improve life and teach others.

Experience

March '09 – Present **CA Energy Commission** **Sacramento, CA**
Air Resources Engineer

- Currently co-authoring staff assessment for the technical area of air quality for the Engineering and Siting Division permitting power plant projects over 50 MW in the state of CA. Currently working on renewable ARRA funding projects along with natural gas power projects.
- Reviewing emission compliance reports
- Authoring staff analysis for project amendments
- Trained in CEQA and NEPA analysis, along with AERMOD air modeling.

August '08 – March '09 **ERRG, Inc.** **Martinez, CA**
Engineering Assistant

- Assisted with both technical and field duties for a variety of environmental investigations.
- Assisted on an environmental site assessment, preliminary assessments (PA), site inspections, and remedial investigations feasibility studies.
- Field duties performed include groundwater sampling and air sampling

June '07 – March '08 **Tetra Tech EC, Inc** **Santa Ana, CA**
Engineering Assistant Intern

- Working on various Department of Defense projects in environmental engineering.
- Helped assist in 5 year review of remediation approaches.
- Helping assist with a commercial project creating a water reuse/recycle treatment plant.

June '05 – September '05 **SF Regional Water Board** **Oakland, CA**
Consultant

- Wrote a memorandum regarding total petroleum hydrocarbons showing up as false positives in submitted quarterly monitoring reports for NPDES FUEL permit.
- Researched various EPA methods of testing for VOC, and Fuel constituents in water.
- Communicated with consultants from Weiss Associates and state funded laboratories to come to a conclusion for memorandum.
- Site inspections, site reports.

Education

2003-June 2008 University of California Irvine Irvine, CA

- B.S., Chemical Engineering
- MAES (Mexican American Engineers and Scientists) - Vice Chair 2004-2005
- CAMP summer science program participant 2003

June 1999 – September 2003 Las Lomas High School Walnut Creek, CA

- High School Diploma
- Life time member of CSF (California Scholarship Federation).

DECLARATION
Testimony of Scott D. White

I, **Scott D. White**, declare as follows:

1. I am presently employed by Aspen Environmental Group, a contractor to the California Energy Commission's Siting, Transmission and Environmental Protection Division, as a senior associate in botany.
2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.
3. I helped prepare the staff testimony on **Biological Resources** for the **Rice Solar Energy Project** based on my independent analysis of the Application for Certification and supplements thereto, data from reliable documents and sources, and my professional experience and knowledge.
4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issue addressed therein.
5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated: August 23, 2010

SCOTT D. WHITE
Senior Associate/Senior Biologist

ACADEMIC BACKGROUND

MA, Biology, 1992 and BA, Biology, 1981, Humboldt State University; Secondary Teaching Credential, Life Science, 1982

PROFESSIONAL EXPERIENCE

Scott D. White holds Bachelor's and Master's degrees in biology from Humboldt State University and has over 17 years experience including NEPA, CEQA and SMARA compliance. His primary experience is with southern California floristics and vegetation, including wetlands, coastal sage scrub, chaparral, and forests. He is well experienced with the regional flora, including rare, threatened, and endangered species and is a coauthor of *Vascular Plants of Western Riverside County: An Annotated Checklist*. Mr. White has recently joined Aspen in the firm's Inland Empire office after working for a number of years as a subcontractor to Aspen. He has performed field surveys and analyzed biological resources professionally in California since 1987. His projects have included biological and cumulative impacts analyses; focused surveys for special status species in a variety of habitats; design and implementation of monitoring plans and land management plans; data collection and analysis in coastal sage scrub, chaparral, oak woodlands, desert shrublands and pinyon woodlands; wetlands delineations and mitigation plans for state and federal permitting; upland revegetation plans for mine reclamation; recovery plans for listed T/E species; and interagency planning efforts for long-term land use and conservation planning on public and private lands. He has extensive experience with federal, state and local agencies and has published a number of studies.

Aspen Environmental Group

2009 to present

- **Newhall Ranch Specific Plan EIR and Sect. 2081 Review (2006-present), California Department of Fish and Game.** Document review and revision, agency/applicant coordination and consultation, in support of CDFG's CEQA and state Endangered Species Act compliance review, including conservation planning and document production addressing listed San Fernando Valley spineflower and other biological impacts.
- **Rice Solar Energy Project; Calico Solar Energy Project (2010-present), California Energy Commission.** Preparing CEC Biological Resources Staff Assessment chapters; review and compile information from Application for Certification and Responses to Data Requests; coordinate with CEC staff; plan and manage coordination and review among cooperating agencies; public workshop participation; CEQA, NEPA, state and federal ESAs, 1600, 404, and Warren-Alquist compliance.

Consulting Biologist: Scott White Biological Consulting; White & Leatherman BioServices 1998-present; Psomas and Associates, 1995-1998; Tierra Madre Consultants 1989-1995. Mr. White performed biological surveys, report preparation (per CEQA, NEPA, SMARA, state and federal wetlands requirements, and local planning policies), client contact, and agency coordination. Specialties include rare plant surveys, wetlands delineations, vegetation sampling and description, habitat characterization (e.g., suitability for rare wildlife species), revegetation planning, and mitigation design. Representative projects include the following:

- **Tehachapi Renewal Transmission Project (2008), California Public Utilities Commission/US Forest Service.** Field surveys for rare, threatened and endangered plants on powerline corridor and alternate routes in Chino/Puente Hills, San Gabriel Mountains, Los Angeles Basin, and Inland Empire areas, Los Angeles, Orange, San Bernardino, and Riverside counties.
- **Carbonate Habitat Management Strategy (1999-2004), Specialty Minerals, Inc.; Mitsubishi Cement Inc.; Omya California Inc.:** Document review, comment, and revision; agency/industry coordination and consultation, including BLM, US Forest Service, CDFG, USFWS in support of management plan and federal Endangered Species Act compliance to resolve land use conflicts among the mining industry and listed threatened/endangered limestone endemic plants, San Bernardino County.
- **Draft Recovery Plan for Three Desert *Astragalus* Species (2004-2007), US Fish and Wildlife Service:** Review and compilation of specimen data, field survey reports, agency planning documents and conservation biology literature to prepare draft recovery plan per US Fish and Wildlife Service specifications; San Bernardino, Riverside, and Imperial Counties.
- **Biological Technical Reports, Desert tortoise surveys, Revegetation Plans (1999-2007, West Coast Aggregate.** Field surveys, data collection and analysis; and technical reports and plans in support of mining plan revisions, per CEQA and State Mining and Reclamation Act (SMARA); Coachella Valley, Riverside County (numerous similar projects documenting and analyzing biological resources impacts for mining and other land use planning projects throughout S. California, 1989-present).
- **Lucerne Valley-Big Bear Lake Fiber Optic Cable (2005), Verizon:** Field surveys and impacts analysis for rare, threatened and endangered plants on cable route from desert floor to Big Bear Lake area; wrote Biological Assessment per National Forest guidelines; managed and directed construction monitoring per National Forest requirements, San Bernardino County.
- **Proposed Fort Irwin Natural Gas Pipeline (2004-2005), Johnson Controls, Inc.:** Field surveys and impacts analysis for rare, threatened and endangered plants and animals (including desert tortoise, Lane Mountain milk vetch, and others) on proposed pipeline alignments, San Bernardino County.
- **Proposed Improvements: State Hwy 79 (2006) and I-215 (2008), CalTrans:** Field surveys and impacts analysis for rare, threatened and endangered plants on numerous public and private parcels on a series of alternate roadway alignments, western Riverside County.
- **San Bernardino National Forest / Rancho Santa Ana Botanic Garden (2008-2009):** Field surveys for rare, threatened and endangered plants in San Jacinto and San Bernardino Mountains. (meadows, pebble plains, etc.) in San Bernardino and Riverside counties.
- **Angeles National Forest Botanical Surveys (2004):** Field surveys and impacts analysis for rare, threatened and endangered plants on ANF project sites for fuel management, transportation, and recreation; San Gabriel Mountains, Los Angeles and San Bernardino counties.
- **Botanical Field Guide (2004):** Field surveys, specimen preparation, photography, and text for botanical field guide for the Soboba Indian Reservation, San Jacinto Mountain foothills, western Riverside County.
- **Biological Technical Reports, field surveys, responses to comments (2002-2007), United States Gypsum, Imperial Co. and BLM:** Field surveys and impacts analysis for special status plants and animals on proposed quarry expansion lands; Biological Technical Report and detailed Responses to Comments for joint EIR/EIS.
- **Los Angeles County. Department of Public Works (2002-03):** Field surveys for threatened or endangered plants (e.g., Braunton's milk vetch) in existing and proposed flood control channels and debris basins, Santa Clarita Valley and San Gabriel Mtn. foothills, Los Angeles County.

Botanist: San Bernardino National Forest

1987-1989

Team leader for data collection and assisted in data analysis for vegetation management planning and ecosystem classification; assisted in analysis and interpretation of vegetation data, leading to a classification system of southern California chaparral; provided mapping and implementation recommendations for prescribed burn planning and other habitat management projects; assisted in vegetation sampling of California spotted owl territories; prepared Environmental Assessments in compliance with NEPA.

SELECTED TECHNICAL EXPERIENCE/TRAINING AND CERTIFICATIONS

- Planning and land use policies, including mitigation banking, to mitigate ongoing loss of native habitats.
- Use of quantitative data and multivariate statistics to classify plant communities and wildlife habitat.
- Occurrence and distributions of native and naturalized plants in Southern California particularly in the Inland Empire and surrounding mountain ranges.
- Role of fire and other natural disturbance in southern California shrublands and forests.
- Effects of brown headed cowbird nest parasitism on native bird populations, and potential application of habitat management to reduce parasitism rates.

CERTIFICATIONS

California Dept. of Fish and Game and USDI Fish and Wildlife Service authorization to collect listed endangered, threatened and rare plants (Research Association permittee under RSABG permits)

SERVICE

- Vegetation Committee; California Native Plant Society (member 1990-1998; acknowledged reviewer of *A Manual of California Vegetation*, J.O. Sawyer & T. Keeler-Wolf 1995 and Second Ed., Sawyer, Keeler-Wolf & J.M. Evans 2009).
- Guest editor; *Fremontia* Coastal Sage Scrub special issue (October 1995).
- Field trip leader and training seminar instructor for local volunteer organizations including The Crafton Hills Conservancy, The Riverside Land Conservancy, The San Bernardino Valley Audubon Society, California Native Plant Society, and Rancho Santa Ana Botanic Garden.
- Peer reviewer of Federal Register listing proposals and critical habitat proposals, US Fish and Wildlife Service (2004-present).
- Southern California Botanists Board of Directors (1997-2002); President (1999-2000); peer reviews for SCB journal *Crossosoma* (1997-present); Co-editor, *Crossosoma* (effective 2009).
- Research Associate, Rancho Santa Ana Botanic Garden and U.C. Riverside Herbarium

MEMBERSHIPS

California Botanical Association

Arizona Native Plant Society

California Native Plant Society

Southwestern Association of Naturalists

Southern California Academy of Sciences

Southern California Botanists

The Wildlife Society

PROFESSIONAL PRESENTATIONS

- “Critiquing Botanical Consulting from a 20 Year Perspective,” presented at California Native Plant Society State-wide conference, Sacramento, 2009.
- “Conservation Planning for Limestone Endemic Plants in the Northern San Bernardino Mountains,” presented at Southern California Botanists annual symposium, Cal State Fullerton, 2002.
- With Orlando Mistretta: “Introducing Two Federally Listed Carbonate endemic Plants onto a Disturbed Site in the San Bernardino Mountains, California,” presented at 3rd Southwestern Rare Plant Symposium, Flagstaff, Arizona, September 2000.
- “Structure and Function in Southern California Chaparral,” presented at Southern California Botanists annual symposium, Cal State Fullerton, 1997.
- With Martha Blane: “Planning and Monitoring for Ecological Function,” presented at Society for Ecological Restoration California Chapter annual conference, Yosemite National Park, 1996.
- “Vegetation Descriptions, Site Characteristics, and Plant Ecology in Puente Hills Shrublands,” presented at Symposium on Natural Resources in the Puente Hills Chino Hills Corridor, Whittier College, 1994.

**DECLARATION OF
Kim Tremaine**

I, **Kim Tremaine**, declare as follows:

1. I am presently employed by **Tremaine & Associates, Inc.** in the **Cultural Division of the California Energy Commission** as a **Cultural Resources Specialist**.
2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.
3. I prepared the staff testimony on **Cultural Resources**, for the **Rice Solar Energy Project**, based on my independent analysis of the Application for Certification and supplements hereto, data from reliable documents and sources, and my professional experience and knowledge.
4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issues addressed therein.
5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

1984-1990. Research Associate, SSU; Project Coordinator, SSU
Field Technician, Basin Research Associates.

1979-1980. Field Technician, Environmental Research Associates.

Relevant Experience from Last Five Years

As business owner and Principal Investigator, Kim is responsible for overseeing the implementation of multiple projects in various stages of completion. As such, she works closely with Project Managers to ensure that the requirements of federal, state, and local laws are met, while balancing her obligation to manage cultural resources and as well as work within budget/scheduling constraints. She also acts as a point-of-contact with government officials and Native American groups/individuals, to work out solutions to problems that may crop up.

2009. Regional Transit District Light Rail Project. Project Investigator under contract with the Regional Transit District. Oversaw project, including deferred identification, testing, data recovery, and archaeological monitoring.

2008. PG&E Pole Replacement Project. Principal Investigator under subcontract with Entrix. Oversaw records searches, intensive archaeological surveys, and impact analyses for pole replacements along numerous transmission lines throughout Northern California.

2008. Sacramento Natural Gas Storage Project. Principal Investigator under subcontract with Sycamore Environmental. Conducted Peer Review as part of EIR Mitigation Measures, conducted additional survey to address areas not previously covered during previous inventory effort.

2007. PG&E Line 108 Replacement Project, Sacramento County, California. Principal Investigator under subcontract with ESA. Oversaw inventory of resources, wrote EIR sections, conducted impacts analysis, developed mitigation measures, and monitored during pipeline replacement work. The lead agency for this project was the California State Lands Commission.

2006-2009. Sutter Hospital
Expansion Project. Principal

Investigator under contract with Sutter Health Medical Center for Cultural Resources services. Oversaw project, including deferred identification, testing, data recovery (historic Sutter's Fort cemetery), archaeological monitoring, Native American inspectors, public outreach, and media representative.

2004-2009. Amtrak Light Rail Extension Project, between Folsom and Sacramento. Principal Investigator under contract with Sacramento Regional Transit for the Cultural Resources services. Oversaw project, including testing and data recovery for late prehistoric sites with burials and cremations, dance house etc., archaeological monitoring, and Native American Inspection. Tremaine worked with the Office of Historic Preservation, the Native American Heritage Commission, the local Native Americans, the City, Regional Transit, the County, and SMUD (all stakeholders), and representative attorneys for these stakeholder, as mediator, facilitating the limit of impacts as much as possible. The lead agency on this project was the Federal Highways Administration.

