

# X-Ray Characterization of Diesel Sprays and the Effects of Nozzle Geometry

**Christopher F. Powell, Ph.D.**

Argonne National Laboratory

Seong-Kyun Cheong, Stephen A. Ciatti, Jinyuan Liu, Jin Wang

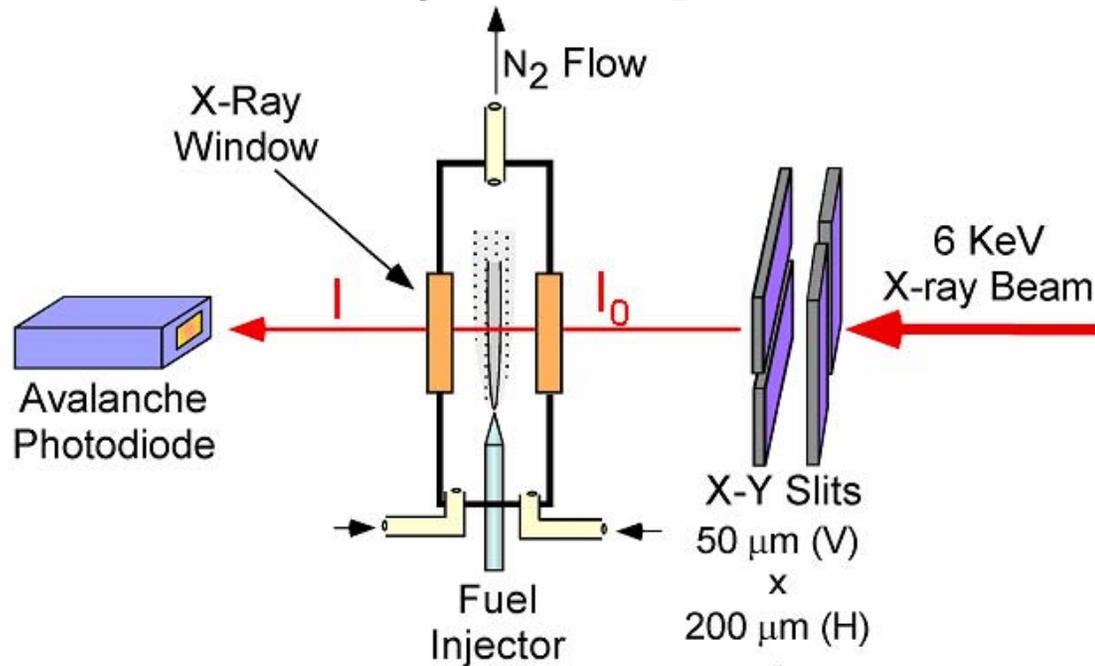

ADVANCED  
PHOTON  
SOURCE

# Project Motivation

- Goal: Understand the mechanisms of spray atomization
  - In-Nozzle effects - nozzle structure, cavitation
  - Aerodynamic effects - air entrainment, stripping, collisions
  - Relative magnitudes unknown
- Near-nozzle spray studies
  - This region determines downstream behavior
  - Aerodynamic effects have little impact
  - Lack of existing data, lack of reliable models
- X-Ray technique
  - Quantitative measurement of fuel, even near the nozzle
  - Provide data necessary for accurate models

# Schematic of X-Ray Setup

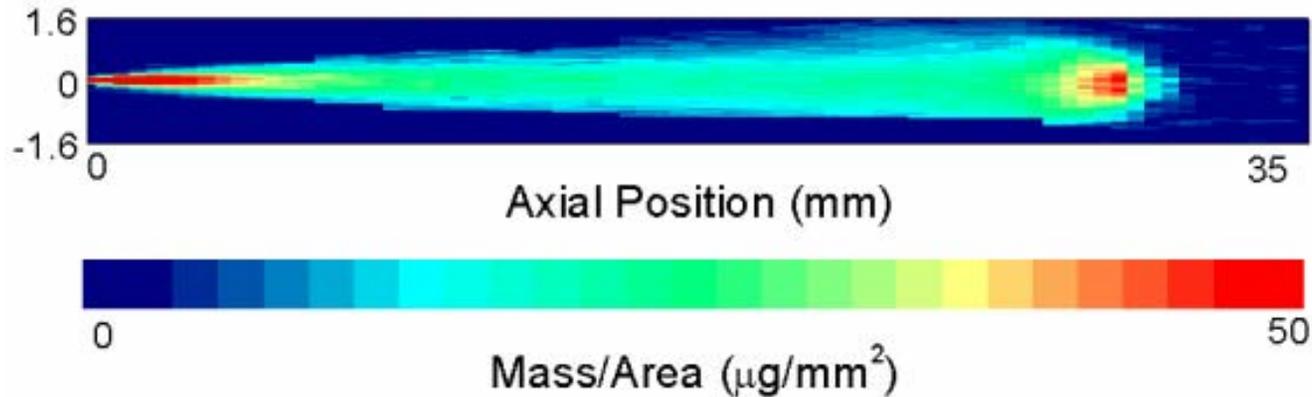

Direct relation between x-ray intensity and fuel mass

$$I/I_0 = \exp(-\mu_M M)$$

- $I_0$  Incident x-ray intensity
- $I$  Measured x-ray intensity
- $\mu_M$  Fuel absorption constant
- $M$  Mass of fuel in x-ray beam

