# Reactivity Controlled Compression Ignition - RCCI

- HCCI Combustion offers high efficiency & low PM and NOx emissions, but is sensitive to fuel properties, is limited to low load and has no direct means to control combustion phasing
- Control can be provided by varying fuel reactivity using **TWO** fuels with different reactivities - dual-fuel PCCI = RCCI:
  - **Port fuel injection of gasoline**  
(mixed with intake air, as in spark-ignition engines)
  - **Multiple direct-injections of diesel fuel** into combustion chamber later during compression (as in diesel engines)
  - **Optimized fuel blending in-cylinder**

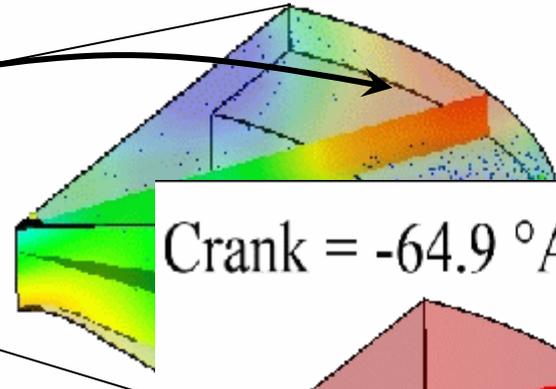

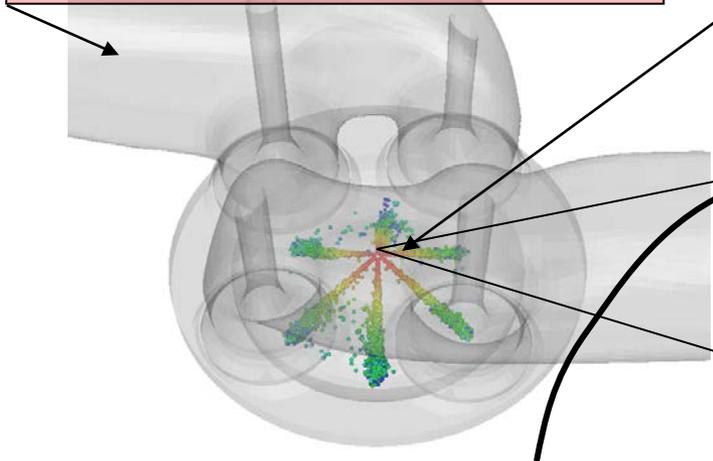

- Emissions regs. met in-cylinder  
- No Diesel Exhaust Fluid tank!

# Dual fuel RCCI combustion – controlled HCCI

Kokjohn, IJER 2011

- Heat release occurs in 3 stages
- Cool flame reactions from diesel (n-heptane) injection
- First energy release where both fuels are mixed
- Final energy release where lower reactivity fuel is located
- Changing fuel ratios changes relative magnitudes of stages
- Fueling ratio provides “next cycle” CA50 transient control

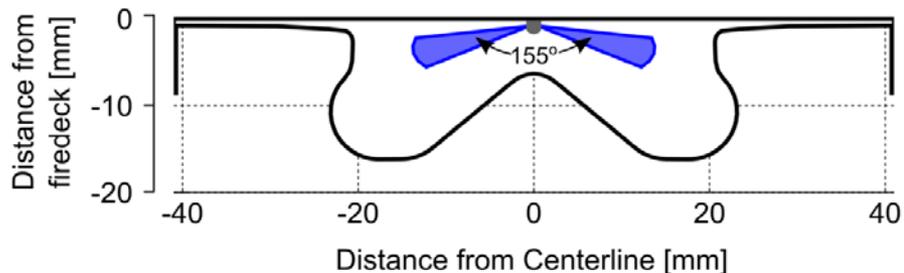

# Light-duty automotive drive-cycle performance

- Compare conventional diesel combustion (CDC) and Reactivity Controlled Compression Ignition (RCCI) combustion
- Same operating conditions (CR, boost, IMT, swirl..)
- ERC KIVA-Chemkin Code
  - Reduced PRF model for diesel and gasoline kinetics
  - Improved ERC spray models