2001-2007. Box Canyon Hydroelectric Facility Relicensing Project. Consultant with GANDA for the Bureau of Indian Affairs (representing the Kalispel Tribe) over a period of six years on the FERC Relicensing Project in northeastern Washington, along the Pend Oreille River. Participated in Studies Requests, Draft 4(e)s, numerous conference calls and meetings, as well as contributing to large documents and/or commenting on documents/milestones such as Additional Draft Settlement Negotiations, Draft FERC License Application, Final License Application, ICDs, Scoping Documents for the DEIS and FEIS, Substantial Evidence Document, Project Impact Report, Watershed Assessment, and Final Study Plan (not listed in chronological order).

2003-2008. Sacramento City Hall Data Recovery Project. Principal Investigator under contract with the City of Sacramento, Department of Public Works. Oversaw geophysics, testing, monitoring, and data recovery efforts in compliance with CEQA regulations. During mass excavation for an underground parking structure, a deeply buried site was encountered, dating between 9,000 and 4,000 years old. The site was found to be exceptionally well preserved, yielding a large collection of faunal remains, cooking stones, large multi-function cobble-core tools, dart points, stone net weights, bone fish hooks, medicine bowls, a few mortars, many pestles, numerous bone awls, and ornamental stone items, as well as human remains. The final report was completed in 2008.

2002. Cosumnes Power Plant Project, Sacramento County, California. Principal Investigator, under subcontract with IEC. Oversaw peer review of cultural resource management compliance documentation, consultation with the California Energy Commission, and geophysical survey of segments along 26-mile pipeline route deemed sensitive for possible buried archaeological deposits.

2003-2004. Wetland Enhancement Projects in Tulare, Kern, Humboldt, Lassen, Modoc, Colusa, Solano, and San Joaquin Counties, California. Principal Investigator under contract with the Natural Resources Conservation Service. Oversaw projects, wrote or edited final reports.

2002-2003. 7th Street Extension Project, Sacramento, California. Principal Investigator under contract with the City of Sacramento, Department of Public Works. Oversaw geophysical survey for subsurface features and various stages of monitoring, testing, report writing, and public outreach.

2002. Central Valley Energy Center Project, Fresno County, California. Principal Investigator/Project Manager under subcontract with Peregrine Environmental. Oversaw identification of historic buildings and structures along various pipeline routes for delivering of natural gas, along with documentation and assessment of their significance, report writing, and consultations with staff at the California Energy Commission regarding data gaps and satisfaction of those gaps and/or other concerns.

2001. Long Haul Fiber Optic Segments between Sacramento and Bakersfield, and between Sacramento and Emeryville, Northern California. Principal Investigator/Project Manager under subcontract with BHE. Oversaw survey, site recordation, and monitoring along the route from Sacramento to Bakersfield. This required deployment of multiple staff at multiple locations for over a year in the field and consultation with multiple tribes of Native Americans. California Public Utilities Commission was the lead agency on this project.

Selected Reports

Tremaine, K.J.

2010. Cultural Resources Inventory for the Johnson Rancho, Bear River Hop Farm, and Dave Browne Properties, Yuba County, California.

Tremaine, K.J., and G. Farris

2009. Rediscovering a Legacy: Archaeological Monitoring Report for the Sacramento Regional Transit District Light Rail Project. Prepared for Sacramento Regional Transit, Sacramento, California,

Tremaine, K.J.

2008. Investigations of a Deeply Buried Early and Middle Holocene Site (Ca-Sac-38) for the City Hall Expansion Project, Sacramento, California. Prepared for the City of Sacramento, California.

DECLARATION OF SHAELYN STRATTAN

I, **Marsha L. (Shaelyn) Strattan**, declare as follows:

1. I am presently employed by the California Energy Commission in the Siting, Transmission, and Environmental Protection Division as a **Planner II**.
2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.
3. I prepared the staff testimony on **Land Use, Recreation, and Wilderness** for the **Rice Solar Energy Project**, based on my independent analysis of the Application for Certification and supplements thereto, data from reliable documents and sources, and my professional experience and knowledge.
4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issue addressed therein.
5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

EXPERIENCE SUMMARY

Twelve years experience in land use planning, recreation, environmental review and analysis, and project management with the California Energy Commission, California State Parks, and Calaveras County Planning Department. Twenty-five years of writing, editing, and research experience, focused on recreation, agriculture, and the environment, with the California Air Resources Board, California Department of Toxic Substances Control, California Department of Fish and Game, and as owner of *The Wordworker*, a writing, editing, and research company, specializing in environmental research, education, and public relations. Seven years experience as an Air Traffic Control Specialist with the Federal Aviation Administration and U.S. Air Force. Six years as National Weather Service (NWS) certified Weather Observer.

PROFESSIONAL EXPERIENCE

***California Energy Commission
Planner II***

2 yrs/9 mos¹

Environmental Technical Specialist - Identify, describe, and analyze complex environmental issues related to the construction and operation of electrical energy production facilities, transmission corridors, alternative energy technologies and energy conservation, and Commission programs and policies. Prepare components of Staff Analyses to comply with requirements of the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA), with emphasis on the identification and mitigation of environmental impacts to land use, traffic and transportation, visual resources, and environmental justice. Prepare and present Commission reports and expert technical testimony.

Project Manager - Plan, organize, and direct the work of an interdisciplinary environmental and engineering staff team engaged in the evaluation of complex/controversial energy facility siting applications and major commission programs.

California Energy Commission (CEC): Analyst for Eastshore Energy Power Plant (06-AFC-06; Land Use and Traffic & Transportation/Aviation); Victorville II Hybrid Power Project (07-AFC-01; Land Use); Humboldt Bay Generating Station (06-AFC-07); Traffic & Transportation); Ridgecrest Solar Power Project (09-AFC-9; Land Use/Recreation/ Wilderness); Rice Solar Energy Project (09-AFC-10; Land Use/Recreation/Wilderness); and Russell City Energy Center Amendment (01-AFC-7C; Land Use and Traffic & Transportation/ Aviation). Project Manager for Beacon Solar Energy Project (08-AFC-02); San Gabriel Generating Station (07-AFC-02); and Kings River Conservation District Community Power Project (07-AFC-07)

***Calaveras County Planning Department
Planner III (Senior Planner)***

2 yrs/9 mos²

Planning and evaluation of complex land use projects; environment review (CEQA/NEPA; Timber Harvest Plans; outside agency reviews); project and contract manager for consultants (EIR, natural and cultural resource studies, and peer reviews); preparation/review of resource ordinances; preparation/coordination of conservation and utility easements; CEQA/NEPA coordinator; liaison with Calaveras Council of Governments and county counsel on land use issues; planning liaison with State

¹ Nov 2006 – Nov 2008 and Dec 2009 – present.

² Feb 2005 – Nov 2006 and Nov 2008 – Nov 2009

and federal resource agencies (e.g., California Department of Fish and Game, Forestry and Fire (CalFIRE), and Parks & Recreation; U.S. Fish and Wildlife Service, U.S. Forest Service, and Bureau of Land Management) to develop consistent mitigations and policies, and coordinate project evaluation and enforcement.

**California Department of Parks & Recreation
Environmental Coordinator (Associate Park & Recreation Specialist)**

Jan 2001 - Jan 2005

Supervising Lead: Coordinate environmental review for DPR's Major Capital Outlay, Minor Capital Outlay, and Accessibility programs with Service Center and district staff. Consult with project managers, designers, and environmental specialists to refine project scope and identify potentially environmental impacts for park projects in Northern and Central California. Prepare environmental documents (CEQA/NEPA) for DPR and joint agency (DPR/BLM,NPS,USFS, USFWS) projects,. Project and contract manager for consultants preparing environmental analysis. Prepare or work with consultants to prepare the environmental impact analysis for General Plans (GPs) and Resource Management Plans for State Park units. Prepare application(s) for project-specific state and federal environmental permits, grant proposal, application, and supporting documents for project-related federal funding (High Sierra Museum and Visitor Center at Donner Memorial State Park). Review environmental documents prepared by non-departmental entities to determine the potential impact on ongoing or proposed projects or programs. Prepare comments identifying potential impacts to the department's interests and/or effectiveness of proposed mitigation. Review and comment on pending legislation, as it relates to environmental issues, CEQA/NEPA, and Departmental policy/procedures.

Statewide Environmental Coordinator (January 2002 - June 2003): Develop and coordinate a standardized CEQA/NEPA review process and establish criteria for evaluating project impacts and environmental compliance documents. Provide training for District and Service Center personnel involved in the preparation and processing of environmental documents. Develop training support materials. Conduct CEQA seminars at California Trails and Greenways Conference (September 2002 & 03) and Resource Ecologists' In-Service Training Seminar (2002). Act as Service Center liaison with the Environmental Stewardship Section of the Natural Resources Division regarding the effectiveness and improvement of the environmental review process.

**California Air Resources Board (Research Division)
Research Writer**

Nov 1998-Nov 2000

Research, write, and/or edit technical documents, presentations, and related materials, with special emphasis on scientific and environmental writing for a general readership. These documents include Requests for Proposals; responses to public inquiries; consumer guidelines and fact sheets; articles for magazines and technical journals; brochures; webpage information (both internal and external); legislative bill analyses; briefing documents; proposals; and Board presentations and agenda items. Evaluate suitability of documents for publication.

**The Wordworker
Owner & Primary Researcher/Editor/Author**

May 1987-Nov 1999

Work included narratives (including voice-overs), scripting, copy editing, transcription, and technical writing; proposals (grants, bids, and new business); legal briefs (environmental and family law); training and teacher's manuals; desktop publishing (brochures, newsletters, flyers, etc.); and adaptation of scientific information for general readership. Research, draft, review/edit, and comment on CEQA/NEPA environmental documents; coordinate preparation of materials among project scientists, lead and responsible agencies, and applicants. Promotional consultant and press liaison for several non-profit fundraisers, seminars, and symposiums.

Federal Aviation Administration
Air Traffic Control Specialist

1975-1981

Control air traffic at Salem Tower (Salem, OR) and the Oakland Air Traffic Control Center in Fremont, CA. Coordinate aviation-related search and rescue operations. Provide pilot weather briefings, flight plan assistance, and in-flight information at Bellingham International Airport, Dannelly Field (Montgomery, AL) and Purdue University Airport (W. Lafayette, IN).

Tennessee Valley Authority
Engineering Aide

1974-75 (18 mos)

Set, monitor, and analyze dosimeters at Browns Ferry and Sequoia Nuclear Power Plants. Collect and analyze vegetation, silage, milk, water, and air samples from surrounding areas to establish background radiation levels and provide on-going radiation monitoring.

WORK HISTORY

California Energy Commission Mechanical Engineer 2002 - Current

- Review and analyze applicants' plans for safe management of hazardous materials, and for protecting worker safety.

Self-Employed Independent Investor 2000 - 2002

- Wrote market analysis computer software and traded personal account.

Read-Rite Corp Wafer Engineering Manager 1994 - 2000

- Designed and developed wafer manufacturing processes for computer data storage systems. Managed team of engineers and technicians responsible for developing wet and dry chemical processes for manufacturing, including process and safety documentation.
- Managed process and equipment selection for manufacturing processes.
- Processes included vacuum processed metals and ceramics, grinding-polishing, plating, etching, encapsulation, process troubleshooting, and SPC reporting.

Dastek Corp (Komag Joint Venture Start-up) Wafer Engineering Manager 1992 - 1994

- Developed wafer processes for new technology recording head for hard disk drives.
- Managed team of engineers and technicians.
- This position included start-up of wafer fab, including line layout, purchase, installation, and startup of new process equipment, etc.

Komag, Inc Alloy Development Manager 1989 - 1992

- Developed new vacuum-deposited recording alloys
- Responsible for planning and carrying-out tests, designing experiments, analyzing results, managing test lab conducting materials characterizations.
- Extensive process modeling and data analysis.

Verbatim Corp (Kodak) Process Development Manager 1983 - 1989

- Mechanical engineering for computer disk manufacturing, including product, process, and equipment including metal-ceramic-plastic processes for optical disk development.
- Production processes included plating, metal evaporation, reactive sputtering, laser-based photolithography, injection molding.
- Steering Committee Member, *Center for Magnetic Recording Research, UC San Diego*

IBM Corp Mechanical/Process Engineer 1977 - 1983

- Product development for photocopiers and computer tape-storage systems.

RESUME

DR. OBED ODOEMELAM

EDUCATION:

- 1979-1981 University of California, Davis, California. Ph.D., Ecotoxicology
- 1976-1978 University of Wisconsin, Eau Claire, Wisconsin. M.S., Biology.
- 1972-1976 University of Wisconsin, Eau Claire, Wisconsin. B.S., Biology

EXPERIENCE:

1989

The Present: California Energy Commission. Staff Toxicologist.

Responsible for the technical oversight of staffs from all Divisions in the Commission as well as outside consultants or University researchers who manage or conduct multi-disciplinary research in support of Commission programs. Research is in the following program areas: Energy conservation-related indoor pollution, power plant-related outdoor pollution, power plant-related waste management, alternative fuels-related health effects, waste water treatment, and the health effects of electromagnetic fields. Serve as scientific adviser to Commissioners and Commission staff on issues related to energy conservation. Serve on statewide advisory panels on issues related to multiple chemical sensitivity, ventilation standards, electromagnetic field regulation, health risk assessment, and outdoor pollution control technology. Testify as an expert witness at Commission hearings and before the California legislature on health issues related to energy development and conservation. Review research proposals and findings for policy implications, interact with federal and state agencies and industry on the establishment of exposure limits for environmental pollutants, and prepare reports for publication.

1985-1989 California Energy Commission.

Responsible for assessing the potential impacts of criteria and noncriteria pollutants and hazardous wastes associated with the construction, operation and decommissioning of specific power plant projects. Testified before the Commission in the power plant certification process, and interacted with federal and state agencies on the establishment of environmental limits for air and water pollutants.

1983-1985 California Department of Food and Agriculture.

Environmental Health Specialist.

Evaluated pesticide registration data regarding the health and environmental effects of agricultural chemicals. Prepared reports for public information in connection with the eradication of specific agricultural pests in California.