# X-Ray Image Reconstruction

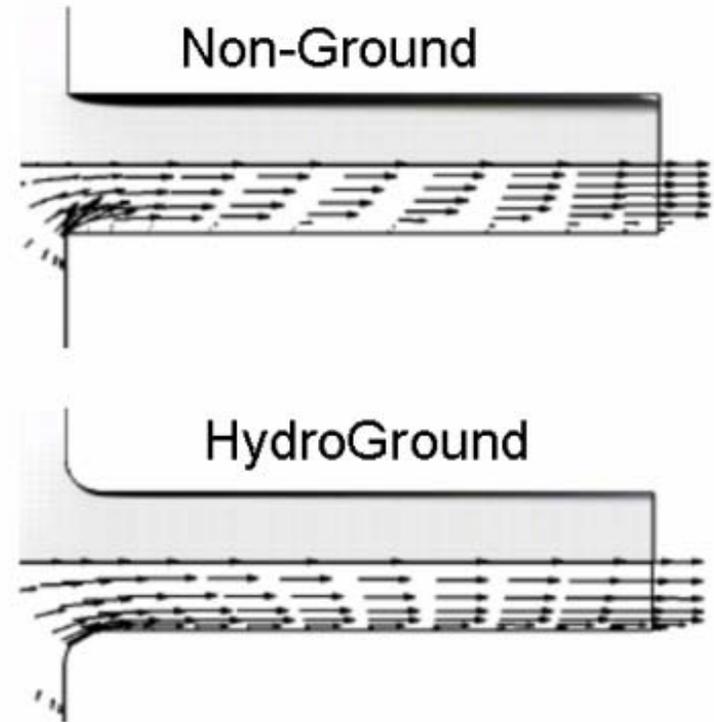

- Image represents line-of-sight mass distribution
- Image is single snapshot in time, we measured more than 250 snapshots throughout spray lifetime

Injection Pressure = 500 bar  
Ambient Pressure = 1 bar  $\text{N}_2$   
200  $\mu\text{s}$  after SOI

# Effects of Nozzle Geometry

- Different geometries predicted to produce different mass distributions.
- Models most easily validated near nozzle exit, other influences minimized
- Quantitative data not available

Schmidt et al., SAE 971597

# Measurement Conditions

## Common rail, single hole, mini-sac nozzles

- |                     |                               |
|---------------------|-------------------------------|
| ➤ Fuel pressure     | 500,1000 bar                  |
| ➤ Pulse duration    | 400 $\mu$ s                   |
| ➤ Spray chamber gas | N <sub>2</sub> @ 1 bar, 25 °C |
| ➤ Fuel              | Calibration fluid             |
| ➤ Fuel Additive     | Ce compound, 10%              |
| ➤ Data Averaging    | 50 sprays                     |