Kokjohn, PhD thesis 2012

## Combustion chamber geometry

## Engine specifications

|                        |                 |
|------------------------|-----------------|
| Base engine            | GM 1.9 L        |
| Bore (mm)              | 82              |
| Stroke (mm)            | 90.4            |
| Connecting rod (mm)    | 145.5           |
| Squish height (mm)     | 0.617           |
| Displacement (L)       | 0.4774          |
| Compression ratio      | 16.7:1          |
| Swirl ratio            | 1.5 - 3.2       |
| IVC ( $^{\circ}$ ATDC) | -132 $^{\circ}$ |
| EVO ( $^{\circ}$ ATDC) | 112 $^{\circ}$  |

## Diesel fuel injector specifications

|                             |                   |
|-----------------------------|-------------------|
| Type                        | Bosch common rail |
| Included angle              | 155 $^{\circ}$    |
| Number of holes             | 7                 |
| Hole size ( $\mu\text{m}$ ) | 141               |

# Comparison between RCCI and Conventional Diesel

- Five operating points of Ad-hoc fuels working group
- Tier 2 bin 5 NOx targets from:
 

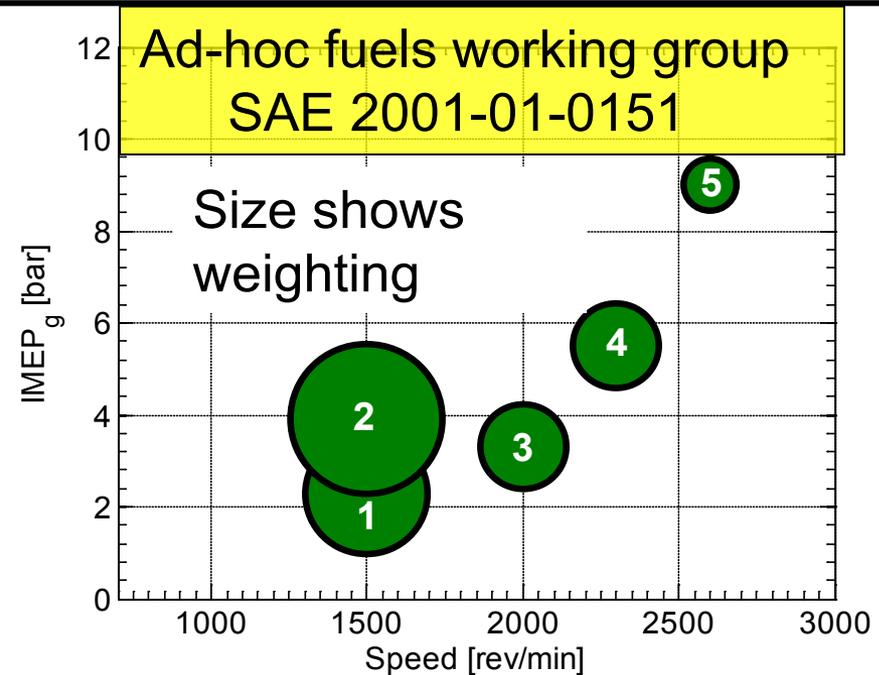

Cooper, SAE 2006-01-1145

 (assumes 3500lb Passenger Car)
- Evaluate NOx / fuel efficiency tradeoff using SCR for CDC