**DECLARATION OF
Kristin Ford, Planner I**

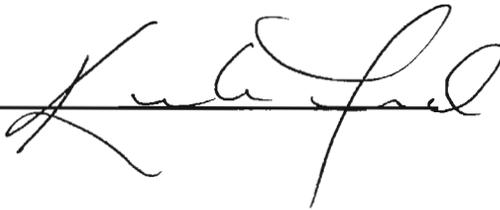

I, Kristin Ford, declare as follows:

1. I am presently employed by the California Energy Commission in the Environmental Office of the Siting, Transmission & Environmental Protection Division as a Planner I.
2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.
3. I helped prepare the staff testimony on Socioeconomics for the Rice Solar Energy Power Project based on my independent analysis of the Application for Certification and supplements thereto, data from reliable documents and sources, and my professional experience and knowledge.
4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issue addressed therein.
5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated: 8/9/10

Signed: _____

Kristin S. Ford

Experience

Environmental Planner November 2009 to Present

California Energy Commission, Sacramento, California

- Conduct CEQA-equivalent environmental review for proposed and existing power plants.
- Write analysis for Socioeconomics, Traffic, Visual Resources and Land Use sections for staff assessments.
- Provide expert witness testimony on Socioeconomics, Traffic, Visual Resources and Land Use issues at Energy Commission hearings.

Assistant Planner June 2006 to July 2009

City of Sacramento, Environmental Planning Services, Sacramento, California

- Evaluated, prepared and supervised the preparation of a variety of environmental documents under the California Environmental Quality Act (CEQA); analyzed data and made recommendations on complex planning matters involving issues related to land use, traffic, utilities, aesthetics, noise, energy, historic preservation, air quality and biological resources.
- Prepared, researched and reviewed Mitigation Monitoring Plans per CEQA, the California State & Federal Endangered Species Acts (CESA & FESA), the Clean Water Act (CWA), the Migratory Bird Treaty Act (MBTA) and the Natomas Basin Habitat Conservation Plan.
- Conducted biological resources site assessments for proposed development projects. Determined the need for preparation and/or review of specific studies, such as Wetland Delineations, Nesting Raptor Surveys, and Arborist Reports, to identify resources and provide mitigation measures.
- Coordinated the release of the City of Sacramento's 2030 General Plan Draft/Final Environmental Impact Report between various City departments, the Planning Commission, City Council and the consultant team.

Environmental Coordinator August 2005 to June 2006

Nella Oil Company, Auburn, California

- Coordinated company-wide environmental regulatory compliance activities, including:
 - site investigations;
 - underground fuel-storage tank environmental compliance recommendations and subsequent tank upgrades; and
 - hazardous waste removal.
- Maintained and managed Air Quality Management District and Environmental Health Department permits for 60+ gas stations.

Student Assistant March 2005 to August 2005

California Energy Commission, Sacramento, California

- Conducted research and provided technical writing support to Biology and Water Departments for the annual Energy Policy Report impact analyses.
- Maintained and managed compliance files on power plant facilities.

Student Assistant June 2004 to March 2005

Central Valley Regional Water Quality Control Board, Sacramento, California

- Supported National Pollutant Discharge Elimination System (NPDES) staff by:
 - maintaining waste water treatment plant discharge self-monitoring reports and case files; and
 - analyzed (Amador, Sutter, Placer and Yolo county) wastewater treatment plant monthly monitoring reports for possible permit violations.

Education

2005 Bachelor of Arts, Environmental Studies, California State University, Sacramento

2001 Associate of Arts, Liberal Studies, Allan Hancock College, Santa Maria, California

**DECLARATION OF
Mike Conway**

I, Mike Conway, declare as follows:

1. I am presently employed by the California Energy Commission in the Siting, Transmission and Environmental Protection Division, as an Engineering Geologist.
2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.
3. I prepared the staff testimony on the **Soil and Water Resources** for the **Rice Solar Energy** project (09-AFC-10) based on my independent analysis of the Application for Certification and supplements thereto, data from reliable documents and sources, and my professional experience and knowledge.
4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issue(s) addressed therein.
5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated: September 22, 2010

Signed: 

At: Sacramento, California

Resume For: Mike Conway

Education: Bachelor of Science in Geology, University of California, Davis, August 2003.
Master of Science in Geology, California State University, Sacramento, expected 2011

Certifications: Certified Professional in Erosion and Sediment Control (CPESC)
Certified Erosion, Sediment and Storm Water Inspector (CESSWI)
Leadership in Energy and Environmental Design Accredited Professional (LEED AP)

Experience:

Engineering Geologist: California Energy Commission, Sacramento, CA **2009**

- Conduct analyses of soil and water resource reports submitted to Commission
- Assess impacts to soil and water resources from construction and operation of energy producing facilities
- Perform onsite evaluations of soil and water resources pre and post-project
- Implement a CEQA-like review of proposed energy projects to evaluate environmental impacts

Environmental Scientist: Central Valley Water Board, Rancho Cordova, CA **2009**

- Wrote municipal storm water permits for Phase I communities in the Central Valley
- Reviewed storm water annual reports for Phase I and II municipalities
- Conducted audits of industrial sites for compliance with storm water permits
- Conducted audits of municipalities for compliance with municipal permits
- Help communities better understand how to effectively implement storm water programs
- Represented Water Board in large technical workshops and other public forums

Environmental Consultant: Wood Rodgers, Inc., Sacramento, CA **2006-2009**

- Consulted clients on how to comply with Federal, State and local storm water quality and environmental regulations
- Helped public and private sector clients gain State Water Resources Control Board (SWRCB) permit coverage under Large and Small MS4 General Permits, NPDES Permits, CWA Section 401 Permits
- Consulted clients on Army Corps of Engineers, 404 Permitting
- Developed a storm water quality manual for Yolo County
- Prepared Caltrans environmental documentation and design for all project phases
- Prepared Storm Water Management Plans (SWMP) and Storm Water Pollution Prevention Plans (SWPPP)
- Drafted water pollution control exhibits using both AutoCAD and MicroStation
- Prepared Caltrans Storm Water Data Reports including cost estimates
- Designed landscaping plans for Caltrans' Modesto Ramp Rehabilitation Project
- Prepared Spill Prevention Control and Countermeasure (SPCC) plans
- Created Hazardous Materials Business Plan for City of Fort Bragg, California
- Prepared proposals for outgoing environmental quality project bids
- Performed field visits to evaluate Best Management Practice (BMP) effectiveness in reducing erosion and sedimentation
- Facilitated multiple storm water quality training workshops for groups up to 20 plus

Storm Water Quality Consultant: Envirosafety Services, Elk Grove, CA **2004-2006**

- Wrote site specific SWPPPs to include guidance specific to city, county, and geographical constraints
- Designed BMP exhibits using AutoCAD
- Conducted inspections at construction sites throughout the Central Valley for (SWPPP) compliance
- Resolved storm water compliance issues in cooperation with site superintendents, county and city inspectors
- Researched current storm water protection regulations to best protect clients

Post-Graduate Researcher: Dept. of Land, Air, and Water Resources, U.C. Davis, CA **2003**

- Studied the effects of irrigation practices on wetland ecology and water quality
- Independently organized monthly analyses and data processing of selenium contaminated invertebrate, algae, and water samples from the Tulare Lake Drainage District
- Managed concentrated acids, carcinogenic solutions, and final fluorescence measurements
- Compiled research data and presented findings to a team of eight colleagues

Lab Technician: Raney Geotechnical Laboratory, West Sacramento, CA **2001**

- Conducted moisture density, unconfined compression tests, Atterburg Limit, curve, plasticity tests, and basic calculations for soil samples
- Administered load tests on concrete cylinders and mortar samples
- Performed percolation tests and Dynamic Cone Penetrator (DCP) tests in the field and gathered water samples for environmental analysis

**DECLARATION OF
AbdelKarim Abulaban**

I, AbdelKarim Abulaban, declare as follows:

1. I am presently employed by the California Energy Commission in the Siting, Transmission and Environmental Protection Division, as an Associate Civil Engineer.
2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.
3. I prepared the staff testimony on the **Soil and Water Resources** for the **Rice Solar Energy** project (09-AFC-10) based on my independent analysis of the Application for Certification and supplements thereto, data from reliable documents and sources, and my professional experience and knowledge.
4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issue(s) addressed therein.
5. I am personally familiar with the facts and conclusions related in the testimony, and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated: September 23, 2010

Signed:

AbdelKarim Abulaban

Education

Ph.D. Civil Engineering, University of Minnesota (*Hydrology and Water Resources*).

Thesis title: Modeling the transport of sorbing chemicals in heterogeneous porous media.

B.S. and M.S. Civil Engineering, Yarmouk University, Jordan (*Water Resources*).

Registration:

Registered Professional Engineer (Civil) with the state of California (Lic. No. 76030)

Employment

June 2010-Present: Associate Civil Engineer

CA Energy Commission, Sacramento, CA.

Reviewing and evaluating the construction, operation, and maintenance of energy facilities and power plants for water supply, wastewater disposal, waste, water quality, and stormwater to assess the potential impacts to human health and the environment. Also, reviewing sensitive project sites that may have issues involving flooding and stormwater management, discharges to impaired water bodies, depleted groundwater and surface water resources, and wastewater management and disposal methods, in addition to responding to soils or water resources issues that may arise regarding power plant operations, and conducting investigations to determine if any violations of the program's regulations, the Energy Commission's conditions of certification, or the CA Environmental Quality Act (CEQA) have occurred.

Dec. 2006-May 2010: Water Resources Engineer

CA Dept. of Water Resources, Fresno, CA.

In charge of hydraulic modeling and sediment transport for the San Joaquin River restoration project. Perform 1- and 2-D hydraulic analysis to support restoration of the San Joaquin River for the purpose of improving spawning/rearing habitat, enhancing floodplain connectivity, and improving riparian corridor.

Dec. 2001-Dec. 2006: Retained Hydrologist

J.L. Nieber & Associates, Hydrologic Consultants, Lindstrom, Minnesota, USA.

Hydrologic analysis and assessment of environmental impact of contamination incidents on ground water resources, as well as design of remediation plans. Contaminants analyzed included hydrocarbons, chlorinated solvents, as well as agrichemicals.

Dec. 90 – Dec. 93: Retained Hydrologist.

BAUMGARTNER ENVIRONICS, INC, Olivia, Minnesota, USA.

Assessment of the environmental impact of contamination incidents on groundwater resources, and design of action plans.

Sep. 2003-Sep. 2005:

Assistant Professor, Hashemite University, Zarqa, Jordan.

Taught general and specialized courses in the civil engineering department: Water and Wastewater Treatment Methods; Wastewater Engineering; Statics; Engineering Drawing; Visual Communication.

June – August, 96, 97, 98, 2000:

Army High Performance Computing Research Center, Minneapolis, Minnesota.

Taught and helped teach the Summer Institute course in hydrology and transport in porous media. The Summer Institute is a summer course offered to promising upper class students from member institutions. The ground water flow and transport group normally has about 4 students from different backgrounds. I was involved in training the students to use a particle tracking solute transport code which I developed, and also to use the DoD's Ground Water Modeling System, GMS; however, in the summer of 2000 I was in charge of the whole group consisting of four students.

August, 1997:

University of Minnesota, Minneapolis, Minnesota, USA.

Taught a short course on the application of the Department of Defense's Ground Water Modeling System, GMS, offered by the American Society of Agricultural Engineers and attended by about 40

professionals and academicians from around the United States as well as several countries around the world.

Research

i- Ground Water Flow and Transport:

Oct. 93-Mar. 2002: Research Associate

Biosystems and Agricultural Engineering Department, University of Minnesota, USA.

Modeling single and multi-phase flow and multicomponent transport in variably saturated heterogeneous porous media with chemical transformation such as adsorption and biodegradation. A computer model based on the Random Walk Particle Tracking technique was successfully developed and applied for this purpose. Because of the large memory and CPU time requirements, the model was developed and implemented using on a **supercomputer platform** through several grants from the Minnesota Supercomputer Center. This work was continued in a joint effort between the Biosystems and Agricultural Engineering Department and the Army High Performance Computing Research Center through a grant from the US Army Corps of Engineers Waterways Experiment Station, Vicksburg, MS.

I also was involved in the modeling of flow and transport through preferential flow paths caused by unstable wetting fronts. Sample results for a simple scenario can be found on the World Wide Web by visiting <http://www.arc.umn.edu/education/SummerInst/1996/>

ii- Surface Water Hydrology:

Oct. 93- Jun. 95: Post-Doctorate Associate

Department of Biosystems and Agricultural Engineering, University of Minnesota, Saint Paul, Minnesota, USA.

Analysis of the impact of and best management practices of surface tile inlets on the water quality in the Minnesota River basin.

Sep. 84 - Jun. 87: Research Assistant

Civil Engineering Dept., Yarmouk University, Irbid, Jordan.

Development of Intensity-Duration-Frequency (IDF) Curves for design rain storms in Irbid Region. This research was supported by a grant from Yarmouk University.

DECLARATION OF
JAMES EARL JEWELL

I, James Earl Jewell, declare as follows:

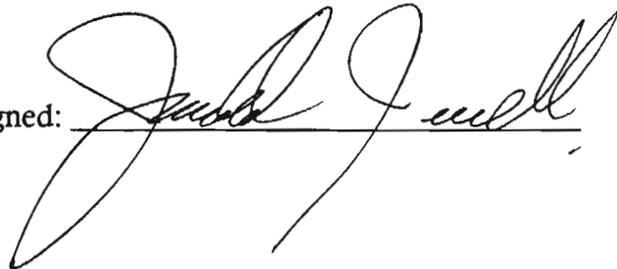

1. I am currently under contract with the Aspen Environmental Group to provide environmental technical assistance to the California Energy Commission. Under Contract No. 700-08-001 I am serving as an Illuminating Engineer to provide Peak Workload Support for the Energy Facility Siting Program and for the Energy Planning Program.
2. A copy of my professional qualifications and experience is attached hereto and incorporated herein.
3. I assisted in the preparation of the staff testimony on Traffic and Transportation and Visual Resources for the Rice Solar Energy Project (09-AFC-10) based on my independent analysis of the Application for Certification and supplements thereto, data from reliable sources and documents, and my professional experience and knowledge.
4. It is my professional opinion that the prepared testimony is accurate and valid with respect to the issues addressed therein.
5. I am personally familiar with the facts and conclusions applicable to matters of intrusive light and glare and relative brightnesses, and if called as a witness, could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated: 28 September 2010

Signed: _____

At: San Francisco, California

A handwritten signature in black ink, appearing to read "James Earl Jewell", is written over a horizontal line. The signature is fluid and cursive.