### HydroGround Nozzle

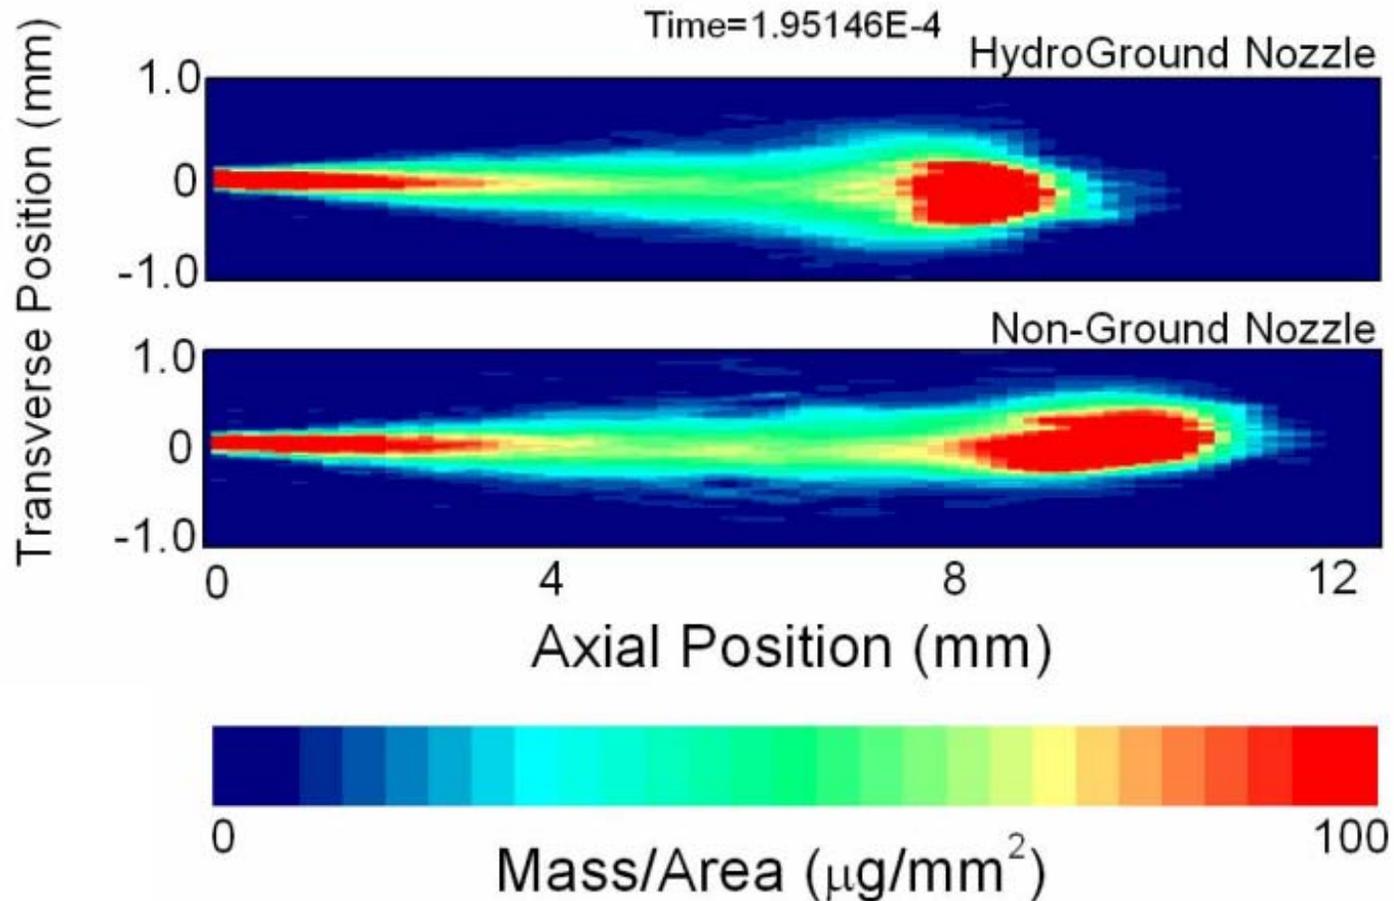

- 183 mm Orifice
- 24% Hydrogrinding
- 109 cm<sup>3</sup>/30s @ 100bar

### Non-Ground Nozzle

- 207 mm Orifice
- No Hydrogrinding
- 115 cm<sup>3</sup>/30s @ 100bar

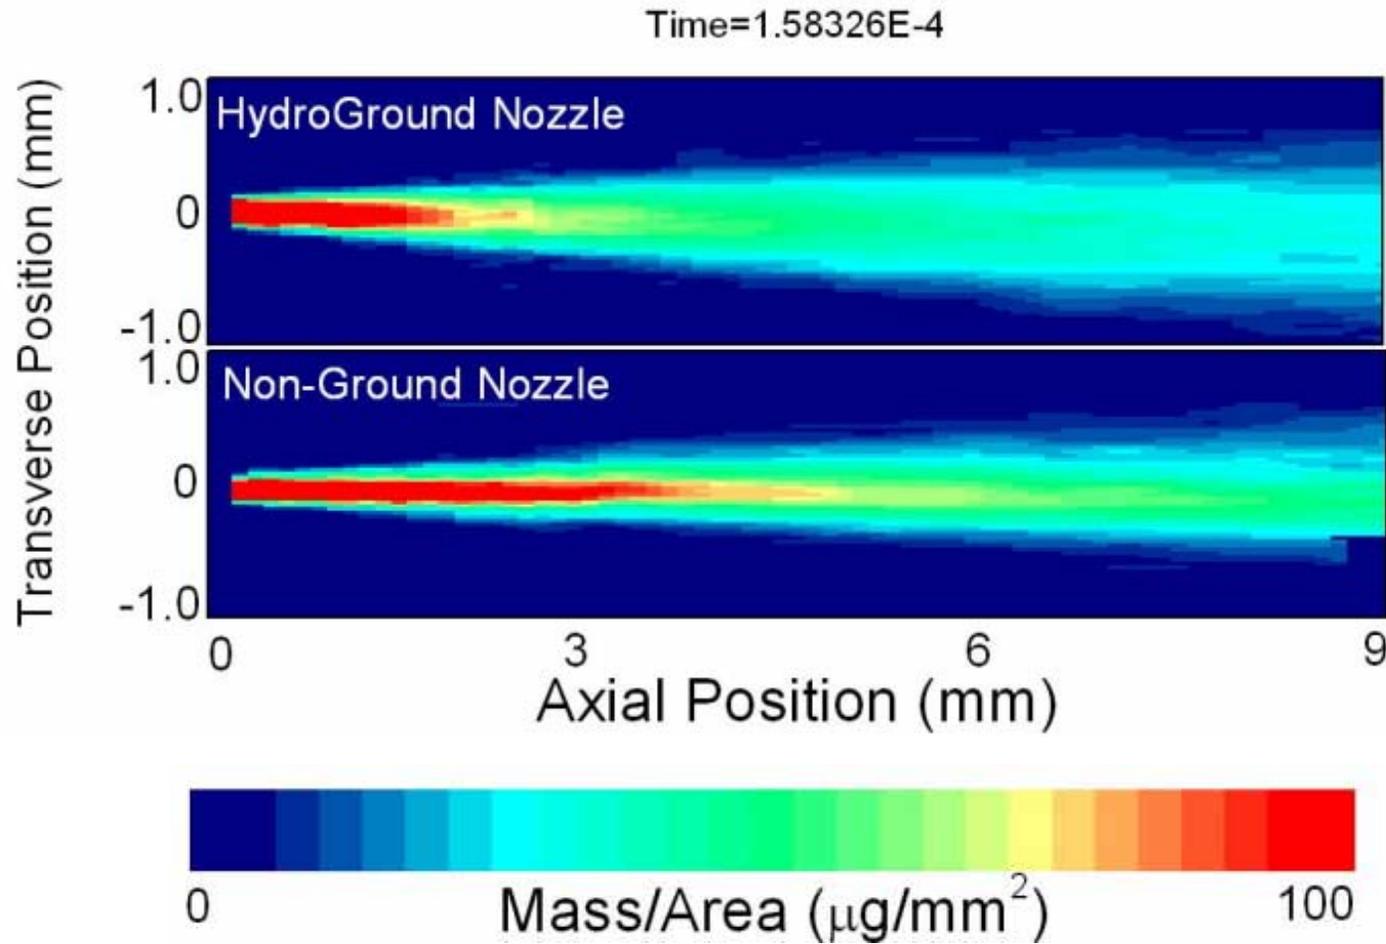

# X-Ray Images of Sprays

500 bar  
100  $\mu\text{s}$  after SOI