## Assumptions

- Diesel exhaust fluid (DEF) consumption 1% per g/kW-hr NOx reduction
 

Johnson, SAE 2011-01-0304
- No DPF regeneration penalty
- UHC and CO only lead to reduced work

| Mode | Speed (rpm) | IMEP (bar) | CDC Baseline NOx (g/kgf)* | NOx Target (g/kgf) |
|------|-------------|------------|---------------------------|--------------------|
| 1    | 1500        | 2          | 1.3                       | 0.2                |
| 2    | 1500        | 3.9        | 0.9                       | 0.4                |
| 3    | 2000        | 3.3        | 1.1                       | 0.3                |
| 4    | 2300        | 5.5        | 8.4                       | 0.6                |
| 5    | 2600        | 9          | 17.2                      | 1.2                |

DEER 10/18/2012

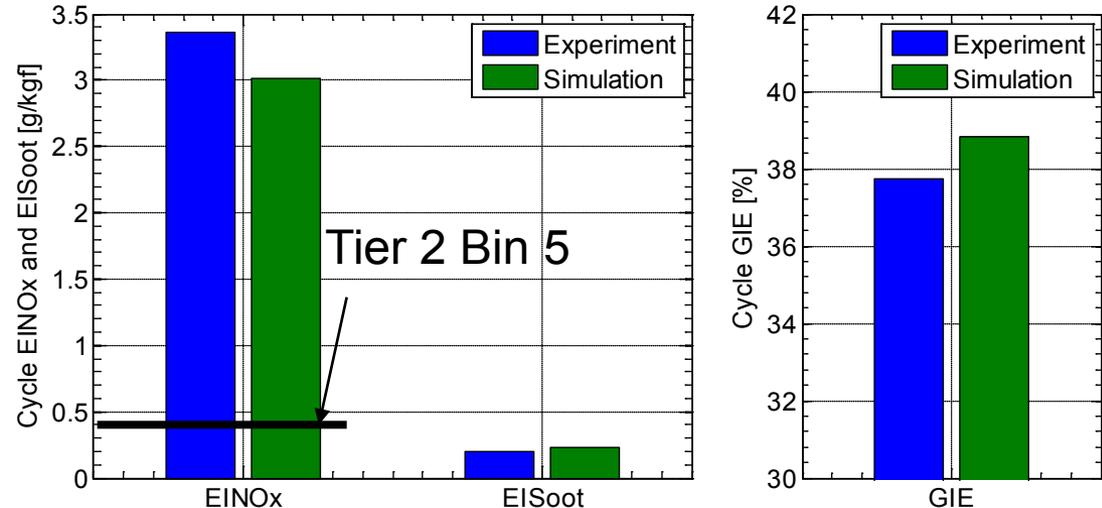

# Model Validation (Euro 4)

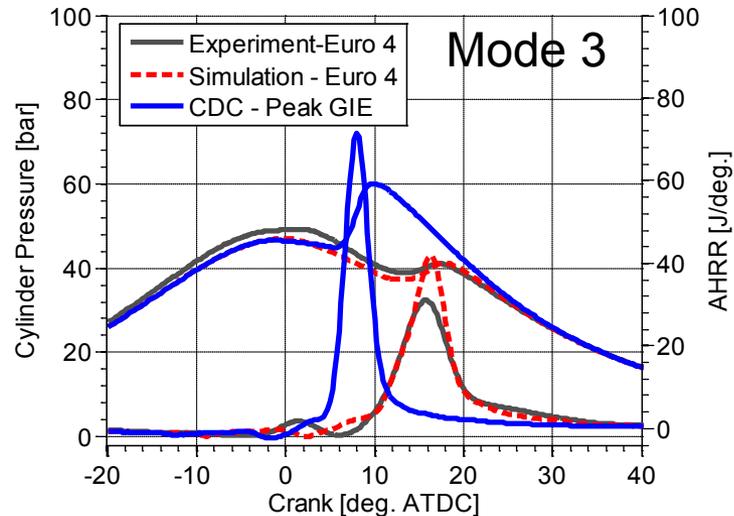

## Comparison at 5 Modes

## Cycle average emissions and performance

## Optimized CDC with SCR for Tier 2 Bin 5

CDC optimized GIE has higher allowable PPRR (advanced SOI) than Euro 4 calibration