JAMES EARL JEWELL, LC, ATF, IES, CIES (Hon), SAH

EDUCATION:

BA, College of the Pacific
MFA, School of Drama, Yale University

EMPLOYMENT:

1957-67, Engineering Division, Holzmüller Corporation
1967-69, Theatre Consulting Service, Bolt, Beranek & Newman
1969-87, Lighting Services Administrator, Pacific Gas & Electric Company
1987- present, Consultant in Lighting
Since 1993 in association with Alan Lindsley, AIA, IES

PROFESSIONAL ACTIVITIES:

Illuminating Engineering Society
President – 1984-85
Vice President – 1983-84
Director – 1979-86
Office Lighting Committee – 1976 - present, Chairman, 1978-80
Roadway Lighting Committee – 1974 – present, Chairman, 1990-92
Regional Energy Committee Chairman – 1974-76, 1978-84
Energy Advisory Committee – 1973-75
Technical Missions – China – 1984, 1987, 1988

European Lighting Congress: Strasbourg, 1969; Florence, 1977; Granada, 1981;
Lausanne, 1985; Budapest, 1989; Edinburgh, 1993; Berlin, 2001

Pacific Basin Lighting Congress: Chairman, Shanghai, 1989; Bangkok, 1993;
Nagoya, 1997; Organizing Committee, Delhi, 2002; Cairns, 2005; Bangkok,

2009

Edison Electric Institute: Street Lighting Committee – 1971-87, Chairman 1979-81

International Commission on Illumination:

Board of Administration – 1983-87, 1987-91
Division Four (Lighting for Transport)
Technical Committee 4.34 -- 1980-95
Technical Committee 4.25 -- 1992-99

Professional Light Designers Convention: London, 2007; Berlin, 2009

Expert Witness – Admitted as an expert witness in the Superior Courts of Amador,
Contra Costa, and San Francisco Counties.

AWARDS AND HONOURS:

IES Regional Technical Award – 1985
IES Distinguished Service Award – 1986
College of Fellows of the American Theatre --1988
Honourary Member, China IES – 1989
CIE Distinguished Service Award – 1991
IES Louis B. Marks Award – 1993

CERTIFICATION:

LC – Granted in 1990 by the National Council on the Qualification of Lighting Professionals

RELEVANT WORK EXPERIENCE:

With PG&E appeared before CEC Committee and Staff on lighting issues with respect to the siting and licensing of Geysers steam power plants.

On behalf of PG&E and the IES appeared before the Simonson Committee to consult on the development of the lighting portions of Title 24.

On behalf of PG&E and the IES appeared before the CEC on numerous occasions to support the development of fluorescent lamp promotional programs and to assist in developing rigorous lighting ballast standards for California and on other lighting energy management issues.

While at PG&E supported and oversaw funding for projects on daylight following and electronic ballasts. Projects supported by both the DOE and CEC.

In practice as a lighting consultant worked with private clients and jurisdictions on matters concerned with light trespass and “intrusive” lighting.

DECLARATION OF
Alan Lindsley, AIA, IESNA, LEED GA

I, Alan Lindsley, declare as follows:

1. I am presently Owner of Lindsley Architectural Lighting.
2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.
3. I helped prepare the Intrusive Light analysis in the Traffic and Transportation section of the Rice Supplement Staff Assessment based on my independent analysis of the Application for Certification and supplements hereto, data from reliable documents and sources, and my professional experience and knowledge.
4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issues addressed therein.
5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Alan Lindsley, AIA, IESNA, LEED GA

Architectural Lighting

Alan Lawrence Lindsley, AIA, IESNA, LEED GA

Alan Lindsley, Principal and Founder of Lindsley Architectural Lighting, is noted for his creativity, depth of knowledge, strategic capabilities and commitment to green design. He has over thirty years of extensive project management experience in lighting design, interior architecture and historic preservation. As a result, he has the unique ability to fully understand and integrate lighting design with architecture. His design solutions integrate the creative use of lighting design products as well as custom fixtures that he creates for the client. The quality of his projects are frequently recognized by clients and peers within the industry. Numerous IESNA Section awards and AIA awards have been awarded for his project work.

As a hands on designer, he is completely involved in the design, technical evaluation, project coordination and implementation of each project. He has strong capabilities in delivering creatively designed, energy efficient and sustainable projects for corporate, institutional and governmental clients. Working with building departments throughout the United States, he has developed a strong base of knowledge in resolving complicated energy and building code issues. He is well-experienced in effectively directing the efforts of large multi-disciplinary teams to provide effective budget and scheduling controls.

Alan's commitment to energy efficiency and sustainable design spans several decades. His approach incorporates daylighting, use of high efficacy light sources, lighting control systems, and the intelligent application of light and darkness to highlight architectural features and address the needs of the people who inhabit or use the space. He has been actively involved in the dark sky movement to reduce light pollution as well as the American Institute of Architect's 2030 Initiative to produce a carbon neutral building. Alan is a LEED (Leadership in Energy and Environmental Design) Green Associate and member of the US Green Building Council.

Prior to starting his firm, Alan was Vice President at Brereton Architects and an Associate at Gensler and Associates. Alan received his Bachelors of Environmental Design / Architecture from University of Colorado at Boulder. He is a licensed architect (AIA) in California as well as several other states and holds a National Council of Architectural Registration Board certificate.

**DECLARATION OF
William D. Kanemoto**

I, William Kanemoto, declare as follows:

1. I am presently under contract with Aspen Environmental Group to provide environmental technical assistance to the California Energy Commission. Under Contract No. 700-08-001, I am serving as a Visual Resource Specialist to provide Peak Workload Support for the Energy Facility Siting Program and for the Energy Planning Program.
2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.
3. I helped prepare the final staff testimony on Visual Resources for the Rice Solar Energy Project (RSEP) Power Plant Licensing Case based on my independent analysis of the Application for Certification and supplements hereto, data from reliable documents and sources, and my professional experience and knowledge.
4. I am personally familiar with the facts and conclusions applicable to the visual resource analysis and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated: September 27, 2010

Signed: _____

At: Oakland, California

William Kanemoto

Visual Resource/Aesthetics Analyst

Academic Background:

M. Landscape Architecture, University of Michigan, Ann Arbor, 1982
B.A. Liberal Arts (Honors), University of California, Santa Cruz, 1973

Professional Experience:

Principal

William Kanemoto & Associates, Oakland, California, 1993 - Present

William Kanemoto is Principal of William Kanemoto & Associates, an environmental consulting practice specializing in visual analysis and computer visualization in the context of environmental review. In this capacity he has served as principal investigator for visual analysis and simulation on a wide range of major infrastructure and development projects, including the High Desert Power Project AFC, Port of Oakland Expansion EIS, Route 4 East/Pittsburg BART EIS, FMC Substation and Transmission Line PEA, and numerous other infrastructure and transportation projects. Mr. Kanemoto received recognition from the California Association of Environmental Professionals for visual analysis, computer simulation, animation, and video production for the Stanford Sand Hill Road Projects EIR, prepared by EIP Associates and judged 'Best State-Wide EIR of 1997'.

Associate Director

Environmental Simulation Laboratory,
Institute of Urban and Regional Development,
Center for Environmental Design Research
University of California, Berkeley, 1994 - 2000

Instructed graduate students in the College of Environmental Design, U.C. Berkeley, served as consultant on various major planning projects in the San Francisco Bay Area, and conducted design collaborations with counterparts at Keio University and ARK CyberUniversity in Tokyo, Japan via the Internet.

Principal Investigator/Project Manager

Dames & Moore, San Francisco/Oakland, California, 1988-1992

Served as principal investigator of numerous visual analyses of major infrastructure projects throughout the U.S., in Europe, and in Asia. Gained extensive familiarity with the application of a wide range of professionally accepted visual assessment techniques in the context of CEQA, NEPA, and related regulatory requirements of the CPUC, CEC, FERC, DOT, U.S. Forest Service, BLM, and other agencies.

Project Manager

LSA Associates, Pt. Richmond, California, 1987-1988

Project manager and planner on environmental impact reports for various residential and commercial development projects in northern California.

Environmental Planner

Holton Associates, Berkeley, California, 1984-1987

Preparation of various resource and regulatory studies including EIRs, FERC Exhibit E, Section 404 alternative analyses, riparian restoration studies, and cumulative impact methodology studies for EPRI and Sierra County, CA.

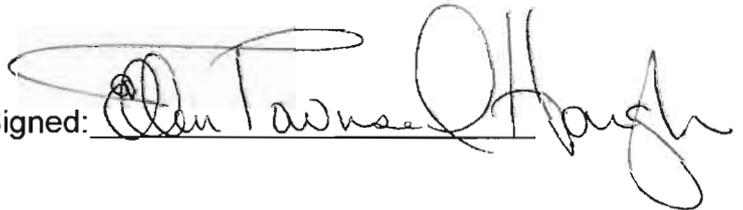

**DECLARATION OF
Ellen Townsend-Hough**

I, **Ellen Townsend-Hough** declare as follows:

1. I am presently employed by the California Energy Commission in the Environmental Siting Office of the Siting Transmission & Environmental Protection Division as an Associate Mechanical Engineer.
2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.
3. I helped prepare the staff testimony on Waste Management for the Rice Solar Energy Project based on my independent analysis of the Application for Certification and supplements thereto, data from reliable documents and sources, and my professional experience and knowledge.
4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issue addressed therein.
5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated: 9/28/10

At: Sacramento, California

Ellen Townsend-Hough, REA
(Registered Environmental Assessor, REA 1 – 05465)

SUMMARY

I am a chemical engineer with 30 years of experience. My professional career has afforded me many unique growth and development opportunities. I have a working knowledge of the California Environmental Quality Act. My strengths are in analyzing and performing complex environmental engineering analyses, in areas such as Waste Management, Hazardous Materials Management, Worker Safety, and Water Resources. I worked as a policy advisor to a California Energy Commissioner for three years. I am also an US Environmental Protection Agency Environmental Justice trainer.

PROFESSIONAL EXPERIENCE

Writing

- Write environmental impact reports , negative declarations that require technical evaluation of mechanical engineering and environmental aspects of pollution control systems, environmental impacts, public health issues and worker safety.

Technical Analysis and Presentation

- Performs mechanical engineering analysis of designs for complex mechanical engineering analysis of designs for systems such as combustion chambers and steam boilers, turbine generators, heat transfer systems, air quality abatement systems, cooling water tower systems, pumps and control systems
- Review and process compliance submittals in accordance with the California Environmental Quality Act, the Warren Alquist Act, the Federal Clean Air Act and the California and Federal Occupational Health and Safety Acts to assure compliance of projects
- Provides licensing recommendations and function as an expert witness in regulatory hearings.
- Provide public health impact analysis to assess the potential for impacts associated with project related air toxic/non-criteria pollutant emissions.
- Evaluate the potential of public exposure to pollutant emissions during routine operation and during incidents due to accidents or control equipment failure
- Provide an engineering analysis examining the likelihood of compliance with the design criteria for power plants and also examine site specific potential significant adverse environmental impacts

Technical Skills

- Establish mitigation that reduces the potential for human exposure to levels which would result in significant health impact or health risk in any segment of the exposed population.
- Assist with on-site audits and inspection to assure compliance with Commission decisions.
- Review and evaluate the pollution control technology applied to thermal power plants and other industrial energy conversion technologies.
- Work with the following software applications: WORD, Excel, and PowerPoint.

Policy Advisor

- Provided policy, administrative and technical advice to the Commissioner Robert Pernell. My work with the Commissioner focused on the policy and environmental issues related to the Commission's power plant licensing, research and development and export programs.
- Track and provide research on varied California Energy Commission (CEC) programs. Prepare analysis of economic, environmental and public health impacts of programs, proposals and other Commission business items.
- Represent Commissioner's position in policy arenas and power plant siting discussions.
- Write and review comments articulating commission positions before other regulatory bodies including Air Resources Board, California Public Utilities Commission, and the Coastal Commission.
- Wrote speeches for the Commissioner's presentations.

EDUCATION

Bachelor of Science, Chemical Engineering
Drexel University, Philadelphia Pennsylvania

Continuing Education

Hazardous Material Management Certificate, University California Davis
Urban Redevelopment and Environmental Law, University of California Berkley
Analytical Skills, California Department of Personnel Administration (DPA) Training Center
Legislative Process/Bill Analysis, DPA Training Center
Federally Certified Environmental Justice Trainer

**DECLARATION OF
Erin Bright**

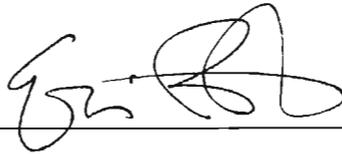

I, **Erin Bright**, declare as follows:

1. I am presently employed by the California Energy Commission in the **Engineering Office** of the Siting, Transmission and Environmental Protection Division as a **Mechanical Engineer**.
2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.
3. I prepared the staff testimony on **Facility Design** for the **Rice Solar Energy Project** (09-AFC-10) based on my independent analysis of the Application, supplements thereto, data from reliable documents and sources, and my professional experience and knowledge.
4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issues addressed therein.
5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Erin Bright
Mechanical Engineer

Experience Summary

Two years of experience in the electric power generation field, including analysis of noise pollution, construction/licensing of electric generating power plants, and engineering and policy analysis of thermal power plant regulatory issues. One year of experience in the alternative energy field, including analysis of alternative fuel production and use.

Education

- University of California, Davis--Bachelor of Science, Mechanical Engineering and Materials Science
- University of California, Davis Extension Program--Renewable Energy Systems

Professional Experience

2007 to Present-- Mechanical Engineer, Energy Facilities Siting Division - California Energy Commission

Performed analysis of generating capacity, reliability, efficiency, noise, and the mechanical, civil/structural and geotechnical engineering aspects of power plant siting cases.

2006 to 2007--Energy Analyst, Fuels & Transportation Division - California Energy Commission

Performed analysis of use potential and environmental effects of emerging non-petroleum fuels, including compressed natural gas, biomass, hydrogen and electricity, in heavy and light duty transportation vehicles. Contributor to Energy Commission's alternative fuels plan.

**DECLARATION OF
AJOY GUHA**

I, **Ajoy Guha**, declare as follows:

1. I am presently employed by the California Energy Commission in the **Transmission System Engineering unit** of the Siting, Transmission and Environmental Protection Division as an Associate Electrical Engineer.
2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.
3. I helped prepare the staff testimony on **Transmission System Engineering**, for the **Rice Solar Energy Project** based on my independent analysis of the Application for Certification and supplements hereto, data from reliable documents and sources, and my professional experience and knowledge.
4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issue addressed therein.
5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

RESUME

AJOY GUHA

*Associate Electrical Engineer
California Energy Commission
1516 Ninth Street, MS 46
Sacramento, CA 95814*

EDUCATION:

MSEE, POWER SYSTEMS ENGINEERING, PURDUE UNIVERSITY, INDIANA
BSEE, ELECTRICAL ENGINEERING, CALCUTTA UNIVERSITY, INDIA

CERTIFICATIONS:

REGISTERED PROFESSIONAL ENGINEER, CALIFORNIA, INDIANA & ILLINOIS
MEMBER OF IEEE; MEMBER OF THE INSTITUTION OF ENGINEERS OF INDIA

SUMMARY OF PROFESSIONAL BACKGROUND:

Ajoy Guha, P. E. has years of electric utility experience with an extensive background in evaluating and determining current and potential transmission system reliability problems and their cost effective solutions. He has a good understanding of the transmission issues and concerns. He is proficient in utilizing computer models of electrical systems in performing power flow, dynamic stability and short circuit studies, and provide system evaluations and solutions, and had performed generator interconnection studies, area transfer and interconnected transmission studies, and prepared five year transmission alternate plans and annual operating plans. He is also experienced in utilizing Integrated Resource Planning computer models for generation production costing and long term resource plans, and had worked as an Executive in electric utilities and experienced in construction, operation, maintenance and standardization of transmission and distribution lines.