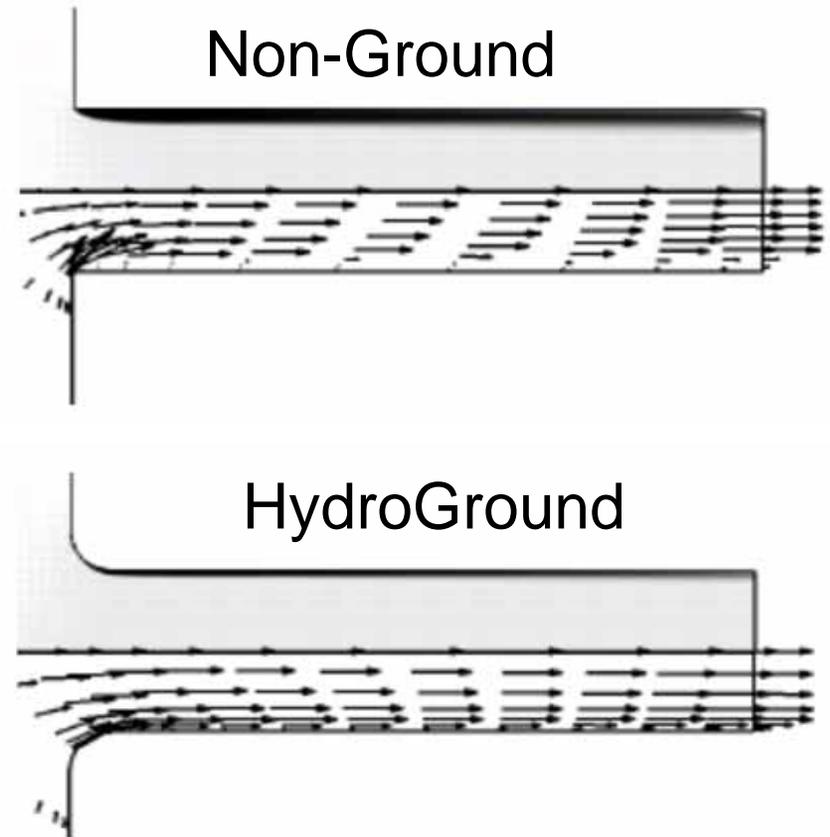

# X-Ray Images of Sprays

1000 bar  
100  $\mu$ s after SOI

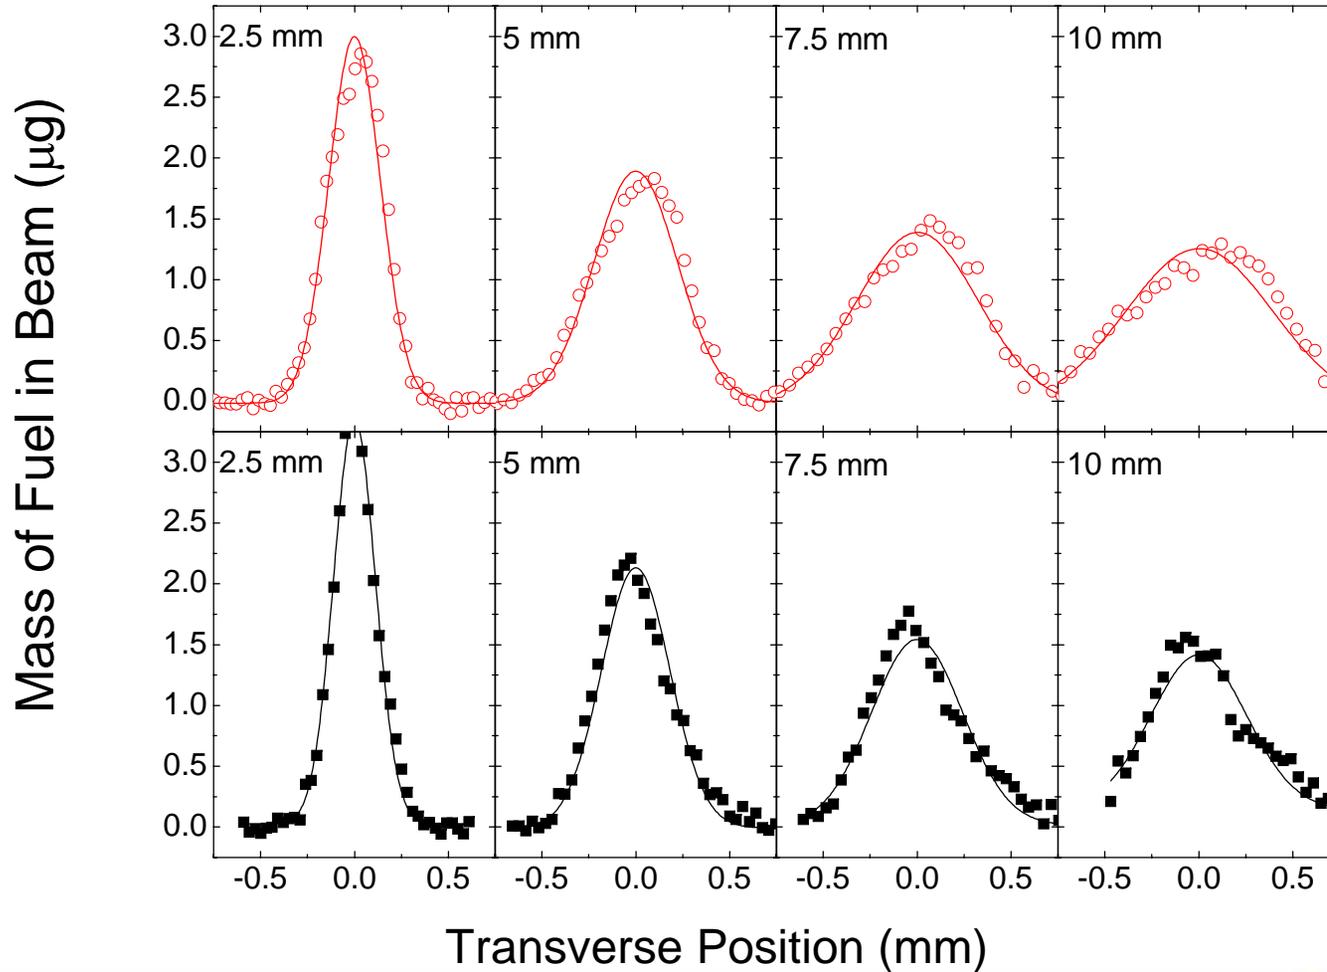

# Effects of Nozzle Geometry

- Different geometries predicted to produce different mass distributions.
- Models most easily validated near nozzle exit, other influences minimized
- Quantitative data not available

