

## Three Rivers Builders

The Three Rivers House

2015 Race to Zero Student Design Competition

**Carnegie Mellon University**

# Contents

---

- Design Goals & Context
- Envelope Durability
- Indoor Air Quality
- Space Conditioning
- Energy Analysis
- Financial Analysis
- Plumbing, Lighting & Appliances
- Construction Documents
- Industry Partnerships

# The Three Rivers Team

---

Timothy Spencer

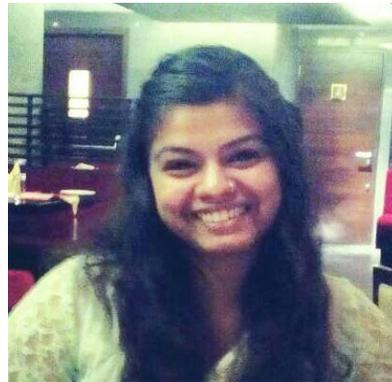

Zoe Kaufman

Rohit Motwani

Swapnil Banzal

Prachi Gupta

Steve Lee

# Design Goals

---

1. Net-Zero source energy
2. Affordable to the median consumer in Pittsburgh
3. Prioritize energy conservation over generation
4. Visitable by persons with disabilities
5. Water efficiency
6. Design a building system that can be adapted to meet net-zero anywhere in North America
7. Design a building system for which a weather-tight envelope can be erected by an experienced crew in one day
8. Design for unpredictable occupant behavior
9. Aesthetically appealing

# Project Snapshot

Location: 1424 Fallowfield Ave, Pittsburgh, PA

IECC Climate Zone: 5A

Built up area: 1640 ft<sup>2</sup>

3 bed, 3 bath, 2 stories

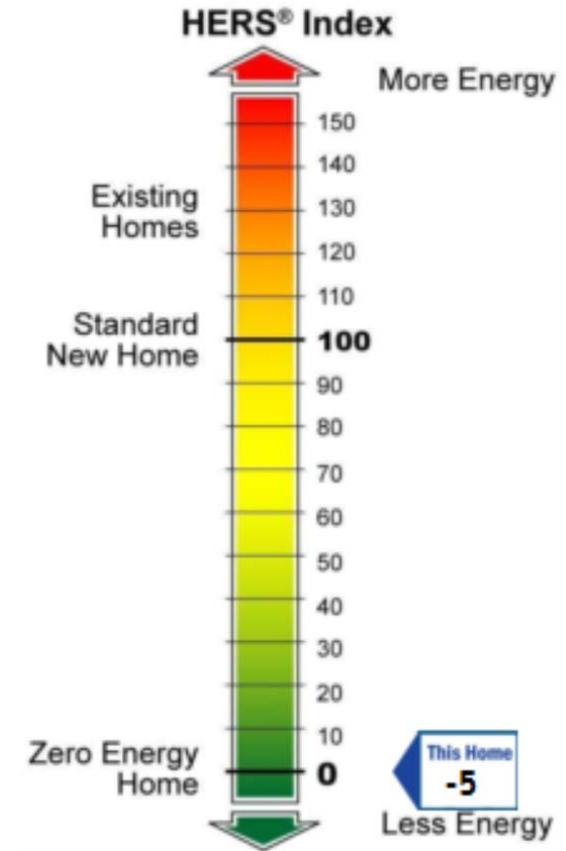

HERS Score: **35** without PV; **-5** with 7kW PV

Monthly energy bills: **\$53** without PV; **-\$1.50** with PV

Ground-Source Heat Pump: COP=5.1, EER=15.7

ERV effectiveness: 83% sensible, 77% total recovery

Instantaneous gas water heater: EF=0.95

HERS score with rooftop PV

# Context & Site – Location

1424 Fallowfield Ave - a vacant lot on Mt. Lebanon,  
Pittsburgh, PA

- Southern exposure
- 60' x 115' lot
- Former site of foreclosed home

## Neighborhood & Community

- Transportation
  - 0.2 mi to light rail station
  - 23 minutes to downtown Pittsburgh via light rail
  - <0.5 mi walk to Market District, elementary and high schools, and parks
- Visual integration
  - Urban infill
  - Modern, high-performance take on surrounding Pittsburgh architecture

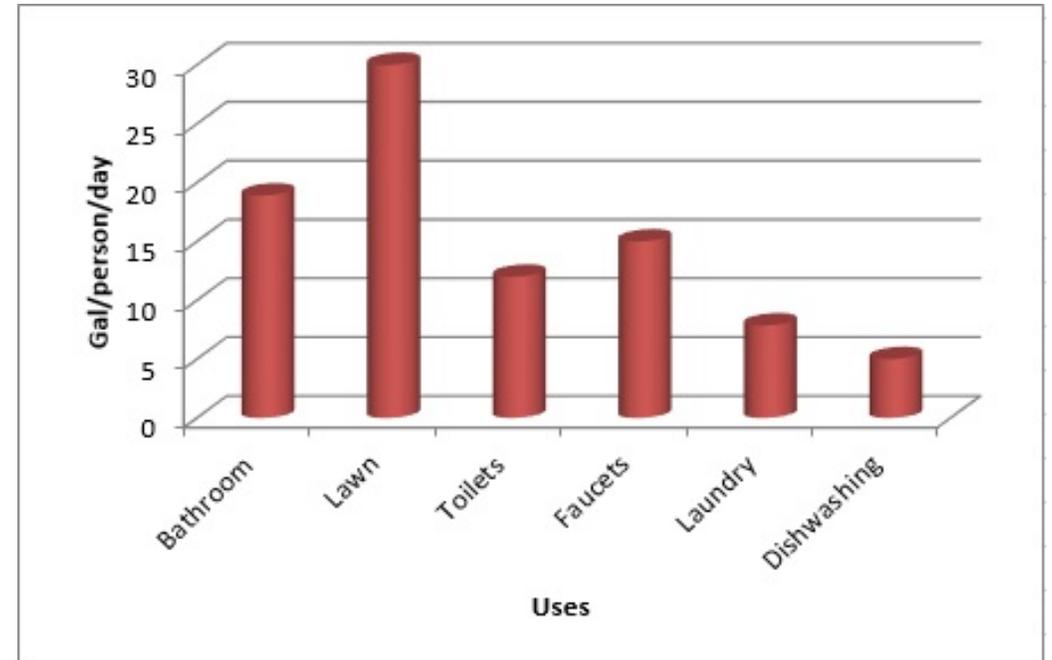

(Image source: Google Maps)

# Context & Site – Water

- Pittsburgh is a wet climate, but its combined storm/sewer system is undersized, causing pollution and wasting water and energy
- Impervious surfaces cause overflow of sewer system
- >30% of household water use in Pittsburgh goes to watering lawns
- Roof has catchment area of 1000 ft<sup>2</sup>
  - Use rainwater capture for landscaping
- 825-gallon storage tank placed at 2nd-story height to use gravity for irrigation

# Context & Site – Climate

## Heating-dominated

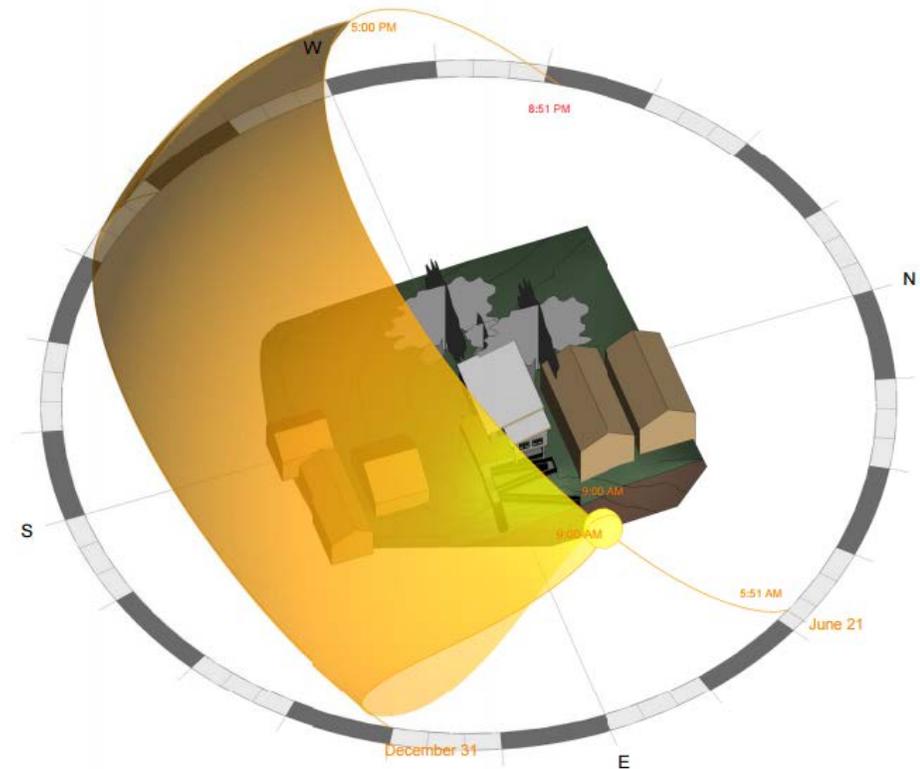

- HDD65: 5053
- CDD65: 654
- Capture internal gains
- Design for strategic solar gain

Overcast: only 2021 hours of sun and 59 clear days per year

- Design for efficiency first, then solar energy

## Humid summer, dry winter

- Hygrothermal design and analysis

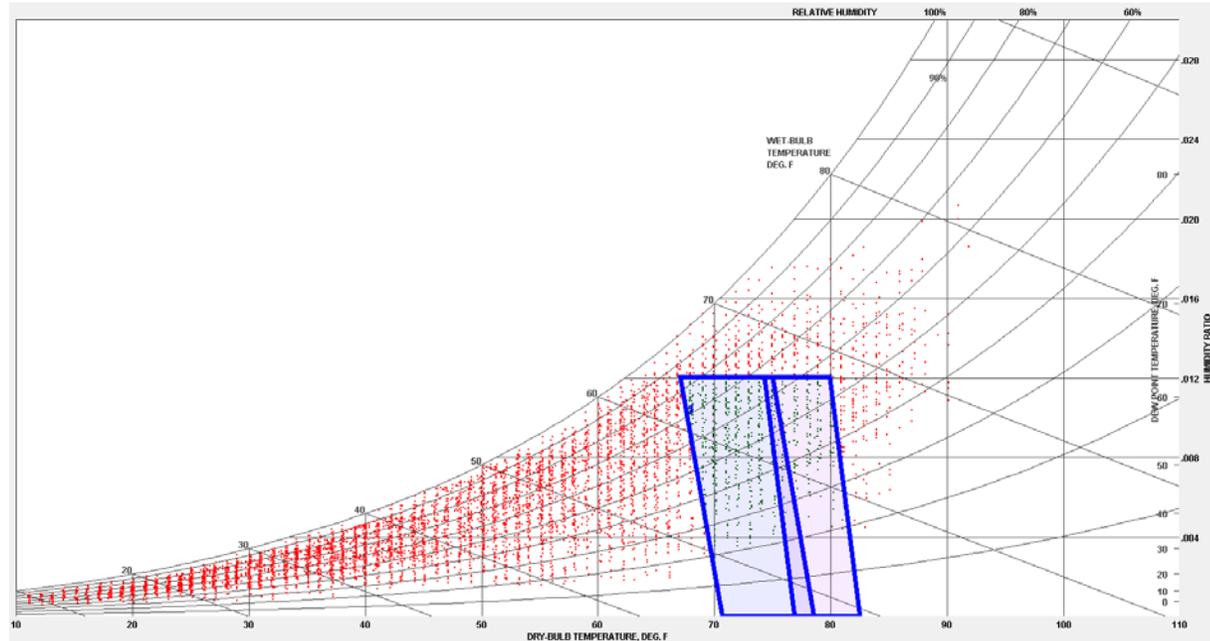

2 SOLAR STUDY

# Context & Site – Climate

- Build tight, insulate right
- Mechanical system sizing and efficiency
- Passive design for shading and solar gain

(Climate Consultant 6.0, 2015)

| Strategy                       | Comfort Contribution<br>(Percent of Year) |
|--------------------------------|---|
| Normal Outside Conditions      | 10.1%                                     |
| Insulation                     | 23.9%                                     |
| Sun Shading                    | 7.3%                                      |
| Passive Solar Gains (Low Mass) | 7.9%                                      |
| Conventional Heating           | 51.5%                                     |
| Dehumidification               | 6.9%                                      |
| Conventional Cooling           | 3.4%                                      |

# Layout

## Small footprint

- Use minimal energy
- Minimize construction costs, material use, and space conditioning
- Maintain a manageable building size and shape

## Open layout

- Minimize circulation space
- Daylighting
- Multi-purpose spaces
- Effective air flow