Weighted average:

$$E_{cycle} = \frac{\sum_{imode=1}^5 E_{imode} Weight_{imode}}{\sum_{imode=1}^5 Weight_{imode}}$$

# Comparison between RCCI and CDC plus SCR

## CDC (with SCR)

- Main injection timing swept
- DEF consumption 1% per 1 g/kW-hr reduction in NOx

$$GIE_{Total} = \frac{Work_{-180 \text{ to } 180}}{(m_{DEF} + m_{Fuel}) * LHV_{Fuel}} \times 100$$

- Peak efficiency at tradeoff between fuel consumption (SOI timing) and DEF consumption (engine-out NOx)

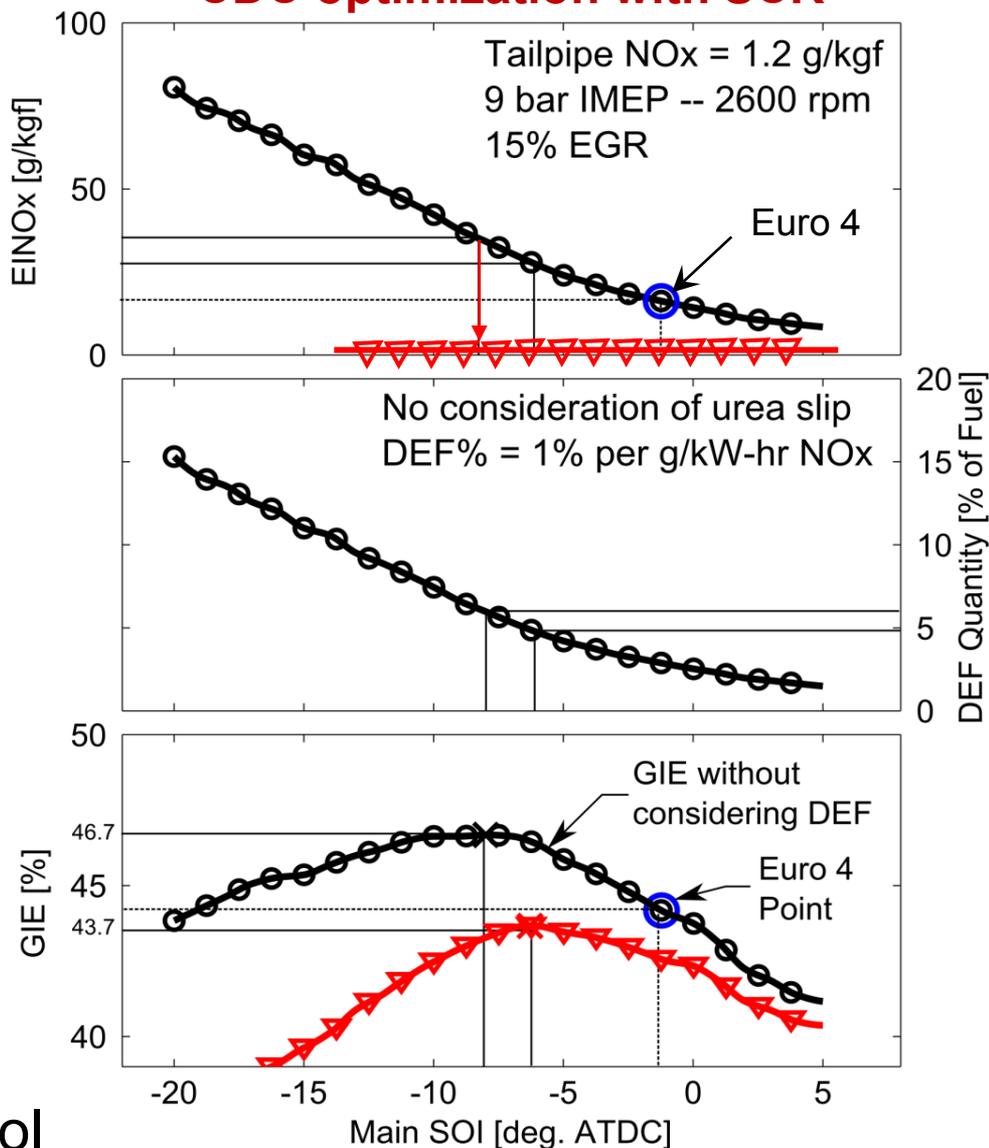

## RCCI (No SCR needed)

Gasoline amount controls CA50 to meet NOx/PRR constraints

Mode 1 uses diesel LTC (no gasoline and EGR)