Schmidt et al., SAE 971597

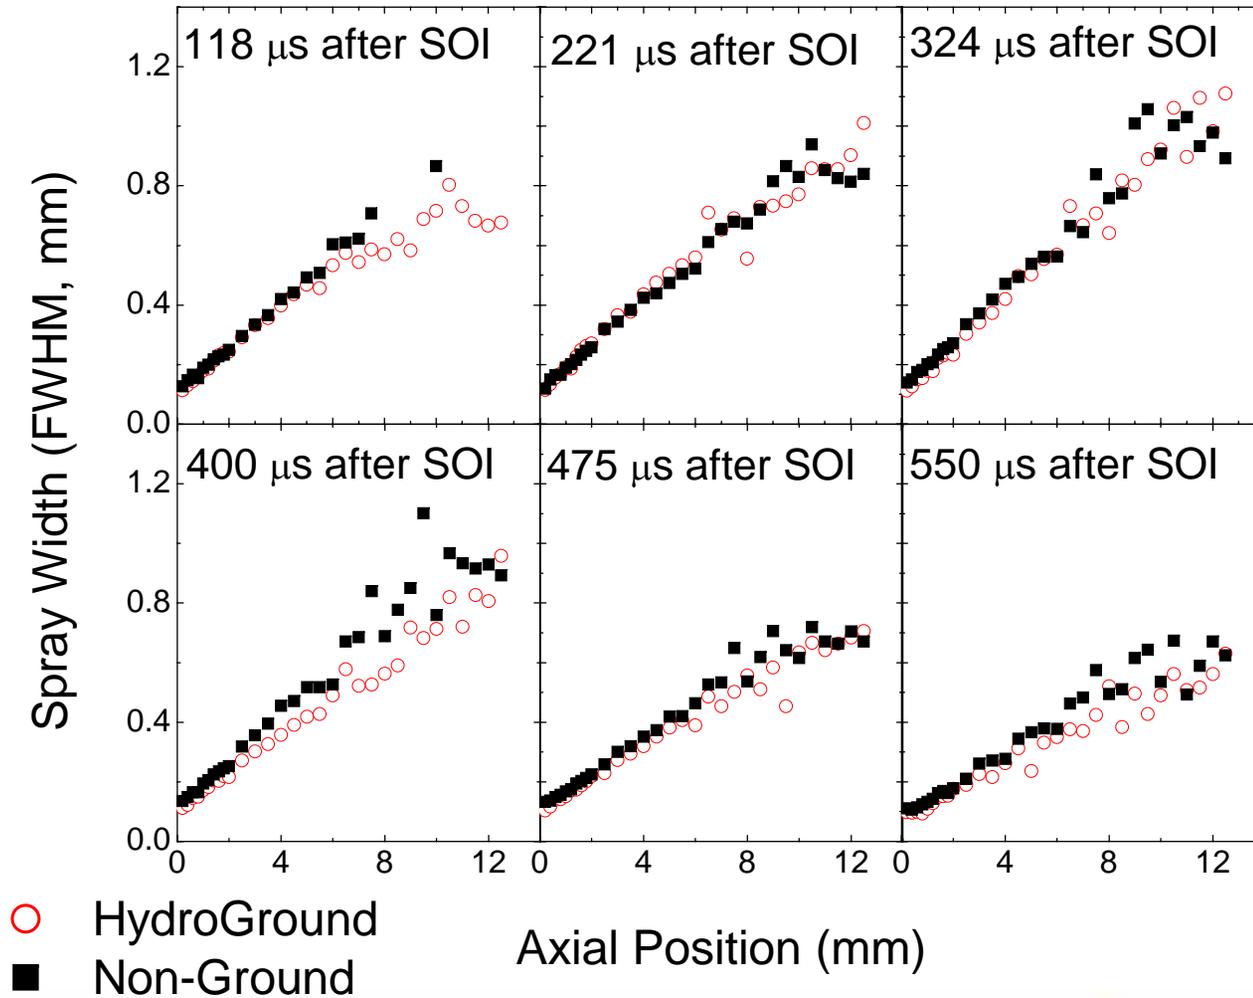

# Transverse Mass Distributions

1000 bar  
221  $\mu\text{s}$  after SOI  
HydroGround

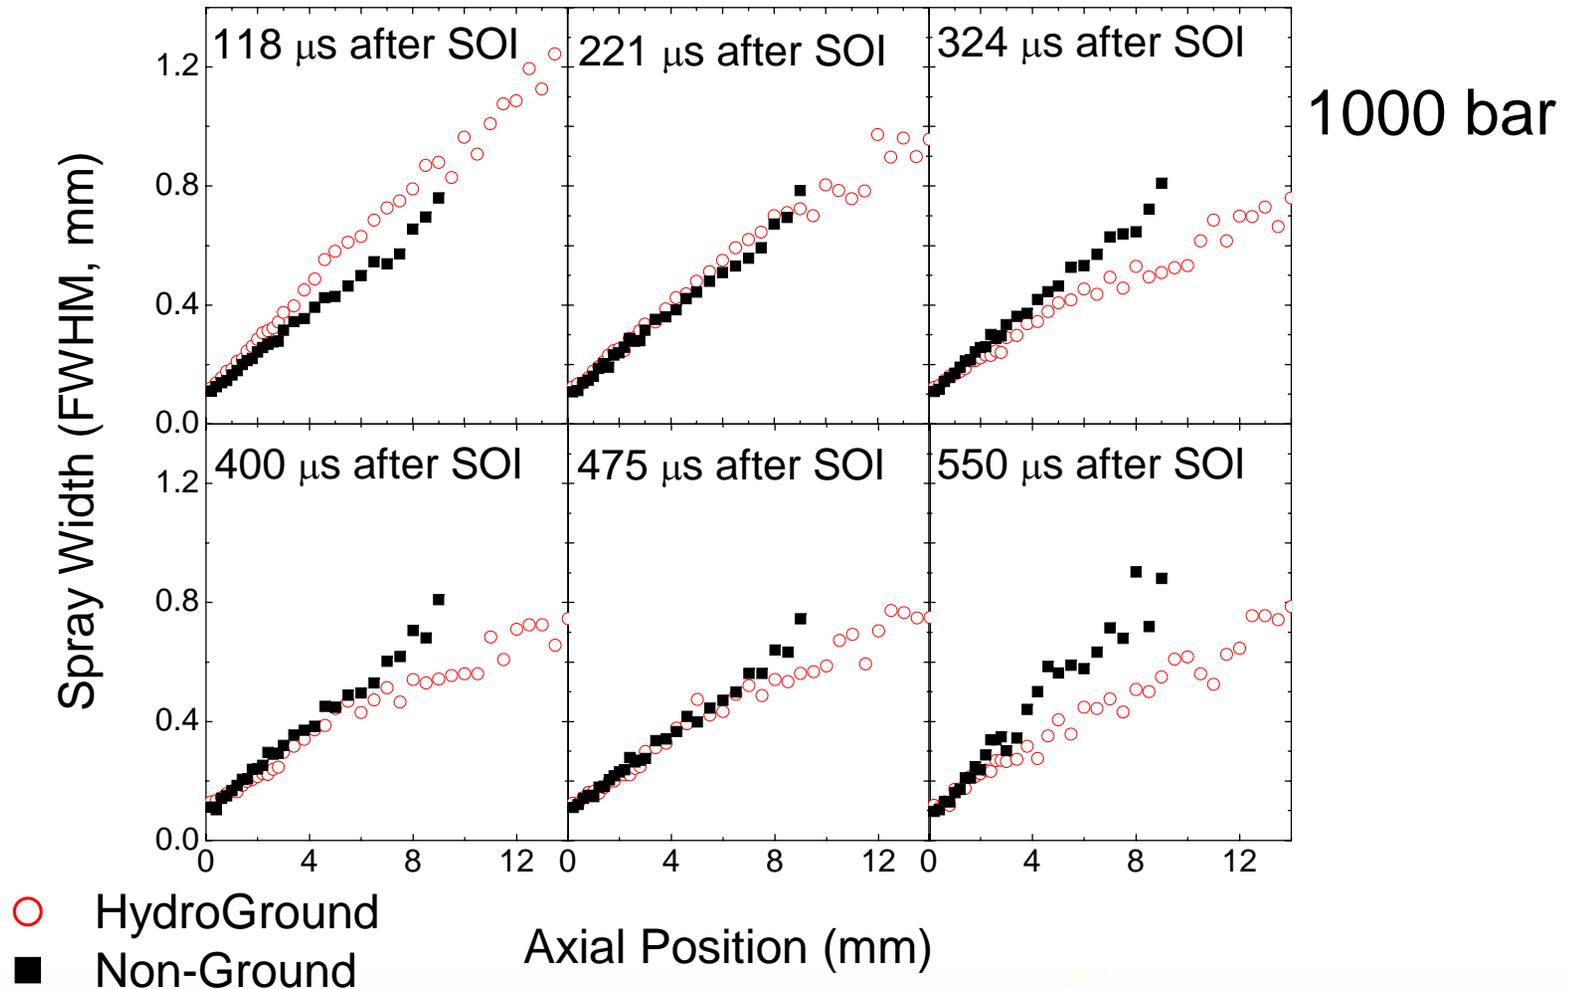

Non-Ground

# Spray Widths

500 bar

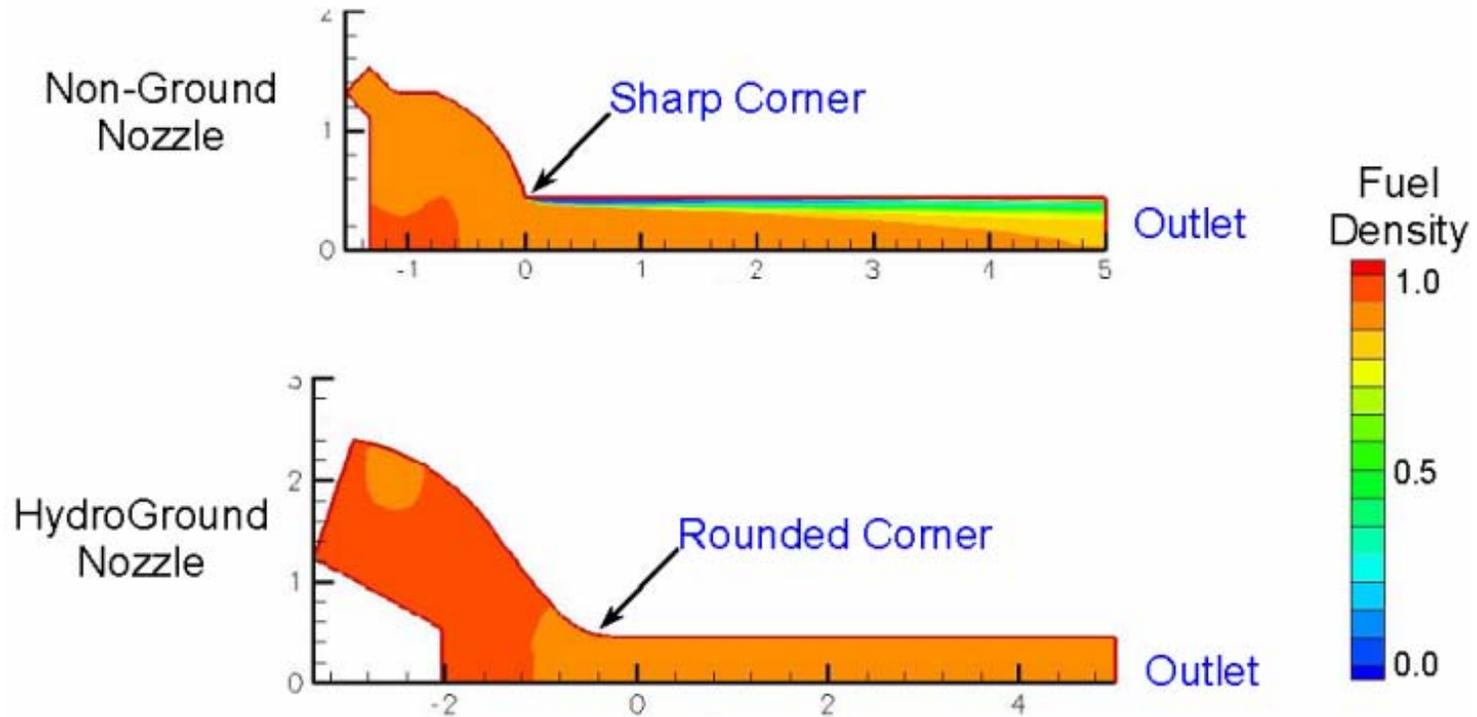

# Spray Widths

# Conclusions

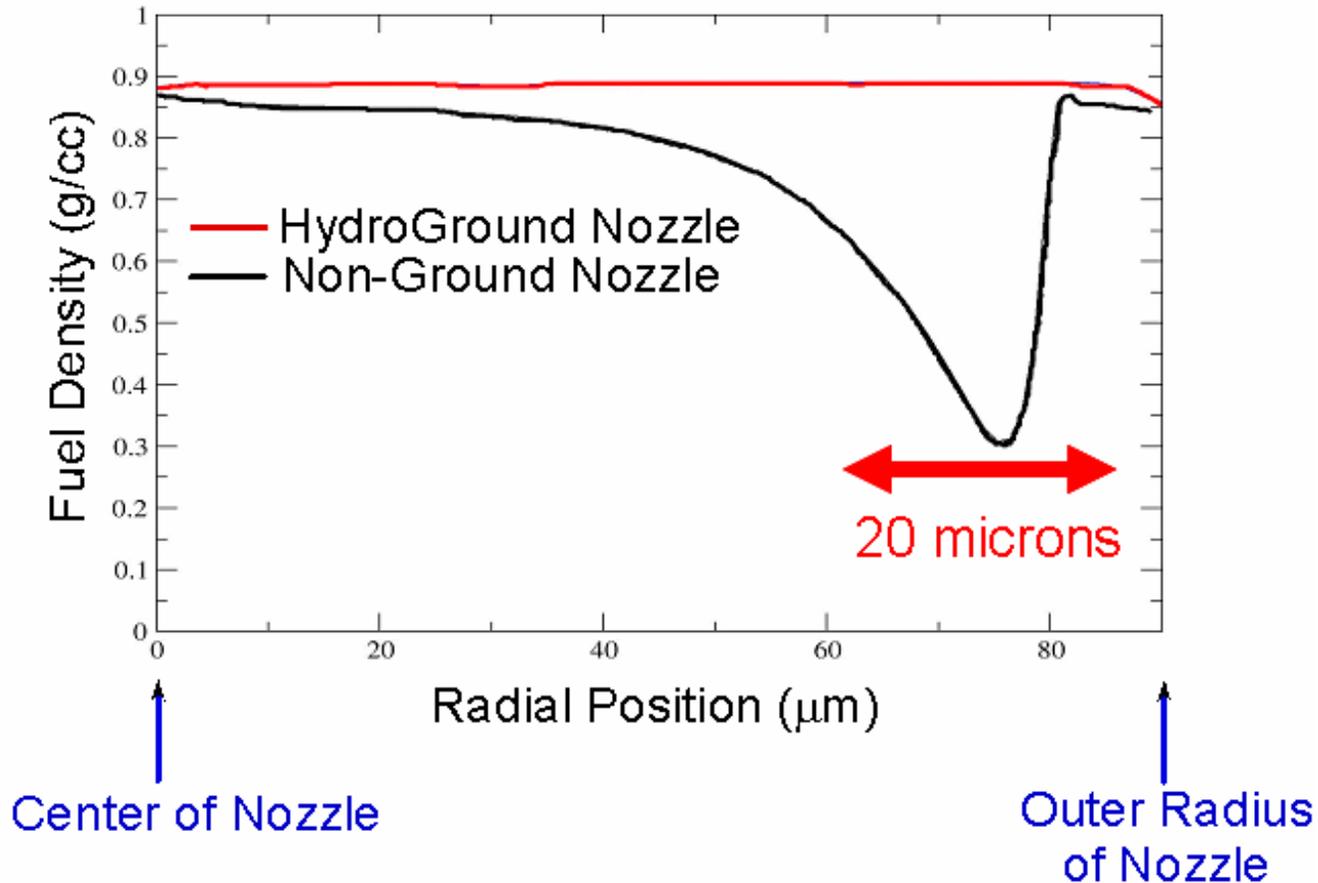