WORK EXPERIENCE:

CALIFORNIA ENERGY COMMISSION, ENERGY FACILITIES SITING AND ENVIRONMENTAL DIVISION, SACRAMENTO, CA, 11/2000-Present.

Working as Associate Electrical Engineer in the Transmission System Engineering unit on licensing generation projects. Work involves evaluating generation interconnection studies and their impacts on transmission system, and providing staff assessments and testimony to the commission, and coordination with utilities and other agencies.

ALLIANT ENERGY, DELIVERY SYSTEM PLANNING, MADISON, WI, 4/2000-9/2000.

Worked as Transmission Services Engineer, performed Generator Interconnection studies and system planning studies.

IMPERIAL IRRIGATION DISTRICT, POWER DEPT., Imperial, California, 1985-1998.

Worked as Senior Planning Engineer in a supervisory position and in Transmission, Distribution and Integrated Resource planning areas. Performed interconnection studies for 500 MW geothermal plants and developed plan for a collector system, developed methodologies for transmission service charges, scheduling fees and losses. Worked as the Project Leader in the 1992 Electricity Report (ER 92) process of the California Energy Commission. Worked as the Project Leader for installation of an engineering computer system and softwares. Assumed the Project Lead in the standardization of construction and materials, and published construction standards.

CITY LIGHT & POWER, Frankfort, Indiana, 1980 – 1985.

Worked as Assistant Superintendent and managed engineering, construction and operation depts.

WESTERN ILLINOIS POWER CO-OP., Jacksonville, Illinois, 1978 – 1980.

Worked as Planning Engineer and was involved in transmission system planning.

THE CALCUTTA ELECTRIC SUPPLY CORPORATION LTD. (CESC), Calcutta, India, 1964 –1978.

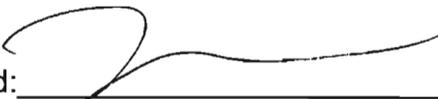

Worked as District Engineer and was responsible for managing customer relations, purchasing and stores, system planning, construction, operation and maintenance departments of the most industrialized Transmission and Distribution division of the Utility. Worked as PROJECT MANAGER for construction of a 30 mile Double Circuit 132 kV gas-filled Underground Cable urban project. During 1961-63, worked as Factory Engineer for design, manufacturing and testing of transformers, motor starters and worked in a coal-fired generating plant.

**DECLARATION OF
Mark Hesters**

I, **Mark Hesters**, declare as follows:

1. I am presently employed by The California Energy Commission in the **Siting, Transmission and Environmental Protection Division** as a Senior Electrical Engineer.
2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.
3. I prepared the staff testimony on **Transmission System Engineering**, for the **Rice Solar Energy Project**, based on my independent analysis of the Application for Certification and supplements hereto, data from reliable documents and sources, and my professional experience and knowledge.
4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issues addressed therein.
5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated: 9/27/10 Signed: 
At: Sacramento, CA

Mark Hesters
Associate Electrical Engineer

Mark Hesters has fourteen years of experience in electric power regulation. He worked in the Engineering Office of the California Energy Commission's Energy Facilities Siting & Environmental Protection Division since 1998 providing analysis of California transmission systems and testimony on transmission systems in several Commission power plant certification processes. Prior to that Mark worked in the CEC's Electricity Analysis Office providing lead analysis on Southern California Edison resource issues and modeling support for all areas of California. He holds a B.S. degree from the University of California at Davis in Environmental Policy Analysis and Planning.

**DECLARATION OF
Chris Davis**

I, Chris Davis, declare as follows:

1. I am presently employed by the California Energy Commission in the Siting, Transmission and Environmental Protection Division, as a Compliance Project Manager.
2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.
3. I prepared the staff testimony on the **General Conditions Including Compliance Monitoring and Closure Plan** for the **Rice Solar Energy Project** (09-AFC-10) based on my independent analysis of the Application for Certification and supplements thereto, data from reliable documents and sources, and my professional experience and knowledge.
4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issue(s) addressed therein.
5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated: 8-9-10

Signed: 

At: Sacramento, California

Chris Davis

California Energy Commission
1516 Ninth St., MS-2000
Sacramento, California 95814
(916) 654-4842

Professional Experience

*January 2008
to present*

California Energy Commission

Planner III Compliance Project Manager – Oversee power plant construction. Process amendments to Energy Commission project certifications. Direct technical staff in tasks related to compliance issues regarding power plant project design, construction, operation, and associated environmental issues. Work with power plant operators, public agencies, community groups, engineering, legal and technical staff to identify and resolve issues.

2007-2008

California Energy Commission

Energy Specialist I – Education and outreach for the New Solar Homes Partnership (NSHP) and the Building Standards Office. Developed fact sheets on proposed changes to the 2008 building standards and a tutorial on how to use the PV Calculator to figure photovoltaic system power production and expected incentives. Wrote case study, articles and Web pages explaining various aspects of the NSHP program. Certified by CalCERTS (California Energy Rating and Testing Services) as a Home Energy Rating System (HERS) rater for photovoltaic systems. Organized, developed materials and staffed Energy Commission booth/tables for conferences put on by California Building Energy Consultants (CABEC) and others.

2005-2007

State Water Quality Control Board

Information Officer I - Liaison between the media and both the State Water Board and Central Valley Regional Water Board. Issues included waste (NPDES) permits, groundwater contamination and treatment, once-through cooling, emerging contaminants, contaminated beaches, stormwater containment, and areas of special biological significance. Organized, produced and served as master of ceremonies for presentations of grant awards to repair watersheds, practice sustainable forestry and construct water treatment facilities.

2005-2008

California Energy Commission

Information Officer I – Joined the Energy Commission media office during California's power crisis. Liaison between Energy Commission and media in the area of power plant licensing. Wrote

news releases about projects as they reached milestones in the approval and construction process, including a number of releases for Governor's office about new facilities beginning operations. Initiated and developed Power Plant Fact Sheet in cooperation with Siting Office manager.

DECLARATION OF

I, **Rick Tyler** declare as follows:

1. I am presently employed by the California Energy Commission in the Engineering Office of the Siting, Transmission, and Environmental Protection Division as a Senior Mechanical Engineer.
2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.
3. I supervised preparation of the Revised Staff Assessment for Hazardous Materials Management and Worker Safety Fire Protection Sections for the Rice Solar Energy Project based on my independent analysis of the Application for Certification and supplements thereto, data from reliable documents and sources, and my professional experience and knowledge.
4. It is my professional opinion that the prepared testimony and errata is valid and accurate with respect to the issue addressed therein.
5. I am personally familiar with the facts and conclusions related in the testimony and errata and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated: 9/28/10

Signed: 

At: Sacramento, California

RICK TYLER

Associate Mechanical Engineer

CALIFORNIA ENERGY COMMISSION

EDUCATION B.S., Mechanical Engineering, California State University, Sacramento. Extra course work in Statistics, Instrumentation, Technical Writing, Management; Toxicology, Risk Assessment, Environmental Chemistry, Hazardous Materials Management, Noise Measurement, and regulations regarding control of toxic substances.

Near completion of course work necessary to obtain a certificate in hazardous materials management from University of California, Davis.

EXPERIENCE

Jan. 1998- Present California Energy Commission - Senior Mechanical Engineer
Energy Facility Siting and Environmental Protection Division

Responsible for review of Applications for Certification (applications for permitting) for large power plants including the review of handling practices associated with the use of hazardous and acutely hazardous materials, loss prevention, safety management practices, design of engineered equipment and safety systems associated with equipment involving hazardous materials use, evaluation of the potential for impacts associated with accidental releases and preparation and presentation of expert witness testimony and conditions of certification. Review of compliance submittals regarding conditions of certifications for hazardous materials handling, including Risk Management Plans Process Safety Management.

April 1985- Jan. 1998 California Energy Commission - Health and Safety
Program Specialist; Energy Facility Siting and Environmental Protection Division.

Responsible for review of Public Health Risk Assessments, air quality, noise, industrial safety, and hazardous materials handling of Environmental Impact Reports on large power generating and waste to energy facilities, evaluation of health effects data related to toxic substances, development of recommendations regarding safe levels of exposure, effectiveness of measures to control criteria and non-criteria pollutants, emission factors, multimedia exposure models. Preparation of testimony providing Staff's position regarding public health, noise, industrial safety, hazardous materials handling, and air quality issues associated with proposed power plants. Advise Commissioners, Management, other Staff and the public regarding issues related to health risk assessment of hazardous materials handling.

Nov. 1977-
April 1985

California Air Resources Board - Engineer (last 4 years Associate level)

Responsible for testing to determine pollution emission levels at major industrial facilities; including planning, supervision of field personnel, report preparation and case development for litigation; evaluate, select and acceptance-test instruments prior to purchase; design of instrumentation systems and oversight of their repair and maintenance; conduct inspections of industrial facilities to determine compliance with applicable pollution control regulations; improved quality assurance measures; selected and programmed a computer system to automate data collection and reduction; developed regulatory procedures and the instrument system necessary to certify and audit independent testing companies; prepared regulatory proposals and other presentations to classes at professional symposia and directly to the Air Resources Board at public hearings. As state representative, coordinated efforts with federal, local, and industrial representatives.

PROFESSIONAL
AFFILIATIONS/
LICENSES

Past President, Professional Engineers in California
Government Fort Sutter Section;
Past Chairman, Legislative Committee for Professional Association of Air Quality Specialists. Have passed the Engineer in Training exam.

PUBLICATIONS,
PROFESSIONAL
PRESENTATIONS
AND
ACCOMPLISHMENTS

Authored staff reports published by the California
Air Resources Board and presented papers regarding
continuous emission monitoring at symposiums.

Authored a paper entitled "A Comprehensive Approach to Health Risk Assessment", presented at the New York Conference on Solid Waste Management and Materials Policy.

Authored a paper entitled "Risk Assessment A Tool For Decision Makers" at the Association of Environmental Professionals AEP Conference on Public Policy and Environmental Challenges.

Conducted a seminar at University of California, Los Angeles for the Doctoral programs in Environmental Science and Public Health on the subject of "Health Risk Assessment".

Authored a paper entitled "Uncertainty Analysis -An Essential Component of Health Risk Assessment and Risk Management" presented at the EPA/ORNL expert workshop on Risk Assessment for Municipal Waste Combustion: Deposition, Uncertainty, and Research Needs.

Presented a talk on off-site consequence analysis for extremely hazardous materials releases. Presented at the workshop for administering agencies conducted by the City of Los Angeles Fire Department.

Evaluated, provided analysis and testimony regarding public health and hazardous materials management issues associated with the permitting of more than 20 major power plants throughout California.

Developed Departmental policy, prepared policy documents, regulations, staff instruction, and other guidance documents and reference materials for use in evaluation of public health and hazardous materials management aspects of proposed power plants.

Project Manager on contracts totaling more than \$500,000.

RES.RT

**DECLARATION OF
SHAHAB KHOSHMAHRAB**

I, **SHAHAB KHOSHMAHRAB**, declare as follows:

1. I am presently employed by the California Energy Commission in the **ENGINEERING OFFICE** of the Facilities Siting Division as a **MECHANICAL ENGINEER**.
2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.
3. I participated in the preparation of the staff testimonies on **Noise and Vibration, Power Plant Efficiency, and Power plant Reliability** for the **Rice Solar Energy Project** based on my independent analysis of the Application for Certification and supplements thereto, data from reliable documents and sources, and my professional experience and knowledge.
4. It is my professional opinion that the prepared testimonies are valid and accurate with respect to the issues addressed therein.
5. I am personally familiar with the facts and conclusions related in the testimonies and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated: October 7, 2010

Signed: 

At: Sacramento, California

Shahab Khoshmashrab
Mechanical Engineer

Experience Summary

Nine years experience in the Mechanical, Civil, Structural, and Manufacturing Engineering fields involving engineering and manufacturing of various mechanical components and building structures. This experience includes QA/QC, construction/licensing of electric generating power plants, analysis of noise pollution, and engineering and policy analysis of thermal power plant regulatory issues.

Education

- California State University, Sacramento-- Bachelor of Science, Mechanical Engineering
- Registered Professional Engineer (Mechanical), California

Professional Experience

2001-2004--Mechanical Engineer, Systems Assessment and Facilities Siting-- California Energy Commission

Performed analysis of generating capacity, reliability, efficiency, noise and vibration, and the mechanical, civil/structural and geotechnical engineering aspects of power plant siting cases.

1998-2001--Structural Engineer – Rankin & Rankin

Engineered concrete foundations, structural steel and sheet metal of various building structures including energy related structures such as fuel islands. Performed energy analysis/calculations of such structures and produced structural engineering detail drawings.

1995-1998--Manufacturing Engineer – Carpenter Advanced Technologies

Managed manufacturing projects of various mechanical components used in high tech medical and engineering equipment. Directed fabrication and inspection of first articles. Wrote and implemented QA/QC procedures and occupational safety procedures. Conducted developmental research of the most advanced manufacturing machines and processes including writing of formal reports. Developed project cost analysis. Developed/improved manufacturing processes.

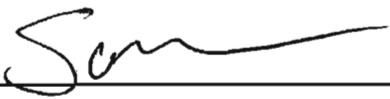

**DECLARATION OF
Testimony of Scott Debauche**

I, **Scott Debauche**, declare as follows:

1. I am presently employed by Aspen Environmental Group, a contractor to the California Energy Commission, Siting, Transmission and Environmental Protection Division, as a **Traffic and Transportation Technical Specialist**.
2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.
3. I prepared the staff testimony on **Traffic and Transportation** for the **Rice Solar Energy Project Staff Assessment/Draft Environmental Impact Statement** based on my independent analysis of the Application for Certification and supplements hereto, data from reliable documents and sources, and my professional experience and knowledge.
4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issue addressed therein.
5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated: August 7, 2010

Signed: 

At: Agoura Hills, California

SCOTT DEBAUCHE
Environmental Planner

ACADEMIC BACKGROUND

B.S., Urban & Regional Planning, University of Minnesota, 1994

PROFESSIONAL EXPERIENCE

Mr. Debauche is an environmental planner with over 14 years of experience preparing a variety of federal and State of California environmental, planning, and analytical documents for large-scale infrastructure and development projects. Mr. Debauche brings the experience of specializing in the integration and completion of NEPA and CEQA documentation joint documentation evaluating Transportation/Traffic, Noise, Socioeconomics and Environmental Justice, Air Quality, and Alternatives analyses.