## Integrated spatial and MEP design

- Minimize plumbing pipe length
- Minimize ductwork

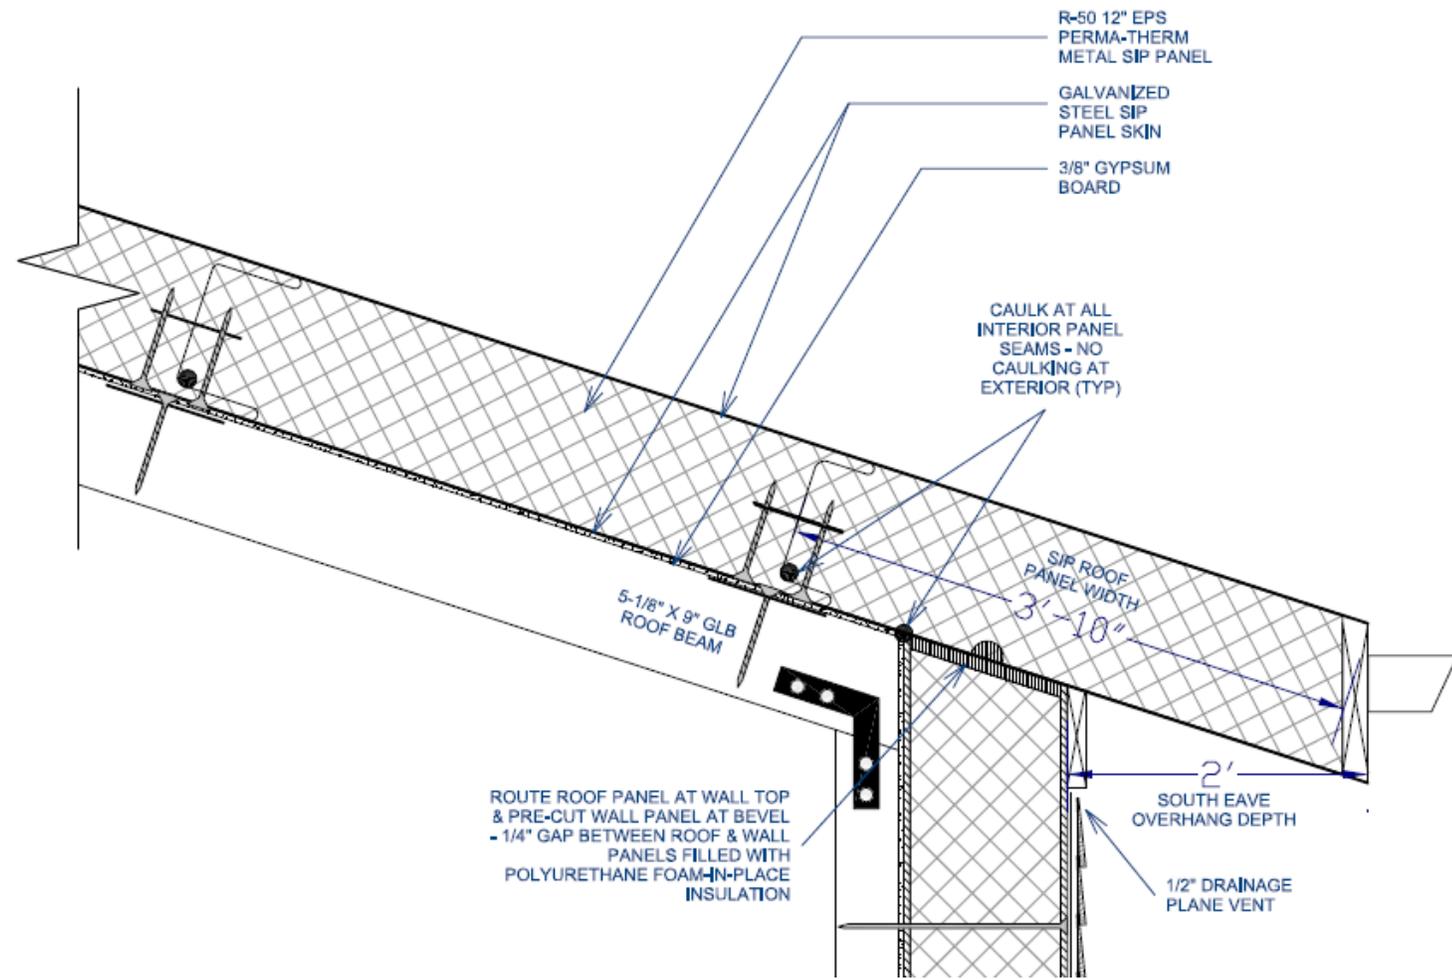

First floor

Second floor

# Envelope Durability

# A Versatile Building System

---

## Envelope Goals

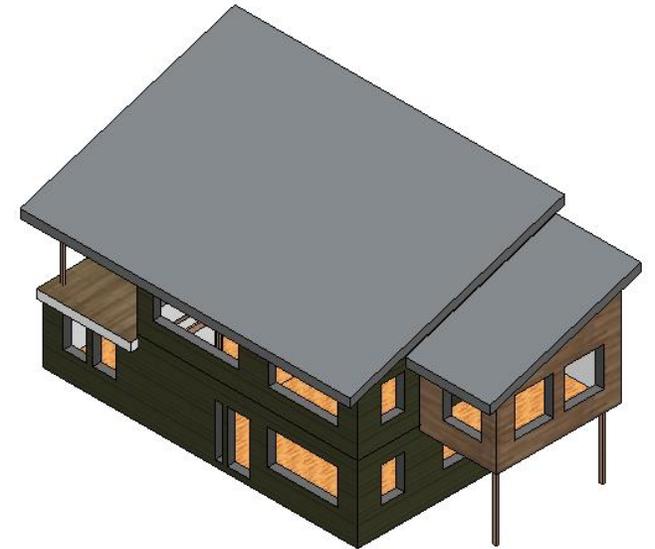

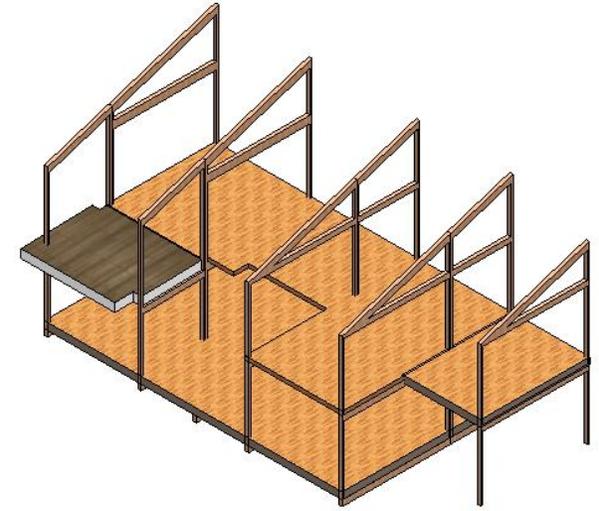

- Super-insulated and air sealed to extremely high levels
- Very low thermal bridging
- Easy to erect
- Durable and long lasting
- Termite resistant
- Moisture and mold resistant
- Can work in a variety of climate zones with minor modifications

# A Versatile Structural System

---

- Prefabricated materials
- Speed of construction
- Adaptable to any US climate zone
- Minimal thermal bridging

# Design for Prefabrication

- Reduced labor cost
- Quality Construction and Air Sealing
- Transportability - All elements are designed to fit on the back of a flatbed truck (<14' wide in PA)
- Cradle to cradle - EPS foam insulation is recyclable

GLB internal frame

Murus SIP Walls

PermaTherm Steel SIP Floor & Roof

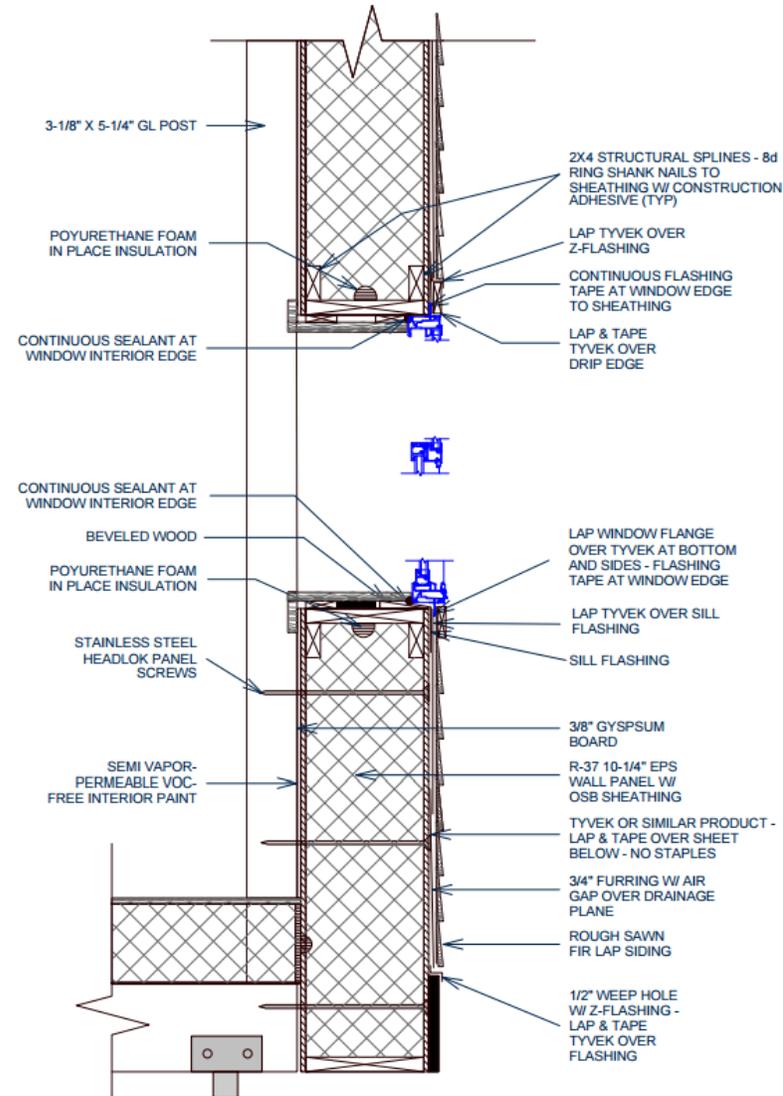

Cross Laminated Timber Internal Floor

# SIP Walls

- Vented drainage plane beneath cladding
- Tyvek house-wrap water barrier
- Caulking and sealing applied to the inside of panel edges
- Walls attached to internal GLB frame
- Housewrap overlaps top of window

Typical Wall Construction

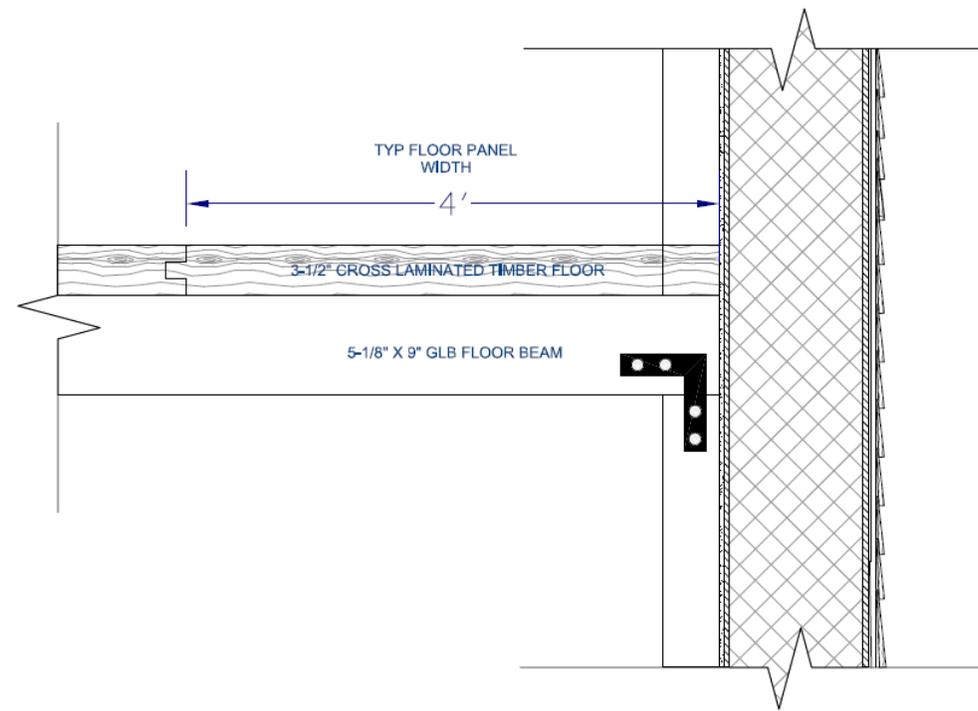

(Buildingscience.com, 2015)

# CLT Panel Floors

- Eliminate Rim-joist Thermal Bridging
- Manufactured from wood harvested with Sustainable Forestry Practices
- Moisture management
- Aesthetics

## TYPICAL CLT FLOOR CONSTRUCTION

SCALE: NTS

# Aesthetics of Sustainability

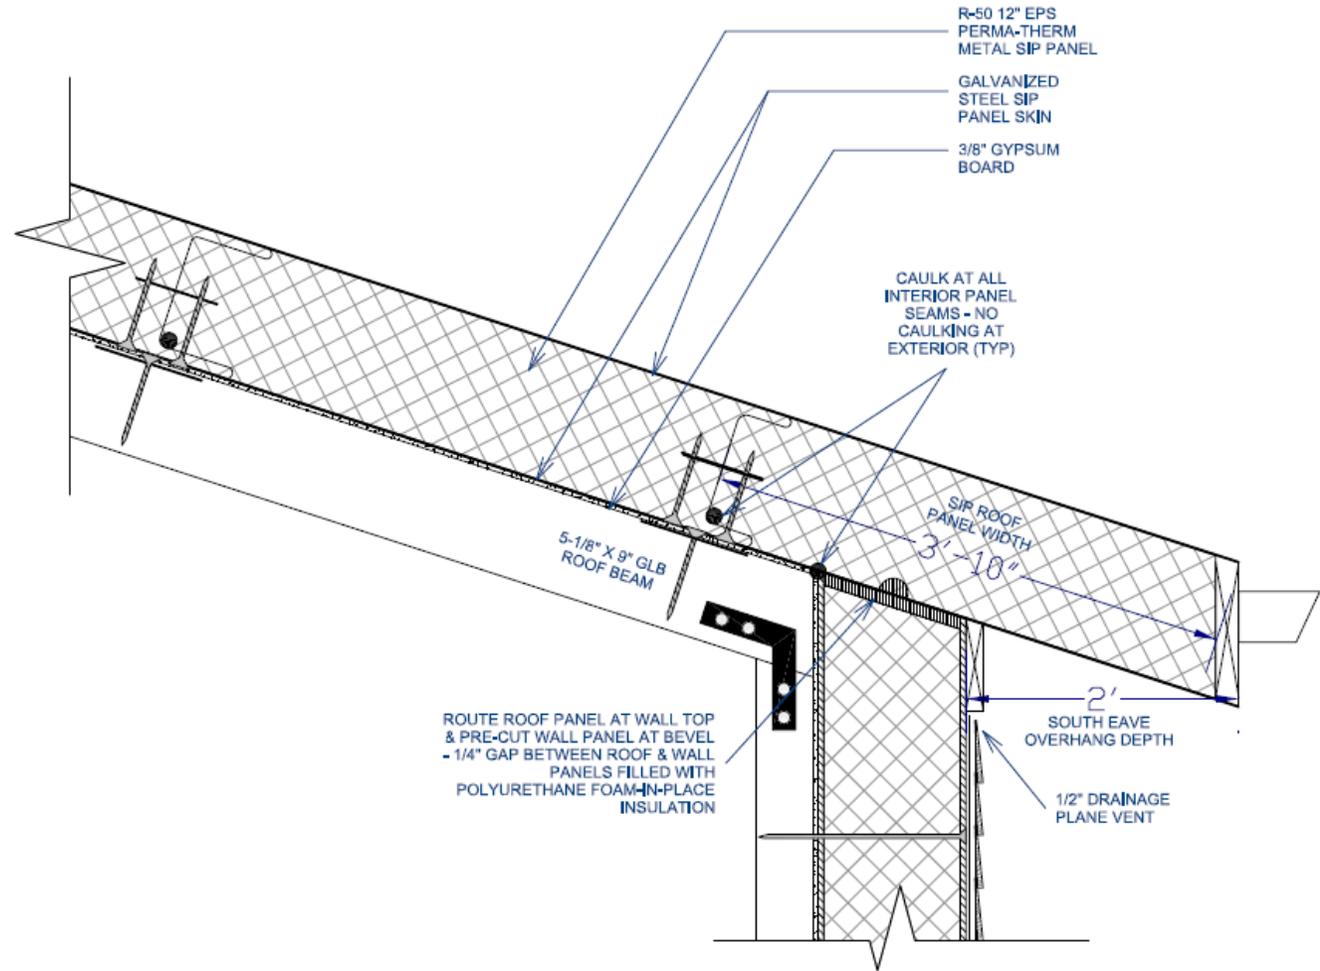

---

- CLT flooring creates an attractive, biophilic interior space
- Forest Stewardship Council wood is specified on construction documentation