Mode 5 has EGR for CA50 control

## CDC optimization with SCR

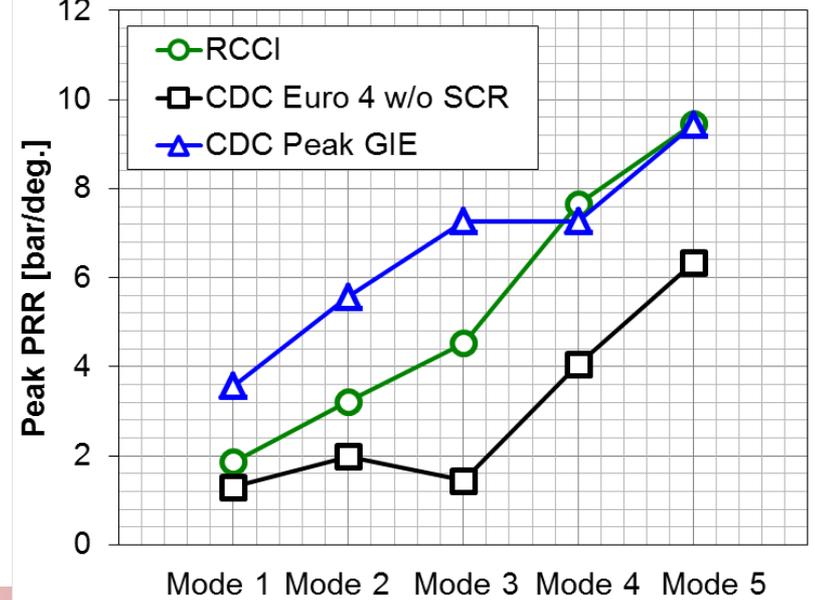

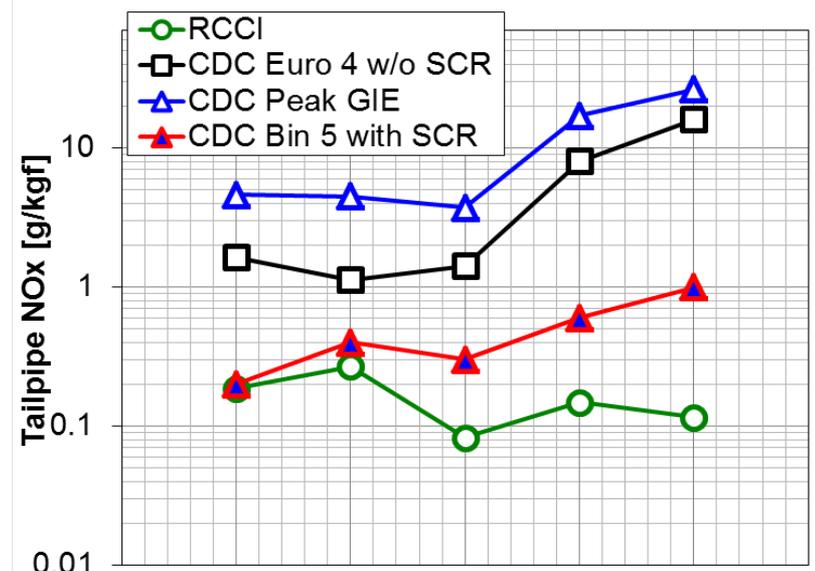

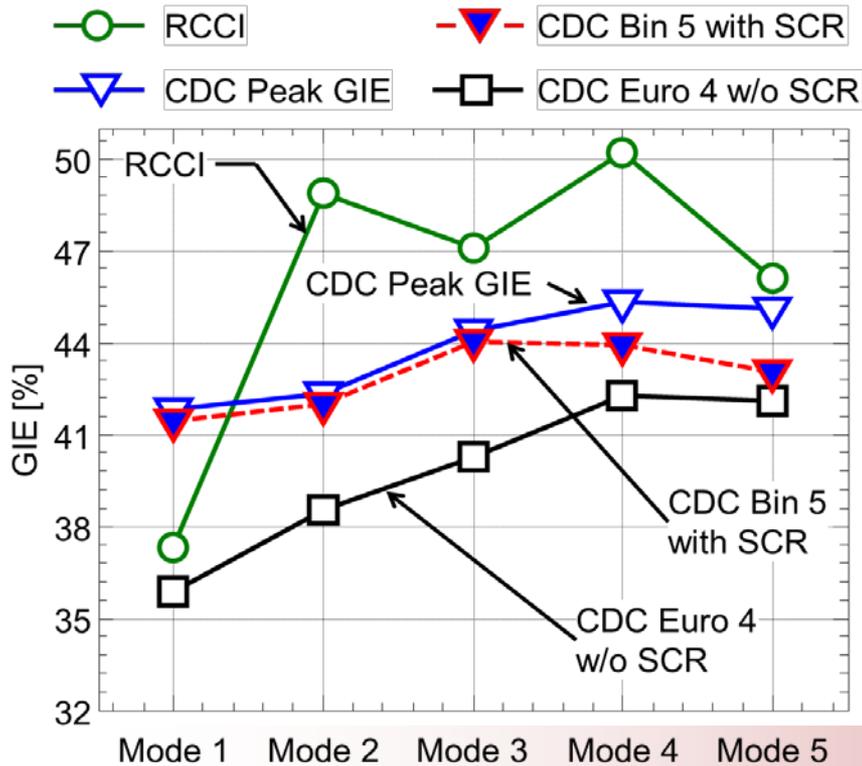

# Comparison of Efficiency, NOx and PRR

RCCI meets NOx Tier 2 Bin 5 targets without DEF

DEF NOx after-treatment has small efficiency penalty at light-load and moderate EGR (~40%)