Aspen Environmental Group

2001 to present

- **TANC Transmission Project (TTP) EIR/EIS, several Northern California Counties.** Mr. Debauche is currently serving as the Technical Specialist in charge of preparation of the EIR/EIS Transportation/Traffic and Socioeconomics CEQA/NEPA analyses. The Transmission Agency of Northern California (TANC) and Western Area Power Administration (Western), an agency of the U.S. Department of Energy (DOE), are the CEQA lead agency and NEPA lead agency, respectively. The TTP generally would consist of new and upgraded 500 kilovolt (kV) and 230 kV transmission lines, substations, and related facilities generally extending from northeastern California near Ravendale in Lassen County to the California Central Valley through Sacramento and Contra Costa Counties and westward into the San Francisco Bay Area.
- **Little Rock Reservoir Sediment Removal Project EIS/EIR, Palmdale, CA.** Mr. Debauche is the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, and Socioeconomics analyses for this joint EIS/EIR evaluating the impacts of sediment removal alternatives for the Little Rock Reservoir and Dam on USFS Angeles National Forest (NEPA Lead Agency) lands in Los Angeles County. The project involves impacts to the arroyo toad, extensive coordination with USFWS for a Section 7 consultation, incorporation of new Forest Service Plan updates and requirements into the analysis, preparation of the Forest Service required BE/BA, and analysis of compliance with federal conformity requirements. Aspen is currently working on the Administrative Draft EIR/EIS and assisting the PWD with portions of their Proposition 50 grant application to the DWR.
- **Alta Wind Project EIR, Kern County, CA.** Mr. Debauche is the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, and Air Quality analyses for this EIR. The applicant, Alta Windpower Development, LLC, proposes to develop the Alta-Oak Creek Mojave Project (proposed project or project) for the commercial production of up to 800 Megawatts (MW) of electricity from wind turbines. The proposed project would result in construction of up to 350 wind turbine generators, their ancillary facilities and supporting infrastructure located on three distinct land areas comprising a total of approximately 10,750 acres located approximately 3 miles west of State Route (SR) 14 (Antelope Valley Freeway) and 3 miles south of SR-58 in the Willow Springs area of eastern Kern County.

- **Liberty Energy Power Plant EIR, Banning, CA.** Mr. Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, Air Quality, Public Services and Utilities, and Hazardous Materials analyses for this CEQA document. Liberty Energy is proposing to construct a new biomass power plant, located at the eastern terminus of Westward Avenue in the City of Banning, Riverside County, California. The generating facility would include three power generation units (trains) to produce 15 MW (17.5 MW gross). Each unit would utilize a bubbling fluidized bed gasifier boiler to generate heat to produce high pressure steam.
- **Baldwin Hills Oil Field Community Standards District EIR Review and Ordinance Preparation, Culver City, CA.** Mr. Debauche served as the Technical Specialist for the City of Culver City reviewing the Los Angeles County Baldwin Hills Oils Field Community Standards District EIR Noise analysis evaluating the impacts of expanding the existing Baldwin Hills oil field. Once completed, Mr. Debauche then prepared the Noise section of the newly enacted City of Culver City Community Standards District overlay zone restricting noise generation by the Baldwin Hills Oil Field on the residents of Culver City.
- **Topaz Solar Project EIR, San Luis Obispo County, CA.** Mr. Debauche is the Technical Specialist in charge of preparation of the Transportation/Traffic and Air Quality sections of this EIR for this 500 MW solar photovoltaic project in the Carrizo Plain area. This project requires the conversion of approximately 6,000 acres of open space (60 percent of which are under land preservation contracts) to an industrial use.
- **California Valley Solar Ranch EIR, San Luis Obispo County, CA.** Mr. Debauche is the technical specialist in charge of preparation of the Air Quality analysis of this EIR for this 250 MW solar photovoltaic project in the Carrizo Plain area. This project requires the conversion of approximately 4,000 acres of open space to an industrial use.
- **Long Beach LNG Import Project EIR/EIS, Long Beach, CA.** Under contract to the City of Long Beach, Aspen was tasked to review the Draft EIS/EIR for the proposed construction and operation of this onshore LNG facility to be located at the Port of Long Beach. Mr. Debauche reviewed the document for technical adequacy and assisted the City in preparing written comments for the following sections of the EIS/EIR: Transportation/Traffic and Noise.
- **Sunset Substation and Transmission and Distribution Project EIR, Banning, CA.** Mr. Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, Socioeconomics, and Alternatives analyses for this EIR. The City of Banning proposes to construct the Sunset Substation and supporting 33-kilovolt (kV) transmission line that would interconnect with the City's existing distribution system. The purpose of this new substation and transmission is to relieve the existing overloads that are occurring within the City's electric system and to accommodate projected growth in the City.
- **MARS EIR/EIS, Monterey, CA.** Mr. Debauche served as the Technical Specialist in charge of preparation of the Environmental Justice analysis for this EIR/EIS, which would evaluate the effects associated with the installation and operation of the proposed Monterey Accelerated Research System (MARS) Cabled Observatory Project (Project) proposed by Monterey Bay Aquarium Research Institute (MBARI)[NEPA Lead Agency]. The goal of the Project was to install and operate, in State and Federal waters, an advanced cabled observatory in Monterey Bay that would provide a continuous monitoring presence in the Monterey Bay National Marine Sanctuary (MBNMS) as well as serve as the test bed for a state-of-the-art regional ocean observatory, currently one component of the National Science Foundation (NSF) Ocean Observatories Initiative (OOI). The Environmental Justice analysis evaluated the potential for any disproportionate project impacts to both land-based populations and fisheries workers.
- **Diablo Canyon Power Plant (DCPP) Steam Generator Replacement Project EIR, San Luis Obispo County, CA.** Mr. Debauche served as the Technical Specialist in charge of preparation

of the Socioeconomics and Alternatives analyses sections of this EIR. The EIR addressed impacts associated with the replacement of the eight original steam generators (OSGs) at DCPD Units 1 and 2 due to degradation from stress and corrosion cracking, and other maintenance difficulties. The Proposed Project would be located at the DCPD facility, which occupies 760 acres within PG&E's 12,000-acre owner-controlled land on the California coast in central San Luis Obispo County. Land use issues of concern include impacts to agricultural lands, recreational resources, and potential Coastal Act inconsistencies.

- **Lake Canyon Dam and Detention Basin Project EIR, Ventura County, CA.** Mr. Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, Air Quality, and Hazardous Materials analyses for this CEQA document. The proposed project would include an earthfill dam and detention basin located in an unincorporated area of Ventura County, California. It would operate in conjunction with the existing Arundell Dam and Detention Basin, which is located an estimated 600 feet south-southwest and downstream of the proposed project site, to detain peak storm flows and capture the associated debris expected from a 100-year storm event.
- **Colton Substation Project IS/MND, Colton, CA.** Mr. Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, Air Quality, and Hazardous Materials analyses for this CEQA document. The City of Colton proposes to construct the 1.9 acre North Substation and supporting 1.7 miles of 69 kV subtransmission and distribution facilities necessary to interconnect with the existing city-owned subtransmission and distribution systems.
- **San Antonio Creek Giant Reed Removal Project IS/MND, Ventura County, CA.** Mr. Debauche served as the Technical Specialist in charge of preparation of a number of technical issues area analyses for this CEQA document including: Transportation/Traffic, Noise, Air Quality, and Hazardous Materials. The purpose of the project is to remove giant reed within the upper reaches of the San Antonio Creek watershed and several tributaries to support other existing efforts to remove this invasive plant species along the main stem of the Ventura River and its watershed.

California Public Utilities Commission (CPUC). Under Aspen's environmental services contract with the CPUC, Mr. Debauche has prepared environmental analysis sections of environmental reports analyzing large-scale infrastructure projects. His project experience with the CPUC includes the following:

- **Tehachapi Renewable Transmission Project (TRTP) EIR/EIS, Kern, Los Angeles, and San Bernardino Counties, CA.** For this EIR/EIS prepared by USFS, Angeles National Forest and CPUC, Mr. Debauche is currently serving as the Technical Specialist for Noise and Alternatives evaluation for SCE's proposal to construct, use, and maintain a series of new and upgraded high-voltage electric transmission lines and substations to deliver electricity generated from new wind energy projects in eastern Kern County. Approximately 46 miles of the project would be located in a 200- to 400-foot right-of-way on National Forest System land (managed by the Angeles National Forest) and approximately three miles would require expanded right-of-way within the Angeles National Forest. The proposed transmission system upgrades of TRTP are separated into eight distinct segments: Segments 4 through 11. Segments 1 (Antelope-Pardee) and Segments 2 and 3 (Antelope Transmission Project) were evaluated in separate CEQA and NEPA documents as described below.
- **Devers-Palo Verde 500 kV Transmission Line Project EIS/EIR, southern California/western Arizona.** For this EIR/EIS prepared by U.S. Bureau of Land Management and CPUC, Mr. Debauche served as the Technical Specialist for Transportation/Traffic, Noise, Socioeconomics, and Alternatives evaluation for SCE's proposed 250-mile transmission line project from the Palo Verde Nuclear power plant in Arizona to the northern Palm Springs area in California. Major issues of concern include EMF and visual impacts on property values, impacts on the area's vast recreational resources and tribal lands, and the development and evaluation of several route alternatives, including the Devers-Valley No. 2 Route Alternative, which eventually was approved by the CPUC.

- **Antelope-Pardee 500 kV Transmission Line Project EIS/EIR, Los Angeles County, CA.** For this EIR/EIS prepared by USFS, Angeles National Forest and CPUC, Mr. Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, Socioeconomics, and Alternatives evaluation for SCE's proposed 25-mile transmission line project from the Antelope Substation in the City of Lancaster, through the ANF, and terminating at SCE's Pardee Substation in Santa Clarita. Major issues of concern included impacts to biological, recreational, and cultural resources within Forest lands, EMF and visual impacts on property values, impacts on residences in the urbanized southern regions of the route, and the development and evaluation of several route alternatives.
- **El Casco System Project EIR, Riverside, CA.** Mr. Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, Socioeconomics, and Alternatives analyses for this EIR prepared for the CPUC to evaluate SCE's application for a Permit to Construct (PTC) the El Casco System Project. The Proposed Project would be located in a rapidly growing area of northern Riverside County, which includes the Cities of Beaumont, Banning, and Calimesa. A 115 kV subtransmission line begins at Banning Substation and extends westward toward the proposed El Casco Substation site within the existing Banning to Maraschino 115 kV subtransmission line and Maraschino–El Casco 115 kV subtransmission line ROWs. Major issues of concern include impacts to existing and residential land uses, which have led to the development of a partial underground alternative and a route alternative different than the project route proposed by SCE (the Applicant). The 1,200-page Draft EIR was released for a 45-day public review and comment on December 12, 2007, and evaluates project alternatives at the same level of detail as the Proposed Project analysis.
- **Antelope Transmission Project, Segments 2 & 3 EIR, Los Angeles and Kern Counties, CA.** For this EIR prepared by the CPUC, Mr. Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, Socioeconomics, and Alternatives evaluation. The proposed Project includes both Segment 2 and Segment 3 of the Antelope Transmission Project, and involves construction of new transmission line infrastructure from the Tehachapi Wind Resource Area in southern Kern County, California, to SCE's existing Vincent Substation in Los Angeles County, California. The Tehachapi Wind Resource Area is one of the State's greatest potential sources for the generation of wind energy. A variety of wind energy projects are currently in development for this region. Major issues of concern include EMF and visual impacts on property values, impacts on residences and agricultural resources, and the development and evaluation of several substation and route alternatives.
- **SDG&E Miguel Mission Substation Draft EIR.** The major part of the Proposed Project would include the installation of a new, bundled 230 kV circuit between Miguel and Mission Substations, which would be located entirely within SDG&E's existing 35-mile ROW. Mr. Debauche prepared social science analysis for the Initial Study, as well as the Draft EIR Project Description and several key environmental sections.
- **PG&E's Proposed Divestiture of Hydroelectric Assets Project EIR.** Mr. Debauche prepared several key sections of the Draft EIR, including Socioeconomics and Hazardous Materials analysis. PG&E owns and operates the largest private hydroelectric power system in the nation. Situated in the Sierra Nevada, Southern Cascade, and Coastal mountain ranges of California, this system is strung along 16 different river basins and annually generates approximately five percent of the power consumed each year in California. The proposed sale of assets also includes approximately 140,000 acres of land proposed for sale with the hydroelectric system. The EIR analyzes the range of operational changes that could occur under new ownership, including complex integrated models that analyze power generation and water management.
- **Viejo System Project IS/MND, Orange County, CA.** Mr. Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, Socioeconomics, and Alternatives evaluation for the project's CEQA documentation, including and Initial Study, prepared on behalf of the CPUC to evaluate Southern California Edison's (SCE) Application for a Permit to Construct the Viejo System Project, which was in SCE's forecasted demand of electricity and goal of providing reliable electric service in southern Orange County. The Viejo System Project would serve Lake Forest, Mission Viejo, and the surrounding areas. Components of the project included, construction of the new 220/66/12 kilovolt (kV) Viejo Substation, installation of a new 66 kV subtransmission line within an existing SCE right-of-way, replacement of 19 double-circuit tubular steel poles with 13 H-frames structures, and minor modification to other transmission lines. Major issues of concern include visual impacts of transmission towers, EMF effects, and project impacts on property values.

- **Looking Glass Networks Fiber Optic Cable Project IS/MND, northern and southern California.** As part of Aspen's ongoing contract with the CPUC for review of Telecommunications projects, this document encompasses and evaluation of project impacts and network upgrades in the San Francisco Bay Area and the Los Angeles Basin Area. Prepared the socioeconomic analysis for this comprehensive CEQA document reviewing the potential impacts of hundreds of miles of newly proposed fiber optic lines throughout northern and southern California, including Los Angeles and Orange Counties. Mr. Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, Socioeconomics, and Alternatives evaluation for the project's CEQA documentation.

California Energy Commission (CEC), Technical Assistance in Application for Certification Review.