# Steel SIP Roof Panels

- Designed for refrigerated warehouses
- Internal spline eliminates thermal bridging from fasteners
- Galvanized - Durable to moisture
- Time saved - Needs no additional roofing surface

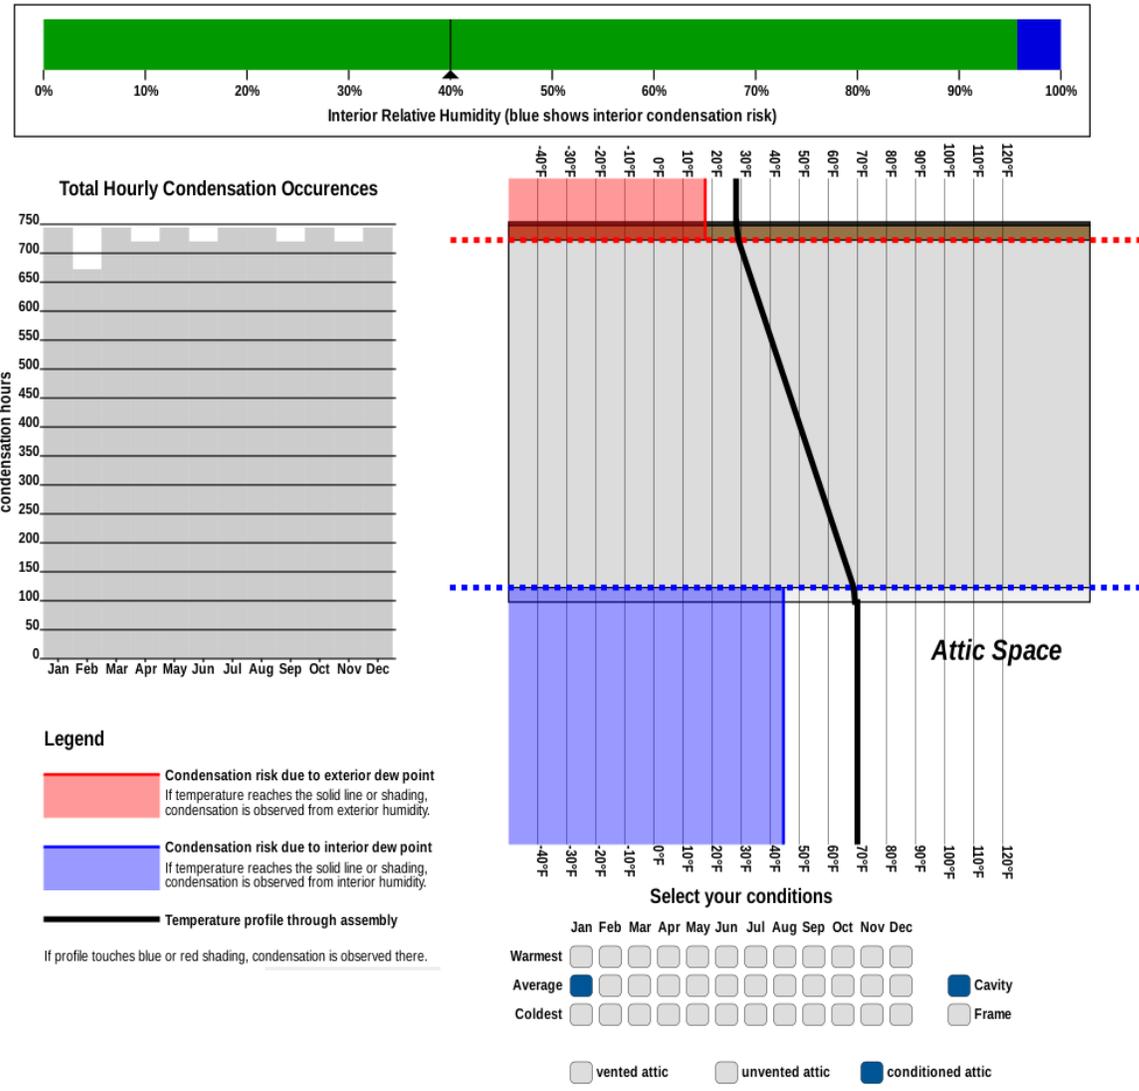

## TYPICAL ROOF CONSTRUCTION

SCALE: NTS

# Hygrothermal Analysis

- Modelled by industry partner and building scientist Michael Sypolt on his custom designed software
- Software models condensation based on construction and TMY weather data
- Condensation occurs where the black line crosses into the red or blue fields
- Roof assembly shows no risk of condensation.

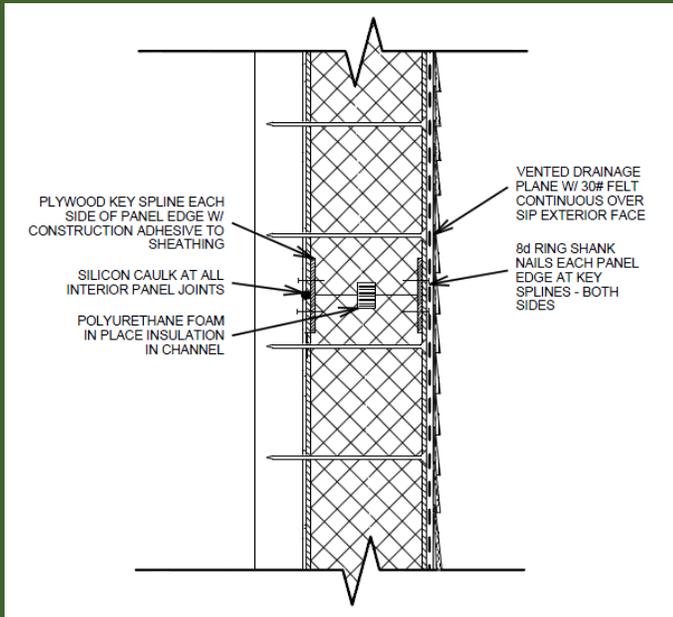

(Michael Sypolt, 2015)

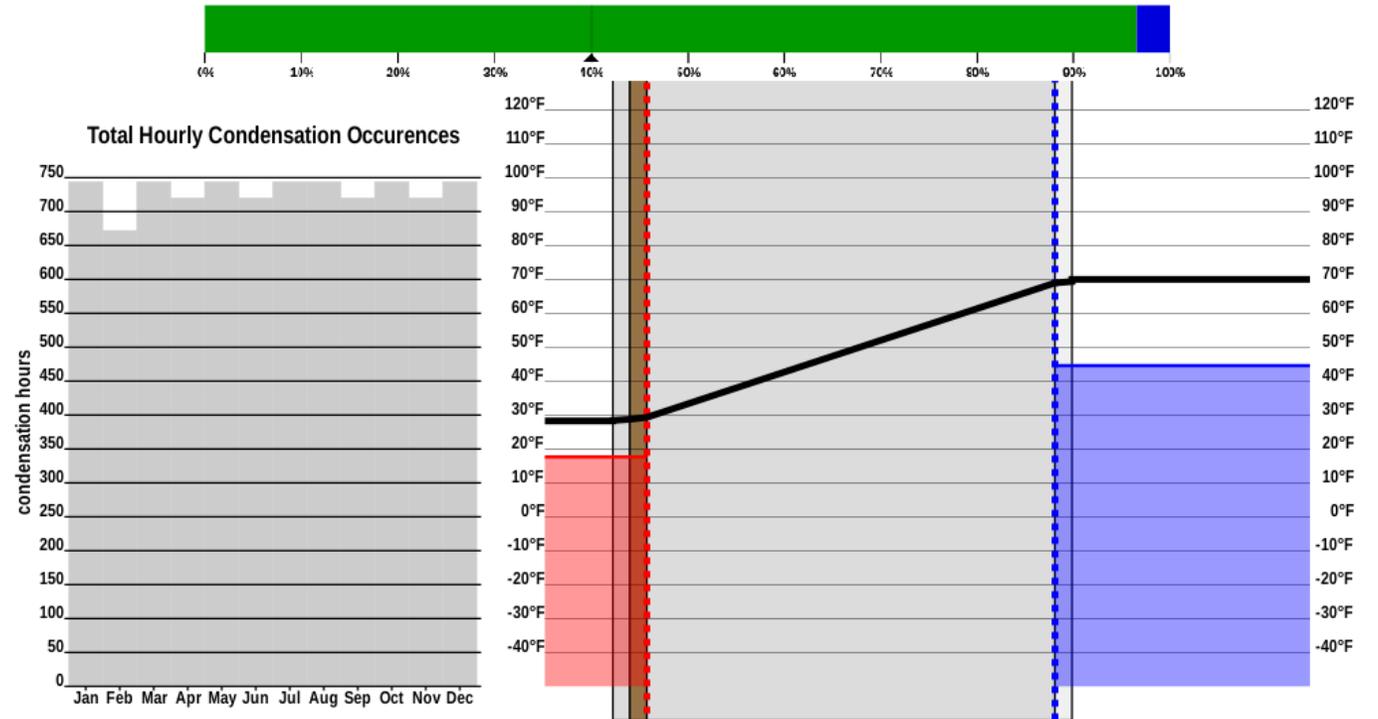

# Hygrothermal Analysis

- Wall assembly shows no risk of condensation

Typical SIP Wall Panel Joint

### Legend

- Condensation risk due to exterior dew point  
If temperature reaches the solid line or shading, condensation is observed from exterior humidity.
- Condensation risk due to interior dew point  
If temperature reaches the solid line or shading, condensation is observed from interior humidity.
- Temperature profile through assembly  
If profile touches blue or red shading, condensation is observed there.

### Select your conditions

Cavity  
 Frame

(Michael Sypolt, 2015)

# Indoor Air Quality

(Image Credit: Jennifer Horton, 2015)

# Air Quality in Pittsburgh

If you live in Allegheny County, the air you breathe may put your health at risk.

Ozone

Particle Pollution 24-hour

Particle Pollution Annual

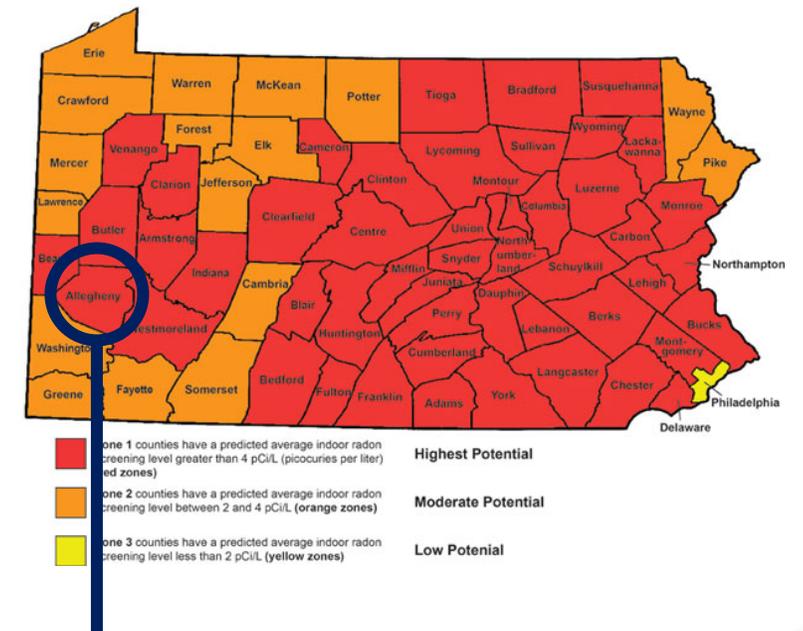

Fail

You can make a difference in the air that you breathe.