DEF penalty larger above 5 bar IMEP

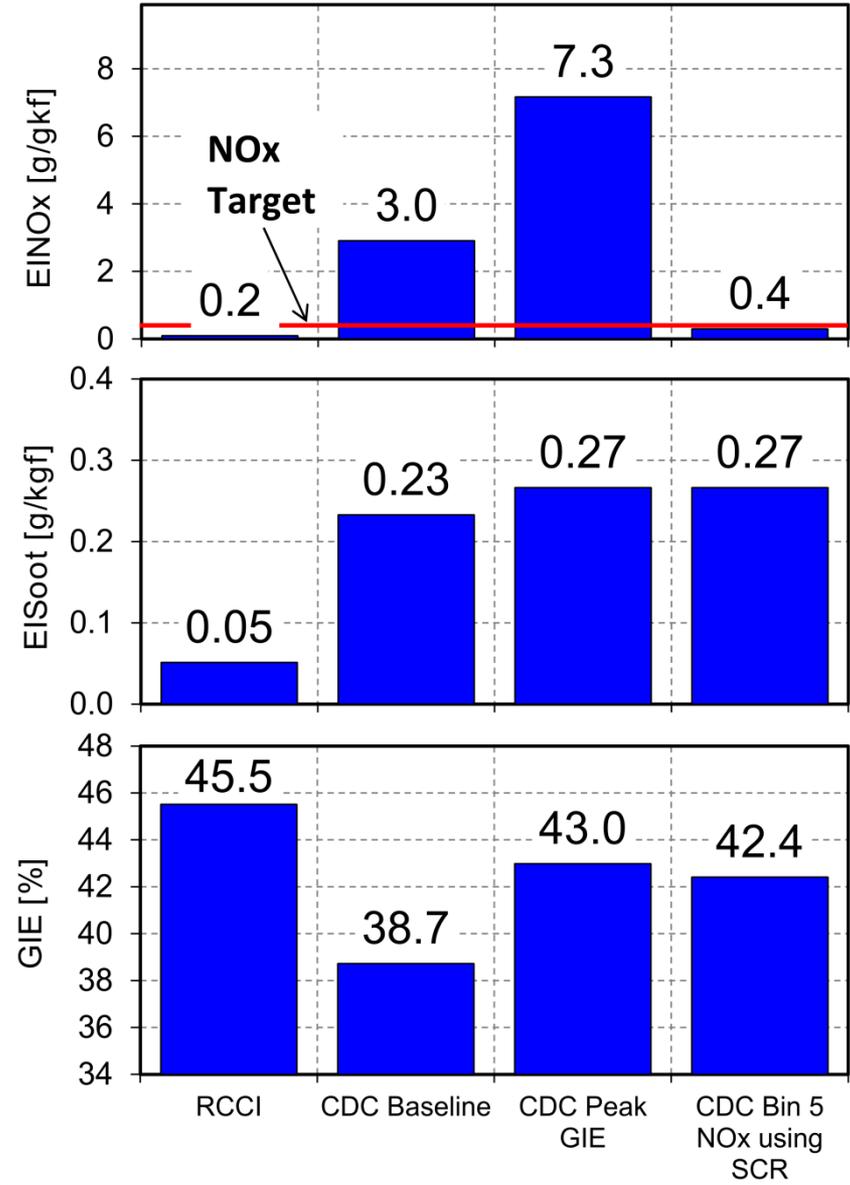

# Cycle averaged NOx, Soot and GIE

RCCI and CDC compared at baseline and Tier 2 Bin 5 NOx  
CDC NOx-GIE tradeoff controlled by main injection timing  
RCCI meets NOx targets without after-treatment  
RCCI gives ~7% improvement in fuel consumption over CDC+SCR  
RCCI soot is an order of magnitude lower than CDC+SCR  
RCCI HC is ~5 times higher than CDC+SCR  
Crevice-originated HC emissions