- We observe differences in sprays between nozzles
  - Differences are small, fluctuate over lifetime of spray
  - Difficult to measure, model

# Modeling Fuel Density in the Nozzle

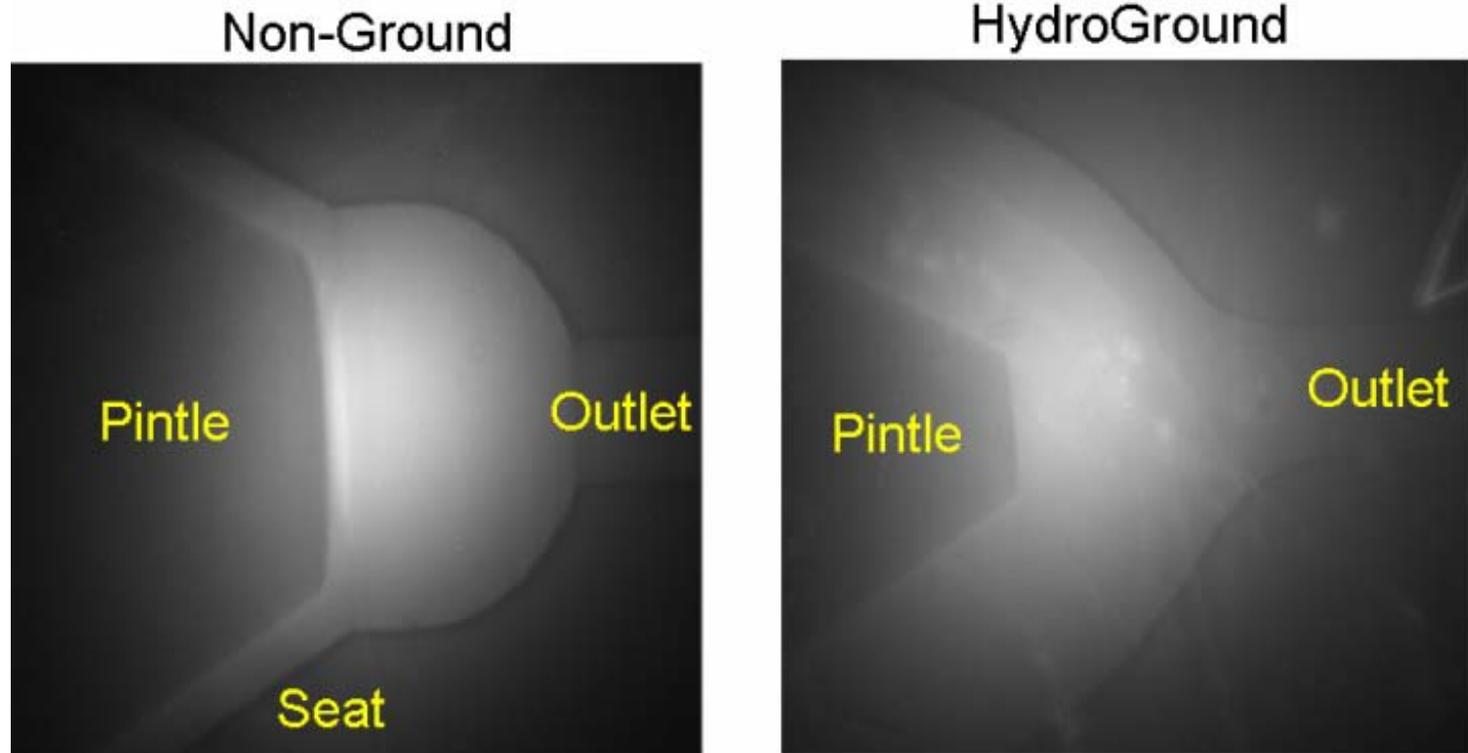

D. P. Schmidt and S. Gopalakrishnan, 17<sup>th</sup> Annual Conference on Liquid Atomization and Spray Systems, Arlington, VA, May 2004

# Predicted Fuel Density at Nozzle Exit

D. P. Schmidt and S. Gopalakrishnan, 17<sup>th</sup> Annual Conference on Liquid Atomization and Spray Systems, Arlington, VA, May 2004

# X-Ray Imaging of Nozzle Structure

Images Courtesy of Kamel Fezzaa and Wah-Keat Lee

# Future Work

- Studies of Nozzle Geometry
  - Need better position resolution
  - Small-area x-ray beam to probe near-nozzle region
  - Conical nozzles, VCO nozzles
- Measurements at Higher Ambient Pressure
  - We recently completed measurement at 20 bar
- Measurements at High Pressure, Temperature
  - Rapid Compression Machine
  - “Diesel-Like” conditions
- X-Ray Imaging of Nozzle Structure
  - Image the pintle in motion