(American Lung Association, 2015)

- Allegheny County ranks 6th in particle pollution in US
- Top 2% for cancer risk due to air pollution
- High risk of Radon: >4 pCi/L

## PA Radon Map (EPA, 2015)

Pittsburgh, PA

# Indoor Air Quality Strategies

---

Indoor air quality must be better than outdoor air quality

- Small particulate filtration
- Tight envelope
- Balanced Air

Moisture management for humid summers and dry winters

- SIPS
- CLT floor
- Dehumidifying cooling system

# Air Quality through Ventilation

---

## Balanced ventilation for less infiltration

- RenewAire GR90 ERV with MERV-13 filter
  - 40-110 cfm (45 cfm required according to ASHRAE Standard 62.2 calculation method)
  - Recovers some humidity in winter
  - CO2 vacancy sensor
- Bathroom - Panasonic WhiserGreen exhaust fan in ceiling
  - Multi-speed with time-delay control
- Kitchen - contaminants exhausted from range hood to outside
  - 36" range hood for 30" stove
  - Variable speeds up to 300 cfm
  - ERV make-up air built in
- MERV-11 filter for recirculated air to filter out indoor air pollutants

RenewAire GR90

# Air Quality in a Tight House:

---

## Avoid combustion gas sources

- Appliance selection
- Direct-vent gas water heater
- Electric range
- No attached garage to avoid car fumes

## Materials

- Hard surfaces and non-VOC finishes
  - No off-gassing materials--hardwood and tile
  - Don't trap moisture, as per EPA's Indoor AirPLUS
- Less on-site construction means less construction debris in mechanical system

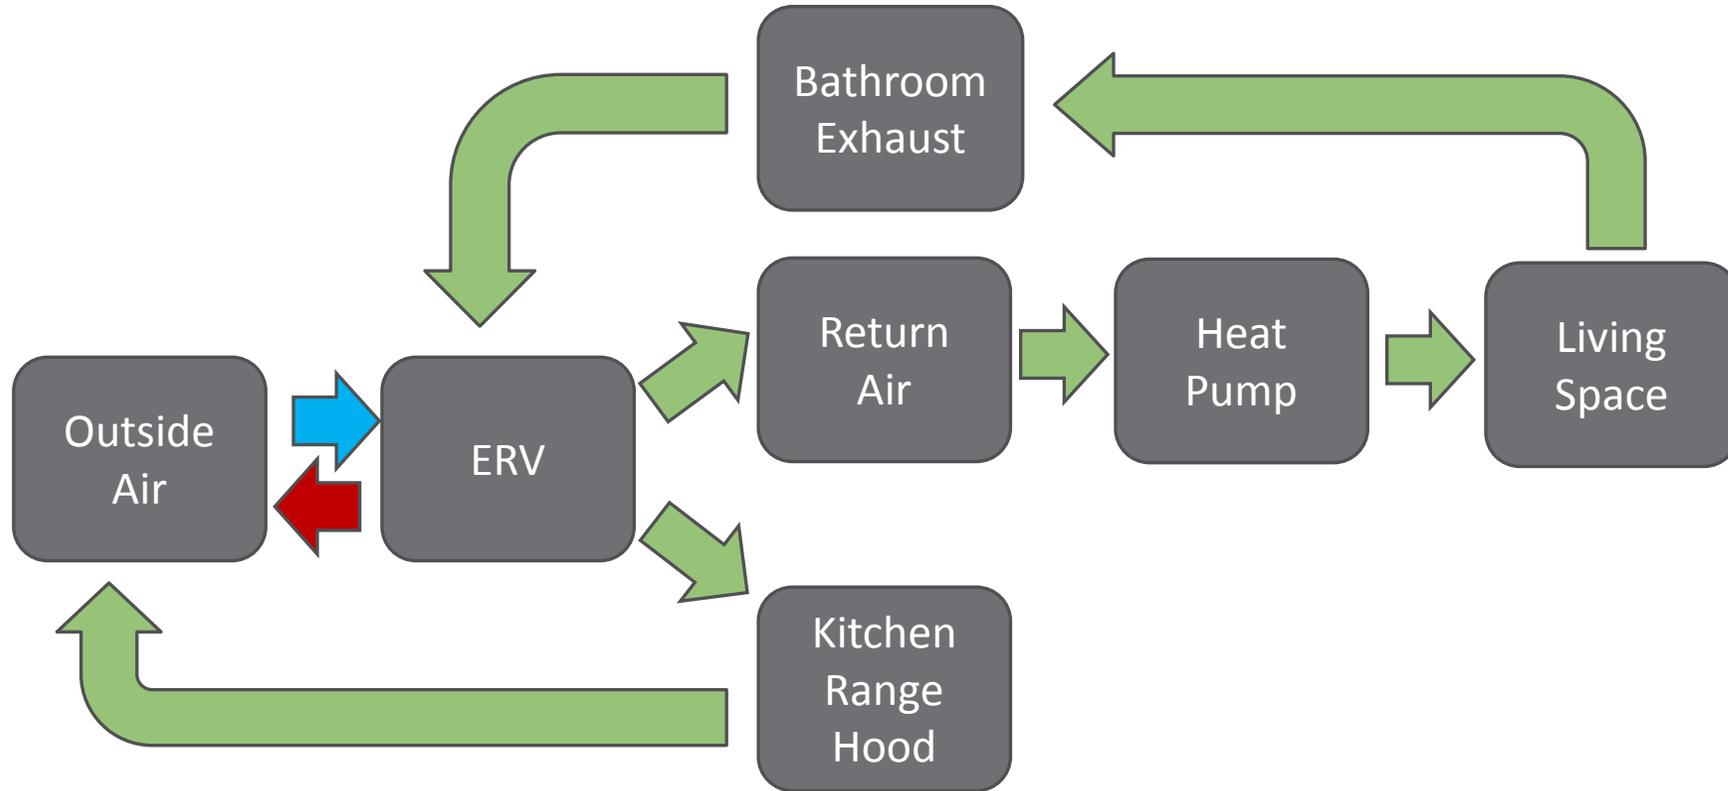

Whirlpool Gold 36"  
range hood

Reliance TS-240-GIH  
water heater

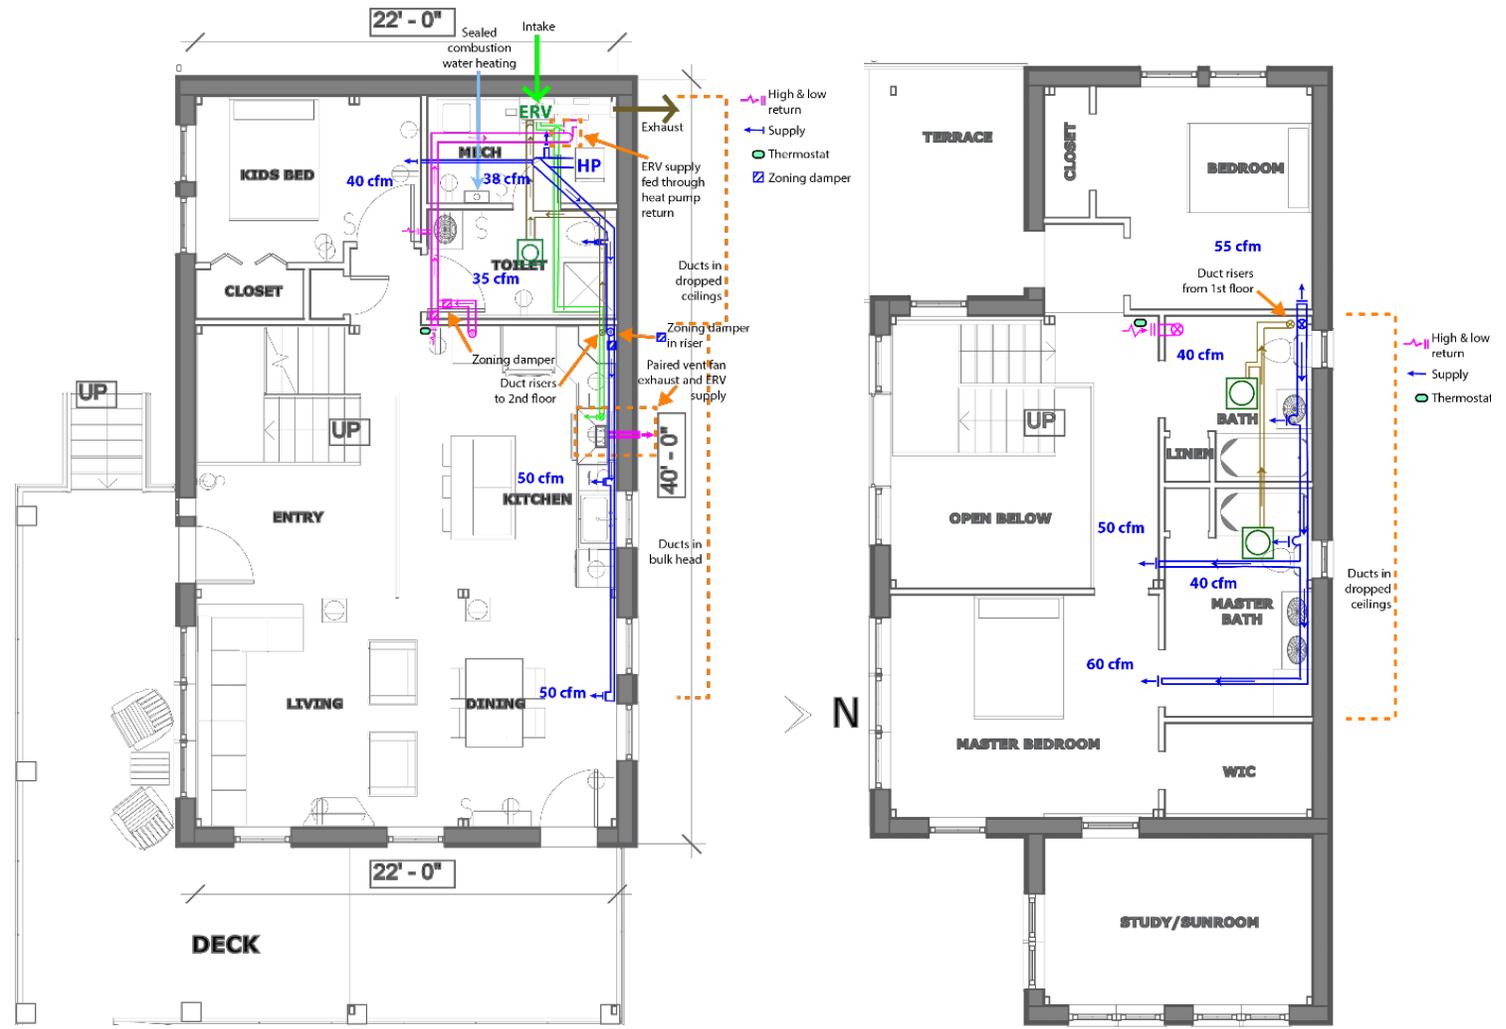

# Space Conditioning

# Simple Layout, Integrated Systems

- Designed for short ductwork
- Forced air to combine heating and cooling distribution and achieve faster response time
- Integrated ERV and heat pump

First Floor

Second Floor

Mechanical plan

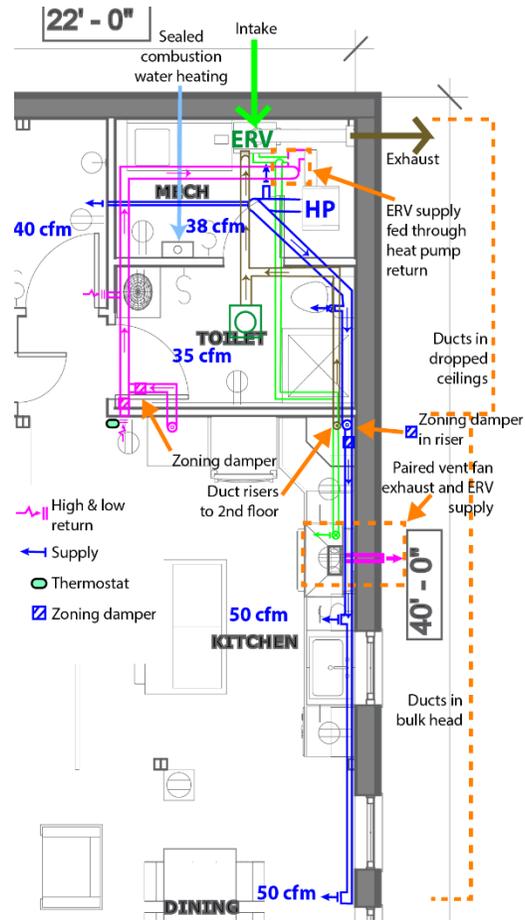

# Geothermal Heat Pump

- 50F Pittsburgh ground temperature
- Closed-loop Water Furnace 5 Series 012
- Horizontal geothermal
  - Lower construction cost
- First-cost justified by savings in energy and maintenance
- COP of 5.1 more than makes up for source energy conversion
  - Twice as source energy effective as a 96% AFUE boiler
- Cooling capacity sized properly for comfort and dehumidification, avoiding sporadic operation

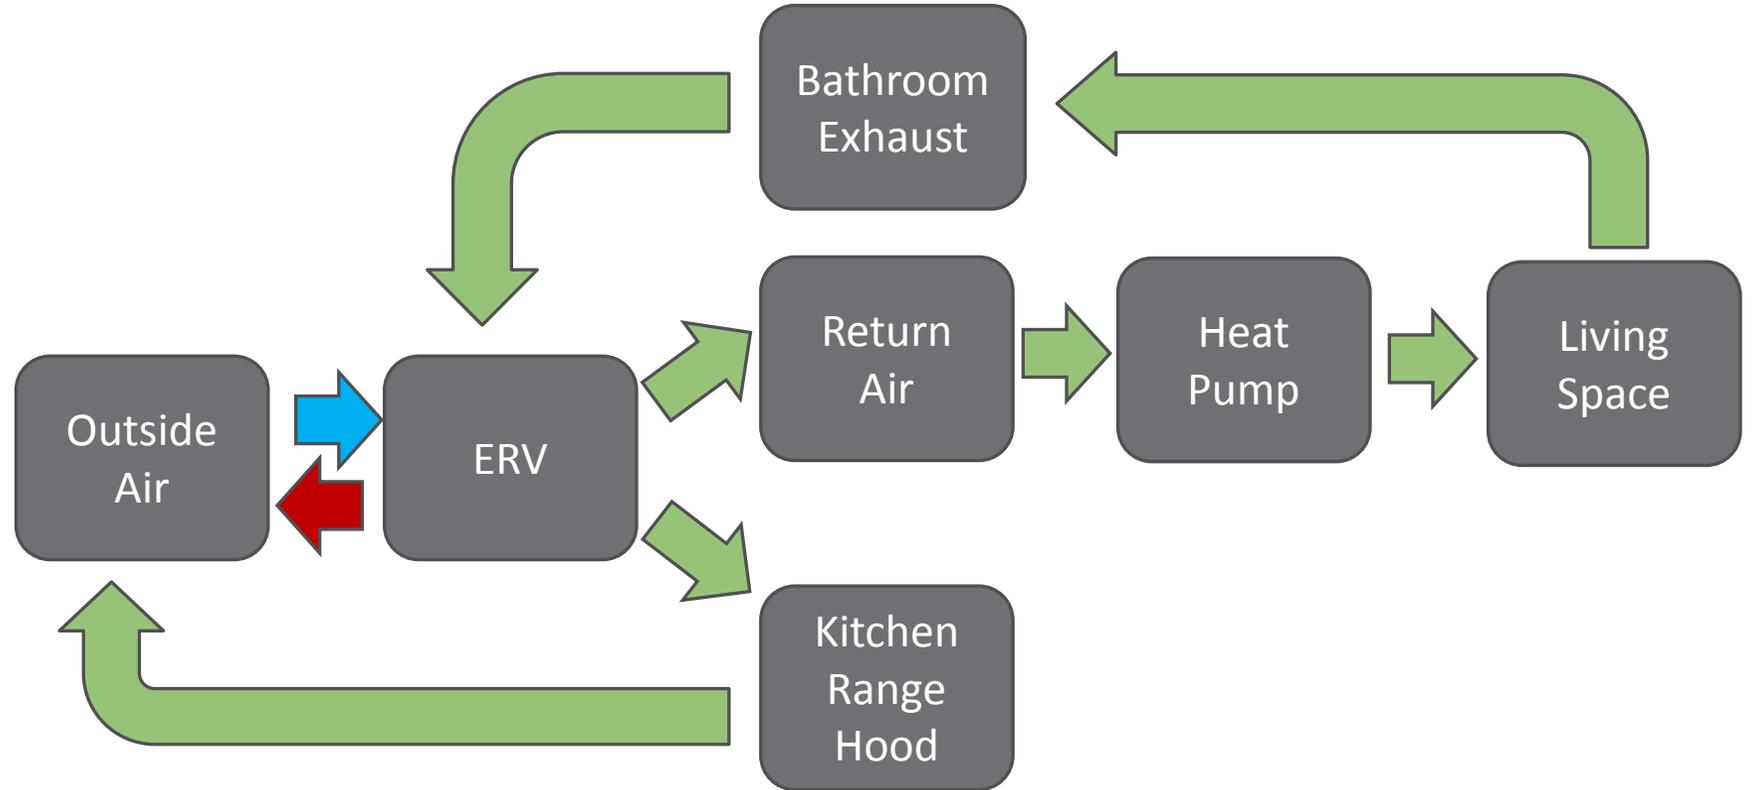

|                          | Cooling capacity<br>(Btuh) | EER  | Heating capacity<br>(Btuh) | COP | Pump<br>GPM | Ventilation fan min.<br>efficiency (cfm/watt) |
|--------------------------|----------------------------|------|----------------------------|-----|-------------|---|
| Energy Star for<br>Homes |                            | 12   |                            | 3.5 |             | 1.2   |
| IECC 2015                |                            |      |                            |     |             | 1.4   |
| Proposed design          | 12,300                     | 15.7 | 14,800                     | 5.1 | 4           | 4   |