Splitter, SAE 2012-01-0383

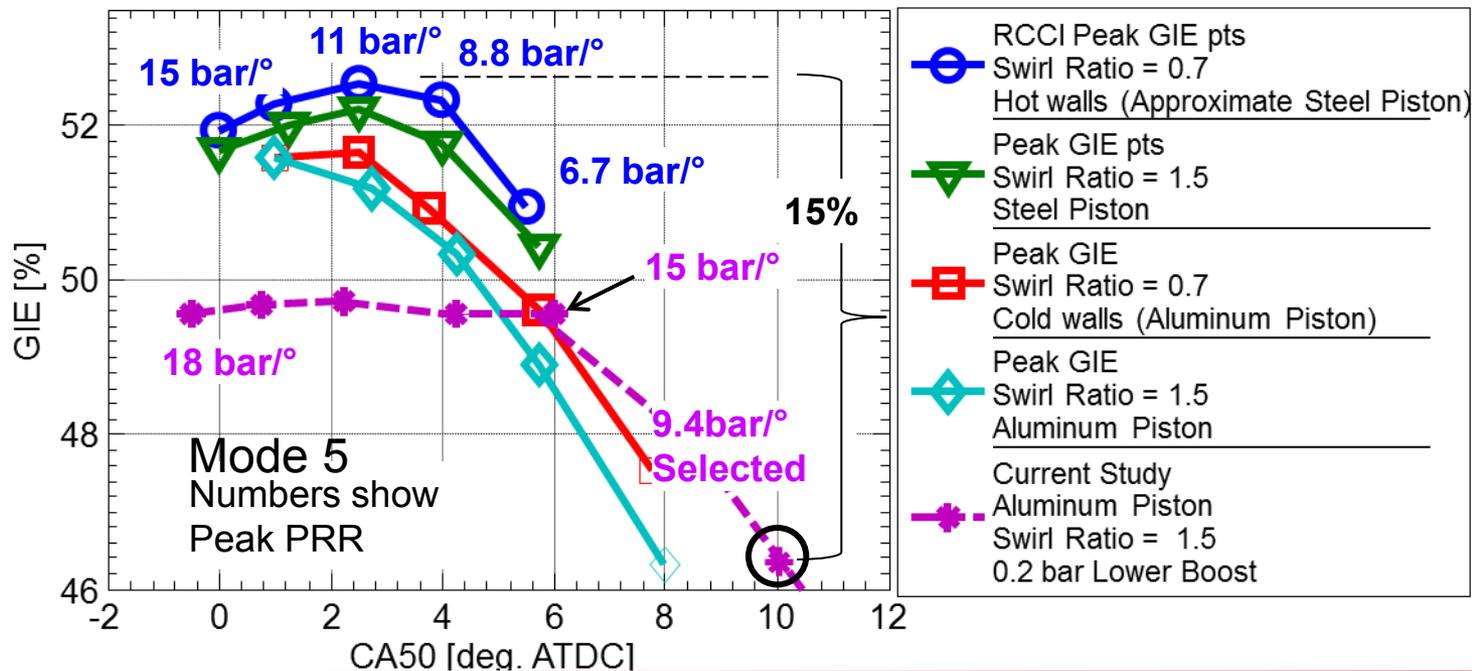

# Future research directions

LD RCCI improved by relaxing constraints (Euro 4 boost, IMT, swirl..)

Peak efficiency at Mode 5 is 46.1% → CFD predicts increase to ~53%

- 7% + 15% ~ DOE goals of 20-40% improvement
- Higher boost (1.86 bar vs. 1.6 bar) allows CA50 advance with same PRR, lowers heat transfer losses due to lower  $\Phi$  (lower temps)
- Lower swirl reduces convective heat transfer losses
- Higher wall temps improve combustion efficiency (steel piston)

Kokjohn,  
PhD thesis  
2012

# Summary and Conclusions

- RCCI yields clean, quiet, and efficient combustion over wide load/speed ranges (HD: 4 to 23 bar IMEP, 800 to 1800 rev/min).  
HD: EPA 2010 NO<sub>x</sub>/PM emissions met in-cylinder with GIE >55%  
LD: Low NO<sub>x</sub> and PM emissions with less EGR over FTP cycle.
- Suggested RCCI strategy: Optimized high EGR CDC combustion at low load (idle) and no EGR up to Mode 5 (~9 bar IMEP).
- RCCI LD modeling indicates ~7% improved fuel consumption over CDC+SCR over FTP cycle using same engine/conditions.
- RCCI meets Tier 2 bin 5 without needing NO<sub>x</sub> after-treatment or DPF, but DOC will likely be needed for UHC reduction
- Further RCCI optimization possible with:  
higher boost pressure, higher piston temps,  
reduced swirl, surface area, optimized crevice
- RCCI experiments/modeling: optimized pistons,  
alternative fuels ..... and vehicle testing!

# Comparison between RCCI and Conventional Diesel

CDC and RCCI efficiency sensitive to selected value of peak PRR

Maximum allowable PRR of CDC points set at 1.5 times higher than for RCCI