In response to California's power shortage, Aspen is assisting the California Energy Commission in evaluating the environmental and engineering aspects of new power plant applications throughout the State. As part of this effort, Mr. Debauche works as a technical specialist for Transportation/Traffic, Socioeconomics and Environmental Justice, and Alternatives analyses for the following power plant projects:

- **Carlsbad Energy Center Project, Carlsbad, CA.** Technical Specialist in charge of preparation of the Transportation/Traffic and Alternatives Staff Assessments for Carlsbad Energy Center, LLC's Application for Certification (AFC) to build the Carlsbad Energy Center Project (CECP), which will consist of a 558 MW gross combined-cycle generating facility configured using two units with one natural-gas-fired combustion turbine and one steam turbine per or unit. Issues of concern include major incompatibilities with local LORS, and cumulative impacts from widening of I-5.
- **Hydrogen Energy California Power Plant Project, Kern County CA.** Technical Specialist in charge of preparation of the Transportation/Traffic and Socioeconomics/Environmental Justice Staff Assessments for Hydrogen Energy International, LLC integrated gasification combined cycle (IGCC) power generating facility called Hydrogen Energy California (HECA) in Kern County, California. The proposed project will gasify petroleum coke (or blends of petroleum coke and coal, as needed) to produce hydrogen to fuel a combustion turbine operating in combined cycle mode. The gasification component would produce 180 million standard cubic feet per day (MMSCFD) of hydrogen to feed a 390 megawatt (MW) gross combined cycle plant providing California with low-carbon baseload power to the grid.
- **CPV Vaca Station Power Plant Project, Vacaville, CA.** Technical Specialist in charge of preparation of the Transportation/Traffic Staff Assessment prepared for the CPV Vaca Station (CPVV) project, a natural gas-fired, combined-cycle electrical generating facility rated at a nominal generating capacity of 660 megawatts (MW). The CPVV is proposed for a 24-acre site located at the intersection of Lewis and Fry roads in a rural area within the city limits of Vacaville, Solano County.
- **Ivanpah Solar Electric Generating System Project, San Bernardino County, CA.** Technical Specialist in charge of preparation of the Socioeconomics/Environmental Justice Staff Assessment/BLM EIS for a 400-megawatt solar thermal electric power generating system. The project's technology would include heliostat mirror fields focusing solar energy on power tower receivers producing steam for running turbine generators. Related facilities would include administrative buildings, transmission lines, a substation, gas lines, water lines, steam lines, and well water pumps. The proposed project would be developed entirely in the Mojave Desert region of San Bernardino County, California.
- **Abengoa Mojave Solar Power Project, San Bernardino County, CA.** Technical Specialist in charge of preparation of the Socioeconomics/Environmental Justice Staff Assessment for a nominal 250 megawatt (MW) solar electric generating facility to be located near Harper Dry Lake in an unincorporated area of San Bernardino County. The project will implement well-established parabolic trough technology to solar heat a heat transfer fluid (HTF) technology.
- **Rice Solar Energy Generating System Project, Riverside County, CA.** Technical Specialist in charge of preparation of the Transportation/Traffic Staff Assessment/BLM EIS for a 50,000 megawatt hours (MWh) of renewable energy annually, with a nominal net generating capacity of 150 megawatts (MW) located in an unincorporated area of eastern Riverside County, California. The proposed facility will use concentrating solar power (CSP) technology, with a central receiver tower and an integrated thermal storage system.

- **Blythe Solar Power Project, Riverside County, CA.** Technical Specialist in charge of preparation of the Socioeconomics/Environmental Justice Staff Assessment/BLM EIS for a 1,000 MW solar thermal electric generating facility in Riverside County. The project will utilize solar parabolic trough technology to generate electricity. With this technology, arrays of parabolic mirrors collect heat energy from the sun and refocus the radiation on a receiver tube located at the focal point of the parabola.
- **GWF Henrietta Peaker Project, Kings County, CA.** Technical Specialist in charge of preparation of the Transportation/Traffic Staff Assessment for GWF's proposal to modify the existing Henrietta Power Plant. New once-through steam generators (OTSGs) will be installed to allow the plant to be operated in its current simple-cycle configuration with no steam generation but with the selective catalytic reduction (SCR) and oxidation catalyst in operation, or to operate as a combined-cycle power plant generating an additional 25 MW of power with new proposed emission limits.
- **Palen Solar Power Project, Riverside County, CA.** Technical Specialist in charge of preparation of the Socioeconomics/Environmental Justice Staff Assessment/BLM EIS for a 500 MW solar thermal electric generating facility in Riverside County. The Project will utilize solar parabolic trough technology to generate electricity. With this technology, arrays of parabolic mirrors collect heat energy from the sun and refocus the radiation on a receiver tube located at the focal point of the parabola.
- **Watson Cogeneration Steam and Electric Reliability Project, Carson, CA.** Technical Specialist for the Transportation/Traffic Staff Assessment for a nominal 85 MW combustion turbine generator (CTG), with a single-pressure heat recovery steam generator (HRSG) to provide additional process steam to the BP Carson refinery, to the existing cogeneration facility owned by Watson. The project site is a 2.5-acre brown field site located within the boundary of the existing Watson Cogeneration Facility, which is a 21.7-acre area within BP's existing Carson Refinery (BP Refinery), in the City of Carson, Los Angeles County.
- **Oakley Generating Station Project, Oakley, CA.** Technical Specialist in charge of preparation of the Transportation/Traffic Staff Assessment for a natural gas-fired, combined-cycle electrical generating facility rated at a nominal generating capacity of 624 megawatts (MW). The proposed project would be located in the City of Oakley, in Contra Costa County.
- **Canyon Power Plant Project, Anaheim, CA.** Technical Specialist in charge of preparation of the Socioeconomics/Environmental Justice Staff Assessments for a nominal 200 megawatt (MW) simple-cycle plant, using four natural gas-fired combustion turbines and associated infrastructure proposed by Southern California Public Power Authority (SCPPA). This project is a peaking power plant project located within the City of Anaheim, California.
- **GWF Tracy Combined Cycle Power Plant Project, San Joaquin County, CA.** Technical Specialist in charge of preparation of the Transportation/Traffic Staff Assessment for GWF's proposal to modify the existing TPP, a nominal 169-megawatt (MW) simple-cycle power plant, by converting the facility into a combined-cycle power plant with a nominal 145 MW, net, of additional generating capacity.
- **Lodi Energy Center Project, Lodi, CA.** Technical Specialist in charge of preparation of the Socioeconomics/Environmental Justice Staff Assessment for a natural gas-fired, combined-cycle electrical generating facility rated at a nominal 225-megawatt (MW). The Lodi Energy Center is proposed for a site parcel of approximately 4.4 acres adjacent to the City of Lodi's White Slough Water Pollution Control Facility (WPCF)
- **Kings River Conservation District Community Peaker Power Plant Project, Fresno County, CA.** Technical Specialist in charge of preparation of the Transportation/Traffic Staff Assessment for the Kings Rivers Conservation District, who filed a Small Power Plant Exemption for the King River Conservation District Peaking Power Plant. The proposed 97-megawatt natural gas-fired plant will be located south of the City of Fresno and near the community of Malaga in Fresno County.
- **Valero Cogeneration Project, Benicia, CA.** Technical Specialist in charge of preparation of the Socioeconomics/Environmental Justice Staff Assessments for a proposed cogeneration facility at the Valero Refinery in Benicia. Issues addressed included impacts on public services and other project-related population impacts such as school impact fees.
- **Rio Linda/Elverta Power Project, Sacramento, CA.** Technical Specialist in charge of preparation of the Socioeconomics/Environmental Justice Staff Assessments for a 560-megawatt natural gas power plant in

the northern Sacramento County. Issues of importance included environmental justice and impacts on property values.

- **Magnolia Power Project, Burbank, CA.** Technical Specialist in charge of preparation of the Socioeconomics/Environmental Justice Staff Assessments for this nominal 250-megawatt natural gas combined-cycle fired electrical generating facility to be located at the site of the existing City of Burbank power plant. Environmental justice issues and potential impacts on local economy and employment were evaluated.
- **Avenal Energy Project, Kings County, CA.** Technical Specialist in charge of preparation of the Socioeconomics/Environmental Justice Staff Assessments for a 600-megawatt combined cycle electrical generating facility, and associated linear facilities.
- **Inland Empire Energy Center Project, Riverside County, CA.** Technical Specialist in charge of preparation of the Socioeconomics/Environmental Justice Staff Assessments for a 670-megawatt natural gas-fired, combined-cycle electric generating facility and associated linear facilities including, a new 18-inch, 4.7-mile pipeline for the disposal of non-reclaimable wastewater, and a new 20-inch natural gas pipeline. The project would be located on approximately 46-acres near Romoland, within Riverside County.
- **Coastal Plant Study.** Technical Specialist in charge of preparation of the Socioeconomics/Environmental Justice Staff Assessments for a possible modernization, re-tooling, or expansion of California's 25 coastal power plants including the Encina Power Plant and the San Onofre Nuclear Power Plant.

Los Angeles Department of Water and Power (LADWP). Responsible for conducting the analyses of the technical and social science issue areas for a variety of EISs and EAs as part of two environmental services contracts. Delivery orders have included:

- **River Supply Conduit (RSC) Upper Reach Project EIR, Los Angeles and Burbank, CA.** Mr. Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, Socioeconomics, and Alternatives analyses for the CEQA document for this project. The RSC is a major transmission pipeline in the LADWP water distribution system. The existing RSC pipeline's purpose is to transport large amounts of water from the Los Angeles Reservoir Complex and local ground water wells to reservoirs and distribution facilities located in the central areas within of the City of Los Angeles. The LADWP proposed a new larger RSC pipeline to replace and realign the Upper and Lower Reaches of the existing RSC pipeline, which would involve the construction of approximately 69,600 linear feet (about 13.2 miles) of 42-, 48-, 60-, 66-, 72-, 84-, and 96-inch diameter welded steel underground pipeline.
- **Mulholland Pumping Station and Lower Hollywood Reservoir Outlet Chlorination Station Project IS/MND, Los Angeles, CA.** Under Aspen's on-going environmental services contract with the City of Los Angeles Department of Water and Power (LADWP), Mr. Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, Socioeconomics, and Alternatives analyses for this project. LADWP proposed to replace the existing historic pumping/chlorination station building as well as the existing lavatory and unoccupied Water Quality Laboratory buildings with a new single structure pumping/chlorination station within the LADWP's Hollywood Reservoir Complex located in the Hollywood Hills section of the City Los Angeles. These improvements were required due to the age and deterioration of the facility and the potential risk of seismic damage to existing structures. An Initial Study was prepared in support of a City of Los Angeles General Exemption.
- **Taylor Yard Water Recycling Project (TYWRP) IS/MND, Los Angeles and Glendale, CA.** Mr. Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, Socioeconomics, and Alternatives analyses for this project. LADWP proposed to construct the TYWRP in order to provide recycled water produced by the Los Angeles–Glendale Water Reclamation Plant (LAGWRP) to the Taylor Yard. An important part of the City of Los Angeles' expanding emphasis on water conservation is the concept that water is a resource that can be used more than once. Because all uses of water do not require the same quality of supply, the City has been developing programs to use recycled water for suitable landscaping and industrial uses. The project is located in the southernmost part of the City of Glendale and northeastern part of the City of Los Angeles. The IS/MND was adopted in the Summer of 2007.

- **DC Electrode Project IS/MND, Los Angeles, CA.** Mr. Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, Socioeconomics, and Alternatives analyses for this project. LADWP proposed to construct a new electrode distribution line from West Los Angeles to the Pacific Ocean stopping point in Malibu, CA up the Pacific Coast Highway.
- **District Cooling Plant Project, Los Angeles IS/MND, CA.** Mr. Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, Socioeconomics, and Alternatives analyses for this project. LADWP proposed to construct a District Cooling Plant and Distribution System (proposed project) in order to provide a centralized system for producing chilled water for use by area users, which are generally large commercial, governmental, industrial and institutional buildings who generate their own chilled water utilizing individual chiller plants for space cooling and air-conditioning.

U.S. Army Corps of Engineers, Los Angeles District. Responsible for conducting the analyses of the social science issue areas for a variety of EISs and EAs as part of two environmental services contracts. Delivery orders have included:

- **Prado Basin/Norco Bluffs/Reach 9 of the Santa Ana River Dikes Supplemental EAs, Riverside County, CA.** Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic analysis of two structural alternatives for the Norco Bluffs Toe Stabilization project as well as the No Action/No Project Alternative. Aspen developed the alternatives analyzed in this Supplemental NEPA Environmental Assessment document, a description of the alternatives' physical, construction, and operational characteristics, and a discussion of the potential environmental impacts.
- **Northeast Phoenix Drainage Area Alternatives Analysis Report, Phoenix and Scottsdale, AZ.** Mr. Debauche served as a Technical Specialist in charge of preparation of the Alternatives analysis report that evaluated the potential environmental impacts associated with channel and detention basin alternatives to control flooding problems resulting from fast rate of development in the northeast Phoenix area.
- **Murrieta Creek Flood Control and Environmental Restoration Project.** Mr. Debauche served as a Technical Specialist in charge of preparation of the Environmental Assessment and Mitigation Monitoring plan for Phase 1 of a flood control and restoration project in Riverside County.

California Department of Water Resources. Responsible for conducting the environmental analyses for CEQA compliance as part of two environmental services contracts. Delivery orders have included:

- **Piru Creek Stabilization and Restoration Project IS/MND, northern Los Angeles County.** The California Department of Water Resources (CDWR) proposes to repair erosion damage at a series of three locations downstream of Pyramid Dam and seismically retrofit the Pyramid Dam access bridge that crosses Piru Creek. Mr Debauche served as Technical Specialist in charge of preparation of the Initial Study Transportation/Traffic, Noise, Socioeconomics, and Alternatives analyses for the proposed project.
- **Pyramid Lake Repairs and Improvements Project IS/MND and EA, northern Los Angeles County.** Mr Debauche served as Technical Specialist in charge of preparation of the Initial Study Transportation/Traffic, Noise, Socioeconomics, and Alternatives analyses for the proposed project, which DWR and the Department of Boating and Waterways (DBW) conducted repairs and improvements at various recreational sites at Pyramid Lake, which is located on the border between Los Padres National Forest and Angeles National Forest; recreation is managed by Angeles National Forest. In addition to the CEQA documentation and preparation of permit applications, Aspen coordinated DWR and DBW's efforts with the USFS, and the permitting agencies (i.e., CDFG, RWQCB, and USACE). Through coordination with the USAC, Aspen prepared the NEPA EA for Corps 404 permit process, and reviewed and coordinated revisions to the 1602 with CDFG.

Los Angeles Unified School District (LAUSD), Los Angeles County, CA. Deputy Program manager and Technical writer for several CEQA documents (EIRs and IS/MNDs) being prepared as part of Aspen's ongoing services contract with the LAUSD to help approve school projects that would meet existing overcrowded conditions in the greater Los Angeles area. Projects have included:

- **New School Construction Program EIR.** Served as a Technical Specialist in charge of preparation of the social science issues, including Socioeconomics, Noise, Transportation/Traffic, and Alternatives analyses for this Program EIR being prepared for the LAUSD. The LAUSD 2020 Program would provide student

seats throughout the LAUSD via a combination of the addition of portable classrooms to existing campuses, modernization and reconfiguration of existing campuses, and the construction of new schools.