# Airflow Path

Mechanical plan, first floor

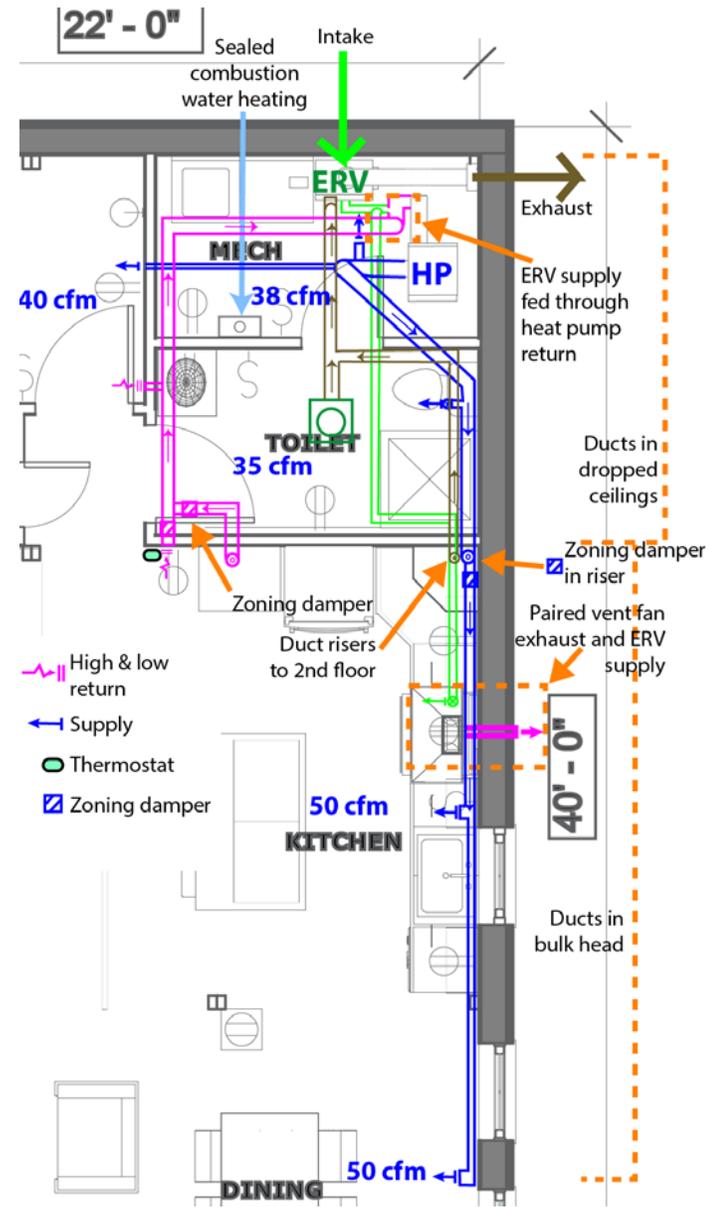

- No cold air directly enters living spaces
- No depressurization

# Air Distribution

- Small ducts because of small loads
- Most of ducting spans 1 wall
- Return air located away from supply for proper mixing
- High and low returns for seasonal responsiveness
- All ducting inside thermal envelope

Mechanical plan, first floor

# Controls and Zoning

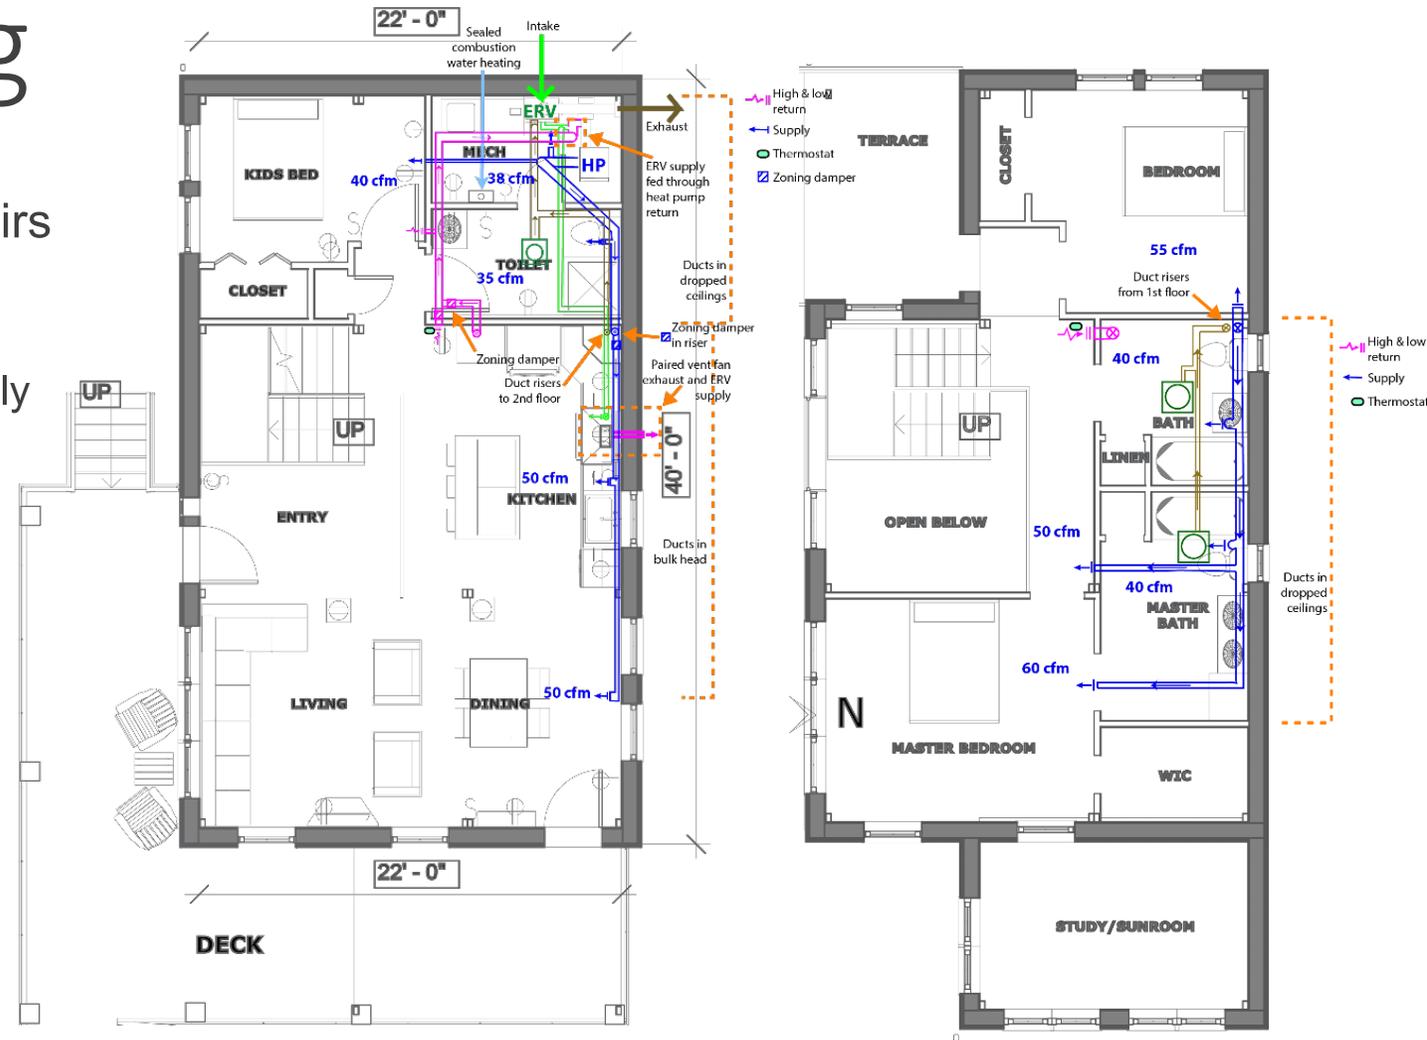

2 main thermal zones: upstairs and downstairs

- Remedies uncomfortable air stratification
- Uses less energy with the option to condition only one level

*Wiser* wireless thermostat

- Programmable, 4-event, 7-day schedule
- Easy operation and smart controls
- Accounts for imperfect occupant behavior

Sun room cantilever is designed as unconditioned space

Mechanical plan

# Home Energy Management System (HEMS)

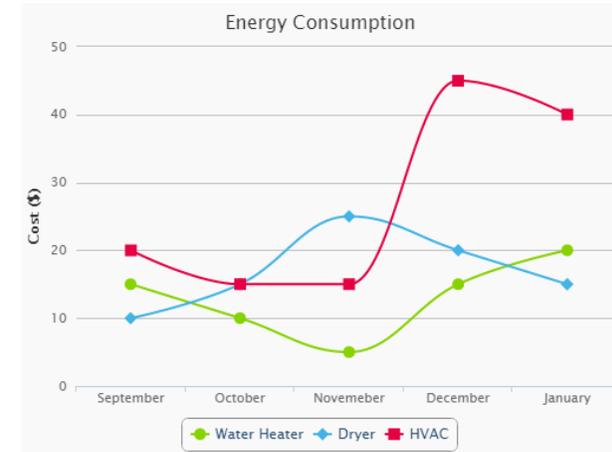

"You can't manage what you can't measure."

Occupant behavior is unpredictable

Energy use AND production should be transparent

Wiser Home Management system by Schneider Electric

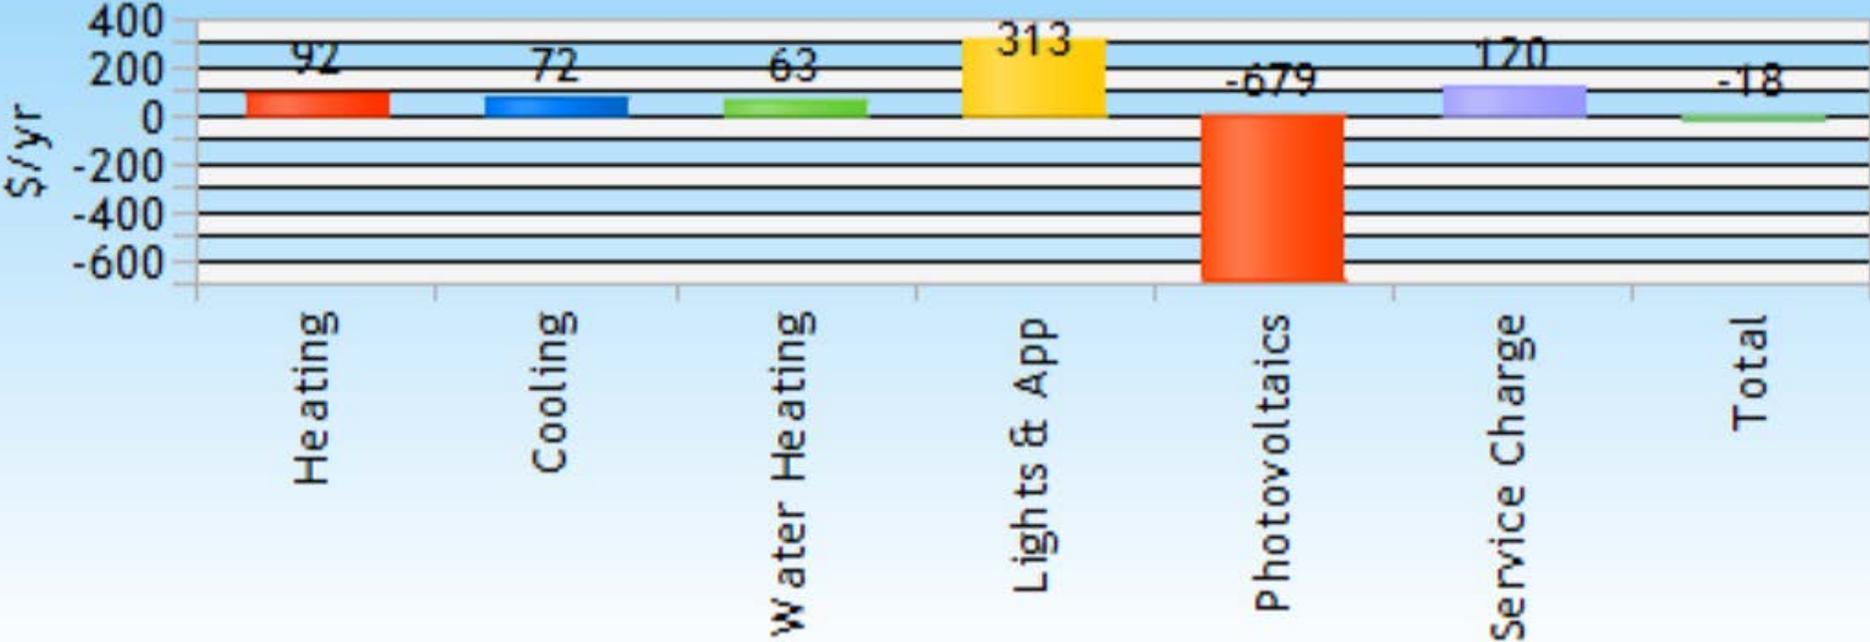

- Remote energy management based on energy use and projected bills
- Remote control of thermostat, lights, and other major appliances
- Real-time net metering
- Provides alerts to users
- Integration with thermostat and compatible with geothermal heat pump