- **East Valley Middle School No. 2 EIR.** Served as a Technical Specialist for this middle school project proposed to be located at the previous Van Nuys Drive-In site, preparing the Transportation/Traffic and Noise analyses. The EIR focused on impacts associated with air quality, hazards and hazardous materials, noise, land use and planning, and traffic and transportation. Major issues of concern included traffic and noise generated by school operation activities. The EIR included LAUSD design standards and measures employed to minimize environmental impacts.
- **Mt. Washington Elementary School Multi-Purpose Room Addition Project IS/MND.** Served as the Technical Specialist in charge of preparation of the IS/MND for the development of a multi-purpose room facility, including a library, auditorium, and theater, to the existing Mt. Washington Elementary School campus located in Los Angeles. The surrounding residential community had concerns regarding the proposed project's impacts on aesthetics, traffic, air quality, and noise. Of particular concern, was impacts generated due to the after-hours use of the multi-purpose room facility by civic and community groups.
- **Canoga Park New Elementary School IS/MND.** Served as Served as the Technical Specialist in charge of preparation of the IS/MND for this elementary school project proposed to be developed on a parcel of land owned by the non-profit organization, New Economics For Women (NEW). This "turn-key" project consisted of a Charter Elementary School to be developed by NEW and sold to the LAUSD for operation. It was later decided that NEW would lease the school back and run it as a charter school. Issues of concern included, pedestrian safety, traffic, air quality, noise, and land use.
- **Hughes Magnet Span School IS/MND.** Served as the Technical Specialist in charge of preparation of the Socioeconomics, Hydrology, Public Services and Utilities, and Recreational analyses for the proposed re-opening of the existing Hughes Middle School as a Magnet Span School serving up to 1,620 District 6th through 12th grade students. The re-opening of the Hughes Middle School would require the relocation of the existing uses of the campus. The existing Enadia Way Elementary School and Platt Ranch Elementary School would be re-opened for the relocation of these uses.
- **Wonderland Elementary School Portable Classroom Additions IS/MND.** Served as the Technical Specialist in charge of preparation of the IS/MND for a proposed addition to the Wonderland Avenue Elementary School, located in the City of Los Angeles.
- **Pio Pico Elementary School Playground Expansion IS/MND.** Technical Specialist in charge of preparation of the Notice of Preparation, Initial Study, and Administrative Draft EIR for the expansion of a playground at the existing Pio Pico School in the LAUSD. The playground was proposed on five residential properties. One of the residences is a potentially significant historical resource because of its association with an African-American woman journalist, Fay M. Jackson. This project was cancelled by the LAUSD after completion of the administrative draft report.
- **Fairfax Senior High School Portable Classroom Addition IS/MND.** Served as Technical Specialist in charge of preparation of the IS/MND for the addition of portable classrooms at the school. Major issue areas covered were noise, hydrology, and geotechnical analysis.
- **Polytechnic Senior High School Portable Classroom Addition IS/MND.** Served Technical Specialist in charge of preparation of the IS/MND for the addition of portable classrooms at the school. Major issue areas covered were noise, hydrology, and geotechnical analysis.
- **Washington Senior High School Portable Classroom Addition IS/MND.** Technical Specialist in charge of preparation of the IS/MND for the addition of portable classrooms at the school. Major issue areas covered were noise, hydrology, and geotechnical analysis.

EIP Associates

1998 to 2001

MTA Mid Cities/Westside Transit Corridor Study EIS/EIR. Was a key Technical Specialist in charge of preparation of the EIS/EIR for this 3-phase (including prepared the Major Investment Study (MIS), the Environmental Impact Statement (EIS), and an evaluation of the urban design implications of transit interventions on selected routes) study intended to address current and long range traffic congestion in the central and westside areas of the Los Angeles Basin. Three east/west corridors and a range of transit

alternatives ranging including Rapid Bus, light rail, and heavy rail are being evaluated. In addition to preparing several issue area chapters of this comprehensive joint EIS/EIR, Mr. Debauche assisted with the Environmental Justice analysis, the Section 4(f) Parklands discussion, Transportation/Traffic, and the Land Use sections of the EIS/EIR.

Wes Thompson Ranch Development Project EIR. Served as Technical Specialist for this hillside residential development in the City of Santa Clarita. Issues of concern included seismic and air quality impacts associated with the excavation of 2 million cubic yards of soil, the project's non-compliance with the City's hillside ordinance for innovative design, and traffic generated by project-related population growth in the area. Four different site configuration alternatives were developed as part of the EIR analysis. Other issues of concern included sensitive biological resources, the potential for hydrological impacts due to disturbance of the hillside, and cultural resources. As the technical writer for socioeconomics, noise, hazardous materials, air quality, and public services, Mr. Debauche conducted the Transportation/Traffic and Alternatives analyses.

City of Santa Monica Environmental Assessments. Was key Technical Specialist in charge of preparation of several environmental assessment documents for housing, commercial, institutional, and mixed-use developments in compliance with CEQA. As the technical writer for socioeconomics, noise, hazardous materials, air quality, and public services, Mr. Debauche conducted the Transportation/Traffic, Noise, and Alternatives analyses for:

- **Seaview Court Condominiums IS/MND.** This comprehensive Initial Study/Mitigated Negative Declaration included six technical reports including traffic, cultural resources, parking survey, shade and shadow analysis, and a geotechnical assessment to evaluate the level of severity of this development in the waterfront area of Santa Monica. Major issues of concern were; parking and project-generated traffic on adjacent narrow residential streets; visual obstruction and shading impacts of the proposed structure; liquefaction and seismic impacts to adjacent properties as result of the project's excavation for a subterranean parking garage; and the potential impacts of the project to impact the integrity of a historic district and the historic Seaview Walkway to the beachfront.
- **Four-Story Hotel IS/MND.** A comprehensive Initial Study/Mitigated Negative Declaration was prepared for this four-story hotel adjacent to St. John's Hospital in Santa Monica. Major issues of concern included project-generated traffic on surrounding multi-family residential uses and emergency access to the hospital.
- **Santa Monica College Parking Structure B Replacement EIR.** This focused EIR addressed issues related to traffic and neighborhood land use impacts associated with the addition of a 3-story parking structure in the center of the SMC campus. Major issues of concern included the potential for project-generated traffic to cause congestion at the school's main entrance on Pico Boulevard, and the potential for overflow traffic to impact the Sunset Community of single-family homes adjacent to the school.
- **North Main St. Mixed-Use Development Project EIR.** This EIR included evaluation of impacts resulting from the development of a mixed-use development in Santa Monica's "Commercial Corridor" on Main Street, with ground-floor residences and boutique commercial uses. Major issues of concern included traffic and parking impacts to Main Street and surrounding residential land uses, shade and shadow impacts, and neighborhood impacts.

Specific Plans and Redevelopment Projects. As Technical Specialist for Transportation/Traffic, Socioeconomics, Noise, Hazardous Materials, Air Quality, and Public Services/Utilities, Mr. Debauche conducted analyses and prepared these environmental sections for:

- **Cabrillo Plaza Specific Plan EIR in Santa Barbara.** This project consisted a mixed-use commercial development on Santa Barbara's waterfront on Cabrillo Boulevard. On-site uses included an aquarium, specialty retail, restaurants, and office space.
- **Culver City Redevelopment Plan and Merger EIR.** This programmatic EIR evaluated the impacts of the City's redevelopment of its redevelopment zones. A major land use survey and calculation of acreage of redevelopment lands was conducted as part of the EIR.

- **Dana Point Headlands Specific Plan EIR.** This EIR evaluated the development of coastal bluff in the City with hotel, single- and multi-family residential, and commercial uses. Major issues of concern included ground disturbance as a result of excavation, impacts to terrestrial and wildlife biology, recreation impacts to beachgoers, and project-generate population inducement.
- **Triangle Gateway Redevelopment Project EIR in Beverly Hills, CA.** This EIR evaluated the development of a supermarket, retail shops, and office space in the triangle gateway portion of downtown Beverly Hills. Issues of concern evaluated by Mr. Debauche included traffic, land use, and impacts to on-site historic structures.
- **UCLA Campus Housing Expansion.** This EIR evaluated the development and expansion of campus housing within the UCLA campus. Issues of concern evaluated by Mr. Debauche included hazardous materials and population/housing.

CH2M Hill - Minneapolis, MN

1995 to 1998

- **Minneapolis/St. Paul International Airport Expansion EIS:** Mr. Debauche was a key writer of the EIS for this \$4 million technical and environmental study, including the preparation of an Environmental Impact Statement (EIS), and an evaluation of the urban design implications of a proposed \$800 million expansion of the existing MSP International airport, including transit and terminal modifications and the inclusion of a new perpendicular runway. The studies included alternatives to the project and the long-term effects on the cities of Minneapolis and St. Paul. In addition to preparing several issue area chapters of this comprehensive EIS, Mr. Debauche assisted with the Environmental Justice Analysis (per Executive Order 12898), the Section 4(f) Parklands discussion, and the socioeconomics sections of the EIS. In addition, Mr. Debauche assisted with preparation of a technical report on airport noise effects on nearby housing and mitigation programs for the impacts of the proposed runway.
- **Minneapolis/St. Paul Wastewater Treatment Facility Expansion EIS:** Was a key writer of the EIS for expansion of the existing wastewater treatment facility serving the twin cities area. The studies included alternatives to the project and the long-term effects on the cities of Minneapolis and St. Paul. Mr. Debauche prepared several issue area chapters of this comprehensive EIS, including the Environmental Justice Analysis (per Executive Order 12898), and the socioeconomics sections of the EIS.

PROFESSIONAL ASSOCIATIONS

- American Planning Association (APA), Chapter Member

DECLARATION OF
Testimony of Dal Hunter, Ph.D., C.E.G.

I, **Dal Hunter, Ph.D., C.E.G.**, declare as follows:

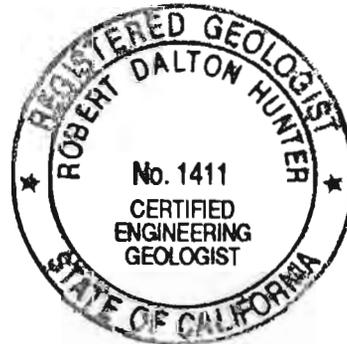

1. I am presently employed as a subcontractor to Aspen Environmental Group, a contractor to the California Energy Commission, Systems Assessment and Facilities Siting Division, as an Engineering Geologist.
2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.
3. I helped prepare the staff testimony on **GEOLOGY AND PALEONTOLOGY** for the **Rice Solar Energy Project** based on my independent analysis of the Application for Certification and supplements hereto, data from reliable documents and sources, and my professional experience and knowledge.
4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issue addressed therein.
5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated: August 6, 2010

Robert D. Hunter, Ph.D., C.E.G.

Engineering Geologist

Vice President

Education

- Ph.D. – Geology – 1989 – University of Nevada, Reno
- M.S. – Geology – 1976 – University of California - Riverside
- B.S. – Earth Science – 1972 – California State University, Fullerton

Registrations

- Registered Geologist – California
- Certified Engineering Geologist – California
- Professional Geological Engineer – Nevada

Experience

1997 to Present: Black Eagle Consulting, Inc.; Vice President. Dr. Hunter is in charge of all phases of geological, geotechnical, and geochemical projects and is responsible for conducting, coordinating, and supervising geotechnical investigations for public and private sector clients. He has worked on numerous industrial and commercial projects over the last 30 years. Dr. Hunter is very familiar with state and federal design specifications as well as CEQA and NEQA requirements related to geology and paleontology.

Dr. Hunter has also provided geological, geotechnical, and paleontological review and written and oral testimony for California Energy Commission (CEC) power plant projects including:

- El Segundo Power Redevelopment Project (including compliance monitoring)
- Magnolia Power Project (including compliance monitoring)
- Ocotillo Energy Project (Wind Turbines)
- Vernon-Malburg Generating Station
- Inland Empire Energy Center (including compliance monitoring)
- Palomar Energy Project
- Henrietta Peaker Project
- BP Carson Peaker Project
- East Altamont Energy Center
- Avenal Energy Center
- Teayawa Energy Center monitoring
- Walnut Energy Center (including compliance monitoring)
- Riverside Energy Resource Center
- Salton Sea Unit 6 (Geothermal Turbines)
- National Modoc Power Plant
- Pastoria Energy Center
- Walnut Creek Energy Park

1978 to 1997: SEA, Incorporated; Geotechnical Manager, Engineering Geologist. Dr. Hunter was in charge of all phases of geotechnical projects for SEA, including project coordination and supervision, field exploration, geotechnical analysis, slope stability analysis, soil mechanics, engineering geochemistry, mineral and aggregate evaluations, and report preparation. Numerous investigations were undertaken on military, commercial, industrial, airport, residential, and roadway projects. He worked on many geothermal power plants, providing expertise in foundations design, slope stability, seismic assessment, geothermal hazard evaluation, expansive clay, and settlement problems. Project types included high-rise structures, airports, warehouses, shopping centers, apartments, subdivisions, storage tanks, roadways, mineral and aggregate evaluations, slope stability analyses, and fault studies.

1977 to 1978: Fugro (Ertec) Incorporated Consulting Engineers and Geologists; Staff Engineering Geologist; Long Beach, California.

DECLARATION OF SERVICE

I, Maria Santourdjian, declare that on October 11, 2010, I served and filed copies of the attached Staff Assessment and Draft Environmental Impact Statement dated October 2010. The original document, filed with the Docket Unit, is accompanied by a copy of the most recent Proof of Service list, located on the web page for this project at: [<http://www.energy.ca.gov/sitingcases/ricesolar>].

The documents have been sent to both the other parties in this proceeding (as shown on the Proof of Service list) and to the Commission's Docket Unit, in the following manner:

(Check all that Apply)

FOR SERVICE TO ALL OTHER PARTIES:

- sent electronically to all email addresses on the Proof of Service list;
 by personal delivery;
 by delivering on this date, for mailing with the United States Postal Service with first-class postage thereon fully prepaid, to the name and address of the person served, for mailing that same day in the ordinary course of business; that the envelope was sealed and placed for collection and mailing on that date to those addresses NOT marked "email preferred."

AND

FOR FILING WITH THE ENERGY COMMISSION:

- one electronic copy, mailed and emailed respectively, to the address below (***preferred method***);

OR

- depositing in the mail an original and 12 paper copies, as follows:

CALIFORNIA ENERGY COMMISSION

Attn: Docket No. 09-AFC-10
1516 Ninth Street, MS-4
Sacramento, CA 95814-5512
docket@energy.state.ca.us

I declare under penalty of perjury that the foregoing is true and correct, that I am employed in the county where this mailing occurred, and that I am over the age of 18 years and not a party to the proceeding.