Wiser user interfaces

# Estimated Annual Energy Cost

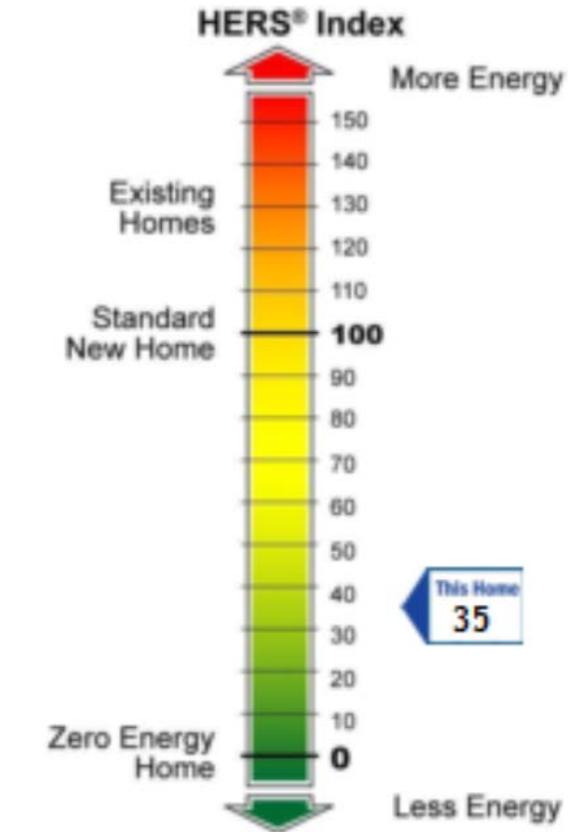

Energy Analysis

# HERS Index Score

## Without Energy Generation

A HERS score of 35 before rooftop PV panels are added indicates a high level of energy conservation

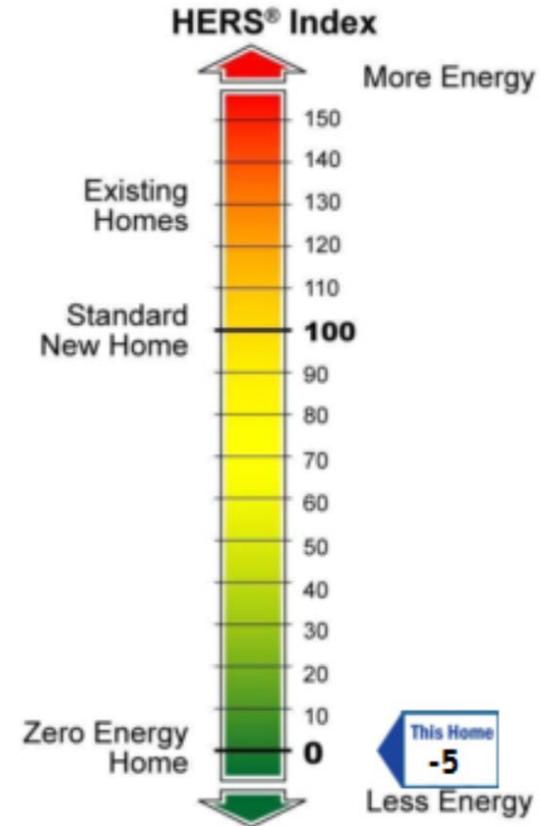

Estimated annual energy cost is \$639 without PV

## With Rooftop PV Panels

A HERS score of -5 shows that the home reaches net zero

Estimated annual energy costs are net negative

- Orienting the house in the "worst case" orientation in REM/Rate yielded a HERS Score of 40 and increased peak cooling loads by 1300 BTU/hr, indicating well-thought-out orientation and envelope design

# Renewable Energy Design

PV chosen over solar thermal

- Limited roof space--with recent PV price drop and maintenance requirements of solar thermal, space is best spent for PV
- More direct energy tracking and monitoring with PV
- Net metering laws in Pennsylvania

PV system sizing for source energy net zero

| Pittsburgh    |      |     |       |     |       |     |       |       |     |     |     |      |         |
|---------------|------|-----|-------|-----|-------|-----|-------|-------|-----|-----|-----|------|---------|
|               | Jan  | Feb | Mar   | Apr | May   | Jun | Jul   | Aug   | Sep | Oct | Nov | Dec  | Average |

# EnergyPLUS Modelling - Insulation

- Graph shows marginal changes in energy savings with each additional R-5 layer of EPS insulation
- Changes in energy use compared with IECC 2015 levels of insulation
- Finding the most valuable place to put insulation
- Create the best value for the high cost of super-insulation

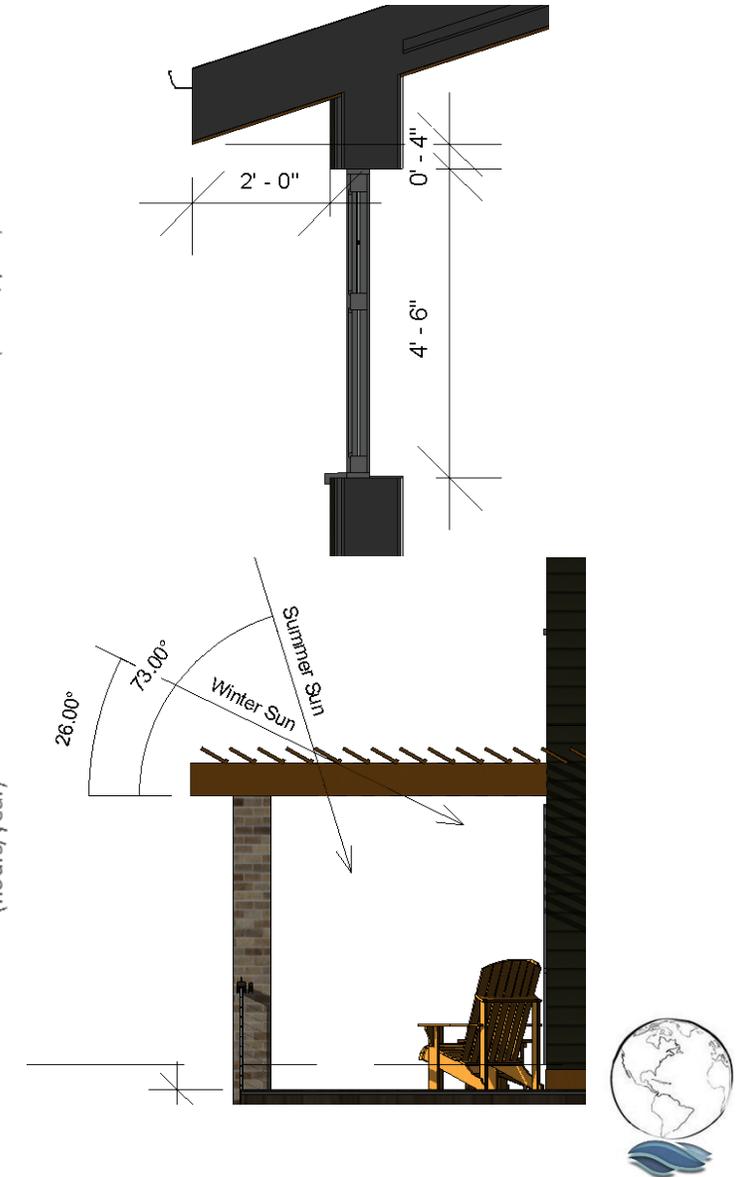

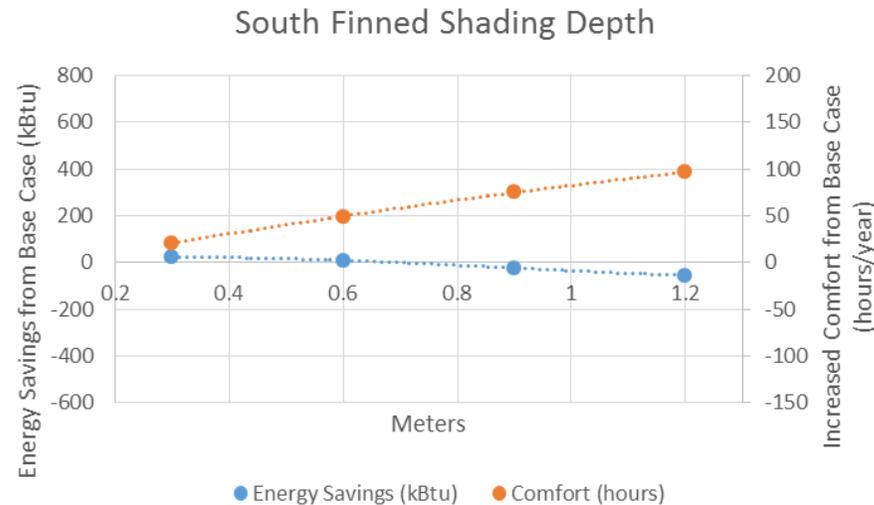

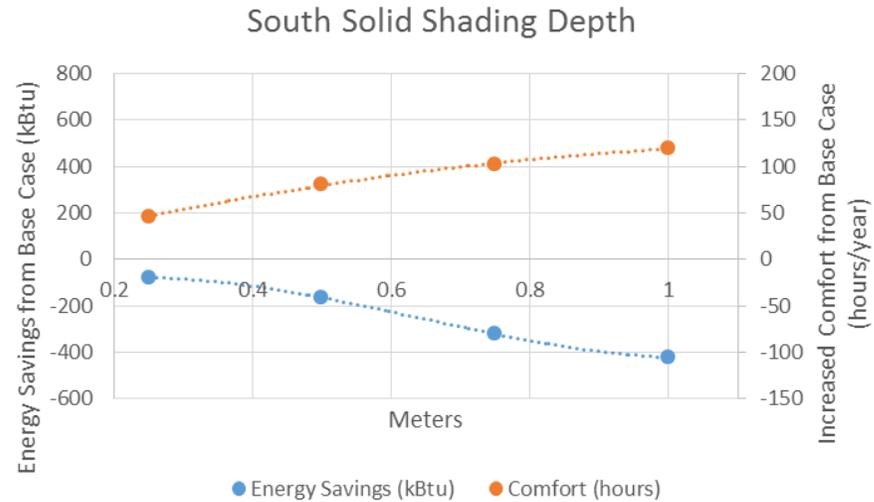

# EnergyPLUS Modelling- Window/Wall Ratio

- Comparing changes in hours of comfort to changes in energy savings
- North WWR has strongest effect on energy use or comfort
- South WWR has little effect on energy use
- Higher WWR on east and west facades increase energy savings and reduce comfort

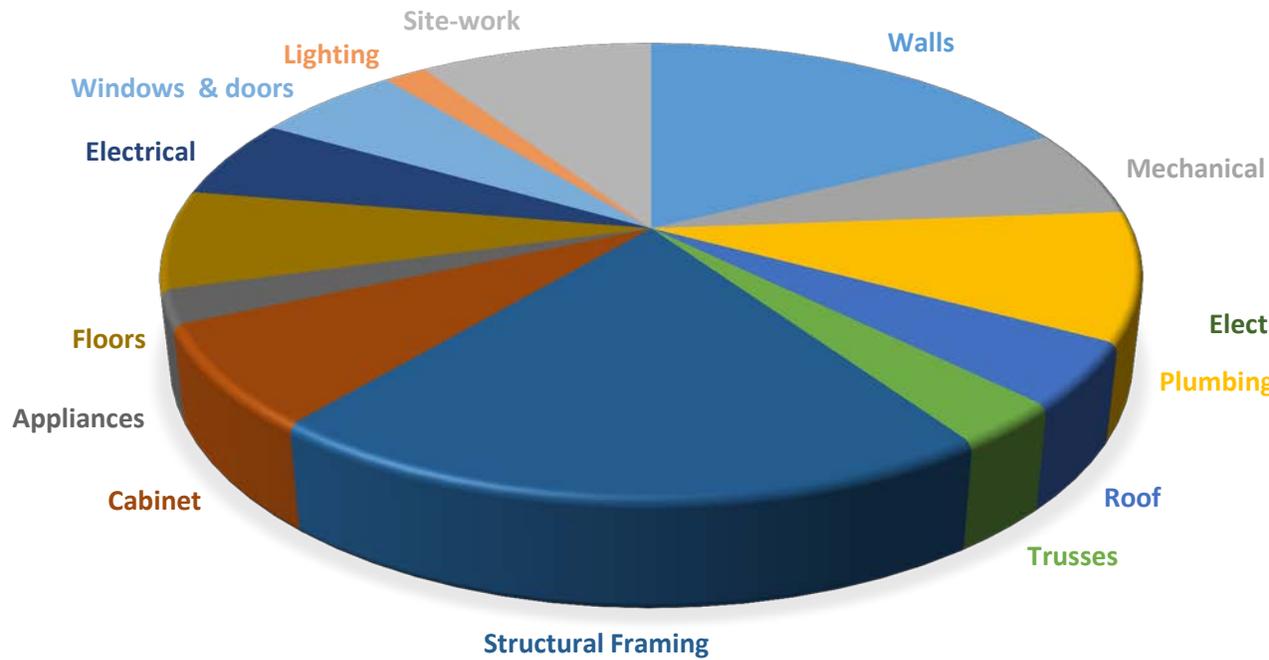

# EnergyPLUS Modelling- External Shading

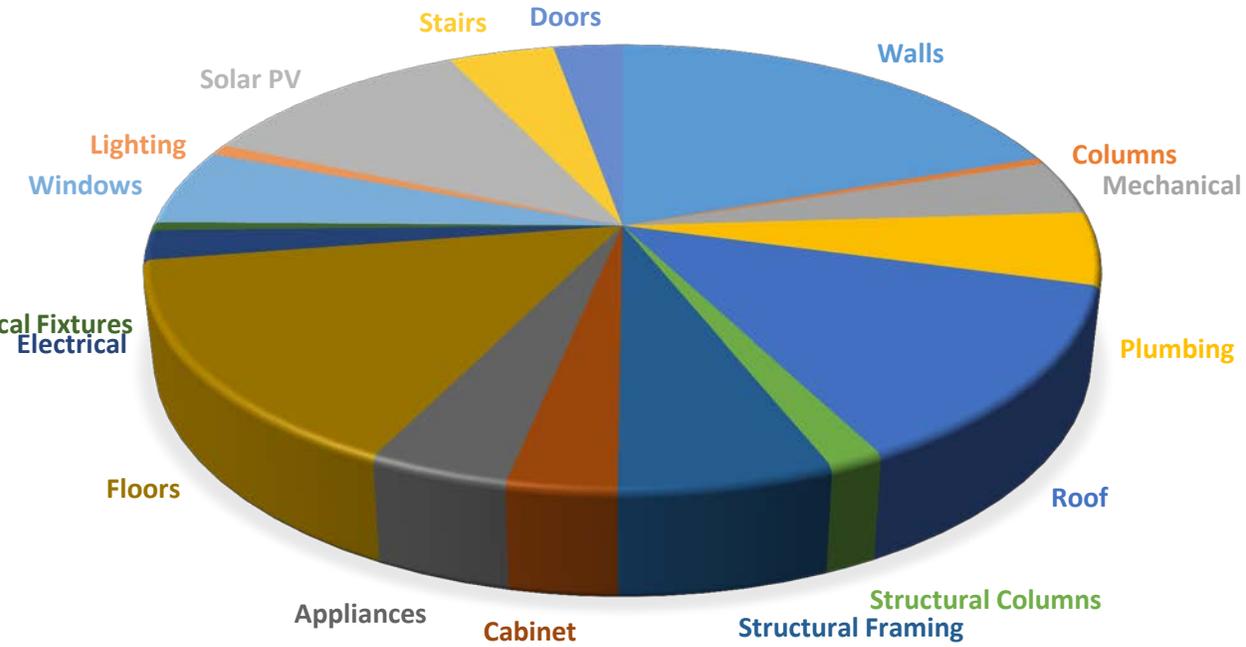

- Compared changes in hours of comfort to changes in energy savings
- Solid shading increases comfort but reduces energy savings
- Trellis shading increases comfort and has little effect on energy use
- Trellis fins are angled at 30 degrees to allow winter sun but deflect summer sun

**COST BREAKDOWN - CONVENTIONAL HOUSE**

**COST BREAKDOWN - 3 RIVERS HOUSE WITH PV**

Financial Analysis

# Assumptions

---

1. Costs are based on RSMeans and adjusted for Pittsburgh
2. Soft costs are based on a percentage value of total construction cost obtained from NAHB's national construction cost survey
3. 10% downpayment
4. 3% Interest rate

# Affordability

---

- Affordable on a household income of \$51,000 (2014 Median for Pittsburgh)
- Target Cost: \$280,500
- Profit Margin: 6.8%

|   |           |   |
|---|-----------|---|
| Pittsburgh median household income year 2014 <sup>1</sup> | \$51,291  | Source: Department of Numbers Pittsburgh Pennsylvania   |
| Property taxes  | \$4,484   | Assuming property value to be \$200,000   |
| Home insurance <sup>2</sup>                               | \$700     | Source: Henshaw   |
| Estimating annual mortgage                                | \$12,910  | =28% of Median household income less property taxes and home insurance  |
| Monthly mortgage  | \$1,076   | Annual mortgage/12  |
| Sales price based on monthly mortgage for a 30 year loan  | \$280,500 | Interest rate is 3% and after taking into account a 10% down-payment a total loan principal of around \$255,000 |

# Cost Comparison

Payback Period of High Performance Features:

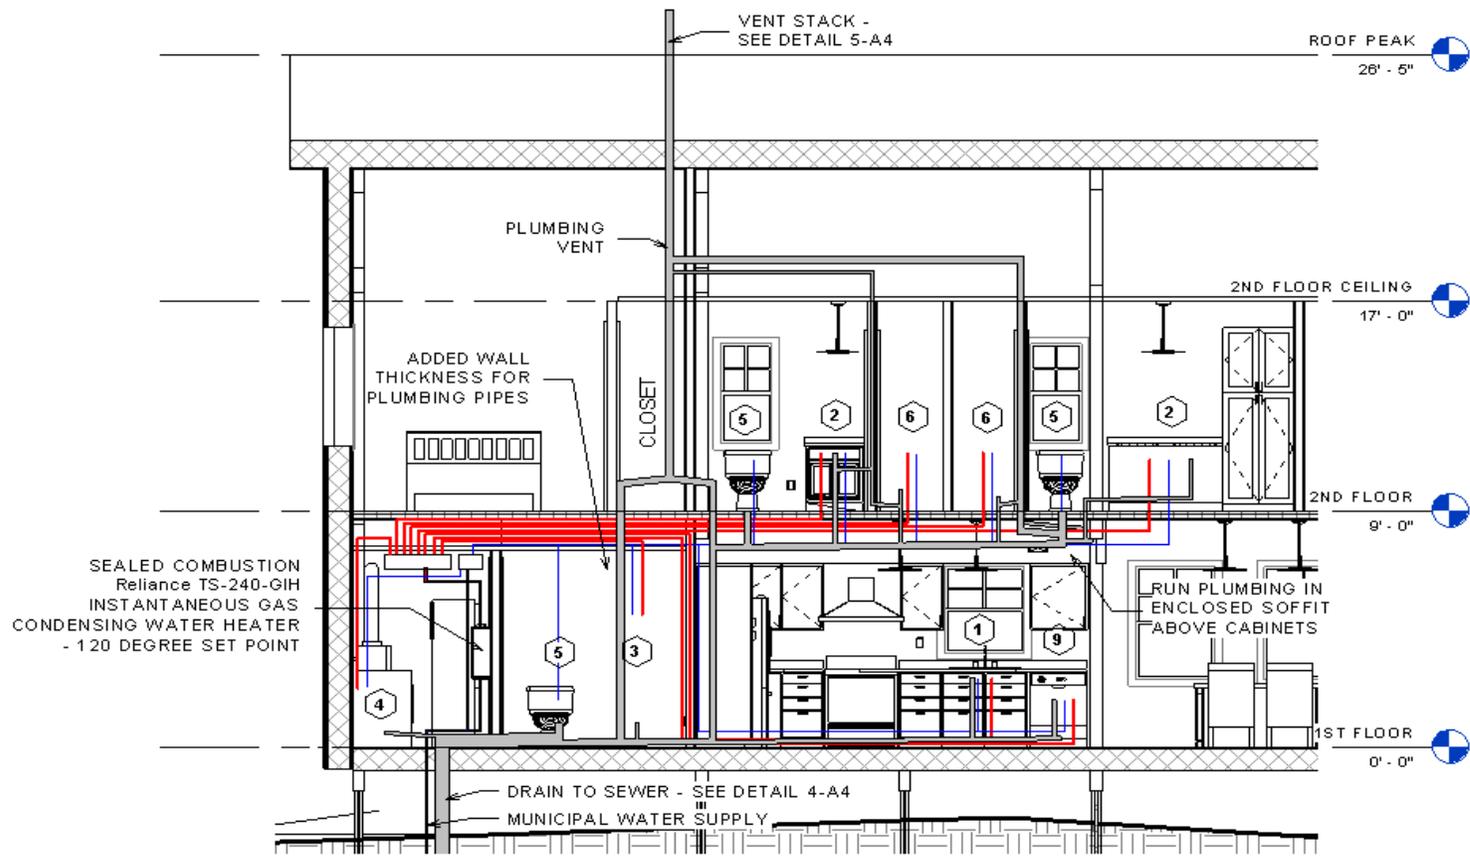

- With PV panels: 12.5 years
- Without PV panels: 24 years

Increased cost over average home:

- \$16,200

| High Performance Features |                   |                   |                  |
|---------------------------|-------------------|-------------------|------------------|
| Component                 | 3 Rivers House    | Conventional      | Difference       |

3 PLUMBING SECTION  
1/4" = 1'-0"

# Plumbing, Lighting & Appliances

# Appliances

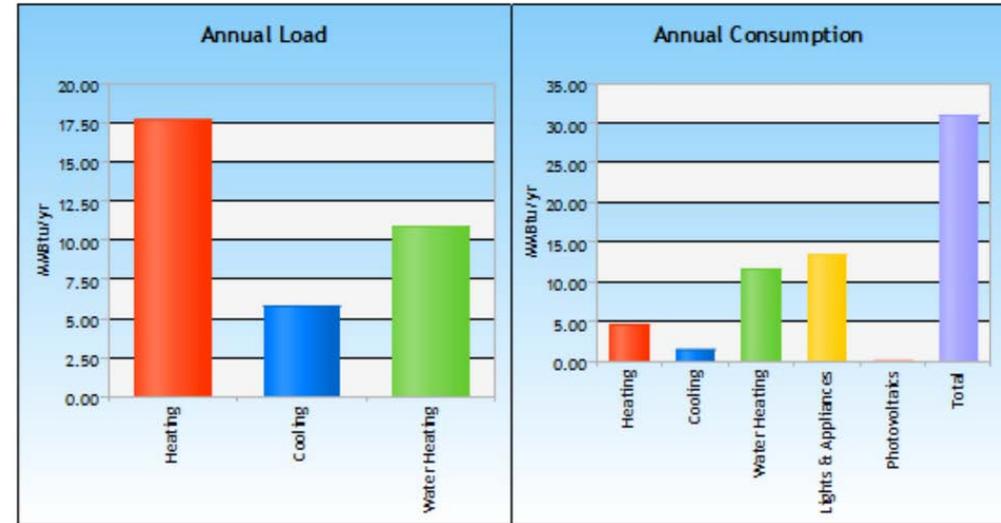

Lighting and appliances are largest end use, indicating efficient design and importance of managing occupant behavior

Highest performing Energy Star and Watersense appliances, wherever possible

Ventless dryer

- Envelope integrity with fewer penetrations
- Avoid combustion appliances
- Don't exhaust heat unnecessarily

Dishwasher with water heater reduces water heating loads by requiring DHW to be heated to 120°F instead of 140°F

Predicted annual load and energy consumption for Three Rivers House without PV

# Lighting

---

## 100% LED lighting

- Longest-lasting and most efficient
- Reduce harmful chemicals

## Daylighting and minimum required light levels supplemented with task lighting

- Main living spaces planned and oriented to receive daylight when occupied

## Lighting controls and dimmers address occupant behavior

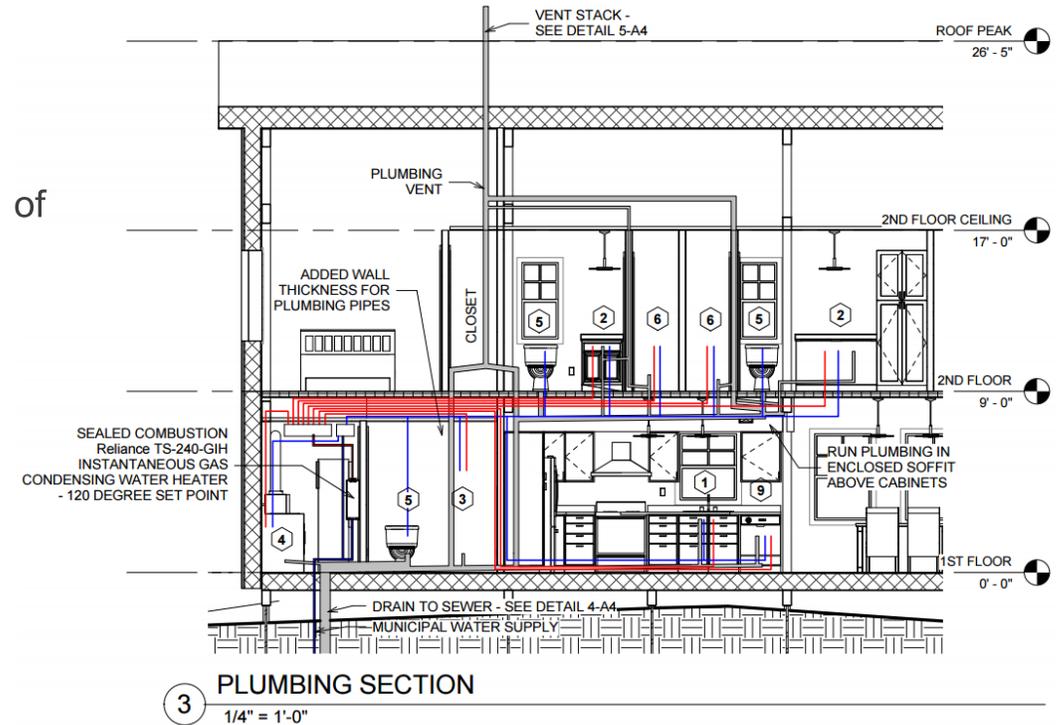

Leviton SureSlide dimmer switch

# Plumbing

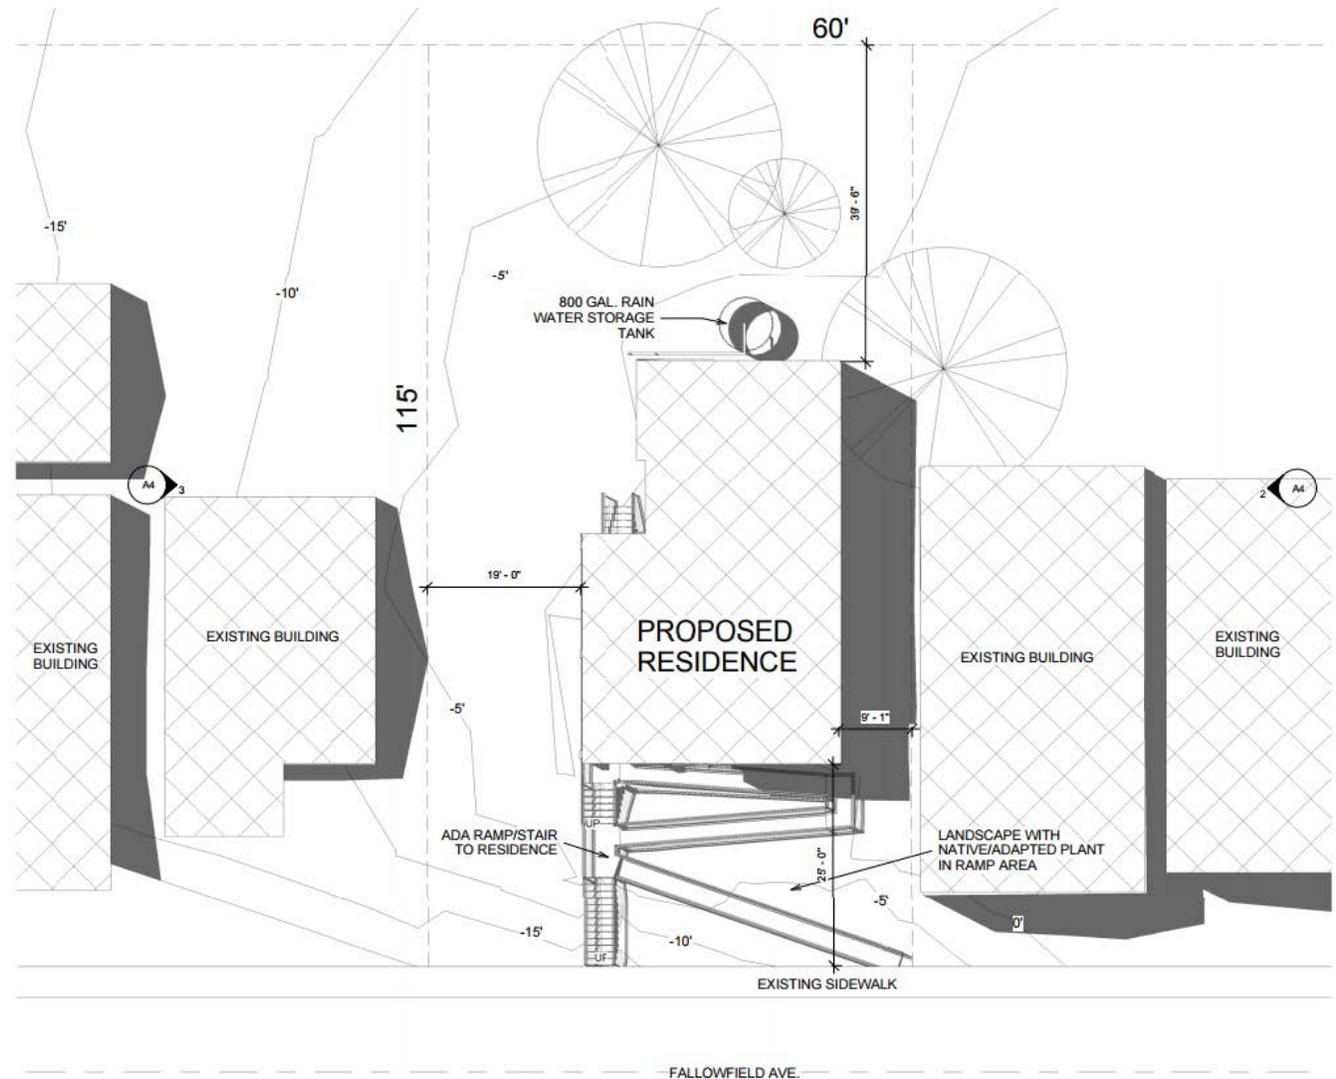

- Reliance TS-240 instantaneous condensing direct-vent water heater with EF=0.95
  - No storage tank required--water heating only when required
- Bathrooms and kitchen located in the same area to minimize length of piping
  - Toe space under cabinets for plumbing
  - Ducts and piping in soffit above cabinets
- PEX tubing
  - Flexibility, fast and easy installation, noise reduction
- Home-run hot water system
  - Average wait time: 7 seconds (discounting the dishwasher)
  - Watersense appliances mean lower flow but slightly longer wait time
- Central vertical plumbing vent to reduce envelope penetrations

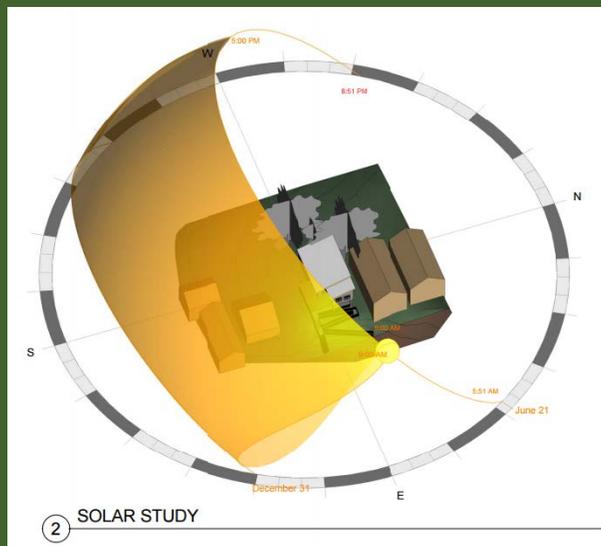

# Site Plan

- Little shading from neighboring buildings
- Handicap accessible stair-ramp at entry to home
- Rainwater storage tank for site irrigation
- Located on a previously built infill lot
- 6900 ft<sup>2</sup> lot

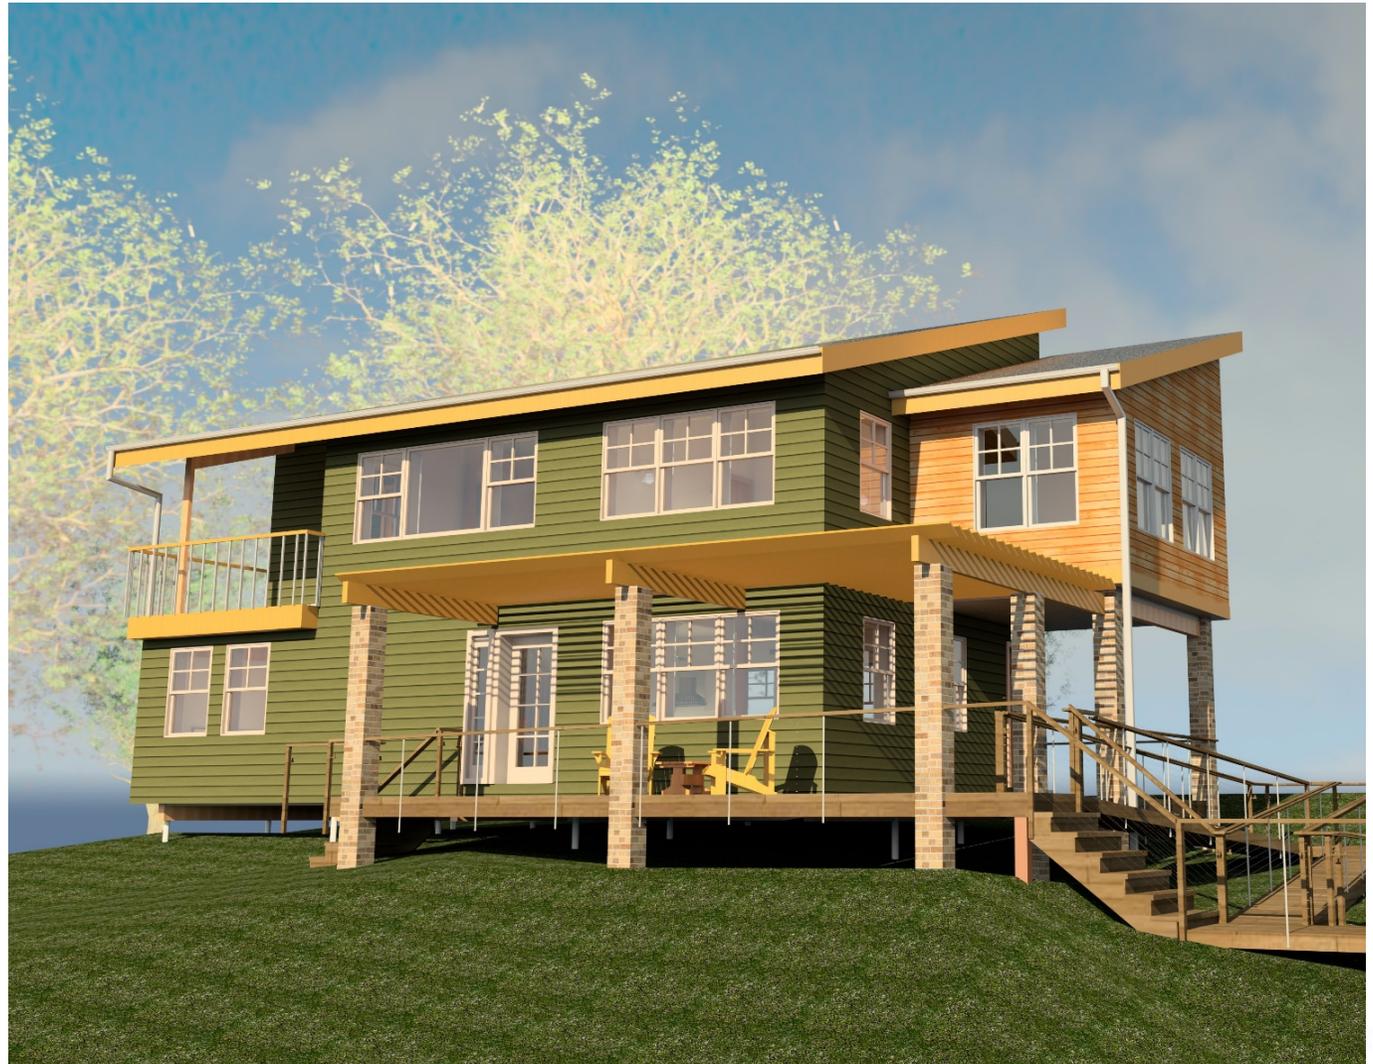

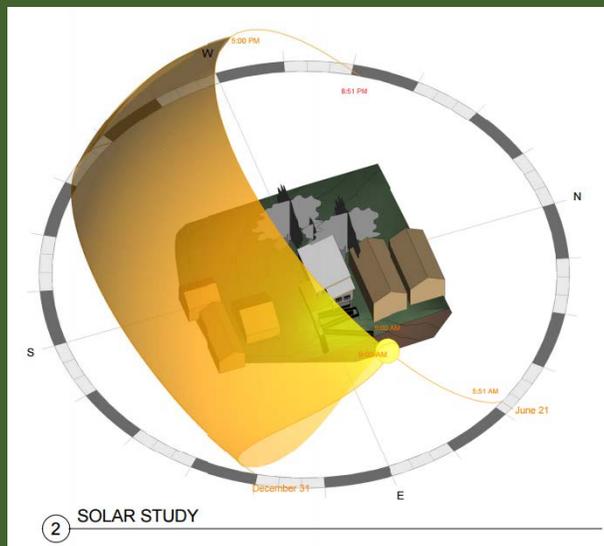

# The Three Rivers House

- Summer Solstice at noon
- Windows mostly shaded
- Shaded outdoor living spaces

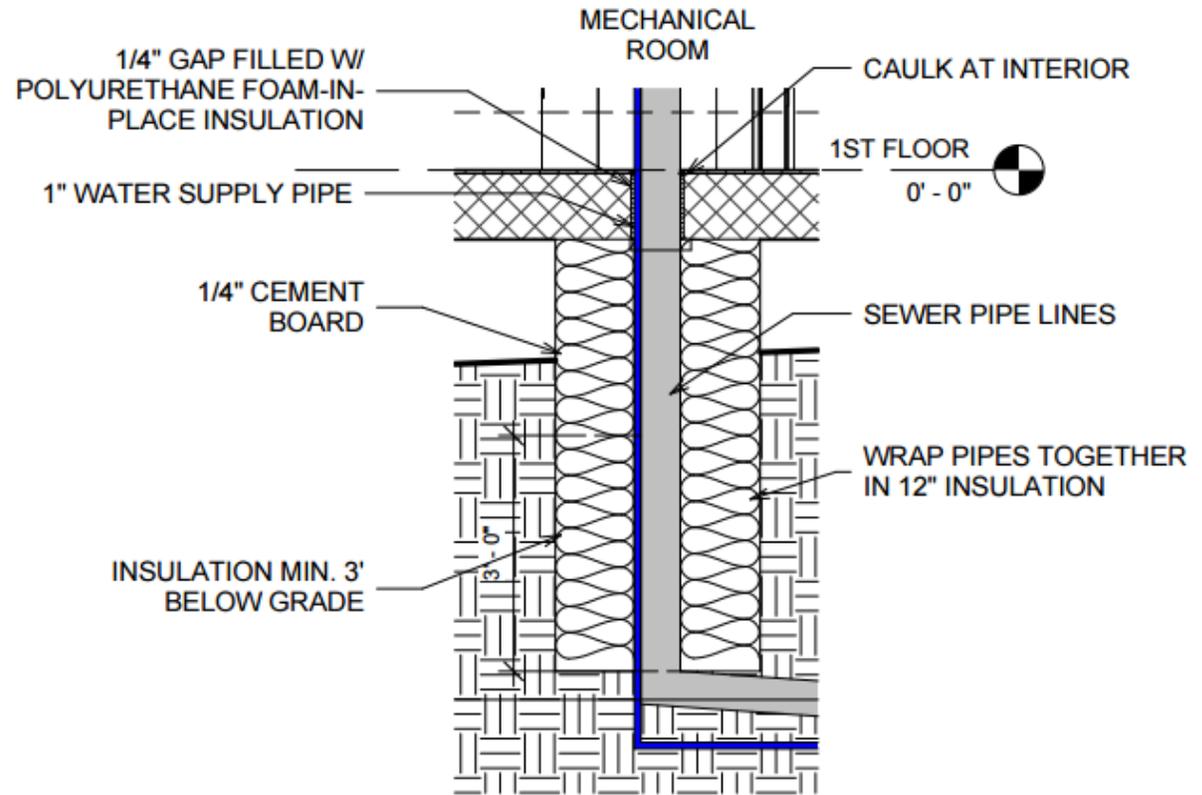

# The Three Rivers House

- Winter Solstice at noon
- Sunlight penetration into living space
